- Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with •beta-blockers; increased myocardial depression when anti-arrhythmics given with •beta-blockers; increased risk of ventricular arrhythmias when

Amiodarone

- Beta-blockers *(continued)*
  amiodarone given with •sotalol—avoid concomitant use
- Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with •diltiazem or •verapamil
- Cardiac Glycosides: amiodarone increases plasma concentration of •digoxin (halve dose of digoxin)

Ciclosporin: amiodarone possibly increases plasma concentration of ciclosporin

Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; amiodarone increases plasma concentration of eplerenone (reduce dose of eplerenone)

Grapefruit Juice: plasma concentration of amiodarone increased by grapefruit juice

- $5HT_3$ Antagonists: increased risk of ventricular arrhythmias when amiodarone given with •dolasetron—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with •ivabradine
- Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with •simvastatin
- Lithium: manufacturer of amiodarone advises avoid concomitant use with •lithium (risk of ventricular arrhythmias)

Orlistat: plasma concentration of amiodarone possibly reduced by orlistat

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with •pentamidine isetionate—avoid concomitant use

Thyroid Hormones: for concomitant use of amiodarone and thyroid hormones see p. 83

Ulcer-healing Drugs: plasma concentration of amiodarone increased by cimetidine

Amisulpride *see* Antipsychotics

Amitriptyline *see* Antidepressants, Tricyclic

Amlodipine *see* Calcium-channel Blockers

Amobarbital *see* Barbiturates

Amoxicillin *see* Penicillins

Amphotericin

Note Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics

Antibacterials: increased risk of nephrotoxicity when amphotericin given with aminoglycosides or polymyxins; possible increased risk of nephrotoxicity when amphotericin given with vancomycin

Antifungals: amphotericin reduces renal excretion and increases cellular uptake of flucytosine (toxicity possibly increased); effects of amphotericin possibly antagonised by imidazoles and triazoles

- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with •cardiac glycosides
- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with •ciclosporin
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with •corticosteroids—avoid concomitant use unless corticosteroids needed to control reactions

Diuretics: increased risk of hypokalaemia when amphotericin given with loop diuretics or thiazides and related diuretics

Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with pentamidine isetionate

- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with •tacrolimus

Ampicillin *see* Penicillins

Anabolic Steroids

- Anticoagulants: anabolic steroids enhance anticoagulant effect of •coumarins and •phenindione

Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of antidiabetics

Anaesthetics, General

Note *See also* Surgery and Long-term Medication, p. 697

ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with ACE inhibitors

- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with ●adrenergic neurone blockers
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with ●alpha-blockers

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with angiotensin-II receptor antagonists

Antibacterials: general anaesthetics possibly potentiate hepatotoxicity of isoniazid; effects of thiopental enhanced by sulphonamides; hypersensitivity-like reactions can occur when general anaesthetics given with intravenous vancomycin

- Antidepressants: Because of hazardous interactions between general anaesthetics and ●MAOIs, MAOIs should normally be stopped 2 weeks before surgery; increased risk of arrhythmias and hypotension when general anaesthetics given with tricyclics
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with ●antipsychotics; effects of thiopental enhanced by droperidol

Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when general anaesthetics given with beta-blockers

- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with calcium-channel blockers; general anaesthetics enhance hypotensive effect of ●verapamil (also AV delay)

Clonidine: enhanced hypotensive effect when general anaesthetics given with clonidine

- Cytotoxics: nitrous oxide increases antifolate effect of ●methotrexate—avoid concomitant use

Diazoxide: enhanced hypotensive effect when general anaesthetics given with diazoxide

Diuretics: enhanced hypotensive effect when general anaesthetics given with diuretics

- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with ●levodopa

Ergot Alkaloids: halothane reduces effects of ergometrine on the parturient uterus

- Memantine: increased risk of CNS toxicity when ketamine given with ●memantine (manufacturer of memantine advises avoid concomitant use)

Methyldopa: enhanced hypotensive effect when general anaesthetics given with methyldopa

Moxonidine: enhanced hypotensive effect when general anaesthetics given with moxonidine

- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with ●suxamethonium; volatile liquid general anaesthetics enhance effects of non-depolarising muscle relaxants and suxamethonium; ketamine enhances effects of atracurium

Nitrates: enhanced hypotensive effect when general anaesthetics given with nitrates

Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with oxytocin

Probenecid: effects of thiopental possibly enhanced by probenecid

- Sympathomimetics: increased risk of arrhythmias when volatile liquid general anaesthetics given with ●adrenaline (epinephrine); increased risk of hypertension when volatile liquid general anaesthetics given with ●methylphenidate

Theophylline: increased risk of convulsions when ketamine given with theophylline; increased risk of arrhythmias when halothane given with theophylline

Anaesthetics, General *(continued)*

Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with hydralazine, minoxidil or sodium nitroprusside

Anaesthetics, General (intravenous) *see* Anaesthetics, General

Anaesthetics, General (volatile liquids) *see* Anaesthetics, General

Anaesthetics, Local *see* Bupivacaine, Levobupivacaine, Lidocaine (lignocaine), Prilocaine, and Ropivacaine

Anagrelide

- Cilostazol: manufacturer of anagrelide advises avoid concomitant use with ●cilostazol
- Phosphodiesterase Inhibitors: manufacturer of anagrelide advises avoid concomitant use with ●enoximone and ●milrinone

Anakinra

- Adalimumab: avoid concomitant use of anakinra with ●adalimumab
- Etanercept: increased risk of side-effects when anakinra given with ●etanercept—avoid concomitant use
- Infliximab: avoid concomitant use of anakinra with ●infliximab
- Vaccines: avoid concomitant use of anakinra with live ●vaccines (see p. 669)

Analgesics *see* Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists

ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol

Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aldesleukin

Aliskiren: irbesartan possibly reduces plasma concentration of aliskiren

Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with general anaesthetics

Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised

Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with heparin

Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs

Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with antipsychotics

Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers

- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ●ciclosporin

Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine

Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide

- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ●diuretics; increased risk of hyperkalaemia when angiotensin-II

Angiotensin-II Receptor Antagonists

- Diuretics *(continued)*
  receptor antagonists given with ●potassium-sparing diuretics and aldosterone antagonists
  Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with levodopa
- Lithium: angiotensin-II receptor antagonists reduce excretion of ●lithium (increased plasma concentration)
  Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with methyldopa
  Moxisylyte (thymoxamine): enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxisylyte
  Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxonidine
  Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with baclofen or tizanidine
  Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with nitrates
  Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by oestrogens
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ●potassium salts
  Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alprostadil
  Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with tacrolimus
  Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with hydralazine, minoxidil or sodium nitroprusside

Antacids

Note Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE Inhibitors: antacids possibly reduce absorption of ACE inhibitors; antacids reduce absorption of captopril, enalapril and fosinopril
Analgesics: alkaline urine due to some antacids increases excretion of aspirin
Antibacterials: antacids reduce absorption of azithromycin, cefaclor, cefpodoxime, ciprofloxacin, isoniazid, levofloxacin, moxifloxacin, norfloxacin, ofloxacin, rifampicin and tetracyclines; oral magnesium salts (as magnesium trisilicate) reduce absorption of nitrofurantoin
Antiepileptics: antacids reduce absorption of gabapentin and phenytoin
Antifungals: antacids reduce absorption of itraconazole and ketoconazole
Antihistamines: antacids reduce absorption of fexofenadine
Antimalarials: antacids reduce absorption of chloroquine and hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of proguanil
Antipsychotics: antacids reduce absorption of phenothiazines and sulpiride
Antivirals: antacids possibly reduce plasma concentration of atazanavir; antacids possibly reduce absorption of fosamprenavir; antacids reduce absorption of tipranavir
Bile Acids: antacids possibly reduce absorption of bile acids
Bisphosphonates: antacids reduce absorption of bisphosphonates
Cardiac Glycosides: antacids possibly reduce absorption of digoxin
Corticosteroids: antacids reduce absorption of deflazacort
Cytotoxics: avoidance of antacids advised by manufacturer of nilotinib

Antacids *(continued)*

Deferasirox: antacids containing aluminium possibly reduce absorption of deferasirox (manufacturer of deferasirox advises avoid concomitant use)
Dipyridamole: antacids possibly reduce absorption of dipyridamole
Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of *oral* iron
Lipid-regulating Drugs: antacids reduce absorption of rosuvastatin
Lithium: sodium bicarbonate increases excretion of lithium (reduced plasma concentration)
Mycophenolate: antacids reduce absorption of mycophenolate
Penicillamine: antacids reduce absorption of penicillamine
Thyroid Hormones: antacids possibly reduce absorption of levothyroxine (thyroxine)
Ulcer-healing Drugs: antacids possibly reduce absorption of lansoprazole

Antazoline *see* Antihistamines

Anti-arrhythmics *see* Adenosine, Amiodarone, Disopyramide, Flecainide, Lidocaine (lignocaine), and Propafenone

Antibacterials *see* individual drugs

Antibiotics (cytotoxic) *see* Bleomycin, Doxorubicin, Epirubicin, Mitomycin

Anticoagulants *see* Coumarins, Dabigatran etexilate, Heparins, Phenindione, and Rivaroxaban

Antidepressants *see* Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Tryptophan; Venlafaxine

Antidepressants, Noradrenaline Re-uptake Inhibitors *see* Reboxetine

Antidepressants, SSRI

Alcohol: sedative effects possibly increased when SSRIs given with alcohol
Anaesthetics, Local: fluvoxamine inhibits metabolism of ropivacaine—avoid prolonged administration of ropivacaine

- Analgesics: increased risk of bleeding when SSRIs given with ●NSAIDs or ●aspirin; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of methadone; increased risk of CNS toxicity when SSRIs given with ●tramadol
  Anti-arrhythmics: fluoxetine increases plasma concentration of flecainide; paroxetine possibly inhibits metabolism of propafenone (increased risk of toxicity)
- Anticoagulants: SSRIs possibly enhance anticoagulant effect of ●coumarins
- Antidepressants: avoidance of fluvoxamine advised by manufacturer of ●reboxetine; possible increased serotonergic effects when SSRIs given with duloxetine; fluvoxamine inhibits metabolism of ●duloxetine—avoid concomitant use; citalopram, escitalopram, fluvoxamine or paroxetine should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine or paroxetine; fluoxetine should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by ●MAOIs (risk of serious toxicity); sertraline should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 2 weeks after stopping sertraline; increased risk of CNS toxicity when escitalopram given with ●moclobemide, preferably avoid concomitant use; after stopping citalopram, fluvoxamine or paroxetine do not start ●moclobemide for at least 1 week; after stopping fluoxetine do not start ●moclobemide for 5 weeks; after stopping sertraline do not start ●moclobemide for 2 weeks; increased serotonergic effects when SSRIs given with ●St John's wort—avoid concomitant use; fluvoxamine inhibits metabolism of ●agomelatine (increased plasma con-

Antidepressants, SSRI

- Antidepressants *(continued)*
  centration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with mirtazapine; SSRIs increase plasma concentration of some ●tricyclics; agitation and nausea may occur when SSRIs given with ●tryptophan
- Antiepileptics: SSRIs antagonise anticonvulsant effect of ●antiepileptics (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of ●carbamazepine; plasma concentration of paroxetine reduced by carbamazepine, phenytoin and primidone; fluoxetine and fluvoxamine increase plasma concentration of ●phenytoin

  Antihistamines: antidepressant effect of SSRIs possibly antagonised by cyproheptadine
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

  Antimuscarinics: paroxetine increases plasma concentration of darifenacin and procyclidine
- Antipsychotics: avoidance of fluoxetine, fluvoxamine or sertraline advised by manufacturer of ●droperidol (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of ●clozapine, ●haloperidol, risperidone, ●sertindole and ●zotepine; paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly inhibit metabolism of ●aripiprazole (reduce dose of aripiprazole); fluvoxamine, paroxetine and sertraline increase plasma concentration of ●clozapine; citalopram possibly increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine increases plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of risperidone (increased risk of toxicity); paroxetine increases plasma concentration of ●sertindole
- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by darunavir; plasma concentration of SSRIs possibly increased by ●ritonavir; plasma concentration of paroxetine possibly reduced by ritonavir
- Anxiolytics and Hypnotics: fluvoxamine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of ●melatonin—avoid concomitant use; sedative effects possibly increased when sertraline given with zolpidem

  Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine; fluoxetine and paroxetine possibly inhibit metabolism of atomoxetine

  Barbiturates: SSRIs antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered); plasma concentration of paroxetine reduced by phenobarbital

  Beta-blockers: citalopram and escitalopram increase plasma concentration of metoprolol; paroxetine possibly increases plasma concentration of metoprolol (enhanced effect); fluvoxamine increases plasma concentration of propranolol

  Bupropion: plasma concentration of citalopram possibly increased by bupropion

  Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of nifedipine (increased plasma concentration)
- Dopaminergics: caution with paroxetine advised by manufacturer of entacapone; increased risk of CNS toxicity when SSRIs given with ●rasagiline; fluvoxamine should not be started until 2 weeks after stopping ●rasagiline; fluoxetine should not be started until 2 weeks after stopping ●rasagiline, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; theoretical risk of serotonin syndrome if citalopram given with selegiline (especially if dose of selegiline exceeds 10 mg daily); manufacturer of escitalopram advises caution with selegiline; increased risk of hypertension and CNS excitation when paroxetine or sertraline given with ●selegiline (selegiline should not be started until 2 weeks after stopping paroxetine or sertraline, avoid paroxetine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine given with ●selegiline (selegiline should not be started until 1 week after stopping fluvoxamine, avoid fluvoxamine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with ●selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline)

Antidepressants, SSRI

- Dopaminergics *(continued)*
- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of ●tamoxifen to active metabolite (avoid concomitant use)
- 5HT$_1$ Agonists: fluvoxamine inhibits the metabolism of frovatriptan; possible increased serotonergic effects when SSRIs given with frovatriptan; increased risk of CNS toxicity when sertraline given with ●sumatriptan (manufacturer of sertraline advises avoid concomitant use); increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with ●sumatriptan; fluvoxamine possibly inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
- Lithium: Increased risk of CNS effects when SSRIs given with ●lithium (lithium toxicity reported)
- Muscle Relaxants: fluvoxamine increases plasma concentration of ●tizanidine (increased risk of toxicity)—avoid concomitant use

  Parasympathomimetics: paroxetine increases plasma concentration of galantamine

  Ranolazine: paroxetine increases plasma concentration of ranolazine
- Sibutramine: increased risk of CNS toxicity when SSRIs given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use)

  Sympathomimetics: metabolism of SSRIs possibly inhibited by methylphenidate
- Theophylline: fluvoxamine increases plasma concentration of ●theophylline (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)

  Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by cimetidine; fluvoxamine possibly increases plasma concentration of lansoprazole; plasma concentration of escitalopram increased by omeprazole

Antidepressants, SSRI (related) *see* Duloxetine and Venlafaxine

Antidepressants, Tricyclic

Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of adrenergic neurone blockers

- Alcohol: increased sedative effect when tricyclics given with ●alcohol

  Alpha$_2$-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of apraclonidine and brimonidine

  Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with general anaesthetics
- Analgesics: increased risk of CNS toxicity when tricyclics given with ●tramadol; side-effects possibly increased when tricyclics given with nefopam; sedative effects possibly increased when tricyclics given with opioid analgesics
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with ●amiodarone—

Antidepressants, Tricyclic

- Anti-arrhythmics *(continued)*
  avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with ●disopyramide or ●flecainide; increased risk of arrhythmias when tricyclics given with ●propafenone
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with ●moxifloxacin—avoid concomitant use; plasma concentration of tricyclics possibly reduced by rifampicin
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of ●coumarins
- Antidepressants: possible increased serotonergic effects when amitriptyline or clomipramine given with duloxetine; increased risk of hypertension and CNS excitation when tricyclics given with ●MAOIs, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start ●moclobemide for at least 1 week; plasma concentration of some tricyclics increased by ●SSRIs; plasma concentration of amitriptyline reduced by St John's wort
- Antiepileptics: tricyclics antagonise anticonvulsant effect of ●antiepileptics (convulsive threshold lowered); metabolism of tricyclics accelerated by ●carbamazepine (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by ●phenytoin; tricyclics antagonises anticonvulsant effect of ●primidone (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

  Antifungals: plasma concentration of imipramine and nortriptyline possibly increased by terbinafine

  Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with antihistamines
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

  Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with antimuscarinics
- Antipsychotics: plasma concentration of tricyclics increased by ●antipsychotics—possibly increased risk of ventricular arrhythmias; avoidance of tricyclics advised by manufacturer of ●droperidol (risk of ventricular arrhythmias); possibly increased antimuscarinic side-effects when tricyclics given with clozapine; increased risk of antimuscarinic side-effects when tricyclics given with phenothiazines; increased risk of ventricular arrhythmias when tricyclics given with ●pimozide—avoid concomitant use
- Antivirals: side-effects of tricyclics possibly increased by fosamprenavir; plasma concentration of tricyclics possibly increased by ●ritonavir

  Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with anxiolytics and hypnotics
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with ●atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine
- Barbiturates: tricyclics antagonises anticonvulsant effect of ●barbiturates (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
- Beta-blockers: plasma concentration of imipramine increased by labetalol and propranolol; increased risk of ventricular arrhythmias when tricyclics given with ●sotalol

  Calcium-channel Blockers: plasma concentration of tricyclics possibly increased by diltiazem and verapamil; plasma concentration of imipramine increased by diltiazem and verapamil
- Clonidine: tricyclics antagonise hypotensive effect of ●clonidine, also increased risk of hypertension on clonidine withdrawal

Antidepressants, Tricyclic *(continued)*

Disulfiram: metabolism of tricyclics inhibited by disulfiram (increased plasma concentration); concomitant amitriptyline reported to increase disulfiram reaction with alcohol

Diuretics: increased risk of postural hypotension when tricyclics given with diuretics

- Dopaminergics: caution with tricyclics advised by manufacturer of entacapone; increased risk of CNS toxicity when tricyclics given with ●rasagiline; CNS toxicity reported when tricyclics given with ●selegiline

Lithium: risk of toxicity when tricyclics given with lithium

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen

Nicorandil: tricyclics possibly enhance hypotensive effect of nicorandil

Nitrates: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Oestrogens: antidepressant effect of tricyclics antagonised by oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with ●pentamidine isetionate
- Sibutramine: increased risk of CNS toxicity when tricyclics given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Sodium Oxybate: increased risk of side-effects when tricyclics given with sodium oxybate

- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with ●adrenaline (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk of hypertension and arrhythmias when tricyclics given with ●noradrenaline (norepinephrine)

Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with ●alcohol

  Alpha$_2$-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of apraclonidine and brimonidine
- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start ●moclobemide for at least 1 week
- Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of ●antiepileptics (convulsive threshold lowered); plasma concentration of mianserin reduced by ●carbamazepine and ●phenytoin; metabolism of mianserin accelerated by ●primidone (reduced plasma concentration)

  Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with antihistamines
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

  Antimuscarinics: possibly increased antimuscarinic side-effects when tricyclic-related antidepressants given with antimuscarinics

  Antivirals: side-effects possibly increased when trazodone given with ritonavir

Antidepressants, Tricyclic (related) *(continued)*

Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with anxiolytics and hypnotics

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

- Barbiturates: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of ●barbiturates (convulsive threshold lowered); metabolism of mianserin accelerated by ●phenobarbital (reduced plasma concentration)

Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with diazoxide

Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

- Sibutramine: increased risk of CNS toxicity when tricyclic-related antidepressants given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with hydralazine or sodium nitroprusside

Antidiabetics

Note Other oral drugs may be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulphonylureas possibly enhanced by ACE inhibitors

Alcohol: hypoglycaemic effect of antidiabetics enhanced by alcohol; increased risk of lactic acidosis when metformin given with alcohol; flushing, in susceptible subjects, when chlorpropamide given with alcohol

Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by anabolic steroids

- Analgesics: effects of sulphonylureas possibly enhanced by ●NSAIDs; effects of tolbutamide enhanced by ●azapropazone (avoid concomitant use)

Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by disopyramide

- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by neomycin, also severity of gastrointestinal effects increased; effects of repaglinide enhanced by clarithromycin; effects of glibenclamide possibly enhanced by ciprofloxacin and norfloxacin; plasma concentration of nateglinide reduced by rifampicin; hypoglycaemic effect of repaglinide possibly antagonised by rifampicin; plasma concentration of rosiglitazone reduced by ●rifampicin—consider increasing dose of rosiglitazone; effects of sulphonylureas enhanced by ●chloramphenicol; metabolism of sulphonylureas possibly accelerated by ●rifamycins (reduced effect); metabolism of chlorpropamide and tolbutamide accelerated by ●rifamycins (reduced effect); effects of sulphonylureas rarely enhanced by sulphonamides and trimethoprim; hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim—manufacturer advises avoid concomitant use
- Anticoagulants: exenatide possibly enhances anticoagulant effect of warfarin; hypoglycaemic effect of sulphonylureas possibly enhanced by ●coumarins, also possible changes to anticoagulant effect

Antidepressants: hypoglycaemic effect of insulin, metformin and sulphonylureas enhanced by MAOIs; hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs

Antiepileptics: tolbutamide transiently increases plasma concentration of phenytoin (possibility of toxicity); plasma concentration of glibenclamide possibly reduced by topiramate

- Antifungals: plasma concentration of sulphonylureas increased by ●fluconazole and ●miconazole; hypoglycaemic effect of gliclazide and glipizide enhanced by ●miconazole—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by fluconazole; hypoglycaemic effect of repaglinide possibly enhanced by itraconazole; hypoglycaemic effect of glipizide possibly enhanced by posaconazole; plasma concentration of sulphonylureas possibly increased by voriconazole

Antihistamines: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)

Antipsychotics: hypoglycaemic effect of sulphonylureas possibly antagonised by phenothiazines

Antivirals: plasma concentration of tolbutamide possibly increased by ritonavir

Aprepitant: plasma concentration of tolbutamide reduced by aprepitant

Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers

- Bosentan: increased risk of hepatotoxicity when glibenclamide given with ●bosentan—avoid concomitant use

Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine

Cardiac Glycosides: acarbose possibly reduces plasma concentration of digoxin; sitagliptin increases plasma concentration of digoxin

Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin

Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids

- Cytotoxics: avoidance of repaglinide advised by manufacturer of ●lapatinib; metabolism of rosiglitazone possibly inhibited by paclitaxel

Deferasirox: plasma concentration of repaglinide increased by deferasirox

Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide

Diuretics: hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics; increased risk of hyponatraemia when chlorpropamide given with potassium-sparing diuretics and aldosterone antagonists plus thiazide; increased risk of hyponatraemia when chlorpropamide given with thiazides and related diuretics plus potassium-sparing diuretic

Hormone Antagonists: requirements for insulin, metformin, repaglinide and sulphonylureas possibly reduced by lanreotide; requirements for insulin, metformin, repaglinide and sulphonylureas possibly reduced by octreotide

Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide

- Lipid-regulating Drugs: hypoglycaemic effect of acarbose possibly enhanced by colestyramine; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with ●gemfibrozil—avoid concomitant use; plasma concentration of rosiglitazone increased by ●gemfibrozil (consider reducing dose of rosiglitazone); plasma concentration of glibenclamide possibly increased by fluvastatin; may be improved glucose tolerance and an additive effect when insulin or sulphonylureas given with fibrates

Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens

Orlistat: avoidance of acarbose advised by manufacturer of orlistat

Pancreatin: hypoglycaemic effect of acarbose antagonised by pancreatin

Probenecid: hypoglycaemic effect of chlorpropamide possibly enhanced by probenecid

Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens

- Sulfinpyrazone: effects of sulphonylureas enhanced by ●sulfinpyrazone

Antidiabetics *(continued)*
Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone
Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration); hypoglycaemic effect of sulphonylureas enhanced by cimetidine

Antiepileptics *see* Carbamazepine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Phenytoin, Primidone, Rufinamide, Stiripentol, Tiagabine, Topiramate, Valproate, Vigabatrin, and Zonisamide

Antifungals *see* Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin; Micafungin; Terbinafine

Antifungals, Imidazole
Aliskiren: ketoconazole increases plasma concentration of aliskiren
- Analgesics: ketoconazole inhibits metabolism of ●buprenorphine (reduce dose of buprenorphine)

Antacids: absorption of ketoconazole reduced by antacids
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with ●disopyramide—avoid concomitant use
- Antibacterials: metabolism of ketoconazole accelerated by ●rifampicin (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of ketoconazole possibly reduced by isoniazid; avoidance of concomitant ketoconazole in severe renal and hepatic impairment advised by manufacturer of ●telithromycin
- Anticoagulants: miconazole enhances anticoagulant effect of ●coumarins (miconazole oral gel and possibly vaginal formulations absorbed); ketoconazole enhances anticoagulant effect of ●coumarins; ketoconazole increases plasma concentration of ●rivaroxaban—avoid concomitant use
- Antidepressants: avoidance of imidazoles advised by manufacturer of ●reboxetine; ketoconazole increases plasma concentration of mirtazapine
- Antidiabetics: miconazole enhances hypoglycaemic effect of ●gliclazide and ●glipizide—avoid concomitant use; miconazole increases plasma concentration of ●sulphonylureas
- Antiepileptics: ketoconazole and miconazole possibly increase plasma concentration of carbamazepine; miconazole enhances anticonvulsant effect of ●phenytoin (plasma concentration of phenytoin increased); plasma concentration of ketoconazole reduced by ●phenytoin

Antifungals: imidazoles possibly antagonise effects of amphotericin
- Antihistamines: manufacturer of loratadine advises ketoconazole possibly increases plasma concentration of loratadine; imidazoles possibly inhibit metabolism of ●mizolastine (avoid concomitant use); ketoconazole inhibits metabolism of ●mizolastine—avoid concomitant use
- Antimalarials: avoidance of imidazoles advised by manufacturer of ●artemether/lumefantrine

Antimuscarinics: absorption of ketoconazole reduced by antimuscarinics; ketoconazole increases plasma concentration of darifenacin—avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketoconazole given with fesoterodine—consult fesoterodine product literature; ketoconazole increases plasma concentration of solifenacin; avoidance of ketoconazole advised by manufacturer of tolterodine
- Antipsychotics: ketoconazole inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when imidazoles given with ●pimozide—avoid concomitant use; imidazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when imidazoles given with ●sertindole—avoid concomitant use; increased risk of

Antifungals, Imidazole
- Antipsychotics *(continued)*
  ventricular arrhythmias when ketoconazole given with ●sertindole—avoid concomitant use
- Antivirals: plasma concentration of both drugs increased when ketoconazole given with darunavir; plasma concentration of ketoconazole increased by fosamprenavir; ketoconazole increases plasma concentration of ●indinavir and ●maraviroc (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by ●nevirapine—avoid concomitant use; combination of ketoconazole with ●ritonavir may increase plasma concentration of either drug (or both); imidazoles possibly increase plasma concentration of saquinavir; ketoconazole increases plasma concentration of saquinavir
- Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of alprazolam; ketoconazole increases plasma concentration of ●midazolam (risk of prolonged sedation)

Aprepitant: ketoconazole increases plasma concentration of aprepitant

Bosentan: ketoconazole increases plasma concentration of bosentan
- Calcium-channel Blockers: ketoconazole inhibits metabolism of ●felodipine (increased plasma concentration); avoidance of ketoconazole advised by manufacturer of lercanidipine; ketoconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Ciclosporin: ketoconazole inhibits metabolism of ●ciclosporin (increased plasma concentration); miconazole possibly inhibits metabolism of ●ciclosporin (increased plasma concentration)
- Cilostazol: ketoconazole possibly increases plasma concentration of ●cilostazol—avoid concomitant use

Cinacalcet: ketoconazole inhibits metabolism of cinacalcet (increased plasma concentration)

Corticosteroids: ketoconazole possibly inhibits metabolism of corticosteroids; ketoconazole increases plasma concentration of inhaled and oral budesonide; ketoconazole increases plasma concentration of active metabolite of ciclesonide; ketoconazole inhibits the metabolism of methylprednisolone; ketoconazole increases plasma concentration of inhaled mometasone
- Cytotoxics: ketoconazole inhibits metabolism of erlotinib and sunitinib (increased plasma concentration); ketoconazole increases plasma concentration of bortezomib and imatinib; ketoconazole increases plasma concentration of ●lapatinib and ●nilotinib—avoid concomitant use; ketoconazole increases plasma concentration of active metabolite of ●temsirolimus—avoid concomitant use; *in vitro* studies suggest a possible interaction between ketoconazole and docetaxel (consult docetaxel product literature); ketoconazole reduces plasma concentration of ●irinotecan (but concentration of active metabolite of irinotecan increased)—avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of ●eplerenone—avoid concomitant use
- Domperidone: ketoconazole possibly increases risk of arrhythmias with ●domperidone
- Ergot Alkaloids: increased risk of ergotism when imidazoles given with ●ergotamine and methysergide—avoid concomitant use
- 5HT$_1$ Agonists: ketoconazole increases plasma concentration of almotriptan (increased risk of toxicity); ketoconazole increases plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: ketoconazole increases plasma concentration of ●ivabradine—avoid concomitant use

Lanthanum: absorption of ketoconazole possibly reduced by lanthanum (give at least 2 hours apart)
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin or simvastatin; increased risk of myopathy when keto-

Antifungals, Imidazole

- Lipid-regulating Drugs *(continued)*
  conazole given with ●simvastatin (avoid concomitant use); possible increased risk of myopathy when miconazole given with ●simvastatin—avoid concomitant use
  Oestrogens: anecdotal reports of contraceptive failure when imidazoles or ketoconazole given with oestrogens
  Parasympathomimetics: ketoconazole increases plasma concentration of galantamine
- Ranolazine: ketoconazole increases plasma concentration of ●ranolazine—avoid concomitant use
  Retinoids: ketoconazole increases plasma concentration of alitretinoin
  Rimonabant: ketoconazole increases plasma concentration of rimonabant
  Sildenafil: ketoconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: ketoconazole increases plasma concentration of ●sirolimus—avoid concomitant use; miconazole increases plasma concentration of ●sirolimus
- Tacrolimus: imidazoles possibly increase plasma concentration of ●tacrolimus; ketoconazole increases plasma concentration of ●tacrolimus
  Tadalafil: ketoconazole increases plasma concentration of tadalafil
- Theophylline: ketoconazole possibly increases plasma concentration of ●theophylline
  Ulcer-healing Drugs: absorption of ketoconazole reduced by histamine H_2-antagonists, proton pump inhibitors and sucralfate
- Vardenafil: ketoconazole increases plasma concentration of ●vardenafil—avoid concomitant use
  Vitamins: ketoconazole possibly increases plasma concentration of paricalcitol

Antifungals, Polyene *see* Amphotericin

Antifungals, Triazole

Note In general, fluconazole interactions relate to multiple-dose treatment

- Analgesics: fluconazole increases plasma concentration of celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of diclofenac and ibuprofen; fluconazole increases plasma concentration of parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of ●alfentanil and ●methadone (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of alfentanil; fluconazole and itraconazole possibly increase plasma concentration of fentanyl
  Antacids: absorption of itraconazole reduced by antacids
- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with ●disopyramide
- Antibacterials: plasma concentration of itraconazole increased by clarithromycin; triazoles possibly increase plasma concentration of ●rifabutin (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of ●rifabutin (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ●rifabutin, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ●rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ●rifabutin—avoid concomitant use; plasma concentration of posaconazole reduced by ●rifampicin; plasma concentration of voriconazole reduced by ●rifampicin—avoid concomitant use; metabolism of fluconazole and itraconazole accelerated by ●rifampicin (reduced plasma concentration)
- Anticoagulants: fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ●coumarins;

Antifungals, Triazole

- Anticoagulants *(continued)*
  avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of rivaroxaban
- Antidepressants: avoidance of triazoles advised by manufacturer of ●reboxetine; plasma concentration of voriconazole reduced by ●St John's wort—avoid concomitant use
- Antidiabetics: posaconazole possibly enhances hypoglycaemic effect of glipizide; fluconazole possibly enhances hypoglycaemic effect of nateglinide; itraconazole possibly enhances hypoglycaemic effect of repaglinide; fluconazole increases plasma concentration of ●sulphonylureas; voriconazole possibly increases plasma concentration of sulphonylureas
- Antiepileptics: plasma concentration of itraconazole and posaconazole possibly reduced by ●carbamazepine; fluconazole possibly increases plasma concentration of carbamazepine; plasma concentration of voriconazole possibly reduced by ●carbamazepine and ●primidone—avoid concomitant use; plasma concentration of itraconazole reduced by ●phenytoin—avoid concomitant use; fluconazole increases plasma concentration of ●phenytoin (consider reducing dose of phenytoin); voriconazole increases plasma concentration of ●phenytoin, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); plasma concentration of posaconazole reduced by ●phenytoin; plasma concentration of posaconazole possibly reduced by ●primidone
  Antifungals: triazoles possibly antagonise effects of amphotericin; plasma concentration of itraconazole increased by micafungin (consider reducing dose of itraconazole)
- Antihistamines: itraconazole inhibits metabolism of ●mizolastine—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of ●artemether/lumefantrine
  Antimuscarinics: avoidance of itraconazole advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when itraconazole given with fesoterodine—consult fesoterodine product literature; itraconazole increases plasma concentration of solifenacin
- Antipsychotics: itraconazole possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when triazoles given with ●pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when triazoles given with ●sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when itraconazole given with ●sertindole—avoid concomitant use
- Antivirals: posaconazole increases plasma concentration of ●atazanavir; plasma concentration of itraconazole and posaconazole reduced by ●efavirenz; plasma concentration of voriconazole reduced by ●efavirenz, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of itraconazole possibly increased by fosamprenavir; itraconazole increases plasma concentration of ●indinavir (consider reducing dose of indinavir); fluconazole increases plasma concentration of ●nevirapine, ritonavir and tipranavir; plasma concentration of itraconazole possibly reduced by nevirapine—consider increasing dose of itraconazole; plasma concentration of voriconazole reduced by ●ritonavir—avoid concomitant use; combination of itraconazole with ●ritonavir may increase plasma concentration of either drug (or both); triazoles possibly increase plasma concentration of saquinavir;

Antifungals, Triazole

- Antivirals *(continued)*
  fluconazole increases plasma concentration of ●zidovudine (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; posaconazole increases plasma concentration of ●midazolam; fluconazole and itraconazole increase plasma concentration of ●midazolam (risk of prolonged sedation); itraconazole increases plasma concentration of buspirone (reduce dose of buspirone)
- Barbiturates: plasma concentration of voriconazole possibly reduced by ●phenobarbital—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ●phenobarbital
- Bosentan: fluconazole possibly increases plasma concentration of ●bosentan—avoid concomitant use; itraconazole possibly increases plasma concentration of bosentan
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with calcium-channel blockers; itraconazole inhibits metabolism of ●felodipine (increased plasma concentration); avoidance of itraconazole advised by manufacturer of lercanidipine; itraconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Cardiac Glycosides: itraconazole increases plasma concentration of ●digoxin
- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of ●ciclosporin (increased plasma concentration)

  Corticosteroids: itraconazole possibly inhibits metabolism of corticosteroids and methylprednisolone; itraconazole increases plasma concentration of inhaled budesonide
- Cytotoxics: itraconazole inhibits metabolism of busulfan (increased risk of toxicity); itraconazole possibly increases side-effects of cyclophosphamide; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●lapatinib; avoidance of itraconazole and voriconazole advised by manufacturer of ●nilotinib; posaconazole possibly inhibits metabolism of ●vinblastine and ●vincristine (increased risk of neurotoxicity); itraconazole possibly inhibits metabolism of ●vincristine (increased risk of neurotoxicity)
- Diuretics: fluconazole increases plasma concentration of eplerenone (reduce dose of eplerenone); itraconazole increases plasma concentration of ●eplerenone—avoid concomitant use; plasma concentration of fluconazole increased by hydrochlorothiazide
- Ergot Alkaloids: increased risk of ergotism when triazoles given with ●ergotamine and methysergide—avoid concomitant use
- 5HT$_1$ Agonists: itraconazole increases plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: fluconazole increases plasma concentration of ivabradine—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when triazoles given with atorvastatin or simvastatin; increased risk of myopathy when itraconazole or posaconazole given with ●atorvastatin (avoid concomitant use); fluconazole increases plasma concentration of fluvastatin; increased risk of myopathy when itraconazole or posaconazole given with ●simvastatin (avoid concomitant use)

  Oestrogens: anecdotal reports of contraceptive failure when fluconazole or itraconazole given with oestrogens
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

Antifungals, Triazole *(continued)*

Sildenafil: itraconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil

- Sirolimus: posaconazole possibly increases plasma concentration of sirolimus; itraconazole and voriconazole increase plasma concentration of ●sirolimus—avoid concomitant use
- Tacrolimus: triazoles possibly increase plasma concentration of ●tacrolimus; posaconazole increases plasma concentration of ●tacrolimus (reduce dose of tacrolimus); fluconazole, itraconazole and voriconazole increase plasma concentration of ●tacrolimus

  Tadalafil: itraconazole possibly increases plasma concentration of tadalafil
- Theophylline: fluconazole possibly increases plasma concentration of ●theophylline
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by ●cimetidine; voriconazole possibly increases plasma concentration of esomeprazole; voriconazole increases plasma concentration of omeprazole (consider reducing dose of omeprazole); absorption of itraconazole reduced by histamine H_2-antagonists and proton pump inhibitors
- Vardenafil: itraconazole possibly increases plasma concentration of ●vardenafil—avoid concomitant use

Antihistamines

Note Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)

- Analgesics: sedative effects possibly increased when sedating antihistamines given with ●opioid analgesics

  Antacids: absorption of fexofenadine reduced by antacids
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with ●amiodarone, ●disopyramide, ●flecainide or ●propafenone—avoid concomitant use
- Antibacterials: manufacturer of loratadine advises plasma concentration possibly increased by erythromycin; metabolism of mizolastine inhibited by ●erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with ●moxifloxacin—avoid concomitant use; metabolism of mizolastine possibly inhibited by ●macrolides (avoid concomitant use)

  Antidepressants: increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; cyproheptadine possibly antagonises antidepressant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with tricyclic-related antidepressants

  Antidiabetics: thrombocyte count depressed when ketotifen given with metformin (manufacturer of ketotifen advises avoid concomitant use)
- Antifungals: manufacturer of loratadine advises plasma concentration possibly increased by ketoconazole; metabolism of mizolastine inhibited by ●itraconazole or ●ketoconazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by ●imidazoles (avoid concomitant use)

  Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with antimuscarinics

  Antivirals: plasma concentration of loratadine possibly increased by fosamprenavir; plasma concentration of chlorphenamine (chlorpheniramine) possibly increased by lopinavir; plasma concentration of non-sedating antihistamines possibly increased by ritonavir

  Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with anxiolytics and hypnotics
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with ●sotalol—avoid concomitant use

Antihistamines *(continued)*

Betahistine: antihistamines theoretically antagonise effect of betahistine

Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by cimetidine

Antihistamines, Non-sedating *see* Antihistamines

Antihistamines, Sedating *see* Antihistamines

Antimalarials *see* Artemether with Lumefantrine, Chloroquine and Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, and Quinine

Antimetabolites *see* Cytarabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, and Tioguanine

Antimuscarinics

Note Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation

Alcohol: increased sedative effect when hyoscine given with alcohol

Analgesics: increased risk of antimuscarinic side-effects when antimuscarinics given with nefopam

- Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with ●amiodarone, ●disopyramide or ●flecainide; increased risk of antimuscarinic side-effects when antimuscarinics given with disopyramide

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by rifampicin

Antidepressants: plasma concentration of darifenacin and procyclidine increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possibly increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants

Antifungals: antimuscarinics reduce absorption of ketoconazole; manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole and ketoconazole—consult fesoterodine product literature; plasma concentration of darifenacin increased by ketoconazole—avoid concomitant use; plasma concentration of solifenacin increased by itraconazole and ketoconazole; manufacturer of tolterodine advises avoid concomitant use with itraconazole and ketoconazole; manufacturer of darifenacin advises avoid concomitant use with itraconazole

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines

Antipsychotics: antimuscarinics possibly reduce effects of haloperidol; increased risk of antimuscarinic side-effects when antimuscarinics given with clozapine; antimuscarinics reduce plasma concentration of phenothiazines, but risk of antimuscarinic side-effects increased

Antivirals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with atazanavir, indinavir, nelfinavir, ritonavir and saquinavir—consult fesoterodine product literature; manufacturer of darifenacin advises avoid concomitant use with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir; manufacturer of tolterodine advises avoid concomitant use with fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir and saquinavir; plasma concentration of solifenacin increased by nelfinavir and ritonavir

- Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with ●sotalol

Antimuscarinics *(continued)*

Calcium-channel Blockers: manufacturer of darifenacin advises avoid concomitant use with verapamil

Cardiac Glycosides: darifenacin possibly increases plasma concentration of digoxin

Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with ciclosporin

Domperidone: antimuscarinics antagonise effects of domperidone on gastro-intestinal activity

Dopaminergics: antimuscarinics possibly reduce absorption of levodopa

Memantine: effects of antimuscarinics possibly enhanced by memantine

Metoclopramide: antimuscarinics antagonise effects of metoclopramide on gastro-intestinal activity

Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Parasympathomimetics: antimuscarinics antagonise effects of parasympathomimetics

Antipsychotics

Note Increased risk of toxicity with myelosuppressive drugs

Note Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with adrenergic neurone blockers; higher doses of chlorpromazine antagonise hypotensive effect of adrenergic neurone blockers; haloperidol antagonises hypotensive effect of adrenergic neurone blockers

Adsorbents: absorption of phenothiazines possibly reduced by kaolin

Alcohol: increased sedative effect when antipsychotics given with alcohol

Alpha-blockers: enhanced hypotensive effect when antipsychotics given with alpha-blockers

- Anaesthetics, General: droperidol enhances effects of thiopental; enhanced hypotensive effect when antipsychotics given with ●general anaesthetics
- Analgesics: avoid concomitant use of clozapine with ●azapropazone (increased risk of agranulocytosis); possible severe drowsiness when haloperidol given with indometacin; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●methadone; increased risk of ventricular arrhythmias when amisulpride given with ●methadone—avoid concomitant use; increased risk of convulsions when antipsychotics given with tramadol; enhanced hypotensive and sedative effects when antipsychotics given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with angiotensin-II receptor antagonists

Antacids: absorption of phenothiazines and sulpiride reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when benperidol given with ●amiodarone—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide, sertindole or zuclopenthixol given with ●amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with ●amiodarone or ●disopyramide; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide, sertindole or zuclopenthixol given with ●disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ●disopyramide; increased risk of arrhythmias when clozapine given with ●flecainide
- Antibacterials: increased risk of ventricular arrhythmias when pimozide given with ●clarithromycin, ●moxifloxacin or ●telithromycin—avoid concomitant use; increased risk of ventricular arrhythmias when

Antipsychotics

- Antibacterials *(continued)*
  sertindole given with •erythromycin or •moxifloxacin—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride or zuclopenthixol given with parenteral •erythromycin—avoid concomitant use; plasma concentration of clozapine possibly increased by •erythromycin (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with •erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with parenteral •erythromycin; plasma concentration of clozapine increased by ciprofloxacin; plasma concentration of olanzapine possibly increased by ciprofloxacin; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with •moxifloxacin—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with •moxifloxacin—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by •rifabutin and •rifampicin—increase dose of aripiprazole; plasma concentration of clozapine possibly reduced by rifampicin; metabolism of haloperidol accelerated by •rifampicin (reduced plasma concentration); avoid concomitant use of clozapine with •chloramphenicol or •sulphonamides (increased risk of agranulocytosis); possible increased risk of ventricular arrhythmias when sertindole given with •macrolides—avoid concomitant use; manufacturer of droperidol advises avoid concomitant use with •macrolides (risk of ventricular arrhythmias); plasma concentration of quetiapine possibly increased by macrolides (reduce dose of quetiapine)
- Antidepressants: plasma concentration of clozapine possibly increased by citalopram (increased risk of toxicity); metabolism of aripiprazole possibly inhibited by •fluoxetine and •paroxetine (reduce dose of aripiprazole); plasma concentration of clozapine, haloperidol, risperidone, sertindole and zotepine increased by •fluoxetine; manufacturer of droperidol advises avoid concomitant use with •fluoxetine, •fluvoxamine, •sertraline or •tricyclics (risk of ventricular arrhythmias); plasma concentration of clozapine and olanzapine increased by •fluvoxamine; plasma concentration of clozapine and sertindole increased by •paroxetine; plasma concentration of risperidone possibly increased by paroxetine (increased risk of toxicity); metabolism of perphenazine inhibited by paroxetine (reduce dose of perphenazine); plasma concentration of clozapine increased by •sertraline and •venlafaxine; plasma concentration of haloperidol increased by venlafaxine; clozapine possibly increases CNS effects of •MAOIs; plasma concentration of pimozide possibly increased by •SSRIs (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by •St John's wort—increase dose of aripiprazole; possibly increased antimuscarinic side-effects when clozapine given with tricyclics; antipsychotics increase plasma concentration of •tricyclics—possibly increased risk of ventricular arrhythmias; increased risk of antimuscarinic side-effects when phenothiazines given with tricyclics; increased risk of ventricular arrhythmias when pimozide given with •tricyclics—avoid concomitant use

  Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulphonylureas
- Antiepileptics: metabolism of haloperidol, olanzapine, quetiapine, risperidone and sertindole accelerated by

Antipsychotics

- Antiepileptics *(continued)*
  carbamazepine (reduced plasma concentration); metabolism of clozapine accelerated by •carbamazepine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by •carbamazepine—increase dose of aripiprazole; plasma concentration of paliperidone reduced by carbamazepine; antipsychotics antagonise anticonvulsant effect of •carbamazepine, •ethosuximide, •oxcarbazepine, •phenytoin, •primidone and •valproate (convulsive threshold lowered); metabolism of clozapine, quetiapine and sertindole accelerated by phenytoin (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by •phenytoin and •primidone—increase dose of aripiprazole; metabolism of haloperidol accelerated by primidone (reduced plasma concentration); increased risk of neutropenia when olanzapine given with •valproate
- Antifungals: metabolism of aripiprazole inhibited by •ketoconazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when sertindole given with •itraconazole or •ketoconazole—avoid concomitant use; metabolism of aripiprazole possibly inhibited by •itraconazole (reduce dose of aripiprazole); plasma concentration of quetiapine possibly increased by imidazoles and triazoles (reduce dose of quetiapine); increased risk of ventricular arrhythmias when pimozide given with •imidazoles or •triazoles—avoid concomitant use; possible increased risk of ventricular arrhythmias when sertindole given with •imidazoles or •triazoles—avoid concomitant use
- Antimalarials: avoidance of antipsychotics advised by manufacturer of •artemether/lumefantrine; increased risk of ventricular arrhythmias when droperidol given with •chloroquine and hydroxychloroquine or •quinine—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with •mefloquine or •quinine—avoid concomitant use

  Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with antimuscarinics; plasma concentration of phenothiazines reduced by antimuscarinics, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by antimuscarinics
- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozide, sertindole or sulpiride given with •droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with •droperidol—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of •flupentixol, •fluphenazine, •haloperidol, •pipotiazine, •risperidone or •zuclopenthixol as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with •haloperidol; increased risk of ventricular arrhythmias when droperidol given with •haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when sertindole given with •amisulpride—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with •phenothiazines—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with •sulpiride
- Antivirals: plasma concentration of pimozide possibly increased by •atazanavir—avoid concomitant use; metabolism of aripiprazole possibly inhibited by •atazanavir, •fosamprenavir, •indinavir, •lopinavir, •nelfinavir, •ritonavir and •saquinavir (reduce dose of aripiprazole); plasma concentration of aripiprazole possibly reduced by •efavirenz and •nevirapine—

Antipsychotics

- Antivirals *(continued)*
  increase dose of aripiprazole; plasma concentration of pimozide possibly increased by ●efavirenz, ●indinavir, ●nelfinavir and ●saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of clozapine possibly increased by fosamprenavir; plasma concentration of pimozide and sertindole increased by ●fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of sertindole increased by ●indinavir, ●lopinavir, ●nelfinavir, ●ritonavir and ●saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of antipsychotics possibly increased by ●ritonavir; plasma concentration of pimozide increased by ●ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of olanzapine reduced by ritonavir—consider increasing dose of olanzapine; plasma concentration of clozapine increased by ●ritonavir (increased risk of toxicity)—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with anxiolytics and hypnotics; plasma concentration of zotepine increased by diazepam; increased risk of hypotension, bradycardia and respiratory depression when intramuscular olanzapine given with parenteral ●benzodiazepines; plasma concentration of haloperidol increased by buspirone
- Aprepitant: avoidance of pimozide advised by manufacturer of ●aprepitant
- Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●atomoxetine
- Barbiturates: antipsychotics antagonise anticonvulsant effect of ●barbiturates (convulsive threshold lowered); metabolism of haloperidol accelerated by phenobarbital (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with phenobarbital; plasma concentration of aripiprazole possibly reduced by ●phenobarbital—increase dose of aripiprazole
- Beta-blockers: enhanced hypotensive effect when phenothiazines given with beta-blockers; plasma concentration of both drugs may increase when chlorpromazine given with ●propranolol; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide, sertindole or sulpiride given with ●sotalol; increased risk of ventricular arrhythmias when droperidol or zuclopenthixol given with ●sotalol—avoid concomitant use
  Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with calcium-channel blockers
  Clonidine: enhanced hypotensive effect when phenothiazines given with clonidine
- Cytotoxics: avoid concomitant use of clozapine with ●cytotoxics (increased risk of agranulocytosis); avoidance of pimozide advised by manufacturer of ●lapatinib
  Desferrioxamine: manufacturer of levomepromazine (methotrimeprazine) advises avoid concomitant use with desferrioxamine; avoidance of prochlorperazine advised by manufacturer of desferrioxamine
  Diazoxide: enhanced hypotensive effect when phenothiazines given with diazoxide
- Diuretics: risk of ventricular arrhythmias with amisulpride or sertindole increased by hypokalaemia caused by ●diuretics; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by ●diuretics (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with diuretics

Antipsychotics *(continued)*

Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with amantadine; antipsychotics antagonise effects of apomorphine, levodopa and pergolide; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of bromocriptine and cabergoline; manufacturer of amisulpride advises avoid concomitant use of levodopa (antagonism of effect); avoidance of antipsychotics advised by manufacturer of pramipexole, ropinirole and rotigotine (antagonism of effect)

- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with ●tamoxifen (risk of ventricular arrhythmias)
- Ivabradine: increased risk of ventricular arrhythmias when pimozide or sertindole given with ●ivabradine
- Lithium: increased risk of ventricular arrhythmias when sertindole given with ●lithium—avoid concomitant use; increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines or zuclopenthixol given with lithium; increased risk of extrapyramidal side-effects when sulpiride given with lithium

Memantine: effects of antipsychotics possibly reduced by memantine

Methyldopa: enhanced hypotensive effect when antipsychotics given with methyldopa (also increased risk of extrapyramidal effects)

Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with metoclopramide

Moxonidine: enhanced hypotensive effect when phenothiazines given with moxonidine

Muscle Relaxants: promazine possibly enhances effects of suxamethonium

Nitrates: enhanced hypotensive effect when phenothiazines given with nitrates

- Penicillamine: avoid concomitant use of clozapine with ●penicillamine (increased risk of agranulocytosis)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with ●pentamidine isetionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ●pentamidine isetionate
- Sibutramine: increased risk of CNS toxicity when antipsychotics given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Sodium Benzoate: haloperidol possibly reduces effects of sodium benzoate

Sodium Oxybate: antipsychotics possibly enhance effects of sodium oxybate

Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate

Sympathomimetics: antipsychotics antagonise hypertensive effect of sympathomimetics; antipsychotic effects of chlorpromazine possibly antagonised by dexamfetamine; side-effects of risperidone possibly increased by methylphenidate

- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with ●tacrolimus (risk of ventricular arrhythmias)

Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with tetrabenazine

- Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by cimetidine; increased risk of ventricular arrhythmias when sertindole given with ●cimetidine—avoid concomitant use; plasma concentration of clozapine possibly reduced by omeprazole; absorption of sulpiride reduced by sucralfate

Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with hydralazine, minoxidil or sodium nitroprusside

Antivirals *see* Abacavir, Aciclovir, Adefovir, Atazanavir, Cidofovir, Darunavir, Didanosine, Efavirenz, Emtricitabine, Etravirine, Famciclovir, Fosamprenavir, Foscarnet, Ganciclovir, Indinavir, Lamivudine, Lopinavir, Maraviroc, Nelfinavir, Nevirapine, Raltegravir, Riba-

virin, Ritonavir, Saquinavir, Stavudine, Telbivudine, Tenofovir, Tipranavir, Valaciclovir, and Zidovudine

Anxiolytics and Hypnotics

ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with adrenergic neurone blockers

Alcohol: increased sedative effect when anxiolytics and hypnotics given with alcohol

Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with alpha-blockers

Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with general anaesthetics

Analgesics: increased sedative effect when anxiolytics and hypnotics given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with angiotensin-II receptor antagonists

- Antibacterials: metabolism of midazolam inhibited by •clarithromycin, •erythromycin, •quinupristin/dalfopristin and •telithromycin (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by erythromycin (reduce dose of buspirone); metabolism of zopiclone inhibited by erythromycin and quinupristin/dalfopristin; metabolism of benzodiazepines possibly accelerated by rifampicin (reduced plasma concentration); metabolism of diazepam accelerated by rifampicin (reduced plasma concentration); metabolism of buspirone and zaleplon possibly accelerated by rifampicin; metabolism of zolpidem accelerated by rifampicin (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by rifampicin; metabolism of diazepam inhibited by isoniazid

  Anticoagulants: chloral and triclofos may transiently enhance anticoagulant effect of coumarins
- Antidepressants: plasma concentration of melatonin increased by •fluvoxamine—avoid concomitant use; plasma concentration of some benzodiazepines increased by fluvoxamine; sedative effects possibly increased when zolpidem given with sertraline; manufacturer of buspirone advises avoid concomitant use with MAOIs; plasma concentration of oral midazolam possibly reduced by St John's wort; increased sedative effect when anxiolytics and hypnotics given with mirtazapine, tricyclic-related antidepressants or tricyclics

  Antiepileptics: plasma concentration of midazolam reduced by carbamazepine; plasma concentration of clonazepam often reduced by carbamazepine, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of phenytoin; diazepam increases or decreases plasma concentration of phenytoin; plasma concentration of clobazam increased by stiripentol; plasma concentration of diazepam and lorazepam possibly increased by valproate; increased risk of side-effects when clonazepam given with valproate; clobazam possibly increases plasma concentration of valproate
- Antifungals: plasma concentration of alprazolam increased by itraconazole and ketoconazole; plasma concentration of midazolam increased by •fluconazole, •itraconazole and •ketoconazole (risk of prolonged sedation); plasma concentration of buspirone increased by itraconazole (reduce dose of buspirone); plasma concentration of midazolam increased by •posaconazole

  Antihistamines: increased sedative effect when anxiolytics and hypnotics given with antihistamines
- Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with antipsychotics; buspirone increases plasma concentration of haloperidol; increased risk of hypotension, bradycardia and respiratory depression when parenteral benzodiazepines given with intramuscular •olanzapine; diazepam increases plasma concentration of zotepine

Anxiolytics and Hypnotics

- Antipsychotics *(continued)*

  diazepines given with intramuscular •olanzapine; diazepam increases plasma concentration of zotepine
- Antivirals: plasma concentration of midazolam possibly increased by •atazanavir—avoid concomitant use of oral midazolam; increased risk of prolonged sedation when midazolam given with •efavirenz—avoid concomitant use; increased risk of prolonged sedation and respiratory depression when alprazolam, clonazepam, diazepam, flurazepam or midazolam given with •fosamprenavir; plasma concentration of midazolam possibly increased by •indinavir, •nelfinavir and •ritonavir (risk of prolonged sedation—avoid concomitant use of oral midazolam); increased risk of prolonged sedation when alprazolam given with •indinavir—avoid concomitant use; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by •ritonavir (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of anxiolytics and hypnotics possibly increased by •ritonavir; plasma concentration of buspirone increased by ritonavir (increased risk of toxicity); plasma concentration of midazolam increased by •saquinavir (risk of prolonged sedation—avoid concomitant use of oral midazolam)

  Aprepitant: plasma concentration of midazolam increased by aprepitant (risk of prolonged sedation)

  Barbiturates: plasma concentration of clonazepam often reduced by phenobarbital

  Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with beta-blockers

  Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with calcium-channel blockers; midazolam increases absorption of lercanidipine; metabolism of midazolam inhibited by diltiazem and verapamil (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by diltiazem and verapamil (reduce dose of buspirone)

  Cardiac Glycosides: alprazolam increases plasma concentration of digoxin (increased risk of toxicity)

  Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with clonidine

  Cytotoxics: plasma concentration of midazolam increased by nilotinib

  Deferasirox: plasma concentration of midazolam possibly reduced by deferasirox

  Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with diazoxide

  Disulfiram: metabolism of benzodiazepines inhibited by disulfiram (increased sedative effects); increased risk of temazepam toxicity when given with disulfiram

  Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with diuretics; administration of chloral or triclofos with parenteral furosemide (frusemide) may displace thyroid hormone from binding sites

  Dopaminergics: benzodiazepines possibly antagonise effects of levodopa

  Grapefruit Juice: plasma concentration of buspirone increased by grapefruit juice

  Lofexidine: increased sedative effect when anxiolytics and hypnotics given with lofexidine

  Methyldopa: enhanced hypotensive effect when anxiolytics and hypnotics given with methyldopa

  Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with moxonidine; sedative effects possibly increased when benzodiazepines given with moxonidine

  Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine

Anxiolytics and Hypnotics *(continued)*

Nabilone: increased sedative effect when anxiolytics and hypnotics given with nabilone

Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with nitrates

Oestrogens: plasma concentration of melatonin increased by oestrogens

Probenecid: excretion of lorazepam reduced by probenecid (increased plasma concentration); excretion of nitrazepam possibly reduced by probenecid (increased plasma concentration)

- Sodium Oxybate: benzodiazepines enhance effects of ●sodium oxybate (avoid concomitant use)

Theophylline: effects of benzodiazepines possibly reduced by theophylline

Ulcer-healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of diazepam possibly inhibited by esomeprazole and omeprazole (increased plasma concentration)

Vasodilator Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with hydralazine, minoxidil or sodium nitroprusside

Apomorphine

Antipsychotics: effects of apomorphine antagonised by antipsychotics

Dopaminergics: effects of apomorphine possibly enhanced by entacapone

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Apraclonidine

Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Aprepitant

Note Fosaprepitant is a prodrug of aprepitant

Antibacterials: plasma concentration of aprepitant possibly increased by clarithromycin and telithromycin; plasma concentration of aprepitant reduced by rifampicin

Anticoagulants: aprepitant possibly reduces anticoagulant effect of warfarin

- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with ●St John's wort

Antidiabetics: aprepitant reduces plasma concentration of tolbutamide

Antiepileptics: plasma concentration of aprepitant possibly reduced by carbamazepine and phenytoin

Antifungals: plasma concentration of aprepitant increased by ketoconazole

- Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with ●pimozide

Antivirals: plasma concentration of aprepitant possibly increased by ritonavir

Anxiolytics and Hypnotics: aprepitant increases plasma concentration of midazolam (risk of prolonged sedation)

Barbiturates: plasma concentration of aprepitant possibly reduced by phenobarbital

Corticosteroids: aprepitant inhibits metabolism of dexamethasone and methylprednisolone (reduce dose of dexamethasone and methylprednisolone)

- Oestrogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ●oestrogens (alternative contraception recommended)
- Progestogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ●progestogens (alternative contraception recommended)

Aripiprazole *see* Antipsychotics

Artemether with Lumefantrine

- Anti-arrhythmics: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●amiodarone, ●disopyramide or ●flecainide (risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●macrolides and ●quinolones
- Antidepressants: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●antidepressants
- Antifungals: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●imidazoles and ●triazoles
- Antimalarials: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●antimalarials; increased risk of ventricular arrhythmias when artemether/lumefantrine given with ●quinine
- Antipsychotics: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●antipsychotics

Antivirals: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir

- Beta-blockers: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●metoprolol and ●sotalol

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice

- Ulcer-healing Drugs: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●cimetidine

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Ascorbic acid *see* Vitamins

Aspirin

Adsorbents: absorption of aspirin possibly reduced by kaolin

- Analgesics: avoid concomitant use of aspirin with ●NSAIDs (increased side-effects); antiplatelet effect of aspirin possibly reduced by ibuprofen

Antacids: excretion of aspirin increased by alkaline urine due to some antacids

- Anticoagulants: increased risk of bleeding when aspirin given with ●coumarins or ●phenindione (due to antiplatelet effect); aspirin enhances anticoagulant effect of ●heparins
- Antidepressants: increased risk of bleeding when aspirin given with ●SSRIs or ●venlafaxine

Antiepileptics: aspirin enhances effects of phenytoin and valproate

Cilostazol: manufacturer of cilostazol recommends dose of aspirin should not exceed 80 mg daily when given with cilostazol

Clopidogrel: increased risk of bleeding when aspirin given with clopidogrel

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate

- Cytotoxics: aspirin reduces excretion of ●methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 575

Diuretics: aspirin antagonises diuretic effect of spironolactone; increased risk of toxicity when high-dose aspirin given with carbonic anhydrase inhibitors

Iloprost: increased risk of bleeding when aspirin given with iloprost

Leukotriene Receptor Antagonists: aspirin increases plasma concentration of zafirlukast

Metoclopramide: rate of absorption of aspirin increased by metoclopramide (enhanced effect)

Probenecid: aspirin antagonises effects of probenecid

Sibutramine: increased risk of bleeding when aspirin given with sibutramine

Sulfinpyrazone: aspirin antagonises effects of sulfinpyrazone

Atazanavir

Antacids: plasma concentration of atazanavir possibly reduced by antacids

- Anti-arrhythmics: atazanavir possibly increases plasma concentration of ●amiodarone and ●lidocaine (lignocaine)
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with clarithromycin; atazanavir increases plasma concentration of ●rifabutin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by ●rifampicin—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin

Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of warfarin; avoidance of atazanavir advised by manufacturer of rivaroxaban

- Antidepressants: plasma concentration of atazanavir reduced by ●St John's wort—avoid concomitant use
- Antifungals: plasma concentration of atazanavir increased by ●posaconazole

Antimalarials: caution with atazanavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of atazanavir advised by manufacturer of darifenacin; manufacturer of fesoterodine advises dose reduction when atazanavir given with fesoterodine—consult fesoterodine product literature

- Antipsychotics: atazanavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); atazanavir possibly increases plasma concentration of ●pimozide—avoid concomitant use
- Antivirals: manufacturer of atazanavir advises avoid concomitant use with ●efavirenz (plasma concentration of atazanavir reduced); avoid concomitant use of atazanavir with ●indinavir; atazanavir increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by ●nevirapine—avoid concomitant use; atazanavir increases plasma concentration of saquinavir; plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of tipranavir (also plasma concentration of atazanavir reduced)
- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of ●midazolam—avoid concomitant use of oral midazolam
- Calcium-channel Blockers: atazanavir increases plasma concentration of ●diltiazem (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of verapamil
- Ciclosporin: atazanavir possibly increases plasma concentration of ●ciclosporin
- Cytotoxics: atazanavir possibly inhibits metabolism of ●irinotecan (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ●ergot alkaloids—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin; possible increased risk of myopathy when atazanavir given with ●rosuvastatin—avoid concomitant use; increased risk of myopathy when atazanavir given with ●simvastatin (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of ●ethinylestradiol—avoid concomitant use
- Ranolazine: atazanavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: atazanavir possibly increases side-effects of ●sildenafil
- Sirolimus: atazanavir possibly increases plasma concentration of ●sirolimus
- Tacrolimus: atazanavir possibly increases plasma concentration of ●tacrolimus
- Ulcer-healing Drugs: plasma concentration of atazanavir possibly reduced by histamine H_2-antagonists;

Atazanavir

- Ulcer-healing Drugs *(continued)*

plasma concentration of atazanavir reduced by ●proton pump inhibitors

Atenolol *see* Beta-blockers

Atomoxetine

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with ●methadone; possible increased risk of convulsions when atomoxetine given with tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with ●amiodarone or ●disopyramide
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with parenteral ●erythromycin; increased risk of ventricular arrhythmias when atomoxetine given with ●moxifloxacin
- Antidepressants: metabolism of atomoxetine possibly inhibited by fluoxetine and paroxetine; possible increased risk of convulsions when atomoxetine given with antidepressants; atomoxetine should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with ●tricyclics
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with ●mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with ●antipsychotics that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with ●sotalol

Bupropion: possible increased risk of convulsions when atomoxetine given with bupropion

- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by ●diuretics

Sympathomimetics, $Beta_2$: Increased risk of cardiovascular side-effects when atomoxetine given with parenteral salbutamol

Atorvastatin *see* Statins

Atovaquone

- Antibacterials: plasma concentration of atovaquone reduced by ●rifabutin and ●rifampicin (possible therapeutic failure of atovaquone); plasma concentration of atovaquone reduced by tetracycline

Antivirals: atovaquone possibly reduces plasma concentration of indinavir; atovaquone possibly inhibits metabolism of zidovudine (increased plasma concentration)

Metoclopramide: plasma concentration of atovaquone reduced by metoclopramide

Atracurium *see* Muscle Relaxants

Atropine *see* Antimuscarinics

Auranofin *see* Gold

Azapropazone *see* NSAIDs

Azathioprine

ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with captopril especially in renal impairment; increased risk of anaemia when azathioprine given with enalapril especially in renal impairment

- Allopurinol: enhanced effects and increased toxicity of azathioprine when given with ●allopurinol (reduce dose of azathioprine to one quarter of usual dose)

Aminosalicylates: possible increased risk of leucopenia when azathioprine given with aminosalicylates

- Antibacterials: increased risk of haematological toxicity when azathioprine given with ●sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with ●trimethoprim (also with co-trimoxazole)
- Anticoagulants: azathioprine possibly reduces anticoagulant effect of ●coumarins

Azithromycin *see* Macrolides

Aztreonam

- Anticoagulants: aztreonam possibly enhances anticoagulant effect of ●coumarins

Aztreonam *(continued)*
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Baclofen *see* Muscle Relaxants

Balsalazide *see* Aminosalicylates

Bambuterol *see* Sympathomimetics, $Beta_2$

Barbiturates
Alcohol: increased sedative effect when barbiturates given with alcohol
Analgesics: phenobarbital reduces plasma concentration of methadone; barbiturates possibly increase CNS effects of opioid analgesics
Anti-arrhythmics: barbiturates accelerate metabolism of disopyramide (reduced plasma concentration)
- Antibacterials: barbiturates accelerate metabolism of ●chloramphenicol, doxycycline and metronidazole (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of rifampicin; phenobarbital reduces plasma concentration of ●telithromycin (avoid during and for 2 weeks after phenobarbital)
- Anticoagulants: barbiturates accelerate metabolism of ●coumarins (reduced anticoagulant effect)
- Antidepressants: phenobarbital reduces plasma concentration of paroxetine; phenobarbital accelerates metabolism of ●mianserin (reduced plasma concentration); anticonvulsant effect of barbiturates possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of barbiturates antagonised by SSRIs (convulsive threshold lowered); avoid concomitant use of phenobarbital with ●St John's wort; anticonvulsant effect of barbiturates antagonised by ●tricyclics (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
- Antiepileptics: phenobarbital reduces plasma concentration of carbamazepine, lamotrigine, tiagabine and zonisamide; phenobarbital possibly reduces plasma concentration of ethosuximide; plasma concentration of phenobarbital increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by phenytoin, plasma concentration of phenytoin often reduced but may be increased; increased sedative effect when barbiturates given with primidone; plasma concentration of phenobarbital increased by ●stiripentol; plasma concentration of phenobarbital increased by valproate (also plasma concentration of valproate reduced); plasma concentration of phenobarbital possibly reduced by vigabatrin
- Antifungals: phenobarbital possibly reduces plasma concentration of itraconazole and ●posaconazole; phenobarbital possibly reduces plasma concentration of ●voriconazole—avoid concomitant use; phenobarbital reduces absorption of griseofulvin (reduced effect)
- Antipsychotics: anticonvulsant effect of barbiturates antagonised by ●antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole
- Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir and ●lopinavir; avoidance of phenobarbital advised by manufacturer of etravirine; phenobarbital possibly reduces plasma concentration of ●indinavir, also plasma concentration of phenobarbital possibly increased; barbiturates possibly reduce plasma concentration of ●indinavir, ●nelfinavir and ●saquinavir

Barbiturates *(continued)*
Anxiolytics and Hypnotics: phenobarbital often reduces plasma concentration of clonazepam
Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant
Beta-blockers: barbiturates reduce plasma concentration of metoprolol and timolol; barbiturates possibly reduce plasma concentration of propranolol
- Calcium-channel Blockers: barbiturates reduce effects of ●felodipine and ●isradipine; barbiturates probably reduce effects of ●dihydropyridines, ●diltiazem and ●verapamil

Cardiac Glycosides: barbiturates accelerate metabolism of digitoxin (reduced effect)
- Ciclosporin: barbiturates accelerate metabolism of ●ciclosporin (reduced effect)
- Corticosteroids: barbiturates accelerate metabolism of ●corticosteroids (reduced effect)

Cytotoxics: phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite
- Diuretics: phenobarbital reduces plasma concentration of ●eplerenone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors

Folates: plasma concentration of phenobarbital possibly reduced by folates
Hormone Antagonists: barbiturates accelerate metabolism of gestrinone (reduced plasma concentration); barbiturates possibly accelerate metabolism of toremifene (reduced plasma concentration)
Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of montelukast
Lofexidine: increased sedative effect when barbiturates given with lofexidine
Memantine: effects of barbiturates possibly reduced by memantine
- Oestrogens: barbiturates accelerate metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: barbiturates accelerate metabolism of ●progestogens (reduced contraceptive effect—see p. 445)
- Sodium Oxybate: barbiturates enhance effects of ●sodium oxybate (avoid concomitant use)

Sympathomimetics: plasma concentration of phenobarbital possibly increased by methylphenidate
- Tacrolimus: phenobarbital reduces plasma concentration of ●tacrolimus

Theophylline: barbiturates accelerate metabolism of theophylline (reduced effect)
Thyroid Hormones: barbiturates accelerate metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)
Tibolone: barbiturates accelerate metabolism of tibolone (reduced plasma concentration)
Vitamins: barbiturates possibly increase requirements for vitamin D

Beclometasone *see* Corticosteroids

Bemiparin *see* Heparins

Bendroflumethiazide (bendrofluazide) *see* Diuretics

Benperidol *see* Antipsychotics

Benzodiazepines *see* Anxiolytics and Hypnotics

Benzthiazide *see* Diuretics

Benzylpenicillin *see* Penicillins

Beta-blockers
Note Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind
ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when beta-blockers given with alcohol

Beta-blockers *(continued)*

Aldesleukin: enhanced hypotensive effect when beta-blockers given with aldesleukin

- Alpha-blockers: enhanced hypotensive effect when beta-blockers given with •alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with general anaesthetics

- Anaesthetics, Local: propranolol increases risk of •bupivacaine toxicity

Analgesics: hypotensive effect of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by morphine

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with angiotensin-II receptor antagonists

- Anti-arrhythmics: increased myocardial depression when beta-blockers given with •anti-arrhythmics; increased risk of ventricular arrhythmias when sotalol given with •amiodarone or •disopyramide—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with •amiodarone; increased risk of myocardial depression and bradycardia when beta-blockers given with •flecainide; propranolol increases risk of •lidocaine (lignocaine) toxicity; plasma concentration of metoprolol and propranolol increased by propafenone
- Antibacterials: increased risk of ventricular arrhythmias when sotalol given with •moxifloxacin—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by rifampicin (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by rifampicin
- Antidepressants: plasma concentration of metoprolol increased by citalopram and escitalopram; plasma concentration of propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine (enhanced effect); labetalol and propranolol increase plasma concentration of imipramine; enhanced hypotensive effect when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with •tricyclics

Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with antidiabetics; beta-blockers enhance hypoglycaemic effect of insulin

- Antihistamines: increased risk of ventricular arrhythmias when sotalol given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of metoprolol and sotalol advised by manufacturer of •artemether/lumefantrine; increased risk of bradycardia when beta-blockers given with mefloquine
- Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with •tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with •droperidol or •zuclopenthixol—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with •chlorpromazine; increased risk of ventricular arrhythmias when sotalol given with •amisulpride, •phenothiazines, •pimozide, •sertindole or •sulpiride; enhanced hypotensive effect when beta-blockers given with phenothiazines
- Antivirals: avoidance of metoprolol for heart failure advised by manufacturer of •tipranavir

Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with anxiolytics and hypnotics

- Atomoxetine: increased risk of ventricular arrhythmias when sotalol given with •atomoxetine

Barbiturates: plasma concentration of metoprolol and timolol reduced by barbiturates; plasma concentration of propranolol possibly reduced by barbiturates

Beta-blockers *(continued)*

- Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with calcium-channel blockers; possible severe hypotension and heart failure when beta-blockers given with •nifedipine; increased risk of AV block and bradycardia when beta-blockers given with •diltiazem; asystole, severe hypotension and heart failure when beta-blockers given with •verapamil (see p. 119)

Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with cardiac glycosides

- Ciclosporin: carvedilol increases plasma concentration of •ciclosporin
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with •clonidine (withdraw beta-blockers several days before slowly withdrawing clonidine)

Corticosteroids: hypotensive effect of beta-blockers antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when beta-blockers given with diazoxide

- Diuretics: enhanced hypotensive effect when beta-blockers given with diuretics; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by •loop diuretics or •thiazides and related diuretics

Dopaminergics: enhanced hypotensive effect when beta-blockers given with levodopa

Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with ergotamine and methysergide

$5HT_1$ Agonists: propranolol increases plasma concentration of rizatriptan (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)

- $5HT_3$ Antagonists: increased risk of ventricular arrhythmias when sotalol given with •dolasetron—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when sotalol given with •ivabradine

Methyldopa: enhanced hypotensive effect when beta-blockers given with methyldopa

- Moxisylyte (thymoxamine): possible severe postural hypotension when beta-blockers given with •moxisylyte

Moxonidine: enhanced hypotensive effect when beta-blockers given with moxonidine

Muscle Relaxants: propranolol enhances effects of muscle relaxants; enhanced hypotensive effect when beta-blockers given with baclofen; possible enhanced hypotensive effect and bradycardia when beta-blockers given with tizanidine

Nitrates: enhanced hypotensive effect when beta-blockers given with nitrates

Oestrogens: hypotensive effect of beta-blockers antagonised by oestrogens

Parasympathomimetics: propranolol antagonises effects of neostigmine and pyridostigmine; increased risk of arrhythmias when beta-blockers given with pilocarpine

Prostaglandins: enhanced hypotensive effect when beta-blockers given with alprostadil

- Ranolazine: avoidance of sotalol advised by manufacturer of •ranolazine
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with •adrenaline (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with •dobutamine; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with •noradrenaline (norepinephrine)

Thyroid Hormones: metabolism of propranolol accelerated by levothyroxine (thyroxine)

Beta-blockers *(continued)*
Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by cimetidine
Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with hydralazine, minoxidil or sodium nitroprusside

Betahistine
Antihistamines: effect of betahistine theoretically antagonised by antihistamines

Betamethasone *see* Corticosteroids

Betaxolol *see* Beta-blockers

Bethanechol *see* Parasympathomimetics

Bexarotene
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by •gemfibrozil—avoid concomitant use

Bezafibrate *see* Fibrates

Bicalutamide
Anticoagulants: bicalutamide possibly enhances anticoagulant effect of coumarins

Biguanides *see* Antidiabetics

Bile Acid Sequestrants *see* Colesevelam, Colestipol, and Colestyramine

Bile Acids *see* Ursodeoxycholic Acid

Bisoprolol *see* Beta-blockers

Bisphosphonates
Analgesics: bioavailability of tiludronic acid increased by indometacin
Antacids: absorption of bisphosphonates reduced by antacids
Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with aminoglycosides
Calcium Salts: absorption of bisphosphonates reduced by calcium salts
- Cytotoxics: sodium clodronate increases plasma concentration of •estramustine

Iron: absorption of bisphosphonates reduced by *oral* iron

Bleomycin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased pulmonary toxicity when bleomycin given with •cisplatin

Bortezomib
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antifungals: plasma concentration of bortezomib increased by ketoconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Bosentan
- Antibacterials: plasma concentration of bosentan reduced by •rifampicin—avoid concomitant use

Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of coumarins
- Antidiabetics: increased risk of hepatotoxicity when bosentan given with •glibenclamide—avoid concomitant use
- Antifungals: plasma concentration of bosentan increased by ketoconazole; plasma concentration of bosentan possibly increased by •fluconazole—avoid concomitant use; plasma concentration of bosentan possibly increased by itraconazole

Antivirals: plasma concentration of bosentan possibly increased by ritonavir

Bosentan *(continued)*
- Ciclosporin: plasma concentration of bosentan increased by •ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use)

Lipid-regulating Drugs: bosentan reduces plasma concentration of simvastatin
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing •oestrogens (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing •progestogens (alternative contraception recommended)

Sildenafil: bosentan reduces plasma concentration of sildenafil

Brimonidine
Antidepressants: manufacturer of brimonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Brinzolamide *see* Diuretics

Bromocriptine
Alcohol: tolerance of bromocriptine reduced by alcohol
Antibacterials: plasma concentration of bromocriptine increased by erythromycin (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by macrolides (increased risk of toxicity)
Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by antipsychotics
Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by domperidone
Hormone Antagonists: plasma concentration of bromocriptine increased by octreotide
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by metoclopramide
- Sympathomimetics: risk of toxicity when bromocriptine given with •isometheptene

Buclizine *see* Antihistamines

Budesonide *see* Corticosteroids

Bumetanide *see* Diuretics

Bupivacaine
Anti-arrhythmics: increased myocardial depression when bupivacaine given with anti-arrhythmics
- Beta-blockers: increased risk of bupivacaine toxicity when given with •propranolol

Buprenorphine *see* Opioid Analgesics

Bupropion
Note Bupropion should be administered with extreme caution to patients receiving other medication known to lower the seizure threshold—see CSM advice p. 281 and Cautions, Contra-indications and Side-effects of individual drugs
- Antidepressants: bupropion possibly increases plasma concentration of citalopram; manufacturer of bupropion advises avoid for 2 weeks after stopping •MAOIs; manufacturer of bupropion advises avoid concomitant use with •moclobemide

Antiepileptics: plasma concentration of bupropion reduced by carbamazepine and phenytoin; metabolism of bupropion inhibited by valproate
- Antivirals: plasma concentration of bupropion increased or decreased by •ritonavir

Atomoxetine: possible increased risk of convulsions when bupropion given with atomoxetine
Dopaminergics: increased risk of side-effects when bupropion given with amantadine or levodopa
- Hormone Antagonists: bupropion possibly inhibits metabolism of •tamoxifen to active metabolite (avoid concomitant use)

Buspirone *see* Anxiolytics and Hypnotics

Busulfan
Analgesics: metabolism of *intravenous* busulfan possibly inhibited by paracetamol (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol)

Busulfan *(continued)*
- Antibacterials: plasma concentration of busulfan increased by ●metronidazole (increased risk of toxicity)
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; plasma concentration of busulfan possibly reduced by phenytoin
- Antifungals: metabolism of busulfan inhibited by itraconazole (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with tioguanine

Butobarbital *see* Barbiturates

Butyrophenones *see* Antipsychotics

Cabergoline
- Antibacterials: plasma concentration of cabergoline increased by erythromycin (increased risk of toxicity); plasma concentration of cabergoline possibly increased by macrolides (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergoline antagonised by antipsychotics
- Domperidone: hypoprolactinaemic effect of cabergoline possibly antagonised by domperidone
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by metoclopramide

Calcium Salts

Note *see also* Antacids
- Antibacterials: calcium salts reduce absorption of ciprofloxacin and tetracycline
- Bisphosphonates: calcium salts reduce absorption of bisphosphonates
- Cardiac Glycosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with cardiac glycosides
- Corticosteroids: absorption of calcium salts reduced by corticosteroids
- Diuretics: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics
- Fluorides: calcium salts reduce absorption of fluorides
- Iron: calcium salts reduce absorption of *oral* iron
- Thyroid Hormones: calcium salts reduce absorption of levothyroxine (thyroxine)
- Zinc: calcium salts reduce absorption of zinc

Calcium-channel Blockers

Note Dihydropyridine calcium-channel blockers include amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine
- ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with adrenergic neurone blockers
- Alcohol: enhanced hypotensive effect when calcium-channel blockers given with alcohol; verapamil possibly increases plasma concentration of alcohol
- Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with aldesleukin
- Aliskiren: avoidance of verapamil advised by manufacturer of aliskiren
- Alpha-blockers: enhanced hypotensive effect when calcium-channel blockers given with ●alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with general anaesthetics or isoflurane; hypotensive effect of verapamil enhanced by ●general anaesthetics (also AV delay)
- Analgesics: hypotensive effect of calcium-channel blockers antagonised by NSAIDs; diltiazem inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with angiotensin-II receptor antagonists
- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with ●amiodarone; increased risk of myocardial depression and asystole when verapamil given with ●disopyramide or ●flecainide
- Antibacterials: metabolism of verapamil possibly inhibited by ●clarithromycin and ●erythromycin (increased risk of toxicity); metabolism of felodipine possibly inhibited by erythromycin (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with erythromycin; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by ●rifampicin (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by ●rifampicin (possible significantly reduced plasma concentration); plasma concentration of nifedipine increased by ●quinupristin/dalfopristin
- Antidepressants: metabolism of nifedipine possibly inhibited by fluoxetine (increased plasma concentration); diltiazem and verapamil increase plasma concentration of imipramine; enhanced hypotensive effect when calcium-channel blockers given with MAOIs; plasma concentration of amlodipine possibly reduced by St John's wort; diltiazem and verapamil possibly increase plasma concentration of tricyclics
- Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with insulin
- Antiepileptics: effects of felodipine and isradipine reduced by carbamazepine; effects of dihydropyridines, nicardipine and nifedipine probably reduced by carbamazepine; diltiazem and verapamil enhance effects of ●carbamazepine; effects of felodipine, isradipine and verapamil reduced by phenytoin; effects of dihydropyridines, nicardipine and nifedipine probably reduced by ●phenytoin; diltiazem increases plasma concentration of ●phenytoin but also effect of diltiazem reduced; effects of dihydropyridines, diltiazem and verapamil probably reduced by ●primidone; effects of felodipine and isradipine reduced by ●primidone
- Antifungals: metabolism of dihydropyridines possibly inhibited by itraconazole and ketoconazole (increased plasma concentration); metabolism of felodipine inhibited by ●itraconazole and ●ketoconazole (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with itraconazole and ketoconazole; negative inotropic effect possibly increased when calcium-channel blockers given with itraconazole; plasma concentration of nifedipine increased by micafungin
- Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with mefloquine
- Antimuscarinics: avoidance of verapamil advised by manufacturer of darifenacin
- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with antipsychotics
- Antivirals: plasma concentration of diltiazem increased by ●atazanavir (reduce dose of diltiazem); plasma concentration of verapamil possibly increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by ●ritonavir; manufacturer of lercanidipine advises avoid concomitant use with ritonavir
- Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with anxiolytics and hypnotics; diltiazem and verapamil inhibit metabolism of midazolam (increased plasma concentration with increased sedation); absorption of

Calcium-channel Blockers

Anxiolytics and Hypnotics *(continued)*
lercanidipine increased by midazolam; diltiazem and verapamil increase plasma concentration of buspirone (reduce dose of buspirone)

- Barbiturates: effects of dihydropyridines, diltiazem and verapamil probably reduced by ●barbiturates; effects of felodipine and isradipine reduced by ●barbiturates
- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with beta-blockers; increased risk of AV block and bradycardia when diltiazem given with ●beta-blockers; asystole, severe hypotension and heart failure when verapamil given with ●beta-blockers (see p. 119); possible severe hypotension and heart failure when nifedipine given with ●beta-blockers

Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with nifedipine

- Cardiac Glycosides: verapamil increases plasma concentration of ●digoxin, also increased risk of AV block and bradycardia; diltiazem, lercanidipine and nicardipine increase plasma concentration of ●digoxin; nifedipine possibly increases plasma concentration of ●digoxin
- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ●ciclosporin; combination of lercanidipine with ●ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyperplasia)
- Cilostazol: diltiazem increases plasma concentration of ●cilostazol—avoid concomitant use

Clonidine: enhanced hypotensive effect when calcium-channel blockers given with clonidine

Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by corticosteroids

Cytotoxics: nifedipine possibly inhibits metabolism of vincristine

Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with diazoxide

Diuretics: enhanced hypotensive effect when calcium-channel blockers given with diuretics; diltiazem and verapamil increase plasma concentration of eplerenone (reduce dose of eplerenone)

Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with levodopa

Grapefruit Juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by grapefruit juice

Hormone Antagonists: diltiazem and verapamil increase plasma concentration of dutasteride

- Ivabradine: diltiazem and verapamil increase plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: diltiazem increases plasma concentration of atorvastatin; possible increased risk of myopathy when diltiazem given with simvastatin; increased risk of myopathy when verapamil given with ●simvastatin

Lithium: neurotoxicity may occur when diltiazem or verapamil given with lithium without increased plasma concentration of lithium

- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and ●parenteral magnesium in pre-eclampsia

Methyldopa: enhanced hypotensive effect when calcium-channel blockers given with methyldopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when calcium-channel blockers given with moxisylyte

Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with moxonidine

Calcium-channel Blockers *(continued)*

Muscle Relaxants: verapamil enhances effects of non-depolarising muscle relaxants and suxamethonium; enhanced hypotensive effect when calcium-channel blockers given with baclofen or tizanidine; risk of arrhythmias when diltiazem given with intravenous dantrolene; hypotension, myocardial depression, and hyperkalaemia when verapamil given with intravenous dantrolene; nifedipine enhances effects of non-depolarising muscle relaxants

Nitrates: enhanced hypotensive effect when calcium-channel blockers given with nitrates

Oestrogens: hypotensive effect of calcium-channel blockers antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with alprostadil

Ranolazine: diltiazem and verapamil increase plasma concentration of ranolazine (consider reducing dose of ranolazine)

Sildenafil: enhanced hypotensive effect when amlodipine given with sildenafil

- Sirolimus: diltiazem increases plasma concentration of ●sirolimus; plasma concentration of both drugs increased when verapamil given with ●sirolimus
- Tacrolimus: diltiazem and nifedipine increase plasma concentration of ●tacrolimus; felodipine, nicardipine and verapamil possibly increase plasma concentration of tacrolimus
- Theophylline: calcium-channel blockers possibly increase plasma concentration of ●theophylline (enhanced effect); diltiazem increases plasma concentration of theophylline; verapamil increases plasma concentration of ●theophylline (enhanced effect)

Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by cimetidine (increased plasma concentration); plasma concentration of isradipine increased by cimetidine (halve dose of isradipine)

Vardenafil: enhanced hypotensive effect when nifedipine given with vardenafil

Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with hydralazine, minoxidil or sodium nitroprusside

Calcium-channel Blockers (dihydropyridines) *see* Calcium-channel Blockers

Candesartan *see* Angiotensin-II Receptor Antagonists

Capecitabine *see* Fluorouracil

Capreomycin

Antibacterials: increased risk of nephrotoxicity when capreomycin given with colistin or polymyxins; increased risk of nephrotoxicity and ototoxicity when capreomycin given with aminoglycosides or vancomycin

Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with platinum compounds

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Captopril *see* ACE Inhibitors

Carbamazepine

Alcohol: CNS side-effects of carbamazepine possibly increased by alcohol

- Analgesics: effects of carbamazepine enhanced by ●dextropropoxyphene; carbamazepine reduces plasma concentration of methadone; carbamazepine reduces effects of tramadol; carbamazepine possibly accelerates metabolism of paracetamol
- Antibacterials: plasma concentration of carbamazepine increased by ●clarithromycin and ●erythromycin; plasma concentration of carbamazepine reduced by ●rifabutin; carbamazepine accelerates metabolism of doxycycline (reduced effect); plasma concentration of carbamazepine increased by ●isoniazid (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentra-

Carbamazepine

- Antibacterials *(continued)*
  tion of ●telithromycin (avoid during and for 2 weeks after carbamazepine)
- Anticoagulants: carbamazepine accelerates metabolism of ●coumarins (reduced anticoagulant effect)
- Antidepressants: plasma concentration of carbamazepine increased by ●fluoxetine and ●fluvoxamine; carbamazepine reduces plasma concentration of ●mianserin, mirtazapine and paroxetine; manufacturer of carbamazepine advises avoid for 2 weeks after stopping ●MAOIs, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort; carbamazepine accelerates metabolism of ●tricyclics (reduced plasma concentration and reduced effect)
- Antiepileptics: carbamazepine possibly reduces plasma concentration of ethosuximide; carbamazepine often reduces plasma concentration of lamotrigine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of carbamazepine sometimes reduced by oxcarbazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; plasma concentration of both drugs often reduced when carbamazepine given with phenytoin, also plasma concentration of phenytoin may be increased; plasma concentration of carbamazepine often reduced by primidone, also plasma concentration of primidone sometimes reduced (but concentration of an active metabolite of primidone often increased); plasma concentration of carbamazepine increased by ●stiripentol; carbamazepine reduces plasma concentration of tiagabine and zonisamide; carbamazepine often reduces plasma concentration of topiramate; carbamazepine reduces plasma concentration of valproate, also plasma concentration of active metabolite of carbamazepine increased
- Antifungals: plasma concentration of carbamazepine possibly increased by fluconazole, ketoconazole and miconazole; carbamazepine possibly reduces plasma concentration of itraconazole and ●posaconazole; carbamazepine possibly reduces plasma concentration of ●voriconazole—avoid concomitant use; carbamazepine possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of carbamazepine antagonised by ●antipsychotics (convulsive threshold lowered); carbamazepine accelerates metabolism of haloperidol, olanzapine, quetiapine, risperidone and sertindole (reduced plasma concentration); carbamazepine reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole; carbamazepine accelerates metabolism of ●clozapine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of paliperidone
- Antivirals: carbamazepine possibly reduces plasma concentration of darunavir, fosamprenavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of both drugs reduced when carbamazepine given with efavirenz; avoidance of carbamazepine advised by manufacturer of etravirine; carbamazepine possibly reduces plasma concentration of ●indinavir, also plasma concentration of carbamazepine possibly increased; plasma concentration of carbamazepine possibly increased by ●ritonavir
- Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of clonazepam; carbamazepine reduces plasma concentration of midazolam
- Aprepitant: carbamazepine possibly reduces plasma concentration of aprepitant
- Barbiturates: plasma concentration of carbamazepine reduced by phenobarbital
- Bupropion: carbamazepine reduces plasma concentration of bupropion
- Calcium-channel Blockers: carbamazepine reduces effects of felodipine and isradipine; carbamazepine probably reduces effects of dihydropyridines, nicardipine and nifedipine; effects of carbamazepine enhanced by ●diltiazem and ●verapamil
- Cardiac Glycosides: carbamazepine accelerates metabolism of digitoxin (reduced effect)
- Ciclosporin: carbamazepine accelerates metabolism of ●ciclosporin (reduced plasma concentration)
- Corticosteroids: carbamazepine accelerates metabolism of ●corticosteroids (reduced effect)
- Cytotoxics: carbamazepine reduces plasma concentration of ●imatinib and ●lapatinib—avoid concomitant use; carbamazepine reduces plasma concentration of irinotecan and its active metabolite
- Diuretics: increased risk of hyponatraemia when carbamazepine given with diuretics; plasma concentration of carbamazepine increased by ●acetazolamide; carbamazepine reduces plasma concentration of ●eplerenone—avoid concomitant use
- Hormone Antagonists: metabolism of carbamazepine inhibited by ●danazol (increased risk of toxicity); carbamazepine accelerates metabolism of gestrinone (reduced plasma concentration); carbamazepine possibly accelerates metabolism of toremifene (reduced plasma concentration)
- $5HT_3$ Antagonists: carbamazepine accelerates metabolism of ondansetron (reduced effect)
- Lithium: neurotoxicity may occur when carbamazepine given with lithium without increased plasma concentration of lithium
- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: carbamazepine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 445)
- Retinoids: plasma concentration of carbamazepine possibly reduced by isotretinoin
- Theophylline: carbamazepine accelerates metabolism of theophylline (reduced effect)
- Thyroid Hormones: carbamazepine accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)
- Tibolone: carbamazepine accelerates metabolism of tibolone (reduced plasma concentration)
- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by ●cimetidine (increased plasma concentration)
- Vitamins: carbamazepine possibly increases requirements for vitamin D

Carbapenems *see* Doripenem, Ertapenem, Imipenem with Cilastatin, and Meropenem

Carbonic Anhydrase Inhibitors *see* Diuretics

Carboplatin *see* Platinum Compounds

Carboprost *see* Prostaglandins

Cardiac Glycosides

- ACE Inhibitors: plasma concentration of digoxin possibly increased by captopril

Cardiac Glycosides *(continued)*

Alpha-blockers: plasma concentration of digoxin increased by prazosin

Aminosalicylates: absorption of digoxin possibly reduced by sulfasalazine

Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDs, also possible exacerbation of heart failure and reduction of renal function

Antacids: absorption of digoxin possibly reduced by antacids

- Anti-arrhythmics: plasma concentration of digoxin increased by •amiodarone and •propafenone (halve dose of digoxin)

Antibacterials: plasma concentration of digoxin possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin possibly reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity); metabolism of digitoxin accelerated by rifamycins (reduced effect)

- Antidepressants: plasma concentration of digoxin reduced by •St John's wort—avoid concomitant use

Antidiabetics: plasma concentration of digoxin possibly reduced by acarbose; plasma concentration of digoxin increased by sitagliptin

Antiepileptics: metabolism of digitoxin accelerated by carbamazepine, phenytoin and primidone (reduced effect); plasma concentration of digoxin possibly reduced by phenytoin

- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with •amphotericin; plasma concentration of digoxin increased by •itraconazole
- Antimalarials: plasma concentration of digoxin possibly increased by •chloroquine and hydroxychloroquine; possible increased risk of bradycardia when digoxin given with mefloquine; plasma concentration of digoxin increased by •quinine

Antimuscarinics: plasma concentration of digoxin possibly increased by darifenacin

Antivirals: plasma concentration of digoxin increased by etravirine; plasma concentration of digoxin possibly increased by ritonavir

Anxiolytics and Hypnotics: plasma concentration of digoxin increased by alprazolam (increased risk of toxicity)

Barbiturates: metabolism of digitoxin accelerated by barbiturates (reduced effect)

Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with beta-blockers

Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of calcium salts

- Calcium-channel Blockers: plasma concentration of digoxin increased by •diltiazem, •lercanidipine and •nicardipine; plasma concentration of digoxin possibly increased by •nifedipine; plasma concentration of digoxin increased by •verapamil, also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by •ciclosporin (increased risk of toxicity)

Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with corticosteroids

Cytotoxics: absorption of digoxin tablets reduced by cytotoxics

- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with •acetazolamide, •loop diuretics or •thiazides and related diuretics; plasma concentration of digoxin possibly increased by potassium canrenoate; plasma concentration of digitoxin possibly affected by spironolactone; plasma concentration of digoxin increased by •spironolactone

Lenalidomide: plasma concentration of digoxin possibly increased by lenalidomide

Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by colestipol and colestyramine; plasma concentration of digoxin possibly increased by atorvastatin

Cardiac Glycosides

Lipid-regulating Drugs *(continued)*

Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with suxamethonium; possible increased risk of bradycardia when cardiac glycosides given with tizanidine

Penicillamine: plasma concentration of digoxin possibly reduced by penicillamine

Ranolazine: plasma concentration of digoxin increased by ranolazine

Sympathomimetics, Beta$_2$: plasma concentration of digoxin possibly reduced by salbutamol

Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by proton pump inhibitors; absorption of cardiac glycosides possibly reduced by sucralfate

Carmustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by cimetidine

Carteolol *see* Beta-blockers

Carvedilol *see* Beta-blockers

Caspofungin

Antibacterials: plasma concentration of caspofungin initially increased and then reduced by rifampicin (consider increasing dose of caspofungin)

Antiepileptics: plasma concentration of caspofungin possibly reduced by carbamazepine and phenytoin—consider increasing dose of caspofungin

Antivirals: plasma concentration of caspofungin possibly reduced by efavirenz and nevirapine—consider increasing dose of caspofungin

- Ciclosporin: plasma concentration of caspofungin increased by •ciclosporin (manufacturer of caspofungin recommends monitoring liver enzymes)

Corticosteroids: plasma concentration of caspofungin possibly reduced by dexamethasone—consider increasing dose of caspofungin

- Tacrolimus: caspofungin reduces plasma concentration of •tacrolimus

Cefaclor *see* Cephalosporins

Cefadroxil *see* Cephalosporins

Cefalexin *see* Cephalosporins

Cefixime *see* Cephalosporins

Cefotaxime *see* Cephalosporins

Cefpodoxime *see* Cephalosporins

Cefradine *see* Cephalosporins

Ceftazidime *see* Cephalosporins

Ceftriaxone *see* Cephalosporins

Cefuroxime *see* Cephalosporins

Celecoxib *see* NSAIDs

Celiprolol *see* Beta-blockers

Cephalosporins

Antacids: absorption of cefaclor and cefpodoxime reduced by antacids

Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with aminoglycosides

- Anticoagulants: cephalosporins possibly enhance anticoagulant effect of •coumarins

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Probenecid: excretion of cephalosporins reduced by probenecid (increased plasma concentration)

Ulcer-healing Drugs: absorption of cefpodoxime reduced by histamine H_2-antagonists

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Cetirizine *see* Antihistamines

Chloral *see* Anxiolytics and Hypnotics

Chloramphenicol

Antibacterials: metabolism of chloramphenicol accelerated by rifampicin (reduced plasma concentration)

- Anticoagulants: chloramphenicol enhances anticoagulant effect of ●coumarins
- Antidiabetics: chloramphenicol enhances effects of ●sulphonylureas
- Antiepileptics: chloramphenicol increases plasma concentration of ●phenytoin (increased risk of toxicity); metabolism of chloramphenicol accelerated by ●primidone (reduced plasma concentration)
- Antipsychotics: avoid concomitant use of chloramphenicol with ●clozapine (increased risk of agranulocytosis)
- Barbiturates: metabolism of chloramphenicol accelerated by ●barbiturates (reduced plasma concentration)
- Ciclosporin: chloramphenicol possibly increases plasma concentration of ●ciclosporin

Hydroxocobalamin: chloramphenicol reduces response to hydroxocobalamin

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

- Tacrolimus: chloramphenicol possibly increases plasma concentration of ●tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Chlordiazepoxide *see* Anxiolytics and Hypnotics

Chloroquine and Hydroxychloroquine

Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by kaolin

Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antacids: absorption of chloroquine and hydroxychloroquine reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ●amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ●moxifloxacin—avoid concomitant use

Antiepileptics: possible increased risk of convulsions when chloroquine and hydroxychloroquine given with antiepileptics

- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine; increased risk of convulsions when chloroquine and hydroxychloroquine given with ●mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with ●droperidol—avoid concomitant use
- Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of ●digoxin
- Ciclosporin: chloroquine and hydroxychloroquine increase plasma concentration of ●ciclosporin (increased risk of toxicity)

Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by lanthanum (give at least 2 hours apart)

Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of laronidase (manufacturer of laronidase advises avoid concomitant use)

Parasympathomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine

Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by cimetidine (increased plasma concentration)

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Chlorothiazide *see* Diuretics

Chlorphenamine (chlorpheniramine) *see* Antihistamines

Chlorpromazine *see* Antipsychotics

Chlorpropamide *see* Antidiabetics

Chlortalidone *see* Diuretics

Ciclesonide *see* Corticosteroids

Ciclosporin

- ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with ●ACE inhibitors
- Aliskiren: ciclosporin increases plasma concentration of ●aliskiren—avoid concomitant use

Allopurinol: plasma concentration of ciclosporin possibly increased by allopurinol (risk of nephrotoxicity)

- Analgesics: increased risk of nephrotoxicity when ciclosporin given with ●NSAIDs; ciclosporin increases plasma concentration of ●diclofenac (halve dose of diclofenac)
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with ●angiotensin-II receptor antagonists

Anti-arrhythmics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone

- Antibacterials: metabolism of ciclosporin inhibited by ●clarithromycin and ●erythromycin (increased plasma concentration); metabolism of ciclosporin accelerated by ●rifampicin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by ●sulfadiazine; plasma concentration of ciclosporin possibly increased by ●chloramphenicol, ●doxycycline and ●telithromycin; increased risk of nephrotoxicity when ciclosporin given with ●aminoglycosides, ●polymyxins, ●quinolones, ●sulphonamides or ●vancomycin; increased risk of myopathy when ciclosporin given with ●daptomycin (preferably avoid concomitant use); metabolism of ciclosporin possibly inhibited by ●macrolides (increased plasma concentration); plasma concentration of ciclosporin increased by ●quinupristin/dalfopristin; increased risk of nephrotoxicity when ciclosporin given with ●trimethoprim, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
- Antidepressants: plasma concentration of ciclosporin reduced by ●St John's wort—avoid concomitant use

Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of repaglinide

- Antiepileptics: metabolism of ciclosporin accelerated by ●carbamazepine and ●phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine; metabolism of ciclosporin accelerated by ●primidone (reduced effect)
- Antifungals: metabolism of ciclosporin inhibited by ●fluconazole, ●itraconazole, ●ketoconazole, ●posaconazole and ●voriconazole (increased plasma concentration); metabolism of ciclosporin possibly inhibited by ●miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with ●amphotericin; ciclosporin increases plasma concentration of ●caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by griseofulvin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin
- Antimalarials: plasma concentration of ciclosporin increased by ●chloroquine and hydroxychloroquine (increased risk of toxicity)

Antimuscarinics: avoidance of ciclosporin advised by manufacturer of darifenacin

- Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by ●atazanavir, ●nelfinavir and ●ritonavir; plasma concentration of ciclosporin possibly reduced by ●efavirenz; plasma concentration of ciclosporin increased by ●indinavir; plasma concentration of both drugs increased when ciclosporin given with ●saquinavir
- Barbiturates: metabolism of ciclosporin accelerated by ●barbiturates (reduced effect)
- Beta-blockers: plasma concentration of ciclosporin increased by ●carvedilol
- Bile Acids: absorption of ciclosporin increased by ●ursodeoxycholic acid

Ciclosporin *(continued)*

- Bosentan: ciclosporin increases plasma concentration of ●bosentan (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with ●lercanidipine may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by ●diltiazem, ●nicardipine and ●verapamil; ciclosporin possibly increases plasma concentration of nifedipine (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of ●digoxin (increased risk of toxicity)
- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with ●colchicine (increased plasma concentration of ciclosporin)
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose ●methylprednisolone (risk of convulsions); ciclosporin increases plasma concentration of prednisolone
- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with ●melphalan; increased risk of neurotoxicity when ciclosporin given with ●doxorubicin; risk of toxicity when ciclosporin given with ●methotrexate; plasma concentration of ciclosporin possibly increased by imatinib; *in vitro* studies suggest a possible interaction between ciclosporin and docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of etoposide (increased risk of toxicity)
- Diuretics: increased risk of hyperkalaemia when ciclosporin given with ●potassium-sparing diuretics and aldosterone antagonists; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with thiazides and related diuretics
- Grapefruit Juice: plasma concentration of ciclosporin increased by ●grapefruit juice (increased risk of toxicity)
- Hormone Antagonists: metabolism of ciclosporin inhibited by ●danazol (increased plasma concentration); plasma concentration of ciclosporin reduced by lanreotide and ●octreotide
- Lipid-regulating Drugs: increased risk of renal impairment when ciclosporin given with bezafibrate or fenofibrate; increased risk of myopathy when ciclosporin given with ●rosuvastatin (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with ●ezetimibe; increased risk of myopathy when ciclosporin given with ●statins

  Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with mannitol
- Metoclopramide: plasma concentration of ciclosporin increased by ●metoclopramide
- Modafinil: plasma concentration of ciclosporin reduced by ●modafinil

  Oestrogens: plasma concentration of ciclosporin possibly increased by oestrogens
- Orlistat: absorption of ciclosporin possibly reduced by ●orlistat
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with ●potassium salts
- Progestogens: metabolism of ciclosporin inhibited by ●progestogens (increased plasma concentration)

  Ranolazine: ciclosporin possibly increases plasma concentration of ranolazine

  Sevelamer: plasma concentration of ciclosporin possibly reduced by sevelamer

  Sirolimus: ciclosporin increases plasma concentration of sirolimus
- Sitaxentan: ciclosporin increases plasma concentration of ●sitaxentan—avoid concomitant use
- Sulfinpyrazone: plasma concentration of ciclosporin reduced by ●sulfinpyrazone

Ciclosporin *(continued)*

- Tacrolimus: plasma concentration of ciclosporin increased by ●tacrolimus (increased risk of nephrotoxicity)—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by ●cimetidine; plasma concentration of ciclosporin possibly affected by omeprazole

Cidofovir

Antivirals: combination of cidofovir with tenofovir may increase plasma concentration of either drug (or both)

Cilazapril *see* ACE Inhibitors

Cilostazol

- Anagrelide: avoidance of cilostazol advised by manufacturer of ●anagrelide

  Analgesics: manufacturer of cilostazol recommends dose of concomitant aspirin should not exceed 80 mg daily
- Antibacterials: plasma concentration of cilostazol increased by ●erythromycin (also plasma concentration of erythromycin reduced)—avoid concomitant use
- Antifungals: plasma concentration of cilostazol possibly increased by ●ketoconazole—avoid concomitant use
- Antivirals: plasma concentration of cilostazol possibly increased by ●fosamprenavir, ●indinavir, ●lopinavir, ●nelfinavir, ●ritonavir and ●saquinavir—avoid concomitant use
- Calcium-channel Blockers: plasma concentration of cilostazol increased by ●diltiazem—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of cilostazol possibly increased by ●cimetidine and ●lansoprazole—avoid concomitant use; plasma concentration of cilostazol increased by ●omeprazole (risk of toxicity)—avoid concomitant use

Cimetidine *see* Histamine H_2-antagonists

Cinacalcet

Antifungals: metabolism of cinacalcet inhibited by ketoconazole (increased plasma concentration)

Tobacco: metabolism of cinacalcet increased by tobacco smoking (reduced plasma concentration)

Cinnarizine *see* Antihistamines

Ciprofibrate *see* Fibrates

Ciprofloxacin *see* Quinolones

Cisatracurium *see* Muscle Relaxants

Cisplatin *see* Platinum Compounds

Citalopram *see* Antidepressants, SSRI

Clarithromycin *see* Macrolides

Clemastine *see* Antihistamines

Clindamycin

- Muscle Relaxants: clindamycin enhances effects of ●non-depolarising muscle relaxants and ●suxamethonium

  Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

  Parasympathomimetics: clindamycin antagonises effects of neostigmine and pyridostigmine

  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Clobazam *see* Anxiolytics and Hypnotics

Clomethiazole *see* Anxiolytics and Hypnotics

Clomipramine *see* Antidepressants, Tricyclic

Clonazepam *see* Anxiolytics and Hypnotics

Clonidine

ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE inhibitors; previous treatment with clonidine possibly delays antihypertensive effect of captopril

Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when clonidine given with alcohol

Aldesleukin: enhanced hypotensive effect when clonidine given with aldesleukin

Clonidine *(continued)*
Alpha-blockers: enhanced hypotensive effect when clonidine given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when clonidine given with general anaesthetics
Analgesics: hypotensive effect of clonidine antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with angiotensin-II receptor antagonists
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIs; hypotensive effect of clonidine antagonised by ●tricyclics, also increased risk of hypertension on clonidine withdrawal

Antipsychotics: enhanced hypotensive effect when clonidine given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with anxiolytics and hypnotics
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with ●beta-blockers (withdraw beta-blockers several days before slowly withdrawing clonidine)

Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with calcium-channel blockers
Corticosteroids: hypotensive effect of clonidine antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when clonidine given with diazoxide
Diuretics: enhanced hypotensive effect when clonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when clonidine given with levodopa
Methyldopa: enhanced hypotensive effect when clonidine given with methyldopa
Moxisylyte (thymoxamine): enhanced hypotensive effect when clonidine given with moxisylyte
Moxonidine: enhanced hypotensive effect when clonidine given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when clonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when clonidine given with nitrates
Oestrogens: hypotensive effect of clonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when clonidine given with alprostadil
- Sympathomimetics: possible risk of hypertension when clonidine given with adrenaline (epinephrine) or noradrenaline (norepinephrine); serious adverse events reported with concomitant use of clonidine and ●methylphenidate (causality not established)

Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with hydralazine, minoxidil or sodium nitroprusside

Clopamide *see* Diuretics

Clopidogrel
Analgesics: increased risk of bleeding when clopidogrel given with NSAIDs or aspirin
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with ●warfarin; antiplatelet action of clopidogrel enhances anticoagulant effect of ●coumarins and ●phenindione; increased risk of bleeding when clopidogrel given with heparins

Dipyridamole: increased risk of bleeding when clopidogrel given with dipyridamole
Iloprost: increased risk of bleeding when clopidogrel given with iloprost
Prasugrel: possible increased risk of bleeding when clopidogrel given with prasugrel
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by ●proton pump inhibitors—avoid concomitant use

Clotrimazole *see* Antifungals, Imidazole
Clozapine *see* Antipsychotics
Co-amoxiclav *see* Penicillins
Co-beneldopa *see* Levodopa
Co-careldopa *see* Levodopa
Codeine *see* Opioid Analgesics
Co-fluampicil *see* Penicillins

Colchicine
- Antibacterials: increased risk of colchicine toxicity when given with ●clarithromycin or ●erythromycin
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ●ciclosporin (increased plasma concentration of ciclosporin)
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with ●statins

Colesevelam
Note Other drugs should be taken at least 1 hour before or 4 hours after colesevelam to reduce possible interference with absorption

Colestipol
Note Other drugs should be taken at least 1 hour before or 4-6 hours after colestipol to reduce possible interference with absorption
Antibacterials: colestipol possibly reduces absorption of tetracycline
Bile Acids: colestipol possibly reduces absorption of bile acids
Cardiac Glycosides: colestipol possibly reduces absorption of cardiac glycosides
Diuretics: colestipol reduces absorption of thiazides and related diuretics (give at least 2 hours apart)
Thyroid Hormones: colestipol reduces absorption of thyroid hormones

Colestyramine
Note Other drugs should be taken at least 1 hour before or 4-6 hours after colestyramine to reduce possible interference with absorption
Analgesics: colestyramine increases the excretion of meloxicam; colestyramine reduces absorption of paracetamol
Antibacterials: colestyramine possibly reduces absorption of tetracycline; colestyramine antagonises effects of oral vancomycin
- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of ●coumarins and ●phenindione

Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of acarbose
Antiepileptics: colestyramine possibly reduces absorption of valproate
Bile Acids: colestyramine possibly reduces absorption of bile acids
Cardiac Glycosides: colestyramine possibly reduces absorption of cardiac glycosides
Diuretics: colestyramine reduces absorption of thiazides and related diuretics (give at least 2 hours apart)
Leflunomide: colestyramine significantly decreases effect of leflunomide (enhanced elimination)—avoid unless drug elimination desired
Mycophenolate: colestyramine reduces absorption of mycophenolate
Raloxifene: colestyramine reduces absorption of raloxifene (manufacturer of raloxifene advises avoid concomitant administration)
Thyroid Hormones: colestyramine reduces absorption of thyroid hormones

Colistin *see* Polymyxins
Contraceptives, oral *see* Oestrogens and Progestogens

Corticosteroids
Note Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified
ACE Inhibitors: corticosteroids antagonise hypotensive effect of ACE inhibitors
Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of adrenergic neurone blockers
Alpha-blockers: corticosteroids antagonise hypotensive effect of alpha-blockers
Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NSAIDs; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with

Corticosteroids

Analgesics *(continued)*
aspirin, also corticosteroids reduce plasma concentration of salicylate

Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of angiotensin-II receptor antagonists

Antacids: absorption of deflazacort reduced by antacids

- Antibacterials: plasma concentration of methylprednisolone possibly increased by clarithromycin; metabolism of corticosteroids possibly inhibited by erythromycin; metabolism of methylprednisolone inhibited by erythromycin; corticosteroids possibly reduce plasma concentration of isoniazid; metabolism of corticosteroids accelerated by ●rifamycins (reduced effect)
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of ●coumarins (high-dose corticosteroids enhance anticoagulant effect)

Antidiabetics: corticosteroids antagonise hypoglycaemic effect of antidiabetics

- Antiepileptics: metabolism of corticosteroids accelerated by ●carbamazepine, ●phenytoin and ●primidone (reduced effect)
- Antifungals: metabolism of corticosteroids possibly inhibited by itraconazole and ketoconazole; plasma concentration of active metabolite of ciclesonide increased by ketoconazole; plasma concentration of inhaled mometasone increased by ketoconazole; plasma concentration of inhaled and oral budesonide increased by ketoconazole; metabolism of methylprednisolone inhibited by ketoconazole; increased risk of hypokalaemia when corticosteroids given with ●amphotericin—avoid concomitant use unless corticosteroids needed to control reactions; plasma concentration of inhaled budesonide increased by itraconazole; metabolism of methylprednisolone possibly inhibited by itraconazole; dexamethasone possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antivirals: dexamethasone possibly reduces plasma concentration of indinavir, lopinavir and saquinavir; plasma concentration of corticosteroids, dexamethasone and prednisolone possibly increased by ritonavir; plasma concentration of inhaled and intranasal budesonide and fluticasone increased by ●ritonavir

Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by aprepitant (reduce dose of dexamethasone and methylprednisolone)

- Barbiturates: metabolism of corticosteroids accelerated by ●barbiturates (reduced effect)

Beta-blockers: corticosteroids antagonise hypotensive effect of beta-blockers

Calcium Salts: corticosteroids reduce absorption of calcium salts

Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of calcium-channel blockers

Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with cardiac glycosides

- Ciclosporin: high-dose methylprednisolone increases plasma concentration of ●ciclosporin (risk of convulsions); plasma concentration of prednisolone increased by ciclosporin

Clonidine: corticosteroids antagonise hypotensive effect of clonidine

- Cytotoxics: increased risk of haematological toxicity when corticosteroids given with ●methotrexate

Diazoxide: corticosteroids antagonise hypotensive effect of diazoxide

Diuretics: corticosteroids antagonise diuretic effect of diuretics; increased risk of hypokalaemia when corticosteroids given with acetazolamide, loop diuretics or thiazides and related diuretics

Methyldopa: corticosteroids antagonise hypotensive effect of methyldopa

Corticosteroids *(continued)*

Mifepristone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after mifepristone

Moxonidine: corticosteroids antagonise hypotensive effect of moxonidine

Muscle Relaxants: corticosteroids possibly antagonise effects of pancuronium and vecuronium

Nitrates: corticosteroids antagonise hypotensive effect of nitrates

Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing oestrogens

Sodium Benzoate: corticosteroids possibly reduce effects of sodium benzoate

Sodium Phenylbutyrate: corticosteroids possibly reduce effects of sodium phenylbutyrate

Somatropin: corticosteroids may inhibit growth-promoting effect of somatropin

Sympathomimetics: metabolism of dexamethasone accelerated by ephedrine

Sympathomimetics, Beta$_2$: increased risk of hypokalaemia when corticosteroids given with high doses of beta$_2$ sympathomimetics—for CSM advice (hypokalaemia) see p. 155

Theophylline: increased risk of hypokalaemia when corticosteroids given with theophylline

- Vaccines: high doses of corticosteroids impair immune response to ●vaccines, avoid concomitant use with live vaccines (see p. 669)

Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Cortisone *see* Corticosteroids

Co-trimoxazole *see* Trimethoprim and Sulfamethoxazole

Coumarins

Note Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of ●alcohol

Allopurinol: anticoagulant effect of coumarins possibly enhanced by allopurinol

- Anabolic Steroids: anticoagulant effect of coumarins enhanced by ●anabolic steroids
- Analgesics: anticoagulant effect of coumarins possibly enhanced by ●NSAIDs; anticoagulant effect of coumarins enhanced by ●azapropazone (avoid concomitant use); increased risk of haemorrhage when anticoagulants given with intravenous ●diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with ●ketorolac (avoid concomitant use, including low-dose heparin); anticoagulant effect of coumarins enhanced by ●tramadol; increased risk of bleeding when coumarins given with ●aspirin (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of paracetamol
- Anti-arrhythmics: metabolism of coumarins inhibited by ●amiodarone (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by ●propafenone
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with ●neomycin (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by ●azithromycin, ●aztreonam, ●cephalosporins, levofloxacin, ●tetracyclines, tigecycline and trimethoprim; anticoagulant effect of coumarins enhanced by ●chloramphenicol, ●ciprofloxacin, ●clarithromycin, ●erythromycin, ●metronidazole, ●nalidixic acid, ●norfloxacin, ●ofloxacin and ●sulphonamides; studies have failed to demonstrate an interaction with coumarins, but

Coumarins

- Antibacterials *(continued)*
  common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin; metabolism of coumarins accelerated by •rifamycins (reduced anticoagulant effect)
- Antidepressants: anticoagulant effect of warfarin possibly enhanced by •venlafaxine; anticoagulant effect of coumarins possibly enhanced by •SSRIs; anticoagulant effect of coumarins reduced by •St John's wort (avoid concomitant use); anticoagulant effect of warfarin enhanced by mirtazapine; anticoagulant effect of coumarins may be enhanced or reduced by •tricyclics
- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by exenatide; coumarins possibly enhance hypoglycaemic effect of •sulphonylureas, also possible changes to anticoagulant effect
- Antiepileptics: metabolism of coumarins accelerated by •carbamazepine and •primidone (reduced anticoagulant effect); metabolism of coumarins accelerated by •phenytoin (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by valproate
- Antifungals: anticoagulant effect of coumarins enhanced by •fluconazole, •itraconazole, •ketoconazole and •voriconazole; anticoagulant effect of coumarins enhanced by •miconazole (miconazole oral gel and possibly vaginal formulations absorbed); anticoagulant effect of coumarins reduced by •griseofulvin

  Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by proguanil
- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by atazanavir, •nevirapine and •ritonavir; anticoagulant effect of coumarins may be enhanced or reduced by fosamprenavir; anticoagulant effect of coumarins possibly enhanced by •ritonavir; anticoagulant effect of warfarin possibly enhanced by saquinavir

  Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by chloral and triclofos

  Aprepitant: anticoagulant effect of warfarin possibly reduced by aprepitant
- Azathioprine: anticoagulant effect of coumarins possibly reduced by •azathioprine
- Barbiturates: metabolism of coumarins accelerated by •barbiturates (reduced anticoagulant effect)

  Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of bosentan
- Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of •clopidogrel; avoidance of warfarin advised by manufacturer of •clopidogrel
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by •corticosteroids (high-dose corticosteroids enhance anticoagulant effect)
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by •cranberry juice—avoid concomitant use
- Cytotoxics: anticoagulant effect of coumarins possibly enhanced by •etoposide, •ifosfamide and •sorafenib; anticoagulant effect of coumarins enhanced by •fluorouracil; anticoagulant effect of warfarin possibly enhanced by gemcitabine; anticoagulant effect of coumarins possibly reduced by •mercaptopurine and •mitotane; increased risk of bleeding when coumarins given with •erlotinib; replacement of warfarin with a heparin advised by manufacturer of imatinib (possibility of enhanced warfarin effect)
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of •dipyridamole
- Disulfiram: anticoagulant effect of coumarins enhanced by •disulfiram

Coumarins *(continued)*

- Dopaminergics: anticoagulant effect of warfarin enhanced by •entacapone
- Enteral Foods: anticoagulant effect of coumarins antagonised by vitamin K (present in some •enteral feeds)
- Glucosamine: anticoagulant effect of warfarin enhanced by •glucosamine (avoid concomitant use)
- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by bicalutamide and •toremifene; metabolism of coumarins inhibited by •danazol (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by •flutamide and •tamoxifen

  Iloprost: anticoagulant effect of coumarins possibly enhanced by iloprost

  Lactulose: anticoagulant effect of coumarins possibly enhanced by lactulose

  Leflunomide: anticoagulant effect of warfarin possibly enhanced by leflunomide

  Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by zafirlukast
- Levamisole: anticoagulant effect of warfarin possibly enhanced by •levamisole
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by •colestyramine; anticoagulant effect of warfarin may be transiently reduced by atorvastatin; anticoagulant effect of coumarins enhanced by •fibrates, •fluvastatin and simvastatin; anticoagulant effect of coumarins possibly enhanced by ezetimibe and •rosuvastatin

  Memantine: anticoagulant effect of warfarin possibly enhanced by memantine
- Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by •oestrogens

  Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of orlistat

  Prasugrel: possible increased risk of bleeding when coumarins given with prasugrel
- Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by •progestogens

  Raloxifene: anticoagulant effect of coumarins antagonised by raloxifene
- Retinoids: anticoagulant effect of coumarins possibly reduced by •acitretin

  Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine
- Sitaxentan: anticoagulant effect of coumarins enhanced by •sitaxentan
- Sulfinpyrazone: anticoagulant effect of coumarins enhanced by •sulfinpyrazone
- Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by •methylphenidate

  Terpene Mixture: anticoagulant effect of coumarins possibly reduced by Rowachol®
- Testolactone: anticoagulant effect of coumarins enhanced by •testolactone
- Testosterone: anticoagulant effect of coumarins enhanced by •testosterone
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by •thyroid hormones

  Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by ubidecarenone
- Ulcer-healing Drugs: metabolism of coumarins inhibited by •cimetidine (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by •esomeprazole, •omeprazole and pantoprazole; absorption of coumarins possibly reduced by •sucralfate (reduced anticoagulant effect)

  Vaccines: anticoagulant effect of warfarin possibly enhanced by influenza vaccine
- Vitamins: anticoagulant effect of coumarins antagonised by •vitamin K

Cranberry Juice

- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of •coumarins—avoid concomitant use

Cyclizine *see* Antihistamines

Cyclopenthiazide *see* Diuretics

Cyclopentolate *see* Antimuscarinics

Cyclophosphamide

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: side-effects of cyclophosphamide possibly increased by itraconazole

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with ●pentostatin—avoid concomitant use

Muscle Relaxants: cyclophosphamide enhances effects of suxamethonium

Cycloserine

- Alcohol: increased risk of convulsions when cycloserine given with ●alcohol

Antibacterials: increased risk of CNS toxicity when cycloserine given with isoniazid

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Cyproheptadine *see* Antihistamines

Cytarabine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: cytarabine possibly reduces plasma concentration of flucytosine

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: intracellular concentration of cytarabine increased by fludarabine

Cytotoxics *see* individual drugs

Dabigatran Etexilate

- Analgesics: possible increased risk of bleeding when dabigatran etexilate given with ●NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous ●diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with ●ketorolac (avoid concomitant use, including low-dose heparin)
- Anti-arrhythmics: plasma concentration of dabigatran etexilate increased by ●amiodarone (reduce dose of dabigatran etexilate)

Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine

Dairy Products

Antibacterials: dairy products reduce absorption of ciprofloxacin and norfloxacin; dairy products reduce absorption of tetracyclines (except doxycycline and minocycline)

Dalteparin *see* Heparins

Danazol

- Anticoagulants: danazol inhibits metabolism of ●coumarins (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of ●carbamazepine (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of ●ciclosporin (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with ●simvastatin

Tacrolimus: danazol possibly increases plasma concentration of tacrolimus

Dantrolene *see* Muscle Relaxants

Dapsone

Antibacterials: plasma concentration of dapsone reduced by rifamycins; plasma concentration of both drugs may increase when dapsone given with trimethoprim

Antivirals: plasma concentration of dapsone possibly increased by fosamprenavir

Dapsone *(continued)*

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Probenecid: excretion of dapsone reduced by probenecid (increased risk of side-effects)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Daptomycin

- Ciclosporin: increased risk of myopathy when daptomycin given with ●ciclosporin (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with ●fibrates or ●statins (preferably avoid concomitant use)

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Darifenacin *see* Antimuscarinics

Darunavir

Anti-arrhythmics: darunavir possibly increases plasma concentration of lidocaine (lignocaine)—avoid concomitant use

- Antibacterials: darunavir increases plasma concentration of ●rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by ●rifampicin—avoid concomitant use

Anticoagulants: avoidance of darunavir advised by manufacturer of rivaroxaban

- Antidepressants: darunavir possibly reduces plasma concentration of paroxetine and sertraline; plasma concentration of darunavir reduced by ●St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of darunavir possibly reduced by carbamazepine and phenytoin

Antifungals: plasma concentration of both drugs increased when darunavir given with ketoconazole

Antimalarials: caution with darunavir advised by manufacturer of artemether/lumefantrine

- Antivirals: plasma concentration of darunavir reduced by efavirenz and saquinavir; plasma concentration of both drugs increased when darunavir given with indinavir; plasma concentration of darunavir reduced by ●lopinavir, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc)

Barbiturates: plasma concentration of darunavir possibly reduced by phenobarbital

- Lipid-regulating Drugs: darunavir possibly increases plasma concentration of pravastatin; possible increased risk of myopathy when darunavir given with ●rosuvastatin—avoid concomitant use
- Ranolazine: darunavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

Dasatinib

- Antibacterials: metabolism of dasatinib accelerated by ●rifampicin (reduced plasma concentration—avoid concomitant use)

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of simvastatin

Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by famotidine

Deferasirox

Antacids: absorption of deferasirox possibly reduced by antacids containing aluminium (manufacturer of deferasirox advises avoid concomitant use)

Antibacterials: plasma concentration of deferasirox reduced by rifampicin

Deferasirox *(continued)*
Antidiabetics: deferasirox increases plasma concentration of repaglinide
Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of midazolam
Deflazacort *see* Corticosteroids
Demeclocycline *see* Tetracyclines
Desferrioxamine
Antipsychotics: avoidance of desferrioxamine advised by manufacturer of levomepromazine (methotrimeprazine); manufacturer of desferrioxamine advises avoid concomitant use with prochlorperazine
Desflurane *see* Anaesthetics, General
Desloratadine *see* Antihistamines
Desmopressin
Analgesics: effects of desmopressin enhanced by indometacin
Loperamide: plasma concentration of *oral* desmopressin increased by loperamide
Desogestrel *see* Progestogens
Dexamethasone *see* Corticosteroids
Dexamfetamine *see* Sympathomimetics
Dexibuprofen *see* NSAIDs
Dexketoprofen *see* NSAIDs
Dextromethorphan *see* Opioid Analgesics
Dextropropoxyphene *see* Opioid Analgesics
Diamorphine *see* Opioid Analgesics
Diazepam *see* Anxiolytics and Hypnotics
Diazoxide
ACE Inhibitors: enhanced hypotensive effect when diazoxide given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when diazoxide given with alcohol
Aldesleukin: enhanced hypotensive effect when diazoxide given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when diazoxide given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when diazoxide given with general anaesthetics
Analgesics: hypotensive effect of diazoxide antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when diazoxide given with MAOIs or tricyclic-related antidepressants
Antidiabetics: diazoxide antagonises hypoglycaemic effect of antidiabetics
Antiepileptics: diazoxide reduces plasma concentration of phenytoin, also effect of diazoxide may be reduced
Antipsychotics: enhanced hypotensive effect when diazoxide given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when diazoxide given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when diazoxide given with clonidine
Corticosteroids: hypotensive effect of diazoxide antagonised by corticosteroids
Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with diuretics
Dopaminergics: enhanced hypotensive effect when diazoxide given with levodopa
Methyldopa: enhanced hypotensive effect when diazoxide given with methyldopa
Moxisylyte (thymoxamine): enhanced hypotensive effect when diazoxide given with moxisylyte
Moxonidine: enhanced hypotensive effect when diazoxide given with moxonidine

Diazoxide *(continued)*
Muscle Relaxants: enhanced hypotensive effect when diazoxide given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when diazoxide given with nitrates
Oestrogens: hypotensive effect of diazoxide antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when diazoxide given with alprostadil
Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with hydralazine, minoxidil or sodium nitroprusside
Diclofenac *see* NSAIDs
Dicycloverine (dicyclomine) *see* Antimuscarinics
Didanosine
Note Antacids in tablet formulation may affect absorption of other drugs
- Allopurinol: plasma concentration of didanosine increased by ●allopurinol (risk of toxicity)—avoid concomitant use
- Antivirals: plasma concentration of didanosine possibly increased by ganciclovir; increased risk of side-effects when didanosine given with ●ribavirin—avoid concomitant use; increased risk of side-effects when didanosine given with ●stavudine; plasma concentration of didanosine increased by ●tenofovir (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by ●tipranavir
- Cytotoxics: increased risk of toxicity when didanosine given with ●hydroxycarbamide—avoid concomitant use

Digitoxin *see* Cardiac Glycosides
Digoxin *see* Cardiac Glycosides
Dihydrocodeine *see* Opioid Analgesics
Diltiazem *see* Calcium-channel Blockers
Dimercaprol
- Iron: avoid concomitant use of dimercaprol with ●iron

Dimethyl sulfoxide
- Analgesics: avoid concomitant use of dimethyl sulfoxide with ●sulindac

Dinoprostone *see* Prostaglandins
Diphenoxylate *see* Opioid Analgesics
Dipipanone *see* Opioid Analgesics
Dipivefrine *see* Sympathomimetics
Dipyridamole
Antacids: absorption of dipyridamole possibly reduced by antacids
- Anti-arrhythmics: dipyridamole enhances and extends the effects of ●adenosine (important risk of toxicity)
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of ●coumarins and ●phenindione; dipyridamole enhances anticoagulant effect of heparins

Clopidogrel: increased risk of bleeding when dipyridamole given with clopidogrel
Cytotoxics: dipyridamole possibly reduces effects of fludarabine
Disodium Etidronate *see* Bisphosphonates
Disodium Pamidronate *see* Bisphosphonates
Disopyramide
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●anti-arrhythmics; increased risk of ventricular arrhythmias when disopyramide given with ●amiodarone—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by ●clarithromycin (increased risk of toxicity); plasma concentration of disopyramide increased by ●erythromycin (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with ●moxifloxacin or ●quinupristin/dalfopristin—avoid concomitant use; metabolism of disopyramide accelerated by ●rifamycins (reduced plasma concentration)

Disopyramide *(continued)*

- Antidepressants: increased risk of ventricular arrhythmias when disopyramide given with •tricyclics

  Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of gliclazide, insulin and metformin

  Antiepileptics: plasma concentration of disopyramide reduced by phenytoin; metabolism of disopyramide accelerated by primidone (reduced plasma concentration)
- Antifungals: increased risk of ventricular arrhythmias when disopyramide given with •ketoconazole—avoid concomitant use; avoidance of disopyramide advised by manufacturer of •itraconazole
- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of disopyramide advised by manufacturer of •artemether/lumefantrine (risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with antimuscarinics; increased risk of ventricular arrhythmias when disopyramide given with •tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with •amisulpride, •droperidol, •pimozide, •sertindole or •zuclopenthixol—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with •phenothiazines or •sulpiride
- Antivirals: plasma concentration of disopyramide possibly increased by •ritonavir (increased risk of toxicity)
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with •atomoxetine

  Barbiturates: metabolism of disopyramide accelerated by barbiturates (reduced plasma concentration)
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with •beta-blockers; increased risk of ventricular arrhythmias when disopyramide given with •sotalol—avoid concomitant use
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with •verapamil
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with •acetazolamide, •loop diuretics or •thiazides and related diuretics
- $5HT_3$ Antagonists: increased risk of ventricular arrhythmias when disopyramide given with •dolasetron—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when disopyramide given with •ivabradine

  Nitrates: disopyramide reduces effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)
- Ranolazine: avoidance of disopyramide advised by manufacturer of •ranolazine

Distigmine *see* Parasympathomimetics

Disulfiram

Alcohol: disulfiram reaction when disulfiram given with alcohol (see p. 280)

Antibacterials: psychotic reaction reported when disulfiram given with metronidazole

- Anticoagulants: disulfiram enhances anticoagulant effect of •coumarins

  Antidepressants: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration)
- Antiepileptics: disulfiram inhibits metabolism of •phenytoin (increased risk of toxicity)

  Anxiolytics and Hypnotics: disulfiram increases risk of temazepam toxicity; disulfiram inhibits metabolism of benzodiazepines (increased sedative effects)

Disulfiram *(continued)*

- Paraldehyde: risk of toxicity when disulfiram given with •paraldehyde

  Theophylline: disulfiram inhibits metabolism of theophylline (increased risk of toxicity)

Diuretics

Note Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

Note Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind

- ACE Inhibitors: enhanced hypotensive effect when diuretics given with •ACE inhibitors; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •ACE inhibitors (monitor potassium concentration with low-dose spironolactone in heart failure)

  Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with adrenergic neurone blockers

  Alcohol: enhanced hypotensive effect when diuretics given with alcohol

  Aldesleukin: enhanced hypotensive effect when diuretics given with aldesleukin

  Aliskiren: plasma concentration of furosemide (frusemide) reduced by aliskiren; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with aliskiren

  Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with allopurinol especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when diuretics given with •alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

  Anaesthetics, General: enhanced hypotensive effect when diuretics given with general anaesthetics
- Analgesics: Diuretic effect of potassium canrenoate possibly antagonised by NSAIDs; possibly increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with NSAIDs; diuretics increase risk of nephrotoxicity of NSAIDs, also antagonism of diuretic effect; effects of diuretics antagonised by indometacin and ketorolac; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with indometacin; occasional reports of reduced renal function when triamterene given with •indometacin—avoid concomitant use; increased risk of toxicity when carbonic anhydrase inhibitors given with high-dose aspirin; diuretic effect of spironolactone antagonised by aspirin
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with •angiotensin-II receptor antagonists; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •angiotensin-II receptor antagonists
- Anti-arrhythmics: plasma concentration of eplerenone increased by amiodarone (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with amiodarone; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •disopyramide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •flecainide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of •lidocaine (lignocaine)
- Antibacterials: plasma concentration of eplerenone increased by •clarithromycin and •telithromycin—avoid concomitant use; plasma concentration of eplerenone increased by erythromycin (reduce dose of eplerenone); plasma concentration of eplerenone reduced by •rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of

Diuretics

- Antibacterials *(continued)*
  lymecycline; increased risk of otoxicity when loop diuretics given with ●aminoglycosides, ●polymyxins or ●vancomycin; acetazolamide antagonises effects of ●methenamine; increased risk of hyperkalaemia when eplerenone given with trimethoprim
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with reboxetine; enhanced hypotensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by ●St John's wort—avoid concomitant use; increased risk of postural hypotension when diuretics given with tricyclics

  Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of antidiabetics; increased risk of hyponatraemia when thiazides and related diuretics plus potassium-sparing diuretic given with chlorpropamide; increased risk of hyponatraemia when potassium-sparing diuretics and aldosterone antagonists plus thiazide given with chlorpropamide
- Antiepileptics: plasma concentration of eplerenone reduced by ●carbamazepine and ●phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine; acetazolamide increases plasma concentration of ●carbamazepine; effects of furosemide (frusemide) antagonised by phenytoin; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenytoin or primidone; acetazolamide possibly reduces plasma concentration of primidone
- Antifungals: plasma concentration of eplerenone increased by ●itraconazole and ●ketoconazole—avoid concomitant use; increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with amphotericin; hydrochlorothiazide increases plasma concentration of fluconazole; plasma concentration of eplerenone increased by fluconazole (reduce dose of eplerenone)
- Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●amisulpride or ●sertindole; enhanced hypotensive effect when diuretics given with phenothiazines; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●pimozide (avoid concomitant use)
- Antivirals: plasma concentration of eplerenone increased by ●nelfinavir and ●ritonavir—avoid concomitant use; plasma concentration of eplerenone increased by saquinavir (reduce dose of eplerenone)

  Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with anxiolytics and hypnotics; administration of parenteral furosemide (frusemide) with chloral or triclofos may displace thyroid hormone from binding sites
- Atomoxetine: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●atomoxetine
- Barbiturates: increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital; plasma concentration of eplerenone reduced by ●phenobarbital—avoid concomitant use
- Beta-blockers: enhanced hypotensive effect when diuretics given with beta-blockers; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with ●sotalol

  Calcium Salts: increased risk of hypercalcaemia when thiazides and related diuretics given with calcium salts

  Calcium-channel Blockers: enhanced hypotensive effect when diuretics given with calcium-channel blockers; plasma concentration of eplerenone increased by diltiazem and verapamil (reduce dose of eplerenone)

Diuretics *(continued)*

- Cardiac Glycosides: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●cardiac glycosides; spironolactone possibly affects plasma concentration of digitoxin; spironolactone increases plasma concentration of ●digoxin; potassium canrenoate possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with ciclosporin; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●ciclosporin

  Clonidine: enhanced hypotensive effect when diuretics given with clonidine

  Corticosteroids: diuretic effect of diuretics antagonised by corticosteroids; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with corticosteroids

  Cytotoxics: avoidance of spironolactone advised by manufacturer of mitotane (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with platinum compounds

  Diazoxide: enhanced hypotensive and hyperglycaemic effects when diuretics given with diazoxide

  Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with acetazolamide; profound diuresis possible when metolazone given with furosemide (frusemide); increased risk of hypokalaemia when thiazides and related diuretics given with loop diuretics

  Dopaminergics: enhanced hypotensive effect when diuretics given with levodopa

  Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with toremifene; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with trilostane

  Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by colestipol and colestyramine (give at least 2 hours apart)
- Lithium: loop diuretics and thiazides and related diuretics reduce excretion of ●lithium (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of ●lithium (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of ●lithium

  Methyldopa: enhanced hypotensive effect when diuretics given with methyldopa

  Moxisylyte (thymoxamine): enhanced hypotensive effect when diuretics given with moxisylyte

  Moxonidine: enhanced hypotensive effect when diuretics given with moxonidine

  Muscle Relaxants: enhanced hypotensive effect when diuretics given with baclofen or tizanidine

  Nitrates: enhanced hypotensive effect when diuretics given with nitrates

  Oestrogens: diuretic effect of diuretics antagonised by oestrogens
- Potassium Salts: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●potassium salts

  Progestogens: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with drospirenone (monitor serum potassium during first cycle)

  Prostaglandins: enhanced hypotensive effect when diuretics given with alprostadil

  Sympathomimetics, $Beta_2$: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of $beta_2$ sympathomimetics—for CSM advice (hypokalaemia) see p. 155
- Tacrolimus: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●tacrolimus

Diuretics *(continued)*
Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with theophylline
Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with hydralazine, minoxidil or sodium nitroprusside
Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with vitamin D

Diuretics, Loop *see* Diuretics

Diuretics, Potassium-sparing and Aldosterone Antagonists *see* Diuretics

Diuretics, Thiazide and related *see* Diuretics

Dobutamine *see* Sympathomimetics

Docetaxel
Antibacterials: *in vitro* studies suggest a possible interaction between docetaxel and erythromycin (consult docetaxel product literature)
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antifungals: *in vitro* studies suggest a possible interaction between docetaxel and ketoconazole (consult docetaxel product literature)
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ciclosporin: *in vitro* studies suggest a possible interaction between docetaxel and ciclosporin (consult docetaxel product literature)
Cytotoxics: plasma concentration of docetaxel increased by sorafenib

Dolasetron *see* $5HT_3$ Antagonists

Domperidone
Analgesics: effects of domperidone on gastro-intestinal activity antagonised by opioid analgesics
- Antifungals: risk of arrhythmias with domperidone possibly increased by •ketoconazole

Antimuscarinics: effects of domperidone on gastro-intestinal activity antagonised by antimuscarinics
Dopaminergics: domperidone possibly antagonises hypoprolactinaemic effects of bromocriptine and cabergoline

Donepezil *see* Parasympathomimetics

Dopamine *see* Sympathomimetics

Dopaminergics *see* Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

Dopexamine *see* Sympathomimetics

Doripenem
Antiepileptics: doripenem possibly reduces plasma concentration of valproate
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Probenecid: excretion of doripenem reduced by probenecid (manufacturers of doripenem advise avoid concomitant use)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Dorzolamide *see* Diuretics

Dosulepin (dothiepin) *see* Antidepressants, Tricyclic

Doxapram
Antidepressants: effects of doxapram enhanced by MAOIs
Sympathomimetics: increased risk of hypertension when doxapram given with sympathomimetics
Theophylline: increased CNS stimulation when doxapram given with theophylline

Doxazosin *see* Alpha-blockers

Doxepin *see* Antidepressants, Tricyclic

Doxorubicin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Antivirals: doxorubicin possibly inhibits effects of stavudine

Doxorubicin *(continued)*
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with •ciclosporin

Cytotoxics: plasma concentration of doxorubicin possibly increased by sorafenib

Doxycycline *see* Tetracyclines

Droperidol *see* Antipsychotics

Drospirenone *see* Progestogens

Drotrecogin Alfa
- Anticoagulants: manufacturer of drotrecogin alfa advises avoid concomitant use with high doses of •heparin—consult product literature

Duloxetine
Analgesics: possible increased serotonergic effects when duloxetine given with pethidine or tramadol
- Antibacterials: metabolism of duloxetine inhibited by •ciprofloxacin—avoid concomitant use
- Antidepressants: metabolism of duloxetine inhibited by •fluvoxamine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John's wort, amitriptyline, clomipramine, •moclobemide, tryptophan or venlafaxine; duloxetine should not be started until 2 weeks after stopping •MAOIs, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start •moclobemide for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Hormone Antagonists: duloxetine possibly inhibits metabolism of •tamoxifen to active metabolite (avoid concomitant use)

$5HT_1$ Agonists: possible increased serotonergic effects when duloxetine given with $5HT_1$ agonists
- Sibutramine: increased risk of CNS toxicity when SSRI-related antidepressants given with •sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Dutasteride
Calcium-channel Blockers: plasma concentration of dutasteride increased by diltiazem and verapamil

Dydrogesterone *see* Progestogens

Edrophonium *see* Parasympathomimetics

Efavirenz
Analgesics: efavirenz reduces plasma concentration of methadone
Antibacterials: increased risk of rash when efavirenz given with clarithromycin; efavirenz reduces plasma concentration of rifabutin—increase dose of rifabutin; plasma concentration of efavirenz reduced by rifampicin—increase dose of efavirenz
- Antidepressants: plasma concentration of efavirenz reduced by •St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine
- Antifungals: efavirenz reduces plasma concentration of itraconazole and •posaconazole; efavirenz reduces plasma concentration of •voriconazole, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antipsychotics: efavirenz possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole; efavirenz possibly increases plasma concentration of •pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of •atazanavir (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of darunavir, fosamprenavir and indinavir; efavirenz possibly reduces plasma concentration of •etravirine—avoid concomitant use; efavirenz reduces plasma concentration of •lopinavir—consider increasing dose of lopinavir; efavirenz possibly

Efavirenz
- Antivirals *(continued)*
  reduces plasma concentration of ●maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nevirapine; toxicity of efavirenz increased by ritonavir, monitor liver function tests; efavirenz significantly reduces plasma concentration of saquinavir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with ●midazolam—avoid concomitant use
  Calcium-channel Blockers: efavirenz reduces plasma concentration of diltiazem
- Ciclosporin: efavirenz possibly reduces plasma concentration of ●ciclosporin
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with ●ergot alkaloids—avoid concomitant use
  Grapefruit Juice: plasma concentration of efavirenz possibly increased by grapefruit juice
  Lipid-regulating Drugs: efavirenz reduces plasma concentration of atorvastatin, pravastatin and simvastatin
  Oestrogens: efavirenz possibly reduces contraceptive effect of oestrogens
- Tacrolimus: efavirenz possibly affects plasma concentration of ●tacrolimus

Eletriptan *see* 5HT$_1$ Agonists

Emtricitabine
  Antivirals: manufacturer of emtricitabine advises avoid concomitant use with lamivudine

Enalapril *see* ACE Inhibitors

Enoxaparin *see* Heparins

Enoximone *see* Phosphodiesterase Inhibitors

Entacapone
- Anticoagulants: entacapone enhances anticoagulant effect of ●warfarin
- Antidepressants: manufacturer of entacapone advises caution with moclobemide, paroxetine, tricyclics and venlafaxine; avoid concomitant use of entacapone with non-selective ●MAOIs
  Dopaminergics: entacapone possibly enhances effects of apomorphine; entacapone possibly reduces plasma concentration of rasagiline; manufacturer of entacapone advises max. dose of 10 mg selegiline if used concomitantly
  Iron: absorption of entacapone reduced by *oral* iron
  Memantine: effects of dopaminergics possibly enhanced by memantine
  Methyldopa: entacapone possibly enhances effects of methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
  Sympathomimetics: entacapone possibly enhances effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine)

Enteral Foods
- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of ●coumarins and ●phenindione
  Antiepileptics: enteral feeds possibly reduce absorption of phenytoin

Ephedrine *see* Sympathomimetics

Epinephrine (adrenaline) *see* Sympathomimetics

Epirubicin
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by ●cimetidine

Eplerenone *see* Diuretics

Eprosartan *see* Angiotensin-II Receptor Antagonists

Eptifibatide
  Iloprost: increased risk of bleeding when eptifibatide given with iloprost

Ergometrine *see* Ergot Alkaloids

Ergot Alkaloids
  Anaesthetics, General: effects of ergometrine on the parturient uterus reduced by halothane
- Antibacterials: increased risk of ergotism when ergotamine and methysergide given with ●macrolides or ●telithromycin—avoid concomitant use; avoidance of ergotamine and methysergide advised by manufacturer of ●quinupristin/dalfopristin; increased risk of ergotism when ergotamine and methysergide given with tetracyclines
  Antidepressants: possible risk of hypertension when ergotamine and methysergide given with reboxetine
- Antifungals: increased risk of ergotism when ergotamine and methysergide given with ●imidazoles or ●triazoles—avoid concomitant use
- Antivirals: plasma concentration of ergot alkaloids possibly increased by ●atazanavir—avoid concomitant use; increased risk of ergotism when ergot alkaloids given with ●efavirenz—avoid concomitant use; increased risk of ergotism when ergotamine and methysergide given with ●fosamprenavir, ●indinavir, ●nelfinavir, ●ritonavir or ●saquinavir—avoid concomitant use
  Beta-blockers: increased peripheral vasoconstriction when ergotamine and methysergide given with beta-blockers
- 5HT$_1$ Agonists: increased risk of vasospasm when ergotamine and methysergide given with ●almotriptan, ●rizatriptan, ●sumatriptan or ●zolmitriptan (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide); increased risk of vasospasm when ergotamine and methysergide given with ●eletriptan or ●frovatriptan (avoid ergotamine and methysergide for 24 hours after eletriptan or frovatriptan, avoid eletriptan or frovatriptan for 24 hours after ergotamine and methysergide); avoid concomitant use of ergotamine and methysergide with ●naratriptan
  Sympathomimetics: increased risk of ergotism when ergotamine and methysergide given with sympathomimetics
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine and methysergide given with ●cimetidine—avoid concomitant use

Ergotamine and Methysergide *see* Ergot Alkaloids

Erlotinib
- Analgesics: increased risk of bleeding when erlotinib given with ●NSAIDs
  Antibacterials: metabolism of erlotinib accelerated by rifampicin (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with ●coumarins
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
  Antifungals: metabolism of erlotinib inhibited by ketoconazole (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
  Cytotoxics: plasma concentration of erlotinib possibly increased by capecitabine
  Tobacco: plasma concentration of erlotinib reduced by tobacco smoking

Ertapenem
  Antiepileptics: ertapenem possibly reduces plasma concentration of valproate
  Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Erythromycin *see* Macrolides

Escitalopram *see* Antidepressants, SSRI

Esmolol *see* Beta-blockers

Esomeprazole *see* Proton Pump Inhibitors

Estradiol *see* Oestrogens

Estramustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by •sodium clodronate

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Estriol *see* Oestrogens

Estrone *see* Oestrogens

Estropipate *see* Oestrogens

Etanercept

Abatacept: increased risk of side-effects when etanercept given with abatacept

- Anakinra: increased risk of side-effects when etanercept given with •anakinra—avoid concomitant use
- Vaccines: avoid concomitant use of etanercept with live •vaccines (see p. 669)

Ethinylestradiol *see* Oestrogens

Ethosuximide

- Antibacterials: metabolism of ethosuximide inhibited by •isoniazid (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by carbamazepine and primidone; plasma concentration of ethosuximide possibly reduced by •phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of ethosuximide antagonised by •antipsychotics (convulsive threshold lowered)

Barbiturates: plasma concentration of ethosuximide possibly reduced by phenobarbital

Etodolac *see* NSAIDs

Etomidate *see* Anaesthetics, General

Etonogestrel *see* Progestogens

Etoposide

- Anticoagulants: etoposide possibly enhances anticoagulant effect of •coumarins

Antiepileptics: plasma concentration of etoposide possibly reduced by phenytoin; cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Barbiturates: plasma concentration of etoposide possibly reduced by phenobarbital

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Ciclosporin: plasma concentration of etoposide possibly increased by ciclosporin (increased risk of toxicity)

Etoricoxib *see* NSAIDs

Etravirine

- Antibacterials: plasma concentration of etravirine increased by •clarithromycin, also plasma concentration of clarithromycin reduced; plasma concentration of both drugs reduced when etravirine given with •rifabutin; manufacturer of etravirine advises avoid concomitant use with rifampicin

Antidepressants: manufacturer of etravirine advises avoid concomitant use with St John's wort

Antiepileptics: manufacturer of etravirine advises avoid concomitant use with carbamazepine and phenytoin

Etravirine *(continued)*

- Antivirals: plasma concentration of etravirine possibly reduced by •efavirenz and •nevirapine—avoid concomitant use; etravirine increases plasma concentration of •fosamprenavir (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of •indinavir—avoid concomitant use; etravirine possibly reduces plasma concentration of maraviroc; etravirine possibly increases plasma concentration of nelfinavir—avoid concomitant use; plasma concentration of etravirine reduced by •tipranavir, also plasma concentration of tipranavir increased (avoid concomitant use)

Barbiturates: manufacturer of etravirine advises avoid concomitant use with phenobarbital

Cardiac Glycosides: etravirine increases plasma concentration of digoxin

Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of atorvastatin

Sildenafil: etravirine reduces plasma concentration of sildenafil

Etynodiol *see* Progestogens

Exemestane

Antibacterials: plasma concentration of exemestane possibly reduced by rifampicin

Ezetimibe

Anticoagulants: ezetimibe possibly enhances anticoagulant effect of coumarins

- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with •ciclosporin

Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when ezetimibe given with fibrates—discontinue if suspected

Famciclovir

Probenecid: excretion of famciclovir possibly reduced by probenecid (increased plasma concentration)

Famotidine *see* Histamine H_2-antagonists

Felodipine *see* Calcium-channel Blockers

Fenbufen *see* NSAIDs

Fenofibrate *see* Fibrates

Fenoprofen *see* NSAIDs

Fenoterol *see* Sympathomimetics, $Beta_2$

Fentanyl *see* Opioid Analgesics

Ferrous Salts *see* Iron

Fesoterodine *see* Antimuscarinics

Fexofenadine *see* Antihistamines

Fibrates

- Antibacterials: increased risk of myopathy when fibrates given with •daptomycin (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of •coumarins and •phenindione
- Antidiabetics: gemfibrozil increases plasma concentration of •rosiglitazone (consider reducing dose of rosiglitazone); fibrates may improve glucose tolerance and have an additive effect with insulin or sulphonylureas; gemfibrozil possibly enhances hypoglycaemic effect of nateglinide; increased risk of severe hypoglycaemia when gemfibrozil given with •repaglinide—avoid concomitant use

Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with ciclosporin

- Cytotoxics: gemfibrozil increases plasma concentration of •bexarotene—avoid concomitant use
- Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; increased risk of myopathy when fibrates given with •statins; increased risk of myopathy when gemfibrozil given with •statins (preferably avoid concomitant use)

Filgrastim

Note Pegfilgrastim interactions as for filgrastim

Cytotoxics: neutropenia possibly exacerbated when filgrastim given with fluorouracil

Flavoxate *see* Antimuscarinics

Flecainide

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Flecainide *(continued)*
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●anti-arrhythmics; plasma concentration of flecainide increased by ●amiodarone (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by fluoxetine; increased risk of ventricular arrhythmias when flecainide given with ●tricyclics
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with ●mizolastine—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of ●artemether/lumefantrine (risk of ventricular arrhythmias); plasma concentration of flecainide increased by ●quinine
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with ●tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●antipsychotics that prolong the QT interval; increased risk of arrhythmias when flecainide given with ●clozapine
- Antivirals: plasma concentration of flecainide possibly increased by ●fosamprenavir, ●indinavir, ●lopinavir and ●ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with ●beta-blockers; increased myocardial depression when anti-arrhythmics given with ●beta-blockers
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with ●verapamil
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with ●acetazolamide, ●loop diuretics or ●thiazides and related diuretics
- $5HT_3$ Antagonists: increased risk of ventricular arrhythmias when flecainide given with ●dolasetron—avoid concomitant use

Ulcer-healing Drugs: metabolism of flecainide inhibited by cimetidine (increased plasma concentration)

Flucloxacillin *see* Penicillins

Fluconazole *see* Antifungals, Triazole

Flucytosine

Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by amphotericin (toxicity possibly increased)

Cytotoxics: plasma concentration of flucytosine possibly reduced by cytarabine

Fludarabine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: fludarabine increases intracellular concentration of cytarabine; increased pulmonary toxicity when fludarabine given with ●pentostatin (unacceptably high incidence of fatalities)

Dipyridamole: effects of fludarabine possibly reduced by dipyridamole

Fludrocortisone *see* Corticosteroids

Flunisolide *see* Corticosteroids

Fluorides

Calcium Salts: absorption of fluorides reduced by calcium salts

Fluorouracil

Note Capecitabine is a prodrug of fluorouracil

Note Tegafur is a prodrug of fluorouracil
- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with ●allopurinol

Antibacterials: metabolism of fluorouracil inhibited by metronidazole (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of ●coumarins

Antiepileptics: fluorouracil possibly inhibits metabolism of phenytoin (increased risk of toxicity); cytotoxics possibly reduce absorption of phenytoin

Fluorouracil *(continued)*
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: capecitabine possibly increases plasma concentration of erlotinib

Filgrastim: neutropenia possibly exacerbated when fluorouracil given with filgrastim
- Temoporfin: increased skin photosensitivity when topical fluorouracil used with ●temoporfin

Ulcer-healing Drugs: metabolism of fluorouracil inhibited by cimetidine (increased plasma concentration)

Fluoxetine *see* Antidepressants, SSRI

Flupentixol *see* Antipsychotics

Fluphenazine *see* Antipsychotics

Flurazepam *see* Anxiolytics and Hypnotics

Flurbiprofen *see* NSAIDs

Flutamide
- Anticoagulants: flutamide enhances anticoagulant effect of ●coumarins

Fluticasone *see* Corticosteroids

Fluvastatin *see* Statins

Fluvoxamine *see* Antidepressants, SSRI

Folates

Aminosalicylates: absorption of folic acid possibly reduced by sulfasalazine

Antiepileptics: folates possibly reduce plasma concentration of phenytoin and primidone

Barbiturates: folates possibly reduce plasma concentration of phenobarbital

Folic Acid *see* Folates

Folinic Acid *see* Folates

Formoterol (eformoterol) *see* Sympathomimetics, $Beta_2$

Fosamprenavir

Note Fosamprenavir is a prodrug of amprenavir

Analgesics: fosamprenavir reduces plasma concentration of methadone

Antacids: absorption of fosamprenavir possibly reduced by antacids
- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of ●amiodarone, ●flecainide and ●propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ●lidocaine (lignocaine)—avoid concomitant use
- Antibacterials: plasma concentration of both drugs increased when fosamprenavir given with erythromycin; fosamprenavir increases plasma concentration of ●rifabutin (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by ●rifampicin—avoid concomitant use; fosamprenavir possibly increases plasma concentration of dapsone; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin

Anticoagulants: fosamprenavir may enhance or reduce anticoagulant effect of coumarins; avoidance of fosamprenavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of fosamprenavir reduced by ●St John's wort—avoid concomitant use; fosamprenavir possibly increases side-effects of tricyclics

Antiepileptics: plasma concentration of fosamprenavir possibly reduced by carbamazepine and phenytoin

Antifungals: fosamprenavir increases plasma concentration of ketoconazole; fosamprenavir possibly increases plasma concentration of itraconazole

Antihistamines: fosamprenavir possibly increases plasma concentration of loratadine

Antimalarials: caution with fosamprenavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of darifenacin and tolterodine
- Antipsychotics: fosamprenavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripi-

Fosamprenavir
- Antipsychotics *(continued)*
  prazole); fosamprenavir possibly increases plasma concentration of clozapine; fosamprenavir increases plasma concentration of •pimozide and •sertindole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of fosamprenavir reduced by efavirenz and •tipranavir; plasma concentration of fosamprenavir increased by •etravirine (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by nevirapine
- Anxiolytics and Hypnotics: increased risk of prolonged sedation and respiratory depression when fosamprenavir given with •alprazolam, clonazepam, •diazepam, •flurazepam or •midazolam

  Barbiturates: plasma concentration of fosamprenavir possibly reduced by phenobarbital
- Cilostazol: fosamprenavir possibly increases plasma concentration of •cilostazol—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with •ergotamine and methysergide—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with •rosuvastatin or •simvastatin—avoid concomitant use

  Oestrogens: fosamprenavir increases plasma concentration of oestrogens, also plasma concentration of fosamprenavir reduced—alternative contraception recommended

  Progestogens: fosamprenavir increases plasma concentration of progestogens, also plasma concentration of fosamprenavir reduced—alternative contraception recommended
- Ranolazine: fosamprenavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Sildenafil: fosamprenavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil

  Tadalafil: fosamprenavir possibly increases plasma concentration of tadalafil

  Ulcer-healing Drugs: fosamprenavir possibly increases plasma concentration of cimetidine

  Vardenafil: fosamprenavir possibly increases plasma concentration of vardenafil

Fosaprepitant *see* Aprepitant

Foscarnet

Antivirals: avoidance of foscarnet advised by manufacturer of lamivudine

Fosinopril *see* ACE Inhibitors

Fosphenytoin *see* Phenytoin

Framycetin *see* Aminoglycosides

Frovatriptan *see* 5HT$_1$ Agonists

Furosemide (frusemide) *see* Diuretics

Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with •ritonavir—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fusidic acid given with atorvastatin; increased risk of myopathy when fusidic acid given with •simvastatin

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Sugammadex: fusidic acid possibly reduces response to sugammadex

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Gabapentin

Analgesics: bioavailability of gabapentin increased by morphine

Gabapentin *(continued)*

Antacids: absorption of gabapentin reduced by antacids
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

Galantamine *see* Parasympathomimetics

Ganciclovir

Note Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature

Note Valganciclovir interactions as for ganciclovir
- Antibacterials: increased risk of convulsions when ganciclovir given with •imipenem with cilastatin
- Antivirals: ganciclovir possibly increases plasma concentration of didanosine; avoidance of intravenous ganciclovir advised by manufacturer of lamivudine; profound myelosuppression when ganciclovir given with •zidovudine (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)

Mycophenolate: plasma concentration of ganciclovir possibly increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Probenecid: excretion of ganciclovir reduced by probenecid (increased plasma concentration and risk of toxicity)

Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus

Gemcitabine

Anticoagulants: gemcitabine possibly enhances anticoagulant effect of warfarin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Gemeprost *see* Prostaglandins

Gemfibrozil *see* Fibrates

Gentamicin *see* Aminoglycosides

Gestodene *see* Progestogens

Gestrinone

Antibacterials: metabolism of gestrinone accelerated by rifampicin (reduced plasma concentration)

Antiepileptics: metabolism of gestrinone accelerated by carbamazepine, phenytoin and primidone (reduced plasma concentration)

Barbiturates: metabolism of gestrinone accelerated by barbiturates (reduced plasma concentration)

Glibenclamide *see* Antidiabetics

Gliclazide *see* Antidiabetics

Glimepiride *see* Antidiabetics

Glipizide *see* Antidiabetics

Glucosamine
- Anticoagulants: glucosamine enhances anticoagulant effect of •warfarin (avoid concomitant use)

Glyceryl Trinitrate *see* Nitrates

Glycopyrronium *see* Antimuscarinics

Gold

Penicillamine: avoidance of gold advised by manufacturer of penicillamine (increased risk of toxicity)

Grapefruit Juice

Anti-arrhythmics: grapefruit juice increases plasma concentration of amiodarone

Antimalarials: grapefruit juice possibly increases plasma concentration of artemether/lumefantrine

Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz

Anxiolytics and Hypnotics: grapefruit juice increases plasma concentration of buspirone

Grapefruit Juice *(continued)*
Calcium-channel Blockers: grapefruit juice increases plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil
- Ciclosporin: grapefruit juice increases plasma concentration of •ciclosporin (increased risk of toxicity)
- Cytotoxics: avoidance of grapefruit juice advised by manufacturer of •lapatinib and •nilotinib
Ivabradine: grapefruit juice increases plasma concentration of ivabradine
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of atorvastatin; grapefruit juice increases plasma concentration of •simvastatin—avoid concomitant use
- Ranolazine: grapefruit juice possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use
Sildenafil: grapefruit juice possibly increases plasma concentration of sildenafil
- Sirolimus: grapefruit juice increases plasma concentration of •sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of •tacrolimus
Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil
- Vardenafil: grapefruit juice possibly increases plasma concentration of •vardenafil—avoid concomitant use

Griseofulvin
Alcohol: griseofulvin possibly enhances effects of alcohol
- Anticoagulants: griseofulvin reduces anticoagulant effect of •coumarins
Antiepileptics: absorption of griseofulvin reduced by primidone (reduced effect)
Barbiturates: absorption of griseofulvin reduced by phenobarbital (reduced effect)
Ciclosporin: griseofulvin possibly reduces plasma concentration of ciclosporin
- Oestrogens: griseofulvin accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: griseofulvin accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 445)

Guanethidine *see* Adrenergic Neurone Blockers

Haloperidol *see* Antipsychotics

Halothane *see* Anaesthetics, General

Heparin *see* Heparins

Heparins
ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors
Aliskiren: increased risk of hyperkalaemia when heparins given with aliskiren
- Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous •diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with •ketorolac (avoid concomitant use, including low-dose heparin); anticoagulant effect of heparins enhanced by •aspirin
Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparin given with angiotensin-II receptor antagonists
Clopidogrel: increased risk of bleeding when heparins given with clopidogrel
Dipyridamole: anticoagulant effect of heparins enhanced by dipyridamole
- Drotrecogin Alfa: avoidance of concomitant use of high doses of heparin with drotrecogin alfa advised by manufacturer of •drotrecogin alfa—consult product literature
Iloprost: anticoagulant effect of heparins possibly enhanced by iloprost
- Nitrates: anticoagulant effect of heparins reduced by infusion of •glyceryl trinitrate
Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine

Histamine H_2-antagonists
- Alpha-blockers: cimetidine and ranitidine antagonise effects of •tolazoline
Analgesics: cimetidine possibly increases plasma concentration of azapropazone; cimetidine inhibits metabolism of opioid analgesics (increased plasma concentration)
- Anti-arrhythmics: cimetidine increases plasma concentration of amiodarone and •propafenone; cimetidine inhibits metabolism of flecainide (increased plasma concentration); cimetidine increases plasma concentration of •lidocaine (lignocaine) (increased risk of toxicity)
Antibacterials: histamine H_2-antagonists reduce absorption of cefpodoxime; cimetidine increases plasma concentration of erythromycin (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of metronidazole (increased plasma concentration); metabolism of cimetidine accelerated by rifampicin (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of •coumarins (enhanced anticoagulant effect)
Antidepressants: cimetidine increases plasma concentration of citalopram, escitalopram, mirtazapine and sertraline; cimetidine inhibits metabolism of amitriptyline, doxepin, imipramine and nortriptyline (increased plasma concentration); cimetidine increases plasma concentration of moclobemide (halve dose of moclobemide); cimetidine possibly increases plasma concentration of tricyclics
Antidiabetics: cimetidine reduces excretion of metformin (increased plasma concentration); cimetidine enhances hypoglycaemic effect of sulphonylureas
- Antiepileptics: cimetidine inhibits metabolism of •carbamazepine, •phenytoin and •valproate (increased plasma concentration)
- Antifungals: histamine H_2-antagonists reduce absorption of itraconazole and ketoconazole; cimetidine reduces plasma concentration of •posaconazole; cimetidine increases plasma concentration of terbinafine
Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of loratadine
- Antimalarials: avoidance of cimetidine advised by manufacturer of •artemether/lumefantrine; cimetidine inhibits metabolism of chloroquine and hydroxychloroquine and quinine (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of antipsychotics, chlorpromazine and clozapine; increased risk of ventricular arrhythmias when cimetidine given with •sertindole—avoid concomitant use
Antivirals: histamine H_2-antagonists possibly reduce plasma concentration of atazanavir; plasma concentration of cimetidine possibly increased by fosamprenavir; histamine H_2-antagonists possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; cimetidine possibly increases plasma concentration of saquinavir
Anxiolytics and Hypnotics: cimetidine inhibits metabolism of benzodiazepines, clomethiazole and zaleplon (increased plasma concentration); cimetidine increases plasma concentration of melatonin
Beta-blockers: cimetidine increases plasma concentration of labetalol, metoprolol and propranolol
Calcium-channel Blockers: cimetidine possibly inhibits metabolism of calcium-channel blockers (increased plasma concentration); cimetidine increases plasma concentration of isradipine (halve dose of isradipine)
- Ciclosporin: cimetidine possibly increases plasma concentration of •ciclosporin
- Cilostazol: cimetidine possibly increases plasma concentration of •cilostazol—avoid concomitant use
- Cytotoxics: cimetidine possibly enhances myelosuppressive effects of carmustine and lomustine; cime-

Histamine H_2-antagonists

- Cytotoxics *(continued)*
  tidine increases plasma concentration of ●epirubicin; cimetidine inhibits metabolism of fluorouracil (increased plasma concentration); famotidine possibly reduces plasma concentration of dasatinib; histamine H_2-antagonists possibly reduce absorption of lapatinib; avoidance of histamine H_2-antagonists advised by manufacturer of nilotinib
  Dopaminergics: cimetidine reduces excretion of pramipexole (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with ●ergotamine and methysergide—avoid concomitant use
  Hormone Antagonists: absorption of cimetidine possibly delayed by octreotide
  $5HT_1$ Agonists: cimetidine inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
  Mebendazole: cimetidine possibly inhibits metabolism of mebendazole (increased plasma concentration)
  Sildenafil: cimetidine increases plasma concentration of sildenafil (reduce initial dose of sildenafil)
- Theophylline: cimetidine inhibits metabolism of ●theophylline (increased plasma concentration)
  Thyroid Hormones: cimetidine reduces absorption of levothyroxine (thyroxine)

Homatropine *see* Antimuscarinics

Hormone Antagonists *see* Bicalutamide, Danazol, Dutasteride, Exemestane, Flutamide, Gestrinone, Lanreotide, Octreotide, Tamoxifen, Toremifene, and Trilostane

$5HT_1$ Agonists

- Antibacterials: plasma concentration of eletriptan increased by ●clarithromycin and ●erythromycin (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by quinolones (reduce dose of zolmitriptan)
- Antidepressants: increased risk of CNS toxicity when sumatriptan given with ●citalopram, ●escitalopram, ●fluoxetine, ●fluvoxamine or ●paroxetine; metabolism of frovatriptan inhibited by fluvoxamine; metabolism of zolmitriptan possibly inhibited by fluvoxamine (reduce dose of zolmitriptan); increased risk of CNS toxicity when sumatriptan given with ●sertraline (manufacturer of sertraline advises avoid concomitant use); possible increased serotonergic effects when $5HT_1$ agonists given with duloxetine; risk of CNS toxicity when rizatriptan or sumatriptan given with ●MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when zolmitriptan given with ●MAOIs; risk of CNS toxicity when rizatriptan or sumatriptan given with ●moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when zolmitriptan given with ●moclobemide (reduce dose of zolmitriptan); possible increased serotonergic effects when frovatriptan given with SSRIs; increased serotonergic effects when $5HT_1$ agonists given with ●St John's wort—avoid concomitant use
- Antifungals: plasma concentration of eletriptan increased by ●itraconazole and ●ketoconazole (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by ketoconazole (increased risk of toxicity)
- Antivirals: plasma concentration of eletriptan increased by ●indinavir, ●nelfinavir and ●ritonavir (risk of toxicity)—avoid concomitant use
  Beta-blockers: plasma concentration of rizatriptan increased by propranolol (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ergot Alkaloids: increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ●ergotamine and methysergide (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide); avoid concomitant use of naratriptan with ●ergotamine and methysergide; increased risk of vasospasm when eletriptan or frovatriptan given with ●ergotamine and methysergide (avoid ergotamine and methysergide for 24 hours after eletriptan or frovatriptan, avoid eletriptan or frovatriptan for 24 hours after ergotamine and methysergide)
  Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by cimetidine (reduce dose of zolmitriptan)

$5HT_3$ Antagonists

Analgesics: ondansetron possibly antagonises effects of tramadol

- Anti-arrhythmics: increased risk of ventricular arrhythmias when dolasetron given with ●amiodarone, ●disopyramide, ●flecainide, ●lidocaine (lignocaine) or ●propafenone—avoid concomitant use

Antibacterials: metabolism of ondansetron accelerated by rifampicin (reduced effect)
Antiepileptics: metabolism of ondansetron accelerated by carbamazepine and phenytoin (reduced effect)

- Beta-blockers: increased risk of ventricular arrhythmias when dolasetron given with ●sotalol—avoid concomitant use

Hydralazine *see* Vasodilator Antihypertensives

Hydrochlorothiazide *see* Diuretics

Hydrocortisone *see* Corticosteroids

Hydroflumethiazide *see* Diuretics

Hydromorphone *see* Opioid Analgesics

Hydrotalcite *see* Antacids

Hydroxocobalamin

Antibacterials: response to hydroxocobalamin reduced by chloramphenicol

Hydroxycarbamide

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: increased risk of toxicity when hydroxycarbamide given with ●didanosine and ●stavudine—avoid concomitant use

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Hydroxychloroquine *see* Chloroquine and Hydroxychloroquine

Hydroxyzine *see* Antihistamines

Hyoscine *see* Antimuscarinics

Ibandronic Acid *see* Bisphosphonates

Ibuprofen *see* NSAIDs

Ifosfamide

- Anticoagulants: ifosfamide possibly enhances anticoagulant effect of ●coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Iloprost

Analgesics: increased risk of bleeding when iloprost given with NSAIDs or aspirin
Anticoagulants: iloprost possibly enhances anticoagulant effect of coumarins and heparins; increased risk of bleeding when iloprost given with phenindione
Clopidogrel: increased risk of bleeding when iloprost given with clopidogrel
Eptifibatide: increased risk of bleeding when iloprost given with eptifibatide
Tirofiban: increased risk of bleeding when iloprost given with tirofiban

Imatinib

- Antibacterials: plasma concentration of imatinib reduced by ●rifampicin—avoid concomitant use

Imatinib *(continued)*
Anticoagulants: manufacturer of imatinib advises replacement of warfarin with a heparin (possibility of enhanced warfarin effect)
- Antidepressants: plasma concentration of imatinib reduced by ●St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of imatinib reduced by ●carbamazepine, ●oxcarbazepine and ●phenytoin—avoid concomitant use; cytotoxics possibly reduce absorption of phenytoin

Antifungals: plasma concentration of imatinib increased by ketoconazole
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ciclosporin: imatinib possibly increases plasma concentration of ciclosporin
Lipid-regulating Drugs: imatinib increases plasma concentration of simvastatin
Thyroid Hormones: imatinib possibly reduces plasma concentration of levothyroxine (thyroxine)

Imidapril *see* ACE Inhibitors

Imipenem with Cilastatin
Antiepileptics: imipenem with cilastatin reduces plasma concentration of valproate
- Antivirals: increased risk of convulsions when imipenem with cilastatin given with ●ganciclovir

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Imipramine *see* Antidepressants, Tricyclic

Immunoglobulins
Note For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 690

Indapamide *see* Diuretics

Indinavir
- Anti-arrhythmics: indinavir possibly increases plasma concentration of ●amiodarone—avoid concomitant use; indinavir possibly increases plasma concentration of ●flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of ●rifabutin—avoid concomitant use; metabolism of indinavir accelerated by ●rifampicin (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin

Anticoagulants: avoidance of indinavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of indinavir reduced by ●St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by ●carbamazepine and ●phenytoin, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by ●primidone
- Antifungals: plasma concentration of indinavir increased by ●itraconazole and ●ketoconazole (consider reducing dose of indinavir)

Antimalarials: caution with indinavir advised by manufacturer of artemether/lumefantrine
Antimuscarinics: avoidance of indinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when indinavir given with fesoterodine—consult fesoterodine product literature
- Antipsychotics: indinavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); indinavir possibly increases plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir increases plasma concentration of ●sertindole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoid concomitant use of indinavir with ●atazanavir; plasma concentration of both drugs

Indinavir
- Antivirals *(continued)*
increased when indinavir given with darunavir; plasma concentration of indinavir reduced by efavirenz and nevirapine; plasma concentration of indinavir possibly reduced by ●etravirine—avoid concomitant use; indinavir increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); combination of indinavir with nelfinavir may increase plasma concentration of either drug (or both); plasma concentration of indinavir increased by ritonavir; indinavir increases plasma concentration of saquinavir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with ●alprazolam—avoid concomitant use; indinavir possibly increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)

Atovaquone: plasma concentration of indinavir possibly reduced by atovaquone
- Barbiturates: plasma concentration of indinavir possibly reduced by ●barbiturates; plasma concentration of indinavir possibly reduced by ●phenobarbital, also plasma concentration of phenobarbital possibly increased
- Ciclosporin: indinavir increases plasma concentration of ●ciclosporin
- Cilostazol: indinavir possibly increases plasma concentration of ●cilostazol—avoid concomitant use

Corticosteroids: plasma concentration of indinavir possibly reduced by dexamethasone
- Ergot Alkaloids: increased risk of ergotism when indinavir given with ●ergotamine and methysergide—avoid concomitant use
- 5HT$_1$ Agonists: indinavir increases plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with atorvastatin; possible increased risk of myopathy when indinavir given with ●rosuvastatin—avoid concomitant use; increased risk of myopathy when indinavir given with ●simvastatin (avoid concomitant use)
- Ranolazine: indinavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: indinavir increases plasma concentration of ●sildenafil—reduce initial dose of sildenafil

Tadalafil: indinavir possibly increases plasma concentration of tadalafil
- Vardenafil: indinavir increases plasma concentration of ●vardenafil—avoid concomitant use

Indometacin *see* NSAIDs

Indoramin *see* Alpha-blockers

Infliximab
Abatacept: increased risk of side-effects when infliximab given with abatacept
- Anakinra: avoid concomitant use of infliximab with ●anakinra
- Vaccines: avoid concomitant use of infliximab with live ●vaccines (see p. 669)

Influenza Vaccine *see* Vaccines

Insulin *see* Antidiabetics

Interferon Alfa *see* Interferons

Interferon Gamma *see* Interferons

Interferons
Note Peginterferon alfa interactions as for interferon alfa
- Antivirals: increased risk of peripheral neuropathy when interferon alfa given with ●telbivudine

Theophylline: interferon alfa inhibits metabolism of theophylline (increased plasma concentration)
Vaccines: manufacturer of interferon gamma advises avoid concomitant use with vaccines

Ipratropium *see* Antimuscarinics

Irbesartan *see* Angiotensin-II Receptor Antagonists

Irinotecan
- Antidepressants: metabolism of irinotecan accelerated by •St John's wort (reduced plasma concentration—avoid concomitant use)

Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by carbamazepine and phenytoin; cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of irinotecan reduced by •ketoconazole (but concentration of active metabolite of irinotecan increased)—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by •atazanavir (increased risk of toxicity)

Barbiturates: plasma concentration of irinotecan and its active metabolite reduced by phenobarbital

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: plasma concentration of irinotecan possibly increased by sorafenib

Iron

Antacids: absorption of *oral* iron reduced by oral magnesium salts (as magnesium trisilicate)

Antibacterials: *oral* iron reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; *oral* iron reduces absorption of tetracyclines, also absorption of *oral* iron reduced by tetracyclines

Bisphosphonates: *oral* iron reduces absorption of bisphosphonates

Calcium Salts: absorption of *oral* iron reduced by calcium salts
- Dimercaprol: avoid concomitant use of iron with •dimercaprol

Dopaminergics: *oral* iron reduces absorption of entacapone; *oral* iron possibly reduces absorption of levodopa

Methyldopa: *oral* iron antagonises hypotensive effect of methyldopa

Mycophenolate: *oral* iron reduces absorption of mycophenolate

Penicillamine: *oral* iron reduces absorption of penicillamine

Thyroid Hormones: *oral* iron reduces absorption of levothyroxine (thyroxine) (give at least 2 hours apart)

Trientine: absorption of *oral* iron reduced by trientine

Zinc: *oral* iron reduces absorption of zinc, also absorption of *oral* iron reduced by zinc

Isocarboxazid *see* MAOIs

Isoflurane *see* Anaesthetics, General

Isometheptene *see* Sympathomimetics

Isoniazid

Anaesthetics, General: hepatotoxicity of isoniazid possibly potentiated by general anaesthetics

Antacids: absorption of isoniazid reduced by antacids

Antibacterials: increased risk of CNS toxicity when isoniazid given with cycloserine
- Antiepileptics: isoniazid increases plasma concentration of •carbamazepine (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of •ethosuximide (increased plasma concentration and risk of toxicity); isoniazid inhibits metabolism of •phenytoin (increased plasma concentration)

Antifungals: isoniazid possibly reduces plasma concentration of ketoconazole

Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of diazepam

Corticosteroids: plasma concentration of isoniazid possibly reduced by corticosteroids

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Theophylline: isoniazid possibly increases plasma concentration of theophylline

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Isosorbide Dinitrate *see* Nitrates

Isosorbide Mononitrate *see* Nitrates

Isotretinoin *see* Retinoids

Isradipine *see* Calcium-channel Blockers

Itraconazole *see* Antifungals, Triazole

Ivabradine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with •amiodarone or •dispyramide
- Antibacterials: plasma concentration of ivabradine possibly increased by •clarithromycin and •telithromycin—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with •erythromycin—avoid concomitant use

Antidepressants: plasma concentration of ivabradine reduced by St John's wort—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by •ketoconazole—avoid concomitant use; plasma concentration of ivabradine increased by fluconazole—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by •itraconazole—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with •mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with •pimozide or •sertindole
- Antivirals: plasma concentration of ivabradine possibly increased by •nelfinavir and •ritonavir—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with •sotalol
- Calcium-channel Blockers: plasma concentration of ivabradine increased by •diltiazem and •verapamil—avoid concomitant use

Grapefruit Juice: plasma concentration of ivabradine increased by grapefruit juice
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when ivabradine given with •pentamidine isetionate

Kaolin

Analgesics: kaolin possibly reduces absorption of aspirin

Antibacterials: kaolin possibly reduces absorption of tetracyclines

Antimalarials: kaolin reduces absorption of chloroquine and hydroxychloroquine

Antipsychotics: kaolin possibly reduces absorption of phenothiazines

Ketamine *see* Anaesthetics, General

Ketoconazole *see* Antifungals, Imidazole

Ketoprofen *see* NSAIDs

Ketorolac *see* NSAIDs

Ketotifen *see* Antihistamines

Labetalol *see* Beta-blockers

Lacidipine *see* Calcium-channel Blockers

Lacosamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

Lactulose

Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins

Lamivudine

Antibacterials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole

Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine; manufacturer of lamivudine advises avoid concomitant use with foscarnet;

Lamivudine
Antivirals *(continued)*
manufacturer of lamivudine advises avoid concomitant use of intravenous ganciclovir

Lamotrigine
- Antibacterials: plasma concentration of lamotrigine reduced by ●rifampicin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort

Antiepileptics: plasma concentration of lamotrigine often reduced by carbamazepine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by phenytoin and primidone; plasma concentration of lamotrigine increased by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine

Barbiturates: plasma concentration of lamotrigine reduced by phenobarbital
- Oestrogens: plasma concentration of lamotrigine reduced by ●oestrogens
- Progestogens: plasma concentration of lamotrigine reduced by ●progestogens

Lanreotide
Antidiabetics: lanreotide possibly reduces requirements for insulin, metformin, repaglinide and sulphonylureas
Ciclosporin: lanreotide reduces plasma concentration of ciclosporin

Lansoprazole *see* Proton Pump Inhibitors

Lanthanum
Antifungals: lanthanum possibly reduces absorption of ketoconazole (give at least 2 hours apart)
Antimalarials: lanthanum possibly reduces absorption of chloroquine and hydroxychloroquine (give at least 2 hours apart)

Lapatinib
- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with ●rifabutin, ●rifampicin and ●telithromycin
- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with ●St John's wort
- Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with ●repaglinide
- Antiepileptics: plasma concentration of lapatinib reduced by ●carbamazepine—avoid concomitant use; cytotoxics possibly reduce absorption of phenytoin; manufacturer of lapatinib advises avoid concomitant use with ●phenytoin
- Antifungals: plasma concentration of lapatinib increased by ●ketoconazole—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ●itraconazole, ●posaconazole and ●voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with ●pimozide
- Antivirals: manufacturer of lapatinib advises avoid concomitant use with ●ritonavir and ●saquinavir

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with ●grapefruit juice

Ulcer-healing Drugs: absorption of lapatinib possibly reduced by histamine H_2-antagonists and proton pump inhibitors

Laronidase
Antimalarials: effects of laronidase possibly inhibited by chloroquine and hydroxychloroquine (manufacturer of laronidase advises avoid concomitant use)

Leflunomide
Note Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by rifampicin
Anticoagulants: leflunomide possibly enhances anticoagulant effect of warfarin
Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of tolbutamide
Antiepileptics: leflunomide possibly increases plasma concentration of phenytoin
- Cytotoxics: risk of toxicity when leflunomide given with ●methotrexate

Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: avoid concomitant use of leflunomide with live ●vaccines (see p. 669)

Lenalidomide
Cardiac Glycosides: lenalidomide possibly increases plasma concentration of digoxin

Lercanidipine *see* Calcium-channel Blockers

Leukotriene Receptor Antagonists
Analgesics: plasma concentration of zafirlukast increased by aspirin
Antibacterials: plasma concentration of zafirlukast reduced by erythromycin
Anticoagulants: zafirlukast enhances anticoagulant effect of warfarin
Antiepileptics: plasma concentration of montelukast reduced by primidone
Barbiturates: plasma concentration of montelukast reduced by phenobarbital
Theophylline: zafirlukast possibly increases plasma concentration of theophylline, also plasma concentration of zafirlukast reduced

Levamisole
Alcohol: possibility of disulfiram-like reaction when levamisole given with alcohol
- Anticoagulants: levamisole possibly enhances anticoagulant effect of ●warfarin

Antiepileptics: levamisole possibly increases plasma concentration of phenytoin

Levetiracetam
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine

Levobunolol *see* Beta-blockers

Levobupivacaine
Anti-arrhythmics: increased myocardial depression when levobupivacaine given with anti-arrhythmics

Levocetirizine *see* Antihistamines

Levodopa
ACE Inhibitors: enhanced hypotensive effect when levodopa given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with adrenergic neurone blockers
Alpha-blockers: enhanced hypotensive effect when levodopa given with alpha-blockers
- Anaesthetics, General: increased risk of arrhythmias when levodopa given with ●volatile liquid general anaesthetics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with angiotensin-II receptor antagonists
- Antidepressants: risk of hypertensive crisis when levodopa given with ●MAOIs, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with moclobemide

Levodopa *(continued)*
Antiepileptics: effects of levodopa possibly reduced by phenytoin
Antimuscarinics: absorption of levodopa possibly reduced by antimuscarinics
Antipsychotics: effects of levodopa antagonised by antipsychotics; avoidance of levodopa advised by manufacturer of amisulpride (antagonism of effect)
Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by benzodiazepines
Beta-blockers: enhanced hypotensive effect when levodopa given with beta-blockers
Bupropion: increased risk of side-effects when levodopa given with bupropion
Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when levodopa given with clonidine
Diazoxide: enhanced hypotensive effect when levodopa given with diazoxide
Diuretics: enhanced hypotensive effect when levodopa given with diuretics
Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)
Iron: absorption of levodopa possibly reduced by *oral* iron
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine
Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen
Nitrates: enhanced hypotensive effect when levodopa given with nitrates
Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside
Vitamins: effects of levodopa reduced by pyridoxine when given without dopa-decarboxylase inhibitor

Levofloxacin *see* Quinolones

Levomepromazine (methotrimeprazine) *see* Antipsychotics

Levonorgestrel *see* Progestogens

Levothyroxine (thyroxine) *see* Thyroid Hormones

Lidocaine (lignocaine)
Note Interactions less likely when lidocaine used topically
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●anti-arrhythmics
- Antibacterials: increased risk of ventricular arrhythmias when lidocaine (lignocaine) given with ●quinupristin/dalfopristin—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of lidocaine (lignocaine) possibly increased by ●atazanavir and lopinavir; plasma concentration of lidocaine (lignocaine) possibly increased by darunavir and ●fosamprenavir—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●beta-blockers; increased risk of lidocaine (lignocaine) toxicity when given with ●propranolol
- Diuretics: action of lidocaine (lignocaine) antagonised by hypokalaemia caused by ●acetazolamide, ●loop diuretics or ●thiazides and related diuretics
- $5HT_3$ Antagonists: increased risk of ventricular arrhythmias when lidocaine (lignocaine) given with ●dolasetron—avoid concomitant use

Lidocaine (lignocaine) *(continued)*
Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine (lignocaine) given with suxamethonium
- Ulcer-healing Drugs: plasma concentration of lidocaine (lignocaine) increased by ●cimetidine (increased risk of toxicity)

Linezolid
Note Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Liothyronine *see* Thyroid Hormones

Lipid-regulating Drugs *see* Colestipol, Colestyramine, Ezetimibe, Fibrates, Nicotinic Acid, and Statins

Lisinopril *see* ACE Inhibitors

Lithium
- ACE Inhibitors: excretion of lithium reduced by ●ACE inhibitors (increased plasma concentration)
- Analgesics: excretion of lithium reduced by ●NSAIDs (increased risk of toxicity); excretion of lithium reduced by ●ketorolac (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by ●angiotensin-II receptor antagonists (increased plasma concentration)

Antacids: excretion of lithium increased by sodium bicarbonate (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of ●amiodarone (risk of ventricular arrhythmias)

Antibacterials: increased risk of lithium toxicity when given with metronidazole
- Antidepressants: possible increased serotonergic effects when lithium given with venlafaxine; increased risk of CNS effects when lithium given with ●SSRIs (lithium toxicity reported); risk of toxicity when lithium given with tricyclics

Antiepileptics: neurotoxicity may occur when lithium given with carbamazepine or phenytoin without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by topiramate
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with clozapine, flupentixol, haloperidol, phenothiazines or zuclopenthixol; increased risk of ventricular arrhythmias when lithium given with ●sertindole—avoid concomitant use; increased risk of extrapyramidal side-effects when lithium given with sulpiride

Calcium-channel Blockers: neurotoxicity may occur when lithium given with diltiazem or verapamil without increased plasma concentration of lithium
- Diuretics: excretion of lithium increased by ●acetazolamide; excretion of lithium reduced by ●loop diuretics and ●thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by ●potassium-sparing diuretics and aldosterone antagonists (increased plasma concentration and risk of toxicity)
- Methyldopa: neurotoxicity may occur when lithium given with ●methyldopa without increased plasma concentration of lithium

Muscle Relaxants: lithium enhances effects of muscle relaxants; hyperkinesis caused by lithium possibly aggravated by baclofen
Parasympathomimetics: lithium antagonises effects of neostigmine and pyridostigmine
Theophylline: excretion of lithium increased by theophylline (reduced plasma concentration)

Lofepramine *see* Antidepressants, Tricyclic

Lofexidine
Alcohol: increased sedative effect when lofexidine given with alcohol

Lofexidine *(continued)*
Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with anxiolytics and hypnotics
Barbiturates: increased sedative effect when lofexidine given with barbiturates

Lomustine
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by cimetidine

Loperamide
Desmopressin: loperamide increases plasma concentration of *oral* desmopressin

Lopinavir
Note In combination with ritonavir as *Kaletra®* (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir
- Anti-arrhythmics: lopinavir possibly increases plasma concentration of •flecainide (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of lidocaine (lignocaine)
- Antibacterials: plasma concentration of lopinavir reduced by •rifampicin—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Anticoagulants: avoidance of lopinavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of lopinavir reduced by •St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by carbamazepine, phenytoin and •primidone

Antihistamines: lopinavir possibly increases plasma concentration of chlorphenamine (chlorpheniramine)
Antimalarials: caution with lopinavir advised by manufacturer of artemether/lumefantrine
Antimuscarinics: avoidance of lopinavir advised by manufacturer of darifenacin and tolterodine
- Antipsychotics: lopinavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); lopinavir increases plasma concentration of •sertindole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: lopinavir reduces plasma concentration of •darunavir, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by •efavirenz—consider increasing dose of lopinavir; lopinavir reduces plasma concentration of fosamprenavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of •maraviroc (consider reducing dose of maraviroc); plasma concentration of lopinavir reduced by nelfinavir, also plasma concentration of active metabolite of nelfinavir increased; plasma concentration of lopinavir possibly reduced by •nevirapine—consider increasing dose of lopinavir; lopinavir increases plasma concentration of saquinavir and tenofovir; plasma concentration of lopinavir reduced by •tipranavir
- Barbiturates: plasma concentration of lopinavir possibly reduced by •phenobarbital
- Cilostazol: lopinavir possibly increases plasma concentration of •cilostazol—avoid concomitant use

Corticosteroids: plasma concentration of lopinavir possibly reduced by dexamethasone
- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with atorvastatin; possible increased risk of myopathy when lopinavir given with •rosuvastatin or •simvastatin—avoid concomitant use

Lopinavir *(continued)*
- Ranolazine: lopinavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sirolimus: lopinavir possibly increases plasma concentration of sirolimus

Loprazolam *see* Anxiolytics and Hypnotics
Loratadine *see* Antihistamines
Lorazepam *see* Anxiolytics and Hypnotics
Lormetazepam *see* Anxiolytics and Hypnotics
Losartan *see* Angiotensin-II Receptor Antagonists
Lumefantrine *see* Artemether with Lumefantrine
Lymecycline *see* Tetracyclines

Macrolides
Note *See also* Telithromycin
Note Interactions do not apply to small amounts of erythromycin used topically
Analgesics: erythromycin increases plasma concentration of alfentanil
Antacids: absorption of azithromycin reduced by antacids
- Anti-arrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with •amiodarone—avoid concomitant use; erythromycin increases plasma concentration of •disopyramide (increased risk of toxicity); clarithromycin possibly increases plasma concentration of •disopyramide (increased risk of toxicity)
- Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with •moxifloxacin—avoid concomitant use; macrolides possibly increase plasma concentration of •rifabutin (increased risk of uveitis—reduce rifabutin dose); clarithromycin increases plasma concentration of •rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of clarithromycin reduced by rifamycins
- Anticoagulants: clarithromycin and erythromycin enhance anticoagulant effect of •coumarins; azithromycin possibly enhances anticoagulant effect of •coumarins
- Antidepressants: avoidance of macrolides advised by manufacturer of •reboxetine

Antidiabetics: clarithromycin enhances effects of repaglinide
- Antiepileptics: clarithromycin and erythromycin increase plasma concentration of •carbamazepine; clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration)

Antifungals: clarithromycin increases plasma concentration of itraconazole
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of •mizolastine (avoid concomitant use); erythromycin inhibits metabolism of •mizolastine—avoid concomitant use
- Antimalarials: avoidance of macrolides advised by manufacturer of •artemether/lumefantrine

Antimuscarinics: erythromycin possibly increases plasma concentration of darifenacin; manufacturer of fesoterodine advises dose reduction when clarithromycin given with fesoterodine—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of tolterodine
- Antipsychotics: avoidance of macrolides advised by manufacturer of •droperidol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with •amisulpride or •zuclopenthixol—avoid concomitant use; erythromycin possibly increases plasma concentration of •clozapine (possible increased risk of convulsions); increased risk of ventricular arrhythmias when clarithromycin given with •pimozide—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with •pimozide—avoid concomitant use; macrolides

Macrolides

- Antipsychotics *(continued)*
  possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when macrolides given with ●sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with ●sulpiride
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with atazanavir; increased risk of rash when clarithromycin given with efavirenz; clarithromycin increases plasma concentration of ●etravirine, also plasma concentration of clarithromycin reduced; plasma concentration of both drugs increased when erythromycin given with fosamprenavir; clarithromycin possibly increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); plasma concentration of azithromycin and erythromycin possibly increased by ritonavir; plasma concentration of clarithromycin increased by ●ritonavir (reduce dose of clarithromycin in renal impairment); plasma concentration of clarithromycin increased by ●tipranavir (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of zidovudine (give at least 2 hours apart)
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of ●midazolam (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of buspirone (reduce dose of buspirone); erythromycin inhibits the metabolism of zopiclone

  Aprepitant: clarithromycin possibly increases plasma concentration of aprepitant
- Atomoxetine: increased risk of ventricular arrhythmias when parenteral erythromycin given with ●atomoxetine
- Calcium-channel Blockers: erythromycin possibly inhibits metabolism of felodipine (increased plasma concentration); avoidance of erythromycin advised by manufacturer of lercanidipine; clarithromycin and erythromycin possibly inhibit metabolism of ●verapamil (increased risk of toxicity)

  Cardiac Glycosides: macrolides increase plasma concentration of digoxin (increased risk of toxicity)
- Ciclosporin: macrolides possibly inhibit metabolism of ●ciclosporin (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of ●ciclosporin (increased plasma concentration)
- Cilostazol: erythromycin increases plasma concentration of ●cilostazol (also plasma concentration of erythromycin reduced)—avoid concomitant use
- Colchicine: clarithromycin or erythromycin increase risk of ●colchicine toxicity

  Corticosteroids: erythromycin possibly inhibits metabolism of corticosteroids; clarithromycin possibly increases plasma concentration of methylprednisolone; erythromycin inhibits the metabolism of methylprednisolone
- Cytotoxics: avoidance of clarithromycin advised by manufacturer of ●nilotinib; *in vitro* studies suggest a possible interaction between erythromycin and docetaxel (consult docetaxel product literature); erythromycin increases toxicity of ●vinblastine—avoid concomitant use
- Diuretics: clarithromycin increases plasma concentration of ●eplerenone—avoid concomitant use; erythromycin increases plasma concentration of eplerenone (reduce dose of eplerenone)

  Dopaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity); erythromycin increases plasma concentration of bromocriptine and cabergoline (increased risk of toxicity)

Macrolides *(continued)*

- Ergot Alkaloids: increased risk of ergotism when macrolides given with ●ergotamine and methysergide—avoid concomitant use
- 5HT$_1$ Agonists: clarithromycin and erythromycin increase plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of ●ivabradine—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●ivabradine—avoid concomitant use

  Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of zafirlukast
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of ●atorvastatin and pravastatin; possible increased risk of myopathy when erythromycin given with atorvastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; increased risk of myopathy when clarithromycin or erythromycin given with ●simvastatin (avoid concomitant use)

  Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

  Parasympathomimetics: erythromycin increases plasma concentration of galantamine
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with ●pentamidine isetionate
- Ranolazine: clarithromycin possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Sildenafil: clarithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil; erythromycin increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: clarithromycin increases plasma concentration of ●sirolimus—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with ●sirolimus
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of ●tacrolimus

  Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil
- Theophylline: azithromycin possibly increases plasma concentration of theophylline; clarithromycin inhibits metabolism of ●theophylline (increased plasma concentration); erythromycin inhibits metabolism of ●theophylline (increased plasma concentration), if erythromycin given by mouth, also decreased plasma-erythromycin concentration

  Ulcer-healing Drugs: plasma concentration of erythromycin increased by cimetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole

  Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 688

  Vardenafil: erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil)

Magnesium (parenteral)

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and ●nifedipine in pre-eclampsia

  Muscle Relaxants: parenteral magnesium enhances effects of non-depolarising muscle relaxants and suxamethonium

Magnesium Salts (oral) *see* Antacids

Mannitol

Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with ciclosporin

MAOIs

Note For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor

ACE Inhibitors: MAOIs possibly enhance hypotensive effect of ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with adrenergic neurone blockers

- Alcohol: MAOIs interact with tyramine found in some beverages containing ●alcohol and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect

Alpha$_2$-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of apraclonidine and brimonidine

- Alpha-blockers: avoidance of MAOIs advised by manufacturer of ●indoramin; enhanced hypotensive effect when MAOIs given with alpha-blockers
- Anaesthetics, General: Because of hazardous interactions between MAOIs and ●general anaesthetics, MAOIs should normally be stopped 2 weeks before surgery
- Analgesics: CNS excitation or depression (hypertension or hypotension) when MAOIs given with ●pethidine—avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of ●nefopam; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with ●opioid analgesics—avoid concomitant use and for 2 weeks after stopping MAOIs

Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of angiotensin-II receptor antagonists

- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with ●reboxetine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start ●citalopram, ●escitalopram, ●fluvoxamine or ●paroxetine for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine or paroxetine; after stopping MAOIs do not start ●fluoxetine for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start ●mirtazapine or ●sertraline for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine or sertraline; after stopping MAOIs do not start ●duloxetine for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with ●venlafaxine (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other ●MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start ●moclobemide for at least 1 week; MAOIs increase CNS effects of ●SSRIs (risk of serious toxicity); after stopping MAOIs do not start ●tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with ●tricyclics, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); CNS excitation and confusion when MAOIs given with ●tryptophan (reduce dose of tryptophan)

Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of antidiabetics; MAOIs enhance hypoglycaemic effect of insulin, metformin and sulphonylureas

- Antiepileptics: MAOIs possibly antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of ●carbamazepine, also antagonism of anticonvulsant effect

Antihistamines: increased antimuscarinic and sedative effects when MAOIs given with antihistamines

- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics

- Antipsychotics: CNS effects of MAOIs possibly increased by ●clozapine

Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of buspirone

- Atomoxetine: after stopping MAOIs do not start ●atomoxetine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

Barbiturates: MAOIs possibly antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered)

Beta-blockers: enhanced hypotensive effect when MAOIs given with beta-blockers

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of ●bupropion

Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when MAOIs given with clonidine

Diazoxide: enhanced hypotensive effect when MAOIs given with diazoxide

Diuretics: enhanced hypotensive effect when MAOIs given with diuretics

- Dopaminergics: avoid concomitant use of non-selective MAOIs with ●entacapone; risk of hypertensive crisis when MAOIs given with ●levodopa, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with ●rasagiline, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with selegiline; avoid concomitant use of MAOIs with tolcapone

Doxapram: MAOIs enhance effects of doxapram

- 5HT$_1$ Agonists: risk of CNS toxicity when MAOIs given with ●rizatriptan or ●sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when MAOIs given with ●zolmitriptan
- Methyldopa: avoidance of MAOIs advised by manufacturer of ●methyldopa

Moxonidine: enhanced hypotensive effect when MAOIs given with moxonidine

Muscle Relaxants: phenelzine enhances effects of suxamethonium

Nicorandil: enhanced hypotensive effect when MAOIs given with nicorandil

Nitrates: enhanced hypotensive effect when MAOIs given with nitrates

- Sibutramine: increased CNS toxicity when MAOIs given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use), also avoid sibutramine for 2 weeks after stopping MAOIs
- Sympathomimetics: risk of hypertensive crisis when MAOIs given with ●sympathomimetics; risk of hypertensive crisis when MAOIs given with ●methylphenidate, some manufacturers advise avoid methylphenidate for at least 2 weeks after stopping MAOIs
- Tetrabenazine: risk of CNS excitation and hypertension when MAOIs given with ●tetrabenazine

MAOIs *(continued)*
Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with hydralazine, minoxidil or sodium nitroprusside

MAOIs, reversible *see* Moclobemide

Maraviroc
- Antibacterials: plasma concentration of maraviroc possibly increased by ●clarithromycin and ●telithromycin (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by ●rifampicin—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by ●St John's wort—avoid concomitant use
- Antifungals: plasma concentration of maraviroc increased by ●ketoconazole (consider reducing dose of maraviroc)
- Antivirals: plasma concentration of maraviroc increased by ●atazanavir, ●darunavir, ●indinavir, ●lopinavir and ●saquinavir (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by ●efavirenz—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by etravirine; plasma concentration of maraviroc possibly increased by ●nelfinavir (consider reducing dose of maraviroc)

Mebendazole
Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by cimetidine (increased plasma concentration)

Medroxyprogesterone *see* Progestogens

Mefenamic Acid *see* NSAIDs

Mefloquine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with ●amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with ●moxifloxacin—avoid concomitant use; plasma concentration of mefloquine reduced by ●rifampicin—avoid concomitant use
- Antiepileptics: mefloquine antagonises anticonvulsant effect of ●antiepileptics
- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine; increased risk of convulsions when mefloquine given with ●chloroquine and hydroxychloroquine; increased risk of convulsions when mefloquine given with ●quinine (but should not prevent the use of intravenous quinine in severe cases)
- Antipsychotics: increased risk of ventricular arrhythmias when mefloquine given with ●pimozide—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with ●atomoxetine

Beta-blockers: increased risk of bradycardia when mefloquine given with beta-blockers

Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with calcium-channel blockers

Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with digoxin
- Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with ●ivabradine

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Megestrol *see* Progestogens

Melatonin *see* Anxiolytics and Hypnotics

Meloxicam *see* NSAIDs

Melphalan
Antibacterials: increased risk of melphalan toxicity when given with nalidixic acid

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Melphalan *(continued)*
- Ciclosporin: increased risk of nephrotoxicity when melphalan given with ●ciclosporin

Memantine
- Anaesthetics, General: increased risk of CNS toxicity when memantine given with ●ketamine (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with ●dextromethorphan (manufacturer of memantine advises avoid concomitant use)

Anticoagulants: memantine possibly enhances anticoagulant effect of warfarin

Antiepileptics: memantine possibly reduces effects of primidone

Antimuscarinics: memantine possibly enhances effects of antimuscarinics

Antipsychotics: memantine possibly reduces effects of antipsychotics

Barbiturates: memantine possibly reduces effects of barbiturates
- Dopaminergics: memantine possibly enhances effects of dopaminergics and selegiline; increased risk of CNS toxicity when memantine given with ●amantadine (manufacturer of memantine advises avoid concomitant use)

Muscle Relaxants: memantine possibly modifies effects of baclofen and dantrolene

Mepacrine
Antimalarials: mepacrine increases plasma concentration of primaquine (increased risk of toxicity)

Meprobamate *see* Anxiolytics and Hypnotics

Meptazinol *see* Opioid Analgesics

Mercaptopurine
- Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with ●allopurinol (reduce dose of mercaptopurine to one quarter of usual dose)

Aminosalicylates: possible increased risk of leucopenia when mercaptopurine given with aminosalicylates
- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with ●sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with ●trimethoprim (also with co-trimoxazole)
- Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of ●coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Meropenem
Antiepileptics: meropenem reduces plasma concentration of valproate

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Probenecid: excretion of meropenem reduced by probenecid (manufacturers of meropenem advise avoid concomitant use)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Mesalazine *see* Aminosalicylates

Mestranol *see* Oestrogens

Metaraminol *see* Sympathomimetics

Metformin *see* Antidiabetics

Methadone *see* Opioid Analgesics

Methenamine
- Antibacterials: increased risk of crystalluria when methenamine given with ●sulphonamides
- Diuretics: effects of methenamine antagonised by ●acetazolamide

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Methenamine *(continued)*
Potassium Salts: avoid concomitant use of methenamine with potassium citrate
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Methocarbamol *see* Muscle Relaxants

Methotrexate
- Anaesthetics, General: antifolate effect of methotrexate increased by ●nitrous oxide—avoid concomitant use
- Analgesics: excretion of methotrexate probably reduced by ●NSAIDs (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 575; excretion of methotrexate reduced by ●azapropazone (avoid concomitant use); excretion of methotrexate reduced by ●aspirin, ●diclofenac, ●ibuprofen, ●indometacin, ●ketoprofen, ●meloxicam and ●naproxen (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 575
- Antibacterials: absorption of methotrexate possibly reduced by neomycin; excretion of methotrexate possibly reduced by ciprofloxacin (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with ●sulfamethoxazole (as co-trimoxazole); increased risk of methotrexate toxicity when given with doxycycline, sulphonamides or tetracycline; excretion of methotrexate reduced by penicillins (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with ●trimethoprim (also with co-trimoxazole)

  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; antifolate effect of methotrexate increased by phenytoin
- Antimalarials: antifolate effect of methotrexate increased by ●pyrimethamine
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Ciclosporin: risk of toxicity when methotrexate given with ●ciclosporin
- Corticosteroids: increased risk of haematological toxicity when methotrexate given with ●corticosteroids
- Cytotoxics: increased pulmonary toxicity when methotrexate given with ●cisplatin
- Leflunomide: risk of toxicity when methotrexate given with ●leflunomide
- Probenecid: excretion of methotrexate reduced by ●probenecid (increased risk of toxicity)
- Retinoids: plasma concentration of methotrexate increased by ●acitretin (also increased risk of hepatotoxicity)—avoid concomitant use

  Theophylline: methotrexate possibly increases plasma concentration of theophylline

  Ulcer-healing Drugs: excretion of methotrexate possibly reduced by omeprazole (increased risk of toxicity)

Methoxamine *see* Sympathomimetics

Methyldopa

ACE Inhibitors: enhanced hypotensive effect when methyldopa given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when methyldopa given with alcohol

Aldesleukin: enhanced hypotensive effect when methyldopa given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when methyldopa given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when methyldopa given with general anaesthetics

Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with angiotensin-II receptor antagonists

Methyldopa *(continued)*
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with ●MAOIs

  Antipsychotics: enhanced hypotensive effect when methyldopa given with antipsychotics (also increased risk of extrapyramidal effects)

  Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with anxiolytics and hypnotics

  Beta-blockers: enhanced hypotensive effect when methyldopa given with beta-blockers

  Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers

  Clonidine: enhanced hypotensive effect when methyldopa given with clonidine

  Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids

  Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide

  Diuretics: enhanced hypotensive effect when methyldopa given with diuretics

  Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics; increased risk of extrapyramidal side-effects when methyldopa given with amantadine; effects of methyldopa possibly enhanced by entacapone; enhanced hypotensive effect when methyldopa given with levodopa

  Iron: hypotensive effect of methyldopa antagonised by *oral* iron
- Lithium: neurotoxicity may occur when methyldopa given with ●lithium without increased plasma concentration of lithium

  Moxisylyte (thymoxamine): enhanced hypotensive effect when methyldopa given with moxisylyte

  Moxonidine: enhanced hypotensive effect when methyldopa given with moxonidine

  Muscle Relaxants: enhanced hypotensive effect when methyldopa given with baclofen or tizanidine

  Nitrates: enhanced hypotensive effect when methyldopa given with nitrates

  Oestrogens: hypotensive effect of methyldopa antagonised by oestrogens

  Prostaglandins: enhanced hypotensive effect when methyldopa given with alprostadil
- Sympathomimetics, $Beta_2$: acute hypotension reported when methyldopa given with infusion of ●salbutamol

  Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with hydralazine, minoxidil or sodium nitroprusside

Methylphenidate *see* Sympathomimetics

Methylprednisolone *see* Corticosteroids

Methysergide *see* Ergot Alkaloids

Metipranolol *see* Beta-blockers

Metoclopramide

Analgesics: metoclopramide increases rate of absorption of aspirin (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by opioid analgesics; metoclopramide increases rate of absorption of paracetamol

Antimuscarinics: effects of metoclopramide on gastrointestinal activity antagonised by antimuscarinics

Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with antipsychotics

Atovaquone: metoclopramide reduces plasma concentration of atovaquone
- Ciclosporin: metoclopramide increases plasma concentration of ●ciclosporin

Dopaminergics: metoclopramide antagonises hyperprolactinaemic effects of bromocriptine and cabergoline; metoclopramide antagonises antiparkinsonian effect of pergolide; avoidance of metoclopramide advised by manufacturer of ropinirole and rotigotine (antagonism of effect)

Muscle Relaxants: metoclopramide enhances effects of suxamethonium

Metoclopramide *(continued)*
Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with tetrabenazine

Metolazone *see* Diuretics

Metoprolol *see* Beta-blockers

Metronidazole
Note Interactions do not apply to topical metronidazole preparations
Alcohol: disulfiram-like reaction when metronidazole given with alcohol
- Anticoagulants: metronidazole enhances anticoagulant effect of ●coumarins
- Antiepileptics: metronidazole inhibits metabolism of ●phenytoin (increased plasma concentration); metabolism of metronidazole accelerated by primidone (reduced plasma concentration)

Barbiturates: metabolism of metronidazole accelerated by barbiturates (reduced plasma concentration)
- Cytotoxics: metronidazole increases plasma concentration of ●busulfan (increased risk of toxicity); metronidazole inhibits metabolism of fluorouracil (increased toxicity)

Disulfiram: psychotic reaction reported when metronidazole given with disulfiram
Lithium: metronidazole increases risk of lithium toxicity
Mycophenolate: metronidazole possibly reduces bioavailability of mycophenolate
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Ulcer-healing Drugs: metabolism of metronidazole inhibited by cimetidine (increased plasma concentration)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Mianserin *see* Antidepressants, Tricyclic (related)

Micafungin
Antifungals: micafungin increases plasma concentration of itraconazole (consider reducing dose of itraconazole)
Calcium-channel Blockers: micafungin increases plasma concentration of nifedipine
Ciclosporin: micafungin possibly increases plasma concentration of ciclosporin
Sirolimus: micafungin increases plasma concentration of sirolimus

Miconazole *see* Antifungals, Imidazole

Midazolam *see* Anxiolytics and Hypnotics

Mifepristone
Corticosteroids: mifepristone may reduce effect of corticosteroids (including inhaled corticosteroids) for 3–4 days

Milrinone *see* Phosphodiesterase Inhibitors

Minocycline *see* Tetracyclines

Minoxidil *see* Vasodilator Antihypertensives

Mirtazapine
- Alcohol: increased sedative effect when mirtazapine given with ●alcohol

Analgesics: possible increased serotonergic effects when mirtazapine given with tramadol
Anticoagulants: mirtazapine enhances anticoagulant effect of warfarin
- Antidepressants: possible increased serotonergic effects when mirtazapine given with fluoxetine, fluvoxamine or venlafaxine; mirtazapine should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start ●moclobemide for at least 1 week

Antiepileptics: plasma concentration of mirtazapine reduced by carbamazepine and phenytoin
Antifungals: plasma concentration of mirtazapine increased by ketoconazole
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

Mirtazapine *(continued)*
Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with anxiolytics and hypnotics
Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Sibutramine: increased risk of CNS toxicity when mirtazapine given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Ulcer-healing Drugs: plasma concentration of mirtazapine increased by cimetidine

Mitomycin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Mitotane
- Anticoagulants: mitotane possibly reduces anticoagulant effect of ●coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Diuretics: manufacturer of mitotane advises avoid concomitant use of spironolactone (antagonism of effect)

Mivacurium *see* Muscle Relaxants

Mizolastine *see* Antihistamines

Moclobemide
- Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with ●dextromethorphan or ●pethidine—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with ●opioid analgesics
- Antidepressants: moclobemide should not be started for at least 1 week after stopping ●MAOIs, ●SSRI-related antidepressants, ●citalopram, ●fluvoxamine, ●mirtazapine, ●paroxetine, ●tricyclic-related antidepressants or ●tricyclics; increased risk of CNS toxicity when moclobemide given with ●escitalopram, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping ●fluoxetine; moclobemide should not be started until 2 weeks after stopping ●sertraline; possible increased serotonergic effects when moclobemide given with ●duloxetine
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Bupropion: avoidance of moclobemide advised by manufacturer of ●bupropion
- Dopaminergics: caution with moclobemide advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with ●selegiline
- 5HT$_1$ Agonists: risk of CNS toxicity when moclobemide given with ●rizatriptan or ●sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with ●zolmitriptan (reduce dose of zolmitriptan)
- Sibutramine: increased CNS toxicity when moclobemide given with ●sibutramine (manufacturer of sibutramine advises avoid concomitant use), also avoid sibutramine for 2 weeks after stopping moclobemide
- Sympathomimetics: risk of hypertensive crisis when moclobemide given with ●sympathomimetics

Ulcer-healing Drugs: plasma concentration of moclobemide increased by cimetidine (halve dose of moclobemide)

Modafinil
Antiepileptics: modafinil possibly increases plasma concentration of phenytoin
- Ciclosporin: modafinil reduces plasma concentration of •ciclosporin
- Oestrogens: modafinil accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 445)

Moexipril *see* ACE Inhibitors
Mometasone *see* Corticosteroids
Monobactams *see* Aztreonam
Montelukast *see* Leukotriene Receptor Antagonists
Morphine *see* Opioid Analgesics
Moxifloxacin *see* Quinolones

Moxisylyte (thymoxamine)
ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with adrenergic neurone blockers
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with •alpha-blockers

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with angiotensin-II receptor antagonists
- Beta-blockers: possible severe postural hypotension when moxisylyte given with •beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when moxisylyte given with clonidine
Diazoxide: enhanced hypotensive effect when moxisylyte given with diazoxide
Diuretics: enhanced hypotensive effect when moxisylyte given with diuretics
Methyldopa: enhanced hypotensive effect when moxisylyte given with methyldopa
Moxonidine: enhanced hypotensive effect when moxisylyte given with moxonidine
Nitrates: enhanced hypotensive effect when moxisylyte given with nitrates
Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with hydralazine, minoxidil or sodium nitroprusside

Moxonidine
ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when moxonidine given with alcohol
Aldesleukin: enhanced hypotensive effect when moxonidine given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when moxonidine given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when moxonidine given with general anaesthetics
Analgesics: hypotensive effect of moxonidine antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIs
Antipsychotics: enhanced hypotensive effect when moxonidine given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with anxiolytics and hypnotics; sedative effects possibly increased when moxonidine given with benzodiazepines
Beta-blockers: enhanced hypotensive effect when moxonidine given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when moxonidine given with clonidine

Moxonidine *(continued)*
Corticosteroids: hypotensive effect of moxonidine antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when moxonidine given with diazoxide
Diuretics: enhanced hypotensive effect when moxonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when moxonidine given with levodopa
Methyldopa: enhanced hypotensive effect when moxonidine given with methyldopa
Moxisylyte (thymoxamine): enhanced hypotensive effect when moxonidine given with moxisylyte
Muscle Relaxants: enhanced hypotensive effect when moxonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when moxonidine given with nitrates
Oestrogens: hypotensive effect of moxonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when moxonidine given with alprostadil
Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with hydralazine, minoxidil or sodium nitroprusside

Muscle Relaxants
ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with adrenergic neurone blockers
Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with alcohol
Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with alpha-blockers
- Anaesthetics, General: effects of atracurium enhanced by ketamine; increased risk of myocardial depression and bradycardia when suxamethonium given with •propofol; effects of non-depolarising muscle relaxants and suxamethonium enhanced by volatile liquid general anaesthetics

Analgesics: excretion of baclofen possibly reduced by NSAIDs (increased risk of toxicity); excretion of baclofen reduced by ibuprofen (increased risk of toxicity)
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with angiotensin-II receptor antagonists
Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with lidocaine (lignocaine)
- Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by piperacillin; plasma concentration of tizanidine increased by •ciprofloxacin (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by norfloxacin (increased risk of toxicity); effects of non-depolarising muscle relaxants and suxamethonium enhanced by •aminoglycosides; effects of non-depolarising muscle relaxants and suxamethonium enhanced by •clindamycin; effects of non-depolarising muscle relaxants and suxamethonium enhanced by •polymyxins; effects of suxamethonium enhanced by •vancomycin
- Antidepressants: plasma concentration of tizanidine increased by •fluvoxamine (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by phenelzine; muscle relaxant effect of baclofen enhanced by tricyclics

Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by carbamazepine and phenytoin (accelerated recovery from neuromuscular blockade)
Antimalarials: effects of suxamethonium possibly enhanced by quinine
Antipsychotics: effects of suxamethonium possibly enhanced by promazine

Muscle Relaxants *(continued)*

Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when baclofen given with beta-blockers; possible enhanced hypotensive effect and bradycardia when tizanidine given with beta-blockers; effects of muscle relaxants enhanced by propranolol

Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with calcium-channel blockers; effects of non-depolarising muscle relaxants enhanced by nifedipine and verapamil; risk of arrhythmias when intravenous dantrolene given with diltiazem; hypotension, myocardial depression, and hyperkalaemia when intravenous dantrolene given with verapamil; effects of suxamethonium enhanced by verapamil

Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine

Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by corticosteroids

Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiotepa

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics

Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with levodopa

Lithium: effects of muscle relaxants enhanced by lithium; baclofen possibly aggravates hyperkinesis caused by lithium

Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by parenteral magnesium

Memantine: effects of baclofen and dantrolene possibly modified by memantine

Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with methyldopa

Metoclopramide: effects of suxamethonium enhanced by metoclopramide

Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with moxonidine

Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with nitrates

Oestrogens: plasma concentration of tizanidine possibly increased by oestrogens (increased risk of toxicity)

Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by donepezil; effects of suxamethonium possibly enhanced by donepezil; effects of non-depolarising muscle relaxants antagonised by edrophonium, neostigmine, pyridostigmine and rivastigmine; effects of suxamethonium enhanced by edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine

Progestogens: plasma concentration of tizanidine possibly increased by progestogens (increased risk of toxicity)

Sympathomimetics, $Beta_2$: effects of suxamethonium enhanced by bambuterol

Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with hydralazine; enhanced hypotensive effect when baclofen or tizanidine given with minoxidil; enhanced hypotensive effect when baclofen or tizanidine given with sodium nitroprusside

Muscle Relaxants, depolarising *see* Muscle Relaxants

Muscle Relaxants, non-depolarising *see* Muscle Relaxants

Mycophenolate

Antacids: absorption of mycophenolate reduced by antacids

Mycophenolate *(continued)*

- Antibacterials: bioavailability of mycophenolate possibly reduced by metronidazole and norfloxacin; plasma concentration of active metabolite of mycophenolate reduced by •rifampicin

Antivirals: mycophenolate increases plasma concentration of aciclovir, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of ganciclovir, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Iron: absorption of mycophenolate reduced by *oral* iron

Lipid-regulating Drugs: absorption of mycophenolate reduced by colestyramine

Sevelamer: plasma concentration of mycophenolate possibly reduced by sevelamer

Mycophenolate Mofetil *see* Mycophenolate

Mycophenolate Sodium *see* Mycophenolate

Mycophenolic Acid *see* Mycophenolate

Nabilone

Alcohol: increased sedative effect when nabilone given with alcohol

Anxiolytics and Hypnotics: increased sedative effect when nabilone given with anxiolytics and hypnotics

Nabumetone *see* NSAIDs

Nadolol *see* Beta-blockers

Nalidixic Acid *see* Quinolones

Nandrolone *see* Anabolic Steroids

Naproxen *see* NSAIDs

Naratriptan *see* $5HT_1$ Agonists

Nateglinide *see* Antidiabetics

Nebivolol *see* Beta-blockers

Nefopam

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with •MAOIs; side-effects possibly increased when nefopam given with tricyclics

Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with antimuscarinics

Nelfinavir

Analgesics: nelfinavir reduces plasma concentration of methadone

- Anti-arrhythmics: increased risk of ventricular arrhythmias when nelfinavir given with •amiodarone—avoid concomitant use
- Antibacterials: nelfinavir increases plasma concentration of •rifabutin (halve dose of rifabutin); plasma concentration of nelfinavir significantly reduced by •rifampicin—avoid concomitant use; avoidance of concomitant nelfinavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Anticoagulants: avoidance of nelfinavir advised by manufacturer of rivaroxaban

- Antidepressants: plasma concentration of nelfinavir reduced by •St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of nelfinavir possibly reduced by carbamazepine and •primidone; nelfinavir reduces plasma concentration of phenytoin

Antimalarials: caution with nelfinavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of nelfinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when nelfinavir given with fesoterodine—consult fesoterodine product literature; nelfinavir increases plasma concentration of solifenacin

- Antipsychotics: nelfinavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); nelfinavir possibly increases plasma concentration of •pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); nelfinavir increases plasma concentration of •sertindole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of nelfinavir possibly increased by etravirine—avoid concomitant use; combination of nelfinavir with indinavir, ritonavir or saquinavir may increase plasma concentration of

Nelfinavir
- Antivirals *(continued)*
  either drug (or both); nelfinavir reduces plasma concentration of lopinavir, also plasma concentration of active metabolite of nelfinavir increased; nelfinavir possibly increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc)
- Anxiolytics and Hypnotics: nelfinavir possibly increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Barbiturates: plasma concentration of nelfinavir possibly reduced by ●barbiturates
- Ciclosporin: nelfinavir possibly increases plasma concentration of ●ciclosporin
- Cilostazol: nelfinavir possibly increases plasma concentration of ●cilostazol—avoid concomitant use
  Cytotoxics: nelfinavir increases plasma concentration of paclitaxel
- Diuretics: nelfinavir increases plasma concentration of ●eplerenone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when nelfinavir given with ●ergotamine and methysergide—avoid concomitant use
- $5HT_1$ Agonists: nelfinavir increases plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: nelfinavir possibly increases plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when nelfinavir given with atorvastatin; possible increased risk of myopathy when nelfinavir given with ●rosuvastatin—avoid concomitant use; increased risk of myopathy when nelfinavir given with ●simvastatin (avoid concomitant use)
- Oestrogens: nelfinavir accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
  Progestogens: nelfinavir possibly reduces contraceptive effect of progestogens
- Ranolazine: nelfinavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
  Sildenafil: nelfinavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Tacrolimus: nelfinavir possibly increases plasma concentration of ●tacrolimus
- Ulcer-healing Drugs: plasma concentration of nelfinavir reduced by ●omeprazole—avoid concomitant use

Neomycin *see* Aminoglycosides

Neostigmine *see* Parasympathomimetics

Nevirapine
  Analgesics: nevirapine possibly reduces plasma concentration of methadone
- Antibacterials: nevirapine possibly increases plasma concentration of rifabutin; plasma concentration of nevirapine reduced by ●rifampicin—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of ●warfarin
- Antidepressants: plasma concentration of nevirapine reduced by ●St John's wort—avoid concomitant use
- Antifungals: nevirapine reduces plasma concentration of ●ketoconazole—avoid concomitant use; plasma concentration of nevirapine increased by ●fluconazole; nevirapine possibly reduces plasma concentration of caspofungin and itraconazole—consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole
- Antivirals: nevirapine possibly reduces plasma concentration of ●atazanavir and ●etravirine—avoid concomitant use; nevirapine reduces plasma concentration of efavirenz and indinavir; nevirapine

Nevirapine
- Antivirals *(continued)*
  possibly reduces plasma concentration of fosamprenavir; nevirapine possibly reduces plasma concentration of ●lopinavir—consider increasing dose of lopinavir
- Oestrogens: nevirapine accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: nevirapine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 445)

Nicardipine *see* Calcium-channel Blockers

Nicorandil
  Alcohol: hypotensive effect of nicorandil possibly enhanced by alcohol
  Antidepressants: enhanced hypotensive effect when nicorandil given with MAOIs; hypotensive effect of nicorandil possibly enhanced by tricyclics
- Sildenafil: hypotensive effect of nicorandil significantly enhanced by ●sildenafil (avoid concomitant use)
- Tadalafil: hypotensive effect of nicorandil significantly enhanced by ●tadalafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nicorandil given with ●vardenafil—avoid concomitant use
  Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with hydralazine, minoxidil or sodium nitroprusside

Nicotinic Acid
  Note Interactions apply to lipid-regulating doses of nicotinic acid
- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with ●statins (applies to lipid regulating doses of nicotinic acid)

Nifedipine *see* Calcium-channel Blockers

Nilotinib
  Antacids: manufacturer of nilotinib advises avoid concomitant use with antacids
- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with ●clarithromycin, ●moxifloxacin and ●telithromycin; plasma concentration of nilotinib reduced by ●rifampicin—avoid concomitant use
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of nilotinib increased by ●ketoconazole—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with ●itraconazole and ●voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of nilotinib advises avoid concomitant use with ●ritonavir
  Anxiolytics and Hypnotics: nilotinib increases plasma concentration of midazolam
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with ●grapefruit juice
  Ulcer-healing Drugs: manufacturer of nilotinib advises avoid concomitant use with histamine H_2-antagonists and proton pump inhibitors

Nimodipine *see* Calcium-channel Blockers

Nitrates
  ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors
  Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers
  Alcohol: enhanced hypotensive effect when nitrates given with alcohol
  Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin
  Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers
  Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Nitrates *(continued)*
Analgesics: hypotensive effect of nitrates antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists
Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)
- Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of ●heparins

Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)
Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)
Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when nitrates given with clonidine
Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide
Diuretics: enhanced hypotensive effect when nitrates given with diuretics
Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa
Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa
Moxisylyte (thymoxamine): enhanced hypotensive effect when nitrates given with moxisylyte
Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine
Oestrogens: hypotensive effect of nitrates antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil
- Sildenafil: hypotensive effect of nitrates significantly enhanced by ●sildenafil (avoid concomitant use)
- Tadalafil: hypotensive effect of nitrates significantly enhanced by ●tadalafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nitrates given with ●vardenafil—avoid concomitant use

Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

Nitrazepam *see* Anxiolytics and Hypnotics

Nitrofurantoin
Antacids: absorption of nitrofurantoin reduced by oral magnesium salts (as magnesium trisilicate)
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Probenecid: excretion of nitrofurantoin reduced by probenecid (increased risk of side-effects)
Sulfinpyrazone: excretion of nitrofurantoin reduced by sulfinpyrazone (increased risk of toxicity)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Nitroimidazoles *see* Metronidazole and Tinidazole

Nitrous Oxide *see* Anaesthetics, General

Nizatidine *see* Histamine H_2-antagonists

Noradrenaline (norepinephrine) *see* Sympathomimetics

Norelgestromin *see* Progestogens

Norepinephrine (noradrenaline) *see* Sympathomimetics

Norethisterone *see* Progestogens

Norfloxacin *see* Quinolones

Norgestimate *see* Progestogens

Norgestrel *see* Progestogens

Nortriptyline *see* Antidepressants, Tricyclic

NSAIDs
Note *See also* Aspirin. Interactions do not generally apply to topical NSAIDs
ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hypotensive effect antagonised
Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers
Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers
- Analgesics: avoid concomitant use of NSAIDs with ●NSAIDs or ●aspirin (increased side-effects); avoid concomitant use of NSAIDs with ●ketorolac (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of aspirin

Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with angiotensin-II receptor antagonists, also hypotensive effect antagonised
- Antibacterials: indometacin possibly increases plasma concentration of amikacin and gentamicin in neonates; plasma concentration of etoricoxib reduced by rifampicin; possible increased risk of convulsions when NSAIDs given with ●quinolones
- Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with ●anticoagulants (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when ketorolac given with ●anticoagulants (avoid concomitant use, including low-dose heparin); NSAIDs possibly enhance anticoagulant effect of ●coumarins and ●phenindione; azapropazone enhances anticoagulant effect of ●coumarins (avoid concomitant use); possible increased risk of bleeding when NSAIDs given with ●dabigatran etexilate or heparins
- Antidepressants: increased risk of bleeding when NSAIDs given with ●SSRIs or ●venlafaxine
- Antidiabetics: azapropazone enhances effects of ●tolbutamide (avoid concomitant use); NSAIDs possibly enhance effects of ●sulphonylureas
- Antiepileptics: NSAIDs possibly enhance effects of ●phenytoin; azapropazone significantly increases plasma concentration of ●phenytoin—avoid concomitant use

Antifungals: plasma concentration of parecoxib increased by fluconazole (reduce dose of parecoxib); plasma concentration of celecoxib increased by fluconazole (halve dose of celecoxib); plasma concentration of diclofenac and ibuprofen increased by voriconazole
- Antipsychotics: possible severe drowsiness when indometacin given with haloperidol; avoid concomitant use of azapropazone with ●clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of piroxicam increased by ●ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of NSAIDs possibly increased by ritonavir; increased risk of haematological toxicity when NSAIDs given with zidovudine

Beta-blockers: NSAIDs antagonise hypotensive effect of beta-blockers
Bisphosphonates: indometacin increases bioavailability of tiludronic acid
Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of calcium-channel blockers
Cardiac Glycosides: NSAIDs possibly increase plasma concentration of cardiac glycosides, also possible exacerbation of heart failure and reduction of renal function

NSAIDs *(continued)*

- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with •ciclosporin; plasma concentration of diclofenac increased by •ciclosporin (halve dose of diclofenac)
  - Clonidine: NSAIDs antagonise hypotensive effect of clonidine
  - Clopidogrel: increased risk of bleeding when NSAIDs given with clopidogrel
  - Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with corticosteroids
- Cytotoxics: NSAIDs probably reduce excretion of •methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 575; azapropazone reduces excretion of •methotrexate (avoid concomitant use); diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of •methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 575; increased risk of bleeding when NSAIDs given with •erlotinib
  - Desmopressin: indometacin enhances effects of desmopressin
  - Diazoxide: NSAIDs antagonise hypotensive effect of diazoxide
- Dimethyl sulfoxide: avoid concomitant use of sulindac with •dimethyl sulfoxide
- Diuretics: risk of nephrotoxicity of NSAIDs increased by diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of diuretics; NSAIDs possibly antagonise diuretic effect of potassium canrenoate; occasional reports of reduced renal function when indometacin given with •triamterene—avoid concomitant use; possibly increased risk of hyperkalaemia when NSAIDs given with potassium-sparing diuretics and aldosterone antagonists; increased risk of hyperkalaemia when indometacin given with potassium-sparing diuretics and aldosterone antagonists
  - Iloprost: increased risk of bleeding when NSAIDs given with iloprost
  - Lipid-regulating Drugs: excretion of meloxicam increased by colestyramine
- Lithium: NSAIDs reduce excretion of •lithium (increased risk of toxicity); ketorolac reduces excretion of •lithium (increased risk of toxicity)—avoid concomitant use
  - Methyldopa: NSAIDs antagonise hypotensive effect of methyldopa
  - Moxonidine: NSAIDs antagonise hypotensive effect of moxonidine
  - Muscle Relaxants: ibuprofen reduces excretion of baclofen (increased risk of toxicity); NSAIDs possibly reduce excretion of baclofen (increased risk of toxicity)
  - Nitrates: NSAIDs antagonise hypotensive effect of nitrates
  - Oestrogens: etoricoxib increases plasma concentration of ethinylestradiol
  - Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with penicillamine
- Pentoxifylline (oxpentifylline): possible increased risk of bleeding when NSAIDs given with pentoxifylline (oxpentifylline); increased risk of bleeding when ketorolac given with •pentoxifylline (oxpentifylline) (avoid concomitant use)
  - Prasugrel: possible increased risk of bleeding when NSAIDs given with prasugrel
- Probenecid: excretion of dexketoprofen, indometacin, ketoprofen and naproxen reduced by •probenecid (increased plasma concentration); excretion of ketorolac reduced by •probenecid (increased plasma concentration)—avoid concomitant use
  - Sibutramine: increased risk of bleeding when NSAIDs given with sibutramine
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of

NSAIDs

- Tacrolimus *(continued)*
  - nephrotoxicity when ibuprofen given with •tacrolimus
  - Ulcer-healing Drugs: plasma concentration of azapropazone possibly increased by cimetidine
  - Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Octreotide

- Antidiabetics: octreotide possibly reduces requirements for insulin, metformin, repaglinide and sulphonylureas
- Ciclosporin: octreotide reduces plasma concentration of •ciclosporin
  - Dopaminergics: octreotide increases plasma concentration of bromocriptine
  - Ulcer-healing Drugs: octreotide possibly delays absorption of cimetidine

Oestrogens

Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings

- ACE Inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors
- Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of adrenergic neurone blockers
- Alpha-blockers: oestrogens antagonise hypotensive effect of alpha-blockers
- Analgesics: plasma concentration of ethinylestradiol increased by etoricoxib
- Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists
- Antibacterials: contraceptive effect of oestrogens possibly reduced by antibacterials that do not induce liver enzymes (risk probably small, see p. 445); metabolism of oestrogens accelerated by •rifamycins (reduced contraceptive effect—see p. 445)
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of •coumarins; oestrogens antagonise anticoagulant effect of •phenindione
- Antidepressants: contraceptive effect of oestrogens reduced by •St John's wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)
  - Antidiabetics: oestrogens antagonise hypoglycaemic effect of antidiabetics
- Antiepileptics: metabolism of oestrogens accelerated by •carbamazepine, •oxcarbazepine, •phenytoin, •primidone, •rufinamide and •topiramate (reduced contraceptive effect—see p. 445); oestrogens reduce plasma concentration of •lamotrigine
- Antifungals: anecdotal reports of contraceptive failure when oestrogens given with fluconazole, imidazoles, itraconazole or ketoconazole; metabolism of oestrogens accelerated by •griseofulvin (reduced contraceptive effect—see p. 445); occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine
- Antivirals: plasma concentration of ethinylestradiol increased by •atazanavir—avoid concomitant use; contraceptive effect of oestrogens possibly reduced by efavirenz; plasma concentration of oestrogens increased by fosamprenavir, also plasma concentration of fosamprenavir reduced—alternative contraception recommended; metabolism of oestrogens accelerated by •nelfinavir, •nevirapine and •ritonavir (reduced contraceptive effect—see p. 445)
  - Anxiolytics and Hypnotics: oestrogens increase plasma concentration of melatonin
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with •aprepitant (alternative contraception recommended)
- Barbiturates: metabolism of oestrogens accelerated by •barbiturates (reduced contraceptive effect—see p. 445)

Oestrogens *(continued)*

Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers

Bile Acids: elimination of cholesterol in bile increased when oestrogens given with bile acids

- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with •bosentan (alternative contraception recommended)

Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers

Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin

Clonidine: oestrogens antagonise hypotensive effect of clonidine

Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids

Diazoxide: oestrogens antagonise hypotensive effect of diazoxide

Diuretics: oestrogens antagonise diuretic effect of diuretics

Dopaminergics: oestrogens increase plasma concentration of ropinirole; oestrogens increase plasma concentration of selegiline (increased risk of toxicity)

Lipid-regulating Drugs: plasma concentration of ethinylestradiol increased by atorvastatin and rosuvastatin

Methyldopa: oestrogens antagonise hypotensive effect of methyldopa

- Modafinil: metabolism of oestrogens accelerated by •modafinil (reduced contraceptive effect—see p. 445)

Moxonidine: oestrogens antagonise hypotensive effect of moxonidine

Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)

Nitrates: oestrogens antagonise hypotensive effect of nitrates

Sitaxentan: plasma concentration of oestrogens increased by sitaxentan

Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin

Sugammadex: plasma concentration of oestrogens possibly reduced by sugammadex

Tacrolimus: metabolism of oestrogens possibly inhibited by tacrolimus; ethinylestradiol possibly increases plasma concentration of tacrolimus

Theophylline: oestrogens reduce excretion of theophylline (increased plasma concentration)

Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism

Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Oestrogens, conjugated *see* Oestrogens

Ofloxacin *see* Quinolones

Olanzapine *see* Antipsychotics

Olmesartan *see* Angiotensin-II Receptor Antagonists

Olsalazine *see* Aminosalicylates

Omeprazole *see* Proton Pump Inhibitors

Ondansetron *see* $5HT_3$ Antagonists

Opioid Analgesics

Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with alcohol

Antibacterials: plasma concentration of alfentanil increased by erythromycin; avoidance of premedication with opioid analgesics advised by manufacturer of ciprofloxacin (reduced plasma concentration of ciprofloxacin) when ciprofloxacin used for surgical prophylaxis; metabolism of methadone accelerated by rifampicin (reduced effect)

- Anticoagulants: tramadol enhances anticoagulant effect of •coumarins
- Antidepressants: plasma concentration of methadone possibly increased by fluoxetine, fluvoxamine, paroxetine and sertraline; possible increased serotonergic effects when pethidine or tramadol given with duloxetine; CNS excitation or depression (hypertension or hypotension) when pethidine given with •MAOIs—avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with •MAOIs—avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with •moclobemide; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with •moclobemide—avoid concomitant use; increased risk of CNS toxicity when tramadol given with •SSRIs or •tricyclics; possible increased serotonergic effects when tramadol given with mirtazapine; sedative effects possibly increased when opioid analgesics given with tricyclics

Opioid Analgesics *(continued)*

- Antidepressants *(continued)*
- Antiepileptics: plasma concentration of methadone reduced by carbamazepine; dextropropoxyphene enhances effects of •carbamazepine; effects of tramadol reduced by carbamazepine; morphine increases bioavailability of gabapentin; metabolism of methadone accelerated by phenytoin (reduced effect and risk of withdrawal effects); plasma concentration of methadone possibly reduced by primidone
- Antifungals: metabolism of buprenorphine inhibited by •ketoconazole (reduce dose of buprenorphine); metabolism of alfentanil inhibited by fluconazole (risk of prolonged or delayed respiratory depression); plasma concentration of fentanyl possibly increased by fluconazole and itraconazole; metabolism of alfentanil possibly inhibited by itraconazole; plasma concentration of alfentanil and methadone increased by •voriconazole (consider reducing dose of alfentanil and methadone)
- Antihistamines: sedative effects possibly increased when opioid analgesics given with •sedating antihistamines
- Antipsychotics: enhanced hypotensive and sedative effects when opioid analgesics given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with •antipsychotics that prolong the QT interval; increased risk of convulsions when tramadol given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with •amisulpride—avoid concomitant use
- Antivirals: plasma concentration of methadone possibly reduced by abacavir and nevirapine; plasma concentration of methadone reduced by efavirenz, fosamprenavir, nelfinavir and ritonavir; plasma concentration of alfentanil and fentanyl increased by •ritonavir; plasma concentration of pethidine reduced by •ritonavir, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); plasma concentration of morphine possibly reduced by ritonavir; plasma concentration of dextropropoxyphene increased by •ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ritonavir; methadone possibly increases plasma concentration of zidovudine

Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with anxiolytics and hypnotics

- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with •atomoxetine; possible increased risk of convulsions when tramadol given with atomoxetine

Barbiturates: CNS effects of opioid analgesics possibly increased by barbiturates; plasma concentration of methadone reduced by phenobarbital

Opioid Analgesics *(continued)*
Beta-blockers: morphine possibly increases plasma concentration of esmolol
Calcium-channel Blockers: metabolism of alfentanil inhibited by diltiazem (risk of prolonged or delayed respiratory depression)
Domperidone: opioid analgesics antagonise effects of domperidone on gastro-intestinal activity
- Dopaminergics: avoid concomitant use of dextromethorphan with ●rasagiline; risk of CNS toxicity when pethidine given with ●rasagiline (avoid pethidine for 2 weeks after rasagiline); hyperpyrexia and CNS toxicity reported when pethidine given with ●selegiline (avoid concomitant use); caution with tramadol advised by manufacturer of selegiline

$5HT_3$ Antagonists: effects of tramadol possibly antagonised by ondansetron
- Memantine: increased risk of CNS toxicity when dextromethorphan given with ●memantine (manufacturer of memantine advises avoid concomitant use)

Metoclopramide: opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity
- Sodium Oxybate: opioid analgesics enhance effects of ●sodium oxybate (avoid concomitant use)

Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by cimetidine (increased plasma concentration)

Orciprenaline *see* Sympathomimetics

Orlistat
Anti-arrhythmics: orlistat possibly reduces plasma concentration of amiodarone
Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of coumarins
Antidiabetics: manufacturer of orlistat advises avoid concomitant use with acarbose
- Ciclosporin: orlistat possibly reduces absorption of ●ciclosporin

Orphenadrine *see* Antimuscarinics

Oxaliplatin *see* Platinum Compounds

Oxandrolone *see* Anabolic Steroids

Oxazepam *see* Anxiolytics and Hypnotics

Oxcarbazepine
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort

Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of carbamazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; oxcarbazepine increases plasma concentration of phenytoin, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of oxcarbazepine antagonised by ●antipsychotics (convulsive threshold lowered)

Barbiturates: oxcarbazepine increases plasma concentration of phenobarbital, also plasma concentration of an active metabolite of oxcarbazepine reduced
Ciclosporin: oxcarbazepine possibly reduces plasma concentration of ciclosporin
- Cytotoxics: oxcarbazepine reduces plasma concentration of ●imatinib—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)

Oxcarbazepine *(continued)*
- Progestogens: oxcarbazepine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 445)

Oxprenolol *see* Beta-blockers

Oxybutynin *see* Antimuscarinics

Oxycodone *see* Opioid Analgesics

Oxymetazoline *see* Sympathomimetics

Oxytetracycline *see* Tetracyclines

Oxytocin
Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with volatile liquid general anaesthetics
Prostaglandins: uterotonic effect of oxytocin potentiated by prostaglandins
Sympathomimetics: risk of hypertension when oxytocin given with vasoconstrictor sympathomimetics (due to enhanced vasopressor effect)

Paclitaxel
Antidiabetics: paclitaxel possibly inhibits metabolism of rosiglitazone
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Antivirals: plasma concentration of paclitaxel increased by nelfinavir and ritonavir
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Paliperidone *see* Antipsychotics

Pancreatin
Antidiabetics: pancreatin antagonises hypoglycaemic effect of acarbose

Pancuronium *see* Muscle Relaxants

Pantoprazole *see* Proton Pump Inhibitors

Papaveretum *see* Opioid Analgesics

Paracetamol
Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of coumarins
Antiepileptics: metabolism of paracetamol possibly accelerated by carbamazepine
Cytotoxics: paracetamol possibly inhibits metabolism of *intravenous* busulfan (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol)
Lipid-regulating Drugs: absorption of paracetamol reduced by colestyramine
Metoclopramide: rate of absorption of paracetamol increased by metoclopramide

Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with ●alcohol
- Disulfiram: risk of toxicity when paraldehyde given with ●disulfiram

Parasympathomimetics
Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by propafenone
- Antibacterials: plasma concentration of galantamine increased by erythromycin; effects of neostigmine and pyridostigmine antagonised by ●aminoglycosides; effects of neostigmine and pyridostigmine antagonised by clindamycin; effects of neostigmine and pyridostigmine antagonised by ●polymyxins

Antidepressants: plasma concentration of galantamine increased by paroxetine
Antifungals: plasma concentration of galantamine increased by ketoconazole
Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine and hydroxychloroquine to increase symptoms of myasthenia gravis
Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics
Beta-blockers: increased risk of arrhythmias when pilocarpine given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol

Parasympathomimetics *(continued)*
Lithium: effects of neostigmine and pyridostigmine antagonised by lithium
Muscle Relaxants: donepezil possibly enhances effects of suxamethonium; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of suxamethonium; donepezil possibly antagonises effects of non-depolarising muscle relaxants; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of non-depolarising muscle relaxants

Parecoxib *see* NSAIDs

Paricalcitol *see* Vitamins

Paroxetine *see* Antidepressants, SSRI

Pegfilgrastim *see* Filgrastim

Peginterferon Alfa *see* Interferons

Penicillamine
Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs
Antacids: absorption of penicillamine reduced by antacids
- Antipsychotics: avoid concomitant use of penicillamine with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: penicillamine possibly reduces plasma concentration of digoxin
Gold: manufacturer of penicillamine advises avoid concomitant use with gold (increased risk of toxicity)
Iron: absorption of penicillamine reduced by *oral* iron
Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc

Penicillins
Allopurinol: increased risk of rash when amoxicillin or ampicillin given with allopurinol
Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin
Anticoagulants: common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin, although studies have failed to demonstrate an interaction with coumarins or phenindione
Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity)
Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and suxamethonium
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Probenecid: excretion of penicillins reduced by probenecid (increased plasma concentration)
Sugammadex: flucloxacillin possibly reduces response to sugammadex
Sulfinpyrazone: excretion of penicillins reduced by sulfinpyrazone
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Pentamidine Isetionate
- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with •amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with parenteral •erythromycin; increased risk of ventricular arrhythmias when pentamidine isetionate given with •moxifloxacin—avoid concomitant use
- Antidepressants: increased risk of ventricular arrhythmias when pentamidine isetionate given with •tricyclics

Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with amphotericin
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with •amisulpride or •droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with •phenothiazines
- Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with •ivabradine

Pentazocine *see* Opioid Analgesics

Pentostatin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased toxicity when pentostatin given with high-dose •cyclophosphamide—avoid concomitant use; increased pulmonary toxicity when pentostatin given with •fludarabine (unacceptably high incidence of fatalities)

Pentoxifylline (oxpentifylline)
- Analgesics: possible increased risk of bleeding when pentoxifylline (oxpentifylline) given with NSAIDs; increased risk of bleeding when pentoxifylline (oxpentifylline) given with •ketorolac (avoid concomitant use)

Theophylline: pentoxifylline (oxpentifylline) increases plasma concentration of theophylline

Pergolide
Antipsychotics: effects of pergolide antagonised by antipsychotics
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: antiparkinsonian effect of pergolide antagonised by metoclopramide

Pericyazine *see* Antipsychotics

Perindopril *see* ACE Inhibitors

Perphenazine *see* Antipsychotics

Pethidine *see* Opioid Analgesics

Phenazocine *see* Opioid Analgesics

Phenelzine *see* MAOIs

Phenindione
Note Change in patient's clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control
- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of •alcohol
- Anabolic Steroids: anticoagulant effect of phenindione enhanced by •anabolic steroids
- Analgesics: anticoagulant effect of phenindione possibly enhanced by •NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous •diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with •ketorolac (avoid concomitant use, including low-dose heparin); increased risk of bleeding when phenindione given with •aspirin (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by •amiodarone (enhanced anticoagulant effect)
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with •neomycin (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by levofloxacin and •tetracyclines; studies have failed to demonstrate an interaction with phenindione, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin
- Antivirals: anticoagulant effect of phenindione possibly enhanced by •ritonavir
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of •clopidogrel
- Dipyridamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of •dipyridamole
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some •enteral feeds)

Phenindione *(continued)*
Iloprost: increased risk of bleeding when phenindione given with iloprost
- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by ●colestyramine; anticoagulant effect of phenindione possibly enhanced by ●rosuvastatin; anticoagulant effect of phenindione enhanced by ●fibrates
- Oestrogens: anticoagulant effect of phenindione antagonised by ●oestrogens

Prasugrel: possible increased risk of bleeding when phenindione given with prasugrel
- Progestogens: anticoagulant effect of phenindione antagonised by ●progestogens

Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine
- Testolactone: anticoagulant effect of phenindione enhanced by ●testolactone
- Testosterone: anticoagulant effect of phenindione enhanced by ●testosterone
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by ●thyroid hormones
- Vitamins: anticoagulant effect of phenindione antagonised by ●vitamin K

Phenobarbital *see* Barbiturates

Phenothiazines *see* Antipsychotics

Phenoxybenzamine *see* Alpha-blockers

Phenoxymethylpenicillin *see* Penicillins

Phentolamine *see* Alpha-blockers

Phenylephrine *see* Sympathomimetics

Phenytoin
Note Fosphenytoin interactions as for phenytoin
- Analgesics: effects of phenytoin possibly enhanced by ●NSAIDs; plasma concentration of phenytoin significantly increased by ●azapropazone—avoid concomitant use; phenytoin accelerates metabolism of methadone (reduced effect and risk of withdrawal effects); effects of phenytoin enhanced by aspirin

Antacids: absorption of phenytoin reduced by antacids
- Anti-arrhythmics: metabolism of phenytoin inhibited by ●amiodarone (increased plasma concentration); phenytoin reduces plasma concentration of disopyramide
- Antibacterials: metabolism of phenytoin inhibited by clarithromycin, ●isoniazid and ●metronidazole (increased plasma concentration); plasma concentration of phenytoin increased or decreased by ciprofloxacin; phenytoin accelerates metabolism of doxycycline (reduced plasma concentration); plasma concentration of phenytoin increased by ●chloramphenicol (increased risk of toxicity); metabolism of phenytoin accelerated by ●rifamycins (reduced plasma concentration); plasma concentration of phenytoin possibly increased by sulphonamides; phenytoin reduces plasma concentration of ●telithromycin (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by ●trimethoprim (also increased antifolate effect)
- Anticoagulants: phenytoin accelerates metabolism of ●coumarins (possibility of reduced anticoagulant effect, but enhancement also reported)
- Antidepressants: plasma concentration of phenytoin increased by ●fluoxetine and ●fluvoxamine; phenytoin reduces plasma concentration of ●mianserin, mirtazapine and paroxetine; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort; phenytoin possibly reduces plasma concentration of ●tricyclics

Antidiabetics: plasma concentration of phenytoin transiently increased by tolbutamide (possibility of toxicity)
- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with carbamazepine, also plasma concentration of phenytoin

Phenytoin
- Antiepileptics *(continued)*
may be increased; plasma concentration of phenytoin possibly increased by ●ethosuximide, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of lamotrigine, tiagabine and zonisamide; plasma concentration of phenytoin increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin possibly reduces plasma concentration of primidone (but concentration of an active metabolite increased), plasma concentration of phenytoin often reduced but may be increased; plasma concentration of phenytoin possibly increased by rufinamide; plasma concentration of phenytoin increased by ●stiripentol; plasma concentration of phenytoin increased by ●topiramate (also plasma concentration of topiramate reduced); plasma concentration of phenytoin increased or possibly reduced when given with valproate, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by vigabatrin
- Antifungals: phenytoin reduces plasma concentration of ●ketoconazole and ●posaconazole; anticonvulsant effect of phenytoin enhanced by ●miconazole (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by ●fluconazole (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of ●itraconazole—avoid concomitant use; plasma concentration of phenytoin increased by ●voriconazole, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine; anticonvulsant effect of phenytoin antagonised by ●pyrimethamine, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of phenytoin antagonised by ●antipsychotics (convulsive threshold lowered); phenytoin possibly reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole; phenytoin accelerates metabolism of clozapine, quetiapine and sertindole (reduced plasma concentration)
- Antivirals: phenytoin possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir, lopinavir and saquinavir; avoidance of phenytoin advised by manufacturer of etravirine; phenytoin possibly reduces plasma concentration of ●indinavir, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin reduced by nelfinavir; phenytoin possibly reduces plasma concentration of ritonavir, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by zidovudine

Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of clonazepam; plasma concentration of phenytoin increased or decreased by diazepam; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines

Aprepitant: phenytoin possibly reduces plasma concentration of aprepitant

Barbiturates: phenytoin often increases plasma concentration of phenobarbital, plasma concentration of phenytoin often reduced but may be increased

Bupropion: phenytoin reduces plasma concentration of bupropion
- Calcium-channel Blockers: phenytoin reduces effects of felodipine, isradipine and verapamil; phenytoin

Phenytoin

- Calcium-channel Blockers *(continued)*
  probably reduces effects of dihydropyridines, nicardipine and ●nifedipine; plasma concentration of phenytoin increased by ●diltiazem but also effect of diltiazem reduced
  Cardiac Glycosides: phenytoin accelerates metabolism of digitoxin (reduced effect); phenytoin possibly reduces plasma concentration of digoxin
- Ciclosporin: phenytoin accelerates metabolism of ●ciclosporin (reduced plasma concentration)
- Corticosteroids: phenytoin accelerates metabolism of ●corticosteroids (reduced effect)
- Cytotoxics: phenytoin possibly reduces plasma concentration of busulfan and etoposide; metabolism of phenytoin possibly inhibited by fluorouracil (increased risk of toxicity); phenytoin increases antifolate effect of methotrexate; absorption of phenytoin possibly reduced by cytotoxics; phenytoin reduces plasma concentration of ●imatinib—avoid concomitant use; avoidance of phenytoin advised by manufacturer of ●lapatinib; phenytoin reduces plasma concentration of irinotecan and its active metabolite
  Diazoxide: plasma concentration of phenytoin reduced by diazoxide, also effect of diazoxide may be reduced
- Disulfiram: metabolism of phenytoin inhibited by ●disulfiram (increased risk of toxicity)
- Diuretics: phenytoin antagonises effects of furosemide (frusemide); phenytoin reduces plasma concentration of ●eplerenone—avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbonic anhydrase inhibitors
  Dopaminergics: phenytoin possibly reduces effects of levodopa
  Enteral Foods: absorption of phenytoin possibly reduced by enteral feeds
  Folates: plasma concentration of phenytoin possibly reduced by folates
  Hormone Antagonists: phenytoin accelerates metabolism of gestrinone (reduced plasma concentration); phenytoin possibly accelerates metabolism of toremifene
  $5HT_3$ Antagonists: phenytoin accelerates metabolism of ondansetron (reduced effect)
  Leflunomide: plasma concentration of phenytoin possibly increased by leflunomide
  Levamisole: plasma concentration of phenytoin possibly increased by levamisole
  Lipid-regulating Drugs: combination of phenytoin with fluvastatin may increase plasma concentration of either drug (or both)
  Lithium: neurotoxicity may occur when phenytoin given with lithium without increased plasma concentration of lithium
  Modafinil: plasma concentration of phenytoin possibly increased by modafinil
  Muscle Relaxants: phenytoin antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)
- Oestrogens: phenytoin accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: phenytoin accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 445)
- Sulfinpyrazone: plasma concentration of phenytoin increased by ●sulfinpyrazone
  Sympathomimetics: plasma concentration of phenytoin increased by methylphenidate
  Tacrolimus: phenytoin reduces plasma concentration of tacrolimus, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with ●theophylline
  Thyroid Hormones: phenytoin accelerates metabolism of thyroid hormones (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

Phenytoin *(continued)*

Tibolone: phenytoin accelerates metabolism of tibolone

- Ulcer-healing Drugs: metabolism of phenytoin inhibited by ●cimetidine (increased plasma concentration); effects of phenytoin enhanced by ●esomeprazole; effects of phenytoin possibly enhanced by omeprazole; absorption of phenytoin reduced by ●sucralfate
  Vaccines: effects of phenytoin enhanced by influenza vaccine
  Vitamins: phenytoin possibly increases requirements for vitamin D

Phosphodiesterase Inhibitors

- Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of ●anagrelide

Physostigmine *see* Parasympathomimetics

Pilocarpine *see* Parasympathomimetics

Pimozide *see* Antipsychotics

Pindolol *see* Beta-blockers

Pioglitazone *see* Antidiabetics

Piperacillin *see* Penicillins

Pipotiazine *see* Antipsychotics

Piroxicam *see* NSAIDs

Pivmecillinam *see* Penicillins

Pizotifen

Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of adrenergic neurone blockers

Platinum Compounds

- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with ●aminoglycosides or ●polymyxins; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with vancomycin
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased pulmonary toxicity when cisplatin given with ●bleomycin and ●methotrexate
  Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with diuretics

Polymyxin B *see* Polymyxins

Polymyxins

Antibacterials: increased risk of nephrotoxicity when colistin or polymyxins given with aminoglycosides; increased risk of nephrotoxicity when colistin or polymyxins given with capreomycin; increased risk of nephrotoxicity and ototoxicity when colistin given with teicoplanin or vancomycin; increased risk of nephrotoxicity when polymyxins given with vancomycin

Antifungals: increased risk of nephrotoxicity when polymyxins given with amphotericin

- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with ●ciclosporin
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with ●platinum compounds
- Diuretics: increased risk of otoxicity when polymyxins given with ●loop diuretics
- Muscle Relaxants: polymyxins enhance effects of ●non-depolarising muscle relaxants and ●suxamethonium

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

- Parasympathomimetics: polymyxins antagonise effects of ●neostigmine and ●pyridostigmine

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Polystyrene Sulphonate Resins

Thyroid Hormones: polystyrene sulphonate resins reduce absorption of levothyroxine (thyroxine)

Posaconazole *see* Antifungals, Triazole

Potassium Canrenoate *see* Diuretics

Potassium Aminobenzoate

Antibacterials: potassium aminobenzoate inhibits effects of sulphonamides

Potassium Bicarbonate *see* Potassium Salts

Potassium Chloride *see* Potassium Salts

Potassium Citrate *see* Potassium Salts

Potassium Salts

Note Includes salt substitutes

- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with •ACE inhibitors

Aliskiren: increased risk of hyperkalaemia when potassium salts given with aliskiren

- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with •angiotensin-II receptor antagonists

Antibacterials: avoid concomitant use of potassium citrate with methenamine

- Ciclosporin: increased risk of hyperkalaemia when potassium salts given with •ciclosporin
- Diuretics: increased risk of hyperkalaemia when potassium salts given with •potassium-sparing diuretics and aldosterone antagonists
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with •tacrolimus

Pramipexole

Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of antipsychotics (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Ulcer-healing Drugs: excretion of pramipexole reduced by cimetidine (increased plasma concentration)

Prasugrel

Analgesics: possible increased risk of bleeding when prasugrel given with NSAIDs

Anticoagulants: possible increased risk of bleeding when prasugrel given with coumarins or phenindione

Clopidogrel: possible increased risk of bleeding when prasugrel given with clopidogrel

Pravastatin *see* Statins

Prazosin *see* Alpha-blockers

Prednisolone *see* Corticosteroids

Prilocaine

Anti-arrhythmics: increased myocardial depression when prilocaine given with anti-arrhythmics

Antibacterials: increased risk of methaemoglobinaemia when prilocaine given with sulphonamides

Primaquine

- Antimalarials: avoidance of antimalarials advised by manufacturer of •artemether/lumefantrine

Mepacrine: plasma concentration of primaquine increased by mepacrine (increased risk of toxicity)

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Primidone

Alcohol: increased sedative effect when primidone given with alcohol

Analgesics: primidone possibly reduces plasma concentration of methadone

Anti-arrhythmics: primidone accelerates metabolism of disopyramide (reduced plasma concentration)

- Antibacterials: primidone accelerates metabolism of •chloramphenicol, doxycycline and metronidazole (reduced plasma concentration); primidone reduces plasma concentration of •telithromycin (avoid during and for 2 weeks after primidone)
- Anticoagulants: primidone accelerates metabolism of •coumarins (reduced anticoagulant effect)
- Antidepressants: primidone reduces plasma concentration of paroxetine; primidone accelerates metabolism of •mianserin (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by

Primidone

- Antidepressants *(continued)*

•SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort; anticonvulsant effect of primidone antagonised by •tricyclics (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

- Antiepileptics: primidone often reduces plasma concentration of carbamazepine, also plasma concentration of primidone sometimes reduced (but concentration of an active metabolite of primidone often increased); primidone possibly reduces plasma concentration of ethosuximide; primidone reduces plasma concentration of lamotrigine and tiagabine; plasma concentration of primidone possibly reduced by phenytoin (but concentration of an active metabolite increased), plasma concentration of phenytoin often reduced but may be increased; plasma concentration of primidone possibly increased by •valproate (plasma concentration of active metabolite of primidone increased), also plasma concentration of valproate reduced; plasma concentration of primidone possibly reduced by vigabatrin
- Antifungals: primidone possibly reduces plasma concentration of •posaconazole; primidone possibly reduces plasma concentration of •voriconazole—avoid concomitant use; primidone reduces absorption of griseofulvin (reduced effect)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of primidone antagonised by •antipsychotics (convulsive threshold lowered); primidone accelerates metabolism of haloperidol (reduced plasma concentration); primidone possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole
- Antivirals: primidone possibly reduces plasma concentration of •indinavir, •lopinavir, •nelfinavir and •saquinavir

Anxiolytics and Hypnotics: primidone often reduces plasma concentration of clonazepam

Barbiturates: increased sedative effect when primidone given with barbiturates

- Calcium-channel Blockers: primidone reduces effects of •felodipine and •isradipine; primidone probably reduces effects of •dihydropyridines, •diltiazem and •verapamil

Cardiac Glycosides: primidone accelerates metabolism of digitoxin (reduced effect)

- Ciclosporin: primidone accelerates metabolism of •ciclosporin (reduced effect)
- Corticosteroids: primidone accelerates metabolism of •corticosteroids (reduced effect)

Diuretics: plasma concentration of primidone possibly reduced by acetazolamide; increased risk of osteomalacia when primidone given with carbonic anhydrase inhibitors

Folates: plasma concentration of primidone possibly reduced by folates

Hormone Antagonists: primidone accelerates metabolism of gestrinone and toremifene (reduced plasma concentration)

Leukotriene Receptor Antagonists: primidone reduces plasma concentration of montelukast

Memantine: effects of primidone possibly reduced by memantine

- Oestrogens: primidone accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: primidone accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 445)

Sympathomimetics: plasma concentration of primidone possibly increased by methylphenidate

Theophylline: primidone accelerates metabolism of theophylline (reduced effect)

Primidone *(continued)*
Thyroid Hormones: primidone accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)
Tibolone: primidone accelerates metabolism of tibolone (reduced plasma concentration)
Vitamins: primidone possibly increases requirements for vitamin D

Probenecid
ACE Inhibitors: probenecid reduces excretion of captopril
Anaesthetics, General: probenecid possibly enhances effects of thiopental
- Analgesics: probenecid reduces excretion of •dexketoprofen, •indometacin, •ketoprofen and •naproxen (increased plasma concentration); probenecid reduces excretion of •ketorolac (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by aspirin

Antibacterials: probenecid reduces excretion of doripenem and meropenem (manufacturers of doripenem and meropenem advise avoid concomitant use); probenecid reduces excretion of cephalosporins, ciprofloxacin, nalidixic acid, norfloxacin and penicillins (increased plasma concentration); probenecid reduces excretion of dapsone and nitrofurantoin (increased risk of side-effects); effects of probenecid antagonised by pyrazinamide
Antidiabetics: probenecid possibly enhances hypoglycaemic effect of chlorpropamide
- Antivirals: probenecid reduces excretion of aciclovir (increased plasma concentration); probenecid possibly reduces excretion of famciclovir (increased plasma concentration); probenecid reduces excretion of ganciclovir and •zidovudine (increased plasma concentration and risk of toxicity)

Anxiolytics and Hypnotics: probenecid reduces excretion of lorazepam (increased plasma concentration); probenecid possibly reduces excretion of nitrazepam (increased plasma concentration)
- Cytotoxics: probenecid reduces excretion of •methotrexate (increased risk of toxicity)

Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by sodium benzoate
Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by sodium phenylbutyrate

Procarbazine
Alcohol: disulfiram-like reaction when procarbazine given with alcohol
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Prochlorperazine *see* Antipsychotics

Procyclidine *see* Antimuscarinics

Progesterone *see* Progestogens

Progestogens
Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings
- Antibacterials: metabolism of progestogens accelerated by •rifamycins (reduced contraceptive effect—see p. 445)
- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of •coumarins; progestogens antagonise anticoagulant effect of •phenindione
- Antidepressants: contraceptive effect of progestogens reduced by •St John's wort (avoid concomitant use)

Antidiabetics: progestogens antagonise hypoglycaemic effect of antidiabetics
- Antiepileptics: metabolism of progestogens accelerated by •carbamazepine, •oxcarbazepine, •phenytoin, •primidone, •rufinamide and •topiramate (reduced contraceptive effect—see p. 445); progestogens reduce plasma concentration of •lamotrigine

Progestogens *(continued)*
- Antifungals: metabolism of progestogens accelerated by •griseofulvin (reduced contraceptive effect—see p. 445); occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbinafine
- Antivirals: plasma concentration of progestogens increased by fosamprenavir, also plasma concentration of fosamprenavir reduced—alternative contraception recommended; contraceptive effect of progestogens possibly reduced by nelfinavir; metabolism of progestogens accelerated by •nevirapine (reduced contraceptive effect—see p. 445)
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with •aprepitant (alternative contraception recommended)
- Barbiturates: metabolism of progestogens accelerated by •barbiturates (reduced contraceptive effect—see p. 445)
- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with •bosentan (alternative contraception recommended)
- Ciclosporin: progestogens inhibit metabolism of •ciclosporin (increased plasma concentration)

Diuretics: risk of hyperkalaemia when drospirenone given with potassium-sparing diuretics and aldosterone antagonists (monitor serum potassium during first cycle)
Dopaminergics: progestogens increase plasma concentration of selegiline (increased risk of toxicity)
Lipid-regulating Drugs: plasma concentration of norethisterone increased by atorvastatin; plasma concentration of norgestrel increased by rosuvastatin
Muscle Relaxants: progestogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)
Sitaxentan: plasma concentration of progestogens increased by sitaxentan
Sugammadex: plasma concentration of progestogens possibly reduced by sugammadex
Tacrolimus: metabolism of progestogens possibly inhibited by tacrolimus

Proguanil
Antacids: absorption of proguanil reduced by oral magnesium salts (as magnesium trisilicate)
Anticoagulants: isolated reports that proguanil may enhance anticoagulant effect of warfarin
- Antimalarials: avoidance of antimalarials advised by manufacturer of •artemether/lumefantrine; increased antifolate effect when proguanil given with pyrimethamine

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Promazine *see* Antipsychotics

Promethazine *see* Antihistamines

Propafenone
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics
- Antibacterials: metabolism of propafenone accelerated by •rifampicin (reduced effect)
- Anticoagulants: propafenone enhances anticoagulant effect of •coumarins
- Antidepressants: metabolism of propafenone possibly inhibited by paroxetine (increased risk of toxicity); increased risk of arrhythmias when propafenone given with •tricyclics
- Antihistamines: increased risk of ventricular arrhythmias when propafenone given with •mizolastine—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval

Propafenone *(continued)*
- Antivirals: plasma concentration of propafenone possibly increased by ●fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by ●ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use)
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●beta-blockers; propafenone increases plasma concentration of metoprolol and propranolol
- Cardiac Glycosides: propafenone increases plasma concentration of ●digoxin (halve dose of digoxin)

Ciclosporin: propafenone possibly increases plasma concentration of ciclosporin
- $5HT_3$ Antagonists: increased risk of ventricular arrhythmias when propafenone given with ●dolasetron—avoid concomitant use

Parasympathomimetics: propafenone possibly antagonises effects of neostigmine and pyridostigmine

Theophylline: propafenone increases plasma concentration of theophylline
- Ulcer-healing Drugs: plasma concentration of propafenone increased by ●cimetidine

Propantheline *see* Antimuscarinics

Propiverine *see* Antimuscarinics

Propofol *see* Anaesthetics, General

Propranolol *see* Beta-blockers

Prostaglandins

ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with adrenergic neurone blockers

Alpha-blockers: enhanced hypotensive effect when alprostadil given with alpha-blockers

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with angiotensin-II receptor antagonists

Beta-blockers: enhanced hypotensive effect when alprostadil given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when alprostadil given with clonidine

Diazoxide: enhanced hypotensive effect when alprostadil given with diazoxide

Diuretics: enhanced hypotensive effect when alprostadil given with diuretics

Methyldopa: enhanced hypotensive effect when alprostadil given with methyldopa

Moxonidine: enhanced hypotensive effect when alprostadil given with moxonidine

Nitrates: enhanced hypotensive effect when alprostadil given with nitrates

Oxytocin: prostaglandins potentiate uterotonic effect of oxytocin

Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with hydralazine, minoxidil or sodium nitroprusside

Protein Kinase Inhibitors *see* Dasatinib, Erlotinib, Imatinib, Lapatinib, Nilotinib, Sorafenib, Sunitinib, and Temsirolimus

Proton Pump Inhibitors

Antacids: absorption of lansoprazole possibly reduced by antacids

Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin
- Anticoagulants: esomeprazole, omeprazole and pantoprazole possibly enhance anticoagulant effect of ●coumarins

Antidepressants: omeprazole increases plasma concentration of escitalopram; plasma concentration of lansoprazole possibly increased by fluvoxamine
- Antiepileptics: esomeprazole enhances effects of ●phenytoin; omeprazole possibly enhances effects of phenytoin

Proton Pump Inhibitors *(continued)*

Antifungals: proton pump inhibitors reduce absorption of itraconazole and ketoconazole; plasma concentration of esomeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)

Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine
- Antivirals: proton pump inhibitors reduce plasma concentration of ●atazanavir; omeprazole reduces plasma concentration of ●nelfinavir—avoid concomitant use; proton pump inhibitors possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; omeprazole increases plasma concentration of ●raltegravir—avoid concomitant use; omeprazole increases plasma concentration of saquinavir; plasma concentration of esomeprazole and omeprazole reduced by ●tipranavir

Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of diazepam (increased plasma concentration)

Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of digoxin

Ciclosporin: omeprazole possibly affects plasma concentration of ciclosporin
- Cilostazol: omeprazole increases plasma concentration of ●cilostazol (risk of toxicity)—avoid concomitant use; lansoprazole possibly increases plasma concentration of ●cilostazol—avoid concomitant use
- Clopidogrel: proton pump inhibitors possibly reduce antiplatelet effect of ●clopidogrel—avoid concomitant use

Cytotoxics: omeprazole possibly reduces excretion of methotrexate (increased risk of toxicity); proton pump inhibitors possibly reduce absorption of lapatinib; avoidance of proton pump inhibitors advised by manufacturer of nilotinib

Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by sucralfate

Pseudoephedrine *see* Sympathomimetics

Pyrazinamide

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Probenecid: pyrazinamide antagonises effects of probenecid

Sulfinpyrazone: pyrazinamide antagonises effects of sulfinpyrazone

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Pyridostigmine *see* Parasympathomimetics

Pyridoxine *see* Vitamins

Pyrimethamine
- Antibacterials: increased antifolate effect when pyrimethamine given with ●sulphonamides or ●trimethoprim
- Antiepileptics: pyrimethamine antagonises anticonvulsant effect of ●phenytoin, also increased antifolate effect
- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine; increased antifolate effect when pyrimethamine given with proguanil

Antivirals: increased antifolate effect when pyrimethamine given with zidovudine
- Cytotoxics: pyrimethamine increases antifolate effect of ●methotrexate

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Quetiapine *see* Antipsychotics

Quinagolide

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Quinapril *see* ACE Inhibitors

Quinine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with •amiodarone—avoid concomitant use; quinine increases plasma concentration of •flecainide
- Antibacterials: increased risk of ventricular arrhythmias when quinine given with •moxifloxacin—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when quinine given with •artemether/lumefantrine; avoidance of antimalarials advised by manufacturer of •artemether/lumefantrine; increased risk of convulsions when quinine given with •mefloquine (but should not prevent the use of intravenous quinine in severe cases)
- Antipsychotics: increased risk of ventricular arrhythmias when quinine given with •droperidol or •pimozide—avoid concomitant use
- Cardiac Glycosides: quinine increases plasma concentration of •digoxin

Muscle Relaxants: quinine possibly enhances effects of suxamethonium

Ulcer-healing Drugs: metabolism of quinine inhibited by cimetidine (increased plasma concentration)

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 688

Quinolones

- Analgesics: possible increased risk of convulsions when quinolones given with •NSAIDs; manufacturer of ciprofloxacin advises avoid premedication with opioid analgesics (reduced plasma concentration of ciprofloxacin) when ciprofloxacin used for surgical prophylaxis

Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with •amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with •disopyramide—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with parenteral •erythromycin—avoid concomitant use
- Anticoagulants: ciprofloxacin, nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of •coumarins; levofloxacin possibly enhances anticoagulant effect of coumarins and phenindione
- Antidepressants: ciprofloxacin inhibits metabolism of •duloxetine—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of •agomelatine; increased risk of ventricular arrhythmias when moxifloxacin given with •tricyclics—avoid concomitant use

Antidiabetics: ciprofloxacin and norfloxacin possibly enhance effects of glibenclamide

Antiepileptics: ciprofloxacin increases or decreases plasma concentration of phenytoin

- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of quinolones advised by manufacturer of •artemether/lumefantrine; increased risk of ventricular arrhythmias when moxifloxacin given with •chloroquine and hydroxychloroquine, •mefloquine or •quinine—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with •benperidol—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with •droperidol, •haloperidol, •phenothiazines, •pimozide, •sertindole or •zuclopenthixol—avoid concomitant use; ciprofloxacin increases plasma concentration of clozapine; ciprofloxacin possibly increases plasma concentration of olanzapine

Quinolones *(continued)*

- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with •atomoxetine
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with •sotalol—avoid concomitant use

Calcium Salts: absorption of ciprofloxacin reduced by calcium salts

- Ciclosporin: increased risk of nephrotoxicity when quinolones given with •ciclosporin
- Cytotoxics: nalidixic acid increases risk of melphalan toxicity; ciprofloxacin possibly reduces excretion of methotrexate (increased risk of toxicity); avoidance of moxifloxacin advised by manufacturer of •nilotinib

Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by dairy products

Dopaminergics: ciprofloxacin inhibits metabolism of ropinirole (increased plasma concentration)

$5HT_1$ Agonists: quinolones possibly inhibit metabolism of zolmitriptan (reduce dose of zolmitriptan)

Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by *oral* iron

- Muscle Relaxants: ciprofloxacin increases plasma concentration of •tizanidine (increased risk of toxicity)—avoid concomitant use; norfloxacin possibly increases plasma concentration of tizanidine (increased risk of toxicity)

Mycophenolate: norfloxacin possibly reduces bioavailability of mycophenolate

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when moxifloxacin given with •pentamidine isetionate—avoid concomitant use

Probenecid: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by probenecid (increased plasma concentration)

Sevelamer: bioavailability of ciprofloxacin reduced by sevelamer

Strontium Ranelate: absorption of quinolones reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)

- Theophylline: possible increased risk of convulsions when quinolones given with •theophylline; ciprofloxacin and norfloxacin increase plasma concentration of •theophylline

Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by sucralfate

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by zinc

Quinupristin with Dalfopristin

- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinupristin/dalfopristin given with •disopyramide or •lidocaine (lignocaine)—avoid concomitant use

Antibacterials: manufacturer of quinupristin/dalfopristin recommends monitoring liver function when given with rifampicin

Antivirals: quinupristin/dalfopristin possibly increases plasma concentration of saquinavir

- Anxiolytics and Hypnotics: quinupristin/dalfopristin inhibits metabolism of •midazolam (increased plasma concentration with increased sedation); quinupristin/dalfopristin inhibits the metabolism of zopiclone
- Calcium-channel Blockers: quinupristin/dalfopristin increases plasma concentration of •nifedipine
- Ciclosporin: quinupristin/dalfopristin increases plasma concentration of •ciclosporin
- Ergot Alkaloids: manufacturer of quinupristin/dalfopristin advises avoid concomitant use with •ergotamine and methysergide

Quinupristin with Dalfopristin *(continued)*
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
- Tacrolimus: quinupristin/dalfopristin increases plasma concentration of •tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Rabeprazole *see* Proton Pump Inhibitors

Raloxifene
Anticoagulants: raloxifene antagonises anticoagulant effect of coumarins
Lipid-regulating Drugs: absorption of raloxifene reduced by colestyramine (manufacturer of raloxifene advises avoid concomitant administration)

Raltegravir
- Antibacterials: plasma concentration of raltegravir reduced by •rifampicin—consider increasing dose of raltegravir
- Ulcer-healing Drugs: plasma concentration of raltegravir increased by •omeprazole—avoid concomitant use; plasma concentration of raltegravir possibly increased by histamine H_2-antagonists and proton pump inhibitors—manufacturer of raltegravir advises avoid concomitant use

Ramipril *see* ACE Inhibitors

Ranitidine *see* Histamine H_2-antagonists

Ranolazine
- Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with •disopyramide
- Antibacterials: plasma concentration of ranolazine possibly increased by •clarithromycin and •telithromycin—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by •rifampicin—manufacturer of ranolazine advises avoid concomitant use

Antidepressants: plasma concentration of ranolazine increased by paroxetine
- Antifungals: plasma concentration of ranolazine increased by •ketoconazole—avoid concomitant use; plasma concentration of ranolazine possibly increased by •itraconazole, •posaconazole and •voriconazole—manufacturer of ranolazine advises avoid concomitant use
- Antivirals: plasma concentration of ranolazine possibly increased by •atazanavir, •darunavir, •fosamprenavir, •indinavir, •lopinavir, •nelfinavir, •ritonavir, •saquinavir and •tipranavir—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with •sotalol

Calcium-channel Blockers: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)
Cardiac Glycosides: ranolazine increases plasma concentration of digoxin
Ciclosporin: plasma concentration of ranolazine possibly increased by ciclosporin
- Grapefruit Juice: plasma concentration of ranolazine possibly increased by •grapefruit juice—manufacturer of ranolazine advises avoid concomitant use

Lipid-regulating Drugs: ranolazine increases plasma concentration of simvastatin (consider reducing dose of simvastatin)

Rasagiline
Note Rasagiline is a MAO-B inhibitor
- Analgesics: avoid concomitant use of rasagiline with •dextromethorphan; risk of CNS toxicity when rasagiline given with •pethidine (avoid pethidine for 2 weeks after rasagiline)
- Antidepressants: after stopping rasagiline do not start •fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start •fluvoxamine for 2 weeks; risk of hypertensive crisis when rasagiline given with •MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with •SSRIs or •tricyclics

Rasagiline *(continued)*
Dopaminergics: plasma concentration of rasagiline possibly reduced by entacapone
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Sympathomimetics: avoid concomitant use of rasagiline with •sympathomimetics

Reboxetine
- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with •macrolides
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with •fluvoxamine; increased risk of hypertension and CNS excitation when reboxetine given with •MAOIs (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- Antifungals: manufacturer of reboxetine advises avoid concomitant use with •imidazoles and •triazoles
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
Diuretics: possible increased risk of hypokalaemia when reboxetine given with loop diuretics or thiazides and related diuretics
Ergot Alkaloids: possible risk of hypertension when reboxetine given with ergotamine and methysergide
- Sibutramine: increased risk of CNS toxicity when noradrenaline re-uptake inhibitors given with •sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Remifentanil *see* Opioid Analgesics

Repaglinide *see* Antidiabetics

Retinoids
- Alcohol: etretinate formed from acitretin in presence of •alcohol (increased risk of teratogenecity in women of child-bearing potential)
- Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with •tetracyclines (avoid concomitant use)
- Anticoagulants: acitretin possibly reduces anticoagulant effect of •coumarins

Antiepileptics: isotretinoin possibly reduces plasma concentration of carbamazepine
Antifungals: plasma concentration of alitretinoin increased by ketoconazole
- Cytotoxics: acitretin increases plasma concentration of •methotrexate (also increased risk of hepatotoxicity)—avoid concomitant use

Lipid-regulating Drugs: alitretinoin reduces plasma concentration of simvastatin
Vitamins: risk of hypervitaminosis A when retinoids given with vitamin A

Ribavirin
- Antivirals: increased risk of side-effects when ribavirin given with •didanosine—avoid concomitant use; ribavirin possibly inhibits effects of •stavudine; increased risk of anaemia when ribavirin given with •zidovudine—avoid concomitant use

Rifabutin *see* Rifamycins

Rifampicin *see* Rifamycins

Rifamycins
ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of imidapril (reduced antihypertensive effect)
Analgesics: rifampicin reduces plasma concentration of etoricoxib; rifampicin accelerates metabolism of methadone (reduced effect)
Antacids: absorption of rifampicin reduced by antacids
- Anti-arrhythmics: rifamycins accelerate metabolism of •disopyramide (reduced plasma concentration); rifampicin accelerates metabolism of •propafenone (reduced effect)
- Antibacterials: rifamycins reduce plasma concentration of clarithromycin and dapsone; plasma concentration of rifabutin increased by •clarithromycin (increased risk of uveitis—reduce rifabutin dose);

Rifamycins

- Antibacterials *(continued)*
  rifampicin accelerates metabolism of chloramphenicol (reduced plasma concentration); plasma concentration of rifabutin possibly increased by •macrolides (increased risk of uveitis—reduce rifabutin dose); monitoring of liver function with rifampicin recommended by manufacturer of quinupristin/dalfopristin; rifampicin reduces plasma concentration of •telithromycin (avoid during and for 2 weeks after rifampicin); rifampicin possibly reduces plasma concentration of trimethoprim
- Anticoagulants: rifamycins accelerate metabolism of •coumarins (reduced anticoagulant effect); rifampicin reduces plasma concentration of rivaroxaban
  Antidepressants: rifampicin possibly reduces plasma concentration of tricyclics
- Antidiabetics: rifamycins accelerate metabolism of •chlorpropamide and •tolbutamide (reduced effect); rifampicin reduces plasma concentration of •rosiglitazone—consider increasing dose of rosiglitazone; rifampicin reduces plasma concentration of nateglinide; rifampicin possibly antagonises hypoglycaemic effect of repaglinide; rifamycins possibly accelerate metabolism of •sulphonylureas (reduced effect)
- Antiepileptics: rifabutin reduces plasma concentration of •carbamazepine; rifampicin reduces plasma concentration of •lamotrigine; rifamycins accelerate metabolism of •phenytoin (reduced plasma concentration)
- Antifungals: rifampicin accelerates metabolism of •ketoconazole (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of rifabutin increased by •fluconazole (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of •fluconazole and •itraconazole (reduced plasma concentration); rifabutin reduces plasma concentration of •itraconazole—avoid concomitant use; plasma concentration of rifabutin increased by •posaconazole (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of •posaconazole and •terbinafine; plasma concentration of rifabutin increased by •voriconazole, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of •voriconazole—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of caspofungin (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by •triazoles (increased risk of uveitis—reduce rifabutin dose)
- Antimalarials: rifampicin reduces plasma concentration of •mefloquine—avoid concomitant use
  Antimuscarinics: rifampicin reduces plasma concentration of active metabolite of fesoterodine
- Antipsychotics: rifampicin accelerates metabolism of •haloperidol (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of •aripiprazole—increase dose of aripiprazole; rifampicin possibly reduces plasma concentration of clozapine
- Antivirals: rifampicin possibly reduces plasma concentration of abacavir and ritonavir; plasma concentration of rifabutin increased by •atazanavir, •darunavir, •fosamprenavir and •tipranavir (reduce dose of rifabutin); rifampicin reduces plasma concentration of •atazanavir, •lopinavir and •nevirapine—avoid concomitant use; rifampicin significantly reduces plasma concentration of •darunavir, •fosamprenavir and •nelfinavir—avoid concomitant use; rifampicin reduces plasma concentration of efavirenz—increase dose of efavirenz; plasma concentration of rifabutin reduced by efavirenz—increase dose of rifabutin; avoidance of rifampicin advised by manufacturer of etravirine and zidovudine; plasma concentration of both drugs reduced when rifabutin given with •etravirine; rifampicin accelerates metabolism of •indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by •indinavir—avoid concomitant use; rifampicin reduces plasma concentration of •maraviroc and •raltegravir—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin increased by •nelfinavir (halve dose of rifabutin); plasma concentration of rifabutin possibly increased by nevirapine; plasma concentration of rifabutin increased by •ritonavir (increased risk of toxicity); rifampicin significantly reduces plasma concentration of •saquinavir, also risk of hepatotoxicity—avoid concomitant use; rifabutin reduces plasma concentration of •saquinavir; rifampicin possibly reduces plasma concentration of •tipranavir—avoid concomitant use

Rifamycins

- Antivirals *(continued)*
  Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone and zaleplon; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone
  Aprepitant: rifampicin reduces plasma concentration of aprepitant
- Atovaquone: rifabutin and rifampicin reduce plasma concentration of •atovaquone (possible therapeutic failure of atovaquone)
  Barbiturates: plasma concentration of rifampicin possibly reduced by phenobarbital
  Beta-blockers: rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol
- Bosentan: rifampicin reduces plasma concentration of •bosentan—avoid concomitant use
- Calcium-channel Blockers: rifampicin possibly accelerates metabolism of •isradipine and •nicardipine (possible significantly reduced plasma concentration); rifampicin accelerates metabolism of •diltiazem, •nifedipine, •nimodipine and •verapamil (plasma concentration significantly reduced)
  Cardiac Glycosides: rifamycins accelerate metabolism of digitoxin (reduced effect); rifampicin possibly reduces plasma concentration of digoxin
- Ciclosporin: rifampicin accelerates metabolism of •ciclosporin (reduced plasma concentration)
- Corticosteroids: rifamycins accelerate metabolism of •corticosteroids (reduced effect)
- Cytotoxics: rifampicin accelerates metabolism of •dasatinib (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of erlotinib and sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of •imatinib and •nilotinib—avoid concomitant use; avoidance of rifabutin and rifampicin advised by manufacturer of •lapatinib; rifampicin reduces plasma concentration of sorafenib; rifampicin reduces plasma concentration of active metabolite of •temsirolimus—avoid concomitant use
  Deferasirox: rifampicin reduces plasma concentration of deferasirox
- Diuretics: rifampicin reduces plasma concentration of •eplerenone—avoid concomitant use
  Hormone Antagonists: rifampicin possibly reduces plasma concentration of exemestane; rifampicin

Rifamycins

Hormone Antagonists *(continued)*
accelerates metabolism of gestrinone and tamoxifen (reduced plasma concentration)

$5HT_3$ Antagonists: rifampicin accelerates metabolism of ondansetron (reduced effect)

Leflunomide: rifampicin possibly increases plasma concentration of active metabolite of leflunomide

Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of atorvastatin and simvastatin; rifampicin accelerates metabolism of fluvastatin (reduced effect)

- Mycophenolate: rifampicin reduces plasma concentration of active metabolite of ●mycophenolate
- Oestrogens: rifamycins accelerate metabolism of ●oestrogens (reduced contraceptive effect—see p. 445); antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
- Progestogens: rifamycins accelerate metabolism of ●progestogens (reduced contraceptive effect—see p. 445)
- Ranolazine: rifampicin reduces plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of ●sirolimus—avoid concomitant use
- Tacrolimus: rifampicin reduces plasma concentration of ●tacrolimus

Tadalafil: rifampicin reduces plasma concentration of tadalafil

Theophylline: rifampicin accelerates metabolism of theophylline (reduced plasma concentration)

Thyroid Hormones: rifampicin accelerates metabolism of levothyroxine (thyroxine) (may increase requirements for levothyroxine (thyroxine) in hypothyroidism)

Tibolone: rifampicin accelerates metabolism of tibolone (reduced plasma concentration)

Ulcer-healing Drugs: rifampicin accelerates metabolism of cimetidine (reduced plasma concentration)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Rimonabant

Antifungals: plasma concentration of rimonabant increased by ketoconazole

Risedronate Sodium *see* Bisphosphonates

Risperidone *see* Antipsychotics

Ritodrine *see* Sympathomimetics, $Beta_2$

Ritonavir

- Alpha-blockers: ritonavir possibly increases plasma concentration of ●alfuzosin—avoid concomitant use
- Analgesics: ritonavir possibly increases plasma concentration of NSAIDs and buprenorphine; ritonavir increases plasma concentration of ●dextropropoxyphene and ●piroxicam (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of ●alfentanil and ●fentanyl; ritonavir reduces plasma concentration of methadone; ritonavir possibly reduces plasma concentration of morphine; ritonavir reduces plasma concentration of ●pethidine, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
- Anti-arrhythmics: ritonavir increases plasma concentration of ●amiodarone and ●propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of ●disopyramide (increased risk of toxicity); ritonavir possibly increases plasma concentration of ●flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: ritonavir possibly increases plasma concentration of azithromycin and erythromycin; ritonavir increases plasma concentration of ●clarithromycin (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of ●rifabutin (increased risk of toxicity); plasma concentration of ritonavir possibly reduced by rifampicin; plasma concentration of both drugs increased when ritonavir given with ●fusidic acid—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin
- Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of ●warfarin; ritonavir possibly enhances anticoagulant effect of ●coumarins and ●phenindione; ritonavir increases plasma concentration of ●rivaroxaban—manufacturer of rivaroxaban advises avoid concomitant use
- Antidepressants: ritonavir possibly reduces plasma concentration of paroxetine; side-effects possibly increased when ritonavir given with trazodone; ritonavir possibly increases plasma concentration of ●SSRIs and ●tricyclics; plasma concentration of ritonavir reduced by ●St John's wort—avoid concomitant use

Antidiabetics: ritonavir possibly increases plasma concentration of tolbutamide

- Antiepileptics: ritonavir possibly increases plasma concentration of ●carbamazepine; plasma concentration of ritonavir possibly reduced by phenytoin, also plasma concentration of phenytoin possibly affected
- Antifungals: combination of ritonavir with ●itraconazole or ●ketoconazole may increase plasma concentration of either drug (or both); plasma concentration of ritonavir increased by fluconazole; ritonavir reduces plasma concentration of ●voriconazole—avoid concomitant use

Antihistamines: ritonavir possibly increases plasma concentration of non-sedating antihistamines

Antimalarials: caution with ritonavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of ritonavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when ritonavir given with fesoterodine—consult fesoterodine product literature; ritonavir increases plasma concentration of solifenacin

- Antipsychotics: ritonavir possibly increases plasma concentration of ●antipsychotics; ritonavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); ritonavir increases plasma concentration of ●clozapine (increased risk of toxicity)—avoid concomitant use; ritonavir reduces plasma concentration of olanzapine—consider increasing dose of olanzapine; ritonavir increases plasma concentration of ●pimozide and ●sertindole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: ritonavir increases toxicity of efavirenz, monitor liver function tests; ritonavir increases plasma concentration of indinavir and ●saquinavir; combination of ritonavir with nelfinavir may increase plasma concentration of either drug (or both)
- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of ●anxiolytics and hypnotics; ritonavir possibly increases plasma concentration of ●alprazolam, ●diazepam, ●flurazepam and ●zolpidem (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of buspirone (increased risk of toxicity)

Aprepitant: ritonavir possibly increases plasma concentration of aprepitant

Bosentan: ritonavir possibly increases plasma concentration of bosentan

- Bupropion: ritonavir increases or decreases plasma concentration of ●bupropion
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of ●calcium-channel blockers;

Ritonavir

- Calcium-channel Blockers *(continued)*
  avoidance of ritonavir advised by manufacturer of lercanidipine
  Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin
- Ciclosporin: ritonavir possibly increases plasma concentration of ●ciclosporin
- Cilostazol: ritonavir possibly increases plasma concentration of ●cilostazol—avoid concomitant use
- Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids, dexamethasone and prednisolone; ritonavir increases plasma concentration of inhaled and intranasal budesonide and ●fluticasone
- Cytotoxics: avoidance of ritonavir advised by manufacturer of ●lapatinib and ●nilotinib; ritonavir increases plasma concentration of paclitaxel
- Diuretics: ritonavir increases plasma concentration of ●eplerenone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with ●ergotamine and methysergide—avoid concomitant use
- $5HT_1$ Agonists: ritonavir increases plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: ritonavir possibly increases plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with atorvastatin; possible increased risk of myopathy when ritonavir given with ●rosuvastatin—avoid concomitant use; increased risk of myopathy when ritonavir given with ●simvastatin (avoid concomitant use)
- Oestrogens: ritonavir accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Ranolazine: ritonavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: ritonavir significantly increases plasma concentration of ●sildenafil—avoid concomitant use
  Sympathomimetics: ritonavir possibly increases plasma concentration of dexamfetamine
- Tacrolimus: ritonavir possibly increases plasma concentration of ●tacrolimus
  Tadalafil: ritonavir increases plasma concentration of tadalafil
- Theophylline: ritonavir accelerates metabolism of ●theophylline (reduced plasma concentration)
- Vardenafil: ritonavir possibly increases plasma concentration of ●vardenafil—avoid concomitant use

Rivaroxaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous ●diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with ●ketorolac (avoid concomitant use, including low-dose heparin)
  Antibacterials: plasma concentration of rivaroxaban reduced by rifampicin
- Antifungals: plasma concentration of rivaroxaban increased by ●ketoconazole—avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with itraconazole, posaconazole and voriconazole
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of rivaroxaban increased by ●ritonavir—manufacturer of rivaroxaban advises avoid concomitant use
  Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine

Rivastigmine *see* Parasympathomimetics

Rizatriptan *see* $5HT_1$ Agonists

Rocuronium *see* Muscle Relaxants

Ropinirole

Antibacterials: metabolism of ropinirole inhibited by ciprofloxacin (increased plasma concentration)
Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of antipsychotics (antagonism of effect)
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of metoclopramide (antagonism of effect)
Oestrogens: plasma concentration of ropinirole increased by oestrogens

Ropivacaine

Anti-arrhythmics: increased myocardial depression when ropivacaine given with anti-arrhythmics
Antidepressants: metabolism of ropivacaine inhibited by fluvoxamine—avoid prolonged administration of ropivacaine

Rosiglitazone *see* Antidiabetics

Rosuvastatin *see* Statins

Rotigotine

Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of antipsychotics (antagonism of effect)
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of metoclopramide (antagonism of effect)

Rowachol®

Anticoagulants: Rowachol® possibly reduces anticoagulant effect of coumarins

Rufinamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
  Antiepileptics: rufinamide possibly increases plasma concentration of phenytoin; plasma concentration of rufinamide possibly increased by valproate (reduce dose of rufinamide)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Oestrogens: rufinamide accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: rufinamide accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 445)

St John's Wort

- Antibacterials: St John's wort reduces plasma concentration of ●telithromycin (avoid during and for 2 weeks after St John's wort)
- Anticoagulants: St John's wort reduces anticoagulant effect of ●coumarins (avoid concomitant use)
- Antidepressants: possible increased serotonergic effects when St John's wort given with duloxetine; St John's wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John's wort given with ●SSRIs—avoid concomitant use
- Antiepileptics: avoid concomitant use of St John's wort with ●antiepileptics
- Antifungals: St John's wort reduces plasma concentration of ●voriconazole—avoid concomitant use
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

St John's Wort *(continued)*

- Antipsychotics: St John's wort possibly reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole
- Antivirals: St John's wort reduces plasma concentration of ●atazanavir, ●darunavir, ●efavirenz, ●fosamprenavir, ●indinavir, ●lopinavir, ●nelfinavir, ●nevirapine, ●ritonavir and ●saquinavir—avoid concomitant use; avoidance of St John's wort advised by manufacturer of etravirine; St John's wort possibly reduces plasma concentration of ●maraviroc and ●tipranavir—avoid concomitant use

Anxiolytics and Hypnotics: St John's wort possibly reduces plasma concentration of oral midazolam

- Aprepitant: avoidance of St John's wort advised by manufacturer of ●aprepitant

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

- Barbiturates: avoid concomitant use of St John's wort with ●phenobarbital

Calcium-channel Blockers: St John's wort possibly reduces plasma concentration of amlodipine

- Cardiac Glycosides: St John's wort reduces plasma concentration of ●digoxin—avoid concomitant use
- Ciclosporin: St John's wort reduces plasma concentration of ●ciclosporin—avoid concomitant use
- Cytotoxics: St John's wort reduces plasma concentration of ●imatinib—avoid concomitant use; avoidance of St John's wort advised by manufacturer of ●lapatinib; St John's wort accelerates metabolism of ●irinotecan (reduced plasma concentration—avoid concomitant use)
- Diuretics: St John's wort reduces plasma concentration of ●eplerenone—avoid concomitant use
- $5HT_1$ Agonists: increased serotonergic effects when St John's wort given with ●$5HT_1$ agonists—avoid concomitant use

Ivabradine: St John's wort reduces plasma concentration of ivabradine—avoid concomitant use

Lipid-regulating Drugs: St John's wort reduces plasma concentration of simvastatin

- Oestrogens: St John's wort reduces contraceptive effect of ●oestrogens (avoid concomitant use)
- Progestogens: St John's wort reduces contraceptive effect of ●progestogens (avoid concomitant use)
- Tacrolimus: St John's wort reduces plasma concentration of ●tacrolimus—avoid concomitant use
- Theophylline: St John's wort reduces plasma concentration of ●theophylline—avoid concomitant use

Salbutamol *see* Sympathomimetics, $Beta_2$

Salmeterol *see* Sympathomimetics, $Beta_2$

Saquinavir

- Antibacterials: plasma concentration of saquinavir reduced by ●rifabutin; plasma concentration of saquinavir significantly reduced by ●rifampicin, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of saquinavir possibly increased by quinupristin/dalfopristin; avoidance of concomitant saquinavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin

Anticoagulants: saquinavir possibly enhances anticoagulant effect of warfarin; avoidance of saquinavir advised by manufacturer of rivaroxaban

- Antidepressants: plasma concentration of saquinavir reduced by ●St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of saquinavir possibly reduced by carbamazepine, phenytoin and ●primidone

Antifungals: plasma concentration of saquinavir increased by ketoconazole; plasma concentration of saquinavir possibly increased by imidazoles and triazoles

Antimalarials: caution with saquinavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of saquinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when saquinavir given with fesoterodine—consult fesoterodine product literature

- Antipsychotics: saquinavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); saquinavir possibly increases plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir increases plasma concentration of ●sertindole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of saquinavir increased by atazanavir, indinavir, lopinavir and ●ritonavir; saquinavir reduces plasma concentration of darunavir; plasma concentration of saquinavir significantly reduced by efavirenz; saquinavir increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); combination of saquinavir with nelfinavir may increase plasma concentration of either drug (or both); plasma concentration of saquinavir reduced by ●tipranavir
- Anxiolytics and Hypnotics: saquinavir increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Barbiturates: plasma concentration of saquinavir possibly reduced by ●barbiturates
- Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ●ciclosporin
- Cilostazol: saquinavir possibly increases plasma concentration of ●cilostazol—avoid concomitant use

Corticosteroids: plasma concentration of saquinavir possibly reduced by dexamethasone

- Cytotoxics: avoidance of saquinavir advised by manufacturer of ●lapatinib

Diuretics: saquinavir increases plasma concentration of eplerenone (reduce dose of eplerenone)

- Ergot Alkaloids: increased risk of ergotism when saquinavir given with ●ergotamine and methysergide—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with atorvastatin; possible increased risk of myopathy when saquinavir given with ●rosuvastatin—avoid concomitant use; increased risk of myopathy when saquinavir given with ●simvastatin (avoid concomitant use)
- Ranolazine: saquinavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sildenafil: saquinavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil

- Tacrolimus: saquinavir increases plasma concentration of ●tacrolimus (consider reducing dose of tacrolimus)

Tadalafil: saquinavir possibly increases plasma concentration of tadalafil—reduce initial dose of tadalafil

Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by cimetidine; plasma concentration of saquinavir increased by omeprazole

Vardenafil: saquinavir possibly increases plasma concentration of vardenafil—reduce initial dose of vardenafil

Secobarbital *see* Barbiturates

Selegiline

Note Selegiline is a MAO-B inhibitor

- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with ●pethidine (avoid concomitant use); manufacturer of selegiline advises caution with tramadol
- Antidepressants: theoretical risk of serotonin syndrome if selegiline given with citalopram (especially if dose of selegiline exceeds 10 mg daily); caution with selegiline advised by manufacturer of escitalopram; increased risk of hypertension and CNS excitation when selegiline given with ●fluoxetine (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with

Selegiline

- Antidepressants *(continued)*
  - ●fluvoxamine or ●venlafaxine (selegiline should not be started until 1 week after stopping fluvoxamine or venlafaxine, avoid fluvoxamine or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●paroxetine or ●sertraline (selegiline should not be started until 2 weeks after stopping paroxetine or sertraline, avoid paroxetine or sertraline for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with MAOIs; avoid concomitant use of selegiline with ●moclobemide; CNS toxicity reported when selegiline given with ●tricyclics
  - Dopaminergics: max. dose of 10 mg selegiline advised by manufacturer of entacapone if used concomitantly; selegiline enhances effects and increases toxicity of levodopa (reduce dose of levodopa)
  - Memantine: effects of dopaminergics and selegiline possibly enhanced by memantine
  - Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
  - Oestrogens: plasma concentration of selegiline increased by oestrogens (increased risk of toxicity)
  - Progestogens: plasma concentration of selegiline increased by progestogens (increased risk of toxicity)
- Sympathomimetics: risk of hypertensive crisis when selegiline given with ●dopamine

Selenium

- Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)

Sertindole *see* Antipsychotics

Sertraline *see* Antidepressants, SSRI

Sevelamer

- Antibacterials: sevelamer reduces bioavailability of ciprofloxacin
- Ciclosporin: sevelamer possibly reduces plasma concentration of ciclosporin
- Mycophenolate: sevelamer possibly reduces plasma concentration of mycophenolate
- Tacrolimus: sevelamer possibly reduces plasma concentration of tacrolimus

Sevoflurane *see* Anaesthetics, General

Sibutramine

- Analgesics: increased risk of bleeding when sibutramine given with NSAIDs or aspirin
- Anticoagulants: increased risk of bleeding when sibutramine given with anticoagulants
- Antidepressants: increased CNS toxicity when sibutramine given with ●MAOIs or ●moclobemide (manufacturer of sibutramine advises avoid concomitant use), also avoid sibutramine for 2 weeks after stopping MAOIs or moclobemide; increased risk of CNS toxicity when sibutramine given with ●SSRI-related antidepressants, ●SSRIs, ●mirtazapine, ●noradrenaline re-uptake inhibitors, ●tricyclic-related antidepressants, ●tricyclics or ●tryptophan (manufacturer of sibutramine advises avoid concomitant use)
- Antipsychotics: increased risk of CNS toxicity when sibutramine given with ●antipsychotics (manufacturer of sibutramine advises avoid concomitant use)

Sildenafil

- Alpha-blockers: enhanced hypotensive effect when sildenafil given with ●alpha-blockers (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 463
- Antibacterials: plasma concentration of sildenafil possibly increased by clarithromycin and telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil increased by erythromycin—reduce initial dose of sildenafil
- Antifungals: plasma concentration of sildenafil increased by itraconazole and ketoconazole—reduce initial dose of sildenafil
- Antivirals: side-effects of sildenafil possibly increased by ●atazanavir; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir, nelfinavir and saquinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil increased by ●indinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ●ritonavir—avoid concomitant use
- Bosentan: plasma concentration of sildenafil reduced by bosentan
- Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with amlodipine
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by grapefruit juice
- Nicorandil: sildenafil significantly enhances hypotensive effect of ●nicorandil (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of ●nitrates (avoid concomitant use)
- Ulcer-healing Drugs: plasma concentration of sildenafil increased by cimetidine (reduce initial dose of sildenafil)

Simvastatin *see* Statins

Sirolimus

- Antibacterials: plasma concentration of sirolimus increased by ●clarithromycin and ●telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with ●erythromycin; plasma concentration of sirolimus reduced by ●rifabutin and ●rifampicin—avoid concomitant use
- Antifungals: plasma concentration of sirolimus increased by ●itraconazole, ●ketoconazole and ●voriconazole—avoid concomitant use; plasma concentration of sirolimus increased by micafungin and ●miconazole; plasma concentration of sirolimus possibly increased by posaconazole
- Antivirals: plasma concentration of sirolimus possibly increased by ●atazanavir and lopinavir
- Calcium-channel Blockers: plasma concentration of sirolimus increased by ●diltiazem; plasma concentration of both drugs increased when sirolimus given with ●verapamil
- Ciclosporin: plasma concentration of sirolimus increased by ciclosporin
- Grapefruit Juice: plasma concentration of sirolimus increased by ●grapefruit juice—avoid concomitant use

Sitaxentan

- Anticoagulants: sitaxentan enhances anticoagulant effect of ●coumarins
- Ciclosporin: plasma concentration of sitaxentan increased by ●ciclosporin—avoid concomitant use
- Oestrogens: sitaxentan increases plasma concentration of oestrogens
- Progestogens: sitaxentan increases plasma concentration of progestogens

Sodium Aurothiomalate *see* Gold

Sodium Benzoate

- Antiepileptics: effects of sodium benzoate possibly reduced by valproate
- Antipsychotics: effects of sodium benzoate possibly reduced by haloperidol
- Corticosteroids: effects of sodium benzoate possibly reduced by corticosteroids
- Probenecid: excretion of conjugate formed by sodium benzoate possibly reduced by probenecid

Sodium Bicarbonate *see* Antacids

Sodium Clodronate *see* Bisphosphonates

Sodium Nitroprusside *see* Vasodilator Antihypertensives

Sodium Oxybate

- Analgesics: effects of sodium oxybate enhanced by ●opioid analgesics (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxybate given with tricyclics
- Antipsychotics: effects of sodium oxybate possibly enhanced by antipsychotics

Sodium Oxybate *(continued)*
- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by •benzodiazepines (avoid concomitant use)
- Barbiturates: effects of sodium oxybate enhanced by •barbiturates (avoid concomitant use)

Sodium Phenylbutyrate
Antiepileptics: effects of sodium phenylbutyrate possibly reduced by valproate
Antipsychotics: effects of sodium phenylbutyrate possibly reduced by haloperidol
Corticosteroids: effects of sodium phenylbutyrate possibly reduced by corticosteroids
Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by probenecid

Sodium Valproate *see* Valproate

Solifenacin *see* Antimuscarinics

Somatropin
Corticosteroids: growth-promoting effect of somatropin may be inhibited by corticosteroids
Oestrogens: increased doses of somatropin may be needed when given with oestrogens (when used as oral replacement therapy)

Sorafenib
Antibacterials: plasma concentration of sorafenib reduced by rifampicin
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of •coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: sorafenib possibly increases plasma concentration of doxorubicin and irinotecan; sorafenib increases plasma concentration of docetaxel

Sotalol *see* Beta-blockers

Spironolactone *see* Diuretics

Statins
Antacids: absorption of rosuvastatin reduced by antacids
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with •amiodarone
- Antibacterials: plasma concentration of atorvastatin and pravastatin increased by •clarithromycin; increased risk of myopathy when simvastatin given with •clarithromycin, •erythromycin or •telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by erythromycin; possible increased risk of myopathy when atorvastatin given with erythromycin or fusidic acid; plasma concentration of pravastatin increased by erythromycin; plasma concentration of atorvastatin and simvastatin possibly reduced by rifampicin; metabolism of fluvastatin accelerated by rifampicin (reduced effect); increased risk of myopathy when statins given with •daptomycin (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with •fusidic acid; increased risk of myopathy when atorvastatin given with •telithromycin (avoid concomitant use)
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; fluvastatin and simvastatin enhance anticoagulant effect of •coumarins; rosuvastatin possibly enhances anticoagulant effect of •coumarins and •phenindione

Antidepressants: plasma concentration of simvastatin reduced by St John's wort
Antidiabetics: fluvastatin possibly increases plasma concentration of glibenclamide
Antiepileptics: combination of fluvastatin with phenytoin may increase plasma concentration of either drug (or both)
- Antifungals: increased risk of myopathy when simvastatin given with •itraconazole, •ketoconazole or •posaconazole (avoid concomitant use); possible increased risk of myopathy when simvastatin given with •miconazole—avoid concomitant use; plasma concentration of fluvastatin increased by fluconazole; increased risk of myopathy when atorvastatin given with •itraconazole or •posaconazole (avoid concomitant use); possible increased risk of myopathy when atorvastatin or simvastatin given with imidazoles; possible increased risk of myopathy when atorvastatin or simvastatin given with triazoles
- Antivirals: increased risk of myopathy when simvastatin given with •atazanavir, •indinavir, •nelfinavir, •ritonavir or •saquinavir (avoid concomitant use); possible increased risk of myopathy when atorvastatin given with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir or saquinavir; possible increased risk of myopathy when rosuvastatin given with •atazanavir, •darunavir, •fosamprenavir, •indinavir, •lopinavir, •nelfinavir, •ritonavir, •saquinavir or •tipranavir—avoid concomitant use; plasma concentration of pravastatin possibly increased by darunavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by efavirenz; plasma concentration of atorvastatin possibly reduced by etravirine; possible increased risk of myopathy when simvastatin given with •fosamprenavir or •lopinavir—avoid concomitant use

Bosentan: plasma concentration of simvastatin reduced by bosentan
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with diltiazem; plasma concentration of atorvastatin increased by diltiazem; increased risk of myopathy when simvastatin given with •verapamil

Cardiac Glycosides: atorvastatin possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of myopathy when statins given with •ciclosporin; increased risk of myopathy when rosuvastatin given with •ciclosporin (avoid concomitant use)
- Colchicine: possible increased risk of myopathy when statins given with •colchicine

Cytotoxics: plasma concentration of simvastatin possibly increased by dasatinib; plasma concentration of simvastatin increased by imatinib
- Grapefruit Juice: plasma concentration of atorvastatin possibly increased by grapefruit juice; plasma concentration of simvastatin increased by •grapefruit juice—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with •danazol
- Lipid-regulating Drugs: increased risk of myopathy when statins given with •gemfibrozil (preferably avoid concomitant use); increased risk of myopathy when statins given with •fibrates; increased risk of myopathy when statins given with •nicotinic acid (applies to lipid regulating doses of nicotinic acid)

Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ethinylestradiol
Progestogens: atorvastatin increases plasma concentration of norethisterone; rosuvastatin increases plasma concentration of norgestrel
Ranolazine: plasma concentration of simvastatin increased by ranolazine (consider reducing dose of simvastatin)
Retinoids: plasma concentration of simvastatin reduced by alitretinoin

Stavudine
- Antivirals: increased risk of side-effects when stavudine given with •didanosine; effects of stavudine possibly inhibited by •ribavirin; effects of stavudine possibly inhibited by •zidovudine (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by doxorubicin; increased risk of toxicity when stavudine given with •hydroxycarbamide—avoid concomitant use

Stiripentol
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
- Antiepileptics: stiripentol increases plasma concentration of ●carbamazepine and ●phenytoin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine

Anxiolytics and Hypnotics: stiripentol increases plasma concentration of clobazam
- Barbiturates: stiripentol increases plasma concentration of ●phenobarbital

Streptomycin *see* Aminoglycosides

Strontium Ranelate

Antibacterials: strontium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

Antibacterials: sucralfate reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin, ofloxacin and tetracyclines
- Anticoagulants: sucralfate possibly reduces absorption of ●coumarins (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of ●phenytoin

Antifungals: sucralfate reduces absorption of ketoconazole

Antipsychotics: sucralfate reduces absorption of sulpiride

Cardiac Glycosides: sucralfate possibly reduces absorption of cardiac glycosides

Theophylline: sucralfate possibly reduces absorption of theophylline (give at least 2 hours apart)

Thyroid Hormones: sucralfate reduces absorption of levothyroxine (thyroxine)

Ulcer-healing Drugs: sucralfate possibly reduces absorption of lansoprazole

Sugammadex

Antibacterials: response to sugammadex possibly reduced by flucloxacillin and fusidic acid

Hormone Antagonists: response to sugammadex possibly reduced by toremifene

Oestrogens: sugammadex possibly reduces plasma concentration of oestrogens

Progestogens: sugammadex possibly reduces plasma concentration of progestogens

Sulfadiazine *see* Sulphonamides

Sulfadoxine *see* Sulphonamides

Sulfamethoxazole *see* Sulphonamides

Sulfasalazine *see* Aminosalicylates

Sulfinpyrazone

Analgesics: effects of sulfinpyrazone antagonised by aspirin

Antibacterials: sulfinpyrazone reduces excretion of nitrofurantoin (increased risk of toxicity); sulfinpyrazone reduces excretion of penicillins; effects of sulfinpyrazone antagonised by pyrazinamide
- Anticoagulants: sulfinpyrazone enhances anticoagulant effect of ●coumarins
- Antidiabetics: sulfinpyrazone enhances effects of ●sulphonylureas
- Antiepileptics: sulfinpyrazone increases plasma concentration of ●phenytoin
- Ciclosporin: sulfinpyrazone reduces plasma concentration of ●ciclosporin

Theophylline: sulfinpyrazone reduces plasma concentration of theophylline

Sulindac *see* NSAIDs

Sulphonamides

Anaesthetics, General: sulphonamides enhance effects of thiopental

Sulphonamides *(continued)*

Anaesthetics, Local: increased risk of methaemoglobinaemia when sulphonamides given with prilocaine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with ●amiodarone—avoid concomitant use of co-trimoxazole
- Antibacterials: increased risk of crystalluria when sulphonamides given with ●methenamine
- Anticoagulants: sulphonamides enhance anticoagulant effect of ●coumarins

Antidiabetics: sulphonamides rarely enhance the effects of sulphonylureas

Antiepileptics: sulphonamides possibly increase plasma concentration of phenytoin
- Antimalarials: increased antifolate effect when sulphonamides given with ●pyrimethamine
- Antipsychotics: avoid concomitant use of sulphonamides with ●clozapine (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●azathioprine
- Ciclosporin: increased risk of nephrotoxicity when sulphonamides given with ●ciclosporin; sulfadiazine possibly reduces plasma concentration of ●ciclosporin
- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●mercaptopurine or ●methotrexate; sulphonamides increase risk of methotrexate toxicity

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Potassium Aminobenzoate: effects of sulphonamides inhibited by potassium aminobenzoate

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Sulphonylureas *see* Antidiabetics

Sulpiride *see* Antipsychotics

Sumatriptan *see* $5HT_1$ Agonists

Sunitinib

Antibacterials: metabolism of sunitinib accelerated by rifampicin (reduced plasma concentration)

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: metabolism of sunitinib inhibited by ketoconazole (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Suxamethonium *see* Muscle Relaxants

Sympathomimetics
- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of ●adrenergic neurone blockers; dexamfetamine antagonises hypotensive effect of ●guanethidine

Alcohol: effects of methylphenidate possibly enhanced by alcohol
- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with ●tolazoline
- Anaesthetics, General: increased risk of hypertension when methylphenidate given with ●volatile liquid general anaesthetics; increased risk of arrhythmias when adrenaline (epinephrine) given with ●volatile liquid general anaesthetics
- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of ●coumarins
- Antidepressants: risk of hypertensive crisis when methylphenidate given with ●MAOIs, some manufacturers advise avoid methylphenidate for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with ●MAOIs or ●moclobemide; methylphenidate possibly inhibits

Sympathomimetics

- Antidepressants *(continued)*
  metabolism of SSRIs and tricyclics; increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) given with ●tricyclics; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with ●tricyclics (but local anaesthetics with adrenaline appear to be safe)

  Antiepileptics: methylphenidate increases plasma concentration of phenytoin; methylphenidate possibly increases plasma concentration of primidone

  Antipsychotics: hypertensive effect of sympathomimetics antagonised by antipsychotics; dexamfetamine possibly antagonises antipsychotic effects of chlorpromazine; methylphenidate possibly increases side-effects of risperidone

  Antivirals: plasma concentration of dexamfetamine possibly increased by ritonavir

  Barbiturates: methylphenidate possibly increases plasma concentration of phenobarbital
- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective ●beta-blockers, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective ●beta-blockers; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective ●beta-blockers
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with clonidine; serious adverse events reported with concomitant use of methylphenidate and ●clonidine (causality not established)

  Corticosteroids: ephedrine accelerates metabolism of dexamethasone
- Dopaminergics: risk of toxicity when isometheptene given with ●bromocriptine; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by entacapone; avoid concomitant use of sympathomimetics with ●rasagiline; risk of hypertensive crisis when dopamine given with ●selegiline

  Doxapram: increased risk of hypertension when sympathomimetics given with doxapram

  Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with ergotamine and methysergide

  Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with oxytocin (due to enhanced vasopressor effect)
- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by ●dopexamine; dopexamine possibly enhances effects of ●noradrenaline (norepinephrine)

  Theophylline: avoidance of ephedrine in children advised by manufacturer of theophylline

Sympathomimetics, Beta$_2$

Atomoxetine: Increased risk of cardiovascular side-effects when parenteral salbutamol given with atomoxetine

Cardiac Glycosides: salbutamol possibly reduces plasma concentration of digoxin

Corticosteroids: increased risk of hypokalaemia when high doses of beta$_2$ sympathomimetics given with corticosteroids—for CSM advice (hypokalaemia) see p. 155

Diuretics: increased risk of hypokalaemia when high doses of beta$_2$ sympathomimetics given with acetazolamide, loop diuretics or thiazides and related diuretics—for CSM advice (hypokalaemia) see p. 155

- Methyldopa: acute hypotension reported when infusion of salbutamol given with ●methyldopa

Muscle Relaxants: bambuterol enhances effects of suxamethonium

Sympathomimetics, Beta$_2$ *(continued)*

Theophylline: increased risk of hypokalaemia when high doses of beta$_2$ sympathomimetics given with theophylline—for CSM advice (hypokalaemia) see p. 155

Tacrolimus

Note Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with alcohol consumption (p. 645) does not apply to tacrolimus taken systemically

- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with NSAIDs; increased risk of nephrotoxicity when tacrolimus given with ●ibuprofen

  Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with angiotensin-II receptor antagonists
- Antibacterials: plasma concentration of tacrolimus increased by ●clarithromycin, ●erythromycin and ●quinupristin/dalfopristin; plasma concentration of tacrolimus reduced by ●rifampicin; increased risk of nephrotoxicity when tacrolimus given with ●aminoglycosides; plasma concentration of tacrolimus possibly increased by ●chloramphenicol and ●telithromycin; possible increased risk of nephrotoxicity when tacrolimus given with vancomycin
- Antidepressants: plasma concentration of tacrolimus reduced by ●St John's wort—avoid concomitant use

  Antiepileptics: plasma concentration of tacrolimus reduced by phenytoin, also plasma concentration of phenytoin possibly increased
- Antifungals: plasma concentration of tacrolimus increased by ●fluconazole, ●itraconazole, ●ketoconazole and ●voriconazole; increased risk of nephrotoxicity when tacrolimus given with ●amphotericin; plasma concentration of tacrolimus increased by ●posaconazole (reduce dose of tacrolimus); plasma concentration of tacrolimus reduced by ●caspofungin; plasma concentration of tacrolimus possibly increased by ●imidazoles and ●triazoles
- Antipsychotics: avoidance of tacrolimus advised by manufacturer of ●droperidol (risk of ventricular arrhythmias)
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with aciclovir or ganciclovir; plasma concentration of tacrolimus possibly increased by ●atazanavir, ●nelfinavir and ●ritonavir; plasma concentration of tacrolimus possibly affected by ●efavirenz; plasma concentration of tacrolimus increased by ●saquinavir (consider reducing dose of tacrolimus)
- Barbiturates: plasma concentration of tacrolimus reduced by ●phenobarbital
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by felodipine, nicardipine and verapamil; plasma concentration of tacrolimus increased by ●diltiazem and ●nifedipine
- Ciclosporin: tacrolimus increases plasma concentration of ●ciclosporin (increased risk of nephrotoxicity)—avoid concomitant use
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with ●potassium-sparing diuretics and aldosterone antagonists
- Grapefruit Juice: plasma concentration of tacrolimus increased by ●grapefruit juice

  Hormone Antagonists: plasma concentration of tacrolimus possibly increased by danazol

  Oestrogens: tacrolimus possibly inhibits metabolism of oestrogens; plasma concentration of tacrolimus possibly increased by ethinylestradiol
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with ●potassium salts

  Progestogens: tacrolimus possibly inhibits metabolism of progestogens

  Sevelamer: plasma concentration of tacrolimus possibly reduced by sevelamer

  Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by omeprazole

Tadalafil

- Alpha-blockers: enhanced hypotensive effect when tadalafil given with ●doxazosin—manufacturer of tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with ●alpha-blockers—see also p. 463

  Antibacterials: plasma concentration of tadalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tadalafil reduced by rifampicin

  Antifungals: plasma concentration of tadalafil increased by ketoconazole; plasma concentration of tadalafil possibly increased by itraconazole

  Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil increased by ritonavir; plasma concentration of tadalafil possibly increased by saquinavir—reduce initial dose of tadalafil

  Grapefruit Juice: plasma concentration of tadalafil possibly increased by grapefruit juice
- Nicorandil: tadalafil significantly enhances hypotensive effect of ●nicorandil (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of ●nitrates (avoid concomitant use)

Tamoxifen

Antibacterials: metabolism of tamoxifen accelerated by rifampicin (reduced plasma concentration)

- Anticoagulants: tamoxifen enhances anticoagulant effect of ●coumarins
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by ●duloxetine, ●fluoxetine and ●paroxetine (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of ●droperidol (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by ●bupropion (avoid concomitant use)

Tamsulosin *see* Alpha-blockers

Taxanes *see* Docetaxel and Paclitaxel

Tegafur with uracil *see* Fluorouracil

Teicoplanin

Antibacterials: increased risk of nephrotoxicity and ototoxicity when teicoplanin given with aminoglycosides or colistin

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Telbivudine

- Interferons: increased risk of peripheral neuropathy when telbivudine given with ●interferon alfa

Telithromycin

- Antibacterials: plasma concentration of telithromycin reduced by ●rifampicin (avoid during and for 2 weeks after rifampicin)
- Antidepressants: plasma concentration of telithromycin reduced by ●St John's wort (avoid during and for 2 weeks after St John's wort)
- Antiepileptics: plasma concentration of telithromycin reduced by ●carbamazepine, ●phenytoin and ●primidone (avoid during and for 2 weeks after carbamazepine, phenytoin and primidone)
- Antifungals: manufacturer of telithromycin advises avoid concomitant use with ●ketoconazole in severe renal and hepatic impairment

  Antimuscarinics: manufacturer of fesoterodine advises dose reduction when telithromycin given with fesoterodine—consult fesoterodine product literature
- Antipsychotics: increased risk of ventricular arrhythmias when telithromycin given with ●pimozide—avoid concomitant use
- Antivirals: manufacturer of telithromycin advises avoid concomitant use with ●atazanavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●nelfinavir, ●ritonavir, ●saquinavir and ●tipranavir in severe renal and hepatic impairment; telithromycin possibly increases

Telithromycin *(continued)*

- Antivirals *(continued)*

  plasma concentration of ●maraviroc (consider reducing dose of maraviroc)
- Anxiolytics and Hypnotics: telithromycin inhibits metabolism of ●midazolam (increased plasma concentration with increased sedation)

  Aprepitant: telithromycin possibly increases plasma concentration of aprepitant
- Barbiturates: plasma concentration of telithromycin reduced by ●phenobarbital (avoid during and for 2 weeks after phenobarbital)

  Cardiac Glycosides: telithromycin possibly increases plasma concentration of digoxin
- Ciclosporin: telithromycin possibly increases plasma concentration of ●ciclosporin
- Cytotoxics: avoidance of telithromycin advised by manufacturer of ●lapatinib and ●nilotinib
- Diuretics: telithromycin increases plasma concentration of ●eplerenone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with ●ergotamine and methysergide—avoid concomitant use
- Ivabradine: telithromycin possibly increases plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with ●atorvastatin or ●simvastatin (avoid concomitant use)

  Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
- Ranolazine: telithromycin possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: telithromycin increases plasma concentration of ●sirolimus—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of ●tacrolimus

  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Telmisartan *see* Angiotensin-II Receptor Antagonists

Temazepam *see* Anxiolytics and Hypnotics

Temocillin *see* Penicillins

Temoporfin

- Cytotoxics: increased skin photosensitivity when temoporfin given with topical ●fluorouracil

Temozolomide

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; plasma concentration of temozolomide increased by valproate

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Temsirolimus

Note The main active metabolite of temsirolimus is sirolimus—*see also* interactions of sirolimus and consult product literature

- Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by ●rifampicin—avoid concomitant use

  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of active metabolite of temsirolimus increased by ●ketoconazole—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Tenofovir

- Antivirals: manufacturer of tenofovir advises avoid concomitant use with adefovir; tenofovir reduces plasma concentration of atazanavir, also plasma concentration of tenofovir possibly increased;

Tenofovir
- Antivirals *(continued)*
  combination of tenofovir with cidofovir may increase plasma concentration of either drug (or both); tenofovir increases plasma concentration of •didanosine (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by lopinavir

Tenoxicam *see* NSAIDs

Terazosin *see* Alpha-blockers

Terbinafine
- Antibacterials: plasma concentration of terbinafine reduced by •rifampicin

Antidepressants: terbinafine possibly increases plasma concentration of imipramine and nortriptyline

Ciclosporin: terbinafine possibly reduces plasma concentration of ciclosporin

Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with oestrogens (when used for contraception)

Progestogens: occasional reports of breakthrough bleeding when terbinafine given with progestogens (when used for contraception)

Ulcer-healing Drugs: plasma concentration of terbinafine increased by cimetidine

Terbutaline *see* Sympathomimetics, $Beta_2$

Terpene Mixture *see* Rowachol®

Testolactone
- Anticoagulants: testolactone enhances anticoagulant effect of •coumarins and •phenindione

Testosterone
- Anticoagulants: testosterone enhances anticoagulant effect of •coumarins and •phenindione

Antidiabetics: testosterone possibly enhances hypoglycaemic effect of antidiabetics

Tetrabenazine
- Antidepressants: risk of CNS excitation and hypertension when tetrabenazine given with •MAOIs

Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with antipsychotics

Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with amantadine

Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide

Tetracosactide *see* Corticosteroids

Tetracycline *see* Tetracyclines

Tetracyclines

ACE Inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate)

Adsorbents: absorption of tetracyclines possibly reduced by kaolin

Antacids: absorption of tetracyclines reduced by antacids
- Anticoagulants: tetracyclines possibly enhance anticoagulant effect of •coumarins and •phenindione

Antiepileptics: metabolism of doxycycline accelerated by carbamazepine (reduced effect); metabolism of doxycycline accelerated by phenytoin and primidone (reduced plasma concentration)

Atovaquone: tetracycline reduces plasma concentration of atovaquone

Barbiturates: metabolism of doxycycline accelerated by barbiturates (reduced plasma concentration)

Calcium Salts: absorption of tetracycline reduced by calcium salts
- Ciclosporin: doxycycline possibly increases plasma concentration of •ciclosporin

Cytotoxics: doxycycline or tetracycline increase risk of methotrexate toxicity

Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by dairy products

Diuretics: manufacturer of lymecycline advises avoid concomitant use with diuretics

Tetracyclines *(continued)*

Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ergotamine and methysergide

Iron: absorption of tetracyclines reduced by *oral* iron, also absorption of *oral* iron reduced by tetracyclines

Lipid-regulating Drugs: absorption of tetracycline possibly reduced by colestipol and colestyramine

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with •retinoids (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)

Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicitratobismuthate

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Zinc: absorption of tetracyclines reduced by zinc, also absorption of zinc reduced by tetracyclines

Theophylline

Allopurinol: plasma concentration of theophylline possibly increased by allopurinol

Anaesthetics, General: increased risk of convulsions when theophylline given with ketamine; increased risk of arrhythmias when theophylline given with halothane

Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of adenosine; plasma concentration of theophylline increased by propafenone
- Antibacterials: plasma concentration of theophylline possibly increased by azithromycin and isoniazid; metabolism of theophylline inhibited by •clarithromycin (increased plasma concentration); metabolism of theophylline inhibited by •erythromycin (increased plasma concentration), if erythromycin given by mouth, also decreased plasma-erythromycin concentration; plasma concentration of theophylline increased by •ciprofloxacin and •norfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with •quinolones
- Antidepressants: plasma concentration of theophylline increased by •fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline reduced by •St John's wort—avoid concomitant use
- Antiepileptics: metabolism of theophylline accelerated by carbamazepine and primidone (reduced effect); plasma concentration of both drugs reduced when theophylline given with •phenytoin
- Antifungals: plasma concentration of theophylline possibly increased by •fluconazole and •ketoconazole
- Antivirals: metabolism of theophylline accelerated by •ritonavir (reduced plasma concentration)

Anxiolytics and Hypnotics: theophylline possibly reduces effects of benzodiazepines

Barbiturates: metabolism of theophylline accelerated by barbiturates (reduced effect)
- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by •calcium-channel blockers (enhanced effect); plasma concentration of theophylline increased by diltiazem; plasma concentration of theophylline increased by •verapamil (enhanced effect)

Corticosteroids: increased risk of hypokalaemia when theophylline given with corticosteroids

Cytotoxics: plasma concentration of theophylline possibly increased by methotrexate

Disulfiram: metabolism of theophylline inhibited by disulfiram (increased risk of toxicity)

Theophylline *(continued)*
Diuretics: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics or thiazides and related diuretics
Doxapram: increased CNS stimulation when theophylline given with doxapram
Interferons: metabolism of theophylline inhibited by interferon alfa (increased plasma concentration)
Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by zafirlukast, also plasma concentration of zafirlukast reduced
Lithium: theophylline increases excretion of lithium (reduced plasma concentration)
Oestrogens: excretion of theophylline reduced by oestrogens (increased plasma concentration)
Pentoxifylline (oxpentifylline): plasma concentration of theophylline increased by pentoxifylline (oxpentifylline)
Sulfinpyrazone: plasma concentration of theophylline reduced by sulfinpyrazone
Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with ephedrine in children
Sympathomimetics, Beta$_2$: increased risk of hypokalaemia when theophylline given with high doses of beta$_2$ sympathomimetics—for CSM advice (hypokalaemia) see p. 155
Tobacco: metabolism of theophylline increased by tobacco smoking (reduced plasma concentration)
● Ulcer-healing Drugs: metabolism of theophylline inhibited by ●cimetidine (increased plasma concentration); absorption of theophylline possibly reduced by sucralfate (give at least 2 hours apart)
Vaccines: plasma concentration of theophylline possibly increased by influenza vaccine

Thiazolidinediones *see* Antidiabetics

Thiopental *see* Anaesthetics, General

Thiotepa
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
● Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Muscle Relaxants: thiotepa enhances effects of suxamethonium

Thioxanthenes *see* Antipsychotics

Thyroid Hormones
Antacids: absorption of levothyroxine (thyroxine) possibly reduced by antacids
Anti-arrhythmics: for concomitant use of thyroid hormones and amiodarone see p. 83
Antibacterials: metabolism of levothyroxine (thyroxine) accelerated by rifampicin (may increase requirements for levothyroxine (thyroxine) in hypothyroidism)
● Anticoagulants: thyroid hormones enhance anticoagulant effect of ●coumarins and ●phenindione
Antidepressants: thyroid hormones enhance effects of amitriptyline and imipramine; thyroid hormones possibly enhance effects of tricyclics
Antiepileptics: metabolism of thyroid hormones accelerated by carbamazepine and primidone (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by phenytoin (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
Barbiturates: metabolism of thyroid hormones accelerated by barbiturates (may increase requirements for thyroid hormones in hypothyroidism)
Beta-blockers: levothyroxine (thyroxine) accelerates metabolism of propranolol
Calcium Salts: absorption of levothyroxine (thyroxine) reduced by calcium salts
Cytotoxics: plasma concentration of levothyroxine (thyroxine) possibly reduced by imatinib
Iron: absorption of levothyroxine (thyroxine) reduced by *oral* iron (give at least 2 hours apart)

Thyroid Hormones *(continued)*
Lipid-regulating Drugs: absorption of thyroid hormones reduced by colestipol and colestyramine
Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by oestrogens
Polystyrene Sulphonate Resins: absorption of levothyroxine (thyroxine) reduced by polystyrene sulphonate resins
Ulcer-healing Drugs: absorption of levothyroxine (thyroxine) reduced by cimetidine and sucralfate

Tiagabine
● Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
Antiepileptics: plasma concentration of tiagabine reduced by carbamazepine, phenytoin and primidone
● Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
Barbiturates: plasma concentration of tiagabine reduced by phenobarbital

Tiaprofenic Acid *see* NSAIDs

Tibolone
Antibacterials: metabolism of tibolone accelerated by rifampicin (reduced plasma concentration)
Antiepileptics: metabolism of tibolone accelerated by carbamazepine and primidone (reduced plasma concentration); metabolism of tibolone accelerated by phenytoin
Barbiturates: metabolism of tibolone accelerated by barbiturates (reduced plasma concentration)

Ticarcillin *see* Penicillins

Tigecycline
Anticoagulants: tigecycline possibly enhances anticoagulant effect of coumarins
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Tiludronic Acid *see* Bisphosphonates

Timolol *see* Beta-blockers

Tinidazole
Alcohol: possibility of disulfiram-like reaction when tinidazole given with alcohol
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Tinzaparin *see* Heparins

Tioguanine
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
● Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: increased risk of hepatotoxicity when tioguanine given with busulfan

Tiotropium *see* Antimuscarinics

Tipranavir
Antacids: absorption of tipranavir reduced by antacids
● Antibacterials: tipranavir increases plasma concentration of ●clarithromycin (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of ●rifabutin (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by ●rifampicin—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin

Tipranavir *(continued)*
Anticoagulants: avoidance of tipranavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of tipranavir possibly reduced by ●St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of tipranavir possibly reduced by carbamazepine
Antifungals: plasma concentration of tipranavir increased by fluconazole
Antimalarials: caution with tipranavir advised by manufacturer of artemether/lumefantrine
Antimuscarinics: avoidance of tipranavir advised by manufacturer of darifenacin
- Antivirals: tipranavir reduces plasma concentration of ●abacavir, ●didanosine, ●fosamprenavir, ●lopinavir, ●saquinavir and ●zidovudine; plasma concentration of tipranavir increased by atazanavir (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of ●etravirine, also plasma concentration of tipranavir increased (avoid concomitant use)
- Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with ●metoprolol for heart failure
- Lipid-regulating Drugs: possible increased risk of myopathy when tipranavir given with ●rosuvastatin—avoid concomitant use
- Ranolazine: tipranavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Ulcer-healing Drugs: tipranavir reduces plasma concentration of ●esomeprazole and ●omeprazole

Vitamins: increased risk of bleeding when tipranavir given with high doses of vitamin E

Tirofiban
Iloprost: increased risk of bleeding when tirofiban given with iloprost

Tizanidine *see* Muscle Relaxants

Tobacco
Cinacalcet: tobacco smoking increases cinacalcet metabolism (reduced plasma concentration)
Cytotoxics: tobacco smoking reduces plasma concentration of erlotinib
Theophylline: tobacco smoking increases theophylline metabolism (reduced plasma concentration)

Tobramycin *see* Aminoglycosides

Tolazoline *see* Alpha-blockers

Tolbutamide *see* Antidiabetics

Tolcapone
Antidepressants: avoid concomitant use of tolcapone with MAOIs
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Tolfenamic Acid *see* NSAIDs

Tolterodine *see* Antimuscarinics

Topiramate
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort

Antidiabetics: topiramate possibly reduces plasma concentration of glibenclamide
- Antiepileptics: plasma concentration of topiramate often reduced by carbamazepine; topiramate increases plasma concentration of ●phenytoin (also plasma concentration of topiramate reduced)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine

Lithium: topiramate possibly affects plasma concentration of lithium

Topiramate *(continued)*
- Oestrogens: topiramate accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 445)
- Progestogens: topiramate accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 445)

Torasemide *see* Diuretics

Toremifene
- Anticoagulants: toremifene possibly enhances anticoagulant effect of ●coumarins

Antiepileptics: metabolism of toremifene possibly accelerated by carbamazepine (reduced plasma concentration); metabolism of toremifene possibly accelerated by phenytoin; metabolism of toremifene accelerated by primidone (reduced plasma concentration)
Barbiturates: metabolism of toremifene possibly accelerated by barbiturates (reduced plasma concentration)
Diuretics: increased risk of hypercalcaemia when toremifene given with thiazides and related diuretics
Sugammadex: toremifene possibly reduces response to sugammadex

Trabectedin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Tramadol *see* Opioid Analgesics

Trandolapril *see* ACE Inhibitors

Tranylcypromine *see* MAOIs

Trazodone *see* Antidepressants, Tricyclic (related)

Tretinoin *see* Retinoids

Triamcinolone *see* Corticosteroids

Triamterene *see* Diuretics

Triclofos *see* Anxiolytics and Hypnotics

Trientine
Iron: trientine reduces absorption of *oral* iron
Zinc: trientine reduces absorption of zinc, also absorption of trientine reduced by zinc

Trifluoperazine *see* Antipsychotics

Trihexyphenidyl (benzhexol) *see* Antimuscarinics

Trilostane
Diuretics: increased risk of hyperkalaemia when trilostane given with potassium-sparing diuretics and aldosterone antagonists

Trimethoprim
- Anti-arrhythmics: increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with ●amiodarone—avoid concomitant use of co-trimoxazole

Antibacterials: plasma concentration of trimethoprim possibly reduced by rifampicin; plasma concentration of both drugs may increase when trimethoprim given with dapsone
Anticoagulants: trimethoprim possibly enhances anticoagulant effect of coumarins
Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of sulphonylureas
- Antiepileptics: trimethoprim increases plasma concentration of ●phenytoin (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with ●pyrimethamine

Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of lamivudine—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with ●azathioprine

Cardiac Glycosides: trimethoprim possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with ●ciclosporin, also plasma

Trimethoprim

- Ciclosporin *(continued)*
  concentration of ciclosporin reduced by intravenous trimethoprim
- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with •mercaptopurine or •methotrexate

Diuretics: increased risk of hyperkalaemia when trimethoprim given with eplerenone

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Trimipramine *see* Antidepressants, Tricyclic

Tripotassium Dicitratobismuthate

Antibacterials: tripotassium dicitratobismuthate reduces absorption of tetracyclines

Tropicamide *see* Antimuscarinics

Trospium *see* Antimuscarinics

Tryptophan

- Antidepressants: possible increased serotonergic effects when tryptophan given with duloxetine; CNS excitation and confusion when tryptophan given with •MAOIs (reduce dose of tryptophan); agitation and nausea may occur when tryptophan given with •SSRIs
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

- Sibutramine: increased risk of CNS toxicity when tryptophan given with •sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Typhoid Vaccine (oral) *see* Vaccines

Typhoid Vaccine (parenteral) *see* Vaccines

Ubidecarenone

Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of warfarin

Ulcer-healing Drugs *see* Histamine H_2-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

Ursodeoxycholic Acid

Antacids: absorption of bile acids possibly reduced by antacids

- Ciclosporin: ursodeoxycholic acid increases absorption of •ciclosporin

Lipid-regulating Drugs: absorption of bile acids possibly reduced by colestipol and colestyramine

Oestrogens: elimination of cholesterol in bile increased when bile acids given with oestrogens

Ustekinumab

- Vaccines: avoid concomitant use of ustekinumab with live •vaccines (see p. 669)

Vaccines

Note For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 669 ; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 690

- Abatacept: avoid concomitant use of live vaccines with •abatacept (see p. 669)
- Adalimumab: avoid concomitant use of live vaccines with •adalimumab (see p. 669)
- Anakinra: avoid concomitant use of live vaccines with •anakinra (see p. 669)

Antibacterials: oral typhoid vaccine inactivated by antibacterials–see p. 688

Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of warfarin

Antiepileptics: influenza vaccine enhances effects of phenytoin

Antimalarials: oral typhoid vaccine inactivated by antimalarials–see p. 688

- Corticosteroids: immune response to vaccines impaired by high doses of •corticosteroids, avoid concomitant use with live vaccines (see p. 669)
- Etanercept: avoid concomitant use of live vaccines with •etanercept (see p. 669)

Vaccines *(continued)*

- Infliximab: avoid concomitant use of live vaccines with •infliximab (see p. 669)

Interferons: avoidance of vaccines advised by manufacturer of interferon gamma

- Leflunomide: avoid concomitant use of live vaccines with •leflunomide (see p. 669)

Theophylline: influenza vaccine possibly increases plasma concentration of theophylline

- Ustekinumab: avoid concomitant use of live vaccines with •ustekinumab (see p. 669)

Valaciclovir *see* Aciclovir

Valganciclovir *see* Ganciclovir

Valproate

Analgesics: effects of valproate enhanced by aspirin

Antibacterials: plasma concentration of valproate possibly reduced by doripenem and ertapenem; plasma concentration of valproate reduced by imipenem with cilastatin and meropenem; metabolism of valproate possibly inhibited by erythromycin (increased plasma concentration)

Anticoagulants: valproate possibly enhances anticoagulant effect of coumarins

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antiepileptics: plasma concentration of valproate reduced by carbamazepine, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of ethosuximide; valproate increases plasma concentration of lamotrigine; valproate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; valproate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of •primidone (plasma concentration of active metabolite of primidone increased), also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of rufinamide (reduce dose of rufinamide)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of valproate antagonised by •antipsychotics (convulsive threshold lowered); increased risk of neutropenia when valproate given with •olanzapine

Antivirals: valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity)

Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by clobazam; increased risk of side-effects when valproate given with clonazepam; valproate possibly increases plasma concentration of diazepam and lorazepam

Barbiturates: valproate increases plasma concentration of phenobarbital (also plasma concentration of valproate reduced)

Bupropion: valproate inhibits the metabolism of bupropion

Cytotoxics: valproate increases plasma concentration of temozolomide

Lipid-regulating Drugs: absorption of valproate possibly reduced by colestyramine

Sodium Benzoate: valproate possibly reduces effects of sodium benzoate

Sodium Phenylbutyrate: valproate possibly reduces effects of sodium phenylbutyrate

- Ulcer-healing Drugs: metabolism of valproate inhibited by •cimetidine (increased plasma concentration)

Valsartan *see* Angiotensin-II Receptor Antagonists

Vancomycin

Anaesthetics, General: hypersensitivity-like reactions can occur when intravenous vancomycin given with general anaesthetics

Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with aminoglycosides, capreomycin or colistin; increased risk of nephrotoxicity when vancomycin given with polymyxins

Antifungals: possible increased risk of nephrotoxicity when vancomycin given with amphotericin

- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with •ciclosporin

Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with cisplatin

- Diuretics: increased risk of otoxicity when vancomycin given with •loop diuretics

Lipid-regulating Drugs: effects of oral vancomycin antagonised by colestyramine

- Muscle Relaxants: vancomycin enhances effects of •suxamethonium

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 445)

Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 688

Vardenafil

- Alpha-blockers: enhanced hypotensive effect when vardenafil given with •alpha-blockers (excludes tamsulosin)—separate doses by 6 hours—see also p. 463

Antibacterials: plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil)

- Antifungals: plasma concentration of vardenafil increased by •ketoconazole—avoid concomitant use; plasma concentration of vardenafil possibly increased by •itraconazole—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by fosamprenavir; plasma concentration of vardenafil increased by •indinavir—avoid concomitant use; plasma concentration of vardenafil possibly increased by •ritonavir—avoid concomitant use; plasma concentration of vardenafil possibly increased by saquinavir—reduce initial dose of vardenafil

Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with nifedipine

- Grapefruit Juice: plasma concentration of vardenafil possibly increased by •grapefruit juice—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with •nicorandil—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with •nitrates—avoid concomitant use

Vasodilator Antihypertensives

ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alcohol

Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with general anaesthetics

Vasodilator Antihypertensives *(continued)*

Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIs; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with tricyclic-related antidepressants

Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with clonidine

Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diazoxide

Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diuretics

Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with levodopa

Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with methyldopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with moxisylyte

Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with baclofen; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with tizanidine

Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with nicorandil

Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with nitrates

Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alprostadil

Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with minoxidil or sodium nitroprusside; enhanced hypotensive effect when minoxidil given with sodium nitroprusside

Vecuronium *see* Muscle Relaxants

Venlafaxine

- Analgesics: increased risk of bleeding when venlafaxine given with •NSAIDs or •aspirin
- Anticoagulants: venlafaxine possibly enhances anticoagulant effect of •warfarin
- Antidepressants: possible increased serotonergic effects when venlafaxine given with duloxetine or mirtazapine; enhanced CNS effects and toxicity when

Venlafaxine
- Antidepressants *(continued)*
  venlafaxine given with •MAOIs (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start •moclobemide for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine
- Antipsychotics: venlafaxine increases plasma concentration of •clozapine and haloperidol
  Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Dopaminergics: caution with venlafaxine advised by manufacturer of entacapone; increased risk of hypertension and CNS excitation when venlafaxine given with •selegiline (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
  Lithium: possible increased serotonergic effects when venlafaxine given with lithium
- Sibutramine: increased risk of CNS toxicity when SSRI-related antidepressants given with •sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Verapamil *see* Calcium-channel Blockers

Vigabatrin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
  Antiepileptics: vigabatrin reduces plasma concentration of phenytoin; vigabatrin possibly reduces plasma concentration of primidone
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
  Barbiturates: vigabatrin possibly reduces plasma concentration of phenobarbital

Vildagliptin *see* Antidiabetics

Vinblastine
- Antibacterials: toxicity of vinblastine increased by •erythromycin—avoid concomitant use
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vinblastine possibly inhibited by •posaconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vincristine
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vincristine possibly inhibited by •itraconazole and •posaconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
  Calcium-channel Blockers: metabolism of vincristine possibly inhibited by nifedipine
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vinorelbine
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vitamin A *see* Vitamins

Vitamin D *see* Vitamins

Vitamin E *see* Vitamins

Vitamin K (Phytomenadione) *see* Vitamins

Vitamins
  Antibacterials: absorption of vitamin A possibly reduced by neomycin
- Anticoagulants: vitamin K antagonises anticoagulant effect of •coumarins and •phenindione
  Antiepileptics: vitamin D requirements possibly increased when given with carbamazepine, phenytoin or primidone
  Antifungals: plasma concentration of paricalcitol possibly increased by ketoconazole
  Antivirals: increased risk of bleeding when high doses of vitamin E given with tipranavir
  Barbiturates: vitamin D requirements possibly increased when given with barbiturates
  Diuretics: increased risk of hypercalcaemia when vitamin D given with thiazides and related diuretics
  Dopaminergics: pyridoxine reduces effects of levodopa when given without dopa-decarboxylase inhibitor
  Retinoids: risk of hypervitaminosis A when vitamin A given with retinoids
  Selenium: ascorbic acid possibly reduces absorption of selenium (give at least 4 hours apart)

Voriconazole *see* Antifungals, Triazole

Warfarin *see* Coumarins

Xipamide *see* Diuretics

Xylometazoline *see* Sympathomimetics

Zafirlukast *see* Leukotriene Receptor Antagonists

Zaleplon *see* Anxiolytics and Hypnotics

Zidovudine
  Note Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature
  Analgesics: increased risk of haematological toxicity when zidovudine given with NSAIDs; plasma concentration of zidovudine possibly increased by methadone
  Antibacterials: absorption of zidovudine reduced by clarithromycin tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with rifampicin
  Antiepileptics: zidovudine increases or decreases plasma concentration of phenytoin; plasma concentration of zidovudine possibly increased by valproate (increased risk of toxicity)
- Antifungals: plasma concentration of zidovudine increased by •fluconazole (increased risk of toxicity)
  Antimalarials: increased antifolate effect when zidovudine given with pyrimethamine
- Antivirals: profound myelosuppression when zidovudine given with •ganciclovir (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of anaemia when zidovudine given with •ribavirin—avoid concomitant use; zidovudine possibly inhibits effects of •stavudine (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by •tipranavir
  Atovaquone: metabolism of zidovudine possibly inhibited by atovaquone (increased plasma concentration)
- Probenecid: excretion of zidovudine reduced by •probenecid (increased plasma concentration and risk of toxicity)

Zinc
  Antibacterials: zinc reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; zinc reduces absorption of tetracyclines, also absorption of zinc reduced by tetracyclines
  Calcium Salts: absorption of zinc reduced by calcium salts
  Iron: absorption of zinc reduced by *oral* iron, also absorption of *oral* iron reduced by zinc
  Penicillamine: absorption of zinc reduced by penicillamine, also absorption of penicillamine reduced by zinc

Zinc *(continued)*
Trientine: absorption of zinc reduced by trientine, also absorption of trientine reduced by zinc
Zoledronic Acid *see* Bisphosphonates
Zolmitriptan *see* $5HT_1$ Agonists
Zolpidem *see* Anxiolytics and Hypnotics
Zonisamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine and phenytoin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine

Barbiturates: plasma concentration of zonisamide reduced by phenobarbital
Zopiclone *see* Anxiolytics and Hypnotics
Zotepine *see* Antipsychotics
Zuclopenthixol *see* Antipsychotics

A2 Liver disease

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

Impaired drug metabolism Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.

A few drugs, e.g. rifampicin and fusidic acid, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

Hypoproteinaemia The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin and prednisolone.

Reduced clotting Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin and phenindione.

Hepatic encephalopathy In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

Fluid overload Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention, e.g. NSAIDs and corticosteroids.

Hepatotoxic drugs Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Table of drugs to be avoided or used with caution in liver disease

The list of drugs given below is not comprehensive and is based on current information concerning the use of prescribed drugs in therapeutic dosage. Products introduced or amended since publication of BNF No. 57 (March 2009) are underlined.

Drug	Comment
Abacavir	Avoid in moderate hepatic impairment unless essential; avoid in severe hepatic impairment
Abciximab	Avoid in severe liver disease—increased risk of bleeding
Acamprosate	Avoid in severe liver disease
Acarbose	Avoid
ACE inhibitors	Use of prodrugs such as cilazapril, enalapril, fosinopril, imidapril, moexipril, perindopril, quinapril, ramipril, and trandolapril requires close monitoring in patients with impaired liver function
Aceclofenac	*see* NSAIDs
Acemetacin	*see* NSAIDs
Acenocoumarol (nicoumalone)	*see* Anticoagulants, Oral
Acitretin	Avoid—further impairment of liver function may occur
Agomelatine	Avoid
Alfentanil	*see* Opioid Analgesics
Alfuzosin	Reduce dose in mild to moderate liver disease; avoid if severe
Alimemazine (trimeprazine)	Avoid—may precipitate coma in severe liver disease; hepatotoxic
Alitretinoin	Manufacturer advises avoid—no information available
Allopurinol	Reduce dose
Almotriptan	Manufacturer advises caution in mild to moderate liver disease; avoid in severe liver disease
Alprazolam	*see* Anxiolytics and Hypnotics
Alteplase	*see* Fibrinolytics
Ambrisentan	Avoid in severe hepatic impairment
Amfebutamone	*see* Bupropion
Aminophylline	*see* Theophylline
Amitriptyline	*see* Antidepressants, Tricyclic (and related)
Amlodipine	Half-life prolonged—may need dose reduction
Amsacrine	Reduce dose
Anabolic steroids	Preferably avoid—dose-related toxicity
Anagrelide	Manufacturer advises caution in mild hepatic impairment; avoid in moderate to severe impairment
Analgesics	*see* Aspirin, NSAIDs, Opioid Analgesics and Paracetamol
Anastrozole	Avoid in moderate to severe liver disease
Androgens	Preferably avoid—dose-related toxicity with some, and produce fluid retention

Drug	Comment
Antacids	In patients with fluid retention, avoid those containing large amounts of sodium
	Avoid those causing constipation—can precipitate coma
Anticoagulants, oral	Avoid in severe liver disease, especially if prothrombin time already prolonged; *see also* Rivaroxaban
Antidepressants, MAOI	May cause idiosyncratic hepatotoxicity; see also Moclobemide
Antidepressants, SSRI	Reduce dose or avoid; *see also* Escitalopram
Antidepressants, tricyclic (and related)	Tricyclics preferable to MAOIs but sedative effects increased (avoid in severe liver disease)
Antihistamines	*see* individual entries
Antipsychotics	All can precipitate coma; phenothiazines are hepatotoxic; *see also* Aripiprazole, Clozapine, Droperidol, Olanzapine, Paliperidone, Quetiapine, Risperidone, and Sertindole
Anxiolytics and hypnotics	All can precipitate coma; small dose of oxazepam or temazepam probably safest; reduce oral dose of clomethiazole; reduce dose of zaleplon to 5 mg (avoid if severe); reduce dose of zolpidem to 5 mg (avoid if severe); reduce dose of zopiclone (avoid if severe); *see also* Buspirone, Chloral Hydrate, Clonazepam, Melatonin, and Sodium Oxybate
Apomorphine	Manufacturer of *APO-go*® advises avoid
Aprepitant	*see* Neurokinin Receptor Antagonists
Aripiprazole	Manufacturer advises use with caution in severe impairment
Arsenic trioxide	Manufacturer advises caution—limited information available
Artemether [ingredient]	*see Riamet*®
Aspirin	Avoid in severe hepatic impairment—increased risk of gastro-intestinal bleeding
Atazanavir	Manufacturer advises caution in mild hepatic impairment; avoid in moderate to severe hepatic impairment
Atomoxetine	Halve dose in moderate liver disease; quarter dose in severe liver disease
Atorvastatin	*see* Statins
Atosiban	No information available
Atovaquone	Manufacturer advises caution—monitor more closely
Auranofin	Caution in mild to moderate liver disease; avoid in severe liver disease
Azacitidine	Caution in severe hepatic impairment
Azapropazone	*see* NSAIDs
Azathioprine	May need dose reduction
Azithromycin	Manufacturer advises avoid in severe liver disease—no information available
Bambuterol	Avoid in severe liver disease
Beclometasone dipropionate	Manufacturer advises avoid tablets in severe hepatic impairment—no information available
Bemiparin	Manufacturer advises avoid in severe liver disease
Bendrofluazide	*see* Thiazides and Related Diuretics
Bendroflumethiazide (bendrofluazide)	*see* Thiazides and Related Diuretics
Benperidol	*see* Antipsychotics
Benzthiazide	*see* Thiazides and Related Diuretics
Betamethasone	*see* Corticosteroids
Bexarotene	Avoid
Bezafibrate	Avoid in severe liver disease
Bicalutamide	Increased accumulation possible in moderate to severe hepatic impairment
Bisoprolol	Max. 10 mg daily in severe liver impairment
Bortezomib	Manufacturer advises caution in mild to moderate hepatic impairment—consider dose reduction; avoid in severe hepatic impairment
Bosentan	Avoid in moderate and severe hepatic impairment
Bromocriptine	Dose reduction may be necessary
Buclizine	Sedation inappropriate in severe liver disease—avoid
Budesonide	Plasma-budesonide concentration may increase on oral administration
Bumetanide	*see* Loop Diuretics
Bupivacaine	Manufacturer advises caution in severe hepatic impairment
Buprenorphine	*see* Opioid Analgesics
Bupropion	Manufacturer recommends 150 mg daily; avoid in severe hepatic cirrhosis
Buspirone	Reduce dose in mild to moderate liver disease; avoid in severe liver disease
Busulfan	Manufacturer advises monitor liver function—no information available
Cabergoline	Reduce dose in severe hepatic impairment
Calcitriol	Manufacturer of topical calcitriol advises avoid—no information available
Candesartan	For hypertension, initially 2 mg once daily in mild or moderate hepatic impairment (no initial dose adjustment necessary in heart failure); avoid in severe hepatic impairment
Capecitabine	Manufacturer advises avoid in severe hepatic impairment
Carbamazepine	Metabolism impaired in advanced liver disease
Carbetocin	Manufacturer advises avoid

Drug	Comment
Carbimazole	Manufacturers advise caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment
Carboprost	Manufacturer advises avoid
Carvedilol	Avoid
Caspofungin	70 mg on first day then 35 mg once daily in moderate hepatic impairment; no information available for severe hepatic impairment
Ceftriaxone	Reduce dose and monitor plasma concentration if both hepatic and severe renal impairment
Celecoxib	*see* NSAIDs
Cetrorelix	Manufacturer advises avoid in moderate or severe liver impairment
Chloral hydrate	Reduce dose in mild to moderate hepatic impairment; avoid in severe impairment; *see also* Anxiolytics and Hypnotics
Chlorambucil	Manufacturer advises consider dose reduction in severe hepatic impairment—limited information available
Chloramphenicol	Avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration
Chlordiazepoxide	*see* Anxiolytics and Hypnotics
Chloroquine	Use with caution in moderate to severe hepatic impairment
Chlorphenamine (chlorpheniramine)	Sedation inappropriate in severe liver disease—avoid
Chlorpheniramine	*see* Chlorphenamine
Chlorpromazine	*see* Antipsychotics
Chlorpropamide	*see* Sulphonylureas
Chlortalidone	*see* Thiazides and Related Diuretics
Ciclosporin	May need dose adjustment
Cilazapril	*see* ACE Inhibitors
Cilostazol	Avoid in moderate or severe liver disease
Cimetidine	Increased risk of confusion; reduce dose
Cinacalcet	Manufacturer advises caution in moderate to severe hepatic impairment—monitor closely especially when increasing dose
Cinnarizine	Sedation inappropriate in severe liver disease—avoid
Ciprofibrate	Avoid in severe liver disease
Citalopram	Use doses at lower end of range
Cladribine	Regular monitoring recommended
Clarithromycin	Hepatic dysfunction including jaundice reported
Clavulanic acid [ingredient]	*see* Co-amoxiclav, below and *Timentin®*, p. 814
Clemastine	Sedation inappropriate in severe liver disease—avoid
Clobazam	*see* Anxiolytics and Hypnotics
Clofarabine	No information available—manufacturer advises caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment
Clomethiazole	*see* Anxiolytics and Hypnotics
Clomifene	Avoid in severe liver disease
Clomipramine	*see* Antidepressants, Tricyclic (and related)
Clonazepam	Reduce dose in mild to moderate impairment; avoid in severe liver impairment; *see also* Anxiolytics and Hypnotics
Clopamide	*see* Thiazides and Related Diuretics
Clopidogrel	Manufacturer advises caution (risk of bleeding); avoid in severe hepatic impairment
Clozapine	Monitor hepatic function regularly; avoid in symptomatic or progressive liver disease or hepatic failure
Co-amoxiclav	Monitor liver function in liver disease. Cholestatic jaundice, *see* p. 300
Codeine	*see* Opioid Analgesics
Colchicine	Caution
Colesevelam	Manufacturer advises caution
Contraceptives, oral	Avoid in active liver disease and if history of pruritus or cholestasis during pregnancy
Corticosteroids	For oral and parental administration, plasma-drug concentration may increase, use with caution and monitor closely; *see also* Beclometasone Dipropionate, Budesonide and Cortisone
Cortisone	Use with caution; hepatic conversion to active metabolite hydrocortisone may be affected
Co-trimoxazole	Manufacturer advises avoid in severe liver disease
Cyclizine	Sedation inappropriate in severe liver disease—avoid
Cyclopenthiazide	*see* Thiazides and Related Diuretics
Cyclophosphamide	Reduce dose
Cyclosporin	*see* Ciclosporin
Cyproheptadine	Sedation inappropriate in severe liver disease—avoid
Cyproterone acetate	Dose-related toxicity; *see also* side-effects, p. 509
Cytarabine	Reduce dose
Dabigatran etexilate	*see* Anticoagulants, Oral
Dacarbazine	Dose reduction may be required in mild to moderate liver disease; avoid if severe
Dalfopristin [ingredient]	*see Synercid®*
Dalteparin	*see* Heparin
Danaparoid	Use with caution in moderate hepatic impairment (increased risk of bleeding); avoid in severe hepatic impairment unless patient has heparin-induced thrombocytopenia and no alternative

Drug	Comment
Dantrolene	Avoid oral use—may cause severe liver damage; injection may be used in emergency for malignant hyperthermia
Daptomycin	Manufacturer advises caution in severe hepatic impairment—no information available
Darbepoetin	Manufacturer advises caution
Darifenacin	Max. 7.5 mg daily in moderate hepatic impairment; avoid in severe hepatic impairment
Darunavir	Manufacturer advises caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment—no information available
Dasatinib	Manufacturer advises caution in moderate to severe hepatic impairment—no information available
Daunorubicin	Reduce dose
Deferasirox	Manufacturer advises caution—no information available; avoid in severe hepatic impairment
Deferiprone	Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase
Deflazacort	*see* Corticosteroids
Degarelix	Manufacturer advises caution in severe hepatic impairment—no information available
Demeclocycline	*see* Tetracyclines
Desogestrel	Avoid; *see also* Contraceptives, Oral
Dexamethasone	*see* Corticosteroids
Dexibuprofen	*see* NSAIDs
Dexketoprofen	*see* NSAIDs
Dexrazoxane	Monitor liver function in patients with liver disease
Dextromethorphan	*see* Opioid Analgesics
Diamorphine	*see* Opioid Analgesics
Diazepam	*see* Anxiolytics and Hypnotics
Diclofenac	*see* NSAIDs
Didanosine	Insufficient information but monitor for toxicity
Diethylstilbestrol	Avoid; *see also* Contraceptives, Oral
Dihydrocodeine	*see* Opioid Analgesics
Diltiazem	Reduce dose
Dinoprostone	Manufacturers advise avoid
Diphenoxylate	*see* Opioid Analgesics
Dipipanone	*see* Opioid Analgesics
Disodium pamidronate	Manufacturer advises caution in severe hepatic impairment—no information available
Disopyramide	Half-life prolonged—may need dose reduction
Docetaxel	Monitor liver function—reduce dose according to liver enzymes; avoid in severe hepatic impairment
Domperidone	Avoid
Donepezil	Manufacturer advises caution in mild to moderate hepatic impairment
Dosulepin (dothiepin)	*see* Antidepressants, Tricyclic (and related)
Dothiepin	*see* Antidepressants, Tricyclic (and related)
Doxazosin	No information—manufacturer advises caution
Doxepin	*see* Antidepressants, Tricyclic (and related)
Doxorubicin	Reduce dose according to bilirubin concentration
Doxycycline	*see* Tetracyclines
Droperidol	In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose
Drotrecogin alfa (activated)	Avoid in chronic severe liver disease
Duloxetine	Manufacturer advises avoid
Dutasteride	Manufacturer advises avoid in severe liver impairment—no information available
Dydrogesterone	Avoid; *see also* Contraceptives, Oral
Efavirenz	In mild to moderate liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function; avoid in severe hepatic impairment
Eletriptan	Manufacturer advises avoid in severe hepatic impairment
Enalapril	*see* ACE Inhibitors
Enfuvirtide	Manufacturer advises caution—no information available
Enoxaparin	*see* Heparin
Enoximone	Dose reduction may be required
Entacapone	Avoid
Epirubicin	Reduce dose according to bilirubin concentration
Eplerenone	Avoid in severe liver disease
Epoetin	Manufacturers advise caution in chronic hepatic failure
Eprosartan	Halve initial dose in mild or moderate liver disease; avoid if severe
Eptifibatide	Avoid in severe liver disease—increased risk of bleeding
Erdosteine	Manufacturer advises max. 300 mg daily in mild to moderate hepatic impairment; avoid in severe hepatic impairment
Ergometrine	Avoid in severe liver disease
Ergotamine	Avoid in severe liver disease—risk of toxicity increased
Erlotinib	Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment
Erythromycin	May cause idiosyncratic hepatotoxicity

Drug	Comment
Escitalopram	Initial dose 5 mg daily in mild to moderate hepatic impairment (for 2 weeks), increased to 10 mg daily according to response; manufacturer advises caution in severe hepatic impairment
Esomeprazole	In severe liver disease dose should not exceed 20 mg daily
Estradiol	Avoid; *see also* Contraceptives, Oral
Estramustine	Manufacturer advises caution and regular liver function tests; avoid in severe liver disease
Estriol	Avoid; *see also* Contraceptives, Oral
Estrone	Avoid; *see also* Contraceptives, Oral
Estropipate	Avoid; *see also* Contraceptives, Oral
Ethinylestradiol	Avoid; *see also* Contraceptives, Oral
Etodolac	*see* NSAIDs
Etomidate	Reduce dose in liver cirrhosis
Etoposide	Avoid in severe hepatic impairment
Etoricoxib	Max. 60 mg daily in mild hepatic impairment; max. 60 mg on alternate days or 30 mg once daily in moderate hepatic impairment; avoid in severe hepatic impairment; *see also* NSAIDs
Etravirine	Manufacturer advises caution in moderate hepatic impairment; avoid in severe hepatic impairment—no information available
Etynodiol diacetate	Avoid; *see also* Contraceptives, Oral
Exemestane	Manufacturer advises caution
Ezetimibe	Avoid in moderate and severe hepatic impairment—may accumulate
Famciclovir	Usual dose in well compensated liver disease (information not available on decompensated)
Felodipine	Reduce dose
Fenbufen	*see* NSAIDs
Fenofibrate	Avoid in severe liver disease
Fenoprofen	*see* NSAIDs
Fentanyl	*see* Opioid Analgesics
Ferric carboxymaltose	Use with caution; avoid in conditions where iron overload increases risk of impairment
Fesoterodine	Manufacturer advises increase dose cautiously; max. 4 mg daily in moderate hepatic impairment; avoid in severe hepatic impairment; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors
Fibrinolytics	Avoid in severe hepatic impairment—increased risk of bleeding
Flecainide	Avoid (or reduce dose) in severe liver disease
Flucloxacillin	Caution in hepatic impairment (risk of cholestatic jaundice and hepatitis, *see* p. 297)
Fluconazole	Toxicity with related drugs
Fludrocortisone	*see* Corticosteroids
Flumazenil	Carefully titrate dose
Fluorouracil	Manufacturer advises caution
Fluoxetine	*see* Antidepressants, SSRI
Flupentixol	*see* Antipsychotics
Fluphenazine	*see* Antipsychotics
Flurazepam	*see* Anxiolytics and Hypnotics
Flurbiprofen	*see* NSAIDs
Flutamide	Use with caution (hepatotoxic)
Fluvastatin	*see* Statins
Fluvoxamine	*see* Antidepressants, SSRI
Fondaparinux sodium	Caution in severe hepatic impairment (increased risk of bleeding)
Formoterol (eformoterol)	Metabolism possibly reduced in severe cirrhosis
Fosamprenavir	Manufacturer advises caution in mild hepatic impairment; reduce dose to 450 mg twice daily in moderate hepatic impairment; reduce dose to 300 mg twice daily in severe hepatic impairment
Fosaprepitant	*see* Neurokinin Receptor Antagonists
Fosinopril	*see* ACE Inhibitors
Fosphenytoin	Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)
Frovatriptan	Avoid in severe hepatic impairment
Frusemide	*see* Loop Diuretics
Fulvestrant	Manufacturer advises caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment
Furosemide (frusemide)	*see* Loop Diuretics
Fusidic acid	*see* Sodium Fusidate
Galantamine	Reduce dose in moderate hepatic impairment; avoid in severe impairment
Ganirelix	Manufacturer advises avoid in moderate or severe hepatic impairment
Gemcitabine	Manufacturer advises caution
Gemfibrozil	Avoid in liver disease
Gestodene	Avoid; *see also* Contraceptives, Oral
Gestrinone	Avoid in severe liver disease
Glibenclamide	*see* Sulphonylureas
Gliclazide	*see* Sulphonylureas
Glimepiride	Manufacturer advises avoid in severe hepatic impairment
Glipizide	*see* Sulphonylureas
Glyceryl trinitrate	*see* Nitrates
Griseofulvin	Avoid in severe liver disease
Haloperidol	*see* Antipsychotics
Halothane	Avoid if history of unexplained pyrexia or jaundice following previous exposure to halothane

Drug	Comment
Heparin	Reduce dose in severe liver disease
Hydralazine	Reduce dose
Hydrochlorothiazide	*see* Thiazides and Related Diuretics
Hydrocortisone	*see* Corticosteroids
Hydroflumethiazide	*see* Thiazides and Related Diuretics
Hydromorphone	*see* Opioid Analgesics
Hydroxycarbamide (hydroxyurea)	For sickle-cell disease, manufacturer advises caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment
Hydroxychloroquine	Use with caution in moderate to severe hepatic impairment
Hydroxyzine	Sedation inappropriate in severe liver disease—avoid
Hyoscine hydrobromide	Manufacturer advises caution
Hypnotics	*see* Anxiolytics and Hypnotics
Ibuprofen	*see* NSAIDs
Idarubicin	Reduce dose according to serum-bilirubin concentration; avoid in severe hepatic impairment
Ifosfamide	Avoid
Iloprost	Elimination reduced in hepatic impairment—initially 2.5 micrograms no more frequently than every 3 hours (max. 6 times daily), adjusted according to response (consult product literature)
Imatinib	Max. 400 mg daily; reduce dose further if not tolerated
Imidapril	*see* ACE Inhibitors
Imipramine	*see* Antidepressants, Tricyclic (and related)
Indapamide	*see* Thiazides and Related Diuretics
Indinavir	Increased risk of nephrolithiasis; reduce dose to 600 mg every 8 hours in mild to moderate hepatic impairment; not studied in severe impairment
Indometacin	*see* NSAIDs
Indoramin	Manufacturer advises caution
Interferon alfa	Close monitoring in mild to moderate hepatic impairment; avoid if severe
Interferon beta	Avoid in decompensated liver disease
Interferon gamma-1b	Manufacturer advises caution in severe liver disease
Irinotecan	Monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range; avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range
Iron dextran	Avoid in severe hepatic impairment
Iron sucrose	Use with caution; avoid in conditions where iron overload increases risk of impairment
Isocarboxazid	*see* Antidepressants, MAOI
Isometheptene [ingredient]	*see Midrid®*
Isoniazid	Use with caution; monitor liver function regularly and particularly frequently in first 2 months; *see also* p. 324
Isosorbide dinitrate	*see* Nitrates
Isosorbide mononitrate	*see* Nitrates
Isotretinoin	Avoid—further impairment of liver function may occur
Isradipine	Reduce dose
Itraconazole	Use only if potential benefit outweighs risk of hepatotoxicity (*see* p. 336); dose reduction may be necessary
Ivabradine	Manufacturer advises caution in moderate hepatic impairment; avoid in severe hepatic impairment
Kaletra®	Avoid oral solution because of propylene glycol content; manufacturer advises avoid capsules and tablets in severe hepatic impairment
Ketoconazole	Avoid; *see also* p. 337
Ketoprofen	*see* NSAIDs
Ketorolac	*see* NSAIDs
Ketotifen	Sedation inappropriate in severe liver disease—avoid
Labetalol	Avoid—severe hepatocellular injury reported
Lacidipine	Antihypertensive effect possibly increased
Lacosamide	Manufacturer advises caution in severe hepatic impairment — no information available
Lamotrigine	Halve dose in moderate hepatic impairment; quarter dose in severe hepatic impairment
Lansoprazole	In severe liver disease dose should not exceed 30 mg daily
Lapatinib	Manufacturer advises caution in moderate to severe hepatic impairment—metabolism reduced
Leflunomide	Avoid—active metabolite may accumulate
Lepirudin	No information—manufacturer advises that cirrhosis may affect renal excretion
Lercanidipine	Avoid in severe liver disease
Levetiracetam	Halve dose in severe hepatic impairment if eGFR less than 70 mL/minute/1.73m^2
Levobupivacaine	Manufacturer advises caution in liver disease
Levomepromazine (methotrimeprazine)	*see* Antipsychotics
Levonorgestrel	Avoid (however levonorgestrel emergency contraception can be used); *see also* Contraceptives, Oral
Lidocaine (lignocaine)	Manufacturer advises caution—increased risk of side-effects
Lignocaine	*see* Lidocaine

Drug	Comment
Linezolid	In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk
Lofepramine	*see* Antidepressants, Tricyclic (and related)
Loop diuretics	Hypokalaemia may precipitate coma (use potassium-sparing diuretic to prevent this); increased risk of hypomagnesaemia in alcoholic cirrhosis
Lopinavir [ingredient]	*see Kaletra®*
Loprazolam	*see* Anxiolytics and Hypnotics
Lorazepam	*see* Anxiolytics and Hypnotics
Lormetazepam	*see* Anxiolytics and Hypnotics
Losartan	Consider dose reduction in mild to moderate hepatic impairment; manufacturer advises avoid in severe impairment—no information available
Lumefantrine [ingredient]	*see Riamet®*
Lymecycline	*see* Tetracyclines
Magnesium salts	Avoid in hepatic coma if risk of renal failure
Maraviroc	Manufacturer advises caution
Medroxyprogesterone	Avoid; *see also* Contraceptives, Oral
Mefenamic acid	*see* NSAIDs
Mefloquine	Avoid for prophylaxis in severe liver disease
Megestrol	Avoid; *see also* Contraceptives, Oral
Melatonin	Manufacturer advises avoid
Meloxicam	*see* NSAIDs
Meprobamate	*see* Anxiolytics and Hypnotics
Meptazinol	*see* Opioid Analgesics
Mercaptopurine	May need dose reduction
Meropenem	Monitor transaminase and bilirubin concentrations
Mesalazine	Avoid in severe hepatic impairment
Mesterolone	*see* Androgens
Mestranol	Avoid; *see also* Contraceptives, Oral
Metformin	Withdraw if tissue hypoxia likely
Methadone	*see* Opioid Analgesics
Methenamine	Avoid
Methionine	May precipitate coma
Methocarbamol	Manufacturer advises caution; half-life may be prolonged
Methotrexate	Dose-related toxicity—avoid in non-malignant conditions (e.g. psoriasis); avoid for all indications in severe hepatic impairment
Methotrimeprazine	*see* Antipsychotics
Methoxy polyethylene glycol-epoetin beta	Manufacturer advises caution in severe liver disease—no information available
Methyldopa	Manufacturer advises caution in history of liver disease; avoid in active liver disease
Methylnaltrexone	Manufacturer advises avoid in severe hepatic impairment—no information available
Methylprednisolone	*see* Corticosteroids
Methysergide	Avoid
Metoclopramide	Reduce dose
Metolazone	*see* Thiazides and Related Diuretics
Metoprolol	Reduce dose in severe hepatic impairment
Metronidazole	In severe liver disease reduce total daily dose to one-third, and give once daily
Mianserin	*see* Antidepressants, Tricyclic (and related)
Micafungin	Use with caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment—no information available
Miconazole	Avoid
Midazolam	*see* Anxiolytics and Hypnotics
Midrid®	Avoid in severe liver disease; *see also* Paracetamol
Mifepristone	Manufacturer advises avoid
Miglustat	No information available—manufacturer advises caution
Minocycline	*see* Tetracyclines
Mirtazapine	Manufacturer advises caution
Mitotane	Manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment
Mitoxantrone	Manufacturer advises caution in severe hepatic impairment
Mivacurium	Reduce dose in severe liver impairment
Mizolastine	Manufacturer recommends avoid in significant hepatic impairment
Moclobemide	Reduce dose in severe liver disease
Modafinil	Halve dose in severe liver disease
Moexipril	*see* ACE Inhibitors
Morphine	*see* Opioid Analgesics
Moxifloxacin	Manufacturer advises avoid in severe hepatic impairment
Moxonidine	Avoid in severe liver disease
Nabilone	Avoid in severe liver disease
Nabumetone	*see* NSAIDs
Nadolol	Manufacturer advises caution
Nalidixic acid	Manufacturer advises caution in liver disease
Naltrexone	Manufacturer advises caution; avoid in acute hepatitis or hepatic failure
Nandrolone	*see* Anabolic Steroids
Naproxen	*see* NSAIDs
Naratriptan	Max. 2.5 mg in 24 hours in moderate hepatic impairment; avoid if severe
Nateglinide	Manufacturer advises caution in moderate hepatic impairment; avoid in severe impairment—no information available
Nebivolol	No information available—manufacturer advises avoid
Nelfinavir	Manufacturer advises caution

Drug	Comment
Neomycin	Absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity
Neurokinin receptor antagonists	Manufacturer advises caution in moderate to severe hepatic impairment
Nevirapine	Manufacturer advises caution in moderate hepatic impairment; avoid in severe hepatic impairment; *see also* p. 347
Nicardipine	Half-life prolonged in severe hepatic impairment—may need dose reduction
Nicotine	Manufacturers advise caution in moderate to severe hepatic impairment
Nicotinic acid	Manufacturer advises monitor liver function in mild to moderate hepatic impairment and avoid in severe impairment; discontinue if severe abnormalities in liver function tests
Nicoumalone	*see* Anticoagulants, Oral
Nifedipine	Dose reduction may be required in severe liver disease
Nilotinib	Manufacturer advises caution—no information available
Nimodipine	Elimination reduced in cirrhosis—monitor blood pressure
Nitrates	Caution in severe hepatic impairment
Nitrazepam	*see* Anxiolytics and Hypnotics
Nitrofurantoin	Cholestatic jaundice and chronic active hepatitis reported
Nitroprusside	*see* Sodium Nitroprusside
Nizatidine	Manufacturer advises caution
Norethisterone	Avoid; *see also* Contraceptives, Oral
Norgestimate	Avoid; *see also* Contraceptives, Oral
Norgestrel	Avoid; *see also* Contraceptives, Oral
Nortriptyline	*see* Antidepressants, Tricyclic (and related)
NSAIDs	Increased risk of gastro-intestinal bleeding and can cause fluid retention; avoid in severe liver disease; aceclofenac, initially 100 mg daily; celecoxib, halve initial dose in moderate liver disease; dexketoprofen, reduce initial dose to max. 50 mg daily in mild to moderate hepatic impairment; parecoxib, halve dose in moderate hepatic impairment (max. 40 mg daily); tiaprofenic acid, reduce dose in mild or moderate hepatic impairment; *see also* Etoricoxib
Oestrogens	Avoid; *see also* Contraceptives, Oral
Ofloxacin	Elimination may be reduced in severe hepatic impairment
Olanzapine	Consider initial dose of 5 mg daily
Olmesartan	Dose should not exceed 20 mg daily in moderate impairment; manufacturer advises avoid in severe impairment—no information available
Omalizumab	Manufacturer advises caution—no information available
Omega-3-acid ethyl esters	Monitor liver function
Omeprazole	In liver disease not more than 20 mg daily should be needed
Ondansetron	Max. 8 mg daily in moderate or severe hepatic impairment
Opioid analgesics	Avoid or reduce dose—may precipitate coma
Oral contraceptives	*see* Contraceptives, Oral
Oxazepam	*see* Anxiolytics and Hypnotics
Oxcarbazepine	Manufacturer advises caution in severe hepatic impairment—no information available
Oxprenolol	Reduce dose
Oxybutynin	Manufacturer advises caution
Oxycodone	*see* Opioid Analgesics
Oxytetracycline	*see* Tetracyclines
Paclitaxel	Avoid in severe liver disease
Paliperidone	Manufacturer advises caution in severe hepatic impairment—no information available
Pancuronium	Possibly slower onset, higher dose requirement and prolonged recovery time
Pantoprazole	Max. 20 mg daily in severe hepatic impairment and cirrhosis—monitor liver function (discontinue if deterioration)
Papaveretum	*see* Opioid Analgesics
Paracetamol	Dose-related toxicity—avoid large doses
Parathyroid hormone	Avoid
Parecoxib	*see* NSAIDs
Paroxetine	*see* Antidepressants, SSRI
Peginterferon alfa	Avoid in severe hepatic impairment
Pentazocine	*see* Opioid Analgesics
Pentostatin	Manufacturer advises caution—limited information available
Pericyazine	*see* Antipsychotics
Perindopril	*see* ACE Inhibitors
Perphenazine	*see* Antipsychotics
Pethidine	*see* Opioid Analgesics
Phenelzine	*see* Antidepressants, MAOI
Phenindione	*see* Anticoagulants, Oral
Phenobarbital	May precipitate coma; avoid in severe hepatic impairment
Phenothiazines	*see* Antipsychotics
Phenytoin	Reduce dose to avoid toxicity
Pholcodine	*see* Opioid Analgesics
Pilocarpine	Reduce initial oral dose in moderate or severe cirrhosis
Pimozide	*see* Antipsychotics
Pioglitazone	Avoid
Piperazine	Manufacturer advises avoid
Pipotiazine	*see* Antipsychotics
Piracetam	Avoid
Piroxicam	*see* NSAIDs

Drug	Comment
Posaconazole	Monitor liver function; use with caution in severe hepatic impairment
Prasugrel	Use with caution—increased risk of bleeding; avoid in severe hepatic impairment
Pravastatin	*see* Statins
Prazosin	Initially 500 micrograms daily; increased with caution
Prednisolone	*see* Corticosteroids
Prilocaine	Manufacturer advises caution
Primidone	Reduce dose; may precipitate coma
Procarbazine	Avoid in severe hepatic impairment
Prochlorperazine	*see* Antipsychotics
Progesterone	Avoid; *see also* Contraceptives, Oral
Progestogens	Avoid; *see also* Contraceptives, Oral
Promazine	*see* Antipsychotics
Promethazine	Avoid—may precipitate coma in severe liver disease; hepatotoxic
Propafenone	Reduce dose
Propantheline	Manufacturer advises caution
Propiverine	Avoid in moderate to severe hepatic impairment
Propofol	Use with caution
Propranolol	Reduce oral dose
Propylthiouracil	Reduce dose
Prothrombin Complex, Dried	Increased risk of thromboembolic events—manufacturer advises use with caution
Pyrazinamide	Monitor hepatic function—idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment; *see also* p. 324
Pyrimethamine	Manufacturer advises caution
Quetiapine	For *immediate-release tablets*, initially 25 mg daily, increased daily in steps of 25–50 mg; for *modified-release tablets*, initially 50 mg daily, increased daily in steps of 50 mg
Quinagolide	Manufacturer advises avoid—no information available
Quinapril	*see* ACE Inhibitors
Quinine	For treatment of malaria in severe hepatic impairment, reduce parenteral maintenance dose to 5–7 mg/kg of salt
Quinupristin [ingredient]	*see Synercid®*
Rabeprazole	Manufacturer advises caution in severe hepatic dysfunction
Raloxifene	Manufacturer advises avoid
Raltegravir	Manufacturer advises caution in severe hepatic impairment—no information available
Raltitrexed	Caution in mild or moderate disease; avoid if severe
Ramipril	*see* ACE Inhibitors
Ranolazine	Use with caution in mild hepatic impairment; avoid in moderate and severe hepatic impairment
Rasagiline	Manufacturer advises caution in mild hepatic impairment; avoid in moderate to severe impairment
Reboxetine	Initial dose 2 mg twice daily, increased according to tolerance
Remifentanil	*see* Opioid Analgesics
Repaglinide	Manufacturer advises avoid in severe liver disease
Reteplase	*see* Fibrinolytics
Riamet®	Manufacturer advises caution in severe hepatic impairment—monitor ECG and plasma-potassium concentration
Ribavirin	No dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or decompensated cirrhosis
Rifabutin	Reduce dose in severe hepatic impairment
Rifampicin	Impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; *see also* p. 325
Riluzole	Avoid
Rimonabant	Manufacturer advises caution in moderate hepatic impairment; avoid in severe impairment
Risperidone	Manufacturer advises initial and subsequent oral doses should be halved; if an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks
Ritonavir	Avoid in decompensated liver disease; in severe hepatic impairment without decompensation, use 'booster' doses with caution (avoid treatment doses)
Rivaroxaban	Manufacturer advises caution in cirrhotic patients with moderate hepatic impairment; avoid in liver disease with coagulopathy
Rivastigmine	No information available—manufacturer advises avoid in severe liver disease
Rizatriptan	Reduce dose to 5 mg in mild to moderate liver disease; avoid in severe liver disease
Rocuronium	Reduce dose
Ropinirole	Manufacturer advises caution in moderate hepatic impairment; avoid in severe hepatic impairment
Ropivacaine	Manufacturer advises caution in severe liver disease
Rosiglitazone	Avoid
Rosuvastatin	*see* Statins
Rotigotine	Manufacturer advises caution in severe hepatic impairment—no information available

Drug	Comment
Rufinamide	Manufacturer advises caution and careful dose titration in mild to moderate hepatic impairment; avoid in severe impairment
Sapropterin	Manufacturer advises caution—no information available
Saquinavir	Manufacturer advises caution in moderate hepatic impairment; avoid in severe impairment
Sertindole	Slower titration and lower maintenance dose in mild to moderate hepatic impairment; avoid in severe hepatic impairment; *see also* Antipsychotics
Sertraline	*see* Antidepressants, SSRI
Sibutramine	Increased plasma-sibutramine concentration; manufacturer advises caution in mild to moderate hepatic impairment; avoid if severe impairment
Sildenafil	For erectile dysfunction, initial dose 25 mg; for pulmonary hypertension reduce to 20 mg twice daily if usual dose not tolerated; manufacturer advises avoid in severe hepatic impairment
Simvastatin	*see* Statins
Sirolimus	Decrease dose by 50%; monitor blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentrations
Sitaxentan sodium	Avoid
Sodium aurothiomalate	Caution in mild to moderate liver disease; avoid in severe liver disease
Sodium bicarbonate	*see* Antacids
Sodium fusidate	Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose
Sodium nitroprusside	Avoid in severe liver disease
Sodium oxybate	Halve initial dose
Sodium phenylbutyrate	Manufacturer advises caution
Sodium valproate	*see* Valproate
Solifenacin	Max. 5 mg daily in moderate liver disease; avoid if severe
Sorafenib	Manufacturer advises caution in severe hepatic impairment—no information available
Statins	Avoid in active liver disease or unexplained persistent elevations in serum transaminases
Stilboestrol (diethylstilbestrol)	Avoid; *see also* Contraceptives, Oral
Streptokinase	*see* Fibrinolytics
Sulindac	*see* NSAIDs
Sulphonylureas	Increased risk of hypoglycaemia in severe liver disease; avoid or use small dose; can produce jaundice; *see also* Glimepiride
Sulpiride	*see* Antipsychotics
Sumatriptan	Manufacturer advises 50 mg oral dose in hepatic impairment; avoid in severe hepatic impairment
Suxamethonium	Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase
Synercid®	Consider reducing dose to 5 mg/kg every 8 hours in moderate hepatic impairment, adjusted according to clinical response; avoid in severe hepatic impairment or if plasma-bilirubin concentration greater than 3 times upper limit of reference range
Tacrolimus	Dose reduction may be necessary in severe hepatic impairment
Tadalafil	Max. dose 10 mg; manufacturer advises monitor patient in severe hepatic impairment
Tamsulosin	Avoid in severe hepatic impairment
Tegafur with uracil	*see Uftoral*®
Telithromycin	Manufacturer advises caution; *see also* p. 314
Telmisartan	20–40 mg once daily in mild or moderate impairment; avoid in severe hepatic impairment or biliary obstruction
Temazepam	*see* Anxiolytics and Hypnotics
Temsirolimus	Manufacturer advises caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment—no information available
Tenecteplase	*see* Fibrinolytics
Tenoxicam	*see* NSAIDs
Terbinafine	Manufacturer advises avoid—elimination reduced
Testosterone and esters	*see* Androgens
Tetracosactide	See Corticosteroids
Tetracyclines	Avoid (or use with caution); tetracycline and demeclocycline max. 1 g daily in divided doses; *see also* Tigecycline
Thalidomide	Manufacturer advises caution in severe hepatic impairment—no information available
Theophylline	Reduce dose
Thiazides and related diuretics	Use with caution in mild to moderate impairment; avoid in severe liver disease; hypokalaemia may precipitate coma (potassium-sparing diuretic can prevent); increased risk of hypomagnesaemia in alcoholic cirrhosis
Thiopental	Reduce dose for induction in severe liver disease
Tiagabine	Maintenance dose 5–10 mg 1–2 times daily initially in mild to moderate hepatic impairment; avoid in severe impairment

Drug	Comment
Tiaprofenic acid	*see* NSAIDs
Tibolone	Avoid in severe liver disease
Ticarcillin [ingredient]	*see Timentin®*
Tigecycline	Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment
Timentin®	Cholestatic jaundice, *see* under Co-amoxiclav p. 300
Timolol	Dose reduction may be necessary
Tinzaparin	*see* Heparin
Tioguanine	Reduce dose in hepatic impairment
Tipranavir	Manufacturer advises caution in mild hepatic impairment; avoid in moderate or severe hepatic impairment—no information available
Tirofiban	Caution in mild to moderate liver disease; avoid in severe liver disease—increased risk of bleeding
Tizanidine	Avoid in severe liver disease
Tolbutamide	*see* Sulphonylureas
Tolcapone	Avoid
Tolfenamic acid	*see* NSAIDs
Tolterodine	Reduce dose to 1 mg twice daily
Topiramate	Use with caution in hepatic impairment—clearance may be decreased
Topotecan	Avoid in severe hepatic impairment
Torasemide	*see* Loop Diuretics
Toremifene	Elimination decreased in hepatic impairment—avoid if severe
Trabectedin	Manufacturer advises caution in liver impairment—consider dose reduction; avoid in patients with raised bilirubin
Tramadol	*see* Opioid Analgesics
Trandolapril	*see* ACE Inhibitors
Tranylcypromine	*see* Antidepressants, MAOI
Trazodone	*see* Antidepressants, Tricyclic (and related)
Tretinoin (oral)	Reduce dose
Triamcinolone	*see* Corticosteroids
Tribavirin	*see* Ribavirin
Triclofos	*see* Anxiolytics and Hypnotics
Trifluoperazine	*see* Antipsychotics
Trimeprazine	*see* Alimemazine
Trimipramine	*see* Antidepressants, Tricyclic (and related)
Trospium	Manufacturer advises avoid—no information available
Uftoral®	Manufacturer advises monitor liver function in mild to moderate hepatic impairment and avoid in severe impairment
Urokinase	*see* Fibrinolytics
Ursodeoxycholic acid	Avoid in chronic liver disease (but used in primary biliary cirrhosis)
Valaciclovir	Manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available
Valproate	Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months); *see also* p. 262
Valproic acid	*see* Valproate
Valsartan	Max. dose 80 mg daily in mild to moderate hepatic impairment; avoid if severe
Vardenafil	Initial dose 5 mg in mild to moderate hepatic impairment, increased subsequently according to response (max. 10 mg in moderate hepatic impairment); manufacturer advises avoid in severe hepatic impairment
Venlafaxine	Halve dose in moderate hepatic impairment; avoid if severe
Verapamil	Reduce oral dose
Verteporfin	Avoid in severe hepatic impairment
Vildagliptin	Manufacturer advises avoid
Vinblastine	Dose reduction may be necessary
Vincristine	Dose reduction may be necessary
Vindesine	Dose reduction may be necessary
Vinorelbine	Dose reduction may be required in significant hepatic impairment
Voriconazole	In mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses; no information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk
Warfarin	*see* Anticoagulants, Oral
Xipamide	*see* Thiazides and Related Diuretics
Zafirlukast	Manufacturer advises avoid
Zaleplon	*see* Anxiolytics and Hypnotics
Zidovudine	Accumulation may occur
Zoledronic acid	Manufacturer advises caution in severe hepatic impairment—limited information available
Zolmitriptan	Max. 5 mg in 24 hours in moderate or severe hepatic impairment
Zolpidem	*see* Anxiolytics and Hypnotics
Zonisamide	Initially, increase dose at 2-week intervals if mild or moderate hepatic impairment; avoid in severe impairment
Zopiclone	*see* Anxiolytics and Hypnotics
Zotepine	Initial dose 25 mg twice daily, increased gradually according to response (max. 75 mg twice daily); monitor liver function at weekly intervals for first 3 months
Zuclopenthixol	*see* Antipsychotics

A3 Renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Principles of dose adjustment in renal impairment

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance (see Use of Dosage Table for details) should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced.

Use of dosage table

Dose recommendations are based on the severity of renal impairment.

Renal function is measured either in terms of estimated **glomerular filtration rate** (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study ('MDRD formula' that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as **creatinine clearance** (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG).

Cockcroft and Gault formula

$$\text{Estimated Creatinine Clearance in mL/minute} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}}$$

Age in years
Weight in kilograms; use ideal body-weight
Serum creatinine in micromol/litre
Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a **rough guide** to drug dosing.

Important
Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m^2 and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).
The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (see exceptions below: Toxic Drugs and Patients at Extremes of Weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD 'formula') can be used to determine dosage adjustments in place of creatinine clearance. An individual's absolute glomerular filtration rate can be calculated from the eGFR as follows: GFR_{Absolute} = eGFR × (individual's body surface area/1.73)

Toxic drugs For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

Patients at extremes of weight In patients at both extremes of weight (BMI of less than 18.5 kg/m^2 or greater than 30 kg/m^2) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages.

In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are

included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

Degree of impairment	eGFR mL/minute/1.73 m²
Normal - Stage 1	More than 90 (with other evidence of kidney damage)
Mild - Stage 2	60–89 (with other evidence of kidney damage)
Moderate[1] - Stage 3	30–59
Severe - Stage 4	15–29
Established renal failure - Stage 5	Less than 15

1. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR 45–59, Stage 3B eGFR 30–44

Dialysis
For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

The following table can be used as a guide to drugs which require a reduction in dose in renal impairment, and to those which are potentially harmful or are ineffective. Drug prescribing should be kept to the minimum in all patients with severe renal disease.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing **any** drug which requires dose modification.

Absence of a drug from the table does not imply safety.

For adjusting drug doses in renal impairment, see Important on p. 815.

Table of drugs to be avoided or used with caution in renal impairment

The list of drugs given below may not be comprehensive and is based on current information concerning the use of prescribed drugs in therapeutic dosage.

Products introduced or amended since publication of BNF No. 57 (March 2009) are underlined.

Drug	Comment
Abacavir	Manufacturer advises avoid in end-stage renal disease; *see also Kivexa®* and *Trizivir®*
Abciximab	Use with caution in severe renal impairment—increased risk of bleeding
Acamprosate	Avoid if serum-creatinine greater than 120 micromol/litre
Acarbose	Avoid if eGFR less than 25 mL/minute/1.73 m²
ACE inhibitors	Use with caution and monitor response (*see also* p. 103); hyperkalaemia and other side-effects more common; *see also* individual drugs
Acebutolol	Halve dose if eGFR 25–50 mL/minute/1.73 m²; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily
Aceclofenac	*see* NSAIDs; avoid in moderate to severe renal impairment
Acemetacin	*see* NSAIDs
Acenocoumarol (nicoumalone)	*see* Anticoagulants, Oral
Acetazolamide	Avoid; metabolic acidosis
Aciclovir	Risk of neurological reactions increased; use normal *intravenous* dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m²; for *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²); for *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m²
Acipimox	Reduce dose if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²
Acitretin	Avoid; increased risk of toxicity
Adefovir dipivoxil	10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m²; no information available if eGFR less than 10 mL/minute/1.73 m²
Agomelatine	Manufacturer advises caution in moderate to severe renal impairment
Alendronic acid	Avoid if eGFR less than 35 mL/minute/1.73 m²
Alfentanil	*see* Opioid Analgesics
Alfuzosin	Start at 2.5 mg twice daily and adjust according to response
Alimemazine (trimeprazine)	Avoid
Aliskiren	Caution if eGFR less than 30 mL/minute/1.73 m²—no information available
Alitretinoin	Manufacturer advises avoid in severe renal impairment—no information available
Allopurinol	Max. 100 mg daily, increased only if response inadequate; in severe renal impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre
Almotriptan	Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m²

Drug	Comment
Alprazolam	*see* Anxiolytics and Hypnotics
Aluminium salts	Risk of accumulation and aluminium toxicity **Note** Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics)
Amantadine	Reduce dose; avoid if eGFR less than 15 mL/minute/1.73 m^2
Ambrisentan	Use with caution if eGFR less than 30 mL/minute/1.73 m^2
Amfebutamone	*see* Bupropion
Amikacin	*see* Aminoglycosides
Amiloride	*see* Potassium-sparing Diuretics
Aminoglycosides	Reduce dose; monitor serum concentrations; *see also* Neomycin and section 5.1.4
Amisulpride	Halve dose if eGFR 30–60 mL/minute/1.73 m^2; use one-third dose if eGFR 10–30 mL/minute/1.73 m^2; no information available if eGFR less than 10 mL/minute/1.73 m^2
Amoxicillin	Risk of crystalluria with high doses (particularly during parenteral therapy). Reduce dose in severe impairment; rashes more common
Amphotericin	Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulations
Ampicillin	Reduce dose if eGFR less than 10 mL/minute/1.73 m^2; rashes more common
Amsacrine	Reduce dose
Anagrelide	Avoid if eGFR less than 50 mL/minute/1.73 m^2
Anakinra	Caution if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Analgesics	*see* Opioid Analgesics, NSAIDs, Paracetamol, *Solpadol®*, and *Tylex®*
Anastrozole	Avoid if creatinine clearance less than 20 mL/minute
Angeliq®	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Anticoagulants, oral	Manufacturer advises avoid in severe renal impairment; *see also* Dabigatran Etexilate and Rivaroxaban
Antipsychotics	Start with small doses in severe impairment; increased cerebral sensitivity; *see also* Amisulpride, Clozapine, Droperidol, Flupentixol, Fluphenazine, Haloperidol, Olanzapine, Paliperidone, Pericyazine, Quetiapine, Risperidone, Sulpiride, and Zotepine
Anxiolytics and hypnotics	Start with small doses in severe impairment; increased cerebral sensitivity; *see also* Buspirone, Chloral Hydrate, Melatonin, and Sodium Oxybate
Arsenic trioxide	Manufacturer advises caution—limited information available
Artemether [ingredient]	*see Riamet®*
Aspirin	Use with caution; avoid in severe renal impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding
Atenolol	Max. 50 mg daily (10 mg on alternate days *intravenously*) if eGFR 15–35 mL/minute/1.73 m^2; max. 25 mg daily or 50 mg on alternate days (10 mg every 4 days *intravenously*) if eGFR less than 15 mL/minute/1.73 m^2
Atosiban	No information available
Atovaquone	Manufacturer advises caution—monitor more closely
Atripla®	Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m^2
Auranofin	*see* Sodium Aurothiomalate
Azacitidine	Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/L
Azapropazone	*see* NSAIDs; reduce dose (max. 600 mg daily) in rheumatoid arthritis and ankylosing spondylitis; avoid in severe impairment (avoid in gout if eGFR less than 60 mL/minute/1.73 m^2)
Azathioprine	Reduce dose and monitor full blood count
Aztreonam	If eGFR 10–30 mL/minute/1.73 m^2, usual initial dose, then half normal dose; if eGFR less than 10 mL/minute/1.73 m^2 usual initial dose, then one-quarter normal dose
Baclofen	Use smaller doses (e.g. 5 mg daily by mouth); excreted by kidney
Balsalazide	Manufacturer advises avoid in moderate to severe renal impairment
Bambuterol	Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m^2
Barbiturates	Reduce dose in severe renal impairment; *see also* Phenobarbital
Bemiparin	Risk of bleeding may be increased—use with caution; monitoring of anti-Factor Xa may be required; use of unfractionated heparin may be preferable

Drug	Comment
Bendrofluazide	*see* Thiazides and Related Diuretics
Bendroflumethiazide (bendrofluazide)	*see* Thiazides and Related Diuretics
Benperidol	*see* Antipsychotics
Benzodiazepines	Use with caution; reduce dose
Benzylpenicillin	Reduce dose—consult product literature; high doses may cause cerebral irritation, convulsions, or coma
Beta-blockers	*see under* individual drugs
Betamethasone	*see* Corticosteroids
Bezafibrate	Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m^2; reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m^2; avoid if eGFR less than 15 mL/minute/1.73 m^2; avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m^2
For adjusting drug doses in renal impairment, see Important on p. 815.	
Bisoprolol	Reduce dose if eGFR less than 20 mL/minute/1.73 m^2 (max. 10 mg daily)
Bivalirudin	For percutaneous coronary intervention, reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m^2 and monitor blood clotting parameters; for acute coronary syndromes and percutaneous coronary intervention, avoid if eGFR less than 30 mL/minute/1.73 m^2
Bleomycin	Reduce dose by half if serum-creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre
Bortezomib	No information available for creatinine clearance less than 20 mL/minute/1.73 m^2
Brinzolamide	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Bupivacaine	Manufacturer advises caution
Buprenorphine	*see* Opioid Analgesics
Bupropion	Manufacturer recommends 150 mg daily
Buspirone	Reduce dose; avoid if eGFR less than 20 mL/minute/1.73 m^2
Calcitriol	Manufacturer of topical calcitriol advises avoid—no information available
Candesartan	Initially 4 mg daily
Capecitabine	Reduce starting dose of 1250 mg/m^2 to 75% if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute
Capreomycin	Reduce dose—consult product literature; nephrotoxic; ototoxic
Captopril	*see* ACE inhibitors; reduce dose; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m^2; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m^2; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m^2
Carbamazepine	Manufacturer advises caution
Carbetocin	Manufacturer advises avoid
Carboplatin	Reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 20 mL/minute
Carboprost	Manufacturer advises avoid
Carnitine	Use with caution—accumulation of metabolites may occur with chronic oral administration in severe renal impairment
Cefaclor	No dose adjustment required—manufacturer advises caution
Cefadroxil	0.5–1 g every 24 hours if eGFR 11–26 mL/minute/1.73 m^2; 0.5–1 g every 36 hours if eGFR less than 11 mL/minute/1.73 m^2
Cefalexin	Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m^2; max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m^2; max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m^2
Cefixime	Reduce dose if eGFR less than 20 mL/minute/1.73 m^2 (max. 200 mg once daily)
Cefotaxime	If eGFR less than 5 mL/minute/1.73 m^2, initial dose of 1 g then use half normal dose
Cefpodoxime	Increase dose interval to every 24 hours if eGFR 10–40 mL/minute/1.73 m^2; increase dose interval to every 48 hours if eGFR less than 10 mL/minute/1.73 m^2
Cefradine	Use half normal dose if eGFR 5–20 mL/minute/1.73 m^2; use one-quarter normal dose if eGFR less than 5 mL/minute/1.73 m^2
Ceftazidime	Reduce dose if eGFR less than 50 mL/minute/1.73 m^2—consult product literature
Ceftriaxone	Reduce dose if creatinine clearance less than 10 mL/minute (max. 2 g daily); monitor plasma concentration if both hepatic and severe renal impairment
Cefuroxime	Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m^2; use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m^2

Drug	Comment
Celecoxib	*see* NSAIDs; avoid if eGFR less than 30 mL/minute/1.73 m^2
Celiprolol	Reduce dose by half if eGFR 15–40 mL/minute/1.73 m^2; avoid if eGFR less than 15 mL/minute/1.73 m^2
Cetirizine	Use half normal dose if eGFR less than 30 mL/minute/1.73 m^2
Cetrorelix	Manufacturer advises avoid in moderate or severe renal impairment
Chloral hydrate	Manufacturer advises avoid in severe impairment
Chloramphenicol	Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis
Chlordiazepoxide	*see* Anxiolytics and Hypnotics
Chloroquine	Manufacturer advises caution; reduce dose (but for malaria prophylaxis *see* p. 360)
Chlorpromazine	*see* Antipsychotics
Chlorpropamide	Avoid
Chlortalidone	*see* Thiazides and Related Diuretics
Ciclosporin	*see* p. 495 (*see also* p. 644 if used in atopic dermatitis or psoriasis and p. 574 if used in rheumatoid arthritis)
Cidofovir	Avoid if creatinine clearance less than 55 mL/minute; nephrotoxic
Cilastatin [ingredient]	*see Primaxin®*
Cilazapril	*see* ACE inhibitors; max. initial dose 500 micrograms once daily (do not exceed 2.5 mg once daily) if eGFR 10–40 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2
Cilostazol	Avoid if eGFR less than 25 mL/minute/1.73 m^2
Cimetidine	Reduce dose; 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m^2; 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m^2; 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m^2; occasional risk of confusion
Ciprofibrate	Manufacturer advises reduce dose to 100 mg on alternate days in moderate renal impairment; avoid in severe renal impairment
Ciprofloxacin	*By mouth*, 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m^2 (every 24 hours if eGFR less than 30 mL/minute/1.73 m^2); *by intravenous infusion* (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m^2 (every 24 hours if eGFR less than 30 mL/minute/1.73 m^2)
Cisplatin	Avoid if possible; nephrotoxic
Citalopram	No information available for eGFR less than 20 mL/minute/1.73 m^2

Drug	Comment
CitraFleet®	Avoid if eGFR less than 30 mL/minute/1.73 m^2—risk of hypermagnesaemia
Citramag®	Avoid if eGFR less than 30 mL/minute/1.73 m^2—risk of hypermagnesaemia
Citrates	Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics)
Cladribine	Regular monitoring recommended
Clarithromycin	Use half normal dose if eGFR less than 30 mL/minute/1.73 m^2; avoid *Klaricid XL®* if eGFR less than 30 mL/minute/1.73 m^2
Clavulanic acid [ingredient]	*see* Co-amoxiclav and *Timentin®*
Clobazam	*see* Anxiolytics and Hypnotics
Clodronate sodium	*see* Sodium Clodronate
Clofarabine	Manufacturer advises caution in mild to moderate renal impairment; avoid in severe renal impairment
Clomethiazole	*see* Anxiolytics and Hypnotics
Clopamide	*see* Thiazides and Related Diuretics
Clopidogrel	Manufacturer advises caution
Clozapine	Manufacturer advises avoid in severe renal impairment
Co-amoxiclav	Risk of crystalluria with high doses (particularly during parenteral therapy); reduce dose if eGFR less than 30 mL/minute/1.73 m^2—consult product literature
Codeine	*see* Opioid Analgesics
Colchicine	Reduce dose if eGFR less than 50 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2
Colistin	Reduce dose and monitor plasma-colistin concentration during parenteral or nebulised treatment—consult product literature
Combivir®	Avoid if eGFR less than 50 mL/minute/1.73 m^2; consult product literature
Corticosteroids	Use oral and parenteral preparations with caution
Cortisone	*see* Corticosteroids
Co-trimoxazole	Use half normal dose if eGFR 15–30 mL/minute/1.73 m^2; avoid if eGFR less than 15 mL/minute/1.73 m^2 and if plasma-sulfamethoxazole concentration cannot be monitored
Cyclopenthiazide	*see* Thiazides and Related Diuretics
Cyclophosphamide	Reduce dose
Cycloserine	Reduce dose (see also p. 323); avoid in severe renal impairment
Cyclosporin	*see* Ciclosporin

Drug	Comment
Dabigatran etexilate	Reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Dacarbazine	Dose reduction may be required in combined renal and hepatic impairment; avoid in severe renal impairment
Dalteparin	Risk of bleeding may be increased—dose reduction, and monitoring of anti-Factor Xa, may be required; use of unfractionated heparin may be preferable
Danaparoid	Caution in moderate renal impairment; increased risk of bleeding (monitor anti-Factor Xa activity); avoid in severe renal impairment unless patient has heparin-induced thrombocytopenia and no alternative available
For adjusting drug doses in renal impairment, see Important on p. 815.	
Daptomycin	Monitor renal function if eGFR less than 80 mL/minute/1.73 m^2; for complicated skin and soft-tissue infections without bacteraemia use 4 mg/kg every 48 hours if eGFR less than 30 mL/minute/1.73 m^2; for other indications, consult product literature if eGFR less than 50 mL/minute/1.73 m^2
Daunorubicin	Reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre
Deferasirox	Reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m^2 and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if eGFR less than 60 mL/minute/1.73 m^2
Deferiprone	Manufacturer advises caution—no information available
Deflazacort	*see* Corticosteroids
Degarelix	Manufacturer advises caution in severe renal impairment—no information available
Demeclocycline	Avoid
Desloratadine	Manufacturer advises caution in severe renal insufficiency
Desmopressin	Antidiuretic effect may be reduced
Dexamethasone	*see* Corticosteroids
Dexamfetamine	Manufacturer advises caution
Dexibuprofen	*see* NSAIDs; reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73 m^2
Dexketoprofen	*see* NSAIDs; reduce initial dose to 50 mg daily; avoid in moderate to severe renal impairment
Dexrazoxane	Manufacturer of *Cardioxane®* advises reduce dose by 50% if creatinine clearance less than 40 mL/minute
Dextromethorphan	*see* Opioid Analgesics
Diafalk®	Manufacturer advises caution
Diamorphine	*see* Opioid Analgesics
Diazepam	*see* Anxiolytics and Hypnotics
Diazoxide	Dose reduction may be required
Diclofenac	*see* NSAIDs; avoid in severe renal impairment; avoid intravenous injection if serum creatinine greater than 160 micromol/litre
Didanosine	Reduce dose if eGFR less than 60 mL/minute/1.73 m^2; consult product literature
Digoxin	Reduce dose; toxicity increased by electrolyte disturbances
Dihydrocodeine	*see* Opioid Analgesics
Diltiazem	Start with smaller dose
Dinoprostone	Manufacturers advise avoid
Diphenoxylate	*see* Opioid Analgesics
Dipipanone	*see* Opioid Analgesics
Disodium etidronate	Reduce dose in mild renal impairment; avoid in moderate to severe renal impairment
Disodium pamidronate	Max. infusion rate 20 mg/hour; avoid if eGFR less than 30 mL/minute/1.73 m^2, except in life-threatening hypercalcaemia if benefit of use outweighs risk; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value
Disopyramide	Reduce dose by increasing dose interval; adjust according to response; avoid sustained release preparation
Diuretics, potassium-sparing	*see* Potassium-sparing Diuretics
Domperidone	Manufacturer advises reduce dose
Doripenem	250 mg every 8 hours if eGFR 30–50 mL/minute/1.73 m^2; 250 mg every 12 hours if eGFR less than 30 mL/minute/1.73 m^2
Dorzolamide	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Doxycycline	Use with caution (avoid excessive doses)
Droperidol	In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose
Drospirenone [ingredient]	*see Angeliq®*, *Yasmin®*, and *Yaz®*

Drug	Comment
Duloxetine	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Efavirenz	Manufacturer advises caution in severe renal failure—no information available; *see also Atripla®*
Eletriptan	Reduce initial dose to 20 mg; max. 40 mg in 24 hours; avoid if eGFR less than 30 mL/minute/1.73 m^2
Emtricitabine	Reduce dose if eGFR less than 50 mL/minute/1.73 m^2; consult product literature; *see also Atripla®* and *Truvada®*
Enalapril	*see* ACE inhibitors; max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m^2
Enoxaparin	Risk of bleeding increased; reduce dose if eGFR less than 30 mL/minute/1.73 m^2—consult product literature for details; monitoring of anti-factor Xa may be required; use of unfractionated heparin may be preferable
Enoximone	Consider dose reduction
Entecavir	Reduce dose if eGFR less than 50 mL/minute/1.73 m^2; consult product literature
Ephedrine	Use with caution
Eplerenone	Increased risk of hyperkalaemia—close monitoring required; avoid if eGFR less than 50 mL/minute/1.73 m^2
Eprosartan	Halve initial dose if eGFR less than 60 mL/minute/1.73 m^2
Eptifibatide	Reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Erdosteine	Avoid if eGFR less than 25 mL/minute/1.73 m^2—no information available
Ergometrine	Manufacturer advises caution in mild or moderate renal impairment and avoid in severe renal impairment
Ergotamine	Avoid; risk of renal vasoconstriction
Erlotinib	Manufacturer advises avoid in severe renal impairment
Ertapenem	Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m^2
Erythromycin	Max. 1.5 g daily in severe renal impairment (ototoxicity)
Escitalopram	Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m^2
Esmolol	Manufacturer advises caution
Esomeprazole	Manufacturer advises caution in severe renal insufficiency
Estramustine	Manufacturer advises caution
Ethambutol	Reduce dose; if creatinine clearance less than 30 mL/minute monitor plasma-ethambutol concentration; optic nerve damage
Etidronate disodium	*see* Disodium Etidronate
Etodolac	*see* NSAIDs
Etoposide	Consider dose reduction
Etoricoxib	Avoid if eGFR less than 30 mL/minute/1.73 m^2; *see also* NSAIDs
Exemestane	Manufacturer advises caution
Exenatide	Caution if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Famciclovir	Reduce dose; consult product literature
Famotidine	Use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m^2; seizures reported very rarely
Fenbufen	*see* NSAIDs
Fenofibrate	Reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m^2; reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m^2; avoid if eGFR less than 15 mL/minute/1.73 m^2
Fenoprofen	*see* NSAIDs
Fentanyl	*see* Opioid Analgesics
Fesoterodine	Increase dose cautiously if eGFR 30–80 mL/minute/1.73 m^2; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m^2; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors
Flecainide	Reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m^2
Fleet Phospho-soda®	Manufacturer advises avoid in significant renal impairment
Flucloxacillin	Reduce dose if eGFR less than 10 mL/minute/1.73 m^2
Fluconazole	Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m^2
Flucytosine	Reduce dose and monitor plasma-flucytosine concentration—consult product literature
Fludarabine	Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute
Fludrocortisone	*see* Corticosteroids
Flupentixol	*see* Antipsychotics; manufacturer advises caution; avoid in renal failure
Fluphenazine	*see* Antipsychotics; manufacturer advises caution; avoid in renal failure
Flurazepam	*see* Anxiolytics and Hypnotics
Flurbiprofen	*see* NSAIDs; avoid in severe renal impairment
Fluvoxamine	Start with smaller dose

Drug	Comment
Fondaparinux	Increased risk of bleeding; for treatment of acute coronary syndromes avoid if eGFR less than 20 mL/minute/1.73 m^2; for treatment of venous thromboembolism use with caution if eGFR 30–50 mL/minute/1.73 m^2, avoid if eGFR less than 30 mL/minute/1.73 m^2; for prophylaxis of venous thromboembolism reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m^2, avoid if less than 20 mL/minute/1.73 m^2
Foscarnet	Reduce dose; consult product literature
Fosinopril	*see* ACE inhibitors
Fosphenytoin	Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)
Frusemide	*see* Furosemide
Furosemide (frusemide)	May need high doses; deafness may follow rapid i/v injection
Fybogel Mebeverine®	Contains 2.5 mmol potassium per sachet
Gabapentin	Reduce dose if eGFR less than 80 mL/minute/1.73 m^2; consult product literature
Galantamine	Avoid if eGFR less than 9 mL/minute/1.73 m^2
Ganciclovir	Reduce dose if eGFR less than 70 mL/minute/1.73 m^2; consult product literature
Ganirelix	Manufacturer advises avoid in moderate to severe renal impairment
Gemcitabine	Manufacturer advises caution
Gemeprost	Manufacturer advises avoid
Gemfibrozil	Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Gentamicin	*see* Aminoglycosides
Gestrinone	Monitor closely; manufacturer advises avoid in severe renal impairment
Glatiramer	No information available—manufacturer advises caution
Glibenclamide	Avoid in severe renal impairment
Gliclazide	Reduce initial dose and monitor closely; avoid in severe renal impairment
Glimepiride	Avoid in severe renal impairment
Glipizide	Increased risk of hypoglycaemia; avoid in severe renal impairment or if hepatic impairment also present
Glyceryl trinitrate	*see* Nitrates
Guanethidine	Reduce dose if eGFR 40–65 mL/minute/1.73 m^2; avoid if eGFR less than 40 mL/minute/1.73 m^2
Haloperidol	*see* Antipsychotics; manufacturer advises caution in renal impairment
Heparin	Risk of bleeding increased in severe renal impairment—dose may need to be reduced
Hetastarch	Avoid in severe renal impairment; excreted by kidney
Hydralazine	Reduce dose if eGFR less than 30 mL/minute/1.73 m^2
Hydrochlorothiazide	*see* Thiazides and Related Diuretics
Hydrocortisone	*see* Corticosteroids
Hydroflumethiazide	*see* Thiazides and Related Diuretics
Hydromorphone	*see* Opioid Analgesics
Hydroxycarbamide (hydroxyurea)	For sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Hydroxychloroquine	Manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe renal impairment
Hydroxyzine	Use half normal dose
Hyoscine hydrobromide	Manufacturer advises caution
Hypnotics	*see* Anxiolytics and Hypnotics
Ibandronic acid	For treatment of osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m^2; for reduction of bone damage in bone metastases, if eGFR 30–50 mL/minute/1.73 m^2 infuse normal dose over 1 hour, if eGFR less than 30 mL/minute/1.73 m^2 reduce *intravenous dose* to 2 mg and infuse over 1 hour, reduce *oral dose* to 50 mg once weekly
Ibuprofen	*see* NSAIDs; avoid in severe renal impairment
Idarubicin	Reduce dose; avoid in severe renal impairment
Ifosfamide	Avoid if serum creatinine concentration greater than 120 micromol/litre
Imatinib	Max. starting dose 400 mg daily if creatinine clearance less than 60 mL/minute
Imidapril	*see* ACE inhibitors; initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Imipenem [ingredient]	*see Primaxin®*
Indapamide	*see* Thiazides and Related Diuretics
Indometacin	*see* NSAIDs; avoid in severe renal impairment
Indoramin	Manufacturer advises caution
Inosine pranobex	Manufacturer advises caution; metabolised to uric acid
Insulin	May need dose reduction; insulin requirements fall; compensatory response to hypoglycaemia is impaired

For adjusting drug doses in renal impairment, see Important on p. 815.

Drug	Comment
Interferon alfa	Close monitoring required; avoid in severe renal impairment
Interferon beta	Manufacturers advise caution and close monitoring in severe renal impairment
Interferon gamma-1b	Manufacturer advises caution in severe renal impairment—risk of accumulation
Irinotecan	Manufacturer advises avoid—no information available
Iron dextran	Avoid in acute renal failure
Isometheptene [ingredient]	see *Midrid®*
Isoniazid	Max. 200 mg daily if eGFR less than 10 mL/minute/1.73 m^2; peripheral neuropathy
Isosorbide dinitrate	*see* Nitrates
Isosorbide mononitrate	*see* Nitrates
Isotretinoin	Reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated
Itraconazole	Risk of congestive heart failure; bioavailability of oral formulations possibly reduced; use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m^2 (monitor renal function); avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m^2
Ivabradine	Use with caution if eGFR less than 15 mL/minute/1.73 m^2
Kaletra®	Avoid oral solution due to propylene glycol content; use tablets with caution in severe renal impairment
Ketoprofen	*see* NSAIDs; avoid in severe renal impairment
Ketorolac	*see* NSAIDs; use lowest effective dose (max. 60 mg daily when given by intramuscular or intravenous injection); avoid if serum creatinine more than 160 micromol/litre
Kivexa®	Avoid if eGFR less than 50 mL/minute/1.73 m^2
Labetalol	Dose reduction may be required
Lacosamide	Manufacturer advises caution; max. 250 mg daily if eGFR less than 30 mL/minute/1.73 m^2
Lamivudine	Reduce dose if eGFR less than 50 mL/minute/1.73 m^2; consult product literature; *see also Combivir®*, *Kivexa®*, and *Trizivir®*
Lamotrigine	Manufacturer advises caution in renal failure; metabolite may accumulate
Lapatinib	Manufacturer advises caution in severe renal impairment—no information available
Leflunomide	Manufacturer advises avoid in moderate or severe impairment—no information available
Lenalidomide	Starting dose 10 mg once daily if creatinine clearance 30–50 mL/minute; starting dose 15 mg on alternate days if creatinine clearance less than 30 mL/minute
Lepirudin	Reduce initial intravenous injection dose to 200 micrograms/kg and reduce subsequent infusion dose by 50–85% if eGFR less than 60 mL/minute/1.73 m^2; but avoid or stop infusion if eGFR less than 15 mL/minute/1.73 m^2 (consult product literature)
Lercanidipine	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Letrozole	Manufacturer advises caution if creatinine clearance less than 10 mL/minute
Levetiracetam	Max. 2 g daily if eGFR 50–80 mL/minute/1.73 m^2; max. 1.5 g daily if eGFR 30–50 mL/minute/1.73 m^2; max. 1 g daily if eGFR less than 30 mL/minute/1.73 m^2
Levocetirizine	5 mg on alternate days if eGFR 30–50 mL/minute/1.73 m^2; 5 mg every 3 days if eGFR 10–30 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2
Levofloxacin	Usual initial dose then reduce subsequent doses (consult product literature) if eGFR less than 50 mL/minute/1.73 m^2
Levomepromazine (methotrimeprazine)	*see* Antipsychotics
Lidocaine	Possible accumulation of lidocaine and active metabolite; manufacturers advise caution in severe renal impairment
Linezolid	Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m^2
Lisinopril	*see* ACE inhibitors; max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m^2 (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m^2 (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m^2
Lithium salts	Avoid if possible or reduce dose and monitor serum-lithium concentration carefully
Lofepramine	Manufacturer advises avoid in severe impairment
Lofexidine	Manufacturer advises caution in chronic renal impairment
Lopinavir [ingredient]	*see Kaletra®*
Loprazolam	*see* Anxiolytics and Hypnotics
Lorazepam	*see* Anxiolytics and Hypnotics
Lormetazepam	*see* Anxiolytics and Hypnotics
Lumefantrine [ingredient]	*see Riamet®*
Lymecycline	Avoid

Drug	Comment
Magnesium salts	Avoid or reduce dose; increased risk of toxicity; magnesium carbonate mixture and magnesium trisilicate mixture also have high sodium content
Malarone®	Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73 m^2
Mannitol	Use with caution in severe renal impairment
Maraviroc	If eGFR less than 80 mL/minute/1.73 m^2, consult product literature
Mefenamic acid	*see* NSAIDs; avoid in severe renal impairment
For adjusting drug doses in renal impairment, see Important on p. 815.	
Melatonin	No information available—manufacturer advises caution
Meloxicam	*see* NSAIDs; avoid if eGFR less than 25 mL/minute/1.73 m^2
Melphalan	Reduce dose initially (consult product literature)
Memantine	Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m^2, if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m^2; avoid if eGFR less than 5 mL/minute/1.73 m^2
Meprobamate	*see* Anxiolytics and Hypnotics
Meptazinol	*see* Opioid Analgesics
Mercaptopurine	Reduce dose
Meropenem	Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m^2; use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m^2; use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m^2
Mesalazine	Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m^2
Metformin	*see* Metformin, p. 383
Methadone	*see* Opioid Analgesics
Methenamine	Avoid if eGFR less than 10 mL/minute/1.73 m^2—risk of hippurate crystalluria
Methocarbamol	Manufacturer advises caution
Methotrexate	Reduce dose; risk of nephrotoxicity at high doses; avoid in severe renal impairment
Methotrimeprazine	*see* Antipsychotics
Methyldopa	Start with small dose; increased sensitivity to hypotensive and sedative effect
Methylnaltrexone	If eGFR less than 30 mL/minute/1.73 m^2, reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days
Methylprednisolone	*see* Corticosteroids
Methysergide	Avoid
Metoclopramide	Avoid or use small dose in severe renal impairment; increased risk of extrapyramidal reactions
Metolazone	*see* Thiazides and Related Diuretics
Micafungin	Use with caution; renal function may deteriorate
Midazolam	*see* Anxiolytics and Hypnotics
Midrid®	Manufacturer advises avoid in severe renal impairment
Mifepristone	Manufacturer advises avoid
Miglustat	For Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m^2; initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m^2; for Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m^2; initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m^2; child under 12 years—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m^2
Milrinone	Reduce dose if eGFR less than 50 mL/minute/1.73 m^2—consult product literature for details
Minocycline	Use with caution (avoid excessive doses)
Minoxidil	Use with caution in significant renal impairment
Mirtazapine	Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m^2; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m^2
Mitotane	Manufacturer advises caution in mild to moderate renal impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe renal impairment
Mivacurium	Clinical effect prolonged in renal failure—reduce dose according to response
Modafinil	Manufacturer advises use half normal dose in severe renal impairment
Moexipril	*see* ACE inhibitors; initial dose 3.75 mg once daily if eGFR less than 40 mL/minute/1.73 m^2
Morphine	*see* Opioid Analgesics
Moviprep®	Caution if eGFR less than 30 mL/minute/1.73 m^2

Drug	Comment
Moxonidine	Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Nabumetone	*see* NSAIDs; avoid in severe renal impairment
Nadolol	Increase dosage interval if eGFR less than 50 mL/minute/1.73 m^2
Nalidixic acid	Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m^2
Naltrexone	Manufacturers advise caution
Naproxen	*see* NSAIDs; avoid if eGFR less than 30 mL/minute/1.73 m^2
Naratriptan	Max. 2.5 mg in 24 hours; avoid if eGFR less than 15 mL/minute/1.73 m^2
Narcotic analgesics	*see* Opioid Analgesics
Nebivolol	For hypertension, initially 2.5 mg once daily, increased to 5 mg once daily if required; for heart failure, manufacturer advises avoid if serum creatinine greater than 250 micromol/litre
Nelfinavir	Manufacturer advises caution
Neomycin	Avoid; ototoxic; nephrotoxic
Neostigmine	May need dose reduction
Nicardipine	Start with small dose
Nicotine	Manufacturers advise caution in severe renal impairment
Nicoumalone	*see* Acenocoumarol
Nimodipine	Manufacturer advises caution with intravenous administration
Nitrates	Manufacturer advises use with caution in severe renal impairment
Nitrazepam	*see* Anxiolytics and Hypnotics
Nitrofurantoin	Avoid if eGFR less than 60 mL/minute/1.73 m^2; ineffective because of inadequate urine concentrations
Nitroprusside	*see* Sodium Nitroprusside
Nizatidine	Use half normal dose if eGFR 20–50 mL/minute/1.73 m^2; use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m^2
Norfloxacin	Use half normal dose if eGFR less than 30 mL/minute/1.73 m^2
NSAIDs	Use lowest effective dose for the shortest possible duration and monitor renal function; sodium and water retention; deterioration in renal function possibly leading to renal failure; deterioration also reported after topical use; *see also* individual drugs
Ofloxacin	Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m^2; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m^2
Olanzapine	Consider lower initial dose of 5 mg daily
Olmesartan	Max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m^2; avoid if eGFR less than 20 mL/minute/1.73 m^2
Olsalazine	Use with caution; manufacturer advises avoid in significant renal impairment
Omalizumab	Manufacturer advises caution—no information available
Opioid analgesics	Reduce doses or avoid; increased and prolonged effect; increased cerebral sensitivity
Oseltamivir	For *treatment*, use 75 mg once daily *or* 30 mg twice daily if eGFR 10–30 mL/minute/1.73 m^2; for *prevention*, use 75 mg every 48 hours *or* 30 mg once daily if eGFR 10–30 mL/minute/1.73 m^2; avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m^2
Oxaliplatin	Manufacturer advises avoid if creatinine clearance less than 30 mL/minute
Oxazepam	*see* Anxiolytics and Hypnotics
Oxcarbazepine	Use half initial dose if eGFR less than 30 mL/minute/1.73 m^2; increase according to response at intervals of at least 1 week
Oxpentifylline	*see* Pentoxifylline
Oxybutynin	Manufacturer advises caution
Oxycodone	*see* Opioid Analgesics
Oxytetracycline	Avoid
Paliperidone	Initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m^2 (max. 6 mg once daily); initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m^2 (max. 3 mg once daily); avoid if eGFR less than 10 mL/minute/1.73 m^2
Pamidronate disodium	*see* Disodium Pamidronate
Pancuronium	Manufacturer advises caution; prolonged duration of block
Pantoprazole	Max. oral dose 40 mg daily
Papaveretum	*see* Opioid Analgesics
Paracetamol	Increase *infusion* dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m^2
Parathyroid hormone	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Parecoxib	*see* NSAIDs
Paroxetine	Reduce dose if eGFR less than 30 mL/minute/1.73 m^2
Peginterferon alfa	Close monitoring required—reduce dose in moderate to severe renal impairment; consult product literature
Pemetrexed	Manufacturer advises avoid if creatinine clearance less than 45 mL/minute
Penicillamine	Reduce dose and monitor renal function or avoid (consult product literature)

Drug	Comment
Pentamidine	Reduce dose for pneumocystis pneumonia if eGFR less than 10 mL/minute/1.73 m^2—consult product literature
Pentazocine	*see* Opioid Analgesics
Pentostatin	Avoid if creatinine clearance less than 60 mL/minute
Pentoxifylline (oxpentifylline)	Reduce dose by 30–50% if eGFR less than 30 mL/minute/1.73 m^2
Pericyazine	Manufacturer advises avoid
Perindopril arginine	*see* ACE inhibitors; max. initial doses 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m^2; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m^2
Perindopril erbumine	*see* ACE inhibitors; max. initial doses 2 mg once daily if eGFR 30–60 mL/minute/1.73 m^2; 2 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m^2
Perphenazine	*see* Antipsychotics
For adjusting drug doses in renal impairment, see Important on p. 815.	
Pethidine	*see* Opioid Analgesics
Phenindione	*see* Anticoagulants, Oral
Phenobarbital	Use with caution
Phenothiazines	*see* Antipsychotics
Pholcodine	*see* Opioid Analgesics
Picolax®	Avoid if eGFR less than 30 mL/minute/1.73 m^2—risk of hypermagnesaemia
Pilocarpine	Manufacturer advises caution with tablets
Pimozide	*see* Antipsychotics
Pindolol	May adversely affect renal function in severe impairment—manufacturer advises avoid
Piperacillin with tazobactam	Max. 4.5 g every 8 hours if eGFR 20–80 mL/minute/1.73 m^2; max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m^2; child under 12 years: Consult product literature
Piperazine	Use with caution; avoid in severe renal impairment; risk of neurotoxicity
Pipotiazine	*see* Antipsychotics
Piracetam	Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m^2; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m^2; use one-sixth normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m^2; avoid if eGFR less than 20 mL/minute/1.73 m^2
Piroxicam	*see* NSAIDs
Potassium salts	Close monitoring required—high risk of hyperkalaemia; avoid in severe renal impairment
Potassium-sparing diuretics	Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); manufacturers advise avoid in severe renal impairment; *see also* Eplerenone
Povidone–iodine	Avoid regular application to inflamed or broken mucosa
Pramipexole	In Parkinson's disease, initially 88 micrograms twice daily if eGFR 20–50 mL/minute/1.73 m^2 (88 micrograms once daily if eGFR less than 20 mL/minute/1.73 m^2); if renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR; in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m^2
Prasugrel	Use with caution in renal impairment—increased risk of bleeding
Pravastatin	Manufacturer advises initial dose of 10 mg once daily in moderate to severe renal impairment
Prazosin	Initially 500 micrograms daily in moderate to severe renal impairment; increased with caution
Prednisolone	*see* Corticosteroids
Pregabalin	Initially 75 mg daily and max. 300 mg daily if eGFR 30–60 mL/minute/1.73 m^2; initially 25–50 mg daily and max. 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m^2; initially 25 mg once daily and max. 75 mg once daily if eGFR less than 15 mL/minute/1.73 m^2
Prilocaine	Manufacturer advises caution
Primaxin®	Reduce dose if eGFR less than 70 mL/minute/1.73 m^2—consult product literature
Primidone	*see* Phenobarbital
Probenecid	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Procarbazine	Use with caution; avoid in severe renal impairment
Prochlorperazine	*see* Antipsychotics
Proguanil	100 mg once daily if eGFR 20–60 mL/minute/1.73 m^2; 50 mg on alternate days if eGFR 10–20 mL/minute/1.73 m^2; 50 mg once weekly if eGFR less than 10 mL/minute/1.73 m^2 (increased risk of haematological toxicity)
Promazine	*see* Antipsychotics
Propantheline	Manufacturer advises caution
Propiverine	Doses above 30 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m^2
Propofol	Use with caution
Propranolol	Manufacturer advises caution—dose reduction may be required

Drug	Comment
Propylthiouracil	Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m^2; use half normal dose if eGFR less than 10 mL/minute/1.73 m^2
Pseudoephedrine	Manufacturer advises caution in moderate to severe renal impairment
Pyridostigmine	Reduce dose; excreted by kidney
Pyrimethamine	Manufacturer advises caution
Quetiapine	For *immediate-release tablets*, initially 25 mg daily, increased daily in steps of 25–50 mg; for *modified-release tablets*, initially 50 mg daily, increased daily in steps of 50 mg
Quinagolide	Manufacturer advises avoid—no information available
Quinapril	*see* ACE inhibitors; max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m^2
Quinine	For treatment of malaria in severe renal impairment, reduce parenteral maintenance dose to 5–7 mg/kg of salt
Raloxifene	Manufacturer advises caution in mild to moderate renal impairment; avoid in severe renal impairment
Raltitrexed	Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature); avoid if creatinine clearance less than 25 mL/minute
Ramipril	*see* ACE inhibitors; max. initial dose 1.25 mg once daily (do not exceed 5 mg once daily) if eGFR 10–30 mL/minute/1.73 m^2; max. initial dose 1.25 mg once daily (do not exceed 2.5 mg once daily) if eGFR less than 10 mL/minute/1.73 m^2
Ranitidine	Use half normal dose if eGFR less than 50 mL/minute/1.73 m^2
Ranolazine	Use with caution if eGFR 30–80 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Reboxetine	Initial dose 2 mg twice daily, increased according to tolerance
Riamet®	Manufacturer advises caution in severe renal impairment—monitor ECG and plasma potassium concentration
Ribavirin	Plasma-ribavirin concentration increased; avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m^2—monitor haemoglobin concentration closely
Rifabutin	Use half normal dose if eGFR less than 30 mL/minute/1.73 m^2
Riluzole	No information available—manufacturer advises avoid
Rimonabant	Manufacturer advises avoid in severe impairment—no information available
Risedronate sodium	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Risperidone	Manufacturer advises initial and subsequent oral doses should be halved
Ritonavir [ingredient]	*see Kaletra®*
Rivaroxaban	Use with caution if eGFR 15–29 mL/minute/1.73 m^2 or if eGFR 30–49 mL/minute/1.73 m^2 and concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature); avoid if eGFR less than 15 mL/minute/1.73 m^2
Rivastigmine	Manufacturer advises caution
Rizatriptan	Manufacturer advises reduce dose to 5 mg in mild to moderate renal impairment; avoid in severe renal impairment
Rocuronium	Reduce maintenance dose; prolonged paralysis
Ropinirole	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Ropivacaine	Manufacturer advises caution in chronic renal impairment
Rosiglitazone	Caution if eGFR less than 30 mL/minute/1.73 m^2
Rosuvastatin	Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Sapropterin	Manufacturer advises caution—no information available
Saquinavir	Dose adjustment possibly required if eGFR less than 30 mL/minute/1.73 m^2—no information available
Sertraline	Manufacturer advises caution
Sevoflurane	Manufacturer advises caution
Sibutramine	Use with caution if eGFR 30–80 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Sildenafil	For erectile dysfunction initial dose 25 mg if eGFR less than 30 mL/minute/1.73 m^2; for pulmonary hypertension reduce to 20 mg twice daily if usual dose not tolerated
Simvastatin	Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m^2
Sitagliptin	Avoid if eGFR less than 50 mL/minute/1.73 m^2
Sodium aurothiomalate	Caution in mild to moderate renal impairment; avoid in severe renal impairment
Sodium bicarbonate	Avoid; specialised role in some forms of renal disease, *see* section 9.2.1.3
Sodium citrate	Use with caution, *see also* Citrates

Drug	Comment
Sodium clodronate	Use half normal dose if eGFR 10–30 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2
Sodium nitroprusside	Cyanide or thiocyanate metabolites may accumulate—avoid prolonged use
Sodium oxybate	Caution—*Xyrem®* oral solution contains 3.96 mmol Na^+/mL
Sodium phenylbutyrate	Manufacturer advises caution
Sodium valproate	*see* Valproate
Solifenacin	Max. 5 mg daily if eGFR less than 30 mL/minute/1.73 m^2
Solpadol®	Avoid effervescent tablets; contains 16.9 mmol sodium per tablet; *see also* Opioid Analgesics
For adjusting drug doses in renal impairment, see Important on p. 815.	
Sotalol	Use half normal dose if eGFR 30–60 mL/minute/1.73 m^2; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2
Spironolactone	*see* Potassium-sparing Diuretics
Stavudine	Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m^2; use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m^2
Streptomycin	*see* Aminoglycosides
Strontium ranelate	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Sucralfate	Use with caution; aluminium is absorbed and may accumulate
Sugammadex	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Sulfadiazine	Use with caution; avoid in severe renal impairment; high risk of crystalluria
Sulfasalazine	Risk of toxicity including crystalluria—ensure high fluid intake; avoid in severe renal impairment
Sulfinpyrazone	Reduce dose; avoid in severe renal impairment
Sulindac	*see* NSAIDs; avoid in severe renal impairment
Sulphonamides	Ensure high fluid intake; rashes and blood disorders; crystalluria a risk; *see* also individual drugs
Sulphonylureas	*see under* individual drugs
Sulpiride	Reduce dose; avoid in severe renal impairment
Sumatriptan	Manufacturer advises caution
Tacalcitol	Monitor serum calcium concentration
Tadalafil	Max. dose 10 mg if eGFR less than 30 mL/minute/1.73 m^2 (avoid regular once-daily dosing)
Tamsulosin	Use with caution if eGFR less than 10 mL/minute/1.73 m^2
Tazobactam [ingredient]	*see* Piperacillin with tazobactam
Teicoplanin	On day 4 use half normal dose if eGFR is 40–60 mL/minute/1.73 m^2 and use one-third normal dose if eGFR is less than 40 mL/minute/1.73 m^2
Telbivudine	600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m^2; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m^2
Telithromycin	Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m^2—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose
Telmisartan	Manufacturer advises initial dose of 20 mg once daily in severe renal impairment
Temazepam	*see* Anxiolytics and Hypnotics
Temocillin	Use normal dose every 24 hours if eGFR 10–30 mL/minute/1.73 m^2; use normal dose every 48 hours if eGFR less than 10 mL/minute/1.73 m^2
Temsirolimus	Manufacturer advises caution in severe renal impairment—no information available
Tenofovir	Monitor renal function—interrupt treatment if further deterioration; 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m^2; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m^2; *see also Atripla®* and *Truvada®*
Tenoxicam	*see* NSAIDs; avoid in severe renal impairment
Terbinafine	Use half normal dose if eGFR less than 50 mL/minute/1.73 m^2
Tetracosactide	*see* Corticosteroids
Tetracyclines	Avoid tetracyclines except doxycycline or minocycline which may be used cautiously (avoid excessive doses)
Thalidomide	Manufacturer advises caution in severe renal impairment—no information available
Thiazides and related diuretics	Avoid if eGFR less than 30 mL/minute/1.73 m^2—ineffective (metolazone remains effective but risk of excessive diuresis)
Tiaprofenic acid	*see* NSAIDs; avoid in severe renal impairment
Ticarcillin [ingredient]	*see Timentin®*
Tiludronic acid	Use with caution and monitor renal function regularly if eGFR 30–90 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2

Drug	Comment
Timentin®	Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m^2; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m^2; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m^2
Timolol	Manufacturer advises caution—dose reduction may be required
Tinzaparin	Risk of bleeding may be increased—dose reduction, and monitoring of anti-Factor Xa may be required; use with caution in elderly and avoid if age over 90 years; unfractionated heparin may be preferable
Tioguanine	Reduce dose
Tiotropium	Plasma-tiotropium concentration raised; use with caution if eGFR less than 50 mL/minute/1.73 m^2
Tirofiban	Increased risk of bleeding; monitor carefully if eGFR less than 60 mL/minute/1.73 m^2; use half normal dose if eGFR less than 30 mL/minute/1.73 m^2
Tizanidine	Manufacturer advises caution
Tobramycin	*see* Aminoglycosides
Tolbutamide	Reduce initial dose and monitor closely; avoid in severe renal impairment
Tolcapone	Caution if eGFR less than 30 mL/minute/1.73 m^2
Tolfenamic acid	*see* NSAIDs
Tolterodine	Reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73 m^2; avoid *Detrusitol®* XL if eGFR less than 30 mL/minute/1.73 m^2
Topiramate	Longer time to steady-state plasma concentrations
Topotecan	Reduce dose; avoid infusion if creatinine clearance less than 20 mL/minute; avoid oral route if creatinine clearance less than 60 mL/minute
Torasemide	May need high doses
Trabectedin	Avoid if creatinine clearance less than 30 mL/minute
Tramadol	*see* Opioid Analgesics
Trandolapril	*see* ACE Inhibitors; max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m^2
Tranexamic acid	Reduce dose—consult product literature for details
Tretinoin (oral)	Reduce dose to 25 mg/m^2
Triamcinolone	*see* Corticosteroids
Triamterene	*see* Potassium-sparing Diuretics
Tribavirin	*see* Ribavirin
Triclofos	*see* Anxiolytics and Hypnotics
Trifluoperazine	*see* Antipsychotics
Trimeprazine	*see* Alimemazine
Trimethoprim	Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m^2; use half normal dose if eGFR less than 15 mL/minute/1.73 m^2 (monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m^2)
Tripotassium dicitratobismuthate	Avoid in severe renal impairment
Trizivir®	Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73m^2 or in end-stage renal disease; consult product literature
Trospium	Use with caution; reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m^2
Truvada®	Monitor renal function; use normal dose every 48 hours if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2
Tylex®	Manufacturer advises caution in severe impairment; effervescent tablets contain 13.6 mmol sodium per tablet; *see also* Opioid Analgesics
Valaciclovir	For *herpes zoster*, 1 g every 12 hours if eGFR 15–30 mL/minute/1.73 m^2 (every 24 hours if eGFR less than 15 mL/minute/1.73 m^2); for *treatment of herpes simplex*, 500 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m^2; for *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised) every 24 hours if eGFR less than 15 mL/minute/1.73 m^2; for *reduction of genital herpes transmission*, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m^2; reduce dose according to eGFR for *cytomegalovirus prophylaxis* following renal transplantation (consult product literature)
Valganciclovir	Reduce dose; consult product literature
Valproate	Reduce dose; adjust dosage according to free serum valproic acid concentration
Valproic acid	*see* Valproate
Valsartan	Use with caution if eGFR less than 10 mL/minute/1.73 m^2—no information available
Vancomycin	Reduce dose—monitor plasma-vancomycin concentration and renal function regularly
Vardenafil	Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m^2
Varenicline	If eGFR less than 30 mL/minute/1.73 m^2, initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily

Drug	Comment
Venlafaxine	Use half normal dose (immediate-release tablets may be given once daily) if eGFR 10–30 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2
Vigabatrin	Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m^2
Vildagliptin	Avoid if eGFR less than 50 mL/minute/1.73 m^2
Voriconazole	Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m^2—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required)
Warfarin	*see* Anticoagulants, Oral
For adjusting drug doses in renal impairment, see Important on p. 815.	
Xipamide	*see* Thiazides and Related Diuretics
Yasmin®	Avoid if eGFR less than 30 mL/minute/1.73 m^2
Yaz®	Manufacturer advises avoid if creatinine clearance less than 30 mL/minute
Zafirlukast	Manufacturer advises caution in moderate to severe impairment
Zidovudine	Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR less than 10 mL/minute/1.73 m^2; *see also Combivir®* and *Trizivir®*
Zoledronic acid	Avoid if serum creatinine above 400 micromol/litre in tumour-induced hypercalcaemia; in advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m^2 reduce dose to 3.5 mg every 3–4 weeks, if eGFR 40–50 mL/minute/1.73 m^2 reduce dose to 3.3 mg every 3–4 weeks, if eGFR 30–40 mL/minute/1.73 m^2 reduce dose to 3 mg every 3–4 weeks, avoid if eGFR less than 30 mL/minute/1.73 m^2 (or if serum creatinine greater than 265 micromol/litre); if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value; avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m^2
Zonisamide	Initially increase dose at 2-week intervals; discontinue if renal function deteriorates
Zopiclone	*see* Anxiolytics and Hypnotics
Zotepine	Initial dose 25 mg twice daily, increased gradually according to response (max. 75 mg twice daily)
Zuclopenthixol	*see* Antipsychotics

A4 Pregnancy

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of *childbearing age* or for men *trying* to *father* a child.

During the *first trimester* drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the *second* and *third trimesters* drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intrauterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The following list includes drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The list is based on human data, but information from *animal* studies has been included for some drugs when its omission might be misleading.

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used.

Few drugs have been shown conclusively to be teratogenic in man, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of a drug from the list does not imply safety.

It should be noted that the BNF provides independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the National Teratology Information Service Telephone: (0191) 232 1525
(0191) 282 5944 (out of hours emergency only)
www.nyrdtc.nhs.uk/Services/teratology/teratology.html

Table of drugs to be avoided or used with caution in pregnancy

Products introduced or amended since publication of BNF No. 57 (March 2009) are underlined.

Drug (trimester of risk)	Comment
Abacavir	Manufacturer advises avoid (toxicity in *animal* studies); *see also* p. 340
Abatacept	Manufacturer advises avoid unless essential—no information available; effective contraception required during treatment and for 14 weeks after last dose
Abciximab	Manufacturer advises use only if potential benefit outweighs risk—no information available
Acamprosate	Manufacturer advises avoid
Acarbose	Manufacturer advises avoid
ACE inhibitors (1, 2, 3)	Avoid unless essential; may adversely affect fetal and neonatal blood pressure control and renal function; also possible skull defects and oligohydramnios
Acebutolol	*see* Beta-blockers
Aceclofenac	*see* NSAIDs
Acemetacin	*see* NSAIDs
Acenocoumarol (nicoumalone)	*see* Anticoagulants, Oral
Acetazolamide	*see* Diuretics
Aciclovir	Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations
Acipimox	Manufacturer advises avoid
Acitretin (1, 2, 3)	Teratogenic; effective contraception must be used for at least 1 month before treatment, during treatment, and for at least 3 years after stopping (oral progestogen-only contraceptives not considered effective)
Adalimumab	Avoid; manufacturer advises adequate contraception during and for at least 5 months after last dose
Adapalene	Manufacturer advises teratogenicity in *animal* studies and recommends effective contraception during treatment

Drug (trimester of risk)	Comment
Adefovir dipivoxil	Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment
Agalsidase	Use with caution
Agomelatine	Manufacturer advises caution—no information available
Alclometasone	*see* Corticosteroids
Alcohol	
(1, 2)	Regular daily drinking is teratogenic (fetal alcohol syndrome) and may cause growth restriction; occasional single drinks are probably safe
(3)	Withdrawal syndrome may occur in babies of alcoholic mothers
Alemtuzumab	Avoid; manufacturer advises effective contraception during and for 6 months after treatment in men or women
Alendronic acid	*see* Bisphosphonates
Alfacalcidol	*see* Vitamin D
Alfentanil	*see* Opioid Analgesics
Alglucosidase alfa	Manufacturer advises avoid unless essential—no information available
Alimemazine (trimeprazine)	*see* Antihistamines
Aliskiren	Manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death
Alitretinoin	
(1, 2, 3)	Teratogenic; effective contraception must be used for at least 1 month before treatment, during treatment, and for 1 month after stopping; see also Pregnancy Prevention, p. 638
Allopurinol	Toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child
Almotriptan	*see* $5HT_1$ Agonists
Alpha-blockers, postsynaptic	No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk
Alprazolam	*see* Benzodiazepines
Alprostadil (urethral application only)	Manufacturer advises barrier contraception if partner pregnant
Alteplase	*see* Fibrinolytics
Amantadine	Avoid; toxicity in *animal* studies
Ambrisentan	Avoid (teratogenic in *animal* studies); exclude pregnancy before treatment and ensure effective contraception during treatment; monthly pregnancy tests advised
Amfebutamone	*see* Bupropion
Amikacin	*see* Aminoglycosides
Amiloride	*see* Diuretics
Aminoglycosides	
(2, 3)	Auditory or vestibular nerve damage; risk greatest with streptomycin; probably very small with gentamicin and tobramycin, but avoid unless essential (if given, serum-aminoglycoside concentration monitoring essential)
Aminophylline	*see* Theophylline
Amiodarone	
(2, 3)	Possible risk of neonatal goitre; use only if no alternative
Amisulpride	Manufacturer advises avoid
Amitriptyline	*see* Antidepressants, Tricyclic (and related)
Amlodipine	No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension
Amobarbital	*see* Barbiturates
Amorolfine	Systemic absorption very low, but manufacturer advises avoid—no information available
Amoxicillin	*see* Penicillins
Amphotericin	Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk
Ampicillin	*see* Penicillins
Amsacrine	Avoid (teratogenic and toxic in *animal* studies); may reduce fertility; *see also* section 8.1
Anabolic steroids	
(1, 2, 3)	Masculinisation of female fetus
Anaesthetics, general	
(3)	Depress neonatal respiration; for maintenance of anaesthesia, doses of propofol should not exceed 6 mg/kg/hour; dose of thiopental should not exceed 250 mg
Anaesthetics, local	
(3)	With large doses, neonatal respiratory depression, hypotonia, and bradycardia after paracervical or epidural block; neonatal methaemoglobinaemia with prilocaine; use lower doses of bupivacaine for intrathecal use during late pregnancy; *see also* Levobupivacaine and Ropivacaine
Anagrelide	Manufacturer advises avoid (toxicity in *animal* studies)
Anakinra	Manufacturer advises avoid; effective contraception must be used during treatment
Analgesics	*see* Opioid Analgesics, Nefopam, NSAIDs, and Paracetamol
Androgens	
(1, 2, 3)	Masculinisation of female fetus

Drug (trimester of risk)	Comment
Anidulafungin	Manufacturer advises avoid—no information available
Anticoagulants, oral (1, 2, 3)	Congenital malformations; fetal and neonatal haemorrhage; *see also* section 2.8.2; *see also* Dabigatran Etexilate and Rivaroxaban
Antidepressants, MAOI (1, 2, 3)	No evidence of harm but manufacturers advise avoid unless compelling reasons
Antidepressants, SSRI	Manufacturers advise use only if potential benefit outweighs risk; risk of neonatal withdrawal, particularly with fluoxetine and paroxetine; toxicity in *animal* studies with escitalopram and paroxetine
Antidepressants, tricyclic (and related) (3)	Tachycardia, irritability, and muscle spasms in neonate reported with imipramine
Antiepileptics	Benefit of treatment outweighs risk to fetus; risk of teratogenicity greater if more than one drug used; **important:** *see also* Carbamazepine, Ethosuximide, Gabapentin, Lamotrigine, Levetiracetam, Oxcarbazepine, Phenobarbital, Phenytoin, Pregabalin, Primidone, Rufinamide, Topiramate, Valproate, Vigabatrin, Zonisamide, and p. 253
Antihistamines	No evidence of teratogenicity; embryotoxicity in *animal* studies with high doses of hydroxyzine and loratadine; manufacturers of cetirizine, cinnarizine, desloratadine, dimenhydrinate, hydroxyzine, ketotifen, loratadine, and mizolastine advise avoid
Antimalarials (1, 3)	Benefit of prophylaxis and treatment in malaria outweighs risk; **important:** *see also* individual drugs and p. 358 and p. 360
Antipsychotics (3)	Extrapyramidal effects in neonate occasionally reported *See also* Amisulpride, Clozapine, Flupentixol, Olanzapine, Paliperidone, Quetiapine, Risperidone, Sertindole, Sulpiride, Zotepine
Antithymocyte immunoglobulin	Manufacturer advises use only if potential benefit outweighs risk—no information available
Apomorphine	Caution
Aprepitant	*see* Neurokinin Receptor Antagonists
Aripiprazole (1, 2, 3)	Manufacturer advises use only if potential benefit outweighs risk—no information available
Arsenic trioxide	Avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises effective contraception during treatment in men or women; *see also* section 8.1
Artemether [ingredient]	*see Riamet®*
Aspirin (3)	Impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of newborn; kernicterus in jaundiced neonates
Atazanavir	Manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia in neonate if used at term
Atenolol	*see* Beta-blockers
Atomoxetine	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Atorvastatin	*see* Statins
Atosiban	For use in premature labour *see* section 7.1.3
Atovaquone	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Atracurium	Does not cross placenta in significant amounts but manufacturer advises use only if potential benefit outweighs risk
Atropine	Not known to be harmful; manufacturer advises caution
Auranofin	Manufacturer advises avoid (effective contraception should be used during and for at least 6 months after treatment) but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency
Azacitidine	Avoid (toxicity in *animal studies*); manufacturer advises effective contraception during and for 3 months after treatment in men or women; *see also* section 8.1
Azapropazone	*see* NSAIDs
Azathioprine	*see* p. 493
Azelastine	*see* Antihistamines
Azithromycin	Manufacturer advises use only if adequate alternatives not available
Aztreonam	Manufacturer advises avoid—no information available

Drug (trimester of risk)	Comment
Baclofen	Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies)
Balsalazide	Manufacturer advises avoid
Bambuterol	*see* section 3.1
Barbiturates	
(1, 2, 3)	Fetal abnormalities reported
(3)	Withdrawal effects in neonate; respiratory depression in neonate if used during labour; *see also* Phenobarbital
Basiliximab	Avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose
Beclometasone	*see* Corticosteroids
Bemiparin	Manufacturer advises avoid unless essential—no information available
Bendrofluazide	*see* Diuretics
Bendroflumethiazide (bendrofluazide)	*see* Diuretics
Benperidol	*see* Antipsychotics
Benzodiazepines	Avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia and respiratory depression)
Benzylpenicillin	*see* Penicillins
Beta-blockers	May cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; risk greater in severe hypertension; *see also* section 2.5
Betaine	Manufacturer advises avoid unless essential—limited information available
Betamethasone	*see* Corticosteroids
Bethanechol	Manufacturer advises avoid—no information available
Bevacizumab	Manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for at least 6 months after treatment in women (*see also* section 8.1)
Bexarotene	Avoid; manufacturer advises effective contraception during and for at least 1 month after treatment in men or women; *see also* section 8.1
Bezafibrate	*see* Fibrates
Bimatoprost	Manufacturer advises use only if potential benefit outweighs risk
Bisoprolol	*see* Beta-blockers
Bisphosphonates	Manufacturers advise avoid
Bivalirudin	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Bleomycin	Avoid (teratogenic and carcinogenic in *animal* studies); *see also* section 8.1
Bortezomib	Manufacturer advises effective contraception during and for 3 months after treatment in men or women—toxicity in *animal* studies; *see also* section 8.1
Bosentan	Avoid (teratogenic in *animal* studies); effective contraception required during and for at least 3 months after administration (hormonal contraception not considered effective); monthly pregnancy tests advised
Botulinum toxin	Manufacturers advise avoid unless essential—toxicity in *animal* studies
Brinzolamide	Manufacturer advises avoid unless essential
Buclizine	*see* Anthistamines
Budesonide	*see* Corticosteroids
Bumetanide	*see* Diuretics
Bupivacaine	*see* Anaesthetics, Local
Buprenorphine	*see* Opioid Analgesics
Bupropion	Manufacturer advises avoid—no information available
Buserelin	Avoid
Buspirone	Manufacturer advises avoid
Busulfan	Avoid (teratogenic in *animals*); manufacturers advise effective contraception during and for 6 months after treatment in men or women; *see also* section 8.1
C1-esterase inhibitor	Manufacturer advises avoid unless essential
Cabergoline	No evidence of harm; manufacturer advises discontinuation one month before intended conception and avoidance during pregnancy; *see also* section 6.7.1
Calcipotriol	Manufacturer advises avoid if possible; *see also* Vitamin D
Calcitonin (salmon) (salcatonin)	Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies)
Calcitriol	*see* Vitamin D
Calcium folinate	Manufacturer advises caution—no information available
Calcium levofolinate	*see* Calcium Folinate
Candesartan	*As for* ACE Inhibitors
Capecitabine	Avoid (teratogenic in animal studies); *see also* section 8.1
Capreomycin	Manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies
Captopril	*see* ACE Inhibitors
Carbamazepine	Risk of teratogenesis including increased risk of neural tube defects; *see also* Antiepileptics

Drug (trimester of risk)	Comment
Carbimazole	Neonatal goitre and hypothyroidism; has been associated with congenital defects including aplasia cutis of the neonate
Carbocisteine (1)	Manufacturer advises avoid
Carboplatin	Avoid (teratogenic and embryotoxic in *animal* studies); *see also* section 8.1
Carglumic acid	Manufacturer advises avoid unless essential—no information available
Carmustine	Avoid (teratogenic and embryotoxic in *animals*); manufacturer advises effective contraception during treatment in men or women; *see also* section 8.1
Carnitine	Appropriate to use; no evidence of teratogenicity in *animal* studies
Carvedilol	*see* Beta-blockers
Caspofungin	Manufacturer advises avoid unless essential—toxicity in *animal* studies
Cefaclor	Not known to be harmful
Cefadroxil	Not known to be harmful
Cefalexin	Not known to be harmful
Cefixime	Not known to be harmful
Cefotaxime	Not known to be harmful
Cefpodoxime	Not known to be harmful
Cefradine	Not known to be harmful
Ceftazidime	Not known to be harmful
Ceftriaxone	Not known to be harmful
Cefuroxime	Not known to be harmful
Celecoxib	Manufacturer advises avoid (teratogenic in *animal* studies); *see also* NSAIDs
Celiprolol	*see* Beta-blockers
Cetirizine	*see* Antihistamines
Cetrorelix	Manufacturer advises avoid in confirmed pregnancy
Cetuximab	Manufacturer advises use only if potential benefit outweighs risk—no information available
Chloral hydrate	Avoid
Chlorambucil	Avoid; manufacturer advises effective contraception during treatment in men or women; *see also* section 8.1
Chloramphenicol (3)	Neonatal 'grey' syndrome
Chlordiazepoxide	*see* Benzodiazepines
Chloroquine	*see* Antimalarials
Chlorphenamine (chlorpheniramine)	*see* Anthistamines
Chlorpheniramine	*see* Antihistamines
Chlorpromazine	*see* Antipsychotics
Chlorpropamide	*see* Sulphonylureas
Chlortalidone	*see* Diuretics
Ciclesonide	*see* Corticosteroids
Ciclosporin	*see* p. 493
Cidofovir	Avoid (toxicity in *animal* studies); effective contraception required during and for 1 month after treatment; also men should avoid fathering a child during and for 3 months after treatment
Cilastatin [ingredient]	*see Primaxin®*
Cilazapril	*see* ACE Inhibitors
Cilostazol	Avoid—toxicity in *animal* studies
Cimetidine	Manufacturer advises avoid unless essential
Cinacalcet	Manufacturer advises use only if potential benefit outweighs risk—no information available
Cinnarizine	*see* Anthistamines
Ciprofibrate	*see* Fibrates
Ciprofloxacin	*see* Quinolones
Cisatracurium	Manufacturer advises avoid—no information available
Cisplatin	Avoid (teratogenic and toxic in *animal* studies); *see also* section 8.1
Citalopram	*see* Antidepressants, SSRI
Cladribine	Avoid (teratogenic in *animal* studies); manufacturer advises that men should not father children during and for 6 months after treatment; *see also* section 8.1
Clarithromycin	Manufacturer advises avoid unless potential benefit outweighs risk
Clavulanic acid [ingredient]	*see* Co-amoxiclav, *Timentin®*
Clemastine	*see* Anthistamines
Clindamycin	Not known to be harmful
Clobazam	*see* Benzodiazepines
Clobetasol	*see* Corticosteroids
Clobetasone	*see* Corticosteroids
Clodronate sodium	*see* Bisphosphonates
Clofarabine	Manufacturer advises avoid (teratogenic in *animal* studies); *see also* section 8.1
Clomethiazole	Avoid if possible—especially during first and third trimesters
Clomifene	Possible effects on fetal development
Clomipramine	*see* Antidepressants, Tricyclic (and related)
Clonazepam	*see* Benzodiazepines
Clonidine	May lower fetal heart rate, but risk should be balanced against risk of uncontrolled maternal hypertension; avoid intravenous injection
Clopidogrel	Manufacturer advises avoid—no information available
Clotrimazole	Minimal absorption from skin and vagina; not known to be harmful; see also section 7.2.2
Clozapine	Manufacturer advises caution
Co-amoxiclav	*see* Penicillins
Co-beneldopa	*see* Levodopa
Co-careldopa	*see* Levodopa

Drug (trimester of risk)	Comment
Co-cyprindiol (1, 2, 3)	Feminisation of male fetus (due to cyproterone)
Co-danthramer	Manufacturer advises avoid—no information available
Co-danthrusate	Manufacturer advises avoid—no information available
Codeine	*see* Opioid Analgesics
Co-fluampicil	*see* Penicillins
Colchicine	Avoid—teratogenicity in animal studies
Colecalciferol	*see* Vitamin D
Colesevelam	Use with caution—drug not absorbed but may cause fat-soluble vitamin deficiency on prolonged use
Colestipol	Use with caution—drug not absorbed but may cause fat-soluble vitamin deficiency on prolonged use
Colestyramine	Use with caution—drug not absorbed but may cause fat-soluble vitamin deficiency on prolonged use
Colistin (2, 3)	Avoid—possible risk of fetal toxicity
Contraceptives, hormonal	Not known to be harmful
Corticosteroids	Benefit of treatment, e.g. in asthma, outweighs risk (*see also* CSM advice, section 6.3.2); risk of intra-uterine growth restriction on prolonged or repeated systemic treatment; corticosteroid cover required by mother during labour; monitor closely if fluid retention
Co-trimoxazole (1)	Teratogenic risk (trimethoprim a folate antagonist)
(3)	Neonatal haemolysis and methaemoglobinaemia; fear of increased risk of kernicterus in neonates appears to be unfounded
Crisantaspase	Avoid; *see also* section 8.1
Cromoglicate	*see* Sodium Cromoglicate
Cyclizine	*see* Antihistamines
Cyclopenthiazide	*see* Diuretics
Cyclophosphamide	Avoid (manufacturer advises effective contraception during and for at least 3 months after treatment in men or women); *see also* section 8.1
Cycloserine	Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta
Cyclosporin	*see* p. 493
Cyproheptadine	*see* Antihistamines
Cyproterone [ingredient]	*see* Co-cyprindiol
Cytarabine	Avoid (teratogenic in *animal* studies); *see also* section 8.1
Dabigatran etexilate	Manufacturer advises avoid—toxicity in *animal* studies
Dacarbazine	Avoid (carcinogenic and teratogenic in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Dactinomycin	Avoid (teratogenic in *animal* studies); *see also* section 8.1
Dalfopristin [ingredient]	*see Synercid®*
Dalteparin	Not known to be harmful; multidose vial contains benzyl alcohol—manufacturer advises avoid
Danaparoid	Limited information available but not known to be harmful—manufacturer advises avoid
Danazol (1, 2, 3)	Avoid; has weak androgenic effects and virilisation of female fetus reported
Dantrolene	Use only for malignant hyperthermia if potential benefit outweighs risk; avoid use in chronic spasticity—embryotoxic in *animal* studies
Dantron (danthron)	*see* Co-danthramer, Co-danthrusate
Dapsone	Folic acid 5 mg daily should be given to mother throughout pregnancy
(3)	Neonatal haemolysis and methaemoglobinaemia reported
Daptomycin	Manufacturer advises use only if potential benefit outweighs risk—no information available
Darbepoetin	No evidence of harm in *animal* studies—manufacturer advises caution
Darifenacin	Manufacturer advises avoid—toxicity in *animal* studies
Darunavir	Manufacturer advises use only if potential benefit outweighs risk—no information available
Dasatinib	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment
Daunorubicin	Avoid (teratogenic and carcinogenic in *animal* studies); *see also* section 8.1
Deferasirox	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies
Deferiprone	Manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in *animal* studies; contraception advised in women of childbearing potential
Deflazacort	*see* Corticosteroids
Demeclocycline	*see* Tetracyclines

Drug (trimester of risk)	Comment
Desferrioxamine	Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk
Desflurane	*see* Anaesthetics, General
Desloratadine	*see* Antihistamines
Desmopressin (3)	Small oxytocic effect in third trimester; increased risk of pre-eclampsia
Desogestrel	*see* Contraceptives, hormonal
Dexamethasone	*see* Corticosteroids
Dexamfetamine	Manufacturer advises avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity)
Dexibuprofen	*see* NSAIDs
Dexketoprofen	*see* NSAIDs
Dexrazoxane	Manufacturer advises avoid unless essential; ensure effective contraception during and for 3 months after treatment in men and women
Dextran	Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death
Dextromethorphan	*see* Opioid Analgesics
Diamorphine	*see* Opioid Analgesics
Diazepam	*see* Benzodiazepines
Diazoxide (2, 3)	Prolonged use may produce alopecia and impaired glucose tolerance in neonate; inhibits uterine activity during labour
Diclofenac	*see* NSAIDs
Didanosine	Manufacturer advises use only if potential benefit outweighs risk
Diethylstilbestrol (1)	High doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring; increased risk of hypospadias in male offspring
Diflucortolone	*see* Corticosteroids
Digoxin	May need dosage adjustment
Dihydrocodeine	*see* Opioid Analgesics
Dihydrotachysterol	*see* Vitamin D
Diloxanide	Manufacturer advises avoid—no information available
Diltiazem	Avoid
Dimenhydrinate	*see* Antihistamines
Diphenoxylate	*see* Opioid Analgesics
Dipipanone	*see* Opioid Analgesics
Dipyridamole	Not known to be harmful
Disodium etidronate	*see* Bisphosphonates
Disodium pamidronate	*see* Bisphosphonates
Disopyramide (3)	May induce labour
Distigmine	Manufacturer advises avoid (may stimulate uterine contractions)
Disulfiram (1)	High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic
Diuretics	Not used to treat gestational hypertension; *see also* Thiazides and Related Diuretics Manufacturers advise avoid acetazolamide and torasemide (toxicity in *animal* studies)
Dobutamine	No information available
Docetaxel	Avoid (toxicity and reduced fertility in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment; *see also* section 8.1
Docusate sodium	Not known to be harmful—manufacturer advises caution
Dolasetron	Not known to be harmful but manufacturer advises avoid unless potential benefit outweighs risk
Domperidone	Manufacturer advises avoid
Donepezil	Manufacturer advises use only if potential benefit outweighs risk
Dopamine	Manufacturer advises use only if potential benefit outweighs risk
Dopexamine	No information available—manufacturer advises avoid
Doripenem	Manufacturer advises avoid unless essential—no information available
Dornase alfa	No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk
Dosulepin (dothiepin)	*see* Antidepressants, Tricyclic (and related)
Dothiepin	*see* Antidepressants, Tricyclic (and related)
Doxazosin	*see* Alpha-blockers, Postsynaptic
Doxepin	*see* Antidepressants, Tricyclic (and related)
Doxorubicin	Avoid (teratogenic and toxic in *animal* studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Doxycycline	*see* Tetracyclines
Droperidol	*see* Antipsychotics
Drospirenone	*see* Contraceptives, hormonal
Drotrecogin alfa (activated)	Manufacturer advises avoid unless benefit outweighs risk—no information available

Drug (trimester of risk)	Comment
Duloxetine	Toxicity in *animal* studies—manufacturer advises avoid in patients with stress urinary incontinence and use only if potential benefit outweighs risk in depression; risk of neonatal withdrawal symptoms if used near term
Dutasteride (1, 2, 3)	Avoid unprotected intercourse (*see* section 6.4.2). May cause feminisation of male fetus
Dydrogesterone	Not known to be harmful
Econazole	Minimal absorption from skin and vagina; not known to be harmful; *see also* section 7.2.2
Eculizumab	No information available—use only if potential benefit outweighs risk; human IgG antibodies known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment
Edrophonium	Manufacturer advises use only if potential benefit outweighs risk
Efavirenz	Manufacturer advises avoid (effective contraception required during treatment and for 12 weeks after treatment); use efavirenz only if no alternative available
Eflornithine	Toxicity in *animal* studies—manufacturer advises avoid
Eletriptan	*see* $5HT_1$ Agonists
Emtricitabine	No information available—manufacturer advises use only if essential
Enalapril	*see* ACE Inhibitors
Enfuvirtide	Manufacturer advises use only if potential benefit outweighs risk
Enoxaparin	Not known to be harmful
Enoximone	Manufacturer advises use only if potential benefit outweighs risk
Entacapone	Manufacturer advises avoid—no information available
Entecavir	Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment
Ephedrine	Increased fetal heart rate reported with parenteral ephedrine
Epinastine	*see* Antihistamines
Epirubicin	Avoid (carcinogenic in *animal* studies); *see also* section 8.1
Eplerenone	Manufacturer advises caution—no information available
Epoetin	No evidence of harm; benefits probably outweigh risk of anaemia and of transfusion in pregnancy
Epoprostenol	Manufacturer advises use with caution—no information available
Eprosartan	*As for* ACE Inhibitors
Eptifibatide	Manufacturer advises use only if potential benefit outweighs risk—no information available
Erdosteine	Manufacturer advises avoid—no information available
Ergocalciferol	*see* Vitamin D
Ergotamine (1, 2, 3)	Avoid; oxytocic effect on the uterus
Erlotinib	Manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for at least 2 weeks after treatment; *see also* section 8.1
Ertapenem	Manufacturer advises avoid unless potential benefit outweighs risk
Erythromycin	Not known to be harmful
Escitalopram	*see* Antidepressants, SSRI
Esmolol	*see* Beta-blockers
Esomeprazole	Manufacturer advises caution—no information available
Estradiol	*see* Contraceptives, hormonal
Etanercept	Manufacturer advises avoid—no information available
Ethambutol	Not known to be harmful; *see also* p. 322
Ethinylestradiol	*see* Contraceptives, hormonal
Ethosuximide (1)	May possibly be teratogenic; *see also* Antiepileptics
Etidronate disodium	*see* Bisphosphonates
Etodolac	*see* NSAIDs
Etomidate	*see* Anaesthetics, General
Etonogestrel	*see* Contraceptives, hormonal
Etoposide	Avoid (teratogenic in *animal* studies); *see also* section 8.1
Etoricoxib	*see* NSAIDs
Etravirine	Manufacturer advises use only if potential benefit outweighs risk
Etynodiol	*see* Contraceptives, hormonal
Exenatide	Manufacturer advises avoid—toxicity in *animal* studies
Ezetimibe	Manufacturer advises use only if potential benefit outweighs risk—no information available
Famciclovir	*see* Aciclovir
Famotidine	Manufacturer advises avoid unless potential benefit outweighs risk
Felodipine	Avoid; toxicity in *animal* studies; may inhibit labour
Fenbufen	*see* NSAIDs
Fenofibrate	*see* Fibrates
Fenoprofen	*see* NSAIDs
Fenoterol	*see* section 3.1
Fentanyl	*see* Opioid Analgesics

Drug (trimester of risk)	Comment
Ferric carboxymaltose	Avoid in first trimester; crosses the placenta in *animal* studies; may influence skeletal development
Fesoterodine	Manufacturer advises avoid—toxicity in *animal* studies
Fexofenadine	*see* Antihistamines
Fibrates	Embryotoxicity in *animal* studies—manufacturers advise avoid
Fibrinolytics (1, 2, 3)	Possibility of premature separation of placenta in first 18 weeks; risk of maternal haemorrhage throughout pregnancy and on postpartum; theoretical risk of fetal haemorrhage throughout pregnancy
Filgrastim	Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk
Finasteride (1, 2, 3)	Avoid unprotected intercourse (*see* section 6.4.2). May cause feminisation of male fetus
Flavoxate	Manufacturer advises avoid unless no safer alternative
Flecainide	Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in *animal* studies; infant hyperbilirubinaemia also reported
Flucloxacillin	*see* Penicillins
Fluconazole	Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses
Flucytosine	Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk
Fludarabine	Avoid (embryotoxic and teratogenic in *animal* studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Fludrocortisone	*see* Corticosteroids
Fludroxycortide (flurandrenolone)	*see* Corticosteroids
Flumazenil	May cross placenta in small amounts—manufacturer advises avoid unless potential benefit outweighs risk
Flunisolide	*see* Corticosteroids
Fluocinolone	*see* Corticosteroids
Fluocinonide	*see* Corticosteroids
Fluocortolone	*see* Corticosteroids
Fluorometholone	*see* Corticosteroids
Fluorouracil	Avoid (teratogenic); *see also* section 8.1
Fluoxetine	*see* Antidepressants, SSRI
Flupentixol	Manufacturer advises avoid unless potential benefit outweighs risk
Fluphenazine	*see* Antipsychotics
Flurandrenolone	*see* Corticosteroids
Flurazepam	*see* Benzodiazepines
Flurbiprofen	*see* NSAIDs
Fluticasone	*see* Corticosteroids
Fluvastatin	*see* Statins
Fluvoxamine	*see* Antidepressants, SSRI
Follitropin alfa and beta	Avoid
Fondaparinux	Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available
Formoterol (eformoterol)	Manufacturers advise use only if potential benefit outweighs risk; *see also* section 3.1
Fosamprenavir	Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk
Fosaprepitant	*see* Neurokinin Receptor Antagonists
Foscarnet	Manufacturer advises avoid
Fosinopril	*see* ACE Inhibitors
Fosphenytoin	*see* Phenytoin
Framycetin	*see* Aminoglycosides
Frovatriptan	*see* $5HT_1$ Agonists
Frusemide	*see* Diuretics
Fulvestrant	Manufacturer advises avoid—increased incidence of fetal abnormalities and death in *animal* studies
Furosemide (frusemide)	*see* Diuretics
Fusidic acid	*see* Sodium Fusidate
Gabapentin	Toxicity in *animal* studies; *see also* Antiepileptics
Galantamine	Developmental delay in *animal* studies
Galsulfase	Manufacturer advises avoid unless essential
Ganciclovir	Avoid—teratogenic risk; *see also* p. 352
Ganirelix	Manufacturer advises avoid in confirmed pregnancy—toxicity in *animal* studies
Gelatin	Manufacturer of *Geloplasma*® advises avoid at the end of pregnancy
Gemcitabine	Avoid (teratogenic in *animal* studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; *see also* p. 467
Gemfibrozil	*see* Fibrates
Gentamicin	*see* Aminoglycosides
Gestodene	*see* Contraceptives, hormonal
Gestrinone (1, 2, 3)	Avoid
Glatiramer	Manufacturer advises avoid—no information available
Glibenclamide	*see* Sulphonylureas

Drug (trimester of risk)	Comment
Gliclazide	*see* Sulphonylureas
Glimepiride	*see* Sulphonylureas
Glipizide	*see* Sulphonylureas
Glucosamine	Manufacturer advises avoid—no information available
Glyceryl trinitrate	Not known to be harmful but most manufacturers advise avoid unless potential benefit outweighs risk
Gonadorelin analogues	*see* individual entries
Goserelin	Manufacturer advises avoid in pregnancy—exclude pregnancy before treatment and use non-hormonal contraceptives during treatment
Granisetron	Manufacturer advises use only when compelling reasons—no information available
Griseofulvin	Avoid (fetotoxicity and teratogenicity in *animals*); effective contraception required during and for at least 1 month after administration (**important:** effectiveness of oral contraceptives reduced, see p. 445); also men should avoid fathering a child during and for at least 6 months after administration
Guanethidine (3)	Postural hypotension and reduced uteroplacental perfusion; should not be used to treat hypertension in pregnancy
Haem arginate	Manufacturer advises avoid unless essential
Haloperidol	*see* Antipsychotics
Halothane	*see* Anaesthetics, General
Heparin (1, 2, 3)	Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid; *see also* Bemiparin, Dalteparin, Enoxaparin, and Tinzaparin
$5HT_1$ agonists	Limited experience—manufacturers advise avoid unless potential benefit outweighs risk
Human menopausal gonadotrophins	Avoid
Hydralazine (1, 2)	Manufacturer advises avoid before third trimester; no reports of serious harm following use in third trimester
Hydrochlorothiazide	*see* Diuretics
Hydrocortisone	*see* Corticosteroids
Hydroflumethiazide	*see* Diuretics
Hydromorphone	*see* Opioid Analgesics
Hydroxycarbamide (hydroxyurea)	Avoid (teratogenic in *animal* studies); manufacturer advises effective contraception before and during treatment *see also* section 8.1
Hydroxychloroquine	Manufacturer advises avoid but see p. 573
Hydroxyurea	*see* Hydroxycarbamide
Hydroxyzine	*see* Antihistamines
Hyoscine butylbromide	Manufacturer advises use only if potential benefit outweighs risk
Hyoscine hydrobromide	Manufacturer advises use only if potential benefit outweighs risk; injection may depress neonatal respiration
Ibandronic acid	*see* Bisphosphonates
Ibuprofen	*see* NSAIDs
Icatibant	Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies
Idarubicin	Avoid (teratogenic and toxic in *animal* studies); *see also* section 8.1
Idoxuridine	Teratogenic in *animal* studies—manufacturer advises avoid
Idursulfase	Manufacturer advises avoid—no information available
Ifosfamide	Avoid (teratogenic and carcinogenic in *animals*); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Iloprost	Manufacturer advises avoid (toxicity in *animal* studies); effective contraception must be used during treatment
Imatinib	Manufacturer advises avoid unless potential benefit outweighs risk; *see also* section 8.1
Imidapril	*see* ACE Inhibitors
Imiglucerase	Manufacturer advises use with caution—limited information available
Imipenem [ingredient]	*see Primaxin®*
Imipramine	*see* Antidepressants, Tricyclic (and related)
Imiquimod	No evidence of teratogenicity or toxicity in *animal* studies; manufacturer advises caution
Indapamide	*see* Diuretics
Indinavir	Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term
Indometacin	*see* NSAIDs
Infliximab	Avoid; manufacturer advises adequate contraception during and for at least 6 months after last dose
Influenza vaccine	Not known to be harmful
Inosine pranobex	Manufacturer advises avoid
Inositol nicotinate	No information available—manufacturer advises avoid unless potential benefit outweighs risk

Drug (trimester of risk)	Comment
Insulin	Insulin requirements should be assessed frequently by an experienced diabetes physician; safety of long-acting insulin analogues not established; short-acting insulin analogues, insulin aspart and insulin lispro, not known to be harmful; see also p. 374
Interferon beta	Manufacturers advise avoid—increased risk of spontaneous abortion; effective contraception required during treatment
Interferons	Manufacturers recommend avoid unless compelling reasons; effective contraception to be used by men and women receiving treatment; *see also* Interferon Beta and Peginterferon Alfa
Iodine and iodides (2, 3)	Neonatal goitre and hypothyroidism; *see also* Iodine, Radioactive and Povidone–iodine
Iodine, radioactive (1, 2, 3)	Permanent hypothyroidism—avoid
Iodoform	*see* Povidone–iodine
Ipratropium	Not known to be harmful; *see* section 3.1
Irbesartan	*As for* ACE Inhibitors
Irinotecan	Avoid (teratogenic and toxic in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment; *see also* section 8.1
Iron (parenteral)	Avoid in first trimester; *see also* Ferric Carboxymaltose
Iron dextran	*see* Iron (parenteral)
Iron sucrose	*see* Iron (parenteral)
Isocarboxazid	*see* Antidepressants, MAOI
Isoflurane	*see* Anaesthetics, General
Isometheptene [ingredient]	*see Midrid®*
Isoniazid	Not known to be harmful; *see also* p. 322
Isosorbide dinitrate	May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk
Isosorbide mononitrate	Manufacturers advise avoid unless potential benefit outweighs risk
Isotretinoin (1, 2, 3)	Teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective); also avoid topical treatment; see also Pregnancy Prevention, p. 650
Isradipine	May inhibit labour; risk to fetus should be balanced against risk of uncontrolled maternal hypertension
Itraconazole	Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies); ensure effective contraception during treatment and until the next menstrual period following end of treatment
Ivabradine	Manufacturer advises avoid—toxicity in *animal* studies
Kaletra®	Avoid oral solution due to high propylene glycol content; manufacturer advises use capsules and tablets only if potential benefit outweighs risk (toxicity in *animal* studies)
Ketamine	*see* Anaesthetics, General
Ketoconazole	Manufacturer advises avoid unless potential benefit outweighs risk (teratogenicity in *animal* studies)
Ketoprofen	*see* NSAIDs
Ketorolac	*see* NSAIDs
Ketotifen	*see* Antihistamines
Labetalol	*see* Beta-blockers
Lacidipine	Manufacturer advises avoid; may inhibit labour
Lacosamide	Manufacturer advises avoid unless potential benefit outweighs risk
Lactulose	Not known to be harmful
Lamivudine (1)	Manufacturer advises avoid during first trimester; *see also* p. 340
Lamotrigine	Risk of teratogenesis; *see also* Antiepileptics
Lanreotide	Manufacturer advises use only if potential benefit outweighs risk
Lansoprazole	Manufacturer advises avoid
Lanthanum	Manufacturer advises avoid—toxicity in *animal* studies
Lapatinib	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also section 8.1
Laronidase	Manufacturer advises avoid unless essential—no information available
Latanoprost	Manufacturer advises avoid
Leflunomide	Avoid—active metabolite teratogenic in *animal* studies; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (*see also* Leflunomide section 10.1.3)

Drug (trimester of risk)	Comment
Lenalidomide	Teratogenic risk; effective contraception must be used for at least 1 month before, during, and for at least 1 month after treatment (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended); men should use condoms during treatment and for at least 1 week after stopping
Lenograstim	Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk
Lepirudin	Avoid
Lercanidipine	Manufacturer advises avoid—no information available
Letrozole	Avoid (toxicity in *animal* studies); manufacturer advises effective contraception required until postmenopausal status fully established
Leuprorelin	Avoid—teratogenic in *animal* studies
Levetiracetam	Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; *see also* Antiepileptics
Levobupivacaine (1)	Manufacturer advises avoid if possible—toxicity in *animal* studies; *see also* Anaesthetics, Local
Levocetirizine	*see* Antihistamines
Levodopa	Manufacturers advise toxicity in *animal* studies
Levofloxacin	*see* Quinolones
Levomepromazine (methotrimeprazine)	*see* Antipsychotics
Levonorgestrel	*see* Contraceptives, hormonal
Levothyroxine (thyroxine)	Monitor maternal serum-thyrotrophin concentration—levothyroxine may cross the placenta and excessive maternal concentration can be detrimental to fetus
Lidocaine (lignocaine)	*see* Anaesthetics, Local
Lignocaine	*see* Anaesthetics, Local
Linezolid	Manufacturer advises use only if potential benefit outweighs risk—no information available
Liothyronine	Does not cross the placenta in significant amounts; monitor maternal thyroid function tests—dosage adjustment may be necessary
Lisinopril	*see* ACE Inhibitors
Lithium salts (1)	Avoid if possible (risk of teratogenicity, including cardiac abnormalities)
(2, 3)	Dose requirements increased (but on delivery return to normal abruptly); close monitoring of serum-lithium concentration advised (risk of toxicity in neonate)
Lofepramine	*see* Antidepressants, Tricyclic (and related)
Lofexidine	Manufacturer advises use only if benefit outweighs risk—no information available
Lomustine	Avoid (manufacturer advises effective contraception during and for at least 6 months after treatment in men or women); *see also* section 8.1
Loperamide	Manufacturers advise avoid—no information available
Lopinavir [ingredient]	*see Kaletra®*
Loprazolam	*see* Benzodiazepines
Loratadine	Embryotoxic in *animal* studies; *see also* Antihistamines
Lorazepam	*see* Benzodiazepines
Lormetazepam	*see* Benzodiazepines
Losartan	*As for* ACE Inhibitors
Lumefantrine [ingredient]	*see Riamet®*
Lymecycline	*see* Tetracyclines
Macrogols (oral)	Manufacturers advise use only if essential—no information available
Magnesium sulphate (3)	Not known to be harmful for short-term intravenous administration in eclampsia but excessive doses cause neonatal respiratory depression
Malarone®	Manufacturer advises avoid unless essential
Mannitol	Manufacturer advises avoid unless essential—no information available
Maraviroc	Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies
Mebendazole	Manufacturer advises toxicity in *animal* studies
Mebeverine	Not known to be harmful; manufacturers advise caution
Mecasermin	Manufacturer advises avoid unless essential; contraception advised in women of childbearing potential
Mecysteine	Manufacturer advises avoid
Medroxyprogesterone	Avoid—genital malformations and cardiac defects reported with high doses; *see also* Contraceptives, hormonal
Mefenamic acid	*see* NSAIDs
Mefloquine (1)	Manufacturer advises teratogenicity in *animal* studies, but *see* p. 360
Melatonin	No information available—manufacturer advises avoid
Meloxicam	*see* NSAIDs
Melphalan	Avoid (manufacturer advises adequate contraception during treatment in men or women); *see also* section 8.1
Memantine	Manufacturer advises avoid unless essential—intra-uterine growth restriction in *animal* studies

Drug (trimester of risk)	Comment
Menadiol (3)	Neonatal haemolytic anaemia, hyperbilirubinaemia and increased risk of kernicterus in jaundiced infants
Menotrophin	Avoid
Meprobamate	Manufacturer advises avoid if possible
Meptazinol	*see* Opioid Analgesics
Mercaptamine	Manufacturer advises avoid
Mercaptopurine	Avoid (teratogenic); *see also* section 8.1
Meropenem	Manufacturer advises use only if potential benefit outweighs risk—no information available
Mesalazine	Negligible quantities cross placenta
Mesna	Not known to be harmful; *see also* section 8.1
Mesterolone	*see* Androgens
Mestranol	*see* Contraceptives, hormonal
Metaraminol	May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk
Metformin	Used in pregnancy for both pre-existing and gestational diabetes—see also p. 381; manufacturer advises avoid
Methadone	*see* Opioid Analgesics
Methocarbamol	Manufacturer advises avoid unless potential benefit outweighs risk
Methotrexate	Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; *see also* section 8.1
Methotrimeprazine	*see* Antipsychotics
Methoxy polyethylene glycol-epoetin beta	No evidence of harm in *animal* studies—manufacturer advises caution
Methyldopa	Not known to be harmful
Methylnaltrexone	Toxicity at high doses in *animal* studies—manufacturer advises avoid unless essential
Methylphenidate	Limited experience—manufacturer advises avoid unless potential benefit outweighs risk; toxicity in *animals*
Methylprednisolone	*see* Corticosteroids
Methysergide	Manufacturer advises avoid
Metoclopramide	Not known to be harmful but manufacturer advises use only when compelling reasons
Metolazone	*see* Diuretics
Metoprolol	*see* Beta-blockers
Metronidazole	Manufacturer advises avoidance of high-dose regimens
Metyrapone	Avoid (may impair biosynthesis of fetal-placental steroids)
Mianserin	*see* Antidepressants, Tricyclic (and related)
Micafungin	Manufacturer advises avoid unless essential—toxicity in *animal* studies
Miconazole	Manufacturer advises avoid if possible—toxicity at high doses in *animal* studies; small amount absorbed from vagina—not known to be harmful (see also section 7.2.2)
Midazolam	*see* Benzodiazepines
Midrid®	Manufacturer advises avoid
Mifepristone	Manufacturer advises that if treatment fails, essential that pregnancy be terminated by another method
Miglustat	Manufacturer advises avoid (toxicity in *animal* studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment
Milrinone	Manufacturer advises use only if potential benefit outweighs risk
Minocycline	*see* Tetracyclines
Minoxidil (3)	Neonatal hirsutism reported
Mirtazapine	Manufacturers advise caution—toxicity in *animal* studies; monitor neonate for withdrawal effects
Misoprostol (1, 2, 3)	Avoid—potent uterine stimulant (has been used to induce abortion) and may be teratogenic
Mitomycin	Avoid (teratogenic in *animal* studies); *see also* section 8.1
Mitotane	Manufacturer advises avoid—women of childbearing age should use effective contraception during and after treatment; *see also* section 8.1
Mitoxantrone (mitozantrone)	Avoid; manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Mitozantrone	*see* Mitoxantrone
Mivacurium	Manufacturer advises avoid—no information available
Mizolastine	Manufacturer advises avoid; *see also* Antihistamines
MMR vaccine, live	*see* Vaccines (live)
Moclobemide	*see* Antidepressants, MAOI
Modafinil	Manufacturer advises avoid
Moexipril	*see* ACE Inhibitors
Montelukast	Manufacturer advises avoid unless essential
Morphine	*see* Opioid Analgesics
Moxifloxacin	*see* Quinolones
Moxisylyte (thymoxamine)	Manufacturer advises avoid
Moxonidine	Manufacturer advises avoid—no information available

Drug (trimester of risk)	Comment
Mupirocin	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Mycophenolate mofetil	Manufacturer advises avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment
Mycophenolic acid	*see* Mycophenolate mofetil
Nabilone	Manufacturer advises avoid unless essential
Nabumetone	*see* NSAIDs
Nadolol	*see* Beta-blockers
Nafarelin	Avoid
Nalidixic acid	*see* Quinolones
Naloxone	Manufacturer advises use only if potential benefit outweighs risk
Naltrexone	Manufacturers advise use only if potential benefit outweighs risk
Nandrolone	*see* Anabolic Steroids
Naproxen	*see* NSAIDs
Naratriptan	*see* $5HT_1$ Agonists
Narcotic analgesics	*see* Opioid Analgesics
Natalizumab	Manufacturer advises avoid unless essential—toxicity in *animal* studies
Nateglinide	Manufacturer advises avoid—toxicity in *animal* studies
Nebivolol	*see* Beta-blockers
Nedocromil	*see* section 3.1
Nefopam	No information available—manufacturer advises avoid unless no safer treatment
Nelarabine	Avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Section 8.1
Nelfinavir	No information available—manufacturer advises use only if potential benefit outweighs risk
Neomycin	*see* Aminoglycosides
Neostigmine	Manufacturer advises use only if potential benefit outweighs risk
Neurokinin receptor antagonists	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Nevirapine	Although manufacturers advise avoid, may be appropriate to use if clearly indicated; *see also* p. 340
Nicardipine	May inhibit labour; manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension
Nicorandil	Manufacturer advises use only if potential benefit outweighs risk—no information available
Nicotine	Use only if smoking cessation without nicotine replacement fails; intermittent therapy preferable but avoid liquorice-flavoured nicotine products
Nicotinic acid	No information available—manufacturer advises avoid unless potential benefit outweighs risk
Nicoumalone	*see* Anticoagulants, Oral
Nifedipine	May inhibit labour; manufacturer advises avoid before week 20; risk to fetus should be balanced against risk of uncontrolled maternal hypertension; use only if other treatment options are not indicated or have failed
Nilotinib	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; *see also* section 8.1
Nimodipine	Manufacturer advises use only if potential benefit outweighs risk
Nitisinone	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies
Nitrazepam	*see* Benzodiazepines
Nitrofurantoin (3)	May produce neonatal haemolysis if used at term
Nitroprusside	*see* Sodium Nitroprusside
Nitrous oxide	*see* Anaesthetics, General
Nizatidine	Manufacturer advises avoid unless essential
Noradrenaline (norepinephrine) (1, 2, 3)	Avoid—may reduce placental perfusion
Norelgestromin	*see* Contraceptives, hormonal
Norethisterone	Masculinisation of female fetuses and other defects reported; *see also* Contraceptives, hormonal
Norfloxacin	*see* Quinolones
Norgestimate	*see* Contraceptives, hormonal
Norgestrel	*see* Contraceptives, hormonal
Nortriptyline	*see* Antidepressants, Tricyclic (and related)
NSAIDs	Most manufacturers advise avoid (or avoid unless potential benefit outweighs risk); ketorolac contra-indicated during pregnancy, labour and delivery; *see also* Celecoxib
(3)	With regular use closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. Delayed onset and increased duration of labour
Nystatin	No information available, but absorption from gastro-intestinal tract negligible

Drug (trimester of risk)	Comment
Octreotide (1, 2, 3)	Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk
Oestrogens	*see* Contraceptives, hormonal
Ofloxacin	*see* Quinolones
Olanzapine (3)	Manufacturer advises use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported
Olmesartan	*As for* ACE inhibitors
Olsalazine	Manufacturer advises avoid unless potential benefit outweighs risk
Omalizumab	Manufacturer advises avoid unless essential; no evidence of teratogenicity in *animal* studies
Omega-3-acid ethyl esters	Manufacturer advises use only if potential benefit outweighs risk—no information available
Omeprazole	Not known to be harmful
Ondansetron	No information available; manufacturer advises avoid unless potential benefit outweighs risk
Opioid analgesics (3)	Depress neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour; *see also* Tramadol
Oral contraceptives	*see* Contraceptives, hormonal
Orlistat	Manufacturer advises caution
Orphenadrine	Manufacturer advises caution
Oseltamivir	Use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 354
Oxaliplatin	Manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men; *see also* section 8.1
Oxazepam	*see* Benzodiazepines
Oxcarbazepine	Risk of teratogenesis including increased risk of neural tube defects; *see also* Antiepileptics
Oxprenolol	*see* Beta-blockers
Oxybutynin	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies
Oxycodone	*see* Opioid Analgesics
Oxytetracycline	*see* Tetracyclines
Paclitaxel	Avoid (toxicity in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Palifermin	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies
Paliperidone	Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies; if discontinuation during pregnancy is necessary, paliperidone should be withdrawn gradually
Palonosetron	Manufacturer advises avoid—no information available
Pamidronate disodium	*see* Bisphosphonates
Pancreatin	Not known to be harmful
Pancuronium	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Panitumumab	Avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for 6 months after treatment; *see also* section 8.1
Pantoprazole	Manufacturer advises avoid unless potential benefit outweighs risk—fetotoxic in *animals*
Papaveretum	*see* Opioid Analgesics
Paracetamol	Not known to be harmful
Paraldehyde	Manufacturer advises avoid unless essential—crosses the placenta
Parecoxib	*see* NSAIDS
Paricalcitol	Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk; *see also* Vitamin D
Paroxetine	*see* Antidepressants, SSRI
Pegaptinib	Manufacturer advises avoid unless potential benefit outweighs risk
Pegfilgrastim	Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk
Peginterferon alfa	manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment
Pemetrexed	Avoid (toxicity in *animal* studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; *see also* section 8.1
Penicillamine (1, 2, 3)	Fetal abnormalities reported rarely; avoid if possible
Penicillins	Not known to be harmful
Pentamidine isetionate	Manufacturer advises avoid unless essential
Pentazocine	*see* Opioid Analgesics

Drug (trimester of risk)	Comment
Pentostatin	Avoid (teratogenic in *animal* studies); manufacturer advises that men should not father children during and for 6 months after treatment; *see also* section 8.1
Pergolide	Manufacturer advises use only if potential benefit outweighs risk
Pericyazine	*see* Antipsychotics
Perindopril	*see* ACE Inhibitors
Perphenazine	*see* Antipsychotics
Pethidine	*see* Opioid Analgesics
Phenelzine	*see* Antidepressants, MAOI
Phenindione	*see* Anticoagulants, Oral
Phenobarbital	Congenital malformations; *see also* Antiepileptics
Phenothiazines	*see* Antipsychotics
Phenoxybenzamine	Hypotension may occur in newborn
Phenoxymethylpenicillin	*see* Penicillins
Phentolamine	Use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia
Phenylephrine	
(1)	Malformations reported
(3)	Avoid if possible—fetal hypoxia and bradycardia reported in late pregnancy and labour
Phenytoin	Congenital malformations; caution in interpreting plasma concentrations—bound may be reduced but free (i.e. effective) unchanged; *see also* Antiepileptics
Pholcodine	*see* Opioid Analgesics
Phytomenadione	Manufacturer advises use only if potential benefit outweighs risk—no specific information available
Pilocarpine	Avoid—smooth muscle stimulant; toxicity in *animal* studies
Pimozide	*see* Antipsychotics
Pindolol	*see* Beta-blockers
Pioglitazone	Manufacturer advises avoid—toxicity in *animal* studies
Piperacillin with tazobactam	Manufacturers advise use only if potential benefit outweighs risk
Piperazine	Not known to be harmful but manufacturer advises avoid in first trimester
Pipotiazine	*see* Antipsychotics
Piracetam	Manufacturer advises avoid
Piroxicam	*see* NSAIDs
Pivmecillinam	*see* Penicillins
Pizotifen	Manufacturer advises avoid unless potential benefit outweighs risk
Podophyllotoxin	Manufacturers advise avoid
Podophyllum	Avoid—neonatal death and teratogenesis have been reported
Polystyrene sulphonate resins	Manufacturers advise use only if potential benefit outweighs risk—no information available
Porfimer	Manufacturer advises avoid unless essential
Posaconazole	Manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment; toxicity in *animal* studies
Povidone–iodine	
(2, 3)	Sufficient iodine may be absorbed to affect the fetal thyroid
Pramipexole	Manufacturer advises use only if potential benefit outweighs risk—no information available
Prasugrel	Manufacturer advises use only if potential benefit outweighs risk
Pravastatin	*see* Statins
Prazosin	*see* Alpha-blockers, Postsynaptic
Prednisolone	*see* Corticosteroids
Pregabalin	Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; *see also* Antiepileptics
Prilocaine	
(3)	Neonatal methaemoglobinaemia reported after paracervical block or pudendal block; *see also* Anaesthetics, Local
Primaquine	
(3)	Neonatal haemolysis and methaemoglobinaemia; *see also* Antimalarials
Primaxin®	Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies)
Primidone	*see* Phenobarbital
Procarbazine	Avoid (teratogenic in *animal* studies and isolated reports in humans); *see also* section 8.1
Prochlorperazine	*see* Antipsychotics
Procyclidine	Manufacturers advise use only if potential benefit outweighs risk
Progesterone	Not known to be harmful
Proguanil	Adequate folate supplements should be given to mother; *see also* Antimalarials
Promazine	*see* Antipsychotics
Promethazine	*see* Antihistamines
Propafenone	Manufacturer advises avoid—no information available
Propantheline	Manufacturer advises avoid—no information available
Propiverine	Manufacturer advises avoid (restriction of skeletal development in *animals*)
Propofol	*see* Anaesthetics, General
Propranolol	*see* Beta-blockers
Propylthiouracil	
(2, 3)	Neonatal goitre and hypothyroidism

Drug (trimester of risk)	Comment
Protionamide	
(1)	May be teratogenic
Pseudoephedrine	Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure
Pyrazinamide	Manufacturer advises use only if potential benefit outweighs risk; *see also* p. 322
Pyridostigmine	Manufacturer advises use only if potential benefit outweighs risk
Pyrimethamine	
(1)	Theoretical teratogenic risk (folate antagonist); adequate folate supplements should be given to mother; *see also* Antimalarials
Pyrimethamine with sulfadoxine	
(1)	Possible teratogenic risk (pyrimethamine a folate antagonist)
(3)	Neonatal haemolysis and methaemoglobinaemia; fear of increased risk of kernicterus in neonates appears to be unfounded
	see also Antimalarials
Quetiapine	Manufacturer advises use only if potential benefit outweighs risk
Quinagolide	Manufacturer advises discontinue when pregnancy confirmed unless medical reason for continuing
Quinapril	*see* ACE Inhibitors
Quinine	
(1)	High doses are teratogenic; but in malaria benefit of treatment outweighs risk
Quinolones	
(1, 2, 3)	Avoid—arthropathy in *animal* studies; safer alternatives available
Quinupristin [ingredient]	*see Synercid*®
Rabeprazole	Manufacturer advises avoid—no information available
Raltegravir	Manufacturer advises avoid—toxicity in *animal* studies
Raltitrexed	Pregnancy must be excluded before treatment; ensure effective contraception during and for at least 6 months after treatment in men or women; *see also* section 8.1
Ramipril	*see* ACE Inhibitors
Ranibizumab	Manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment
Ranitidine	Manufacturer advises avoid unless essential, but not known to be harmful
Ranolazine	Manufacturer advises avoid unless essential—no information available
Rasagiline	Manufacturer advises caution
Rasburicase	Manufacturer advises avoid—no information available
Reboxetine	Manufacturer advises use only if potential benefit outweighs risk—limited information available
Remifentanil	No information available; *see also* Opioid Analgesics
Repaglinide	Manufacturer advises avoid
Reteplase	*see* Fibrinolytics
Riamet®	Toxicity in *animal* studies with artemether; manufacturer advises use only if potential benefit outweighs risk
Ribavirin	Avoid; teratogenicity in *animal* studies; ensure effective contraception during oral administration and for 4 months after treatment in women and for 7 months after treatment in men; *see also* Ribavirin section 5.3.5
Rifabutin	Manufacturer advises avoid—no information available
Rifampicin	
(1)	Manufacturers advise very high doses teratogenic in *animal* studies; *see also* p. 322
(3)	Risk of neonatal bleeding may be increased
Riluzole	No information available; manufacturer advises avoid
Rimonabant	Manufacturer advises avoid
Risedronate sodium	*see* Bisphosphonates
Risperidone	Manufacturer advises use only if potential benefit outweighs risk.
(3)	Extrapyramidal effects reported in neonates
Ritodrine	For use in premature labour *see* section 7.1.3
Ritonavir	Manufacturer advises use only if potential benefit outweighs risk—no information available
Rituximab	Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus—effective contraception required during and for 12 months after treatment
Rivaroxaban	Manufacturer advises avoid—toxicity in *animal* studies
Rivastigmine	Manufacturer advises use only if potential benefit outweighs risk
Rizatriptan	*see* $5HT_1$ Agonists
Rocuronium	Manufacturer advises caution
Ropinirole	
(1)	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies
Ropivacaine	Safety not established but not known to be harmful
Rosiglitazone	Manufacturer advises avoid—toxicity in *animal* studies
Rosuvastatin	*see* Statins

Drug (trimester of risk)	Comment
Rotigotine	Manufacturer advises avoid—no information available
Rufinamide	Manufacturer advises avoid unless potential benefit outweighs risk—fetotoxic in *animal* studies; effective contraception must be used during treatment; *see also* Antiepileptics
Salbutamol	For use in asthma *see* section 3.1
(3)	For use in premature labour *see* section 7.1.3
Salcatonin	*see* Calcitonin (salmon)
Salmeterol	*see* section 3.1
Sapropterin	Manufacturer advises caution—consider only if dietary management inadequate
Saquinavir	Manufacturer advises use only if potential benefit outweighs risk
Selegiline	Manufacturer advises avoid—no information available
Sertindole	Manufacturer advises avoid
Sertraline	*see* Antidepressants, SSRI
Sevelamer	Manufacturer advises use only if potential benefit outweighs risk
Sevoflurane	*see* Anaesthetics, General
Sibutramine	Manufacturer advises avoid—toxicity in *animal* studies
Sildenafil	Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies
Silver sulfadiazine	*see* Sulphonamides
Simvastatin	*see* Statins
Sirolimus	Manufacturer advises avoid (toxicity in *animal* studies); effective contraception must be used during treatment and for 12 weeks after stopping
Sitagliptin	Manufacturer advises avoid—toxicity in *animal* studies
Sitaxentan sodium	Avoid unless essential—toxicity in *animal* studies; manufacturer advises effective contraception during treatment
Sodium aurothiomalate	Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency
Sodium clodronate	*see* Bisphosphonates
Sodium cromoglicate	Not known to be harmful; *see also* section 3.1
Sodium fusidate	Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk
Sodium nitroprusside	Potential for accumulation of cyanide in fetus—avoid prolonged use
Sodium oxybate	Manufacturer advises avoid
Sodium phenylbutyrate	Avoid (toxicity in *animal* studies); manufacturer advises adequate contraception during administration
Sodium stibogluconate	Manufacturer advises use only if potential benefit outweighs risk
Sodium valproate	*see* Valproate
Solifenacin	Manufacturer advises caution—no information available
Somatropin	Discontinue if pregnancy occurs—no information available but theoretical risk
Sorafenib	Manufacturer advises avoid unless essential—toxicity in *animal* studies; *see also* section 8.1
Sotalol	*see* Beta-blockers
Spironolactone	Manufacturers advise toxicity in *animal* studies
Statins	Avoid—congenital anomalies reported; decreased synthesis of cholesterol possibly affects fetal development
Stavudine	Manufacturer advises use only if potential benefit outweighs risk
Streptokinase	*see* Fibrinolytics
Streptomycin	*see* Aminoglycosides
Strontium ranelate	Avoid—toxicity in *animal* studies
Sugammadex	Manufacturer advises caution—no information available
Sulfadiazine	*see* Sulphonamides
Sulfadoxine	*see* Sulphonamides
Sulfasalazine	
(3)	Theoretical risk of neonatal haemolysis; adequate folate supplements should be given to mother
Sulindac	*see* NSAIDs
Sulphonamides	
(3)	Neonatal haemolysis and methaemoglobinaemia; fear of increased risk of kernicterus in neonates appears to be unfounded
Sulphonylureas	Avoid; possible neonatal hypoglycaemia
Sulpiride	Limited experience but no evidence of harm in *animal* studies
Sumatriptan	*see* $5HT_1$ Agonists
Sunitinib	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; *see also* section 8.1
Suxamethonium	Mildly prolonged maternal paralysis may occur
Synercid®	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Tacalcitol	Manufacturer advises avoid unless no safer alternative—no information available; *see also* Vitamin D

Drug (trimester of risk)	Comment
Tacrolimus	Avoid unless potential benefit outweighs risk—risk of premature delivery and hyperkalaemia; toxicity in *animal* studies following systemic administration
Tamoxifen	Avoid—possible effects on fetal development; effective contraception must be used during treatment and for 2 months after stopping
Tazarotene	Avoid; effective contraception required (oral progestogen-only contraceptives not considered effective)
Tazobactam [ingredient]	*see* Piperacillin with tazobactam
Tegafur with uracil	*see Uftoral®*
Teicoplanin	Manufacturer advises use only if potential benefit outweighs risk
Telbivudine	Manufacturer advises use only if potential benefit outweighs risk
Telithromycin	Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk
Telmisartan	*As for* ACE Inhibitors
Temazepam	*see* Benzodiazepines
Temocillin	Temocillin *see* Penicillins
Temoporfin	Toxicity in *animal* studies—manufacturer advises avoid pregnancy for at least 3 months after treatment
Temozolomide	Avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises adequate contraception during treatment; *see also* section 8.1; also men should avoid fathering a child during and for at least 6 months after treatment
Temsirolimus	Manufacturer advises avoid (toxicity in *animal* studies); ensure effective contraception during treatment in men and women; *see also* section 8.1
Tenecteplase	*see* Fibrinolytics
Tenofovir	No information available—manufacturer advises use only if potential benefit outweighs risk
Tenoxicam	*see* NSAIDs
Terazosin	*see* Alpha-blockers, Postsynaptic
Terbinafine	Manufacturer advises use only if potential benefit outweighs risk—no information available
Terbutaline	For use in asthma *see* section 3.1
(3)	For use in premature labour *see* section 7.1.3
Testosterone	*see* Androgens
Tetrabenazine	Inadequate information but no evidence of harm
Tetracosactide	Manufacturer advises avoid (but may be used diagnostically if essential)
Tetracyclines	
(1)	Effects on skeletal development in *animal* studies
(2, 3)	Dental discoloration; maternal hepatotoxicity with large parenteral doses
Thalidomide	Teratogenic risk; effective contraception must be used for at least 1 month before, during, and for at least 1 month after treatment (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended); men should use condoms during treatment and for at least 1 week after stopping
Theophylline	
(3)	Neonatal irritability and apnoea have been reported
Thiazides and related diuretics	Not used to treat gestational hypertension; may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced; stimulation of labour, uterine inertia, and meconium staining also reported
Thiopental	*see* Anaesthetics, General
Thiotepa	Avoid (teratogenic and embryotoxic in *animals*); *see also* section 8.1
Thymoxamine	*see* Moxisylyte
Thyroxine	*see* Levothyroxine
Tiagabine	Manufacturer advises avoid unless potential benefit outweighs risk; *see also* Antiepileptics
Tiaprofenic acid	*see* NSAIDs
Ticarcillin [ingredient]	*see* Penicillins
Tigecycline	*see* Tetracyclines
Tiludronic acid	*see* Bisphosphonates
Timentin®	*see* Penicillins
Timolol	*see* Beta-blockers
Tinidazole	Manufacturer advises avoid in first trimester
Tinzaparin	Not known to be harmful; vials contain benzyl alcohol—manufacturer advises avoid
Tioconazole	Manufacturer advises avoid
Tioguanine	Avoid (teratogenicity reported when men receiving tioguanine have fathered children); ensure effective contraception during treatment in men or women; *see also* section 8.1
Tiotropium	Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk
Tipranavir	Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

Drug (trimester of risk)	Comment
Tirofiban	Manufacturer advises use only if potential benefit outweighs risk—no information available
Tizanidine	Manufacturer advises use only if potential benefit outweighs risk—no information available
Tobramycin	*see* Aminoglycosides
Tocopheryl acetate (1, 2, 3)	No evidence of safety of high doses
Tolbutamide	*see* Sulphonylureas
Tolcapone	Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk
Tolfenamic acid	*see* NSAIDs
Tolterodine	Manufacturer advises avoid—toxicity in *animal* studies
Topiramate	Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; *see also* Antiepileptics
Topotecan	Avoid (teratogenicity and fetal loss in *animal* studies); *see also* section 8.1
Torasemide	*see* Diuretics
Trabectedin	Effective contraception recommended during and for at least 3 months after treatment in women and at least 5 months after treatment in men; *see also* section 8.1
Tramadol	Embryotoxic in animal studies—manufacturers advise avoid; *see also* Opioid Analgesics
Trandolapril	*see* ACE Inhibitors
Tranexamic acid	No evidence of teratogenicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta
Tranylcypromine	*see* Antidepressants, MAOI
Trastuzumab	Avoid unless potential benefit outweighs risk
Travoprost	Manufacturer advises use only if potential benefit outweighs risk
Trazodone	*see* Antidepressants, Tricyclic (and related)
Treosulfan	Avoid; *see also* section 8.1
Tretinoin (1, 2, 3)	Teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective); also avoid topical treatment
Triamcinolone	*see* Corticosteroids
Triamterene	*see* Diuretics
Tribavirin	*see* Ribavirin
Triclofos	Avoid
Trientine	Manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in *animal* studies
Trifluoperazine	*see* Antipsychotics
Trihexyphenidyl	Manufacturer advises use only if potential benefit outweighs risk
Trilostane (1, 2, 3)	Interferes with placental sex hormone production
Trimeprazine	*see* Antihistamines
Trimethoprim (1)	Teratogenic risk (folate antagonist); manufacturers advise avoid
Trimipramine	*see* Antidepressants, Tricyclic (and related)
Tripotassium dicitratobismuthate	Manufacturer advises avoid on theoretical grounds
Triptorelin	Manufacturers advise avoid
Trospium	Manufacturer advises caution—no information available
Tryptophan	No information available
Uftoral®	Avoid; manufacturer advises effective contraception during and for 3 months after treatment in men or women
Urokinase	*see* Fibrinolytics
Ursodeoxycholic acid	No evidence of harm but manufacturer advises avoid
Ustekinumab	Avoid; manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment
Vaccines (live)	Theoretical risk of fetal infection, but need for vaccination may outweigh possible risk to fetus (*see also* p. 670); avoid MMR vaccine, live and see, p. 683; avoid varicella–zoster vaccine, see p. 689; *see also* yellow fever vaccine (live), p. 690
Valaciclovir	*see* Aciclovir
Valganciclovir	*see* Ganciclovir
Valproate (1, 3)	Increased risk of congenital malformations and developmental delay (counselling and screening advised—**important:** *see also* Antiepileptics and p. 253); neonatal bleeding (related to hypofibrinaemia) and neonatal hepatotoxicity also reported
Valproic acid	*see* Valproate
Valsartan	*As for* ACE Inhibitors
Vancomycin	Manufacturer advises use only if potential benefit outweighs risk—plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity
Varenicline	Manufacturer advises avoid—toxicity in *animal* studies

Drug (trimester of risk)	Comment
Varicella-zoster vaccine	*see* Vaccines (live)
Vasopressin	Oxytocic effect in third trimester
Vecuronium	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Venlafaxine	Manufacturer advises avoid unless potential benefit outweighs risk; risk of withdrawal effects in neonate
Verapamil	May reduce uterine blood flow with fetal hypoxia; manufacturer advises avoid in first trimester unless absolutely necessary; may inhibit labour
Verteporfin	Manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal* studies)
Vigabatrin	Congenital anomalies reported—manufacturer advises avoid unless potential benefit outweighs risk; *see also* Antiepileptics
Vildagliptin	Manufacturer advises avoid—toxicity in *animal* studies
Vinblastine	Avoid (limited experience suggests fetal harm; teratogenic in *animal* studies); *see also* section 8.1
Vincristine	Avoid (teratogenicity and fetal loss in *animal* studies); *see also* section 8.1
Vindesine	Avoid (teratogenic in *animal* studies); *see also* section 8.1
Vinorelbine	Avoid (teratogenicity and fetal loss in *animal* studies); *see also* section 8.1
Vitamin A (1)	Excessive doses may be teratogenic; *see also* p. 547
Vitamin D	High systemic doses teratogenic in *animals* but therapeutic doses unlikely to be harmful; avoid *topical* calcitriol—use in restricted amounts if clearly necessary (significant systemic absorption; monitor urine and plasma-calcium concentration); *see also* Calcipotriol, Paricalcitol, and Tacalcitol
Voriconazole	Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment
Warfarin	*see* Anticoagulants, Oral
Xipamide	*see* Diuretics
Yellow fever vaccine, live	*see* Vaccines (live)
Zafirlukast	Manufacturer advises use only if potential benefit outweighs risk
Zaleplon	Use only if necessary and restrict to occasional short-term use; risk of withdrawal symptoms in neonate if used in late pregnancy
Zanamivir	Use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 354
Zidovudine	Limited information available; manufacturer advises use only if clearly indicated; *see also* p. 340
Zinc acetate	Usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion
Zinc sulphate	Safety not established—crosses placenta
Zoledronic acid	Manufacturer advises avoid—toxicity in *animal* studies
Zolmitriptan	*see* $5HT_1$ Agonists
Zolpidem	*see* Benzodiazepines
Zonisamide	Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk—effective contraception required during and for 4 weeks after treatment; *see also* Antiepileptics
Zopiclone	*see* Benzodiazepines
Zotepine	Manufacturer advises avoid unless potential benefit outweighs risk
Zuclopenthixol	*see* Antipsychotics

A5 Breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital) while others can affect lactation (e.g. bromocriptine)

The following table identifies drugs:

- that should be used with caution or are contra-indicated in breast-feeding;
- that can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
- that might be present in milk in significant amount but are not known to be harmful.

For many drugs insufficient evidence is available to provide guidance and it is advisable to use only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence from the table does not imply safety.

Table of drugs present in breast milk

Products introduced or amended since publication of BNF No. 57 (March 2009) are underlined.

Drug	Comment
Abacavir	Breast-feeding not advised in HIV infection
Abatacept	Present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose
Abciximab	Manufacturer advises avoid—no information available
Acamprosate	Manufacturer advises avoid
Acarbose	Manufacturer advises avoid
Acebutolol	*see* Beta-blockers
Aceclofenac	Manufacturer advises avoid—no information available
Acemetacin	Manufacturer advises avoid
Acenocoumarol (nicoumalone)	*see* Anticoagulants, Oral
Acetazolamide	Amount too small to be harmful
Aciclovir	Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution
Acipimox	Manufacturer advises avoid
Acitretin	Avoid
Adalimumab	Avoid; manufacturer advises avoid for at least 5 months after last dose
Adapalene	Manufacturer advises avoid (if used, avoid application to chest)—no information available
Adefovir dipivoxil	Manufacturer advises avoid—no information available
Agalsidase	Use with caution—no information available
Agomelatine	Manufacturer advises avoid—present in milk in *animal* studies
Alcohol	Large amounts may affect infant and reduce milk consumption
Alemtuzumab	Avoid; manufacturer advises avoid breast-feeding for at least 4 weeks after administration
Alendronic acid	No information available
Alfacalcidol	*see* Vitamin D
Alfentanil	Present in milk—manufacturer advises withhold breast-feeding for 24 hours
Alglucosidase alfa	Manufacturer advises avoid—no information available
Alimemazine (trimeprazine)	*see* Antihistamines

Drug	Comment
Aliskiren	Present in milk in *animal* studies—manufacturer advises avoid
Alitretinoin	Manufacturer advises avoid
Allopurinol	Present in milk—not known to be harmful
Almotriptan	Present in milk in *animal* studies—withhold breast-feeding for 24 hours
Alprazolam	*see* Benzodiazepines
Alverine	Manufacturer advises avoid—little information available
Amantadine	Avoid; present in milk; toxicity in infant reported
Ambrisentan	Manufacturer advises avoid—no information available
Amfebutamone	*see* Bupropion
Amiloride	Manufacturer advises avoid—no information available
Aminophylline	*see* Theophylline
Amiodarone	Avoid; present in milk in significant amounts; theoretical risk from release of iodine; *see also* Iodine
Amisulpride	Manufacturer advises avoid—no information available
Amitriptyline	*see* Antidepressants, Tricyclic (and related)
Amlodipine	Manufacturer advises avoid—no information available
Amobarbital	*see* Barbiturates
Amorolfine	Manufacturer advises avoid—no information available
Amoxicillin	*see* Penicillins
Amphetamines	Significant amount in milk. Avoid
Amphotericin	No information available
Ampicillin	*see* Penicillins
Amsacrine	*see* Cytotoxic Drugs
Anagrelide	Manufacturer advises avoid—no information available
Anakinra	Manufacturer advises avoid—no information available
Analgesics	*see* Aspirin, NSAIDs, Opioid Analgesics and Paracetamol
Androgens	Avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation
Anidulafungin	Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies
Anticoagulants, oral	Risk of haemorrhage; increased by vitamin-K deficiency; warfarin appears safe but phenindione should be avoided; manufacturer of acenocoumarol (nicoumalone) recommends prophylactic vitamin K for the infant (consult product literature); *see also* Dabigatran Etexilate and Rivaroxaban
Antidepressants, SSRI	*see* individual entries
Antidepressants, tricyclic (and related)	Amount of tricyclic antidepressants (including related drugs such as mianserin and trazodone) too small to be harmful but most manufacturers advise avoid; accumulation of doxepin metabolite may cause sedation and respiratory depression
Antihistamines	Significant amount of some antihistamines present in milk; although not known to be harmful, manufacturers of alimemazine, cetirizine, cinnarizine, cyproheptadine, desloratadine, dimenhydrinate, fexofenadine, hydroxyzine, loratadine, and mizolastine advise avoid; manufacturer of ketotifen advises avoid; adverse effects in infant reported with clemastine
Antipsychotics	Although amount present in milk probably too small to be harmful, *animal* studies indicate possible adverse effects of these drugs on developing nervous system therefore avoid unless absolutely necessary; *see also* Amisulpride, Chlorpromazine, Clozapine, Droperidol, Olanzapine, Paliperidone, Quetiapine, Risperidone, Sertindole, Sulpiride, Zotepine
Antithymocyte immunoglobulin	Manufacturer advises avoid—no information available
Apomorphine	Manufacturer advises avoid—no information available
Aprepitant	*see* Neurokinin Receptor Antagonists
Aripiprazole	Manufacturer advises avoid—present in milk in *animal* studies
Arsenic trioxide	*see* Cytotoxic Drugs
Artemether [ingredient]	*see Riamet®*
Aspirin	Avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low
Atazanavir	Breast-feeding not advised in HIV infection
Atenolol	*see* Beta-blockers
Atomoxetine	Manufacturer advises avoid—present in milk in *animal* studies
Atorvastatin	*see* Statins
Atosiban	Small amounts present in milk
Atovaquone	Manufacturer advises avoid; for malaria prophylaxis or treatment *see Malarone®*
Atracurium	Breast-feeding unlikely to be harmful following recovery from neuromuscular block; some manufacturers advise avoiding breast-feeding for 24 hours after administration

Drug	Comment
Atropine	Small amount present in milk—manufacturer advises caution
Auranofin	Present in milk; manufacturer advises avoid
Azacitidine	*see* Cytotoxic Drugs
Azapropazone	Small amount present in milk—manufacturer advises avoid
Azathioprine	Teratogenic metabolite present in milk in low concentration but no evidence of harm in small studies—consider if potential benefit outweighs risk
Azithromycin	Present in milk; use only if no suitable alternative
Aztreonam	Amount probably too small to be harmful—manufacturer advises avoid
Baclofen	Amount too small to be harmful
Balsalazide	Manufacturer advises avoid
Barbiturates	Avoid if possible (*see also* Phenobarbital); large doses may produce drowsiness
Basiliximab	Avoid
Beclometasone	*see* Corticosteroids
Bemiparin	Manufacturer advises avoid—no information available
Bendrofluazide	*see* Thiazides and Related Diuretics
Bendroflumethiazide (bendrofluazide)	*see* Thiazides and Related Diuretics
Benperidol	*see* Antipsychotics
Benzodiazepines	Present in milk—avoid if possible; *see also* Midazolam
Benzylpenicillin	*see* Penicillins
Beta-blockers	Monitor infant; possible toxicity due to beta-blockade but amount of most beta-blockers present in milk too small to affect infant; acebutolol, atenolol, nadolol, and sotalol are present in greater amounts than other beta-blockers; manufacturers advise avoid celiprolol and nebivolol
Betaine	Manufacturer advises caution—no information available
Betamethasone	*see* Corticosteroids
Bethanechol	Manufacturer advises avoid
Bevacizumab	Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment
Bexarotene	*see* Cytotoxic Drugs
Bezafibrate	Manufacturer advises avoid—no information available
Bimatoprost	Manufacturer advises avoid
Bisoprolol	*see* Beta-blockers
Bivalirudin	Manufacturer advises caution—no information available
Bleomycin	*see* Cytotoxic Drugs
Bortezomib	*see* Cytotoxic Drugs
Bosentan	Manufacturer advises avoid—no information available
Botulinum toxin	Manufacturers advise avoid (or avoid unless essential)—no information available
Bromocriptine	Suppresses lactation
Buclizine	*see* Antihistamines
Budesonide	*see* Corticosteroids
Bumetanide	Manufacturer advises avoid if possible—no information available
Bupivacaine	Amount too small to be harmful
Buprenorphine	Avoid unless essential—may inhibit lactation; manufacturer advises contra-indicated in the treatment of opioid dependence
Bupropion	Present in milk—manufacturer advises avoid
Buserelin	Small amount present in milk—manufacturer advises avoid
Buspirone	Manufacturer advises avoid
Busulfan	*see* Cytotoxic Drugs
Butobarbital	*see* Barbiturates
C1-esterase inhibitor	Manufacturer advises use only if potential benefit outweighs risk—no information available
Cabergoline	Suppresses lactation
Caffeine	Regular intake of large amounts can affect infant
Calciferol	*see* Vitamin D
Calcipotriol	No information available; *see also* Vitamin D
Calcitonin (salmon) (salcatonin)	Avoid; inhibits lactation in *animals*
Calcitriol	*see* Vitamin D
Calcium folinate	Manufacturer advises caution—no information available
Calcium levofolinate	*see* Calcium Folinate
Candesartan	Avoid—no information available
Capecitabine	Discontinue breast-feeding
Capreomycin	Manufacturer advises caution—no information available
Captopril	Avoid in first few weeks after delivery—risk of profound neonatal hypotension; can be used when infant is older if essential but monitor infant's blood pressure
Carbamazepine	Amount probably too small to be harmful
Carbimazole	Amounts in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used (*see also* section 6.2.2)
Carbocisteine	No information available
Carboplatin	*see* Cytotoxic Drugs
Carglumic acid	Manufacturer advises avoid—present in milk in *animal* studies
Carisoprodol	Concentrated in milk; no adverse effects reported but best avoided
Carmustine	*see* Cytotoxic Drugs
Carvedilol	*see* Beta-blockers
Caspofungin	Present in milk in *animal* studies—manufacturer advises avoid
Cefaclor	Present in milk in low concentration

Drug	Comment
Cefadroxil	Present in milk in low concentration
Cefalexin	Present in milk in low concentration
Cefixime	Manufacturer advises avoid—no information available
Cefotaxime	Present in milk in low concentration
Cefpodoxime	Present in milk in low concentration
Cefradine	Present in milk in low concentration
Ceftazidime	Present in milk in low concentration
Ceftriaxone	Present in milk in low concentration
Cefuroxime	Present in milk in low concentration
Celecoxib	Manufacturer advises avoid—present in milk in *animal* studies
Celiprolol	*see* Beta-blockers
Cetirizine	*see* Antihistamines
Cetrorelix	Manufacturer advises avoid
Cetuximab	Manufacturer advises avoid breast-feeding during and for 2 months after treatment—no information available
Chloral hydrate	Sedation in infant—manufacturer advises avoid
Chlorambucil	*see* Cytotoxic Drugs
Chloramphenicol	Use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'
Chlordiazepoxide	*see* Benzodiazepines
Chloroquine	Amount probably too small to be harmful when used for malaria prophylaxis; inadequate for reliable protection against malaria, *see* section 5.4.1; avoid breast-feeding when used for rheumatic diseases
Chlorphenamine (chlorpheniramine)	*see* Antihistamines
Chlorpheniramine	*see* Antihistamines
Chlorpromazine	Drowsiness in infant reported; *see* Antipsychotics
Chlorpropamide	*see* Sulphonylureas
Chlortalidone	*see* Thiazides and Related Diuretics
Ciclesonide	*see* Corticosteroids
Ciclosporin	Present in milk—manufacturer advises avoid
Cidofovir	Manufacturer advises avoid
Cilastatin [ingredient]	*see Primaxin®*
Cilazapril	Avoid—no information available
Cilostazol	Present in milk in *animal* studies—manufacturer advises avoid
Cimetidine	Significant amount—not known to be harmful but manufacturer advises avoid
Cinacalcet	Manufacturer advises avoid—present in milk in *animal* studies
Cinnarizine	*see* Antihistamines
Ciprofibrate	Manufacturer advises avoid—present in milk in *animal* studies
Ciprofloxacin	Amount probably too small to be harmful but manufacturer advises avoid
Cisatracurium	No information available
Cisplatin	*see* Cytotoxic Drugs
Citalopram	Present in milk—manufacturer advises avoid
Cladribine	*see* Cytotoxic Drugs
Clarithromycin	Manufacturer advises avoid unless potential benefit outweighs risk—present in milk
Clavulanic acid [ingredient]	see Co-amoxiclav, *Timentin®*
Clemastine	*see* Antihistamines
Clindamycin	Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant
Clobazam	*see* Benzodiazepines
Clodronate sodium	*see* Sodium Clodronate
Clofarabine	*see* Cytotoxic Drugs
Clofazimine	May alter colour of milk; skin discoloration of infant
Clomethiazole	Amount too small to be harmful
Clomifene	May inhibit lactation
Clomipramine	*see* Antidepressants, Tricyclic (and related)
Clonazepam	*see* Benzodiazepines
Clonidine	Present in milk—manufacturer advises avoid
Clopidogrel	Manufacturer advises avoid
Clozapine	Manufacturer advises avoid
Co-amoxiclav	*see* Penicillins
Co-beneldopa	*see* Levodopa
Co-careldopa	*see* Levodopa
Co-danthramer	Manufacturer advises avoid—limited information available
Co-danthrusate	Manufacturer advises avoid—limited information available
Codeine	Amount usually too small to be harmful; however mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant
Co-fluampicil	*see* Penicillins
Colchicine	Present in milk but no adverse effects reported; manufacturers advise avoid because of risk of cytotoxicity
Colecalciferol	*see* Vitamin D
Colesevelam	Use with caution—drug not absorbed but may cause fat-soluble vitamin deficiency on prolonged use
Colestipol	Use with caution—drug not absorbed but may cause fat-soluble vitamin deficiency on prolonged use
Colestyramine	Use with caution—drug not absorbed but may cause fat-soluble vitamin deficiency on prolonged use

Drug	Comment
Colistin	Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk)
Contraceptives, hormonal	Avoid combined hormonal contraceptives until weaning or for 6 months after birth (adverse effects on lactation); progestogen-only contraceptives do not affect lactation (start 3 weeks after birth or later)
Corticosteroids	Systemic effects in infant unlikely with maternal dose of prednisolone up to 40 mg daily; monitor infant's adrenal function with higher doses—the amount of inhaled drugs in breast milk is probably too small to be harmful
Cortisone acetate	*see* Corticosteroids
Co-trimoxazole	Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole)
Crisantaspase	*see* Cytotoxic Drugs
Cromoglicate	*see* Sodium Cromoglicate
Cyclopenthiazide	*see* Thiazides and Related Diuretics
Cyclophosphamide	Discontinue breast-feeding during and for 36 hours after stopping treatment
Cycloserine	Amount too small to be harmful
Cyclosporin	*see* Ciclosporin
Cyproheptadine	*see* Antihistamines
Cyproterone	Caution; possibility of antiandrogen effects in neonate
Cytarabine	*see* Cytotoxic Drugs
Cytotoxic drugs	Discontinue breast-feeding; *see also* Azathioprine, Natalizumab, Nilotinib, Panitumumab, Rituximab, and Trabectedin
Dabigatran etexilate	Manufacturer advises avoid—no information available
Dacarbazine	*see* Cytotoxic Drugs
Dactinomycin	*see* Cytotoxic Drugs
Dalfopristin [ingredient]	*see Synercid®*
Dalteparin	No information available
Danaparoid	Amount probably too small to be harmful but manufacturer advises avoid
Danazol	No data available but avoid because of possible androgenic effects in infant
Dantrolene	Present in milk—manufacturer advises avoid use in chronic spasticity; use only for malignant hyperthermia if potential benefit outweighs risk
Dantron (danthron)	*see* Co-danthramer, Co-danthrusate
Dapsone	Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient
Daptomycin	Manufacturer advises avoid—no information available
Darbepoetin	Manufacturer advises avoid—no information available
Darifenacin	Present in milk in *animal* studies—manufacturer advises caution
Darunavir	Breast-feeding not advised in HIV infection
Dasatinib	*see* Cytotoxic Drugs
Daunorubicin	*see* Cytotoxic Drugs
Deferasirox	Manufacturer advises avoid—present in milk in *animal* studies
Deferiprone	Manufacturer advises avoid—no information available
Deflazacort	*see* Corticosteroids
Demeclocycline	*see* Tetracyclines
Desferrioxamine	Manufacturer advises use only if potential benefit outweighs risk—no information available
Desflurane	Manufacturer advises avoid—no information available
Desloratadine	*see* Antihistamines
Desmopressin	Not known to be harmful
Desogestrel	*see* Contraceptives, hormonal
Dexamethasone	*see* Corticosteroids
Dexamfetamine	*see* Amphetamines
Dexibuprofen	Present in milk—but risk to infant minimal
Dexketoprofen	Manufacturer advises avoid—no information available
Dexrazoxane	*see* Cytotoxic Drugs
Diamorphine	Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring
Diazepam	*see* Benzodiazepines
Diclofenac	Amount too small to be harmful
Dicycloverine	Avoid—present in milk; apnoea reported in infant
Didanosine	Breast-feeding not advised in HIV infection
Digoxin	Amount too small to be harmful
Dihydrocodeine	Manufacturer advises use only if potential benefit outweighs risk
Dihydrotachysterol	*see* Vitamin D
Diloxanide	Manufacturer advises avoid
Diltiazem	Significant amount present in milk—no evidence of harm but avoid unless no safer alternative
Dimenhydrinate	*see* Antihistamines
Dipyridamole	Small amount present in milk—manufacturer advises caution
Disodium etidronate	No information available
Disodium pamidronate	Manufacturer advises avoid
Disopyramide	Present in milk—use only if essential and monitor infant for antimuscarinic effects
Distigmine	Manufacturer advises avoid—no information available

Drug	Comment
Disulfiram	Manufacturer advises avoid—no information available
Docetaxel	*see* Cytotoxic Drugs
Docusate sodium	Present in milk following oral administration—manufacturer advises caution; rectal administration not known to be harmful
Dolasetron	Not known to be harmful but manufacturer advises avoid
Domperidone	Amount probably too small to be harmful
Donepezil	Manufacturer advises avoid—no information available
Doripenem	Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies
Dornase alfa	Amount probably too small to be harmful—manufacturer advises caution
Dosulepin (dothiepin)	*see* Antidepressants, Tricyclic (and related)
Dothiepin	*see* Antidepressants, Tricyclic (and related)
Doxazosin	Accumulates in milk—manufacturer advises avoid
Doxepin	*see* Antidepressants, Tricyclic (and related)
Doxorubicin	*see* Cytotoxic Drugs
Doxycycline	*see* Tetracyclines
Droperidol	Limited information available—manufacturer advises avoid repeated administration
Drospirenone	*see* Contraceptives, hormonal
Drotrecogin alfa (activated)	Manufacturer advises avoid—no information available
Duloxetine	Present in milk—manufacturer advises avoid
Dydrogesterone	Present in milk—no adverse effects reported
Eculizumab	No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment
Edrophonium	Amount probably too small to be harmful
Efavirenz	Breast-feeding not advised in HIV infection
Eflornithine	Manufacturer advises avoid—no information available
Eletriptan	Present in milk—avoid breast-feeding for 24 hours
Emtricitabine	Breast-feeding not advised in HIV infection
Enalapril	Avoid in first few weeks after delivery—risk of profound neonatal hypotension; can be used when infant is older if essential but monitor infant's blood pressure
Enfuvirtide	Breast-feeding not advised in HIV infection
Enoxaparin	Manufacturer advises avoid—no information available
Enoximone	Manufacturer advises caution—no information available
Entacapone	Manufacturer advises avoid—present in milk in *animal* studies
Entecavir	Manufacturer advises avoid—present in milk in *animal* studies
Ephedrine	Irritability and disturbed sleep reported
Epinastine	Present in milk in *animal* studies—manufacturer advises caution
Epirubicin	*see* Cytotoxic Drugs
Eplerenone	Manufacturer advises use only if potential benefit outweighs risk
Epoetin	Unlikely to be present in milk; minimal effect on infant
Eprosartan	Avoid—no information available
Eptifibatide	No information available—manufacturer advises avoid
Erdosteine	Manufacturer advises avoid—no information available
Ergocalciferol	*see* Vitamin D
Ergotamine	Avoid; ergotism may occur in infant; repeated doses may inhibit lactation
Erlotinib	Manufacturer advises avoid—no information available
Ertapenem	Present in milk—manufacturer advises avoid
Erythromycin	Only small amounts in milk—not known to be harmful
Escitalopram	Present in milk; manufacturer advises avoid
Esmolol	*see* Beta-blockers
Esomeprazole	Manufacturer advises avoid—no information available
Estradiol	*see* Oestrogens
Etamsylate	Significant amount but not known to be harmful
Etanercept	Manufacturer advises avoid—present in milk in *animal* studies
Ethambutol	Amount too small to be harmful
Ethinylestradiol	*see* Oestrogens
Ethosuximide	Present in milk but unlikely to be harmful; manufacturer advises avoid
Etidronate disodium	*see* Disodium Etidronate
Etodolac	Manufacturer advises avoid—no information available
Etomidate	Avoid breast-feeding for 24 hours after administration
Etonogestrel	*see* Contraceptives, hormonal
Etoposide	*see* Cytotoxic Drugs
Etoricoxib	Manufacturer advises avoid—present in milk in *animal* studies
Etravirine	Breast-feeding not advised in HIV infection
Etynodiol	*see* Contraceptives, hormonal
Exenatide	Manufacturer advises avoid—no information available
Ezetimibe	Present in milk in *animal* studies—manufacturer advises avoid
Famciclovir	Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies

Drug	Comment
Famotidine	Present in milk—not known to be harmful but manufacturer advises avoid
Felodipine	Present in milk
Fenbufen	Small amount present in milk—manufacturer advises avoid
Fenofibrate	Manufacturer advises avoid—no information available
Fenoprofen	Amount too small to be harmful
Fentanyl	Amount too small to be harmful
Fesoterodine	Manufacturer advises avoid—no information available
Fexofenadine	*see* Antihistamines
Filgrastim	No information available—manufacturer advises avoid
Flavoxate	Manufacturer advises caution—no information available
Flecainide	Significant amount present in milk but not known to be harmful
Flucloxacillin	*see* Penicillins
Fluconazole	Present in milk but amount probably too small to be harmful
Flucytosine	Manufacturer advises avoid
Fludarabine	*see* Cytotoxic Drugs
Fludrocortisone	see Corticosteroids
Fluorouracil	*see* Cytotoxic Drugs
Fluoxetine	Present in milk—manufacturer advises avoid
Flupentixol	see Antipsychotics
Fluphenazine	*see* Antipsychotics
Flurazepam	*see* Benzodiazepines
Flurbiprofen	Amount too small to be harmful
Fluticasone	*see* Corticosteroids
Fluvastatin	*see* Statins
Fluvoxamine	Present in milk—manufacturer advises avoid
Follitropin alfa and beta	Avoid
Fomepizole	Manufacturer advises caution—no information available
Fondaparinux	Present in milk in *animal* studies—manufacturer advises avoid
Formoterol (eformoterol)	Amount in milk probably too small to be harmful but manufacturers advise avoid
Fosamprenavir	Breast-feeding not advised in HIV infection
Fosaprepitant	*see* Neurokinin Receptor Antagonists
Foscarnet	Avoid—present in milk in *animal* studies
Fosinopril	Avoid—present in milk
Fosphenytoin	*see* Phenytoin
Frovatriptan	Present in milk in *animal* studies—withhold breast-feeding for 24 hours
Frusemide	*see* Furosemide
Fulvestrant	Manufacturer advises avoid—present in milk in *animal* studies

Drug	Comment
Furosemide (frusemide)	Amount too small to be harmful; may inhibit lactation
Fusidic acid	*see* Sodium Fusidate
Gabapentin	Present in milk—manufacturer advises use only if potential benefit outweighs risk
Galantamine	Manufacturer advises avoid—no information available
Galsulfase	Manufacturer advises avoid—no information available
Ganciclovir	Avoid—no information available
Ganirelix	Manufacturer advises avoid—no information available
Gemcitabine	*see* Cytotoxic Drugs
Gemfibrozil	Manufacturer advises avoid—no information available
Gestodene	*see* Contraceptives, hormonal
Gestrinone	Manufacturer advises avoid
Glatiramer	Manufacturer advises caution—no information available
Glibenclamide	*see* Sulphonylureas
Gliclazide	*see* Sulphonylureas
Glimepiride	*see* Sulphonylureas
Glipizide	*see* Sulphonylureas
Glucosamine	Manufacturer advises avoid—no information available
Glyceryl trinitrate	No information available—manufacturers advise use only if potential benefit outweighs risk
Goserelin	Manufacturer advises avoid
Granisetron	Not known to be harmful but manufacturer advises avoid
Griseofulvin	Avoid—no information available
Haem arginate	Manufacturer advises avoid unless essential—no information available
Haloperidol	*see* Antipsychotics
Halothane	Present in milk—withhold breast-feeding for 24 hours after termination of anaesthesia
Heparin	Not excreted into milk due to high molecular weight
Hepatitis A vaccine	No information available
Human menopausal gonadotrophins	Avoid
Hydralazine	Present in milk but not known to be harmful; monitor infant
Hydrochlorothiazide	*see* Thiazides and Related Diuretics
Hydrocortisone	*see* Corticosteroids
Hydroflumethiazide	*see* Thiazides and Related Diuretics
Hydromorphone	Manufacturer advises avoid—no information available
Hydroxocobalamin	Present in milk but not known to be harmful
Hydroxycarbamide (hydroxyurea)	*see* Cytotoxic Drugs
Hydroxychloroquine	Avoid—risk of toxicity in infant
Hydroxyurea	*see* Cytotoxic Drugs
Hydroxyzine	*see* Antihistamines
Hyoscine	Amount too small to be harmful

Drug	Comment
Ibandronic acid	Manufacturer advises avoid—present in milk in *animal* studies
Ibuprofen	Amount too small to be harmful but some manufacturers advise avoid (including topical use)
Icatibant	Manufacturer advises avoid in breast-feeding for 12 hours after administration
Idarubicin	*see* Cytotoxic Drugs
Idoxuridine	May make milk taste unpleasant
Idursulfase	No information available
Ifosfamide	*see* Cytotoxic Drugs
Iloprost	Manufacturer advises avoid—no information available
Imatinib	*see* Cytotoxic Drugs
Imidapril	Avoid—no information available
Imiglucerase	No information available
Imipenem [ingredient]	*see Primaxin®*
Imipramine	*see* Antidepressants, Tricyclic (and related)
Imiquimod	Manufacturer advises no information available
Indapamide	Present in milk—manufacturer advises avoid
Indinavir	Breast-feeding not advised in HIV infection
Indometacin	Amount probably too small to be harmful but convulsions reported in one infant—manufacturers advise avoid
Infliximab	Amount probably too small to be harmful
Influenza vaccine	Not known to be harmful
Interferons	Manufacturers advise avoid—no information available
Iodine and iodides	Stop breast-feeding; danger of neonatal hypothyroidism or goitre; appears to be concentrated in milk; *see also* Povidone–iodine
Iodine, radioactive	Breast-feeding contra-indicated after therapeutic doses. With diagnostic doses withhold breast-feeding for at least 24 hours
Ipratropium	Amount probably too small to be harmful
Irbesartan	Avoid—no information available
Irinotecan	*see* Cytotoxic Drugs
Isoflurane	Manufacturer advises avoid—withhold breast-feeding for at least 12 hours after termination of anaesthesia
Isoniazid	Monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother and infant
Isosorbide dinitrate	No information available—manufacturers advise use only if potential benefit outweighs risk
Isosorbide mononitrate	No information available—manufacturers advise use only if potential benefit outweighs risk
Isotretinoin	Avoid
Isradipine	Manufacturer advises avoid—present in milk in *animal* studies
Itraconazole	Small amounts present in milk—may accumulate; manufacturer advises avoid
Ivabradine	Present in milk in *animal* studies—manufacturer advises avoid
Kaletra®	Breast-feeding not advised in HIV infection
Ketoconazole	Manufacturer advises avoid
Ketoprofen	Amount probably too small to be harmful but manufacturer advises avoid unless essential
Ketorolac	Amount too small to be harmful but manufacturer advises avoid
Ketotifen	*see* Antihistamines
Labetalol	*see* Beta-blockers
Lacidipine	Manufacturer advises avoid—no information available
Lacosamide	Manufacturer advises avoid—present in milk in *animal* studies
Lamivudine	Present in milk—manufacturer advises avoid; breast-feeding not advised in HIV infection
Lamotrigine	Present in milk but limited data suggest no harmful effects on infants
Lanreotide	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Lansoprazole	Manufacturer advises avoid unless essential—present in milk in *animal* studies
Lanthanum	Manufacturer advises caution—no information available
Lapatinib	*see* Cytotoxic Drugs
Laronidase	Manufacturer advises avoid—no information available
Latanoprost	May be present in milk—manufacturer advises avoid
Leflunomide	Present in milk in *animal* studies—manufacturer advises avoid
Lenalidomide	Manufacturer advises discontinue breast-feeding—no information available
Lenograstim	Manufacturer advises avoid—no information available
Lepirudin	Avoid
Lercanidipine	Manufacturer advises avoid
Letrozole	Manufacturer advises avoid
Leuprorelin	Manufacturer advises avoid
Levetiracetam	Present in milk—manufacturer advises avoid
Levobupivacaine	Likely to be present in milk but risk to infant minimal
Levocetirizine	*see* Antihistamines

Drug	Comment
Levodopa	May suppress lactation; present in milk—manufacturers advise avoid
Levofloxacin	Manufacturer advises avoid
Levomepromazine (methotrimeprazine)	*see* Antipsychotics
Levonorgestrel	*see* Contraceptives, hormonal
Levothyroxine (thyroxine)	Amount too small to affect tests for neonatal hypothyroidism
Lidocaine (lignocaine)	Amount too small to be harmful
Lignocaine	*see* Lidocaine
Linezolid	Manufacturer advises avoid—present in milk in *animal* studies
Liothyronine	Amount too small to affect tests for neonatal hypothyroidism
Lisinopril	Avoid—no information available
Lithium salts	Present in milk and risk of toxicity in infant—manufacturers advise avoid
Lofepramine	*see* Antidepressants, Tricyclic (and related)
Lofexidine	Manufacturer advises use only if potential benefit outweighs risk—no information available
Loperamide	Amount probably too small to be harmful
Lopinavir [ingredient]	*see Kaletra®*
Loprazolam	*see* Benzodiazepines
Loratadine	*see* Antihistamines
Lorazepam	*see* Benzodiazepines
Lormetazepam	*see* Benzodiazepines
Losartan	Avoid—no information available
Lumefantrine [ingredient]	*see Riamet®*
Lymecycline	*see* Tetracyclines
Macrogols	Manufacturers advise use only if essential—no information available
Malarone®	Use only if no suitable alternative available; *see also* p. 360
Mannitol	Manufacturer advises avoid unless essential—no information available
Maraviroc	Breast-feeding not advised in HIV infection
Mebendazole	Amount too small to be harmful but manufacturer advises avoid
Mecysteine	Manufacturer advises avoid
Medroxyprogesterone	Present in milk—no adverse effects reported; *see also* Contraceptives, hormonal
Mefenamic acid	Amount too small to be harmful but manufacturer advises avoid
Mefloquine	Present in milk but risk to infant minimal
Melatonin	Present in milk—manufacturer advises avoid
Meloxicam	No information available—manufacturer advises avoid
Melphalan	*see* Cytotoxic Drugs
Memantine	Manufacturer advises avoid—no information available
Menotrophin	Avoid
Meprobamate	Avoid; concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant
Meptazinol	Manufacturer advises use only if potential benefit outweighs risk
Mercaptamine	Manufacturer advises avoid
Mercaptopurine	*see* Cytotoxic Drugs
Meropenem	Unlikely to be absorbed (however, manufacturer advises avoid unless potential benefit justifies potential risk)
Mesalazine	Diarrhoea reported but manufacturers advise negligible amounts detected in breast milk
Mesterolone	*see* Androgens
Mestranol	*see* Oestrogens
Metaraminol	Manufacturer advises caution—no information available
Metformin	May be used during breast-feeding—see section 6.1.2; manufacturer advises avoid
Methadone	Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation
Methenamine	Amount too small to be harmful
Methocarbamol	Present in milk in *animal* studies—manufacturer advises caution
Methotrexate	*see* Cytotoxic Drugs
Methotrimeprazine	*see* Antipsychotics
Methoxy polyethylene glycol-epoetin beta	Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies
Methyldopa	Amount too small to be harmful
Methylnaltrexone	Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies
Methylphenidate	No information available—manufacturer advises avoid
Methylprednisolone	*see* Corticosteroids
Methysergide	Manufacturer advises avoid
Metoclopramide	Small amount present in milk; manufacturer advises avoid
Metolazone	*see* Thiazides and Related Diuretics
Metoprolol	*see* Beta-blockers
Metronidazole	Significant amount in milk; manufacturer advises avoid large single doses
Metyrapone	Manufacturer advises avoid—no information available
Mianserin	*see* Antidepressants, Tricyclic (and related)
Micafungin	Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies

Drug	Comment
Miconazole	Manufacturer advises caution—no information available
Midazolam	Present in milk—manufacturer advises avoid breast-feeding for 24 hours after administration
Mifepristone	No information available—manufacturer advises avoid
Miglustat	Manufacturer advises avoid—no information available
Milrinone	Manufacturer advises caution—no information available
Minocycline	*see* Tetracyclines
Minoxidil	Present in milk but not known to be harmful
Mirtazapine	Small amount present in milk; manufacturer advises avoid
Misoprostol	No information available—manufacturer advises avoid
Mitomycin	*see* Cytotoxic Drugs
Mitotane	*see* Cytotoxic Drugs
Mitoxantrone (mitozantrone)	*see* Cytotoxic Drugs
Mitozantrone	*see* Cytotoxic Drugs
Mizolastine	*see* Antihistamines
Moclobemide	Amount too small to be harmful, but patient leaflet advises avoid
Modafinil	Manufacturer advises avoid—present in milk in *animal* studies
Moexipril	Avoid—no information available
Montelukast	Manufacturer advises avoid unless essential
Morphine	Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring
Moxifloxacin	Manufacturer advises avoid—present in milk in *animal* studies
Moxonidine	Present in milk—manufacturer advises avoid
Mupirocin	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Mycophenolate mofetil	Manufacturer advises avoid—present in milk in *animal* studies
Nabilone	Manufacturer advises avoid—no information available
Nabumetone	No information available—manufacturer advises avoid
Nadolol	*see* Beta-blockers
Nafarelin	Manufacturer advises avoid—no information available
Nalidixic acid	Risk to infant very small but one case of haemolytic anaemia reported
Naloxone	No information available
Naltrexone	Manufacturers advise avoid—present in milk in *animal* studies
Naproxen	Amount too small to be harmful but manufacturer advises avoid
Naratriptan	Manufacturer advises caution—no information available
Natalizumab	Present in milk in *animal* studies—manufacturer advises avoid
Nateglinide	Manufacturer advises avoid—present in milk in *animal* studies
Nebivolol	*see* Beta-blockers
Nedocromil	Unlikely to be present in milk
Nelarabine	*see* Cytotoxic Drugs
Nelfinavir	Breast-feeding not advised in HIV infection
Neostigmine	Amount probably too small to be harmful; monitor infant
Neurokinin receptor antagonists	Manufacturer advises avoid—present in milk in *animal* studies
Nevirapine	Breast-feeding not advised in HIV infection
Nicardipine	Manufacturer advises avoid—no information available
Nicorandil	No information available—manufacturer advises avoid
Nicotine	Present in milk; intermittent therapy preferable
Nicotinic acid	Present in milk—avoid
Nicoumalone	*see* Anticoagulants, Oral
Nifedipine	Amount too small to be harmful but manufacturers advise avoid
Nilotinib	Manufacturer advises avoid—present in milk in *animal* studies
Nimodipine	No information available
Nitisinone	Manufacturer advises avoid—adverse effects in *animal* studies
Nitrazepam	*see* Benzodiazepines
Nitrofurantoin	Only small amounts in milk but could be enough to produce haemolysis in G6PD-deficient infants
Nitroprusside	*see* Sodium Nitroprusside
Nizatidine	Amount too small to be harmful
Nonoxinol 9	Present in milk in *animal* studies
Norelgestromin	*see* Contraceptives, hormonal
Norethisterone	Higher doses may suppress lactation and alter milk composition—use lowest effective dose; *see also* Contraceptives, hormonal
Norfloxacin	No information available—manufacturer advises avoid
Norgestimate	*see* Contraceptives, hormonal
Norgestrel	*see* Contraceptives, hormonal
Nortriptyline	*see* Antidepressants, Tricyclic (and related)
NSAIDs	*see* individual entries
Nystatin	No information available, but absorption from gastro-intestinal tract negligible

Drug	Comment
Octreotide	Manufacturer advises avoid unless essential—no information available
Oestrogens	Avoid; adverse effects on lactation; *see also* Contraceptives, hormonal
Ofloxacin	Amount probably too small to be harmful but manufacturer advises avoid
Olanzapine	Manufacturer advises avoid—present in milk
Olmesartan	Avoid—no information available
Olsalazine	Manufacturer advises use only if potential benefit outweighs risk; monitor infant for diarrhoea
Omalizumab	Manufacturer advises avoid—present in milk in *animal* studies
Omega-3-acid ethyl esters	Manufacturer advises avoid—no information available
Omeprazole	Present in milk but not known to be harmful
Ondansetron	Not known to be harmful but manufacturer advises avoid
Opioid analgesics	*see* individual entries
Oral contraceptives	*see* Contraceptives, hormonal
Orlistat	Manufacturer advises avoid—no information available
Orphenadrine	Manufacturers advise caution
Oseltamivir	Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); *see also* p. 354
Oxaliplatin	*see* Cytotoxic Drugs
Oxazepam	*see* Benzodiazepines
Oxcarbazepine	Present in milk—manufacturer advises avoid
Oxprenolol	*see* Beta-blockers
Oxybutynin	Present in milk—manufacturers advise avoid
Oxycodone	Present in milk—manufacturer advises avoid
Oxytetracycline	*see* Tetracyclines
Paclitaxel	*see* Cytotoxic Drugs
Palifermin	Manufacturer advises avoid—no information available
Paliperidone	Manufacturer advises avoid—present in milk
Palonosetron	Manufacturer advises avoid—no information available
Pamidronate disodium	*see* Disodium Pamidronate
Pancuronium	Manufacturer advises avoid unless potential benefit outweighs possble risk—no information available
Panitumumab	Manufacturer advises avoid breast-feeding during and for 3 months after treatment
Pantoprazole	Manufacturer advises avoid unless potential benefit outweighs risk—small amount present in milk in *animal* studies
Papaveretum	*see* Morphine
Paracetamol	Amount too small to be harmful
Paraldehyde	Manufacturer advises avoid unless essential—present in milk
Parecoxib	Manufacturer advises avoid—present in milk in animal studies
Paricalcitol	Manufacturer advises caution—no information available; *see also* Vitamin D
Paroxetine	Present in milk but amount too small to be harmful
Pegaptinib	Manufacturer advises avoid—no information available
Pegfilgrastim	No information available—manufacturer advises avoid
Peginterferon alfa	*see* Interferons
Pemetrexed	*see* Cytotoxic Drugs
Penicillamine	Manufacturer advises avoid unless potential benefit outweighs risk—no information available
Penicillins	Trace amounts in milk
Pentamidine isetionate	Manufacturer advises avoid unless essential
Pentazocine	Small amount present in milk—manufacturer advises caution
Pentostatin	*see* Cytotoxic Drugs
Pergolide	May suppress lactation
Pericyazine	*see* Antipsychotics
Perindopril	Avoid—no information available
Perphenazine	*see* Antipsychotics
Pethidine	Present in milk but not known to be harmful
Phenindione	*see* Anticoagulants, Oral
Phenobarbital	Avoid when possible; drowsiness may occur but risk probably small; one report of methaemoglobinaemia with phenobarbital and phenytoin
Phenoxybenzamine	May be present in milk
Phenoxymethylpenicillin	*see* Penicillins
Phentolamine	Manufacturer advises avoid—no information available
Phenytoin	Small amount present in milk; manufacturer advises avoid—but *see* section 4.8.1
Phytomenadione	Present in milk
Pilocarpine	Manufacturer advises avoid—present in milk in *animal* studies
Pimozide	*see* Antipsychotics
Pindolol	*see* Beta-blockers
Pioglitazone	Manufacturer advises avoid—present in milk in *animal* studies
Piperacillin with tazobactam	Present in milk—manufacturers advise use only if potential benefit outweighs risk
Piperazine	Present in milk—manufacturer advises avoid breast-feeding for 8 hours after dose (express and discard milk during this time)
Piracetam	Manufacturer advises avoid

Drug	Comment
Piroxicam	Amount too small to be harmful
Pivmecillinam	*see* Penicillins
Pizotifen	Amount probably too small to be harmful, but manufacturer advises avoid
Podophyllotoxin	Manufacturers advise avoid
Podophyllum	Avoid
Porfimer	No information available—manufacturer advises avoid
Posaconazole	Manufacturer advises avoid—present in milk in *animal* studies
Povidone–iodine	Avoid; iodine absorbed from vaginal preparations is concentrated in milk
Pramipexole	May suppress lactation; manufacturer advises avoid—present in milk in *animal* studies
Prasugrel	Manufacturer advises avoid—no information available
Pravastatin	Small amount present in milk—manufacturer advises avoid
Prazosin	Amount probably too small to be harmful
Prednisolone	*see* Corticosteroids
Pregabalin	Present in milk in *animal* studies—manufacturer advises avoid
Prilocaine	Present in milk but not known to be harmful
Primaxin®	Present in milk but unlikely to be absorbed (however, manufacturer advises avoid)
Primidone	*see* Phenobarbital
Probenecid	No information available
Procarbazine	*see* Cytotoxic Drugs
Prochlorperazine	*see* Antipsychotics
Procyclidine	No information available
Progesterone	Manufacturers advise avoid—present in milk
Proguanil	Amount probably too small to be harmful when used for malaria prophylaxis; inadequate for reliable protection against malaria in breast-fed infant, *see* p. 360; for Proguanil with Atovaquone *see Malarone®*
Promazine	*see* Antipsychotics
Promethazine	*see* Antihistamines
Propafenone	Manufacturer advises avoid—no information available
Propantheline	May suppress lactation
Propiverine	Manufacturer advises avoid—present in milk in *animal* studies
Propofol	Present in milk but amount probably too small to be harmful
Propranolol	*see* Beta-blockers
Propylthiouracil	Monitor infant's thyroid status but amounts in milk probably too small to affect infant; high doses might affect neonatal thyroid function
Protirelin	Breast enlargement and leaking of milk reported
Pseudoephedrine	Amount too small to be harmful
Pyrazinamide	Amount too small to be harmful
Pyridostigmine	Amount probably too small to be harmful
Pyrimethamine	Significant amount—avoid administration of other folate antagonists to infant; avoid breast-feeding during toxoplasmosis treatment
Pyrimethamine with sulfadoxine	Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfadoxine)
Quetiapine	Manufacturer advises avoid—no information available
Quinagolide	Suppresses lactation
Quinapril	Avoid in first few weeks after delivery—risk of profound neonatal hypotension; can be used when infant is older if essential but monitor infant's blood pressure
Quinupristin [ingredient]	*see Synercid®*
Rabeprazole	Manufacturer advises avoid—no information available
Raltegravir	Breast-feeding not advised in HIV infection
Raltitrexed	*see* Cytotoxic Drugs
Ramipril	Avoid—no information available
Ranibizumab	Manufacturer advises avoid—no information available
Ranitidine	Significant amount but not known to be harmful
Ranolazine	Manufacturer advises avoid—no information available
Rasagiline	Manufacturer advises caution—may suppress lactation
Rasburicase	Manufacturer advises avoid—no information available
Reboxetine	Small amount present in milk—manufacturer advises use only if potential benefit outweighs risk
Remifentanil	Manufacturer advises caution—present in milk in *animal* studies
Repaglinide	Manufacturer advises avoid—present in milk in *animal* studies
Reteplase	Manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time)
Riamet®	Manufacturer advises avoid breast-feeding for at least 1 week after last dose; present in milk in *animal* studies
Ribavirin	Avoid—no information available
Rifabutin	Manufacturer advises avoid—no information available
Rifampicin	Amount too small to be harmful
Riluzole	Manufacturer advises avoid—no information available

Drug	Comment
Rimonabant	Manufacturer advises avoid—present in milk in *animal* studies
Risedronate sodium	Manufacturer advises avoid
Risperidone	Manufacturer advises use only if potential benefit outweighs risk—small amount present in milk
Ritonavir	Breast-feeding not advised in HIV infection
Rituximab	Avoid breast-feeding during and for 12 months after treatment
Rivaroxaban	Manufacturer advises avoid—present in milk in *animal* studies
Rivastigmine	Present in milk in *animal* studies—manufacturer advises avoid
Rizatriptan	Present in milk in *animal* studies—withhold breast-feeding for 24 hours
Rocuronium	Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies
Ropinirole	May suppress lactation—manufacturer advises avoid
Ropivacaine	Not known to be harmful
Rosiglitazone	Manufacturer advises avoid—present in milk in *animal* studies
Rosuvastatin	*see* Statins
Rotigotine	May suppress lactation; manufacturer advises avoid—present in milk in *animal* studies
Rufinamide	Manufacturer advises avoid—no information available
Salbutamol	Probably present in milk; manufacturer advises avoid unless potential benefit outweighs risk—the amount of inhaled drugs in breast milk is probably too small to be harmful
Salcatonin	*see* Calcitonin (salmon)
Sapropterin	Manufacturer advises avoid—no information available
Saquinavir	Breast-feeding not advised in HIV infection
Secobarbital	*see* Barbiturates
Selegiline	Manufacturer advises avoid—no information available
Senna	Not known to be harmful
Sertindole	Manufacturer advises avoid—no information available
Sertraline	Present in milk but not known to be harmful in short-term use
Sevelamer	Manufacturer advises use only if potential benefit outweighs risk
Sevoflurane	Manufacturer advises caution—no information available
Sibutramine	Manufacturer advises avoid—no information available
Sildenafil	Manufacturer advises avoid—no information available
Silver sulfadiazine	*see* Sulphonamides
Simvastatin	*see* Statins
Sirolimus	Discontinue breast-feeding
Sitagliptin	Manufacturer advises avoid—present in milk in *animal* studies
Sitaxentan sodium	Manufacturer advises avoid—present in milk in *animal* studies
Sodium aurothiomalate	Caution—present in milk; theoretical possibility of rashes and idiosyncratic reactions
Sodium clodronate	No information available
Sodium cromoglicate	Unlikely to be present in milk
Sodium fusidate	Present in milk—manufacturer advises caution
Sodium nitroprusside	No information available; caution advised due to thiocyanate metabolite
Sodium oxybate	No information available
Sodium phenylbutyrate	Manufacturer advises avoid—no information available
Sodium picosulfate	Not known to be present in milk but manufacturer advises avoid unless potential benefit outweighs risk
Sodium stibogluconate	Amount probably too small to be harmful
Sodium valproate	*see* Valproate
Solifenacin	Manufacturer advises avoid—present in milk in *animal* studies
Somatropin	No information available
Sorafenib	*see* Cytotoxic Drugs
Sotalol	*see* Beta-blockers
Spironolactone	Amount probably too small to be harmful but manufacturer advises avoid
Statins	Manufacturers of atorvastatin, fluvastatin, rosuvastatin and simvastatin advise avoid—no information available; *see also* pravastatin
Stavudine	Breast-feeding not advised in HIV infection
Strontium ranelate	Avoid
Sulfadiazine	*see* Sulphonamides
Sulfasalazine	Small amounts in milk (1 report of bloody diarrhoea and rashes); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants
Sulfinpyrazone	No information available
Sulindac	No information available
Sulphonamides	Small risk of kernicterus in jaundiced infants particularly with long-acting sulphonamides, and of haemolysis in G6PD-deficient infants
Sulphonylureas	Theoretical possibility of hypoglycaemia in infant; see section 6.1.2
Sulpiride	Best avoided; present in milk; *see also* Antipsychotics
Sumatriptan	Present in milk—withhold breast-feeding for 12 hours
Sunitinib	*see* Cytotoxic Drugs
Suxamethonium	No information available
Synercid®	Manufacturer advises avoid—no information available

Drug	Comment
Tacalcitol	Manufacturer advises avoid application to breast area—no information available; *see also* Vitamin D
Tacrolimus	Avoid—present in milk following systemic administration
Tamoxifen	Supresses lactation; manufacturer advises avoid unless potential benefit outweighs risk
Tazarotene	Manufacturer advises avoid—present in milk in *animal* studies
Tazobactam [ingredient]	*see* Piperacillin with tazobactam
Tegafur with uracil	*see* Cytotoxic Drugs
Teicoplanin	No information available
Telbivudine	Manufacturer advises avoid—present in milk in *animal* studies
Telithromycin	Manufacturer advises avoid—present in milk in *animal* studies
Telmisartan	Avoid—no information available
Temazepam	*see* Benzodiazepines
Temocillin	*see* Penicillins
Temoporfin	Manufacturer advises avoid breast-feeding for at least 1 month after treatment—no information available
Temozolomide	*see* Cytotoxic Drugs
Temsirolimus	*see* Cytotoxic Drugs
Tenecteplase	Manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time)
Tenofovir	Breast-feeding not advised in HIV infection
Tenoxicam	Present in milk in *animal* studies
Terazosin	No information available
Terbinafine	Avoid systemic use; absorption from gastro-intestinal tract negligible after topical application, but avoid topical application to the nipple
Terbutaline	Amount too small to be harmful
Terlipressin	Not known to be harmful
Testosterone	*see* Androgens
Tetrabenazine	Manufacturer advises avoid
Tetracosactide	Manufacturer advises avoid (but may be used diagnostically if essential)
Tetracyclines	Avoid (although absorption and therefore discoloration of teeth in infant probably usually prevented by chelation with calcium in milk); *see also* tigecycline
Thalidomide	Manufacturer advises avoid—present in milk in *animal* studies
Theophylline	Present in milk—irritability in infant reported; modified-release preparations preferable
Thiamine	Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk
Thiazides and related diuretics	Amount too small to be harmful; large doses may suppress lactation
Thiopental	Present in milk—manufacturer advises avoid
Thiotepa	*see* Cytotoxic Drugs
Thyroxine	*see* Levothyroxine
Tiagabine	Manufacturer advises avoid unless potential benefit outweighs risk
Tiaprofenic acid	Amount too small to be harmful
Ticarcillin [ingredient]	*see* Penicillins
Tigecycline	Manufacturer advises caution—present in milk in *animal* studies
Tiludronic acid	Manufacturer advises avoid—no information available
Timentin®	*see* Penicillins
Timolol	*see* Beta-blockers
Tinidazole	Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment
Tinzaparin	Manufacturer advises avoid—no information available
Tioguanine	*see* Cytotoxic Drugs
Tiotropium	Amount in milk probably too small to be harmful (present in milk in *animal* studies)—manufacturer advises use only if potential benefit outweighs risk
Tipranavir	Breast-feeding not advised in HIV infection
Tirofiban	Manufacturer advises avoid—no information available
Tizanidine	Manufacturer advises use only if potential benefit outweighs risk—no information available
Tolbutamide	*see* Sulphonylureas
Tolcapone	Manufacturer advises avoid—present in milk in *animal* studies
Tolfenamic acid	Amount too small to be harmful
Tolterodine	Manufacturer advises avoid—no information available
Topiramate	Manufacturer advises avoid—present in milk
Topotecan	*see* Cytotoxic Drugs
Torasemide	No information available
Trabectedin	Manufacturer advises avoid breast-feeding during and for 3 months after treatment
Tramadol	Amount probably too small to be harmful, but manufacturer advises avoid
Trandolapril	Avoid—no information available
Tranexamic acid	Small amount present in milk—antifibrinolytic effect in infant unlikely
Trastuzumab	Avoid breast-feeding during treatment and for six months after
Travoprost	Present in milk in animal studies; manufacturer advises avoid

Drug	Comment
Trazodone	*see* Antidepressants, Tricyclic (and related)
Treosulfan	*see* Cytotoxic Drugs
Tretinoin	Avoid
Triamcinolone	*see* Corticosteroids
Triamterene	Present in milk—manufacturer advises avoid
Tribavirin	*see* Ribavirin
Triclofos	Avoid
Trifluoperazine	*see* Antipsychotics
Trihexyphenidyl	Manufacturer advises avoid
Trimeprazine	*see* Antihistamines
Trimethoprim	Present in milk—short-term use not known to be harmful
Trimipramine	*see* Antidepressants, Tricyclic (and related)
Triptorelin	Manufacturers advise avoid
Trospium	Manufacturer advises caution—no information available
Tryptophan	No information available
Urokinase	Manufacturer advises avoid—no information available
Ursodeoxycholic acid	Not known to be harmful but manufacturer advises avoid
Ustekinumab	Manufacturer advises avoid—present in milk in *animal* studies
Valaciclovir	No information available; *see also* Aciclovir
Valganciclovir	*see* Ganciclovir
Valproate	Amount too small to be harmful
Valproic acid	*see* Valproate
Valsartan	Avoid—no information available
Vancomycin	Present in milk—significant absorption following oral administration unlikely
Varenicline	Present in milk in *animal* studies
Vasopressin	Not known to be harmful
Vecuronium	No information available
Venlafaxine	Present in milk—manufacturer advises avoid
Verapamil	Amount too small to be harmful
Verteporfin	No information available—manufacturer advises avoid breast-feeding for 48 hours after administration
Vigabatrin	Present in milk—manufacturer advises avoid
Vildagliptin	Manufacturer advises avoid—present in milk in *animal* studies
Vinblastine	*see* Cytotoxic Drugs
Vincristine	*see* Cytotoxic Drugs
Vindesine	*see* Cytotoxic Drugs
Vinorelbine	*see* Cytotoxic Drugs
Vitamin A	Theoretical risk of toxicity in infants of mothers taking large doses
Vitamin D	Caution with high systemic doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration; manufacturer of *topical* calcitriol advises avoid; *see also* Calcipotriol, Paricalcitol, and Tacalcitol
Voriconazole	Manufacturer advises avoid—no information available
Warfarin	*see* Anticoagulants, Oral
Xipamide	No information available
Zafirlukast	Present in milk—manufacturer advises avoid
Zaleplon	Present in milk but amount probably too small to be harmful
Zanamivir	Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); *see also* p. 354
Zidovudine	Breast-feeding not advised in HIV infection
Zoledronic acid	Manufacturer advises avoid—no information available
Zolmitriptan	Manufacturer advises caution—present in milk in *animal* studies
Zolpidem	Small amounts present in milk—manufacturer advises avoid
Zonisamide	Avoid; manufacturer advises avoid breast-feeding for 4 weeks after administration
Zopiclone	Present in milk—manufacturer advises avoid
Zotepine	Manufacturer advises avoid
Zuclopenthixol	*see* Antipsychotics

A6 Intravenous additives

Intravenous additives policies A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion container should be labelled with the patient's name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer's label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*® (section 9.3) may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** (lignocaine hydrochloride) is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** (frusemide) injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. amphotericin, dacarbazine, and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

Use of table

The table lists preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition *via* the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically *via* the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made *via* the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

Table of drugs given by intravenous infusion

Covers addition to *Glucose intravenous infusion* 5 and 10%, *Sodium chloride intravenous infusion* 0.9%, *Compound sodium chloride intravenous infusion* (Ringer's solution), and *Compound sodium lactate intravenous infusion* (Hartmann's solution). Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer

Abatacept (*Orencia®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in infusion fluid to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron)

Abciximab (*ReoPro®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose in infusion fluid and give *via* infusion pump; filter upon dilution with infusion fluid through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter *or* upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter

Acetylcysteine (*Parvolex®*)

Continuous *in* Glucose 5% or Sodium chloride 0.9%

Glucose 5% is preferable—see Emergency Treatment of Poisoning

Aciclovir (as sodium salt) (*Zovirax IV®*; *Aciclovir IV*, Hospira; *Aciclovir IV*, Genus; *Aciclovir Sodium*, Zurich)

Intermittent *in* Sodium chloride 0.9% *or* Sodium chloride and glucose *or* Compound sodium lactate

For *Zovirax IV®*, *Aciclovir IV* (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour

Agalsidase alfa (*Replagal®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution

Agalsidase beta (*Fabrazyme®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL; dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

Alemtuzumab (*MabCampath®*)

Intermittent in Glucose 5% *or* Sodium chloride 0.9%

Add requisite dose to 100 mL infusion fluid; infuse over 2 hours

Alfentanil (as hydrochloride) (*Rapifen®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Alglucosidase alfa (*Myozyme®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

Alprostadil (*Prostin VR®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 150 micrograms/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Undiluted solution must not come into contact with the barrel of the plastic syringe; add the required volume of alprostadil to a volume of infusion fluid, and then make up to final volume

Alteplase (*Actilyse®*)

Continuous *or* intermittent *in* Sodium chloride 0.9%

Dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution

Amikacin sulphate (*Amikin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

To be given over 30 minutes

Aminophylline

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Amiodarone hydrochloride (*Cordarone X®*)

Continuous *or* intermittent *in* Glucose 5%

Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; infusion in extreme emergency see section 2.7.3; should not be diluted to less than 600 micrograms/mL; incompatible with sodium chloride infusion; avoid equipment containing the plasticizer di-2-ethylhexyphthalate (DEHP)

Amoxicillin (as sodium salt) (*Amoxil®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Continuous infusion not usually recommended

Amphotericin (colloidal) (*Amphocil®*)

Intermittent *in* Glucose 5%

Initially reconstitute with water for injections (50 mg in 10 mL, 100 mg in 20 mL), shaking gently to dissolve (fluid may be opalescent) then dilute to a concentration of 625 micrograms/mL (1 volume of reconstituted solution with 7 volumes of infusion fluid); give at a rate of 1–2 mg/kg/hour or slower if not tolerated (initial test dose 2 mg of a 100 microgram/mL solution over 10 minutes); incompatible with sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

Amphotericin (lipid complex) (*Abelcet®*)

Intermittent *in* Glucose 5%

Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

Amphotericin (liposomal) (*AmBisome®*)

Intermittent *in* Glucose 5%

Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes (initial test dose 1 mg over 10 minutes); incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line

Amphotericin (as sodium deoxycholate complex) (*Fungizone®*)

Intermittent *in* Glucose 5%

Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used

Ampicillin sodium (*Penbritin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Continuous infusion not usually recommended

Amsacrine (*Amsidine®*)

Intermittent in Glucose 5%

Reconstitute with diluent provided and dilute to suggested volume 500 mL; give over 60–90 minutes; use glass syringes; incompatible with sodium chloride infusion

Anidulafungin (*Ecalta®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 100 mg with solvent provided, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 360 micrograms/mL; give at a rate not exceeding 1.1 mg/minute

Antithymocyte immunoglobulin (*Thymoglobuline®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with heparin and hydrocortisone in glucose infusion as precipitation reported

Arsenic trioxide (*Trisenox®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose with 100–250 mL infusion fluid; infuse over 1–2 hours (up to 4 hours if vasomotor reactions observed)

Atenolol (*Tenormin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested infusion time 20 minutes

Atosiban (*Tractocile®* concentrate for intravenous infusion)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL

Atracurium besilate (*Tracrium®*; *Atracurium besilate injection*, Hospira; *Atracurium injection/infusion*, Genus)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL

Azathioprine (as sodium salt) (*Imuran®*)

Intermittent *in* Sodium chloride 0.9% *or* Sodium chloride and glucose

Reconstitute 50 mg with 5–15 mL water for injections; dilute with 20–200 mL infusion fluid

Aztreonam (*Azactam®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes

Basiliximab (*Simulect®*)

Intermittent in Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes

Benzylpenicillin sodium (*Crystapen®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 100 mL given over 30–60 minutes

Continuous infusion not usually recommended

Betamethasone (as sodium phosphate) (*Betnesol®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Bevacizumab (*Avastin®*)

Intermittent in Sodium chloride 0.9%

Dilute requisite dose in infusion fluid to 100 mL and give over 90 minutes; if initial dose well tolerated give second dose over 60 minutes; if second dose well tolerated give subsequent doses over 30 minutes; incompatible with glucose solutions

Bivalirudin (*Angiox®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid

Bleomycin sulphate

Intermittent *in* Sodium chloride 0.9%

To be given slowly; suggested volume 200 mL

Bumetanide

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 500 mL given over 30–60 minutes; concentrations above 25 mg/litre may cause precipitation

Busulfan (*Busilvex®*)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 500 micrograms/mL; give through a central venous catheter over 2 hours

Calcitonin (salmon)/Salcatonin (*Miacalcic®*)

Intermittent *in* Sodium chloride 0.9%

Diluted solution given without delay; dilute in 500 mL and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration

Calcium folinate (*Refolinon®*; *Calcium folinate injection*, Hospira, Wockhardt)

Intermittent *in* Sodium chloride 0.9%

Calcium folinate (Hospira and Wockhardt) can also be infused in Glucose 5%

Protect from light

Calcium gluconate

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Avoid bicarbonates, phosphates, or sulphates

Calcium levofolinate (*Isovorin®*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Protect from light

Carboplatin (*Paraplatin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Final concentration as low as 500 micrograms/mL; give over 15–60 minutes

Caspofungin (*Cancidas®*)

Intermittent *in* Sodium chloride 0.9% *or* Compound sodium lactate

Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions

Cefotaxime (as sodium salt)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate *or* Water for injections

Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions

Cefradine (*Velosef®*)

Continuous *or* intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Reconstitute 500 mg with 5 mL water for injections or glucose 5% or sodium chloride 0.9% then dilute with infusion fluid

Ceftazidime (as pentahydrate) (*Fortum®*, *Kefadim®*)

Intermittent *or via* drip tubing *in* Glucose 5 and 10% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid; for *Fortum®* dilute further to a concentration of 40 mg/mL; for *Kefadim®* dilute further to a concentration of 20 mg/mL; give over up to 30 minutes

Ceftriaxone (as sodium salt) (*Rocephin®*; *Ceftriaxone Injection*, Genus)

Intermittent *or via* drip tubing *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Reconstitute 2-g vial with 40 mL infusion fluid; give intermittent infusion over at least 30 minutes (60 minutes in neonates); not to be given with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines

Cefuroxime (as sodium salt) (*Zinacef®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes

Chloramphenicol (as sodium succinate) (*Kemicetine®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Ciclosporin (*Sandimmun®*)

Intermittent *or* continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment

Cidofovir (*Vistide®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

Cisatracurium (*Nimbex®*, *Nimbex Forte®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL

Cisplatin (*Cisplatin powder*, Pharmacia; *Cisplatin injection solution*, Hospira, Wockhardt)

Intermittent *in* Sodium chloride 0.9%

Cisplatin *injection solution* (Wockhardt) and *powder* can also be infused in Sodium chloride and Glucose

Reconstitute powder initially with water for injections to produce 1 mg/mL solution.

Dilute in 2 litres infusion fluid; give over 6–8 hours; avoid equipment containing aluminium; protect from light

Cladribine (*Leustat®*)

Continuous *in* Sodium chloride 0.9%

Dilute with 100–500 mL; glucose solutions are unsuitable

Clarithromycin (*Klaricid® I.V.*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes

Clindamycin (as phosphate) (*Dalacin® C Phosphate*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion)

Clofarabine (*Evoltra®*)

Intermittent *in* Sodium chloride 0.9%

Filter requisite dose through a 0.2 micron filter and dilute with infusion fluid; give over 2 hours

Clonazepam (*Rivotril®*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Suggested volume 250 mL

Co-amoxiclav (*Augmentin®*; *Co-amoxiclav Injection*, Wockhardt)

Intermittent *in* Sodium chloride 0.9% *or* Water for injections; see also package leaflet

Suggested volume 50–100 mL given over 30–40 minutes and completed within 4 hours of reconstitution

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Co-fluampicil (as sodium salts) (*Magnapen®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Colistimethate sodium (*Colomycin®*)

Intermittent *in* Sodium chloride 0.9% *or* Water for injections

Dilute with 50 mL infusion fluid and give over 30 minutes

Co-trimoxazole (*Septrin® for infusion*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9% *or* Ringer's solution

Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes

Cyclophosphamide (*Endoxana®*)

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%

Cytarabine (*Cytarabine injection solution*, Pharmacia, Hospira)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

For *Cytarabine injection solution* 100 mg/mL (Pharmacia) before use, vials should be warmed to 55°C for 30 minutes, with adequate shaking, and allowed to cool to room temperature

Dacarbazine (*Dacarbazine*, Medac)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with water for injections then dilute in 200–300 mL infusion fluid; give over 15–30 minutes; protect infusion from light

Dactinomycin (*Cosmegen Lyovac®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with water for injections

Danaparoid sodium (*Orgaran®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Daptomycin (*Cubicin®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute with water for injections or sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes

Daunorubicin (as hydrochloride) (*Daunorubicin*, Winthrop)

Intermittent *via* drip tubing *in* Sodium chloride 0.9%

Reconstitute vial with 4 mL water for injections to give 5 mg/mL solution; dilute requisite dose with infusion fluid to a concentration of 1 mg/mL; give over 20 minutes; protect from light

Daunorubicin (liposomal) (*DaunoXome®*)

Intermittent *in* Glucose 5%

Dilute to a concentration of 0.2–1 mg/mL; give over 30–60 minutes; incompatible with sodium chloride solutions; in-line filter not recommended (if used, pore size should be no less than 5 micron)

Desferrioxamine mesilate (*Desferal®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid

Desmopressin (*DDAVP®*, *Octim®*)

Intermittent *in* Sodium chloride 0.9%

Dilute with 50 mL and give over 20 minutes

Dexamethasone sodium phosphate (*Dexamethasone*, Hospira; *Dexamethasone*, Organon)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Dexamethasone (Organon) can also be infused in Ringer's solution *or* Compound sodium lactate

Dexrazoxane (*Savene®*)

Intermittent *in Savene®* diluent

Reconstitute 500 mg with 25 mL of Water for Injections then dilute in 500 mL *Savene®* diluent; give over 1–2 hours into a large vein in an area other than the one affected

Diamorphine hydrochloride (*Diamorphine Injection*, Wockhardt)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Glucose is preferred as infusion fluid

Diazepam (solution) (*Diazepam*, Wockhardt)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of not more than 10 mg in 200 mL; adsorbed to some extent by the plastics of bags and infusion sets

Diazepam (emulsion) (*Diazemuls®*)

Continuous *in* Glucose 5 and 10%

May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration; adsorbed to some extent by the plastics of the infusion set

via drip tubing *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Adsorbed to some extent by the plastics of the infusion set

Diclofenac sodium (*Voltarol®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution *or* with 1 mL sodium bicarbonate 4.2% solution); for intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes; for continuous infusion give at a rate of 5 mg/hour

Digoxin (*Lanoxin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours. Protect from light

Digoxin-specific antibody fragments (*Digibind®*)

Intermittent *in* Sodium chloride 0.9%

Dissolve initially in water for injections (4 mL/vial) then dilute with the sodium chloride 0.9% and give through a 0.22 micron sterile, disposable filter over 30 minutes

Dinoprostone (*Prostin E2®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Disodium folinate (*Sodiofolin®*)

Intermittent *in* Sodium chloride 0.9%

Protect from light

Avoid bicarbonate containing infusions

Disodium levofolinate (*Levofolinic acid*, Medac)

Intermittent in Glucose 5% *or* Sodium chloride 0.9%

Disodium pamidronate (*Aredia®*; *Disodium pamidronate*, Forum, Hospira, Medac)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

For *Aredia®* and *Pamidronate disodium* (Britannia), reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL); for *Aredia®*, *Pamidronate disodium* (Britannia), *Disodium pamidronate* (Hospira), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL; for *Disodium pamidronate* (Medac) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium

Disopyramide (as phosphate) (*Rythmodan®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

Dobutamine (as hydrochloride)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 0.5–1 mg/mL and give *via* a controlled infusion device; give higher concentration (max. 5 mg/mL) with infusion pump; incompatible with bicarbonate

Docetaxel (*Taxotere®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Stand docetaxel vials and diluent at room temperature for 5 minutes; add diluent to produce a concentrate containing 10 mg/mL and allow to stand for a further 5 minutes; dilute the requisite dose with at least 250 mL infusion fluid to a final concentration not exceeding 740 micrograms/mL; infuse over 1 hour

Dolasetron mesilate (*Anzemet®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Suggested volume 50 mL given over 30 seconds–15 minutes

Dopamine hydrochloride

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Dilute to max concentration of 3.2 mg/mL; incompatible with bicarbonate

Dopexamine hydrochloride (*Dopacard®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 400 or 800 micrograms/mL; max. concentration *via* large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused *via* central vein; give *via* infusion pump or other device which provides accurate control of rate; contact with metal should be minimised; incompatible with bicarbonate

Doripenem (*Doribax®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 500 mg with 10 mL water for injections or sodium chloride 0.9% then dilute with 100 mL infusion fluid; give over 1 hour (for severe hospital-acquired pneumonia or hospital-acquired pneumonia caused by less sensitive organisms, may extend infusion time to 4 hours using sodium chloride 0.9% as the infusion fluid)

Doxorubicin hydrochloride

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with water for injections or sodium chloride 0.9% (10 mg in 5 mL, 50 mg in 25 mL); give over 3–5 minutes; for continuous infusion over 24 hours (*Doxorubicin*, Medac and *Doxorubicin*, Teva UK only), consult local protocol

Doxorubicin hydrochloride (liposomal) (*Caelyx®*)

via drip tubing *in* Glucose 5%

Dilute up to 90 mg in 250 mL infusion fluid and over 90 mg in 500 mL infusion fluid

Eculizumab (*Soliris®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur)

Enoximone (*Perfan®*)

Continuous *or* intermittent *in* Sodium chloride 0.9% *or* Water for injections

Dilute to a concentration of 2.5 mg/mL; incompatible with glucose solutions; use only plastic containers or syringes

Epirubicin hydrochloride (*Pharmorubicin® Rapid Dissolution*, *Pharmorubicin® Solution*)

via drip tubing *in* Sodium chloride 0.9%

Reconstitute *Pharmorubicin® Rapid Dissolution* with sodium chloride 0.9% or with water for injections (10 mg in 5 mL, 20 mg in 10 mL, 50 mg in 25 mL); give over 3–5 minutes

Epoprostenol (*Flolan®*)

Continuous *in* Sodium chloride 0.9% (but see also below)

Reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for *pulmonary hypertension* dilute further with glycine buffer diluent only, for *renal dialysis* may be diluted further with sodium chloride 0.9%

Ertapenem (*Invanz®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 1 g with 10 mL water for injections or sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions

Erythromycin (as lactobionate)

Continuous *or* intermittent *in* Glucose 5% (neutralised with sodium bicarbonate) *or* Sodium chloride 0.9%

Dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1 mg/mL for continuous infusion and 1–5 mg/mL for intermittent infusion; give intermittent infusion over 20–60 minutes

Esomeprazole (as sodium salt) (*Nexium®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 40 mg with 5 mL sodium chloride 0.9% then dilute with up to 100 mL infusion fluid, give requisite dose over 10–30 minutes

Ethanol

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Dilute to a concentration of 5–10%

Etoposide (*Eposin®*; *Etoposide*, TEVA UK and Hospira)

Intermittent *in* Sodium chloride 0.9%

For *Etoposide* (TEVA UK) dilute with either sodium chloride 0.9% or glucose 5% to a concentration of 200 micrograms/mL and give over 30–60 minutes; for *Etoposide* (Hospira) dilute with either sodium chloride 0.9% or glucose 5% to a concentration of not more than 250 micrograms/mL and give over not less than 30 minutes; for *Eposin®* dilute with either sodium chloride 0.9% or glucose 5% to a concentration of 200–400 micrograms/mL and give over at least 30 minutes; check container for haze or precipitate during infusion

Etoposide (as phosphate) (*Etopophos®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with 5–10 mL of either water for injections *or* with infusion fluid then dilute further with infusion fluid to a concentration as low as 100 micrograms/mL and give over 5 minutes to 3.5 hours

Fentanyl (*Sublimaze®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Ferric carboxymaltose (*Ferinject®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes

Filgrastim (*Neupogen®*; *Ratiograstim®*)

Continuous *or* intermittent *in* Glucose 5%

For a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human serum albumin) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution

Flecainide acetate (*Tambocor®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Minimum volume in infusion fluids containing chlorides 500 mL

Flucloxacillin (as sodium salt) (*Floxapen®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Continuous infusion not usually recommended

Fludarabine phosphate (*Fludara®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 50 mg with 2 mL water for injections and dilute requisite dose in 100 mL; give over 30 minutes

Flumazenil (*Anexate®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Fluorouracil (as sodium salt)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Give intermittent infusion over 30–60 minutes or over 4 hours

Fondaparinux (*Arixtra®*)

Intermittent *in* Sodium chloride 0.9%

For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

Fosaprepitant (*Ivemend®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 115-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 110 mL infusion fluid; give over 15 minutes

Foscarnet sodium (*Foscavir®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution *via* central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours)

Fosphenytoin Sodium (*Pro-Epanutin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent)/mL

Furosemide/Frusemide (as sodium salt) (*Lasix®*)

Continuous *in* Sodium chloride 0.9% *or* Ringer's solution

Infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable

Fusidic acid (as sodium salt)

Continuous *in* Glucose 5% (but see below) *or* Sodium chloride 0.9%

Reconstitute with the buffer solution provided and dilute to 500 mL; give through central venous line over 2 hours (or over 6 hours if superficial vein used); incompatible in solution of pH less than 7.4

Galsulfase (*Naglazyme®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours

Ganciclovir (as sodium salt) (*Cymevene®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Reconstitute initially in water for injections (500 mg/10 mL) then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour

Gemcitabine (*Gemzar®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute initially with sodium chloride 0.9% (200 mg in at least 5 mL, 1 g in at least 25 mL); may be diluted further with infusion fluid; give over 30 minutes

Gentamicin (as sulphate) (*Cidomycin®*; *Gentamicin Paediatric Injection*, Beacon; *Gentamicin Injection*, Hospira)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume for intermittent infusion 50–100 mL given over 20–30 minutes

Glyceryl trinitrate (*Nitrocine®*, *Nitronal®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

For *Nitrocine®* suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as *Viaflex®* or *Steriflex®*; use glass or polyethylene containers or give *via* a syringe pump

Granisetron (as hydrochloride) (*Kytril®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Dilute 3 mL in 20–50 mL infusion fluid (up to 3 mL in 10–30 mL for children); give over 5 minutes

Haem arginate (*Normosang®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes *via* large antebrachial vein; administer within 1 hour after dilution

Heparin sodium

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Administration with a motorised pump advisable

Hydralazine hydrochloride (*Apresoline®*)

Continuous *in* Sodium chloride 0.9% *or* Ringer's solution

Suggested infusion volume 500 mL

Hydrocortisone (as sodium phosphate) (*Efcortesol®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Hydrocortisone (as sodium succinate) (*SoluCortef®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Ibandronic acid (*Bondronat®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours

Idarubicin hydrochloride (*Zavedos®*)

via drip tubing *in* Sodium chloride 0.9%

Reconstitute with water for injections to produce a 1 mg/mL solution; give over 5–10 minutes

Idursulfase (*Elaprase®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions)

Ifosfamide (*Mitoxana®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

For continuous infusion, suggested volume 3 litres given over 24 hours; for intermittent infusion, give over 30–120 minutes

Imiglucerase (*Cerezyme®*)

Intermittent *in* Sodium chloride 0.9%

Initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give over 1–2 hours *or* at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution

Imipenem with cilastatin (as sodium salt) (*Primaxin®*)

Intermittent *in* Sodium chloride 0.9% *or* Sodium chloride and Glucose

Dilute to a concentration of 5 mg (as imipenem)/mL; infuse 250–500 mg (as imipenem) over 20–30 minutes, 1 g over 40–60 minutes

Continuous infusion not usually recommended

Infliximab (*Remicade®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (patients being treated for rheumatoid arthritis who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution

Insulin (soluble)

Continuous *in* Sodium chloride 0.9%

Adsorbed to some extent by plastics of infusion set; see also section 6.1.3; ensure insulin is not injected into 'dead space' of injection port of the infusion bag

Insulin aspart

Continuous *in* Sodium chloride 0.9% *or* Glucose 5%

Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set

Insulin lispro

Continuous *in* Sodium chloride 0.9% *or* Glucose 5%

Interferon alfa-2b (*IntronA®*)

Intermittent *in* Sodium chloride 0.9%

For *IntronA®* solution, dilute requisite dose in 50 mL infusion fluid and administer over 20 minutes; not to be diluted to less than 300 000 units/mL

For *IntronA®* powder, reconstitute with 1 mL water for injections; dilute requisite dose in 100 mL infusion fluid and administer over 20 minutes; not to be diluted to less than 100 000 units/mL

Irinotecan hydrochloride (*Campto®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose in 250 mL infusion fluid; give over 30–90 minutes

Iron dextran (*Cosmofer®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 100–200 mg in 100 mL infusion fluid; give 25 mg over 15 minutes as a test dose initially, then give at a rate not exceeding 6.67 mg/minute; *total dose infusion* diluted in 500 mL infusion fluid and given over 4–6 hours (initial test dose 25 mg over 15 minutes)

Iron sucrose (*Venofer®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes as a test dose initially, then give at a rate not exceeding 3.33 mg/minute

Isosorbide dinitrate (*Isoket 0.05%®*, *Isoket 0.1%®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give *via* a syringe pump; *Isoket 0.05%®* can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe

Itraconazole (*Sporanox®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 250 mg in 50 mL infusion fluid and infuse only **60 mL** through an in-line filter (0.2 micron) over 60 minutes

Ketamine (as hydrochloride) (*Ketalar®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to 1 mg/mL; microdrip infusion for maintenance of anaesthesia

Labetalol hydrochloride (*Trandate®*)

Intermittent *in* Glucose 5% *or* Sodium chloride and glucose

Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette

Lacosamide (*Vimpat®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate solution

May be administered undiluted

Laronidase (*Aldurazyme®*)

Intermittent *in* Sodium chloride 0.9%

Body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through an in-line filter (0.22 micron) at an initial rate of 2 units/kg/hour then increasing gradually every 15 minutes to max. 43 units/kg/hour

Lenograstim (*Granocyte®*)

Intermittent *in* Sodium chloride 0.9%

Initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of *Granocyte-13* or up to 100 mL infusion fluid for *Granocyte-34*; give over 30 minutes

Lepirudin (*Refludan®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with water for injections *or* sodium chloride 0.9% then dilute to a concentration of 2 mg/mL with infusion fluid

Levetiracetam (*Keppra®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Dilute requisite dose with at least 100 mL of infusion fluid; give over 15 minutes

Magnesium sulphate

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested concentration up to 200 mg/mL; max. rate 150 mg/minute

Melphalan (*Alkeran®*)

Intermittent *or via* drip tubing *in* Sodium chloride 0.9%

Reconstitute with the solvent provided then dilute with infusion fluid; max. 90 minutes between addition and completion of administration; incompatible with glucose infusion

Meropenem (*Meronem®*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Dilute in 50–200 mL infusion fluid and give over 15–30 minutes

Mesna (*Uromitexan®*)

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Metaraminol (as tartrate) (*Aramine®*)

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 500 mL

Methotrexate (as sodium salt) (*Methotrexate*, Lederle)

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate *or* Ringer's solution

Dilute in a large-volume infusion; max. 24 hours between addition and completion of administration

Methylprednisolone (as sodium succinate) (*Solu-Medrone®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes

Metoclopramide hydrochloride (*Maxolon High Dose®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Continuous infusion recommended; loading dose, dilute with 50–100 mL and give over 15–20 minutes; maintenance dose, dilute with 500 mL and give over 8–12 hours; for intermittent infusion dilute with at least 50 mL and give over at least 15 minutes

Micafungin (*Mycamine®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect from light; give over 60 minutes

Midazolam (*Hypnovel®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

For neonates and children under 15 kg dilute to a max. concentration of 1 mg/mL

Milrinone (*Primacor®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a suggested concentration of 200 micrograms/mL

Mitoxantrone/Mitozantrone (as hydrochloride) (*Onkotrone®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

For administration *via* drip tubing suggested volume at least 50 mL given over at least 3–5 minutes; for intermittent infusion, dilute with 50–100 mL and give over 15–30 minutes

Mivacurium (as chloride) (*Mivacron®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 500 micrograms/mL; may also be given undiluted

Mycophenolate mofetil (as hydrochloride) (*CellCept®*)

Intermittent *in* Glucose 5%

Reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours

Naloxone (*Minijet® Naloxone Hydrochloride*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reversal of opioid-induced respiratory depression, dilute to a concentration of 4 micrograms/mL; opioid overdose only, dilute 10 mg in 50 mL glucose 5%, see Emergency Treatment of Poisoning

Natalizumab (*Tysabri®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

Nimodipine (*Nimotop®*)

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Not to be added to infusion container; administer *via* an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light

Nizatidine (*Axid®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

Noradrenaline acid tartrate/Norepinephrine bitartrate

Continuous *in* Glucose 5% *or* Sodium chloride and glucose

Give *via* controlled infusion device; for administration *via* syringe pump, dilute 4 mg noradrenaline acid tartrate (2 mL solution) with 48 mL; for administration *via* drip counter dilute 40 mg (20 mL solution) with 480 mL; give through a central venous catheter; incompatible with alkalis

Omeprazole (as sodium salt) (*Losec®*)

Intermittent *or* continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion, give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% *or* 12 hours in sodium chloride 0.9%

Ondansetron (as hydrochloride) (*Zofran®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution

For intermittent infusion, dilute 32 mg in 50–100 mL and give over at least 15 minutes

Oxaliplatin (*Eloxatin®*)

Continuous *in* Glucose 5%

Dilute requisite dose to a concentration of 200–700 micrograms/mL and give over 2–6 hours; incompatible with alkaline or chloride-containing fluids; avoid equipment containing aluminium

Oxycodone hydrochloride (*OxyNorm®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 1 mg/mL

Oxytocin (*Syntocinon®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate *or* Ringer's solution

Preferably given *via* a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for *induction or enhancement of labour*, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for *treatment of postpartum uterine haemorrhage* dilute 5–30 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential

Paclitaxel (*Abraxane®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute to a concentration of 5 mg/mL. Inject requisite dose volume into an empty, sterile, intravenous bag and give over 30 minutes; in-line filter not recommended

Paclitaxel (*Taxol®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 0.3–1.2 mg/mL and give through an in-line filter (0.22 micron or less) over 3 hours; not to be used with PVC equipment (short PVC inlet or outlet on filter may be acceptable)

Panitumumab (*Vectibix®*)

Intermittent *in* Sodium chloride 0.9%

Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute requisite dose with infusion fluid to 100 mL (final concentration not to exceed 10 mg/mL); gently invert to mix, do not shake; give *via* infusion pump through a low protein-binding in-line filter (0.2 or 0.22 micron) over 60 minutes; for doses higher than 1 g, dilute requisite dose with infusion fluid to 150 mL and give over 90 minutes

Pantoprazole (as sodium sesquihydrate) (*Protium®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid; give 40 mg over 15 minutes

Paracetamol (*Perfalgan®*)

Intermittent *in* Sodium chloride 0.9% *or* Glucose 5%

Dilute to a concentration of 1 mg/mL and use within 1 hour; may also be given undiluted

Pemetrexed (*Alimta®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 500-mg vial with 20 mL sodium chloride 0.9% to produce a 25 mg/mL solution; dilute requisite dose with infusion fluid to 100 mL; give over 10 minutes

Pentamidine isetionate (*Pentacarinat®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in water for injections (300 mg in 3–5 mL) then dilute in 50–250 mL; give over at least 60 minutes

Pentostatin (*Nipent®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with 5 mL water for injections to produce a 2 mg/mL solution; dilute requisite dose in 25–50 mL infusion fluid (final concentration 180–330 micrograms/mL) and give over 20–30 minutes

Phenoxybenzamine hydrochloride

Intermittent *in* Sodium chloride 0.9%

Dilute in 200–500 mL infusion; give over at least 2 hours; max. 4 hours between dilution and completion of administration

Phenylephrine hydrochloride

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 10 mg in 500 mL infusion fluid

Phenytoin sodium (*Epanutin®*)

Intermittent *in* Sodium chloride 0.9%

Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give through an in-line filter (0.22–0.50 micron) at a rate not exceeding 50 mg/minute (neonates, give at a rate of 1–3 mg/kg/minute); complete administration within 1 hour of preparation

Phytomenadione (in mixed micelles vehicle) (*Konakion® MM*)

Intermittent *in* Glucose 5%

Dilute with 55 mL; may be injected into lower part of infusion apparatus

Piperacillin with tazobactam (as sodium salts)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Water for injections (*or* Compound sodium lactate for *Tazocin®* brand only)

Reconstitute initially with water for injections or sodium chloride 0.9% (2.25 g in 10 mL, 4.5 g in 20 mL), then dilute to 50–150 mL with infusion fluid (to max. 50 mL with water for injections); give over 20–30 minutes

Potassium chloride

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute in a large-volume infusion; mix thoroughly to avoid 'layering', especially in non-rigid infusion containers; use ready-prepared solutions when possible

Propofol (emulsion) (*Diprivan®*; Abbott; Baxter; *Propofol-Lipuro®*, *Propofen®*, Braun; Hospira; Fresenius Kabi)

1% or 2% emulsion

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

To be administered *via* a Y-piece close to injection site; microbiological filter not recommended

1% emulsion only

Continuous *in* Glucose 5% (*or* Sodium chloride 0.9% for *Propofol-Lipuro®*, *Propofen®*, Braun, and Fresenius Kabi brands only)

Dilute to a concentration not less than 2 mg/mL; microbiological filter not recommended; administer using suitable device to control infusion rate; use glass or PVC containers (if PVC bag used it should be full—withdraw volume of infusion fluid equal to that of propofol to be added); give within 6 hours of preparation; propofol may alternatively be infused undiluted using a suitable infusion pump

Quinine dihydrochloride

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

To be given over 4 hours; see also section 5.4.1

Quinupristin with dalfopristin (*Synercid®*)

Intermittent *in* Glucose 5%

Reconstitute 500 mg with 5 mL water for injections or glucose 5%; gently swirl vial without shaking to dissolve; allow to stand for at least 2 minutes until foam disappears; dilute requisite dose in 100 mL infusion fluid and give over 60 minutes *via* central venous catheter (in an emergency, first dose may be diluted in 250 mL infusion fluid and given over 60 minutes *via* peripheral line); flush line with glucose 5% before and after infusion; incompatible with sodium chloride solutions

Raltitrexed (*Tomudex®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with water for injections; dilute requisite dose in 50–250 mL infusion fluid and give over 15 minutes

Ranitidine (as hydrochloride) (*Zantac®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Rasburicase (*Fasturtec®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes

Remifentanil (*Ultiva®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Water for injections

Reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years; 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device)

Rifampicin (*Rifadin®*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9% *or* Ringer's solution

Reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours

Ritodrine hydrochloride (*Yutopar®*)

Continuous *in* Glucose 5%

Give *via* controlled infusion device, preferably a syringe pump; if syringe pump available dilute to a concentration of 3 mg/mL; if syringe pump not available dilute to a concentration of 300 micrograms/mL; close attention to patient's fluid and electrolyte status essential

Rituximab (*MabThera®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to 1–4 mg/mL and gently invert bag to avoid foaming

Rocuronium bromide (*Esmeron®*)

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Salbutamol (as sulphate) (*Ventolin® For Intravenous Infusion*)

Continuous *in* Glucose 5%

For *bronchodilatation* dilute to a concentration of 200 micrograms/mL with glucose 5%, sodium chloride 0.9%, or water for injections; for *premature labour* dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump *or* for other infusion methods (preferably *via* controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential

Sodium calcium edetate (*Ledclair®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of not more than 3%; suggested volume 250–500 mL given over at least 1 hour

Sodium clodronate (*Bonefos® Concentrate*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 300 mg in 500 mL and give over at least 2 hours or 1.5 g in 500 mL and give over at least 4 hours

Sodium nitroprusside

Continuous *in* Glucose 5%

Infuse *via* infusion device to allow precise control; protect infusion from light. For further details consult product literature

Sodium valproate (*Epilim®*, *Episenta®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute *Epilim®* with solvent provided then dilute with infusion fluid

Sotalol hydrochloride (*Sotacor®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of between 0.01–2 mg/mL

Streptokinase (*Streptase®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%, then dilute further with infusion fluid

Sulfadiazine sodium

Continuous *in* Sodium chloride 0.9%

Suggested volume 500 mL; ampoule solution has a pH of over 10

Suxamethonium chloride (*Anectine®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Tacrolimus (*Prograf®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC

Teicoplanin (*Targocid®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Reconstitute initially with water for injections provided; infuse over 30 minutes

Continuous infusion not usually recommended

Temocillin (*Negaban®*)

Intermittent *in* Glucose 5% or 10% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Reconstitute 1 g with 20 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes

Temsirolimus (*Torisel®*)

Intermittent *in* Sodium chloride 0.9%

Add 1.8 mL of the supplied diluent to the vial of concentrate to produce a concentration of 10 mg/mL; dilute requisite dose with 250 mL of sodium chloride 0.9%; give (preferably via infusion pump) through an in-line filter with a maximum pore size of 5 microns; avoid PVC equipment; protect from light and administer within 6 hours of dilution

Terbutaline sulphate (*Bricanyl®*)

Continuous *in* Glucose 5%

For *bronchodilatation* dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours; for *premature labour* dilute in glucose 5% and give *via* controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential

Ticarcillin sodium with clavulanic acid (*Timentin®*)

Intermittent *in* Glucose 5% *or* Water for injections

Suggested volume (depending on dose) glucose 5% 100–150 mL or water for injections 50–100 mL; given over 30–40 minutes

Tigecycline (*Tygacil®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes

Tirofiban (*Aggrastat®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL

Tobramycin (as sulphate) (*Nebcin®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes

Topotecan (as hydrochloride) (*Hycamtin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 4 mg with 4 mL water for injections then dilute to a final concentration of 25–50 micrograms/mL; give over 30 minutes

Tramadol hydrochloride (*Zydol®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution *or* Compound sodium lactate

Tranexamic acid (*Cyklokapron®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution

Trastuzumab (*Herceptin®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 150-mg vial with 7.2 mL water for injections to produce 21 mg/mL solution, swirl vial gently to avoid excessive foaming and allow to stand for approximately 5 minutes; dilute requisite dose in 250 mL infusion fluid

Treosulfan (*Treosulfan*) (Medac)

Intermittent *in* Water for injections

Infusion suggested for doses above 5 g; dilute to a concentration of 5 g in 100 mL

Urokinase (*Syner-KINASE®*)

Continuous *or* intermittent *in* Sodium chloride 0.9%

Vancomycin (as hydrochloride) (*Vancocin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

Vasopressin, synthetic (*Pitressin®*)

Intermittent *in* Glucose 5%

Suggested concentration 20 units/100 mL given over 15 minutes

Vecuronium bromide (*Norcuron®*)

Continuous *or* via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9% *or* Ringer's solution

Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution; *alternatively* reconstitute with up to 10 mL glucose 5% *or* sodium chloride 0.9% *or* water for injections—unsuitable for further dilution if not reconstituted with water for injections. For *continuous intravenous infusion*, dilute to a concentration up to 40 micrograms/mL

Verteporfin (*Visudyne®*)

Intermittent *in* Glucose 5%

Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

Vinblastine sulphate (*Velbe®*)

via drip tubing *in* Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%; give over approx. 1 minute

Vincristine sulphate (*Oncovin®*)

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Vindesine sulphate (*Eldisine®*)

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%; give over 1–3 minutes

Vinorelbine (*Navelbine®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute in 125 mL infusion fluid; give over 20–30 minutes

Vitamins B & C (*Pabrinex® I/V High potency*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Ampoule contents should be mixed, diluted, and administered without delay; give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

Vitamins, multiple

(*Cernevit®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in 5 mL water for injections (or infusion fluid)

(*Solivito N®*)

Intermittent *in* Glucose 5 and 10%

Suggested volume 500–1000 mL given over 2–3 hours; see also section 9.3

Voriconazole (*Vfend®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Compound sodium lactate

Reconstitute each 200 mg with 19 mL water for injections to produce a 10 mg/mL solution; dilute dose in infusion fluid to concentration of 0.5–5 mg/mL; give at a rate not exceeding 3 mg/kg/hour

Zidovudine (*Retrovir®*)

Intermittent *in* Glucose 5%

Dilute to a concentration of 2 mg/mL or 4 mg/mL and give over 1 hour

Zoledronic acid (*Zometa®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line; do not mix with calcium or other divalent cation-containing infusion solutions such as lactated Ringer's solution

A7 Borderline substances

A7.1 Enteral feeds (non-disease specific) 881
A7.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL 881
A7.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL 883
A7.1.3 Enteral feeds (non-disease specific): Child under 12 years 887
A7.2 Nutritional supplements (non-disease specific) 887
A7.2.1 Nutritional supplements: less than 5 g protein/100 mL 887
A7.2.2 Nutritional supplements: 5 g (or more) protein/100 mL 888
A7.3 Specialised formulas 894
A7.3.1 Specialised formulas: Infant and child 894
A7.3.2 Specialised formulas for specific clinical conditions 894
A7.4 Feed supplements 898
A7.4.1 High-energy supplements 898
A7.4.2 Fibre, vitamin, and mineral supplements 902
A7.5 Feed additives 903
A7.5.1 Special foods for conditions of intolerance 903
A7.5.2 Feed thickeners and pre-thickened foods 903
A7.5.3 Flavouring preparations 903
A7.6 Foods for special diets 903
A7.6.1 Gluten-free foods 903
A7.6.2 Low-protein foods 905
A7.7 Nutritional supplements for metabolic diseases 905

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)

Note All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The **fat** or **oil** content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins**, **minerals**, and **trace elements**—the manufacturer's product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see **interactions:** Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

For details of enteral feeds, nutritional supplements, and specialised formulas suitable for infants and children under 12 years see *BNF for Children* (Appendix 2)

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Standard ACBS indications
Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

A7.1 Enteral feeds (non-disease specific)

A7.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

For further information on composition of feeds, see p. 880

A7.1.1.1 Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Original (Fresenius Kabi)	Liquid (sip or tube feed)	420 kJ (100 kcal) **per 100 mL**	3.8 g cows' milk soya	13.8 g (sugars 3.5 g[1])	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Standard, p. 880	Bottle: 200 mL = £1.74 Black currant, chocolate, mocha, nut, peach, vanilla Flexible pack: 500 mL = £3.36 1000 mL = £6.63 1500 mL = £9.97
Fresubin® Original Fibre (Fresenius Kabi)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	3.8 g cows' milk soya	13.8 g (sugars 1 g)	3.4 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 880 except bowel fistula. Not suitable for child under 2 years	Flexible pack: 500 mL = £3.80 1000 mL = £7.59 1500 mL = £10.69
Isosource® Fibre (Nestlé)	Liquid (tube feed)	422 kJ (100 kcal) **per 100 mL**	3.8 g cows' milk	13.6 g	3.4 g	1.4 g	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 2 years	Flexible pack: 500 mL = £3.39 1000 mL = £6.77
Isosource® Standard (Nestlé)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	4 g cows' milk	13.6 g	3.3 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 500 mL = £2.98 1000 mL = £5.95
Jevity® (Abbott)	Liquid (tube feed)	441 kJ (106 kcal) **per 100 mL**	4 g caseinates	14.1 g (sugars 470 mg)	3.47 g	1.76 g	Gluten-free Residual lactose	Standard, p. 880 except bowel fistula. Not suitable for child under 2 years	Flexible pack: 500 mL = £4.04 1000 mL = £7.59 1500 mL = £11.40
Novasource® GI Control (Nestlé)	Liquid (tube feed)	444 kJ (106 kcal) **per 100 mL**	4.1 g cows' milk	14.4 g (sugars 500 mg)	3.5 g (MCT 40 %)	2.2 g	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 500 mL = £4.52
Nutrison® (Nutricia Clinical) Formerly *Nutrison® Standard*	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Bottle: 500 mL = £3.76 Flexible pack: 500 mL = £4.17 1000 mL = £7.32 1500 mL = £10.97

1. Sugar content varies with flavour

A7.1.1.1 Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL *(product list continued)*

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrison® Multi Fibre (Nutricia Clinical)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	1.5 g	Gluten-free Residual lactose	Standard, p. 880 except bowel fistula	Bottle: 500 mL = £4.09 Flexible pack: 500 mL = £4.51 1000 mL = £8.16 1500 mL = £12.25
Osmolite® (Abbott)	Liquid (tube feed)	424 kJ (100 kcal) **per 100 mL**	4 g caseinates soy isolate	13.6 g (sugars 630 mg)	3.4 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Can: 250 mL = £1.83 Bottle: 500 mL = £3.47 1000 mL = £6.62 1500 mL = £9.93
Soya protein formula									
Nutrison® Soya (Nutricia Clinical)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	4 g soy isolate	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose Milk protein-free	Standard, p. 880; *also* cows' milk and protein and lactose intolerance	Bottle: 500 mL = £4.24 Flexible pack: 1000 mL = £8.49
Nutrison® Soya Multi Fibre (Nutricia Clinical)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	4 g soy isolate	12.3 g (sugars 700 mg)	3.9 g	1.5 g	Gluten-free Residual lactose Milk protein-free	Standard, p. 880 except bowel fistula; *also* cows' milk protein and lactose intolerance	Flexible pack: 1500 mL = £14.12
Peptide-based formula									
Peptamen® (Nestlé)	Liquid (sip or tube feed)	420 kJ (100 kcal) **per 100 mL**	4 g whey peptides	12.7 g (sugars 480 mg)[1]	3.7 g (MCT 70 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Cup (vanilla flavour): 200 mL = £2.68 Can (unflavoured)[2]: 375 mL = £4.84 Flexible pack: 500 mL = £5.38 1000 mL = £10.10
Peptisorb® (Nutricia Clinical)	Liquid (tube feed)	425 kJ (100 kcal) **per 100 mL**	4 g whey protein hydrolysate	17.6 g (sugars 1.7 g)	1.7 g (MCT 47 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Bottle: 500 mL = £5.76 Flexible pack: 500 mL = £6.31 1000 mL = £11.41
Survimed® OPD (Fresenius Kabi)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	4.5 g lactalbumin hydrolysate	15 g (sugars 300 mg)	2.4 g (MCT 54 %)	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 880; *also* growth failure	Flexible pack: 500 mL = £5.60

1. Sugar content varies with flavour
2. Flavouring: see *Flavour Mix*, p. 903

A7.1.1.2 Enteral feeds: Less than 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Amino acid formula (essential and non-essential amino acids)									
Elemental 028® Extra (SHS)	Liquid (sip or tube feed)	360 kJ (86 kcal) **per 100 mL**	2.5 g (protein equivalent)	11 g (sugars 4.7 g)	3.5 g (MCT 35%)	Nil		Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Carton: 250 mL = £2.88 Grapefruit, orange-pineapple, summer fruits
	Standard dilution (20%) of powder (sip or tube feed)	374 kJ [1] (89 kcal) **per 100 mL**	2.5 g (protein equivalent)	11.8 g (sugars 1.8 g)	3.5 g (MCT 35%)	Nil			Sachet: 100 g = £5.60 Banana, citrus, orange, unflavoured [2]
Powder provides protein equivalent 12.5 g, carbohydrate 59 g, fat 17.45 g, energy 1871 kJ (443 kcal)/100 g									

1. Minor nutritional variations between flavours—consult product literature
2. Flavouring: see *Modjul® Flavour System*, p. 903

A7.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL

For further information on composition of feeds, see p. 880

A7.1.2.1 Enteral feeds: 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Clinutren® 1.5 (Nestlé)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	5.6 g cows' milk	21 g (sugars 5.2 g) [1]	5 g	less than 500 mg	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 3 years	Plastic cup: 4 × 200 mL = £6.59 Apricot, banana, chocolate, coffee, strawberry-raspberry, vanilla
Clinutren® 1.5 Fibre (Nestlé)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	5.7 g cows' milk	19 g (sugars 6.1 g)	5.9 g	2.6 g	Gluten-free Residual lactose	Standard, p. 880 except bowel fistula Not suitable for child under 3 years	Plastic cup: 4 × 200 mL = £6.59 Plum or vanilla
Fresubin® 2250 Complete (Fresenius Kabi) (Formerly *Fresubin® Energy Fibre*)	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	5.6 g cows' milk	18.8 g (sugars 1.5 g)	5.8 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 880	Flexible pack: 1500 mL = £11.94

1. Sugar content varies with flavour

A7.1.2.1 Enteral feeds: 1.5 kcal/mL and 5 g (or more) protein/100 mL *(product list continued)*

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Energy (Fresenius Kabi)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	5.6 g cows' milk	18.8 g (sugars)[1]	5.8 g	Nil	[2]Gluten-free Residual lactose Contains fish gelatin	Standard, p. 880	Bottle: 200 mL = £1.74 Banana, black currant, cappuccino, chocolate, lemon, neutral, strawberry, tropical fruits, vanilla
	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	5.6 g cows' milk	18.8 g (sugars 1.4 g)	5.8 g	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 880	Flexible pack: 500 mL = £4.10 1000 mL = £8.07 1500 mL = £10.82
Fresubin® Energy Fibre (Fresenius Kabi)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	5.6 g cows' milk	18.8 g (sugars)[1]	5.8 g	2 g	Gluten-free Residual lactose Contains fish gelatin	Standard, p. 880	Bottle: 200 mL = £1.82 Banana, caramel, cherry, chocolate, strawberry, vanilla
	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	5.6 g cows' milk	18.8 g (sugars 1.5 g)	5.8 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 880	Flexible pack: 500 mL = £4.51 1000 mL = £8.59
Fresubin® HP Energy (Fresenius Kabi)	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	7.5 g cows' milk	17 g (sugars 1 g)	5.8 g (MCT 57%)	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 880; *also* CAPD and haemodialysis	Flexible pack: 500 mL = £4.18 1000 mL = £8.38
Isosource® Energy Fibre (Nestlé)	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	4.9 g cows' milk	20.2 g	5.5 g	1.5 g	Gluten-free Residual lactose	Standard, p. 880 except bowel fistula	Flexible pack: 500 mL = £3.96 1000 mL = £7.93
Jevity® 1.5 kcal (Abbott)	Liquid (tube feed)	640 kJ (152 kcal) **per 100 mL**	6.38 g caseinates soy isolate	20.1 g (sugars 1.47 g)	4.9 g	2.2 g	Gluten-free Residual lactose	Standard, p. 880. Not suitable for child under 2 years; not recommended for child 2–10 years	Flexible pack: 500 mL = £4.78 1000 mL = £9.14 1500 mL = £14.26
Novasource® GI Forte (Nestlé)	Liquid (tube feed)	631 kJ (150 kcal) **per 100 mL**	6 g cows' milk	18.3 g (sugars 1.8 g)	5.9 g	2.2 g	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 500 mL = £4.49 1000 mL = £8.98

1. Sugar content varies with flavour
2. Strawberry flavour may contain traces of wheat starch and egg

Nutrison® Energy (Nutricia Clinical)	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	6 g cows' milk	18.5 g (sugars 1.5 g)	5.8 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Bottle: 500 mL = £4.38 Flexible pack: 500 mL = £4.86 1000 mL = £8.81 1500 mL = £13.18
Nutrison® Energy Multi Fibre (Nutricia Clinical)	Liquid (tube feed)	630 kJ (150 kcal) **per 100 mL**	6 g cows' milk	18.5 g (sugars 1.5 g)	5.8 g	1.5 g	Gluten-free Residual lactose	Standard, p. 880	Bottle: 500 mL = £4.90 Flexible pack: 500 mL = £5.39 1000 mL = £9.77 1500 mL = £15.66
Osmolite® 1.5 kcal (Abbott) Formerly *Ensure® Plus* (Ready to Hang)	Liquid (tube feed)	632 kJ (150 kcal) **per 100 mL**	6.25 g cows' milk soya protein isolate	20 g (sugars 4.9 g)	5 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 500 mL = £4.15 1000 mL = £8.10 1500 mL = £12.13

A7.1.2.2 Enteral feeds: Less than 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® 1000 Complete (Fresenius Kabi)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	5.5 g cows' milk	12.5 g (sugars 1.1 g)	3.1 g	2 g	Gluten-free Residual lactose Contains fish oil	Standard, p. 880	Flexible pack: 1000 mL = £8.59
Fresubin® 1200 Complete (Fresenius Kabi)	Liquid (tube feed)	500 kJ (120 kcal) **per 100 mL**	6 g cows' milk	15 g (sugars 1.22 g)	4.1 g	2 g	Gluten-free Residual lactose Contains fish oil	Standard, p. 880	Flexible pack: 1000 mL = £11.12
Jevity® Plus (Abbott)	Liquid (tube feed)	504 kJ (120 kcal) **per 100 mL**	5.5 g caseinates soy isolates	15.1 g (sugars 890 mg)	3.93 g	2.2 g	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 2 years; not recommended for child 2–10 years	Flexible pack: 500 mL = £4.35 1000 mL = £8.90 1500 mL = £13.36
Jevity® Promote (Abbott)	Liquid (tube feed)	427 kJ (101 kcal) **per 100 mL**	5.55 g caseinates soy isolates	12 g (sugars 670 mg)	3.32 g	1.7 g	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 2 years; not recommended for child 2–10 years	Flexible pack: 1000 mL = £8.70
Nutrison® MCT (Nutricia Clinical)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	5 g cows' milk	12.6 g (sugars 1 g)	3.3 g (MCT 61%)	Nil	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 1000 mL = £7.96

A7.1.2.2 Enteral feeds: Less than 1.5 kcal/mL and 5 g (or more) protein/100 mL *(product list continued)*

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrison® Protein Plus (Nutricia Clinical)	Liquid (tube feed)	525 kJ (125 kcal) **per 100 mL**	6.3 g cows' milk	14.2 g (sugars 1.1 g)	4.9 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 1000 mL = £8.19
Nutrison® Protein Plus Multi Fibre (Nutricia Clinical)	Liquid (tube feed)	525 kJ (125 kcal) **per 100 mL**	6.3 g cow's milk	14.1 g (sugars 1.1 g)	4.9 g	1.5 g	Gluten-free Residual lactose	Disease-related malnutrition	Flexible pack: 1000 mL = £9.12
Nutrison® 1000 Complete Multi Fibre (Nutricia Clinical)	Liquid (tube feed)	420 kJ (100 kcal) **per 100 mL**	5.5 g cows' milk	11.3 g (sugars 700 mg)	3.7 g	2 g	Gluten-free Residual lactose	Disease-related malnutrition in patients with low energy and/or low fluid requirements	Flexible pack: 1000 mL = £8.85
Nutrison® 1200 Complete Multi Fibre (Nutricia Clinical)	Liquid (tube feed)	505 kJ (120 kcal) **per 100 mL**	5.5 g cows' milk	15 g (sugars 1.2 g)	4.3 g	2 g	Gluten-free Residual lactose	Standard, p. 880 except bowel fistula	Bottle: 500 mL = £4.69 Flexible pack: 1000 mL = £9.37 1500 mL = £14.07
Osmolite® Plus (Abbott)	Liquid (tube feed)	508 kJ (121 kcal) **per 100 mL**	5.55 g caseinates	15.8 g (sugars 730 mg)	3.93 g	Nil	Gluten-free Residual lactose	Standard, p. 880 Not recommended for child under 10 years	Flexible pack: 500 mL = £4.06 1000 mL = £7.83 1500 mL = £11.73
Peptamen® HN (Nestlé)	Liquid (tube feed)	556 kJ (133 kcal) **per 100 mL**	6.6 g whey protein hydrolysates	15.6 g (sugars 1.4 g)	4.9 g (MCT 70%)	Nil	Gluten-free Residual lactose Hydrolysed with pork trypsin	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula Not suitable for child under 3 years	Flexible pack: 500 mL = £5.97
Perative® (Abbott)	Liquid (sip or tube feed)	552 kJ (131 kcal) **per 100 mL**	6.7 g caseinate whey protein hydrolysates	17.7 g (sugars 660 mg)	3.7 g (MCT 42%)	Nil	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 5 years	Flexible pack: 500 mL = £5.66 1000 mL = £11.32

A7.1.2.3 Enteral feeds: More than 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Ensure® Twocal (Abbott)	Liquid (sip or tube feed)	838 kJ (200 kcal) **per 100 mL**	8.4 g cows' milk	21 g (sugars 4.5 g)	8.9 g	1 g	Gluten-free Residual lactose	Standard, p. 880; *also* haemodialysis, CAPD	Bottle: 200 mL = £2.08 Banana, neutral, strawberry, vanilla
Isosource® Energy (Nestlé)	Liquid (tube feed)	670 kJ (160 kcal) **per 100 mL**	5.7 g cows' milk	20 g	6.2 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Flexible pack: 500 mL = £3.66 1000 mL = £7.31

A7.1.3 Enteral feeds (non-disease specific): Child under 12 years *see BNF for Children*

A7.2 Nutritional supplements (non-disease specific)

A7.2.1 Nutritional supplements: less than 5 g protein/100 mL

For further information on composition of feeds, see p. 880

A7.2.1.1 Nutritional supplements: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year; use with caution in child 1–5 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Ensure® (Abbott)	Liquid (sip or tube feed)	423 kJ (100 kcal)[1] **per 100 mL**	4 g caseinates soy isolate	13.6 g (sugars 3.93 g)	3.36 g	Nil	Gluten-free Residual lactose	Standard, p. 880	Can: 250 mL = £2.01 Chocolate, vanilla

1. Nutritional values vary with flavour—consult product literature

A7.2.1.2 Nutritional supplements: More than 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year; use with caution in child 1–5 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Clinutren® Fruit (Nestlé)	Liquid (sip feed)	520 kJ (125 kcal) **per 100 mL**	4 g whey protein hydrolysate	27 g (sugars 9.5 g[1])	less than 200 mg	less than 200 mg[2]	Gluten-free Residual lactose Non-milk taste	Standard, p. 880 Not suitable for child under 3 years	Carton: 4 × 200 mL = £6.63 Apple, grapefruit, orange, pear-cherry, raspberry-black currant
Ensure® Plus Juce (Abbott)	Liquid (sip feed)	638 kJ (150 kcal) **per 100 mL**	4.8 g whey protein isolate	32.7 g (sugars 9.4 g[1])	Nil	Nil	Gluten-free Residual lactose Non-milk taste	Standard, p. 880	Bottle: 220 mL = £1.75 Apple, fruit punch, grapefruit, lemon-lime, orange, peach, pine-apple, strawberry
Fortijuce® (Nutricia Clinical)	Liquid (sip feed)	640 kJ (150 kcal) **per 100 mL**	4.0 g cows' milk	33.5 g (sugars 13.1 g[1])	Nil	Nil	Gluten-free Residual lactose Non-milk taste	Standard, p. 880 Not suitable for child under 3 years	Bottle: 200 mL = £1.85 Apple, black currant, forest fruits, lemon, orange, strawberry, tropical Starter pack (mixed): 4 × 200 mL = £7.40
Provide® Xtra Juice Drink (Fresenius Kabi)	Liquid (sip feed)	525 kJ (125 kcal) **per 100 mL**	3.75 g pea and soya protein hydrolysates	27.5 g[1]	Nil	Nil[2]	Gluten-free Lactose-free Non-milk taste Sweet-flavoured products contain fish gelatin	Standard, p. 880	Bottle: 200 mL = £1.71 Apple, black currant, carrot-apple, cherry, citrus-cola, lemon-lime, melon, orange-pineapple, tomato
Resource® Dessert Energy (Nestlé)	Semi-solid	671 kJ (160 kcal) **per 100 g**	4.8 g cows' milk	21.2 g (sugars 9.9 g[1])	6.2 g	Nil	Gluten-free Contains lactose	Standard, p. 880; *also* CAPD, haemodialysis	Cup: 125 g = £1.35 Caramel, chocolate, vanilla
Resource® Fruit Flavour Drink (Nestlé)	Liquid (sip feed)	638 kJ (150 kcal) **per 100 mL**	4.0 g cows' milk	33.5 g (sugars 8 g[1])	Nil	Nil	Gluten-free Residual lactose Non-milk taste	Standard, p. 880 Not suitable for child under 3 years	Carton: 200 mL = £1.53 Apple, orange, pineapple

1. Sugar content varies with flavour
2. Fibre content varies with flavour

A7.2.2 Nutritional supplements: 5 g (or more) protein/100 mL

For further information on composition of feeds, see p. 880

A7.2.2.1 Nutritional supplements: 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year; use with caution in child 1–5 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Ensure® Plus Fibre (Abbott)	Liquid (sip or tube feed)	642 kJ (153 kcal)[1] **per 100 mL**	6.25 g cows' milk soya protein isolate	20.2 g (sugars 5.5 g)	4.92 g	2.5 g	Gluten-free Residual lactose	Standard, p. 880; *also* CAPD, haemodialysis	Bottle: 200 mL = £1.80 Banana, chocolate, fruits of the forest, raspberry, strawberry, vanilla
Ensure® Plus Milkshake style (Abbott)	Liquid (sip or tube feed)	632 kJ (150 kcal)[1] **per 100 mL**	6.25 g cows' milk soya protein isolate	20.2 g (sugars 5.6 g)	4.92 g	Nil	Gluten-free Residual lactose	Standard, p. 880; *also* CAPD, haemodialysis	Can: 250 mL = £2.28 (vanilla) 250 mL = £2.28 (chicken or mushroom) Bottle: 220 mL = £1.80 Banana, black currant, caramel, chocolate, coffee, fruits of the forest, orange, peach, raspberry, strawberry, vanilla, neutral
Ensure® Plus Yoghurt style (Abbott)	Liquid (sip feed)	632 kJ (150 kcal)[1] **per 100 mL**	6.25 g cows' milk	20.2 g (sugars 11.7 g)	4.92 g	Nil	Gluten-free Residual lactose	Standard, p. 880; *also* CAPD, haemodialysis	Bottle: 220 mL = £1.80 Orange, peach, pineapple, strawberry
Ensure® Plus Commence (Abbott)	Starter pack (5–10 day's supply), contains: *Ensure® Plus Milkshake Style* (various flavours), 1 pack (10 × 220-mL) = £18.00.								
Enmix® Plus Commence (Abbott)	Starter pack (5–10 day's supply), contains: *Ensure® Plus* (Milkshake, Yoghurt, & Juce style; various flavours), 1 pack (10 × 220-mL) = £18.00.								
Fortisip® Bottle (Nutricia Clinical)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	6 g cows' milk	18.4 g[2]	5.8 g	Nil	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 3 years	Bottle: 200 mL = £1.85 Banana, chocolate, neutral, orange, strawberry, toffee, tropical fruits, vanilla

1. Minor nutritional variations between flavours—consult product literature
2. Sugar content varies with flavour

A7.2.2.1 Nutritional supplements: 1.5 kcal/mL and 5 g (or more) protein/100 mL *(product list continued)*

Not suitable for use in child under 1 year; use with caution in child 1–5 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fortisip® Multi Fibre (Nutricia Clinical)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	6 g cows' milk	18.4 g (sugars 7.0 g)	5.8 g	2.3 g	Gluten-free Residual lactose	Standard, p. 880 Not suitable for child under 3 years	Bottle: 200 mL = £1.91 Banana, chocolate, orange, strawberry, tomato, vanilla
Fortisip® Yogurt Style (Nutricia Clinical)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	6 g cows' milk	18.7 g (sugars 10.8 g)	5.8 g	200 mg	Gluten-free Contains lactose	Standard, p. 880 Not suitable for child under 3 years	Bottle: 200 mL = £1.85 Peach-orange, raspberry, vanilla-lemon
Fortisip® Range (Nutricia Clinical)	Starter pack contains 4 × *Fortisip®* Bottle, 4 × *Fortijuce®*, 2 × *Fortisip®* Yogurt Style, 1 pack (10 × 200 mL) = £18.50.								
Fresubin® Protein Energy Drink (Fresenius Kabi)	Liquid (sip feed)	630 kJ (150 kcal) **per 100 mL**	10 g cows' milk	12.4 g (sugars 6.4 g[1])	6.7 g	Nil[2]	Gluten-free Residual lactose Contains fish gelatin	Standard, p. 880; *also* CAPD, haemodialysis	Bottle: 200 mL = £1.77 Cappuccino, chocolate, strawberry, tropical fruits, vanilla

1. Sugar content varies with flavour
2. Fibre content varies with flavour

A7.2.2.2 Nutritional supplements: Less than 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year; use with caution in child 1–5 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Clinutren® Dessert (Nestlé)	Semi-solid	520 kJ (125 kcal) **per 100 g**	9.5 g cows' milk	15.5 g (sugars 14 g[1])	2.6 g	500 mg[2]	Gluten-free Contains lactose	Standard, p. 880; *also* CAPD, haemodialysis Not suitable for child under 3 years	Pot: 4 × 125 g = £5.40 Caramel, chocolate, peach, vanilla

1. Sugar content varies with flavour
2. Fibre content varies with flavour

Ensure® Plus Crème (Abbott)	Semi-solid	574 kJ (137 kcal)[1] **per 100 g**	5.68 g milk protein isolate soy protein isolate	18.4 g (sugars 12.4 g)	4.47 g	Nil	Gluten-free Residual lactose Contains soya	Standard, p. 880; *also* CAPD, haemodialysis Not suitable for child under 3 years	Pot: 125 g = £1.67 Banana, chocolate, neutral, vanilla
Fortimel® Regular (Abbott) (Formerly *Fortimel®*)	Liquid (sip feed)	420 kJ (100 kcal) **per 100 mL**	10 g cows' milk	10.3 g (sugars 8.1 g[2])	2.1 g	Nil	Gluten-free Contains lactose	Standard, p. 880 Not suitable for child under 3 years	Bottle: 200 mL = £1.57 Chocolate, forest fruits, strawberry, vanilla
Fortisip® Fruit Dessert (Nutricia Clinical)	Semi-Solid	560 kJ (133 kcal) **per 100 g**	7 g whey isolate	16.7 g (sugars 11.3 g[2])	4 g	2.6 g	Residual lactose Gluten-free	Standard, p. 880 except bowel fistula; *also* CAPD, haemodialysis Not suitable for child under 3 years	Pot: 3 × 150 g = £6.49 Apple 3 × 150 g = £6.49 Strawberry
Resource® Protein (Nestlé)	Liquid (sip feed)	530 kJ (125 kcal)[3] **per 100 mL**	9.4 g cows' milk	14 g (sugars 4.5 g)	3.5 g	Nil	Gluten-free Contains lactose	Standard, p. 880 Not suitable for child under 3 years	Bottle: 200 mL = £1.33 Apricot, chocolate, forest fruits, strawberry, vanilla

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Alicalm® (SHS)	Standard dilution (30%) of powder	567 kJ (135 kcal) **per 100 mL**	4.5 g caseinate whey	17.4 g (sugars 3.2 g)	5.3 g	Nil	Residual lactose	Crohn's disease Not suitable for child under 1 year; use as nutritional supplement only in children 1–6 years.	Powder: 400 g = £16.85 Vanilla
Powder provides: protein 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g									
Casilan® 90 (Heinz)	Powder	1572 kJ (370 kcal) **per 100 g**	90 g cows' milk	300 mg	1 g	Nil	Gluten-free Electrolytes/100 g: Na^+ 1.3 mmol K^+ 8.7 mmol Ca^{2+} 35 mmol P^+ 22.6 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 250 g = £5.90
Forticare® (Nutricia Clinical)	Liquid (sip feed)	675 kJ (160 kcal) **per 100 mL**	9 g cows' milk	19.1 g (sugars 13.6 g)	5.3 g	2.1 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement in patients with lung cancer undergoing chemotherapy, or with pancreatic cancer Not suitable in child under 3 years	Carton: 125 mL = £1.98 Cappuccino, orange-lemon, peach-ginger .
Generaid® (SHS)	Powder	1586 kJ (374 kcal) **per 100 g**	76 g protein equivalent (whey protein, plus branched chain amino acids)	5 g (sugars 5 g)	5.5 g	Nil	Electrolytes/100 g: Na^+ 6.1 mmol K^+ 10.8 mmol Ca^{2+} 6.5 mmol P^+ 6.45 mmol	Nutritional supplement for use in chronic liver disease and/or porto-hepatic encephalopathy	Tub: 200 g = £23.97 Unflavoured[1]

1. Flavouring: see *Modjul® Flavour System*, p. 903

Generaid® Plus (SHS)	Standard dilution (22%) of powder	428 kJ (102 kcal) **per 100 mL**	2.4 g protein equivalent (whey protein, branched chain amino acids)	13.6 g (sugars 1.4 g)	4.2 g (MCT 32%)	Nil	Electrolytes/100 mL: Na^+ 0.7 mmol K^+ 2.7 mmol Ca^{2+} 1.72 mmol P^+ 1.67 mmol	A sole source of nutrition or nutritional supplement in children over 1 year with hepatic disorders	Can: 400 g = £17.15 Unflavoured[1] (5-g measuring scoop provided)
Powder provides: protein equivalent 11 g, carbohydrate 62 g, fat 19 g, energy 1944 kJ (463 kcal)/100 g									
KetoCal® (SHS)	Standard dilution (20%) of powder	602 kJ (146 kcal) **per 100 mL**	3.1 g cows' milk with additional amino acids	600 mg (sugars 120 mg)	14.6 g (LCT 100%)	Nil	Electrolytes/100 mL: Na^+ 4.3 mmol K^+ 4.1 mmol Ca^{2+} 2.15 mmol P^+ 2.77 mmol	Sole source of nutrition or nutritional supplement as part of ketogenic diet in management of epilepsy resistant to drug therapy, in children over 1 year, only on the advice of secondary care physician with experience of ketogenic diet	Can: 300 g = £23.87 Vanilla, Unflavoured
Powder provides: protein 15.25 g, carbohydrate 3 g, fat 73 g, energy 3011 kJ (730 kcal)/100 g									
Kindergen® (SHS)	Standard dilution (20%) of powder	421 kJ (101 kcal) **per 100 mL**	1.5 g whey protein	11.8 mg (sugars 1.2 g)	5.3 g (LCT 93%)	Nil	Electrolytes/100 mL: Na^+ 2 mmol K^+ 0.6 mmol Ca^{2+} 2.8 mmol P^+ 3 mmol Low Vitamin A	Sole source of nutrition or nutritional supplement for infants and children with chronic renal failure receiving peritoneal rapid overnight dialysis	Tub: 400 g = £22.77 (5-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 59 g, fat 26.3 g, energy 2104 kJ (504 kcal)/100 g									
Medium-chain Triglyceride (MCT) Oil	Liquid	3515 kJ (855 kcal) **per 100 mL**	Nil	Nil	MCT 100 %	Nil		Nutritional supplement for steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease and liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in management of epilepsy, type 1 hyperlipoproteinaemia	Bottle: 500 mL = £11.50
Modulen IBD® (Nestlé)	Standard dilution (20%) of powder (sip or tube feed)	420 kJ (100 kcal) **per 100 mL**	3.6 g casein	11 g (sugars 3.98 g)	4.7 g	Nil	Gluten-free Residual lactose	Crohn's disease active phase, and in remission if malnourished	Can: 400 g = £13.60 Unflavoured[2] (8.3-g measuring scoop provided)
Powder provides: protein 18 g, carbohydrate 54 g, fat 23 g, 2070 kJ (500 kcal)/100 g

2. Flavouring: see *Flavour Mix*, p. 903

A7.3.2 Specialised formulas for specific clinical conditions *(product list continued)*

For further information on composition of feeds, see p. 880

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nepro® (Abbott)	Liquid (sip or tube feed)	838 kJ (200 kcal)[1] **per 100 mL**	7 g cows' milk	20.6 g (sugars 3.26 g)	9.6 g	1.56 g	Gluten-free Residual lactose Electrolytes/100 mL: Na^+ 3.67 mmol K^+ 2.72 mmol Ca^{2+} 3.43 mmol P^+ 2.23 mmol	Sole source of nutrition or nutritional supplement in patients with chronic renal failure who are on haemodialysis or CAPD, or with cirrhosis, or other conditions requiring a high energy, low fluid, low electrolyte diet. Not suitable for child under 1 year; use with caution in child 1–5 years	Carton: 200 mL = £2.34 Strawberry, vanilla Flexible pack: 500 mL = £5.07 Vanilla
ProSure® (Abbott)	Liquid (sip or tube feed)	529 kJ (125 kcal)[1] **per 100 mL**	6.65 g cows' milk	18.3 g (sugars 2.95 g)	2.56 g	2.07 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement for patients with pancreatic cancer Not suitable for child under 1 year; use with caution in child 1–4 years	Carton: 240 mL = £2.77 Banana, vanilla
Protifar® (Nutricia Clinical) Powder provides: protein 2.2 g per 2.5 g	Powder	1580 kJ (373 kcal) **per 100 g**	88.5 g cows' milk	less than 1.5 g	1.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na^+ 1.3 mmol K^+ 1.28 mmol Ca^{2+} 33.75 mmol P^+ 22.58 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 225 g = £7.44 Unflavoured (2.5-g measuring scoop provided)
Renamil® (KoRa)	Powder (sip or tube feed when reconstituted)	2003 kJ (477 kcal) **per 100 g**	4.6 g cows' milk	70.8 g	19.3 g	Nil	Contains lactose Gluten-free Electrolytes/100 g: Na^+ 1.04 mmol K^+ 0.13 mmol Ca^{2+} 10.22 mmol P^+ 1.06 mmol Contains no vitamin A or vitamin D	Sole source of nutrition or nutritional supplement for adults and children over 1 year with chronic renal failure	Sachet: 10 × 100 g = £25.40

1. Minor nutritional variations between flavours—consult product literature

Renapro® (KoRa)	Powder	1580 kJ (372 kcal) **per 100 g**	90 g whey protein	800 mg	1 g	Nil	Gluten-free Residual lactose Electrolytes/100 g: Na^+ 23 mmol K^+ 2 mmol Ca^{2+} 4.99 mmol P^+ 4.84 mmol	Nutritional supplement for bio-chemically proven hypoprotein-aemia and patients undergoing dialysis Not suitable for child under 1 year	Sachet: 30 × 20 g = £69.60
Powder provides: protein 18 g, energy 316 kJ (74 kcal)/20-g sachet									
Renastart® (Vitaflo)	Standard dilution (20%) of powder	411 kJ (98 kcal) **per 100 mL**	1.5 g cows' milk soya	12.6 g (sugars 1.2 g)	4.6 g	Nil	Contains lactose Electrolytes/100 mL: Na^+ 2.1 mmol K^+ 0.6 mmol Ca^{2+} 0.58 mmol P^+ 0.58 mmol	Dietary management of renal failure in neonates and children 1 month–10 years	Powder: 10 × 100 g = £56.93 Unflavoured (7-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 63 g, fat 23.2 g, energy 2053 kJ (491 kcal)/100 g									
Respifor® (Nutricia Clinical)	Liquid (sip feed)	633 kJ (150 kcal) **per 100 mL**	7.5 g cows' milk	22.5 g (sugars 6.4 g[1])	3.3 g	Nil[2]	Contains lactose	Nutritional supplement for dietary management of disease-related malnutrition in patients with chronic obstructive pulmonary disease and body-mass index less than 20. Not suitable for child under 3 years; caution in child 3–5 years	Bottle: 125 mL = £1.85 Chocolate, strawberry, vanilla
Suplena® (Abbott)	Liquid (sip or tube feed)	840 kJ (200 kcal) **per 100 mL**	3 g caseinates	25.5 g (sugars 2.7 g)	9.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na^+ 3.39 mmol K^+ 2.87 mmol Ca^{2+} 3.48 mmol P^+ 2.39 mmol	A sole source of nutrition or nutri-tional supplement in patients with chronic or acute renal failure who are not undergoing dialysis, or with chronic or acute liver disease with fluid restriction; other conditions requiring high energy, low protein, low electrolyte, low volume enteral feed Not suitable for child under 1 year; use with caution in child 1–5 years	Can: 237 mL = £2.40 Vanilla

A7.4 Feed supplements

A7.4.1 High-energy supplements

For further information on composition of feeds, see p. 880

A7.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

ACBS Indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Caloreen® (Nestlé)	Powder	1640 kJ (390 kcal) **per 100 g**	Nil	96 g Maltodextrin	Nil	Nil	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Powder: 500 g = £3.42 Unflavoured (10-g measuring scoop provided)
Maxijul® Super Soluble (SHS)	Powder	1615 kJ (380 kcal) **per 100 g**	Nil	95 g Glucose polymer (sugars 8.6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Sachets: 4 × 132 g = £5.04 Can: 200 g = £1.96 2.5 kg = £17.94 25 kg = £121.85 Unflavoured
Maxijul® Liquid (SHS)	Liquid	850 kJ (200 kcal) **per 100 mL**	Nil	50 g Glucose polymer (sugars 4.5 g[1])	Nil	Nil	Gluten-free Lactose-free	See above	Carton: 200 mL = £1.28 Orange, unflavoured
Polycal® (Nutricia Clinical)	Powder	1630 kJ (384 kcal) **per 100 g**	Nil	96 g Maltodextrin (sugars 6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £3.66 Neutral (5-g measuring scoop provided)
	Liquid	1050 kJ (247 kcal) **per 100 mL**	Nil	61.9 g Maltodextrin (sugars 12.2 g)	Nil	Nil		Liquid not suitable for child under 3 years	Bottle: 200 mL = £1.46 Neutral, orange
Vitajoule® (Vitaflo)	Powder	1610 kJ (380 kcal) **per 100 g**	Nil	96 g Dried glucose syrup	Nil	Nil	Gluten-free Lactose-free	See above	Can: 500 g = £3.58 2.5 kg = £17.65 25 kg = £105.03 (10-g measuring scoop provided)

1. Sugar content varies with flavour

A7.4.1.2 High-energy supplements: fat

Liquid supplements should be diluted before use in child under 5 years

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen® (Nutricia Clinical)	Liquid (emulsion)	1850 kJ (450 kcal)[1] **per 100 mL**	Nil	100 mg	50 g (LCT 100%)	Nil	Gluten-free Lactose-free	See above	Bottle: 200 mL = £3.91 500 mL = £9.60 Banana[2], neutral, strawberry[2]
Liquigen® (SHS)	Liquid (emulsion)	1850 kJ (450 kcal) **per 100 mL**	Nil	Nil	50 g (MCT 97%) Fractionated coconut oil	Nil	Gluten-free Lactose-free	Steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in epilepsy, and in type 1 lipoproteinaemia Not suitable for child under 1 year	Bottle: 250 mL = £7.26
Fat and Carbohydrate									
Duobar® (SHS)	Bar	1211 kJ (292 kcal) **per 45 g**	Less than 20 mg	22.5 g (sucrose)	22.5 g	Nil	Contains phenylalanine 180 micrograms/45-g bar Gluten-free Lactose-free	See above	Bar: 45 g = £1.54 Neutral, strawberry, toffee
Duocal® (SHS)	Liquid	695 kJ (166 kcal) **per 100 mL**	Nil	23.7 g (sugars 2.1 g)	7.9 g (MCT 30%)	Nil	Contains vitamin E	See above	Bottle: 250 mL = £3.14
Duocal® Super Soluble (SHS)	Powder	2061 kJ (492 kcal) **per 100 g**	Nil	72.7 g (sugars 6.5 g)	22.3 g (MCT 35%)	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £14.16 (5-g measuring scoop provided)
Energivit® (SHS)	Standard dilution (15%) of powder	309 kJ (74 kcal) **per 100 mL**	Nil	10 g (sugars 900 mg)	3.75 g	Nil	Lactose-free With vitamins, minerals, and trace elements	For children requiring additional energy, vitamins, minerals, and trace elements following a protein-restricted diet	Can: 400 g = £17.23 (5-g measuring scoop provided)

Powder provides: carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g

1. Nutritional values vary with flavour—consult product literature
2. Flavour not suitable for child under 3 years

A7.4.1.2 High-energy supplements: fat *(product list continued)*

Liquid supplements should be diluted before use in child under 5 years

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
MCT Duocal® (SHS)	Powder	2082 kJ (497 kcal) **per 100 g**	Nil	72 g (sugars 10.1 g)	23.2 g (MCT 83%)	Nil		See above	Can: 400 g = £16.84

A7.4.1.3 High-energy supplements: protein

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Vitapro® (Vitaflo)	Powder	1506 kJ (360 kcal) **per 100 g**	75 g whey protein isolate	9 g	6 g	Nil	Contains lactose	Biochemically proven hypoproteinaemia	Tub: 250 g = £7.31 2 kg = £57.40 (5-g measuring scoop provided)
Protein and carbohydrate									
Dialamine® (SHS)	Standard dilution (20%) of powder	264 kJ (62 kcal) **per 100 mL**	4.3 g protein equivalent (essential and non-essential amino acids)	11.2 g (sugars 10.2 g)	Nil	Nil	Contains vitamin C	Hypoproteinaemia, chronic renal failure, wound fistula leakage with excessive protein loss, conditions requiring a controlled nitrogen intake, and haemodialysis Not suitable for child under 6 months	Can: 400 g = £57.53 Orange
Powder provides: protein equivalent 25 g, carbohydrate 65 g, vitamin C 125 mg, energy 1530 kJ (360 kcal)/100 g									
Protein, fat, and carbohydrate									
Calogen® Extra (Nutricia Clinical)	Liquid	1650 kJ (400 kcal) **per 100 mL**	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Residual lactose With vitamins, minerals, and trace elements	See above Not suitable for child under 3 years; may require dilution for child 3–5 years	Bottle: 200 mL = £4.45 Neutral, strawberry
Calshake® (Fresenius Kabi)	Powder	1841 kJ (439 kcal)[1] **per 87 g**	4.1 g cows' milk	56.4 g (sugars 20 g)	22 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year	Sachet: 87 g = £1.96 Banana, neutral, strawberry, vanilla 90 g = £1.96 Chocolate
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 12 g									

1. Nutritional values vary with flavour—consult product literature

Enshake® (Abbott)	Powder	1893 kJ (450 kcal[1]) **per 100 g**	8.4 g cows' milk, soy protein isolate	69 g (sugars 14.5 g)	15.6 g	Nil	Residual lactose With vitamins and minerals	See above Not suitable for child under 1 year; use with caution in child 1–6 years	Sachet: 96.5 g = £1.92 Banana, chocolate, strawberry, vanilla
Powder: 96.5 g reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 16 g									
Pro-Cal® (Vitaflo)	Powder	2788 kJ (667 kcal) **per 100 g**	13.5 g cows' milk	27 g	56 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Sachets: 25 × 15 g = £13.21 Tub: 510 g = £12.24 1.5 kg = £24.94 12.5 kg = £177.29 25 kg = £273.21 (15-g measuring scoop provided)
Powder 15 g provides: protein 2 g, carbohydrate 4 g, fat 8.4 g, energy 418 kJ (100 kcal)									
Pro-Cal® Shot (Vitaflo)	Liquid	1393 kJ (334 kcal) **per 100 mL**	6.7 g cows' milk	13.4 g	28.2 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Bottle: 6 × 250 mL = £26.22 Banana, neutral, strawberry[2]
QuickCal® (Vitaflo)	Powder	3263 kJ (780 kcal) **per 100 g**	4.6 g cows' milk	17 g	77 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Sachets: 25 × 13 g = £11.89
Powder 13 g provides: protein 600 mg, carbohydrate 2.2 g, fat 10 g, energy 418 kJ (100 kcal)									
Scandishake® Mix (Nutricia Clinical)	Powder	2099 kJ (500 kcal)[1] **per 100 g**	4.7 g cows' milk	65 g (sugars 14.3 g)	24.7 g	Nil	Gluten-free Contains lactose	See above Not suitable for child under 3 years	Sachet: 85 g = £2.08 Banana, caramel, chocolate, strawberry, vanilla, unflavoured
Powder: 85 g reconstituted with 240 mL whole milk provides: protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal)									
Vitasavoury® (Vitaflo)	Powder	2590 kJ (619 kcal)[1] **per 100 g**	12.7 g cows' milk	23.5 g (sugars 1.5 g)	52.3 g	6.2 g	Contains lactose	See above Not suitable for child under 3 years	Cup (200 kcal): 24 × 33 g = £26.53 Sachet (300 kcal) 10 × 50 g = £15.99 Chicken, leek and potato, mushroom, vegetable

1. Nutritional values vary with flavour—consult product literature
2. Flavour not suitable for child under 3 years

A7.4.2 Fibre, vitamin, and mineral supplements

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
High-fibre supplements									
Resource® Benefiber® (Nestlé)	Powder	323 kJ (76 kcal) **per 100 g**	Nil	19 g guar gum, partially hydrolysed	Nil	78 g	Gluten-free Lactose-free	Standard, p. 880 except dysphagia Not suitable for child under 5 years	Sachets 16 x 8 g = £5.72 Can: 250 g = £8.76 (5-g measuring scoop provided)
Vitamin and Mineral supplements									
Metabolic Mineral Mixture® (SHS)	Powder	729 kJ (175 kcal) **per 100 g**	Nil	Nil	Nil	Nil	Contains trace elements Electrolytes/100 g: Na^+ 172 mmol K^+ 212 mmol Ca^{2+} 205 mmol P^+ 192 mmol Energy source: Calcium lactate	Mineral supplement for synthetic diets Suitable for infants (but may require further dilution)	Tub: 100 g = £9.94
Paediatric Seravit® (SHS)	Powder	1275 kJ (300 kcal) **per 100 g**	Nil	75 g (sugars 6.75 g)[1]	Nil	Nil		Vitamin and mineral supplement in infants and children with restrictive therapeutic diets	Tub: 200 g = £14.03 Unflavoured[2] 200 g = £14.94 Pineapple[3] (5-g measuring scoop provided)

1. Sugar content varies with flavour
2. Flavouring: see *Modjul® Flavour System*, p. 903
3. Flavour not suitable for child under 3 years

A7.5 Feed additives

A7.5.1 Special foods for conditions of intolerance

Colief® (Forum)

Liquid, lactase 50 000 units/g, Net price 7-mL dropper bottle = £7.00

For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature

Fructose (Laevulose)

For proven glucose/galactose intolerance

VSL#3® (Ferring)

Powder, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose. Net price 30 × 4.4-g sachets = £32.98

Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature

A7.5.2 Feed thickeners and pre-thickened foods

For pre-thickened infant feeds see *BNF for Children* (Appendix 2)

Carobel, Instant® (Cow & Gate)

Powder, carob seed flour. Net price 135 g = £2.92

For thickening feeds in the treatment of vomiting

Nutilis® (Nutricia Clinical)

Powder, modified maize starch, gluten- and lactose-free, Net price 20 × 9-g sachets = £5.88; 225 g = £4.51.

For thickening of foods in dysphagia. Not suitable for children under 3 years

Resource® Thickened Drink (Nestlé)

Liquid, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 375 kJ (89 kcal)/100 mL. Syrup and custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.08.

For dysphagia. Not suitable for children under 1 year

Resource® ThickenUp® (Nestlé)

Powder, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.11; 75 × 4.5-g sachet = £15.75.

For thickening of foods in dysphagia. Not suitable for children under 1 year

SLO Drinks® (SLO Drinks)

Powder, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange, or peach, net price 25 × 115 mL = £7.50.

Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

Thick and Easy® (Fresenius Kabi)

Powder. Modified maize starch, net price 225-g can = £4.35; 100 × 9-g sachets = £26.35; 4.54 kg = £70.53.

Thickened Juices, liquid, modified food starch. Flavours: apple, orange, net price 118-mL pot = 57p; apple, black currant, cranberry, kiwi-strawberry, and orange, 1.42-litre bottle = £3.61.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Thixo-D® (Sutherland)

Powder, modified maize starch, gluten-free. Net price 375-g tub = £6.75.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Vitaquick® (Vitaflo)

Powder. Modified maize starch. Net price 300 g = £6.59; 2 kg = £33.57; 6 kg = £85.90.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

A7.5.3 Flavouring preparations

Flavour Mix® (Nestlé)

Powder. Flavours: banana, chocolate, coffee, lemon-lime, strawberry. Net price 60 g = £5.62

FlavourPac® (Vitaflo)

Powder, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £11.29

For use with Vitaflo's range of unflavoured protein substitutes for metabolic diseases

Modjul® Flavour System (SHS)

Powder, flavours: black currant, orange, pineapple, 100 g = £9.54; cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £9.54.

For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months

A7.6 Foods for special diets

A7.6.1 Gluten-free foods

ACBS indications: gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

Aproten® (Ultrapharm)

Gluten-free. Flour. Net price 500 g = £4.99.

Barkat® (Gluten Free Foods Ltd)

Gluten-free. Baguettes (par-baked), net price 200 g = £3.36. Bread (white, sliced, par-baked), 300 g = £2.70; country loaf (par-baked, sliced), 250 g = £3.36; rolls (par-baked), 200 g = £2.48. Bread mix, 500 g = £5.74. Multi Grain Bread, 500 g = £4.44. Rice bread, brown or white, 500 g = £4.44. Crackers (matzo), 200 g = £2.52. Biscuits (coffee) 200 g = £1.68. Pasta, (animal shapes, macaroni, spaghetti, spirals, tagliatelle), 500 g = £4.95, buckwheat (penne or spirals), 250 g = £2.03. Rice pizza crust, brown or white, 150 g = £3.83. Flour mix, 750 g = £5.35.

Bi-Aglut® (Ultrapharm)

Gluten-free. Bread flour mix or plain flour, net price 500 g = £4.75. Bread rolls, 150 g = £1.77. Bread sticks, 150 g = £1.95.Biscuits, 180 g = £2.89. Crackers, 150 g = £2.36. Cracker toast, 240 g = £4.18. Pasta (fusilli, macaroni, penne, spaghetti), 500 g = £5.23.

Dietary Specials (Nutrition Point)

Gluten-free. Bread, loaf, sliced (white, brown or white multigrain) 400 g = £2.94; bread rolls, long (white) 3 = £1.84. Bread mix, 500 g = £5.20; cracker bread, 150 g = £1.89; cake mix (white), 750 g = £5.20; white mix, 500 g = £5.20. Tea biscuits, 220 g = £2.10. Pasta (spaghetti, penne, fusilli), 500 g = £3.36. Pizza base, 2 = £5.15

Ener-G® (General Dietary)

Gluten-free. Cookies (vanilla flavour), net price 435 g = £5.00. Rolls, dinner 6 × 280 g = £2.97, long, white 220 g = £2.39, round, white 200 g = £2.39. Rice bread (sliced), brown, 474 g = £4.39; white, 456 g = £4.39. Rice loaf (sliced), 612 g = £4.39. Seattle brown loaf, 600 g = £5.05. Tapioca bread (sliced), 480 g = £4.39. Rice pasta (macaroni, shells, small shells, and lasagne), 454 g = £4.08; spaghetti, 447 g = £3.98; tagliatelle, 400 g = £3.98; vermicelli, 300 g = £4.08; cannelloni, 335 g = £3.98. Brown rice pasta: lasagne, 454 g = £3.98; macaroni, 454 g = £3.98; spaghetti, 447 g = £3.98. Xanthan gum, 170 g = £6.93.

Freebake® (Freebake)

Gluten-free. Bread mix, net price 2.4 kg = £12.15, cake mix, 2.4 kg = £11.90, pizza base mix, 2.4 kg = £12.00. Flour (plain), 2.4 kg = £11.50.

Gadsby's

Gluten-free. White bread flour, net price 1 kg = £4.99. White bread (sliced or unsliced), 400 g = £2.50. White bread rolls, 4 × 75 g = £2.00

Glutafin® (Nutrition Point)

Gluten-free. Bread loaf, fibre or white (sliced or unsliced), 400 g = £3.41; rolls, fibre or white, 4 = £3.41. Biscuits, savoury, 125 g = £1.89; savoury shorts, 150 g = £2.59. Biscuits, digestive, sweet or tea, 150 g = £1.89. Biscuits, 200 g = £3.68. Biscuits, shortbread, 100 g = £1.56. Mixes, bread, fibre or white, 500 g = £5.91. Crackers, 200 g = £3.08. High fibre crackers, 200 g = £2.58. Pasta (penne, shells, spirals, spaghetti), 500 g = £5.97; (lasagne, tagliatelle), 250 g = £3.13. Pizza bases, 2 × 150 g = £5.83.

Select Gluten-free. Bread, fibre loaf (sliced), 400 g = £3.04; part-baked, 400 g = £3.41, fresh, white or brown, (sliced), 400 g = £3.17. Seeded loaf, 400 g = £3.31. White loaf (sliced), 400 g = £3.04; part-baked, 400 g = £3.41. Fibre rolls, 4 = £3.17. White rolls, 4 = £3.17, part-baked 4 = £3.41; long (part-baked), 2 = £3.41. Mixes (bread, cake, fibre, fibre bread, pastry, and white), 500 g = £5.91

Heron Foods® (Gluten Free Foods Ltd)

Gluten-free. Bread mix, organic (standard or fibre), net price 500 g = £4.12

Il Pane di Anna® (Gluten Free Foods Ltd)

Gluten-free. Bread mix, white, net price 500 g = £5.25, cake mix, white 500 g = £5.25, pizza base mix, 500 g = £5.25

Juvela® (Juvela)

Gluten-free. Harvest mix, fibre mix, and flour mix, net price 500 g = £6.33. Bread (whole or sliced), 400-g loaf = £3.05; part-baked loaf (with or without fibre), 400g = £3.27; fresh sliced loaf (white) 400 g = £3.17, (fibre) 400 g = £3.05. Fibre bread (sliced and unsliced), 400-g loaf = £3.05. Bread rolls (white), 5 × 85 g = £4.11, fibre bread rolls, 5 × 85 g = £4.11, part-baked rolls (with or without fibre), 5 × 75 g = £4.25. Crispbread, 210 g = £3.82. Pasta (fibre linguine, fibre penne, fusilli, macaroni, spaghetti), 500 g = £6.20; lasagne, 250 g = £3.16; tagliatelle, 250 g = £2.99. Pizza bases, 2 × 180 g = £7.56. Digestive biscuits, 150 g = £2.62. Savoury biscuits, 150 g = £3.29. Sweet biscuits, 150 g = £2.48. Tea biscuits, 150 g = £2.62.

Lifestyle® (Ultrapharm)

Gluten-free. Brown bread (sliced and unsliced), net price 400 g = £2.82. White bread (sliced and unsliced), 400 g = £2.82. High fibre bread (sliced and unsliced), 400 g = £2.82. Bread rolls, (brown, white, or high-fibre) 400 g = £2.82.

Livwell® (Livwell)

Gluten-free. Bread, sliced, (brown or white), 200 g = £2.25; baguette (white) 250 g = £2.50; rolls (white), 4 = £2.50; flat bread, 4 = £3.00

Orgran® (Community)

Gluten-free. Pasta: lasagne (corn, rice and maize), 150 g = £2.89; macaroni (rice and maize), 250 g = £2.35; shells (split pea and soya), 200 g = £2.25; spaghetti (corn, rice, rice and maize), 250 g = £2.25; spirals (buckwheat, corn, rice, rice and millet, rice and maize), 250 g = £2.35, spirals (organic brown rice), 250 g = £2.60. Crispbread (corn or rice), 200 g = £2.70. Pizza and pastry mix, 375 g = £3.52. Flour, self-raising, 500 g = £2.89. Bread mix, 450 g = £3.10

Proceli (Generpharm)

Gluten-free. Bread, (white, sliced), net price 165 g = £2.19; sandwich bread, 155 g = £2.06. Baguettes (part-baked), 2 × 125 g = £2.90. Bread buns, 4 × 50 g = £3.26. Dinner rolls (white, part-baked), 4 × 35 g = £1.86. Flat bread (part-baked), 3 × 40 g = £4.04. Hotdog rolls (white, part-baked) 3 × 35 g = £1.96. Long rolls (white, part-baked), 3 × 83 g = £2.74. Lunch rolls (white), 6 × 45 g = £3.11. Flour (white), 1 kg = £5.14. Pasta (macaroni, small macaroni, puntini, short spaghetti, spirals), 250 g = £2.59. Pizza bases, 3 × 125 g = £5.18. Rice bread (sandwich loaf), 200 g = £2.32; rice bread (brown), 220 g = £2.19.

Pure® (Innovative)

Gluten-free. Blended flour, net price 1 kg = £3.56; potato starch flour 500 g = £1.42; rice flour (brown) 500 g = £1.33, (white) 500 g = £1.42; tapioca starch flour 500 g = £1.89; teff flour, (brown or white), 1 kg = £3.99; xanthan gum 100 g = £5.46

Rite-Diet® Gluten-free (Nutricia Dietary)

Gluten-free Flour mix (white or fibre), 500 g = £5.22.

Rizopia® (PGR Health Foods)

Gluten-free. Brown rice pasta (fusilli, penne, spaghetti) 500 g = £2.50, (lasagne) 375 g = £2.50

Schar® (Nutrition Point)

Gluten-free. Bread.(white, sliced), net price 2 x 200 g = £3.05. Baguette (french bread), 400 g = £3.20. Bread rolls, 150 g = £1.91. Lunch rolls, 150 g = £1.94. Bread mix, 1 kg = £4.99. Ertha brown bread, 2 x 250 g = £3.26. Cake mix, 500 g = £4.99. Flour mix, 1 kg = £4.99. Breadsticks (Grissini), 150 g = £2.05. Cracker toast, 150 g = £2.21. Crackers, 200 g = £2.68. Crispbread, 250 g = £3.68. Pasta (fusilli, penne), 500 g = £3.47; lasagne, 250 g = £3.47; macaroni pipette, 500 g = £3.47; spaghetti, 500 g = £3.47. Biscuits (frollini tea), 200 g = £2.36. Savoy biscuits, 200 g = £2.57.

Sunnyvale® (Everfresh)

Gluten-free. Mixed grain bread (sour dough), net price 400 g = £1.91.

Tobia Teff (Tobia Teff)

Gluten-free. Teff flour (brown or white), net price 1 kg = £2.95

Tritamyl® (Gluten Free Foods Ltd)

Gluten-free. Flour, net price 1 kg = £5.60. Bread mix (brown or white), 1 kg = £5.60.

Ultra® (Ultrapharm)

Gluten-free. Baguette, net price 400 g = £2.46. Bread, 400 g = £2.46. High-fibre bread, 500 g = £3.35. Bread rolls, 400 g = £2.46. Crackerbread, 100 g = £1.77. Sweet biscuits, 250 g = £2.93. Pasta (fusilli, penne, spaghetti, tagliatelle), 250 g = £2.95. Pizza base, 400 g = £2.65.

Valpiform® (Ultrapharm)

Gluten-free. Bread mix, 2 × 500 g = £6.73; country loaf (sliced), 400 g = £3.75. Crac'form toast, 2 × 125 g = £3.52. Crisp rolls, 220 g = £3.60; Baguettes, maxi, 2 × 200 g = £4.49, petites, 2 × 160 g = £2.99. Pastry mix, 2 × 500 g = £6.73.

Wellfoods® (Wellfoods)

Gluten-free. Bread, loaf (unsliced), net price 600 g = £4.85, (sliced) 600 g = £4.95; burger buns, 4 = £3.95; rolls, 4 = £3.65. Flour alternative 1 kg = £7.65. Pizza base, 2 = £8.95

A7.6.1.1 Gluten- and wheat-free foods

ACBS indications: established gluten enteropathy (including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis) with coexisting established wheat sensitivity only.

Ener-G® (General Dietary)
Gluten-free, wheat-free. Pizza bases, 372 g = £3.75. Six flour bread loaf, 576 g = £3.60. Seattle brown rolls (round or long), 4 x 119 g = £3.00

Glutafin® (Nutricia Dietary)
Gluten-free, wheat-free. Crisp bread, 2 × 125 g = £3.82. Mixes (fibre bread, bread), 500 g = £5.63; cake or pastry mix, 500 g = £5.63.

Heron Foods® (Gluten Free Foods Ltd)
Gluten-free, wheat-free. Bread mix, organic (fibre), net price 500 g = £4.12; bread and cake mix, organic, 500 g = £4.12

A7.6.2 Low-protein foods

ACBS indications: inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

Aproten® (Ultrapharm)
Low protein. Low Na^+ and K^+. Biscuits, net price 180 g (36) = £2.88; bread mix 250 g = £2.17; crispbread 260 g = £4.06; pasta (anellini, ditalini, rigatini, spaghetti) 500 g = £4.06; tagliatelle 250 g = £2.16.

Ener-G® (General Dietary)
Low protein. Egg replacer, net price 454 g = £4.05. Rice bread, 600 g = £4.39.

Fate® (Fate)
Low protein. All-purpose mix, net price 500 g = £6.39; Cake mix, 2 × 250 g = £6.39, chocolate-flavour, 2 × 250 g = £6.39.

Harifen® (Ultrapharm)
Low protein. Cracker toast, net price 200 g = £2.75. Cookies, white chip, 200 g = £2.25

Juvela® (SHS)
Low Protein. Mix, net price 500 g = £6.66. Bread (sliced), 400-g loaf = £3.12. Bread rolls, 5 × 70 g = £3.87. Biscuits, orange and cinnamon flavour, 125 g = £6.51; chocolate chip, 130 g = £6.51. Pizza base, 2 = £7.37

Loprofin® (SHS)
Low protein. Sweet biscuits, net price 150 g = £2.08; chocolate cream-filled biscuits, 125 g = £2.08; cookies (chocolate chip or cinnamon), 100 g = £5.51; crunch bar, 8 × 41 g = £11.09; wafers (orange, vanilla, or chocolate), 100 g = £2.02. Breakfast cereal, flakes (apple, chocolate, or strawberry), 375 g = £6.24, loops 375 g = £6.48. Egg replacer, 500 g = £12.14. Egg-white replacer, 100 g = £7.81. Bread (sliced), 400-g loaf = £3.12. Bread rolls (white) 4 = £2.91, (part-baked) 4 × 65 g = £3.28. Mix, 500 g = £6.61. Cake mix (chocolate or lemon), 500 g = £6.99. Dessert mix (chocolate, strawberry, vanilla), 150 g = £3.82. Crackers, 150 g = £2.84. Herb crackers, 150 g = £2.84. Pasta (fusilli, penne, spaghetti), 500 g = £6.91, (macaroni, puntoni, tagliatelle) 250 g = £3.32, (conchigle, gnoccetti sardi) 500 g = £6.66, (lasagne), 250 g = £3.36, (vermicelli), 250 g = £3.44, (animal shapes) 500 g = £6.64. Snack Pot (unflavoured, curry, or tomato and basil), 47 g = £3.67, Rice, 500 g = £6.71.

Low protein drink (Milupa)
Powder, whey protein 500 mg, carbohydrate 6 g, fat 3 g, energy 220 kJ (53 kcal)/10 g, with vitamins, minerals, and trace elements. Net price 400 g = £7.23.
For inherited disorders of amino acid metabolism in children over 1 year
Note Termed *Milupa® lpd* by manufacturer

PK Foods® (Gluten Free Foods Ltd)
Low-protein. Bread (white sliced) net price 550 g = £4.00. Crispbread, 75 g = £2.00. Pasta (spirals) 250 g = £2.00. *Aminex®* biscuits, 150 g = £4.25; cookies, 200 g = £4.25; rusks, 200 g = £4.25
For phenylketonuria and similar amino acid abnormalities
Cookies (chocolate chip, orange, or cinnamon), 150 g = £4.25. Egg replacer, 350 g = £4.25. Flour mix, 750 g = £9.60. Jelly (orange or cherry flavour), 4 × 80 g = £6.76.
For phenylketonuria only

Promin® (Firstplay Dietary)
Low protein. Burger mix, 2 × 62 g = £5.60, (lamb and mint), 4 × 72 g = £5.50. Sausage mix (apple and sage, tomato and basil, or original), 4 × 30 g = £6.30. Cous Cous, 500 g = £6.35. Pasta (alphabets, macaroni, shells, shortcut spaghetti, spirals) and pasta tricolour (alphabets, shells, spirals), 500 g = £6.35; Lasagne sheets, 200 g = £2.70. Pasta shells in tomato, pepper and herb sauce, 4 × 72-g sachets = £7.32; Pasta elbows in cheese and broccoli sauce, 4 × 66-g sachets = £7.32. Pasta spirals in Moroccan sauce, 4 × 72 g = £7.32. Pasta meal, 500 g = £6.35. Pasta imitation rice, 500 g = £6.35. Rice pudding imitation (apple, banana, strawberry, and original flavours), 4 × 69-g sachets = £5.60. Dessert (chocolate and banana, strawberry and vanilla, custard, or caramel) 6 × 36.5-g = £5.60. Hot breakfast (apple and cinnamon, banana, chocolate, original) 6 × 57-g = £7.14. Spread, chocolate and hazelnut, 230 g = £6.80

Rite-Diet® Low-protein (SHS)
Low protein. Baking mix, net price 500 g = £6.61

Sno-Pro® (SHS)
Low-protein. Drink, protein 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 280 kJ (67 kcal)/100 mL. Net price 200 mL = 98p.
For phenylketonuria, chronic renal failure, and other inborn errors of metabolism

Taranis (Firstplay Dietary)
Low protein. Cake bars (lemon), net price 6 × 40 g = £5.10

Ultra® (Ultrapharm)
Low protein. PKU bread, 400 g = £2.65. PKU flour, 500 g = £3.07. PKU biscuits, 200 g = £2.21. PKU pizza base, 400 g = £2.45. PKU savoy biscuits, 150 g = £2.06.

Valpiform® (Ultrapharm)
Low protein. Biscuits, shortbread, net price 120 g = £4.06

Vita Bite® (Vitaflo)
Low-protein. Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, net price 25 g = 99p.
Not recommended for children under 1 year

A7.7 Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

GA Gel® (Vitaflo)
Gel, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 8.4 g, carbohydrate 8.6 g, fat trace, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 903), net price 30 × 20-g sachets = £145.76
Nutritional supplement for dietary management of type 1 glutaric aciduria in children 1–10 years

[1]XLYS, Low TRY, Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22. (5-g measuring scoop provided)

Nutritional supplement for the dietary management of type 1 glutaric aciduria

[2]XLYS, Low TRY, Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £76.94.

Nutritional supplement for the dietary management of type 1 glutaric aciduria

XLYS, TRY Glutaridon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 2 × 500 g = £291.46.

Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements

Glucogen storage disease

Corn flour and corn starch

For hypoglycaemia associated with glycogen-storage disease

Glucose (Dextrose monohydrate)

Net price 500 g = £1.14.

For glycogen storage disease and sucrose/isomaltose intolerance

Glycosade® (Vitaflo)

Powder, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 × 60-g sachets = £90.00

Nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for children under 2 years

Homocystinuria or hypermethioninaemia

HCU cooler® (Vitaflo)

Liquid, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7.8 g, fat trace, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals and trace elements. Orange flavour, net price 30 × 130-mL pouch = £271.20

A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years of age with homocystinuria

HCU Express® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 903), net price 30 × 25-g sachets = £265.90

A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years of age with homocystinuria

HCU gel® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 8.4 g, carbohydrate 8.6 g, fat 30 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 903), net price 30 × 20-g sachets = £148.59

A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria

HCU LV® (SHS)

Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903) or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £386.17

A nutritional supplement for the dietary management of hypermethioninaemia or vitamin B_6 non-responsive homocystinuria in patients over 8 years.

[1]XMET Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

XMET Homidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour system*, p. 903), net price 500 g = £145.76.

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults

[2]XMET Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 25 g,, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour Sytem*, p. 903), net price 500 g = £76.94

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

[3]XMET Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £123.34.

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

Hyperlysinamia

[1]XLYS Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22. (5-g measuring scoop provided)

Nutritional supplement for the dietary management of hyperlysinaemia

[2]XLYS Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £76.94.

Nutritional supplement for the dietary management of hyperlysinaemia

Isovaleric acidaemia

[1]XLEU Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein

1. Analog products are generally intended for use in children up to 1 year
2. Maxamaid products are generally intended for use in children 1–8 years
3. Maxamum products are generally intended for use in children over 8 years and adults

equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22. (5-g measuring scoop provided)

Nutritional supplement for the dietary management of isovaleric acidaemia

XLEU Faladon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 200 g = £58.29.

Nutritional supplement for the dietary management of isovaleric acidaemia

[1]**XLEU Maxamaid** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £76.94.

Nutritional supplement for the dietary management of isovaleric acidaemia

Maple syrup urine disease

Isoleucine Amino Acid Supplement (Vitaflo)

Powder, isoleucine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £43.50

Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year and adults

Mapleflex® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 30 × 29-g sachets = £162.82.

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD Aid III® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £145.76.

Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

[2]**MSUD Analog** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22. (5-g measuring scoop provided)

Nutritional supplement for the dietary management of maple syrup urine disease

MSUD express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®* sachets, p. 903), net price 30 × 25-g sachets = £265.90.

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

MSUD express cooler® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7.8 g, fat trace, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange flavour, net price 30 × 130-mL = £271.20.

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

MSUD Gel® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®* sachets, p. 903), net price 30 × 20-g sachets = £148.59.

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

[1]**MSUD Maxamaid®** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £76.94.

Nutritional supplement for the dietary management of maple syrup urine disease

[3]**MSUD Maxamum®** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £123.34.

Nutritional supplement for the dietary management of maple syrup urine disease

Valine Amino Acid Supplement (Vitaflo)

Powder, valine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £43.50

Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year and adults

Methylmalonic or propionic acidaemia

[2]**XMTVI Analog** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

XMTVI Asadon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 903), net price 200 g = £58.29.

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults

[1]**XMTVI Maxamaid** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £76.94.

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

1. Maxamaid products are generally intended for use in children 1–8 years
2. Analog products are generally intended for use in children up to 1 year
3. Maxamum products are generally intended for use in children over 8 years and adults

[1]XMTVI Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £123.34.

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

Other inborn errors of metabolism

Cystine Amino Acid Supplement (Vitaflo)

Powder, cystine 500 mg, carbohydrate 3.4 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £43.50

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in children over 1 year and adults

EAA® Supplement (Vitaflo)

Powder, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 x 12.5-g sachets = £170.64

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

KeyOmega® (Vitaflo)

Powder, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 × 4-g sachet = £32.30

A nutritional supplement for the dietary management of inborn errors of metabolism

Leucine Amino Acid Supplement (Vitaflo)

Powder, leucine 0.1 g, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £43.50

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in children over 1 year and adults

Phenylalanine Amino Acid Supplement (Vitaflo)

Powder, phenylalanine 50 mg, carbohydrate 3.8 g, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £43.50

Nutritional supplement for use in the dietary management of inborn errors of metabolism only

Phenylketonuria

Add-Ins® (SHS)

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 60 × 18.2-g sachets = £294.00.

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years

Easiphen® (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements. Forest berries, orange, or tropical flavour, net price 250-mL carton = £7.56.

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years

Lophlex® (SHS)

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy[2] 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 × 27.8-g sachets = £226.87.

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

Lophlex® LQ (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, or orange, net price 3 × 125 mL = £24.27.

Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults including pregnant women

Lophlex® LQ 10 (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 170 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Berry flavour, net price 60 × 62.5 mL = £243.00.

Nutritional supplement for dietary management of phenylketonuria in children over 4 years and adults including pregnant women

Loprofin® PKU Drink (SHS)

Liquid, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 60p.

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults

Milupa PKU 2-prima® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £122.70

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

Milupa PKU 2-secunda® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £143.15

Nutritional supplement for the dietary management of phenylketonuria in children 9–14 years

Milupa PKU 3-advanta® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £143.15

Nutritional supplement for the dietary management of phenylketonuria in patients 15 years and over

Minaphlex® (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Chocolate, pineapple-vanilla. Unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 × 29-g sachets = £98.92.

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

Phlexy-10® Exchange System (SHS)

Bar, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 20.5 g, fat 3.7 g, fibre 1.7 g/42-g bar. Citrus fruit flavour. Net price per bar = £4.76

Capsules, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule. Net price 200-cap pack = £33.33

Tablets, protein equivalent (essential and non-essential amino acids except phenylalanine), 833 mg/tablet. Net price 75-tab pack = £21.59

Drink Mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour. Net price 30 × 20-g sachet = £100.51

Nutritional supplement for the dietary management of phenylketonuria

1. Maxamum products are generally intended for use in children over 8 years and adults
2. Minor nutritional variations between flavours—consult product literature

Phlexy-Vits® (SHS)

Powder, vitamins, minerals, and trace elements, net price 30 × 7-g sachets = £56.08.

Tablets, vitamins, minerals, and trace elements, net price 180-tab pack = £68.69.

For use as a vitamin and mineral component of restricted therapeutic diets in children 11 years and over and adults with phenylketonuria and similar amino acid abnormalities

PK Aid-4® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £112.04 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of phenylketonuria in children and adults

PKU Anamix Junior LQ® (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry or orange, net price 125-mL carton = £4.50

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU cooler10® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Orange or purple option. Net price 30 × 87 mL = £110.40.

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU cooler15® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or purple option, net price 30 x 130 mL = £164.40.

Nutritional supplement for the dietary management of phenylketonuria, not recommended for children under 3 years

PKU cooler20® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Orange or purple option. Net price 30 × 174 mL = £220.50.

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 3.8 g, energy 315 kJ (76 kcal)/25-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical or unflavoured (flavouring: see *Flavour Pac®*, p. 903), net price 30 x 25-g sachets = £161.21.

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 8 years

PKU gel® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20-g sachet with vitamins, minerals and trace elements. Orange, raspberry, or unflavoured (flavouring: see *Flavour Pac®*, p. 903), net price 30 × 20-g sachets = £92.94.

Nutritional supplement for use as part of the low-protein dietary management of phenylketonuria in children 1–10 years.

PKU Start® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £5.46

Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

L-Tyrosine (SHS)

Powder, net price 100 g = £12.53.

For use as a supplement in maternal phenylketonurics who have low plasma tyrosine concentrations

[1]XP Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 13 g, carbohydrate 54 g, fat 23 g (of which LCT 95%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL, net price 400 g = £22.54 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

XP Analog LCP (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 13 g, carbohydrate 54 g, fat 23 g (of which LCT 98.7%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL, net price 400 g = £25.64 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

[2]XP Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see *Modjul® Flavour System*, p. 903), net price 500 g = £45.52

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

[3]XP Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavouring: see *Modjul® Flavour System*, p. 903). Net price 30 × 50-g sachets = £211.14, 500 g = £70.39.

Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults

Tyrosinaemia

TYR cooler® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7.8 g, fat nil, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange flavour, net price 30 x 130-mL pouch = £271.20.

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults

TYR express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (76 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®* sachets, p. 903), net price 30 × 25-g sachets = £265.90

Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years

1. Analog products are generally intended for use in children up to 1 year
2. Maxamaid products are generally intended for use in children 1–8 years
3. Maxamum products are generally intended for use in children over 8 years and adults

TYR Gel® (Vitaflo)

Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals and trace elements. Unflavoured (flavouring: see *Flavourpac®* sachets, p. 903), net price 30 × 20-g sachets = £148.59

Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

Tyrosine Amino Acid Supplement (Vitaflo)

Powder, tyrosine 1 g, carbohydrate 2.9 g, energy 62 kJ (15 kcal)/4-g sachet, net price 30 × 4-g sachets = £37.80.

Nutritional supplement for the dietary management of tyrosinaemia and other inborn errors of amino acid metabolism

[1]XPHEN TYR Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13 g, carbohydrate 54 g, fat 23 g (of which LCT 95%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured, net price 400 g = £28.22.

Nutritional supplement for the dietary management of tyrosinaemia in children under 1 year

[2]XPHEN TYR Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903). Net price 500 g = £76.94.

Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

XPHEN TYR Tyrosidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903). Net price 500 g = £145.76

Nutritional supplement for the dietary management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

[1]XPTM Analog (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 13 g, carbohydrate 54 g, fat 23 g (of which LCT 95%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 1.95 g, carbohydrate 8.1 g, fat 3.5 g, energy 300 kJ (72 kcal)/100 mL. Unflavoured Net price 400 g = £28.22.

Nutritional supplement for the dietary management of tyrosinaemia type 1 in children under 1 year

XPTM Tyrosidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 903). Net price 500 g = £145.76.

Nutritional supplement for the dietary management of tyrosinaemia type 1 in children and adults where plasma-methionine concentrations are above normal

1. Analog products are generally intended for use in children up to 1 year
2. Maxamaid products are generally intended for use in children 1–8 years

Urea cycle disorders (other than arginase deficiency)

L-Arginine (SHS)

Powder, net price 100 g = £10.64.

Nutritional supplement for the dietary management of urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase

Conditions for which ACBS products can be prescribed

Birthmarks See Disfiguring skin lesions, below

Dermatitis Aveeno Bath Oil; Aveeno Cream; Aveeno Colloidal; Aveeno Lotion; E45 Emollient Bath Oil; E45 Emollient Wash Cream; E45 Lotion

For details of preparations see section 13.2.1, p. 625

Dermatitis herpetiformis See also Gluten-free foods, p. 903

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo) Covermark classic foundation and finishing powder; Dermacolor Camouflage cream and fixing powder; Keromask masking cream and finishing powder; Veil Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)

For details of preparations see section 13.8.2, p. 654

Disinfectants (antiseptics) May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygenic purposes.

Dry mouth (xerostomia) For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

AS Saliva Orthana; Biotène Oralbalance; BioXtra; Glandosane; Saliveze; Salivix.

For details of preparations see section 12.3.5, p. 621

Eczema See Dermatitis, above

Photodermatoses (skin protection in) Delph Sun Lotion SPF 30; E45 Sun SPF 50; Spectraban Ultra; Sunsense Ultra; Uvistat Lipscreen SPF 50, Uvistat Suncream SPF 30 and 50.

For details of preparations see section 13.8.1, p. 653

Pruritus See Dermatitis, above

Wound dressings The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process.
The principal stages of healing are:

- cleansing, removal of debris;
- granulation, vascularisation;
- epithelialisation.

The ideal dressing for moist wound healing needs to ensure that the wound remains:

- moist with exudate, but not macerated;
- free of clinical infection and excessive slough;
- free of toxic chemicals, particles or fibres;
- at the optimum temperature for healing;
- undisturbed by the need for frequent changes;
- at the optimum pH value.

As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).

Advanced wound dressings, (section A8.2) are designed to control the environment for wound healing, for example to donate fluid (**hydrogels**), maintain hydration (**hydrocolloids**), or to absorb wound exudate (**alginates, foams**).

Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with physiological saline.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see *Buyers' Guide: Advanced wound dressings* (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

A8.1 Basic wound contact dressings

A8.1.1 Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces

Wound contact material for different types of wounds

Low Exudate	Moderate Exudate	Heavy Exudate
Wound PINK (Epithelialising)		
Low adherence A8.1.1 Vapour-permeable film A8.2.2 Soft polymer A.8.2.3 Hydrocolloid A8.2.4	Soft polymer A8.2.3 Foam, low absorbent A8.2.5 Alginate A8.2.6	
Wound RED (Granulating) Symptoms or signs of infection, see **Wounds with signs of infection**		
Low adherence A8.1.1 Soft polymer A8.2.3 Hydrocolloid A8.2.4 Foam, low absorbent A8.2.5	Hydrocolloid-fibrous A8.2.4 Foam A8.2.5 Alginate A8.2.6	Foam with extra absorbency A8.2.5 Hydrocolloid-fibrous A8.2.4 Alginate A8.2.6
Wound YELLOW (Sloughy) Symptoms or signs of infection, see **Wounds with signs of infection**		
Hydrogel A8.2.1 Hydrocolloid A8.2.4	Hydrocolloid-fibrous A8.2.4 Alginate A8.2.6	Hydrocolloid-fibrous A8.2.4 Alginate A8.2.6 Capillary-action A8.2.7
Wound BLACK (Necrotic/Eschar) Consider mechanical debridement alongside autolytic debridement		
Hydrogel A8.2.1 Hydrocolloid A8.2.4	Hydrocolloid A8.2.4 Hydrocolloid-fibrous A8.2.4 Foam A8.2.5	Seek advice from wound care specialist
Wounds with signs of infection **Consider systemic antibacterials if appropriate;** also consider odour-absorbent dressings (section A8.2.8) For malodourous wounds with slough or necrotic tissue, consider mechanical or autolytic debridement		
Low adherence with honey A8.3.1 Low adherence with iodine A8.3.2 Low adherence with silver A8.3.3 Hydrocolloid with silver A8.3.3 Honey—topical A8.3.1	Hydrocolloid-fibrous with silver A8.3.3 Foam with silver A8.3.3 Alginate with silver A8.3.3 Honey—topical A8.3.1 Cadexomer–iodine A8.3.2	Hydrocolloid-fibrous with silver A8.3.3 Foam, extra absorbent, with silver A8.3.3 Alginate with honey A8.3.1 Alginate with silver A8.3.3

Note In each section of this table the dressings are listed in order of increasing absorbency.
Some wound contact (primary) dressings require a secondary dressing

absorbency of the dressing. Dressings with a reduced content of soft paraffin are less liable to interfere with absorption; those containing the traditional amount (such as *Jelonet*®) have been considered more suitable for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

Knitted Viscose Primary Dressing, BP 1993

Warp knitted fabric manufactured from a bright viscose monofilament.

N-A Dressing®, 9.5 cm × 9.5 cm = 35p, 9.5 cm × 19 cm = 66p (Systagenix)

N-A Ultra® (silicone-coated), 9.5 cm × 9.5 cm = 33p, 9.5 cm × 19 cm = 62p (Systagenix)

Paratex®, 9.5 cm × 9.5 cm = 24p (Urgo)

Profore® wound contact layer, 14 cm × 20 cm = 29p (S&N Hlth.)

Tricotex®, 9.5 cm × 9.5 cm = 31p (S&N Hlth.)

Paraffin Gauze Dressing, BP 1993

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading) = 25p; (normal loading) = 37p (most suppliers including Synergy Healthcare—*Paranet*® (light loading); BSN Medical—*Cuticell*® *Classic* (normal loading); S&N Hlth.—*Jelonet*® (normal loading); Neomedic—*Neotulle*® (normal loading); C D Medical—*Paragauze*® (normal loading))

Atrauman® (Hartmann)

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides, 5 cm × 5 cm = 24p, 7.5 cm × 10 cm = 25p, 10 cm × 20 cm = 57p, 20 cm × 30 cm = £1.57

A8.1.2 Absorbent dressings

Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are **not** appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate.

For lightly exuding wounds

Absorbent Perforated Dressing with Adhesive Border

Low adherence dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cosmopor E®, 5 cm × 7.2 cm = 7p, 8 cm × 10 cm = 16p, 8 cm × 15 cm = 25p, 10 cm × 20 cm = 41p, 10 cm × 25 cm = 51p, 10 cm × 35 cm = 71p (Hartmann)

Leukomed®, 7.2 cm × 5 cm = 8p, 8 cm × 10 cm = 17p, 8 cm × 15 cm = 30p, 10 cm × 20 cm = 40p, 10 cm × 25 cm = 45p, 10 cm × 30 cm = 58p , 10 cm × 35 cm = 67p (BSN Medical)

Medipore® + Pad, 5 cm × 7.2 cm = 7p, 10 cm × 10 cm = 15p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 45p, 10 cm × 35 cm = 62p (3M)

Medisafe®, 6 cm × 8 cm = 8p, 8 cm × 10 cm = 13p, 8 cm × 12 cm = 23p, 9 cm × 15 cm = 29p, 9 cm × 20 cm = 34p, 9 cm × 25 cm = 36p (Neomedic)

Mepore®, 7 cm × 8 cm = 10p, 10 cm × 11 cm = 20p, 11 cm × 15 cm = 34p, 9 cm × 20 cm = 41p, 9 cm × 25 cm = 57p, 9 cm × 30 cm = 65p, 9 cm × 35 cm = 71p (Mölnlycke)

PremierPore®, 5 cm × 7 cm = 5p, 10 cm × 10 cm = 12p, 10 cm × 15 cm = 18p, 10 cm × 20 cm = 32p, 10 cm × 25 cm = 36p, 10 cm × 30 cm = 45p, 10 cm × 35 cm = 52p (Shermond)

Primapore®, 6 cm × 8.3 cm = 16p, 8 cm × 10 cm = 18p, 8 cm × 15 cm = 30p, 10 cm × 20 cm = 40p, 10 cm × 25 cm = 46p, 10 cm × 30 cm = 57p, 10 cm × 35 cm = 88p (S&N Hlth)

Softpore®, 6 cm × 7 cm = 6p, 10 cm × 10 cm = 13p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 40p, 10 cm × 30 cm = 49p, 10 cm × 35 cm = 58p (Richardson)

Sterifix®, 5 cm × 7 cm = 18p, 7 cm × 10 cm = 30p, 10 cm × 14 cm = 53p (Hartmann)

Telfa® Island, 5 cm × 10 cm = 8p, 10 cm × 12.5 cm = 27p, 10 cm × 20 cm = 35p, 10 cm × 25.5 cm = 44p, 10 cm × 35 cm = 61p (Covidien)

Absorbent Perforated Plastic Film Faced Dressing

Low-adherence dressing consisting of 3 layers. Where no size specified by the prescriber, the 5 cm size to be supplied

Askina® Pad, 5 cm × 5 cm = 13p, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 40p (Braun)

Cutisorb® LA, 5 cm × 5 cm = 8p, 10 cm × 10 cm = 14p, 10 cm × 20 cm = 29p (BSN Medical)

Interpose®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 32p (Frontier)

Melolin®, 5 cm × 5 cm = 16p, 10 cm × 10 cm = 25p, 20 cm × 10 cm = 49p (S&N Hlth)

Release®, 5 cm × 5 cm = 14p, 10 cm × 10 cm = 23p, 20 cm × 10 cm = 43p (Systagenix)

Skintact®, 5 cm × 5 cm = 10p, 10 cm × 10 cm = 17p, 20 cm × 10 cm = 34p (Robinson)

Solvaline N®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 16p, 10 cm × 20 cm = 33p (Activa)

Telfa®, 5 cm × 7.5 cm = 12p, 10 cm × 7.5 cm = 15p, 15 cm × 7.5 cm = 17p, 20 cm × 7.5 cm = 29p (Covidien)

For moderately to heavily exuding wounds

Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclypse®, 15 cm × 15 cm = 97p, 20 cm × 30 cm = £2.14, 60 cm × 40 cm = £8.15, 80 cm × 50 cm = £9.35 (Advancis)

Exu-Dry®, 10 cm × 15 cm = £1.03, 15 cm × 23 cm = £2.11, 23 cm × 38 cm = £4.90 (S&N Hlth.)

Mesorb®, cellulose wadding pad with gauze wound contact layer and non-woven repellent backing, 10 cm × 10 cm = 58p, 10 cm × 15 cm = 75p, 10 cm × 20 cm = 93p, 15 cm × 20 cm = £1.32, 20 cm × 25 cm = £2.08, 20 cm × 30 cm = £2.36 (Mölnlycke)

Telfa Max®, 22.8 cm × 38 cm = £4.62, 38 cm × 45.7 cm = £5.61, 38 cm × 60.9 cm = £8.16 (Covidien)

Zetuvit® E, *non-sterile*, 10 cm × 10 cm = 6p, 10 cm × 20 cm = 8p, 20 cm × 20 cm = 13p, 20 cm × 40 cm = 25p; *sterile*, 10 cm × 10 cm = 19p, 10 cm × 20 cm = 22p, 20 cm × 20 cm = 35p, 20 cm × 40 cm = 98p (Hartmann)

KerraMax® (Ark Therapeutics)

Super absorbent polyacrylate primary dressing, 10 cm × 22 cm = £1.02, 20 cm × 22 cm = £1.80

A8.2 Advanced wound dressings

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section (A8.2) start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components

A8.2.1 Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent

dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds

Hydrogel sheet dressings

ActiFormCool® (Activa)
Hydrogel dressing, 5 cm × 6.5 cm = £1.65, 10 cm × 10 cm = £2.43, 20 cm × 20 cm = £7.45, 10 cm × 15 cm = £3.49

Aquaflo® (Covidien)
Hydrogel dressing, 7.5 cm diameter = £2.55, 12 cm diameter = £5.26

Coolie® (Zeroderma)
Hydrogel dressing with lint backing, 7 cm diameter = £1.96

Gel FX® (Synergy Healthcare)
Hydrogel dressing (without adhesive border) 10 cm × 10 cm = £1.60, 15 cm × 15 cm = £3.20

Geliperm® (Geistlich)
Hydrogel sheets, 10 cm × 10 cm = £2.27

Hydrosorb® (Hartmann)
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film, 5 cm × 7.5 cm = £1.43; 10 cm × 10 cm = £2.04; 20 cm × 20 cm = £6.12
Hydrosorb® comfort (with adhesive border, waterproof), 4.5 cm × 6.5 cm = £1.69; 7.5 cm × 10 cm = £2.24; 12.5 cm × 12.5 cm = £3.26

Intrasite Conformable® (S&N Hlth.)
Soft non-woven dressing impregnated with *Intrasite®* gel, 10 cm × 10 cm = £1.66; 10 cm × 20 cm = £2.23; 10 cm × 40 cm = £3.99

Novogel® (Ford)
Glycerol-based hydrogel sheets, 10 cm × 10 cm = £3.07; 30 cm × 30 cm, standard = £13.00, thin = £12.27; 5 cm × 7.5 cm = £1.95; 15 cm × 20 cm = £5.86; 20 cm × 40 cm = £11.16; 7.5 cm diameter = £2.79

Vacunet® (Protex)
Non-adherent, hydrogel coated polyester net dressing, 10 cm × 10 cm = £1.93, 10 cm × 15 cm = £2.86

Hydrogel application (amorphous)

ActivHeal® Hydrogel (MedLogic)
Hydrogel containing guar gum and propylene glycol, 15 g = £1.36

Aquaform® (Unomedical)
Hydrogel containing modified starch copolymer, 8 g = £1.57, 15 g = £1.91

Askina® Gel (Braun)
Hydrogel containing modified starch and glycerol, 15 g = £1.89

Cutimed® (BSN Medical)
Hydrogel, 8 g = £1.56, 15 g = £1.90, 25 g = £2.80

Flexigran® (A1 Pharmaceuticals)
Hydrogel containing starch polymer and glycerol, 15 g = £1.90

GranuGel® (ConvaTec)
Hydrogel containing carboxymethylcellulose, pectin, and propylene glycol, 15 g = £2.13

Intrasite® Gel (S&N Hlth.)
Hydrogel containing modified carmellose polymer and propylene glycol, 8-g sachet = £1.66, 15-g sachet = £2.22, 25-g sachet = £3.29

Nu-Gel® (Systagenix)
Hydrogel containing alginate and propylene glycol, 15 g = £2.05

Purilon® Gel (Coloplast)
Hydrogel containing carboxymethylcellulose and calcium alginate, 8 g = £1.61, 15 g = £2.10

A8.2.2 Vapour-permeable films and membranes

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

Vapour-permeable Adhesive Film Dressing, BP 1993 (Semi-permeable Adhesive Dressing)

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

ActivHeal® Film, 6 cm × 7 cm = 31p, 10 cm × 12.7 cm = 73p, 15 cm × 17.8 cm = £1.78 (MedLogic)

Askina® Derm, 6 cm × 7 cm = 35p, 10 cm × 12 cm = £1.02, 10 cm × 20 cm = £1.94, 15 cm × 20 cm = £2.35, 20 cm × 30 cm = £4.20 (Braun)

Bioclusive®, 10.2 cm × 12.7 cm = £1.51 (Systagenix)

Blisterfilm®, 5 cm × 7.5 cm = 41p, 9 cm × 10 cm = 71p, 10 cm × 12.5 cm = 92p, 14 cm × 15 cm = £1.25 (Covidien)

C-View®, 6 cm × 7 cm = 39p, 10 cm × 12 cm = £1.08, 12 cm × 12 cm = £1.25, 15 cm × 20 cm = £2.47 (Unomedical)

Episil®, 12 cm × 12 cm = £1.10, 12 cm × 35 cm = £2.75, 15 cm × 20 cm = £2.10 (Advancis)

Hydrofilm®, 6 cm × 7 cm = 21p, 6 cm × 9 cm = 51p, 10 cm × 12.5 cm = 39p, 10 cm × 15 cm = 49p, 10 cm × 25 cm = 76p, 12 cm × 25 cm = 80p, 15 cm × 20 cm = 90p, 20 cm × 30 cm = £1.49 (Hartmann)

Hypafix® Transparent, 10 cm × 2 m = £8.15 (BSN Medical)

Leukomed T®, 7.2 cm × 5 cm = 35p, 8 cm × 10 cm = 65p, 10 cm × 12.5 cm = 95p, 11 cm × 14 cm = £1.15, 15 cm × 20 cm = £2.20, 15 cm × 25 cm = £2.35 (BSN Medical)

Mepore® Film, 6 cm × 7 cm = 43p, 10 cm × 12 cm = £1.14, 10 cm × 25 cm = £2.23, 15 cm × 20 cm = £2.83 (Mölnlycke)

OpSite® Flexifix, (non-sterile) 5 cm × 1 m = £3.59, 10 cm × 1 m = £6.05, *OpSite® Flexigrid*, 6 cm × 7 cm = 36p, 12 cm × 12 cm = £1.04, 15 cm × 20 cm = £2.62, (S&N Hlth)

Polyskin® II, 4 cm × 4 cm = 36p, 5 cm × 7 cm = 39p, 10 cm × 12 cm = £1.01, 10 cm × 20 cm = £2.00, 15 cm × 20 cm = £2.31, 20 cm × 25 cm = £4.03 (Covidien)

ProtectFilm®, 6 cm × 7 cm = 11p, 10 cm × 12 cm = 20p, 15 cm × 20 cm = 40p (Wallace Cameron)

Suprasorb F®, 5 cm × 7 cm = 31p, 10 cm × 12 cm = 73p, 15 cm × 20 cm = £2.30, (Activa)

Tegaderm®, 6 cm × 7 cm = 38p, 12 cm × 12 cm = £1.23, 15 cm × 20 cm = £2.34 (3M)

Vacuskin®, 6 cm × 7 cm = 40p, 10 cm × 12 cm = £1.06, 10 cm × 25 cm = £2.06, 15 cm × 20 cm = £2.19 (Protex)

With absorbent pad

Vapour-permeable Adhesive Film Dressing with absorbent pad

Alldress®, with absorbent pad, 10 cm × 10 cm = 88p, 15 cm × 15 cm = £1.92, 15 cm × 20 cm = £2.37 (Mölnlycke)

Hydrofilm® Plus, with absorbent pad, 5 cm × 7.2 cm = 15p, 9 cm × 10 cm = 20p, 9 cm × 15 cm = 22p, 10 cm × 20 cm = 34p, 10 cm × 25 cm = 36p, 10 cm × 30 cm = 53p (Hartmann)

Leukomed T® Plus, with absorbent pad, 7.2 cm × 5 cm = 25p, 8 cm × 10 cm = 50p, 8 cm × 15 cm = 75p, 10 cm × 20 cm = £1.25, 10 cm × 25 cm = £1.40, 10 cm × 30 cm = £2.35, 10 cm × 35 cm = £2.85 (BSN Medical)

Mepore® Ultra, with absorbent pad, 6 cm × 7 cm = 28p, 7 cm × 8 cm = 38p, 9 cm × 10 cm = 61p, 9 cm × 15 cm = 92p, 9 cm × 20 cm = £1.39, 9 cm × 25 cm = £1.54, 9 cm × 30 cm = £2.54, 10 cm × 11 cm = 74p, 11 cm × 15 cm = £1.10 (Mölnlycke)

OpSite® Plus, with absorbent pad, 5 cm × 5 cm = 29p, 9.5 cm × 8.5 cm = 81p, 10 cm × 12 cm = £1.10, 10 cm × 20 cm = £1.85, 35 cm × 10 cm = £3.07 (S&N Hlth)

Pharmapore-PU®, with absorbent pad, 8.5 cm × 15.5 cm = 20p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 58p (Wallace Cameron)

PremierPore VP®, with absorbent pad, 5 cm × 7 cm = 13p, 6 cm × 7 cm = 21p, 10 cm × 10 cm = 16p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 57p, 10 cm × 35 cm = 69p (Shermond)

Tegaderm®, with absorbent pad, 5 cm × 7 cm = 25p, 9 cm × 10 cm = 62p, 9 cm × 15 cm = 92p, 9 cm × 20 cm = £1.34, 9 cm × 25 cm = £1.51, 9 cm × 35 cm = £2.50 (3M)

For intravenous and subcutaneous catheter sites

Central Gard® (Unomedical)

16 cm × 7 cm (central venous catheter) = 94p, 16 cm × 8.8 cm (central venous catheter) = £1.03

Easi-V® (ConvaTec)

7 cm × 7.5 cm (intravenous peripheral cannula) = 38p

IV3000® (S&N Hlth.)

5 cm × 6 cm (1-hand) = 39p, 6 cm × 7 cm (non-winged peripheral catheter) = 51p, 7 cm × 9 cm (ported peripheral catheter) = 67p, 9 cm × 12 cm (PICC line) = £1.34, 10 cm × 12 cm (central venous catheter) = £1.28

Mepore® IV (Mölnlycke)

5 cm × 5.5 cm = 29p, 8 cm × 9 cm = 37p, 10 cm × 11 cm = 97p

Niko Fix® (Unomedical)

7 cm × 8.5 cm (intravenous ported peripheral catheter) = 19p

Pharmapore-PU® IV (Wallace Cameron)

8.5 cm × 7 cm = 7p, 6 cm × 7 cm (ported peripheral cannula) = 8p, 7 cm × 9 cm (peripheral cannula, hand) = 17p

Tegaderm® IV (3M)

7 cm × 8.5 cm (peripheral catheter) = 57p, 8.5 cm × 10.5 cm (central venous catheter) = £1.11, 10 cm × 15.5 cm (peripherally inserted central venous catheter) = £1.60

A8.2.3 Soft polymer dressings

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used.

Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes.

Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface.

For *silicone keloid dressings* see section A8.4.2.

Mepitel® (Mölnlycke)

Soft silicone wound contact dressing. 5 cm × 7 cm = £1.52, 8 cm × 10 cm = £3.05, 12 cm × 15 cm = £6.17, 20 cm × 30 cm = £16.61

Physiotulle® (Coloplast)

Non-adherent soft polymer wound contact dressing, 10 cm × 10 cm = £2.09, 15 cm × 20 cm = £6.37

Silon-TSR® (Jobskin)

Soft silicone polymer wound contact dressing, 13 cm × 13 cm = £3.52, 13 cm × 25 cm = £5.47, 28 cm × 30 cm = £7.37

Siltex® (Advancis)

Soft silicone-coated polyester wound contact dressing, 5 cm × 7 cm = £1.25, 8 cm × 10 cm = £2.55, 12 cm × 15 cm = £5.15, 20 cm × 30 cm = £13.25

Tegaderm® Contact (3M)

Non-adherent soft polymer wound contact dressing, 7.5 cm × 10 cm = £2.14, 7.5 cm × 20 cm = £4.20, 20 cm × 25 cm = £10.23

Urgotul® (Urgo)

Non-adherent soft polymer wound contact dressing, 11 cm × 11 cm = £3.00, 10 cm × 40 cm = £9.89, 16 cm × 21 cm = £8.49

Urgotul® Start, soft polymer wound contact dressing, 5 cm × 7 cm = £2.80, 11 cm × 11 cm = £3.98, 16 cm × 21 cm = £9.50

With absorbent pad

Allevyn® Gentle (S&N Hlth.)

Soft gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = £1.23, 10 cm × 10 cm = £2.43, 10 cm × 20 cm = £3.91, 15 cm × 15 cm = £4.40, 20 cm × 20 cm = £6.52

Allevyn® Gentle Border, silicone gel wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.43, 10 cm × 10 cm = £2.44, 12.5 cm × 12.5 cm = £3.14, 17.5 cm × 17.5 cm = £6.11, 23 cm × 23.2 cm (heel) = £8.95

Eclypse® Adherent (Advancis)

Soft silicone wound contact layer with absorbent pad and film-backing, 10 cm × 10 cm = £2.99, 10 cm × 20 cm = £3.75, 15 cm × 15 cm = £4.99, 20 cm × 30 cm = £9.99

Episil® Absorbent (Advancis)

Soft silicone wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £2.16, 10 cm × 20 cm = £2.90, 10 cm × 30 cm = £4.25, 15 cm × 15 cm = £3.15, 15 cm × 20 cm = £4.10

Flivasorb® (Activa)

Absorbent polymer dressing with non-adherent wound contact layer, 10 cm × 10 cm = £2.09, 20 cm × 20 cm = £6.58, 10 cm × 20 cm = £3.50

Mepilex® (Mölnlycke)

Absorbent soft silicone dressing with polyurethane foam film backing, 10 cm × 11 cm = £2.53, 11 cm × 20 cm = £4.18, 15 cm × 16 cm = £4.59, 20 cm × 21 cm = £6.93, 20 cm × 50 cm = £27.24

Mepilex® Border, absorbent soft silicone dressing with polyurethane foam and adhesive border, 7 cm × 7.5 cm = £1.31, 10 cm × 12.5 cm = £2.59, 10 cm × 20 cm = £3.47, 10 cm × 30 cm = £5.21, 15 cm × 17.5 cm = £4.46, 17 cm × 20 cm = £5.78

Mepilex® Border Lite, thin absorbent soft silicone dressing with polyurethane foam and adhesive border, 4 cm × 5 cm = 88p, 7.5 cm × 7.5 cm = £1.33, 5 cm × 12.5 cm = £1.92, 10 cm × 10 cm = £2.42, 15 cm × 15 cm = £3.95; 18 cm × 18 cm (sacrum) = £4.56, 23 cm × 23 cm (sacrum) = £7.44; 13 cm × 20 cm (heel) = £5.15

Mepilex® Lite, thin absorbent soft silicone dressing with polyurethane foam, 6 cm × 8.5 cm = £1.69, 10 cm × 10 cm = £2.02, 15 cm × 15 cm = £3.92, 20 cm × 50 cm = £24.77

Mepilex® Transfer, soft silicone exudate transfer dressing, 7.5 cm × 8.5 cm = £2.10, 10 cm × 12 cm = £3.30, 15 cm × 20 cm = £9.89, 20 cm × 50 cm = £25.27

Proguide® (S&N Hlth.)

Non-adherent polyurethane wound contact layer with absorbent pad, 10 cm × 10 cm = £2.00

Sorbion® Sana (H&R)

Non-adherent polyethylene wound contact dressing with absorbent core, 8.5 cm × 8.5 cm = £4.93, 12 cm × 12 cm = £6.68, 12 cm × 22 cm = £12.37, 22 cm × 22 cm = £19.84

UrgoCell® (Urgo)

Non-adherent soft polymer wound contact dressing with polyurethane foam film backing, 10 cm × 12 cm = £4.44, 15 cm × 20 cm = £9.00; *with adhesive border* 13 cm × 13 cm = £4.44, 15 cm × 20 cm = £9.00

UrgoCell Start®, soft polymer wound contact dressing with polyurethane foam backing, 6 cm × 6 cm = £4.30, 10 cm × 10 cm = £5.95, 15 cm × 20 cm = £10.70

Urgotul® Duo (Urgo)

Non-adherent, soft polymer wound contact dressing with absorbent pad, 5 cm × 10 cm = £2.29, 10 cm × 12 cm = £3.54, 15 cm × 20 cm = £8.22

Urgotul® Duo Border, soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing, 8 cm × 8 cm = £2.24, 10 cm × 12 cm = £3.47, 15 cm × 20 cm = £8.05

Bio-cellulose dressings

Suprasorb® X (Activa)

Biosynthetic cellulose fibre dressing, 5 cm × 5 cm = £1.87, 9 cm × 9 cm = £3.89, 14 cm × 20 cm = £7.71; 2 cm × 21 cm (rope) = £5.99

A8.2.4 Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation.

Hydrocolloid-fibrous dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.

Without adhesive border

ActivHeal® Hydrocolloid (MedLogic)

Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, 5 cm × 7.5 cm = 75p, 10 cm × 10 cm = £1.52, 15 cm × 15 cm = £3.31, 15 cm × 18 cm (sacral) = £3.84; *with polyurethane foam layer*, 5 cm × 7.5 cm = 94p, 10 cm × 10 cm = £1.49, 15 cm × 15 cm = £2.81, 15 cm × 18 cm (sacral) = £3.24

Alione® (Coloplast)

Semi–permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.96, 12.5 cm × 12.5 cm = £4.07, 12 cm × 20 cm = £5.34, 15 cm × 15 cm = £5.14, 20 cm × 20 cm = £7.68

Askina® Biofilm Transparent (Braun)

Semi-permeable, polyurethane film dressing with hydrocolloid adhesive, 10 cm × 10 cm = £1.02, 15 cm × 15 cm = £2.31, 20 cm × 20 cm = £3.02

Comfeel® Plus (Coloplast)

Hydrocolloid dressings containing carmellose sodium and calcium alginate. *contour*, 6 cm × 8 cm = £2.04, 9 cm × 11 cm = £3.54; *ulcer*, 4 cm × 6 cm = 88p, 10 cm × 10 cm = £2.25, 15 cm × 15 cm = £4.82, 18 cm × 20 cm (triangular) = £5.25, 20 cm × 20 cm = £6.94; *transparent*, 5 cm × 7 cm = 61p, 5 cm × 15 cm = £1.46, 5 cm × 25 cm = £2.37, 9 cm × 14 cm = £2.24, 9 cm × 25 cm = £3.18, 10 cm × 10 cm = £1.17, 15 cm × 15 cm = £3.06, 15 cm × 20 cm = £3.11, 17 cm × 17 cm (sacral) = £3.44, 20 cm × 20 cm = £3.13; *pressure relieving*, 7 cm diameter = £3.18, 10 cm = £4.26, 15 cm = £6.42

DuoDERM® Extra Thin (ConvaTec)

Semi-permeable hydrocolloid dressing, 5 cm × 10 cm = 71p, 7.5 cm × 7.5 cm = 73p, 10 cm × 10 cm = £1.21, 9 cm × 15 cm = £1.63, 9 cm × 25 cm = £2.61, 9 cm × 35 cm = £3.65, 15 cm × 15 cm = £2.61

DuoDERM® Signal, hydrocolloid dressing with 'Time to change' indicator, 10 cm × 10 cm = £1.97, 14 cm × 14 cm = £3.45, 20 cm × 20 cm = £6.86, 11 cm × 19 cm (oval) = £2.99, 18.5 cm × 19.5 cm (heel) = £4.82, 22.5 cm × 20 cm (sacral) = £5.64

Flexigran® (A1 Pharmaceuticals)

Semi-permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.19; *thin*, 10 cm × 10 cm = £1.08

Granuflex® (ConvaTec)

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 10 cm × 10 cm = £2.56, 15 cm × 15 cm = £4.87, 15 cm × 20 cm = £5.27, 20 cm × 20 cm = £7.32

Hydrocoll® Basic (Hartmann)

Hydrocolloid dressing with absorbent wound contact pad, 10 cm × 10 cm = £2.23; *thin*, 7.5 cm × 7.5 cm = 63p, 10 cm × 10 cm = £1.05, 15 cm × 15 cm = £2.36

NU DERM® (Systagenix)

Semi-permeable hydrocolloid dressing, 5 cm × 5 cm = 83p, 10 cm × 10 cm = £1.53, 15 cm × 15 cm = £3.12, 20 cm × 20 cm = £6.24, 8 cm × 12 cm (heel/elbow) = £3.12, 15 cm × 18 cm (sacral) = £4.37; *thin*, 10 cm × 10 cm = £1.04

Suprasorb® H (Activa)

Semi-permeable hydrocolloid dressing, without adhesive border 10 cm × 10 cm = £1.54, 15 cm × 15 cm = £3.37; *thin*, 5 cm × 10 cm = 66p, 10 cm × 10 cm = £1.01, 15 cm × 15 cm = £2.31

Tegaderm® Hydrocolloid (3M)

Hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.30, 15 cm × 15 cm = £4.46; *thin*, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 10 cm = £1.51

Ultec Pro® (Covidien)

Semi-permeable hydrocolloid dressing; without adhesive border 10 cm × 10 cm = £2.23, 15 cm × 15 cm = £4.36, 20 cm × 20 cm = £6.56

With adhesive border

Alione® (Coloplast)

Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £2.96, 12.5 cm × 12.5 cm = £4.07, 12 cm × 20 cm = £5.34, 15 cm × 15 cm = £5.14, 20 cm × 20 cm = £7.68

Granulflex® Bordered (ConvaTec)

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 6 cm × 6 cm = £1.63, 10 cm × 10 cm = £3.06, 15 cm × 15 cm = £5.88, 10 cm × 13 cm (triangular) = £3.61, 15 cm × 18 cm (triangular) = £5.62

Hydrocoll® Border (Hartmann)

Hydrocolloid dressing with adhesive border and absorbent wound contact pad, 5 cm × 5 cm = 92p, 7.5 cm × 7.5 cm = £1.51, 10 cm × 10 cm = £2.20, 15 cm × 15 cm = £4.13; 8 cm × 12 cm (concave) = £1.93; 12 cm × 18 cm (sacral) = £3.29

Suprasorb® H (Activa)

Semi-permeable hydrocolloid dressing with adhesive border, 14 cm × 14 cm = £2.27

Tegaderm® Hydrocolloid (3M)

Hydrocolloid dressing with adhesive border, 10 cm × 12 cm (oval) = £2.26, 13 cm × 15 cm (oval) = £4.22; 17.1 cm × 16.1 cm (sacral) = £4.71; *thin*, semi-permeable, clear film dressing with hydrocolloid 10 cm × 12 cm (oval) = £1.50; 13 cm × 15 cm (oval) = £2.81

Ultec Pro® (Covidien)

Semi-permeable hydrocolloid dressing with adhesive border, 21 cm × 21 cm = £4.58, 15 cm × 18 cm (sacral) = £3.23, 19.5 cm × 23 cm (sacral) = £4.88

Hydrocolloid-fibrous dressings

Aquacel® (ConvaTec)

Soft non-woven pad containing hydrocolloid-fibres, 4 cm × 10 cm = £1.38, 4 cm × 20 cm = £2.04, 4 cm × 30 cm = £3.05, 5 cm × 5 cm = £1.07; 10 cm × 10 cm = £2.54; 15 cm × 15 cm = £4.78; 2 cm × 45 cm (ribbon) = £2.59

Versiva® XC (ConvaTec)

Hydrocolloid gelling foam dressing, without adhesive border, 7.5 cm × 7.5 cm = £1.35, 11 cm × 11 cm = £2.25, 15 cm × 15 cm = £4.15, 20 cm × 20 cm = £6.20; with adhesive border, 10 cm × 10 cm = £2.30, 14 cm × 14 cm = £3.10, 19 cm × 19 cm = £4.95, 22 cm × 22 cm = £5.50, 18.5 cm × 20.5 cm (heel) = £5.50, 21 cm × 25 cm (sacral) = £5.90

Polyurethane matrix dressing

Cutinova® Hydro (S&N Hlth.)

Polyurethane matrix with absorbent particles and waterproof polyurethane film, 5 cm × 6 cm = £1.16, 10 cm × 10 cm = £2.33, 15 cm × 20 cm = £4.94

A8.2.5 Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependant on the level of exudate

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handing capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound.

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin.

For lightly exuding wounds

Polyurethane Foam Film Dressing with Adhesive Border

PolyMem®, 5 cm × 5 cm = 48p (Unomedical)

Tielle® Lite, 11 cm × 11 cm = £2.24; 7 cm × 9 cm = £1.19; 8 cm × 15 cm = £2.76; 8 cm × 20 cm = £2.91 (Systagenix)

For lightly to moderately exuding wounds

Polyurethane Foam Dressing, BP 1993

Lyofoam®, 7.5 cm × 7.5 cm = £1.02, 10 cm × 10 cm = £1.17, 10 cm × 17.5 cm = £1.88, 15 cm × 20 cm = £2.54

Suprasorb® M, 10 cm × 10 cm = £1.75, 10 cm × 20 cm = £3.09, 20 cm × 20 cm = £5.15 (Activa)

Polyurethane Foam Film Dressing with Adhesive Border

Suprasorb® P, 7.5 cm × 7.5 cm = £1.18, 10 cm × 10 cm = £1.28, 15 cm × 15 cm = £2.28 (Activa)

Tielle®, 11 cm × 11 cm = £2.33; 15 cm × 15 cm = £3.81, 18 cm × 18 cm = £4.85, 7 cm × 9 cm = £1.25, 15 cm × 20 cm = £4.77, 18 cm × 18 cm (sacral) = £3.53 (Systagenix)

Polyurethane Foam Film Dressing without Adhesive Border

ActivHeal FlexiPore®, self-adhesive, 6 cm × 7 cm = 93p; 10 cm × 10 cm = £1.73, 15 cm × 20 cm = £3.70; 20 cm × 20 cm = £5.06; 10 cm × 30 cm = £3.60 (MedLogic)

Allevyn® Lite, 5 cm × 5 cm = £1.04; 10 cm × 10 cm = £1.88; 10 cm × 20 cm = £3.22; 15 cm × 20 cm = £4.02 (S&N Hlth.)

Allevyn® Thin, self-adhesive, 5 cm × 6 cm = 98p, 10 cm × 10 cm = £1.98, 15 cm × 15 cm = £3.26, 15 cm × 20 cm = £3.96 (S&N Hlth)

Suprasorb® P, 5 cm × 5 cm = 92p, 7.5 cm × 7.5 cm = 98p, 10 cm × 10 cm = £1.15, 15 cm × 15 cm = £3.07 (Activa)

Transorbent®, self-adhesive, 5 cm × 7 cm = £1.00; 10 cm × 10 cm = £1.89; 15 cm × 15 cm = £3.47; 20 cm × 20 cm = £5.55 (Unomedical)

For moderately to heavily exuding wounds

Polyurethane Foam Dressing

Copa®, 5 cm × 5 cm = 70p, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £1.04, 12.5 cm × 12.5 cm = £1.77, 15 cm × 15 cm = £2.55, 20 cm × 20 cm = £2.95, 10 cm × 20 cm = £2.01, 8.5 cm × 7.5 cm (fenestrated) = 89p (Covidien)

Polyurethane Foam Film Dressing with Adhesive Border

ActivHeal® Foam Island, 10 cm × 10 cm = £1.57, 12.5 cm × 12.5 cm = £1.50, 15 cm × 15 cm = £1.92, 20 cm × 20 cm = £4.34 (MedLogic)

Avazorb® Border, 6 cm × 10 cm = £1.10, 8 cm × 12 cm = £1.90 (Advancis)

Allevyn® Adhesive, 7.5 cm × 7.5 cm = £1.39, 10 cm × 10 cm = £2.00, 12.5 cm × 12.5 cm = £2.50, 17.5 cm × 17.5 cm = £4.93, 12.5 cm × 22.5 cm = £3.89, 22.5 cm × 22.5 cm = £7.18; (sacral) 17 cm x 17 cm = £3.70, 22 cm x 22 cm = £5.32 (S&N Hlth.)

Allevyn® Plus Adhesive, 12.5 cm × 12.5 cm = £3.08; 17.5 cm × 17.5 cm = £5.93; 12.5 cm × 22.5 cm = £5.45; (sacral) 17 cm x 17 cm = £4.48, 22 cm x 22 cm = £6.49 (S&N Hlth)

Biatain® Adhesive, 10 cm × 10 cm = £1.62; 12 cm × 12 cm = £2.38, 18 cm × 18 cm = £4.77, 18 cm × 28 cm = £7.06, 23 cm × 23 cm (sacral) = £4.08, 19 cm × 20 cm (heel) = £4.76; 17 cm diameter (contour) = £4.59 (Coloplast)

Copa® Island, 10 cm × 10 cm = £1.51, 15 cm × 15 cm = £2.84, 20 cm × 20 cm = £5.36 (Coviden)

Lyofoam® Extra Adhesive, 9 cm × 9 cm = £1.27; 15 cm × 15 cm = £2.39; 22 cm × 22 cm = £4.70; 15 cm × 13 cm (sacral) = £1.95 (Medlock)

PermaFoam®, 16.5 cm × 18 cm (concave) = £ 3.67; 18 cm × 18 cm (sacral) = £3.02; 22 cm × 22 cm (sacral) = £3.47; *PermaFoam Comfort®* 8 cm × 8 cm = £1.02, 10 cm × 20 cm = £3.06, 11 cm × 11 cm = £1.94, 15 cm × 15 cm = £3.16, 20 cm × 20 cm = £4.59 (Hartmann)

PolyMem®, 5 cm × 7.6 cm = £1.07, 8.8 cm × 12.7 cm = £1.90, 10 cm × 13 cm = £2.06, 15 cm × 15 cm = £2.77, 16.5 cm × 20.9 cm = £6.25, 18.4 cm × 20 cm (sacral) = £4.28 (Unomedical)

Tegaderm® Foam Adhesive, 10 cm × 11 cm = £2.30, 14 cm × 14 cm = £3.40, 14 cm × 15 cm = £4.08, 19 cm × 22.5 cm = £6.69, 14 cm × 14 cm (heel) = £4.09 (3M)

Tielle® Plus, 11 cm × 11 cm = £2.58; 15 cm × 15 cm = £4.21; 15 cm × 20 cm = £5.28; 15 cm × 15 cm (sacrum) = £3.07; 20 cm × 26.5 cm (heel) = £4.37 (Systagenix)

Trufoam®, 11 cm × 11 cm = £2.16, 15 cm × 15 cm = £3.62, 7 cm × 9 cm = £1.13, 15 cm × 20 cm = £4.53 (Unomedical)

Polyurethane Foam Film Dressing without Adhesive Border

ActivHeal® Foam Non-Adhesive, 5 cm × 5 cm = 72p, 10 cm × 10 cm = £1.09, 10 cm × 17.8 cm = £2.26, 20 cm × 20 cm = £3.78 (MedLogic)

Advazorb® Plus, 5 cm × 7.5 cm = 70p, 10 cm × 10 cm = £1.08, 15 cm × 15 cm = £2.10, 20 cm × 20 cm = £3.75 (Advancis)

Allevyn®, 5 cm × 5 cm = £1.18, 10 cm × 10 cm = £2.33, 10 cm × 20 cm = £3.75, 20 cm × 20 cm = £6.27, 10.5 cm × 13.5 cm (heel) = £4.68 (S&N Hlth.)

Allevyn® Cavity, circular, 5 cm diameter = £3.86, 10 cm diameter = £9.21; tubular, 9 cm × 2.5 cm = £3.75, 12 cm × 4 cm = £6.60 (S&N Hlth.)

Allevyn® Compression, 5 cm × 6 cm = £1.15; 10 cm × 10 cm = £2.36; 15 cm × 15 cm = £4.01, 15 cm × 20 cm = £4.49 (S&N Hlth.)

Allevyn® Plus Cavity, 5 cm × 6 cm = £1.74, 10 cm × 10 cm = £2.89, 15 cm × 20 cm = £5.79 (S&N Hlth.)

Askina® Foam, 10 cm × 10 cm = £2.06, 10 cm × 20 cm = £3.25, 20 cm × 20 cm = £5.43, 12 cm × 20 cm (heel) = £4.40; cavity dressing, 2.4 cm × 40 cm = £2.30 (Braun)

Biatain® Non-Adhesive, 10 cm × 10 cm = £2.20, 10 cm × 20 cm = £3.63, 15 cm × 15 cm = £4.05, 20 cm × 20 cm = £6.01; 5 cm × 7 cm = £1.21, 5 cm diameter = £1.13, 8 cm diameter = £1.59; *Biatain® Soft-Hold*, 10 cm × 10 cm = £2.39, 15 cm × 15 cm = £3.97, 5 cm × 7 cm = £1.21, 10 cm × 20 cm = £3.63 (Coloplast)

Copa® Plus, 5 cm × 5 cm = 80p, 7.5 cm × 7.5 cm = £1.39, 10 cm × 10 cm = £1.44, 12.5 cm × 12.5 cm = £2.20, 15 cm × 15 cm = £3.32, 20 cm × 20 cm = £3.96, 10 cm × 20 cm = £2.64, 8.5 cm × 7.5 cm (fenestrated) = £1.22 (Covidien)

Kerraboot®, (clear or white), foot-shaped, extra small = £14.38, small = £14.66, large = £14.66, extra large = £14.38 (Ark)

Lyofoam® Extra, 10 cm × 10 cm = £2.02, 17.5 cm × 10 cm = £3.43, 20 cm × 15 cm = £4.44 (Medlock)

PermaFoam®, 10 cm × 10 cm = £1.94, 10 cm × 20 cm = £3.32, 15 cm × 15 cm = £3.67, 20 cm × 20 cm = £5.61; 6 cm diameter = £1.00, 8 cm × 8 cm (fenestrated) = £1.14; cavity dressing, 10 cm × 10 cm = £1.84 (Hartmann)

PolyMem®, 8 cm × 8 cm = £1.50, 10 cm × 10 cm = £2.34, 13 cm × 13 cm = £3.90, 17 cm × 19 cm = £5.75, 10 cm × 61 cm = £12.39; *PolyMem® Max* 11 cm × 11 cm = £2.81 (Unomedical)

Tegaderm® Foam, 8.8 cm × 8.8 cm (fenestrated) = £2.14, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £3.57, 20 cm × 20 cm = £5.69, 10 cm × 60 cm = £12.05 (3M)

Tielle® Plus Borderless, 11 cm × 11 cm = £3.04; 15 cm × 20 cm = £5.51 (Systagenix)

Tielle® Xtra, 11 cm × 11 cm = £2.20; 15 cm × 15 cm = £3.30, 15 cm × 20 cm = £5.40 (Systagenix)

Trufoam® NA, 5 cm × 5 cm = £1.08, 10 cm × 10 cm = £2.05, 15 cm × 15 cm = £3.78 (Unomedical)

Cavi-Care® (S&N Hlth.)

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity. 20 g = £18.12

A8.2.6 Alginate dressings

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue.

Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

ActivHeal® (MedLogic)

Activheal® Alginate, calcium sodium alginate dressing, 5 cm × 5 cm = 57p, 10 cm × 10 cm = £1.11, 10 cm × 20 cm = £2.73; cavity dressing, 2 cm × 30 cm = £2.05

ActivHeal Aquafiber®, non-woven, calcium sodium alginate dressing, 5 cm × 5 cm = 73p, 10 cm × 10 cm = £1.74, 15 cm × 15 cm = £3.28; cavity dressing, 2 cm × 42 cm = £1.75

Algisite® M (S&N Hlth.)

Calcium alginate fibre, non-woven dressing, 5 cm × 5 cm = 85p, 10 cm × 10 cm = £1.75, 15 cm × 20 cm = £4.71; cavity dressing, 2 cm × 30 cm = £3.18

Algosteril® (S&N Hlth.)

Calcium alginate dressing. 5 cm × 5 cm = 84p, 10 cm × 10 cm = £1.92, 10 cm × 20 cm = £3.25; cavity dressing, 2 g, 30 cm = £3.47

Curasorb® (Covidien)

Calcium alginate dressing, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.49, 10 cm × 14 cm = £2.41, 10 cm × 20 cm = £2.93, 15 cm × 25 cm = £5.15, 30 cm × 61 cm = £27.03; cavity dressing, 30 cm = £2.84, 61 cm = £4.98, 91 cm = £5.36

Curasorb® Plus, calcium alginate dressing, 10 cm × 10 cm = £2.04

Curasorb® Zn, calcium alginate and zinc dressing, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.30

Kaltostat® (ConvaTec)

Calcium alginate fibre, non-woven, 5 cm × 5 cm, = 87p, 7.5 cm × 12 cm = £1.91, 10 cm × 20 cm = £3.77, 15 cm × 25 cm = £6.48; cavity dressing, 2 g = £3.54

Melgisorb® (Mölnlycke)

Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven, 5 cm × 5 cm = 84p, 10 cm × 10 cm = £1.74, 10 cm × 20 cm = £3.27; cavity dressing, 32 cm × 2.2 cm, (2 g) = £3.30

SeaSorb® (Coloplast)

SeaSorb® Soft, alginate containing hydrocolloid dressing, highly absorbent, gelling dressing, 5 cm × 5 cm = 90p, 10 cm × 10 cm = £2.14, 15 cm × 15 cm = £4.05

SeaSorb® Soft Filler, calcium sodium alginate fibre, highly absorbent, gelling filler, 44 cm = £2.52

Sorbalgon® (Hartmann)

Calcium alginate dressing, 5 cm × 5 cm = 74p, 10 cm × 10 cm = £1.55; cavity dressing, 2 g, 32 cm = £3.17

Sorbsan® (Unomedical)

Sorbsan® Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = 78p, 10 cm × 10 cm = £1.64, 10 cm × 20 cm = £3.08

Sorbsan® Plus, alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.93, 10 cm × 20 cm = £3.74, 15 cm × 20 cm = £5.20

Sorbsan® Plus SA, alginate dressing with adhesive border and absorbent backing, 11.5 cm × 14 cm = £2.89, 14 cm × 19 cm = £4.22, 14 cm × 24 cm = £5.10, 19 cm × 24 cm = £6.40

Sorbsan® Ribbon, 40 cm (with probe) = £1.99

Sorbsan® Surgical Packing, 30 cm (2 g, with probe) = £3.41

Suprasorb® A (Activa)

Calcium alginate dressing, 5 cm × 5 cm = 57p, 10 cm × 10 cm = £1.12; cavity dressing, 2 g × 30 cm = £2.08

Tegaderm® Alginate (3M)

5 cm × 5 cm = 77p, 10 cm × 10 cm = £1.62; cavity dressing, 2 cm × 30 cm = £2.70

Tielle® Packing (Systagenix)

Tielle® Packing, 9.5 cm × 9.5 cm = £2.08

Urgosorb® (Urgo)

Alginate and hydrocolloid dressing without adhesive border, 5 cm × 5 cm = 81p, 10 cm × 10 cm = £1.93, 10 cm × 20 cm = £3.55; cavity dressing, 30 cm = £2.58

A8.2.7 Capillary-action dressings

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer.

The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

Advadraw® (Advancis)

Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 56p, 10 cm × 10 cm = 87p, 10 cm × 15 cm = £1.17, 15 cm × 20 cm = £1.54

Advadraw Spiral®, 0.5 cm × 40 cm = 81p

Cerdak® Basic (CliniMed)

Non-adhesive wound contact sachet containing ceramic spheres, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08; cavity dressing, 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63

Cerdak® Aerocloth, non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing, 5 cm × 5 cm = £1.37, 5 cm × 10 cm = £1.94

Cerdak® Aerofilm, non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing, 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07

Sumar® (Lantor)

Sumar® Lite, for light to moderately exuding wounds and cavities, 5 cm × 5 cm = 93p, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12

Sumar® Max, for heavily exuding wounds, 5 cm × 5 cm = 95p, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15

Sumar® Spiral, 0.5 cm × 40 cm = £1.57

Vacutex® (Protex)

Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer. 5 cm × 5 cm = 94p, 10 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.23, 10 cm × 20 cm = £2.68, 15 cm × 20 cm = £3.14, 20 cm × 20 cm = £4.28

A8.2.8 Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes.

Fungating wounds and chronic infected wounds produce high volumes of exudate. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

Askina® Carbosorb (Braun)

Activated charcoal and non-woven viscose rayon dressing, 10 cm × 10 cm = £2.72, 10 cm × 20 cm = £5.25

CarboFLEX® (ConvaTec)

Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer. 10 cm × 10 cm = £2.95, 8 cm × 15 cm = £3.55, 15 cm × 20 cm = £6.72

Carbopad® VC (Synergy Healthcare)

Activated charcoal non-absorbent dressing, 10 cm × 10 cm = £1.59, 10 cm × 20 cm = £2.15

CliniSorb® Odour Control Dressings (CliniMed)

Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating. 10 cm × 10 cm = £1.75, 10 cm × 20 cm = £2.33, 15 cm × 25 cm = £3.75

Lyofoam® C (Medlock)

Lyofoam sheet with layer of activated charcoal cloth and additional outer envelope of polyurethane foam. 10 cm × 10 cm = £2.85, 15 cm × 20 cm = £6.47

Sorbsan® Plus Carbon (Unomedical)

Alginate dressing with activated carbon, 7.5 cm × 10 cm = £2.42, 10 cm × 15 cm = £4.70, 10 cm × 20 cm = £5.62, 15 cm × 20 cm = £6.47

A8.3 Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials.

For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

Medical grade honey (section A8.3.1), has antimicrobial and anti-inflammatory properties. Dressings impregnated with **iodine** (section A8.3.2), can be used to treat clinically infected wounds. Dressings containing **silver** (section A8.3.3), should be used only when clinical signs or symptoms of infection are present.

Dressings containing other **antimicrobials** (section A8.3.4) such as polihexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

A8.3.1 Honey

Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

Sheet dressing

Actilite® (Advancis)

Knitted viscose impregnated with medical grade manuka honey and manuka oil, 10 cm × 10 cm = 95p, 10 cm × 20 cm = £1.85

Activon Tulle® (Advancis)

Knitted viscose impregnated with medical grade manuka honey, 5 cm × 5 cm = £1.78, 10 cm × 10 cm = £3.01

Where no size stated by the prescriber the 5 cm size to be supplied

Algivon® (Advancis)

Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey, 5 cm × 5 cm = £2.09, 10 cm × 10 cm = £3.53

Medihoney® (Medihoney)

Antibacterial Honey Tulle, woven fabric impregnated with medical grade manuka honey, 10 cm × 10 cm = £2.98

Gel sheet, sodium alginate dressing impregnated with medical grade honey, 5 cm × 5 cm = £1.75, 10 cm × 10 cm = £4.20

Mesitran® (Unomedical)

Hydrogel, semi-permeable dressing impregnated with medical grade honey, 10 cm × 10 cm = £2.51, 10 cm × 17.5 cm = £4.52, 15 cm × 20 cm = £5.22; *with adhesive border*, 10 cm × 10 cm = £2.61, 15 cm × 13 cm (sacral) = £4.42, 15 cm × 15 cm = £4.62

Mesitran® Mesh, hydrogel, non-adherent wound contact layer, without adhesive border, 10 cm × 10 cm = £2.41

Honey-based topical application

Medical grade honey is applied directly to the wound and covered with a primary low adherence wound dressing; an additional secondary dressing may be required for exuding wounds.

Activon® (Advancis)

Manuka honey, (medical grade), 25-g tube = £1.99

Medihoney® (Medihoney)

Antibacterial Medical Honey, honey (medical grade, *Leptospermum* sp.), 20-g tube = £3.96, 50-g tube = £9.90

Antibacterial Wound Gel, honey (medical grade, *Leptospermum* sp.), 80% in natural waxes and oils, 10-g tube = £2.69, 20-g tube = £4.02

Note *Antibacterial Wound Gel* is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult

Melladerm® (Danetre)

Honey (medical grade; S. African, Fynbos) 45% in basis containing polyethylene glycol, 50-g tube = £7.50

Melladerm® Plus, honey (medical grade; Bulgarian, mountain flower) 45% in basis containing polyethylene glycol, 20-g tube = £4.49, 50-g tube = £8.50

Mesitran® (Unomedical)

Ointment, honey (medical grade) 47%, 15-g tube = £3.47, 50-g tube = £9.55

Excipients include lanolin

Ointment S, honey (medical grade) 40%, 15-g tube = £3.46

Excipients include lanolin

A8.3.2 Iodine

Cadexomer–iodine, like povidone–iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages desloughing.

Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen.

Povidone–iodine fabric dressing is a knitted viscose dressing with povidone–iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate.

Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.

Iodoflex® (S&N Hlth.)

Paste, iodine 0.9% as cadexomer–iodine in a paste basis with gauze backing, 5-g unit = £3.73; 10 g = £7.46; 17 g = £11.81

Uses for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment

Cautions iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

Contra-indications children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

Iodosorb® (S&N Hlth.)

Ointment, iodine 0.9% as cadexomer–iodine in an ointment basis, 10 g = £4.04; 20 g = £8.24

Powder, iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet = £1.76

Uses for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment

Cautions iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

Contra-indications children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

Iodozyme® (Insense)

Hydrogel (two-component dressing containing glucose oxidase and iodide ions), 10 cm × 10 cm = £12.50

Uses antimicrobial dressing for lightly to moderately exuding wounds

Cautions children; pregnancy and breast-feeding

Contra-indications thyroid disorders; patients receiving lithium

Oxyzyme® (Insense)

Hydrogel (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £6.00, 10 cm × 10 cm = £10.00

Uses non-infected, dry to moderately exuding wounds

Cautions children; pregnancy and breast-feeding

Contra-indications thyroid disorders; patients receiving lithium

Povidone–iodine Fabric Dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = 32p; 9.5 cm × 9.5 cm = 47p (Systagenix—*Inadine®*)

Uses wound contact layer for abrasions and superficial burns

Cautions iodine may be absorbed particularly if large wounds treated; children under 6 months; thyroid disease

Contra-indications severe renal impairment; pregnancy; breast-feeding

A8.3.3 Silver

Antimicrobial dressings containing **silver** should be used only when infection is suspected as a result of clinical signs or symptoms (see also p. 919). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing.

Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discolouration (see section 13.10.1.1). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment.

Low adherence dressings

Acticoat® (S&N Hlth.)

Three layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver coated high density polyethylene mesh, 5 cm × 5 cm = £3.22, 10 cm × 10 cm = £7.85, 10 cm × 20 cm = £12.28, 20 cm × 40 cm = £42.01

Acticoat® 7 five layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver coated high density polyethylene mesh, 5 cm × 5 cm = £5.59, 10 cm × 12.5 cm = £16.65, 15 cm × 15 cm = £29.93

Atrauman® Ag (Hartmann)

Non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = 47p, 10 cm × 10 cm = £1.14, 10 cm × 20 cm = £2.23

With charcoal

Actisorb® Silver 220 (Systagenix)

Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.61, 10.5 cm × 10.5 cm = £2.53, 10.5 cm × 19 cm = £4.60

Soft polymer dressings

Mepilex® Ag (Mölnlycke)

Soft silicone wound contact dressing with polyurethane foam film backing, with silver, 10 cm × 10 cm = £5.80, 10 cm × 20 cm = £9.57, 15 cm × 15 cm = £10.77, 20 cm × 20 cm = £15.96

UrgoCell® Silver (Urgo)

Non-adherent soft polymer wound contact dressing with polyurethane foam film backing, with silver, 6 cm × 6 cm = £4.00, 10 cm × 10 cm = £5.50, 15 cm × 20 cm = £9.90

Urgotul® Silver (Urgo)

Non-adherent soft polymer wound contact dressing, with silver, 10 cm × 12 cm = £3.32, 15 cm × 20 cm = £9.03

Urgotul® Duo Silver, non-adherent, soft polymer wound contact dressing, with silver, 5 cm × 7 cm = £1.94, 11 cm × 11 cm = £3.85, 15 cm × 20 cm = £9.28

Hydrocolloid dressings

Aquacel® Ag (ConvaTec)

Soft non-woven pad containing hydrocolloid fibres, (silver impregnated), 4 cm × 10 cm = £2.65, 4 cm × 20 cm = £3.46, 4 cm × 30 cm = £5.17, 5 cm × 5 cm = £1.81, 10 cm × 10 cm = £4.32, 15 cm × 15 cm = £8.13, 20 cm × 30 cm = £20.17; 2 cm × 45 cm (ribbon) = £4.34

Biatain® Ag Hydrocolloid (Coloplast)

Semi-permeable, antimicrobial barrier dressing with ionic silver (silver sodium thiosulphate), 10 cm × 10 cm = £6.72, 15 cm × 15 cm = £13.44

Physiotulle® Ag (Coloplast)

Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine, 10 cm × 10 cm = £2.10

Urgotul® SSD (Urgo)

Non-adherent, polyester fabric with hydrocolloid and silver sulfadiazine, 11 cm × 11 cm = £2.97, 16 cm × 21 cm = £8.42

Contra-indications pregnancy, renal, or hepatic impairment, neonates

Foam dressings

Acticoat® Moisture Control (S&N Hlth.)

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £6.58, 10 cm × 10 cm = £15.39, 10 cm × 20 cm = £29.99

Allevyn® Ag (S&N Hlth.)

Silver sulfadiazine impregnated polyurethane foam film dressing *with adhesive border*, 7.5 cm × 7.5 cm = £3.21, 10 cm × 10 cm = £5.06, 12.5 cm × 12.5 cm = £6.65, 17.5 cm × 17.5 cm = £12.79, 17 cm × 17 cm (sacral) = £9.99, 22 cm × 22 cm (sacral) = £13.38; *without adhesive border*, 5 cm × 5 cm = £3.00, 10 cm × 10 cm = £5.65, 15 cm × 15 cm = £10.71, 20 cm × 20 cm = £15.69, 10.5 cm × 13.5 cm (heel) = £9.90

Cautions large open wounds; sensitivity to sulphonamides; G6PD deficiency; significant hepatic or renal impairment; **interactions**: Appendix 1 (sulphonamides)

Avance® (Medlock)

Silver impregnated polyurethane foam film dressing, *without adhesive border*, 10 cm × 10 cm = £2.75, 10 cm × 17.5 cm = £4.38, 15 cm × 20 cm = £6.05; *with adhesive border*, 9 cm × 9 cm = £2.31, 12 cm × 12 cm = £3.83, 15 cm × 15 cm = £4.69, 15 cm × 13 cm (sacral) = £3.45

Biatain® Ag (Coloplast)

Silver impregnated polyurethane foam film dressing *with adhesive border*, 12.5 cm × 12.5 cm = £8.55, 18 cm × 18 cm = £17.14, 19 cm × 20 cm (heel) = £16.91, 23 cm × 23 cm (sacral) = £17.97; *without adhesive border*, 10 cm × 10 cm = £7.47, 5 cm × 7 cm = £3.07, 10 cm × 20 cm = £13.73, 15 cm × 15 cm = £15.00, 20 cm × 20 cm = £21.15, 5 cm diameter = £3.13; cavity dressing 5 cm × 8 cm = £3.72

PolyMem® (Unomedical)

Silver impregnated polyurethane foam film dressing, *with adhesive border*, 5 cm × 7.6 cm (oval) = £2.15, 12.7 cm × 8.8 cm (oval) = £5.30; *without adhesive border*, 10.8 cm × 10.8 cm = £8.20, 17 cm × 19 cm = £16.93

Alginate dressings

Acticoat® Absorbent (S&N Hlth.)

Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £4.91, 10 cm × 12.5 cm = £11.78; 2 cm × 30 cm (cavity) = £11.85

Algisite® Ag (S&N Hlth.)

Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.83, 10 cm × 20 cm = £7.04; 2 g, 30 cm (cavity) = £5.28

Silvercel® (Systagenix)

Alginate and hydrocolloid dressing impregnated with silver, 2.5 cm × 30.5 cm = £4.37, 5 cm × 5 cm = £1.64, 10 cm × 20 cm = £7.53, 11 cm × 11 cm = £4.06

Sorbsan® (Unomedical)

Sorbsan® Silver Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, with silver, 5 cm × 5 cm = £1.50, 10 cm × 10 cm = £3.80, 10 cm × 20 cm = £6.94

Sorbsan® Silver Plus, calcium alginate dressing with absorbent backing, with silver, 7.5 cm × 10 cm = £3.25, 10 cm × 15 cm = £5.41, 10 cm × 20 cm = £6.58, 15 cm × 20 cm = £8.82

Sorbsan® Silver Plus SA, calcium alginate dressing with absorbent backing and adhesive border, with silver, 11.5 cm × 14 cm = £5.28, 14 cm × 19 cm = £7.60, 14 cm × 24 cm = £8.36, 19 cm × 24 cm = £9.32

Sorbsan® Silver Ribbon, with silver, 40 cm (with probe) = £3.97

Sorbsan® Silver Surgical Packing, with silver, 30 cm (2 g, with probe) = £5.55

Urgosorb® Silver (Urgo)

Alginate and hydrocolloid dressing, impregnated with silver, 5 cm × 5 cm = £1.42, 10 cm × 10 cm = £3.39, 10 cm × 20 cm = £6.39; cavity dressing, 2.5 cm × 30 cm = £3.41

A8.3.4 Other antimicrobials

Chlorhexidine Gauze Dressing, BP 1993

Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate, 5 cm × 5 cm = 27p; 10 cm × 10 cm = 56p (S&N Hlth.—*Bactigras®*)

Cutimed® Sorbact (BSN Medical)

Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride, (dressing pad) 7 cm × 9 cm = £3.20, 10 cm × 10 cm = £5.00, 10 cm × 20 cm = £7.80; (swabs) 4 cm × 6 cm = £1.50, 7 cm × 9 cm = £2.50, (round swabs) 3 cm, 5 pad pack = £3.00; (cavity dressing, cotton) 2 cm × 50 cm = £3.74, 5 cm × 2 m = £7.37

Flaminal® (Ark Therapeutics)

Forte gel, alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds, 15 g = £7.18, 50 g = £23.77

Hydro gel, alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds, 15 g = £7.18, 50 g = £23.77

Prontosan® Wound Gel (Braun)

Hydrogel containing betaine surfactant and polyhexanide, 30 mL = £5.97

Suprasorb® X + PHMB (Activa)

Biosynthetic cellulose fibre dressing with polihexanide, 5 cm × 5 cm = £2.34, 9 cm × 9 cm = £4.66, 14 cm × 20 cm = £10.60; 2 cm × 21 cm (rope) = £6.60

Telfa® AMD (Covidien)

Low adherence absorbent perforated plastic film faced dressing with polihexanide, 7.5 cm × 10 cm = 17p, 7.5 cm × 20 cm = 28p

Telfa® AMD Island Low adherence dressing with adhesive border and absorbent pad, with polihexanide, 10 cm × 12.5 cm = 58p, 10 cm × 20 cm = 85p, 10 cm × 25.5 cm = 96p, 10 cm × 35 cm = £1.19

A8.4 Specialised dressings

A8.4.1 Protease-modulating matrix dressings

Protease-modulating matrix dressings alter the activity of *proteolytic enzymes* in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

Cadesorb® (S&N Hlth.)

Ointment, starch-based, 10 g = £4.96, 20 g = £8.46

Promogran® (Systagenix)

Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm^2 (hexagonal) = £5.09, 123 cm^2 (hexagonal) = £15.32

Promogran® Prisma® Matrix (Systagenix)

Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm^2 (hexagonal) = £6.19, 123 cm^2 (hexagonal) = £17.63

Sorbion® S (H&R)

Absorbent polymers in cellulose matrix, hypoallergenic fleece envelope, 7.5 cm × 7.5 cm = £1.75, 10 cm × 10 cm = £2.22, 20 cm × 20 cm = £6.90, 20 cm × 10 cm = £3.68, 30 cm × 10 cm = £5.29, 30 cm × 20 cm = £9.92, 12 cm × 5 cm = £1.86

Suprasorb® C (Activa)

Collagen, 4 cm × 6 cm = £2.60, 6 cm × 8 cm = £3.98, 8 cm × 12 cm = £7.80

Tegaderm® Matrix (3M)

Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis, 5 cm × 6 cm = £4.75, 8 cm × 10 cm = £9.75

A8.4.2 Silicone keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Advasil® Conform (Advancis)

Self-adhesive silicone gel sheet with polyurethane film backing, 10 cm × 10 cm = £5.20, 10 cm × 15 cm = £9.17

Cica-Care® (S&N Hlth.)

Soft, self-adhesive, semi-occlusive silicone gel sheet with backing. 6 cm × 12 cm = £13.42; 15 cm × 12 cm = £26.16

Ciltech® (Su-Med)

Silicone gel sheet, 10 cm × 10 cm = £7.50, 15 cm × 15 cm = £14.00, 10 cm × 20 cm = £12.50

Silicone gel, 15 g = £17.50, 60 g = £50.00

Dermatix® (Valeant)

Self-adhesive silicone gel sheet (clear- or fabric-backed), 4 cm × 13 cm = £6.61, 13 cm × 13 cm = £15.17, 13 cm × 25 cm = £27.41, 20 cm × 30 cm = £49.92;
Silicone gel, 15 g = £19.38, 60 g = £58.14

Kelo-cote® (ABT Healthcare)

Silicone gel, 15 g = £17.88, 60 g = £51.00

Silicone spray, 100 mL = £51.00

Mepiform® (Mölnlycke)

Self-adhesive silicone gel sheet with polyurethane film backing, 5 cm × 7 cm = £3.20, 9 cm × 18 cm = £12.53, 4 cm × 31 cm = £10.12

Silgel® (Nagor)

Silicone gel sheet, 10 cm × 10 cm = £13.50; 20 cm × 20 cm = £40.00; 40 cm × 40 cm = £144.00; 10 cm × 5 cm = £7.50; 15 cm x 10 cm = £19.50; 30 cm × 5 cm = £19.50; 10 cm × 30 cm = £31.50; 25 cm × 15 cm (submammary) = £21.12; 46 cm × 8.5 cm (abdominal) = £39.46; 5.5 cm diameter (circular) = £4.00

Silgel® STC-SE silicone gel, 20-mL tube = £19.00

A8.5 Adjunct dressings and appliances

A8.5.1 Surgical absorbents

Surgical absorbent dressings, applied directly to the wound, have many disadvantages, since they adhere to the wound, shed fibres into it, and dehydrate it; they also permit leakage of exudate ('strike through') with an associated risk of infection. Surgical absorbents may be used as secondary absorbent layers in the management of heavily exuding wounds.

Cotton

Absorbent Cotton, BP

Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls, 25 g = 69p; 100 g = £1.58; 500 g = £5.31 (most suppliers). 25-g pack to be supplied when weight not stated

Uses general purpose cleansing and swabbing, pre-operative skin preparation, application of medicaments; supplementary absorbent pad to absorb excess wound exudate

Absorbent Cotton, Hospital Quality

As for absorbent cotton but lower quality materials, shorter staple length etc. 100 g = £1.10; 500 g = £3.46 (most suppliers)

Drug Tariff specifies to be supplied only where specifically ordered

Uses suitable only as general purpose absorbent, for swabbing, and routine cleansing of incontinent patients; not for wound cleansing

Gauze and tissue

Absorbent Cotton Gauze, BP 1988

Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile, 90 cm (all) × 1 m = £1.04; 3 m = £2.17; 5 m = £3.38; 10 m = £6.47 (most suppliers). 1-m packet supplied when no size stated

Uses pre-operative preparation, for cleansing and swabbing

Note Drug Tariff also includes unsterilised absorbent cotton gauze, 25 m roll = £14.82

Absorbent Cotton Ribbon Gauze, BP 1993 NHS

Cotton fabric of plain weave in ribbon form with fast selvedge edges

Uses post-surgery cavity packing for sinus, dental, throat cavities etc.

Absorbent Cotton and Viscose Ribbon Gauze, BP 1993

Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile. 5 m (both) × 1.25 cm = 78p; 2.5 cm = 86p

Uses post-surgery cavity packing for sinus, dental, throat cavities etc.

Gauze and Cotton Tissue, BP 1988

Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2. 500 g = £6.74 (most suppliers, including Robinsons—*Gamgee Tissue*® (blue label))

Uses absorbent and protective pad, as burns dressing on non-adherent layer

Gauze and Cotton Tissue

(Drug Tariff specification 14). Similar to above. 500 g = £4.92 (most suppliers, including Robinsons—*Gamgee Tissue*® (pink label))

Drug Tariff specifies to be supplied only where specifically ordered

Uses absorbent and protective pad, as burns dressing on non-adherent layer

Lint and muslin

Absorbent Lint, BPC

Cotton cloth of plain weave with nap raised on one side from warp yarns. 25 g = 86p; 100 g = £2.63; 500 g = £11.07 (most suppliers). 25-g pack supplied where no quantity stated

Note Not recommended for wound management

Absorbent Muslin, BP 1988 NHS

Fabric of plain weave, warp threads of cotton, weft threads of cotton and/or viscose

Uses wet dressing, soaked in 0.9% sterile sodium chloride solution

Pads

Absorbent Dressing Pads, Sterile

Drisorb®, 10 cm × 20 cm = 17p (Synergy Healthcare)

Xupad®, 10 cm × 20 cm = 17p, 20 cm × 20 cm = 28p, 20 cm × 40 cm = 40p (Richardson)

[1] **Surgipad®** (Systagenix) NHS

Absorbent pad of absorbent cotton and viscose in sleeve of non-woven viscose fabric, pouch 12 cm × 10 cm = 18p, 20 cm × 10 cm = 25p, 20 cm × 20 cm = 30p, 40 cm × 20 cm = 41p; *non sterile* pack 12 cm × 10 cm = 5p, 20 cm × 10 cm = 10p, 20 cm × 20 cm = 17p, 40 cm × 20 cm = 28p

1. NHS Except in Sterile Dressing Pack with Non-woven Pads

A8.5.2 Wound drainage pouches

Biotrol® (Braun)

Draina S Fistula, wound drainage pouch, mini (cut to 20 mm), 150-mL capacity = £2.40; medium (cut to 50 mm), 350-mL capacity = £3.59; large (cut to 88 mm), 500-mL capacity = £4.41

Draina S Vision, wound drainage pouch, (cut to 50 mm), 150-mL capacity = £9.39; (cut to 88 mm), 250-mL capacity = £9.92; (cut to 100 mm), 300-mL capacity = £11.51

Dermasure® (ADI Medical)

Pouch, small (wound size up to 9 cm × 16 cm) = £15.60; medium (wound size up to 15 cm × 27 cm) = £20.80

Eakin® (Eakin)

Wound pouch, *fold and tuck closure*, small (wound size up to 45 mm × 30 mm) = £4.50; medium (wound size up to 110 mm × 75 mm) = £6.50; large (wound size up to 175 mm × 110 mm) = £8.50; extra large (horizontal wound up to 245 mm × 160 mm) = £15.00

Wound pouch, *bung closure*, small (wound size up to 45 mm × 30 mm) = £5.00; medium (wound size up to 110 mm × 75 mm) = £7.00; large (wound size up to 175 mm × 110 mm) = £9.50; extra large (horizontal or vertical wound up to 245 mm × 160 mm) = £17.00, (vertical incision wound up to 290 mm × 130 mm) = £17.00; (horizontal wound up to 245 mm × 160 mm), *with access window* = £19.00

Access window, for use with *Eakin*® pouches = £7.00

Oakmed® Option (Oakmed)

Wound Manager, extra small (wound size up to 90 mm × 180 mm) = £10.91; small (horizontal wound size up to 245 mm × 160 mm) = £12.13; medium (vertical wound size up to 90 mm × 260 mm) = £12.41; large (wound size up to 160 mm × 200 mm) = £12.95

Wound manager, with access port, extra small (wound size up to 90 mm × 180 mm) = £11.93; small (horizontal wound size up to 245 mm × 160 mm) = £12.68; medium (vertical wound size up to 90 mm × 260 mm) = £12.95; large (wound size up to 160 mm × 260 mm) = £15.81; square (vertical wound size up to 160 mm × 200 mm) = £13.49

Wound manager, cut-to-fit, small (10–30 mm) = £2.23, medium (10–50 mm) = £2.47, large (10–50 mm) = £2.59

Welland® (CliniMed)

Fistula bag, *wound manager*, cut-to-fit (wound size up ro 40 mm × 70 mm) = £2.54

A8.6 Complex adjunct therapies

Topical negative pressure (or vacuum-assisted) therapy requires specific wound dressings for use with the vacuum-pump equipment.

Other complex adjunct therapies include sterile larvae (maggots), and growth factors such as becalpermin (see section 13.11.7)

A8.6.1 Topical negative pressure therapy

Vacuum assisted closure products

Exsu-Fast® (Synergy Healthcare)

Dressing kit, Kit 1 (small wound, low exudate) = £28.04; Kit 2 (large wound, heavy exudate) = £35.83; Kit 3 (large wound, medium to low exudate) = £35.83; Kit 4 (small wound, heavy exudate) = £28.04

V.A.C. GranuFoam® (KCI Medical)

Dressing kit, polyurethane foam dressing (with adhesive drapes and pad connector), 10 cm × 7.5 cm × 3.3 cm (small) = £21.41, 18 cm × 12.5 cm × 3.3 cm (medium) = £25.49, 26 cm × 15 cm × 3.3 cm (large) = £29.57

Venturi® (Talley)

Wound sealing kit, flat drain, standard = £15.00, large = £17.50; channel drain = £15.00

V1STA® (S&N Hlth.)

Dressing kit, flat drain, small = £16.52, medium = £20.70, large = £26.28; round drain, small = £16.52, large = £26.28; channel drain, medium = £20.70

WoundASSIST® (Huntleigh)

Wound pack, small–medium = £20.50, medium–large = £23.50

Wound drainage collection devices

V.A.C Freedom® (KCI Medical)

Canister (with gel), 300 mL = £26.51

Venturi® (Talley)

Canister kit (with solidifier) = £12.50

V1STA® (S&N Hlth.)

Canister kit, 250 mL (with solidifier) = £18.63, 800 mL (with solidifier) = £20.70

WoundASSIST® (Huntleigh)

Canister, 500 mL = £20.00

A8.7 Wound care acccessories

A8.7.1 Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

Non-Drug Tariff Specification Sterile Dressing Pack

Dressit® contains vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field = 60p (Richardson)

Nurse It® contains powder-free vinyl gloves, sterile polythene sheet, non-woven swabs, paper towel, disposable bag, compartmented tray, plastic forceps = 52p (Medicare)

Polyfield® Nitrile Patient Pack contains powder-free nitrile gloves, laminate sheet, non-woven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

Polyfield® Soft Vinyl Patient Pack contains powder-free sterile soft vinyl gloves, polythene sheet, non-woven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

Propax® SDP contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 45p (BSN Medical)

Woundcare® contains nitrile gloves, sterile field, compartmented tray, large apron, disposable bag, non-woven swabs, drape = 44p (Frontier)

Sterile Dressing Pack

(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 49p (Synergy Healthcare—*Vernaid®*)

Sterile Dressing Pack with Non-woven Pads

(Drug Tariff specification 35). Contains non-woven fabric covered dressing pad, non-woven fabric swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 48p (Synergy Healthcare—*Vernaid®*)

A8.7.2 Woven and fabric swabs

Gauze Swab, BP 1988

Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm 5-pad packet = 38p; non-sterile, 10 cm × 10 cm, 100-pad packet = £1.31 (most suppliers)

Filmated Gauze Swab, BP 1988

As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.52 (Synergy Healthcare—*Cotfil®*)

Non-woven Fabric Swab

(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 24p; non-sterile, 10 cm × 10 cm, 100-pad packet = 76p

Filmated Non-woven Fabric Swab

(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.52 (Systagenix—*Regal®*)

A8.7.3 Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Permeable adhesive tapes

Elastic Adhesive Tape, BP 1988

(Elastic Adhesive Plaster). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.64 (Robinsons—*Flexoplast®*; S&N—*Elastoplast®*)

For 5 cm width, see Elastic Adhesive Bandage

Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988

Non-woven fabric with a polyacrylate adhesive.

Hypafix®, 5 cm × 5 m = £1.34, 10 cm × 5 m = £2.25, 10 m (all): 2.5 cm = £1.56, 5 cm = £2.48, 10 cm = £4.33, 15 cm = £6.42, 20 cm = £8.51, 30 cm = £12.31 (BSN Medical)

Mefix®, 5 m (all): 2.5 cm = 95p, 5 cm = £1.68; 10 cm = £2.69, 15 cm = £3.66, 20 cm = £4.69, 30 cm = £6.72 (Mölnlycke)

Omnifix®, 10 m (all): 5 cm = £2.19, 10 cm = £3.69, 15 cm = £5.44 (Hartmann)

Permeable Non-woven Synthetic Adhesive Tape, BP 1988

Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass:

Clinipore®, 5 m (all) 1.25 cm = 35p, 2.5 cm = 59p, 5 cm = 99p; 2.5 cm × 10 m = 73p (Clinisupplies)

Leukofix®, 5 m (all) 1.25 cm = 52p, 2.5 cm = 83p, 5 cm = £1.45 (BSN Medical)

Leukopor®, 5 m (all) 1.25 cm = 46p, 2.5 cm = 72p, 5 cm = £1.26 (BSN Medical)

Mediplast®, 5 m (all) 1.25 cm = 30p, 2.5 cm = 50p (Neomedic)

Micropore®, 5 m (all) 1.25 cm = 60p, 2.5 cm = 89p, 5 cm = £1.57 (3M)

Scanpor®, 5 m (all) 1.25 cm = 40p, 2.5 cm = 65p, 5 cm = £1.12; 10 m (all), 1.25 cm = 52p, 2.5 cm = 87p, 5 cm = £1.65, 7.5 cm = £2.42 (BioDiagnostics)

Where no brand stated by prescriber, net price of tape supplied not to exceed 35p (1.25 cm), 59p (2.5 cm), 99p (5 cm)

Permeable Woven Synthetic Adhesive Tape, BP 1988

Non-extensible closely woven fabric, spread with a polymeric adhesive. 5 m (all): 1.25 cm = 77p; 2.5 cm = £1.12; 5 cm = £1.95 (Beiersdorf—*Leukosilk®*)

Silicone adhesive tape

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

Insil®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Insight)

Mepitac®, 2 cm × 3 m = £6.39, 4 cm × 1.5 m = £6.39 (Mölnlycke)

Siltape®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Advancis)

Zinc Oxide Adhesive Tape, BP 1988

(Zinc Oxide Plaster). Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide. 5 m (all): 1.25 cm = 93p; 2.5 cm = £1.35; 5 cm = £2.28; 7.5 cm = £3.43 (most suppliers)

Zinc Oxide Adhesive Tape

Mediplast®, 5 m (all), 1.25 cm = 82p, 2.5 cm = £1.19, 5 cm = £1.99, 7.5 cm = £2.99 (Neomedic)

Strappal®, 5 m (all): 1.25 cm = 89p, 2.5 cm = £1.29, 5 cm = £2.17, 7.5 cm = £3.27 (BSN Medical)

Occlusive adhesive tapes

Impermeable Plastic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with an adhesive mass. 2.5 cm × 3 m = £1.30; 2.5 cm × 5 m = £1.95; 5 cm × 5 m = £2.47; 7.5 cm × 5 m = £3.59 (BSN Medical—*Sleek®*)

Impermeable Plastic Synthetic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with a polymeric adhesive mass. 5 m (both): 2.5 cm = £1.72; 5 cm = £3.27 (3M—*Blenderm®*)

A8.7.4 Adhesive dressings

Adhesive dressings (also termed 'island dressings') have a limited role for minor wounds only. The inclusion of an antiseptic is not particularly useful and may cause skin irritation in susceptible subjects.

Permeable adhesive dressings

Elastic Adhesive Dressing, BP 1993 NHS

Wound dressing or dressing strip, pad attached to piece of extension plaster, leaving suitable adhesive margin; both pad and margin covered with suitable protector; pad may be dyed yellow and may be impregnated with suitable antiseptic (see below); extension plaster may be perforated or ventilated

Note Permitted antiseptics are aminoacridine hydrochloride (aminacrine hydrochloride), chlorhexidine hydrochloride (both 0.07–0.13%), chlorhexidine gluconate (0.11–0.20%); domiphen bromide (0.05–0.25%)

Permeable Plastic Wound Dressing, BP 1993 NHS

Consisting of an absorbent pad, which may be dyed and impregnated with a suitable antiseptic (see under Elastic Adhesive Dressing), attached to a piece of permeable plastic surgical adhesive tape, to leave a suitable adhesive margin; both pad and margin covered with suitable protector (most suppliers)

Vapour permeable adhesive dressings

Vapour-permeable Waterproof Plastic Wound Dressing, BP 1993

(former Drug Tariff title: Semipermeable Waterproof Plastic Wound Dressing). Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to piece of semi-permeable waterproof surgical adhesive tape, to leave suitable adhesive margin; both pad and margin covered with suitable protector.(S&N Hlth—*Elastoplast Airstrip®*)

Occlusive adhesive tapes

Impermeable Plastic Wound Dressing, BP 1993 NHS

Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to piece of impermeable plastic surgical adhesive tape, to leave suitable adhesive margin; both pad and margin covered with suitable protector (most suppliers)

A8.7.5 Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

Skin closure strips, sterile

Leukostrip®, 6.4 mm × 76 mm, 3 strips per envelope. 10 envelopes = £5.79 (S&N Hlth.)

Steri-strip®, 6 mm × 75 mm, 3 strips per envelope. 12 envelopes = £8.52 (3M)

Drug Tariff specifies that these are specifically for personal administration by the prescriber

A8.8 Bandages

According to their structure and performance bandages are used for dressing retention, for support, and for compression.

A8.8.1 Non-extensible bandages

Bandages made from non-extensible woven fabrics have generally been replaced by more conformable products, therefore their role is now extremely limited. Triangular calico bandage has a role as a sling.

Domette Bandage, BP 1988 NHS

Fabric, plain weave, cotton warp and wool weft (hospital quality also available, all cotton). 5 m (all): 5 cm = 54p; 7.5 cm = 81p; 10 cm = £1.08; 15 cm = £1.61 (Steraid)

Multiple Pack Dressing No. 1

(Drug Tariff). Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded). 1 pack = £3.93

Open-wove Bandage, BP 1988

Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length. Type 1, 5 m (all): 2.5 cm = 30p; 5 cm = 51p; 7.5 cm = 72p; 10 cm = 94p (most suppliers) 5 m × 5 cm supplied when size not stated

Triangular Calico Bandage, BP 1980

Unbleached calico right-angled triangle, 90 cm × 90 cm × 1.27 m = £1.13 (most suppliers)

A8.8.2 Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of **conforming-stretch bandages** (also termed contour bandages) is greater than that of **cotton conforming bandages**.

Conforming Bandage (Synthetic)

Fabric, plain weave, warp of polyamide, weft of viscose. 4 m stretched (all):

Hospiform® (formerly *Peha Crepp*® E), 6 cm = 12p, 8 cm = 15p, 10 cm = 17p, 12 cm = 21p (Hartmann)

Cotton Conforming Bandage, BP 1988

Cotton fabric, plain weave, treated to impart some elasticity to warp and weft. 3.5 m (all): type A, 5 cm = 63p, 7.5 cm = 77p, 10 cm = 96p, 15 cm = £1.30 (S&N Hlth— *Easifix Crinx*®)

Knitted Polyamide and Cellulose Contour Bandage, BP 1988

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched (all):

K-Band®, 5 cm = 19p, 7 cm = 24p, 10 cm = 26p, 15 cm = 46p (Urgo)

Knit-Band®, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (CliniMed)

Knit Fix®, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

Polyamide and Cellulose Contour Bandage, BP 1988 (formerly Nylon and Viscose Stretch Bandage)

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):

Acti-Wrap®, cohesive, latex-free, 6 cm = 43p, 8 cm = 62p, 10 cm = 74p (Activa)

Easifix®, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 47p, 15 cm = 80p (S&N Hlth)

Kontour®, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrip)

Slinky®, 5 cm = 39p, 7.5 cm = 55p, 10 cm = 66p, 15 cm = 95p (Medlock)

Stayform®, 5 cm = 29p, 7.5 cm = 36p, 10 cm = 40p, 15 cm = 68p (Robinsons)

A8.8.3 Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

Compression hosiery (section A8.9.1) reduces the recurrence of venous leg ulcers and should be considered after wound healing.

Silk clothing is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below)

Elasticated

Elasticated Surgical Tubular Stockinette, Foam padded

(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. Heel, elbow, knee, small = £2.68, medium = £2.83, large = £3.09; sacral,, medium, and large (all) = £13.82 (Medlock—*Tubipad*®)

Uses relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface

Elasticated Tubular Bandage, BP 1993

(formerly Elasticated Surgical Tubular Stockinette). Knitted fabric, elasticated threads of rubber-cored polyamide or polyester with cotton or cotton and viscose yarn, tubular. Lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm; Synergy—*Comfigrip*®; Easigrip—*EasiGRIP*®; Sallis—*Eesiban*®; Sigma—*Sigma ETB*®; Medlock—*Tubigrip*®. Where no size stated by prescriber the 50 cm length should be supplied and width endorsed

Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage.

Acti-Fast®, 3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.50, 5 m = £4.40; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15 (Activa)

CliniFast®, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83; vest (long-sleeved), 6–24 months = £7.13, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small, = £12.75, medium = £14.54, large = £16.58; vest (short-sleeved), adult, small = £12.50, medium = £14.25, large = £16.25; tights (pair) 6–24 months = £7.13; leggings (pair) 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small, = £12.75, medium = £14.54, large = £16.58; cycle shorts, adult, small = £12.50, medium = £14.25, large = £16.25; socks (pair) up to 8 years = £2.97, 8–14 years = £2.97; mittens (pair) up to 24 months = £2.97, 2–8 years = £2.97, 8–14 years = £2.97; clava 6 months–5 years = £5.85, 5–14 years = £6.75 (Clinisupplies)

Comfifast®, 3.5 cm red line (small limb), length 1 m = 59p; 5 cm green line (medium limb), length 1 m = 61p, 3 m = £1.67, 5 m = £2.86; 7.5 cm blue line (large limb), length 1 m = 81p, 3 m = £2.19, 5 m = £3.80; 10.75 cm yellow line (child trunk), length 1 m = £1.26, 3 m = £3.54, 5 m = £6.09; 17.5 cm beige line (adult trunk), length 1 m = £1.88 (Synergy)

Comfifast® Easy Wrap, vest (long-sleeved), 6–24 months = £8.08, 2–5 years = £10.77, 5–8 years = £12.12, 8–11 years = £13.46, 11–14 years = £13.46, adult, small = £15.30, medium = £17.44, large = 19.89; tights (pair) 6–24 months = £8.08; leggings (pair) 2–5 years = £10.77, 5–8 years = £12.12, 8–11 years = £13.46, 11–14 years = £13.46, adult, small = £15.30, medium = £17.44, large = £19.89; socks (pair) up to 8 years = £3.37, 8–14 = £3.37; mittens (pair) up to 24 months = £3.37, 2–8 years = £3.37, 8–14 years = £3.37; clava, 6 months–5 years = £6.63, 5–14 years = £7.65 (Synergy)

Coverflex®, 3.5 cm red line (small limb), length 1 m = 75p; 5 cm green line (medium limb), length 1 m = 78p, 3 m = £2.28, 5 m = £3.94; 7.5 cm blue line (large limb), length 1 m = £1.09, 3 m = £2.60, 5 m = £ 5.14; 10.75 cm yellow line (child trunk), length 1 m = £1.71, 3 m = £4.93, 5 m = £8.67; 17.5 cm beige line (adult trunk), length 1 m = £2.28 (Hartmann)

Easifast®, 3.5 cm red line (small limb), length 1 m = 65p; 5 cm green line (medium limb), length 1 m = 69p, 3 m = £1.95, 5 m = £3.40; 7.5 cm blue line (large limb), length 1 m = 94p, 3 m = £2.60, 5 m = £4.50; 10.75 cm yellow line (child trunk), length 1 m = £1.50, 3 m = £4.25, 5 m = £7.20; 17.5 cm beige line (adult trunk), length 1 m = £1.90 (Easigrip)

Skinnies®, clava 6 months–5 years = £6.62, 5–14 years = £7.60; vest (long-sleeved) 6–24 months = £10.30, 2–5 years = £13.50, 5–8 years = £15.25, 8–11 years or 11–14 years = £16.90, adult (small) = £20.90, (medium) = £22.80, (large) = £24.70; body-suit 0–3 months or 3–6 months = £15.90; leggings (pair) 6–24 months = £10.30, 2–5 years = £13.50, 5–8 years = £15.25, 8–11 years or 11–14 years = £16.90, adult (small) = £20.90, (medium) = £22.80, (large) = £24.70; socks (pair) 6 months–8 years or 8–14 years = £4.20; mittens 0–24 months, 2–8 years, or 8–14 years = £3.80; gloves child (small) = £5.20, (medium or large) = £5.25, adult (small) = £5.20, (medium or large) = £5.25. (Skinnies)

Tubifast®, 3.5 cm red line (small limb), length 1 m = 85p; 5 cm green line (medium limb), length 1 m = 92p, 3 m = £2.62, 5 m = £4.49; 7.5 cm blue line (large limb), length 1 m = £1.23, 3 m = £3.45, 5 m = £6.02; 10.75 cm yellow line (child trunk), length 1 m = £1.97, 3 m = £5.62, 5 m = £9.66; 20 cm purple line (large adult trunk), length 1 m = £3.18, 5 m = £15.57; vest (long-sleeved), 6–24 months = £10.68, 2–5 years = £14.23, 5–8 years = £16.01, 8–11 years = £17.79, 11–14 years = £17.79; tights (pair) 6–24 months = £10.68; leggings (pair) 2–5 years = £14.23, 5–8 years = £16.01, 8–11 years = £17.79, 11–14 years = £17.79; socks (pair) = £4.45; gloves (small, medium or large adult, medium or large child) = £5.46 (Medlock)

Non-elasticated

Cotton Stockinette, Bleached, BP 1988

Knitted fabric, cotton yarn, tubular length, 1 m (all), 2.5 cm = 33p; 5 cm = 51p; 7.5 cm = 62p; 6 m × 10 cm = £4.23 (J&J, Medlock)

Uses 1 m lengths, basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage

Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988

Knitted fabric of 1:1 ribbed structure, singles yarn spun from blend of two-thirds cotton and one-third viscose fibres, tubular. Length 5 m (all):

type A (lightweight): arm/leg (child), arm (adult) 5 cm = £2.40; arm (OS adult), leg (adult) 7.5 cm = £3.15; leg (OS adult) 10 cm = £4.18; trunk (child) 15 cm = £6.02; trunk (adult) 20 cm = £6.95; trunk (OS adult) 25 cm = £8.31 (Mölnlycke)

type B (heavyweight): sizes as for type A, net price £2.30–£7.97 (Sallis—*Eesiban®*)

Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage

Uses protective dressings with tar-based and other non-steroid ointments

Silk Clothing

Knitted, medical grade silk clothing can be used as an adjunct to normal treatment for severe eczema and allergic skin conditions. When used in combination with medical creams and ointments, care should be taken to ensure that the medication is fully absorbed into the skin before the silk clothing is worn; silk garments are not suitable for use in direct contact with emollients used in 'wet wrapping techniques'.

DermaSilk® (Espere)

Knitted silk fabric, hypoallergenic, sericin-free, *body suit*, child up to 6 months (height 68 cm) = £35.65, 6–9 months (height 74 cm) = £36.67, 12–18 months (height 86 cm) = £36.69, 2–3 years (height 98 cm) = £38.71, 3–4 years (height 110 cm) = £39.73; *Facial mask*, child 6–12 months = £15.30, 1–6 years = £15.30; *Gloves*, adult (small, medium or large) = £19.33, child 3–4 years = £13.77, 5–9 years = £13.77; *Leggings*, child up to 6 months (height 68 cm) = £25.45, 6–9 months (height 74 cm) = £26.47, 12–18 months (height 86 cm) = £27.49, 2–3 years (height 98 cm) = £28.51, 3–4 years (height 110 cm) = £29.53; *Pyjamas*, child 3–4 years (height 110 cm) = £66.25, 5–6 years (height 120 cm) = £70.33, 7–8 years (height 135 cm) = £73.39, 10–12 years (height 150 cm) = £76.45; *Sleeves (tubular)* one size = £25.45; *Undersocks, (heel-less)*, 2 pairs standard or longer length = £22.95; *Undersocks*, adult shoe-size 5½–6½, 7–8½, 9–10½, 11–13, child shoe-size 3–8, 9–1, 2–5, 2 pairs = £17.45

A8.8.4 Support bandages

Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see section A8.8.7.

Crepe Bandage, BP 1988

Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all): 5 cm = 90p; 7.5 cm = £1.26; 10 cm = £1.65; 15 cm = £2.39 (most suppliers)

Cotton Crepe Bandage

Light support bandage, 4.5 m stretched (all): 5 cm = 48p; 7.5 cm = 67p; 10 cm = 87p; 15 cm = £1.27 (Steraid—*Hospicrepe® 239*)

Cotton Crepe Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both): 7.5 cm = £2.81; 10 cm = £3.62; other sizes NHS (most suppliers)

Cotton, Polyamide and Elastane Bandage

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all): 5 cm = 54p, 7.5 cm = 73p, 10 cm = 91p, 15 cm = £1.12 (Neomedic—*Neosport®*); 5 cm = 64p, 7.5 cm = 91p, 10 cm = £1.16, 15 cm = £1.67 (BSN Medical—*Soffcrepe®*); 10 cm = £1.10 (Mölnlycke—*Setocrepe®*); 10 cm = £1.24, latex-free = £1.31 (S&N Hlth.—*Profore® #2*)

Cotton Stretch Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all):

Hospicrepe® 233, 5 cm = 52p; 7.5 cm = 72p; 10 cm = 96p; 15 cm = £1.36 (Steraid)

PremierBand®, 5 cm = 45p, 7.5 cm = 63p, 10 cm = 79p, 15 cm = £1.18 (Shermond)

Cotton Suspensory Bandage

(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all) = £1.55, extra large = £1.65. Type 2: cotton net bag with elastic edge and webbing waistband; small = £1.72, medium = £1.77, large = £1.83, extra large = £1.91. Type 3: cotton net bag with elastic edge and webbing waistband with elastic insertion; small, medium, and large (all) = £1.86; extra large = £1.92. Type supplied to be endorsed

Knitted Elastomer and Viscose Bandage

Knitted fabric, viscose and elastomer yarn.

Type 2 (light support bandage)

CliniLite®, 4.5 m (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 80p, 15 cm = £1.16 (Clinisupplies)

K-Lite®, 4.5 m stretched, 5 cm = 51p, 7 cm = 71p, 10 cm = 93p, 15 cm = £1.34; 5.2 m stretched, 10 cm = £1.06 (Urgo)

Knit-Firm®, 4.5 m stretched, 5 cm = 36p, 7 cm = 51p, 10 cm = 66p, 15 cm = 96p (Steraid)

Type 3a (light compression bandage):

CliniPlus®, 8.7 m × 10 cm = £1.80 (Clinisupplies)

Elset®, 6 m stretched, 10 cm = £2.39, 15 cm = £2.59; 8 m stretched, 10 cm = £3.06; 12 m stretched, 15 cm = £5.13 (Mölnlycke)

K-Plus®, 8.7 m stretched, 10 cm = £2.08 (Urgo)

K-Plus® Long, 10.25 m stretched, 10 cm = £2.41 (Urgo)

Profore® #3, 8.7 m stretched, 10 cm = £3.60, latex-free = £3.91 (S&N Hlth.)

L3, 8.6 m stretched, 10 cm = £2.04 (S&N Hlth.)

A8.8.5 Adhesive bandages

Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with **zinc paste bandage** in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

Elastic Adhesive Bandage, BP 1993

Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched (all): 5 cm = £3.31; 7.5 cm = £4.80; 10 cm = £6.38 (Robinsons—*Flexoplast®*; S&N Hlth—*Elastoplast®* Bandage). 7.5 cm width supplied when size not stated

A8.8.6 Cohesive bandages

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. They should not be used if arterial disease is suspected.

Cohesive extensible bandages

These elastic bandages adhere to themselves and not to skin; this prevents slipping during use.

Uses: support of sprained joints; outer layer of multi-layer compression bandaging

Coban® (3M)

6 m (stretched), 10 cm = £2.76; other sizes NHS 4.5 m stretched (all): 2.5 cm = £1.29; 5 cm = £1.81; 7.5 cm = £2.74; 10 cm = £3.61; 15 cm = £5.33

K-Press® (Urgo)

6.5 m × 10 cm (0, short) = £2.76, 7.5 m × 10 cm (18–25 cm ankle circumference) = £3.22, 10.5 m × 10 cm (25–32 cm ankle circumference) = £3.53

Profore® #4 (S&N Hlth.)

2.5 m (unstretched) = £2.97, latex-free = £3.23

Ultra Fast® (Robinsons)

6.3 m (stretched), 10 cm = £2.59

A8.8.7 Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline (section 2.6.4) can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

High compression bandages

PEC High Compression Bandage

Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched (both): 7.5 cm = £2.51; 10 cm = £3.25 (Mölnlycke—*Setopress®*)

VEC High Compression Bandage

Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both); 7.5 cm = £2.53; 10 cm = £3.25 (S&N—*Tensopress®*)

High Compression Bandage

Cotton, viscose, nylon, and Lycra® extensible bandage, 3 m (unstretched), 10 cm = £3.33 (ConvaTec— *SurePress®*);

3 m (unstretched), 10 cm = £2.64 (Urgo—*K-ThreeC®*); 3.5 m (unstretched), 10 cm = £1.82 (Advancis—*Adva-Co®*)

ProGuide® #2 (S&N Hlth.)
Woven, elastomer, cohesive, extensible, compression bandage, 3 m (unstretched), 10 cm (red) = £5.37, 10 cm (yellow) = £5.85, 10 cm (green) = £6.34

Short stretch compression bandage

Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (*see* Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

Actiban® (Activa)
All 5 m, 8 cm = £3.08; 10 cm = £3.31; 12 cm = £4.02

Actico® (Activa)
Cohesive, all 6 m, 4 cm = £2.19, 6 cm = £2.57, 8 cm = £2.95, 10 cm = £3.07, 12 cm = £3.91

Comprilan® (BSN Medical)
All 5 m, 6 cm = £2.52; 8 cm = £2.96; 10 cm = £3.18; 12 cm = £3.87

Rosidal K® (Activa)
All 5 m, 4cm = £1.73, 6cm = £2.42, 8 cm = £2.89, 10 cm = £3.15, 12 cm = £3.83; 10m x 10cm = £5.49

Silkolan® (Urgo)
All 5 m, 8 cm = £3.00; 10 cm = £3.39

Sub-compression wadding bandage

Advasoft® (Advancis)
3.5 m unstretched, 10 cm = 37p

Cellona® Undercast Padding (Activa)
2.75 m unstretched (all): 5 cm = 29p, 7.5 cm = 35p; 10 cm = 43p; 15 cm = 55p

Flexi-Ban® (Activa)
Padding, 3.5 m unstretched, 10cm = 46p

K-Soft® (Urgo)
3.5 m unstretched, 10 cm = 42p; 4.5 m unstretched, 10 cm = 52p

K-Tech® (Urgo)
5 m unstretched, 10 cm (0, short) = £3.73, 6 m unstretched, 10 cm (18–25 cm ankle circumference) = £4.48, 7.3 m unstretched, 10 cm (25–32 cm ankle circumference) = £4.89

Ortho-Band Plus® (Steraid)
10 cm × 3.5 cm unstretched = 37p

Profore® #1 (S&N Hlth.)
Viscose fleece, 3.5 m unstretched, 10 cm = 64p, latex-free = 70p

ProGuide® #1 (S&N Hlth.)
Polyester and viscose fleece, 4 m unstretched, 10 cm = £1.49

Softexe® (Mölnlycke)
3.5 m unstretched, 10 cm = 58p

SurePress® (ConvaTec)
Absorbent padding, 3 m unstretched, 10 cm = 56p

Ultra Soft® (Robinsons)
Soft absorbent bandage, 3.5 m unstretched, 10 cm = 39p

Velband® (BSN Medical)
Absorbent padding, 4.5 m unstretched, 10 cm = 67p

A8.8.8 Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A8.8.7) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

Four layer systems

K-Four® (Urgo)
K-Four® Wound Dressing (*Paratex®*—see Knitted Viscose Primary Dressing, p. 913); *K-Four® # 1* (*K-Soft®*—see Sub-compression Wadding Bandage, above); *K-Four® # 2* (*K-Lite®*—see Knitted Elastomer and Viscose Bandage, p. 928); *K-Four® # 3* (*K-Plus®*—see Knitted Elastomer and Viscose Bandage, p. 928); *K-Three C®*—see High compression bandages, p. 928; *K-Four® # 4* (*Ko-Flex®*), 6 m (stretched), 10 cm = £2.76; 7 m (stretched), 10 cm = £3.16
Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.93, 18–25 cm = £6.51, 25–30 cm = £6.64, above 30 cm = £9.05; *reduced compression*, 18 cm+ = £4.43

Profore® (S&N Hlth.)
Profore® wound contact layer (see Knitted Viscose Primary Dressing, p. 913); *Profore® #1* (see Sub-compression Wadding Bandage, above); *Profore® #2* (see Cotton, Polyamide and Elastane Bandage, p. 928); *Profore® #3* (see Knitted Elastomer and Viscose Bandage, p. 928); *Profore® #4* (see Cohesive bandages, p. 928); *Profore® Plus* 3 m (unstretched), 10 cm = £3.37, latex-free = £3.60
Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £9.32, 18–25 cm = £8.68, 25–30 cm = £7.21, above 30 cm = £10.79, latex-free, 18–25 cm = £9.28; *Profore Lite®* above 18 cm = £5.01, latex-free = £5.45

System 4® (Mölnlycke)
System 4® #1 (*Softexe®*—see Sub-compression Wadding Bandage, above); *System 4® #2* (*Setocrepe®*—see Cotton, Polyamide and Elastane Bandage, p. 928); *System 4® #3* (*Elset®*—see Knitted Elastomer and Viscose Bandage, p. 928); *System 4® #4* (*Coban®*—see Cohesive Bandages, p. 928)
Multi-layer compression bandaging kit, four layer system, for ankle circumference 18–25 cm = £7.51

Ultra Four® (Robinsons)
Ultra Four® #1 (*Ultra Soft®*—see Sub-compression Wadding Bandage, above); *Ultra Four® #2* (*Ultra Lite®*) 10 cm × 4.5 cm (stretched) = 85p; *Ultra Four® #3* (*Ultra Plus®*) 10 cm × 8.7 cm (stretched) = £1.89; *Ultra Four® #4* (*Ultra Fast®*—see Cohesive Bandages, p. 928)
Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.41, 18–25 cm = £5.67; *Ultra Four® RC* (reduced compression) 18–25 cm = £4.14

Two layer systems

Coban® (3M)
Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08

K-Two® (Urgo)
K-Tech® (see Sub-compression Wadding Bandages, above); *K-Press®* (see Cohesive Bandages, p. 928)
Multi-layer compression bandaging kit, two layer system, ankle circumference 18–25 cm (short) = £6.50, ankle circumference 18–25 cm= £7.70, ankle circumference 25–32 cm = £8.41

K-Two® Start, Urgotul® Start (see Soft polymer dressings, p. 915); *K-Tech®* (see Sub-compression Wadding Bandages, p. 929); *K-Press®* (see Cohesive Bandages, p. 928)

Multi-layer compression bandaging kit, two-layer system, for ankle circumference 18–25cm = £9.68; 25–32cm = £10.33

ProGuide® (S&N Hlth.)

ProGuide® wound contact layer (see Soft polymer dressings, p. 916); *ProGuide®* #1 (see Sub-compression Wadding Bandage, p. 929); *ProGuide®* #2 (see High Compression Bandages, p. 929)

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–22 cm (red) = £8.98; 22–28 cm (yellow) = £9.48; 28–32 cm (green) = £9.96

A8.8.9 Medicated bandages

Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution.

Zinc paste bandages are also used with **coal tar** or **ichthammol** in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with **calamine** in milder eczematous skin conditions.

Zinc Paste Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging, 6 m × 7.5 cm = £3.23 (S&N Hlth.—*Viscopaste PB7®* (10%), *excipients: include* cetostearyl alcohol, hydroxybenzoates)

Zinc Paste and Calamine Bandage

(Drug Tariff specification 5). Cotton fabric, plain weave, impregnated with suitable paste containing calamine and zinc oxide; requires additional bandaging. 6 m × 7.5 cm = £3.33 (Mölnlycke—*Calaband®*)

Zinc Paste and Ichthammol Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m × 7.5 cm = £3.31 S&N Hlth.—*Ichthopaste®* (6/2%), *excipients: include* cetostearyl alcohol

Uses see section 13.5

Steripaste® (Mölnlycke)

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m × 7.5 cm = £3.24

Excipients include polysorbate 80

Medicated stocking

Zipzoc® (S&N Hlth.)

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52; 10-pouch carton = £31.30

Note Can be used under appropriate compression bandages or hosiery in chronic venous insufficiency

A8.9 Compression hosiery and garments

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging (section A8.8.7). Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

Note Graduated compression tights are NHS

Compression values for hosiery and lymphoedema garments

Compression class	Compression hosiery (British standard)	Lymphoedema garments (European classification)
Class 1	14–17 mmHg	18–21 mmHg
Class 2	18–24 mmHg	23–32 mmHg
Class 3	25–35 mmHg	34–46 mmHg
Class 4	Not available	49–70 mmHg
Class 4 super	Not available	60–90 mmHg

A8.9.1 Graduated compression hosiery

Class 1 Light Support

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.44, below knee = £6.80, (made-to-measure), thigh length = £36.95, below knee = £23.12; lightweight elastic net (made-to-measure), thigh length = £19.93, below knee = £15.55

Uses superficial or early varices, varicosis during pregnancy

Class 2 Medium Support

Hosiery, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.06, below knee = £9.94, (made-to-measure), thigh length = £36.95, below knee = £23.12; net (made-to-measure), thigh length = £19.93, below knee = £15.55; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £36.95, below knee = £23.12

Uses varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

Class 3 Strong Support

Hosiery, compression at ankle 25–35 mmHg, thigh length or below knee with open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.11, below knee = £11.27, (made-to-measure) thigh length = £36.95, below knee = £23.12; flat bed (made-to-measure, only with open heel and open toe), thigh length = £36.95, below knee = £23.12

Uses gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis

Accessories

In addition to the product listed below, accessories such as application aids for hosiery are available, see Drug Tariff for details

Suspender

Suspender, for thigh stockings = 65p, belt (specification 13), = £4.96, fitted (additional price) = 62p

Anklets

Class 2 Medium Support

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.51; flat bed (standard and made-to-measure) = £13.53; net (made-to-measure) = £12.80

Class 3 Strong Support

Anklets, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £9.09; flat bed (standard) = £9.09, (made-to-measure) = £13.53

Knee caps

Class 2 Medium Support

Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.51; flat bed (standard and made-to-measure) = £13.53; net (made-to-measure) = £10.63

Class 3 Strong Support

Kneecaps, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £8.68; flat bed (standard) = £8.68, (made-to-measure) = £13.53

A8.9.2 Lymphoedema garments

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention.

In addition to the products listed below, made-to-measure garments up to compression 90 mmHg and accessories also available; see Drug Tariff for details. There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 930

Low Compression

Armsleeves (with grip top), compression 12–16 mmHg, small, medium, and large sizes all available short or long, 1 pair = £16.70

Class 1 Light support

Hosiery and armsleeves, compression 18–21 mmHg, small, medium, large, and extra large (hosiery only) sizes all available standard length (some available petite), 1 pair below knee closed toe (no top band) = £25.50, thigh closed toe (with top band) = £49.00; 1 piece armsleeve (no top band) = £13.50, armsleeve (with top band) = £18.00, combined armsleeve (no top band) = £24.50, combined armsleeve (with top band) = £29.00

Armsleeves (with grip top), compression 18–22 mmHg, small, medium, and large sizes all available short or long, 1 pair = £16.70

Class 2 Medium support

Hosiery and armsleeves, compression 23–32 mmHg, small, medium, large, and extra large (hosiery only) sizes all available standard length (some available petite), 1 pair below knee closed or open toe (no top band) = £25.50, thigh closed or open toe (with top band) = £49.00; 1 piece armsleeve (no top band) = £14.50, armsleeve (with top band) = £19.00, combined armsleeve (no top band) = £25.50, combined armsleeve (with top band) = £30.00

Class 3 Strong support

Hosiery, compression 34–46 mmHg, small, medium, large, and extra large sizes all available standard length (some available petite), 1 pair below knee open toe (no top band) = £28.00, thigh open toe (with top band) = £51.00

A9 Cautionary and advisory labels for dispensed medicines

Numbers following the preparation entries in the BNF correspond to the code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient. The pharmacist should ensure that the patient understands how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on driving or work, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this is indicated where necessary.

Original packs Most preparations are now dispensed in unbroken original packs (see Patient Packs, p. x) that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard . . . . days after opening' and 'Do not use after . . . .', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

Wordings which can be given as separate warnings are labels 1–19 and labels 29–33. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

1 **Warning. May cause drowsiness**
To be used on *preparations for children* containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 **Warning. May cause drowsiness. If affected do not drive or operate machinery. Avoid alcoholic drink**
To be used on *preparations for adults that can cause drowsiness*, thereby affecting the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs.*

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.
In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.
Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3).
Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.
Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include *blurred vision, dizziness, or nausea*. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning. May cause drowsiness. If affected do not drive or operate machinery
To be used on *preparations containing monoamine-oxidase inhibitors*; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet.
Also to be used as for label 2 but where alcohol is not an issue.

4 Warning. Avoid alcoholic drink
To be used on *preparations where a reaction such as flushing may occur if alcohol is taken* (e.g. metronidazole and chlorpropamide). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

5 Do not take indigestion remedies at the same time of day as this medicine
To be used with label 25 on *preparations coated to resist gastric acid* (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.
Label 5 also applies to drugs such as ketoconazole *where the absorption is significantly affected by antacids*; the usual period of avoidance recommended is 2 to 4 hours.

6 Do not take indigestion remedies or medicines containing iron or zinc at the same time of day as this medicine
To be used on *preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine*. These drugs chelate calcium, iron and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. These incompatible preparations should be taken 2–3 hours apart.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc at the same time of day as this medicine
To be used on *preparations containing ciprofloxacin, norfloxacin or tetracyclines that chelate calcium, iron, magnesium, and zinc* and are thus less available for absorption; these incompatible preparations should be taken 2–3 hours apart. Doxycycline, lymecycline and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Do not stop taking this medicine except on your doctor's advice
To be used on *preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit* (e.g. antituberculous drugs).
Also to be used on *preparations that contain a drug whose withdrawal is likely to be a particular hazard* (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Take at regular intervals. Complete the prescribed course unless otherwise directed
To be used on *preparations where a course of treatment should be completed* to reduce the incidence of relapse or failure of treatment.
The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning. Follow the printed instructions you have been given with this medicine
To be used particularly on *preparations containing anticoagulants, lithium and oral corticosteroids*. The appropriate treatment card should be given to the patient and any necessary explanations given.
This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Avoid exposure of skin to direct sunlight or sun lamps
To be used on *preparations that may cause phototoxic or photoallergic reactions* if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 9 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine
To be used on *preparations containing probenecid and sulfinpyrazone* whose activity is reduced by aspirin.
Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or *mix with water* before taking
To be used on *preparations that are intended to be dissolved in water* (e.g. soluble tablets) or *mixed with water* (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour the urine
To be used on *preparations that may cause the patient's urine to turn an unusual colour*. These include phenolphthalein (alkaline urine pink), triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution flammable: keep away from fire or flames
To be used on *preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame*.

16 Allow to dissolve under the tongue. Do not transfer from this container. Keep tightly closed. Discard eight weeks after opening
To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than . . . in 24 hours
To be used on *preparations for the treatment of acute migraine* except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.
It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than . . . in 24 hours or . . . in any one week
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning. Causes drowsiness which may continue the next day. If affected do not drive or operate machinery. Avoid alcoholic drink
To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night*. On the rare occasions (e.g. nitrazepam in epilepsy) when hypnotics are prescribed for daytime administration this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) *for anxiolytics prescribed to be taken at night*.
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.

21 . . . with or after food
To be used on *preparations that are liable to cause gastric irritation, or those that are better absorbed with food*.
Patients should be advised that a *small amount of food is sufficient*.

22 . . . half to one hour before food
To be used on some preparations *whose absorption is thereby improved*.
Most oral antibacterials require label 23 instead (see below).

23 . . . an hour before food or on an empty stomach
To be used on *oral preparations whose absorption may be reduced by the presence of food and acid in the stomach*.

24 . . . sucked or chewed
To be used on *preparations that should be sucked or chewed*.
The pharmacist should use discretion as to which of these words is appropriate.

25 . . . swallowed whole, not chewed
To be used on *preparations that are enteric-coated or designed for modified-release*.
Also to be used on *preparations that taste very unpleasant or may damage the mouth* if not swallowed whole.

26 . . . dissolved under the tongue
To be used on *preparations designed for sublingual use*. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 . . . with plenty of water
To be used on *preparations that should be well diluted* (e.g. chloral hydrate), *where a high fluid intake is required* (e.g. sulphonamides), or *where water is required to aid the action* (e.g. methylcellulose). The patient should be advised that 'plenty' means at least 150 mL (about a tumblerful). In most cases fruit juice, tea, or coffee may be used.

28 To be spread thinly . . .
To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
To be used on containers of dispensed *solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis*. The dose form should be specified, e.g. tablets or capsules.
This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Do not take with any other paracetamol products
To be used on all containers of dispensed *preparations containing paracetamol*.

31 Contains aspirin and paracetamol. Do not take with any other paracetamol products
To be used on all containers of dispensed *preparations containing aspirin and paracetamol*.

32 Contains aspirin
To be used on containers of dispensed *preparations containing aspirin when the name on the label does not include the word 'aspirin'*.

33 Contains an aspirin-like medicine
To be used on containers of dispensed *preparations containing aspirin derivatives*.

Products and their labels

Products introduced or amended since publication of BNF No. 57 (March 2009) are underlined.
Proprietary names are in *italic*.

Tenoretic, 8
Tenormin, 8
Tenoxicam tabs, 21
Tensipine MR, 21, 25
Terazosin, C, initial dose, driving
Terbinafine, 9
Terbutaline inhalations, C, dose, see BNF
Terbutaline m/r, 25
Testim, C, administration, see BNF
Testogel, C, administration, see BNF
Testosterone buccal tablets, C, administration, see BNF
Testosterone gel, C, administration, see BNF
Testosterone patch, C, administration, see BNF
Testosterone undecanoate caps, 21, 25
Tetrabenazine, 2
Tetracycline, 7, 9, 23, C, posture
Tetralysal preps, 6, 9
Teveten, 21
Thalidomide, 2, C, symptoms of peripheral neuropathy and thromboembolism, see BNF
Thalidomide Pharmion, 2, C, symptoms of peripheral neuropathy and thromboembolism, see BNF
Theophylline m/r, see preps
Tiagabine, 21
Tiaprofenic acid tabs, 21
Tifaxin XL, 3, 25, C, driving
Tilade, 8, C, change to CFC-free inhaler
Tildiem preps, 25
Tiludronic acid, C, food and calcium
Timodine, 28, C, application, see BNF
Timolol, 8
Tinidazole tabs, 4, 9, 21, 25
Tipranavir, 5, 21
Tizanidine, 2
Toctino, 10, patient information leaflet, 11, 21
Tolcapone, 14, 25
Tolfenamic acid, 21
Tolterodine, 3
Tolterodine m/r, 3, 25
Topamax Sprinkle, 3, 8, C, administration, driving (see BNF)
Topamax tabs, 3, 8, C, driving (see BNF)
Topiramate Sprinkle caps, 3, 8, C, administration, driving (see BNF)
Topiramate tabs, 3, 8, C, driving (see BNF)
Topotecan, 25
Toradol tabs, 17, 21
Tostran, C, administration
Toviaz, 3, 25
Tradorec XL, 2, 25
Tramacet, 2, 25, 29, 30
Tramadol, 2
Tramadol m/r, 2, 25
Tramadol soluble, 2, 13
Tramake, 2
Tramquel SR, 2, C, administration, see BNF
Trandate, 8, 21
Trasicor, 8
Trasidrex, 8, 25
Traxam foam, 15
Trazodone, 2, 21
Trental m/r, 21, 25
Treosulfan, 25
Tretinoin caps, 21, 25
Triamcinolone inj, 10, steroid card
Triamterene, 14, (urine blue in some lights), 21
Triapin preps, 25
Triclofos sodium, 19
Trientine, 6, 22
Trifluoperazine, 2
Trihexyphenidyl syrup, C, driving, see BNF
Trihexyphenidyl tabs, C, with or after food, driving, see BNF
Trileptal, 3, 8, C, see BNF
Trilostane, 21
Trimethoprim susp and tabs, 9
Trimipramine, 2
Trimopan, 9
Trimovate, 28, C, application, see BNF
Tripotassium dicitratobismuthate, C, administration, see BNF
Triptafen preps, 2
Trizivir, C, hypersensitivity reactions, see BNF
Tropium, 2
Trospium chloride, 23
Truvada, 21, C, administration, see BNF
Tryptophan, 3
Tuinal, 19
Tylex caps, 2, 29, 30
Tylex effervescent tabs, 2, 13, 29, 30
Typhoid vaccine, oral, 23, 25, C, administration, see BNF
Tyverb, C, see BNF

Ubretid, 22
Ucerax, 2
Ultralanum Plain, 28, C, application, see BNF
Uniphyllin Continus, 25
Univer, 25
Urdox, 21
Uriben, 9, 11
Urispas, 3
Ursodeoxycholic acid, 21
Ursogal, 21
Ursofalk, 21
Ustekinumab, 10, C, tuberculosis, see BNF
Utinor, 7, 9, 23, C, driving
Utrogestan, C, administration, see BNF

Valaciclovir, 9
Valcyte, 21
Valganciclovir, 21
Vallergan, 2
Valoid, 2
Valni XL, 25
Valproic acid, see individual preparations
Valtrex, 9
Vancocin caps, 9
Vancomycin caps, 9
Varenicline, 3
Velosef, 9
Venaxx XL, 3, 25, C, driving
Venlafaxine, 3, C, driving
Venlafaxine m/r, 3, 25, C, driving
Venlalic XL, 3, 25, C, driving
Ventmax SR, 25
Ventolin Evohaler, C, dose, change to CFC-free inhaler, see BNF
Ventolin inhalations, C, dose, see BNF
Vepesid caps, 23
Verapamil m/r, 25
Verapress, 25
Vertab SR, 25
Vesanoid, 21, 25
Vesicare, 3
Vfend, 9, 11, 23
Viazem XL, 25

Vibramycin-D, 6, 9, 11, 13
Videx e/c caps, 25, C, administration, see BNF
Videx tabs, 23, C, administration, see BNF
Vigabatrin sachets, 3, 8, 13, C, driving (see BNF)
Vigabatrin tabs, 3, 8, C, driving (see BNF)
Vimpat tabs and syrup, 8, C, driving, see BNF
Vinorelbine caps, 21, 25
Vioform-Hydrocortisone, 28, C, application, see BNF
Viracept tabs, 21
Viramune, C, hypersensitivity reactions, see BNF
Viread, 21, C, administration, see BNF
Visclair, 5, 22, 25
Viskaldix, 8
Visken, 8
Vivotif, 23, 25, C, administration, see BNF
Voltarol dispersible tabs, 13, 21
Voltarol 75 mg SR and Retard, 21, 25
Voltarol tabs, 5, 25
Voriconazole, 9, 11, 23

Warfarin, 10, anticoagulant card
Warticon, 15
Welldorm, 19, 27
Wellvone, 21
Wilzin, 23

Xagrid, C, driving
Xamiol, 28
Xanax, 2
Xatral, 3, C, dose, see BNF
Xatral XL, 3, 21, 25, C, dose, see BNF
Xeloda, 21
Xepin, 2, 10, patient information leaflet
Xismox XL, 25
Xyzal, C, driving

Yentreve, 2

Zaditen, 2, 21
Zafirlukast, 23
Zaleplon, 2
Zamadol, 2
Zamadol 24hr, 2, 25
Zamadol SR, 2, C, administration, see BNF
Zanaflex, 2
Zanidip, 22
Zantac effervescent tabs, 13
Zaponex, 2, 10, patient information leaflet
Zarontin, 8, C, blood disorder symptoms (see BNF), driving (see BNF)
Zavedos caps, 25
Zelapar, C, administration, see BNF
Zemon XL, 25
Zemtard XL, 25
Zeridame SR, 2, 25
Zerit, 23
Ziagen, C, hypersensitivity reactions, see BNF
Zidovudine oral solution, C, use of oral syringe
Zimbacol XL, 21, 25
Zimovane, 19
Zinc acetate, 23
Zinc sulphate, see preps
Zinnat susp, 9, 21
Zinnat tabs, 9, 21, 25
Zispin SolTab, 2
Zithromax caps, 5, 9, 23
Zithromax susp, 5, 9
Zocor, C, muscle effects, see BNF
Zofran Melt, C, administration, see BNF
Zoleptil, 2
Zolmitriptan orodispersible tabs, C, administration, see BNF
Zolpidem, 19
Zomig Rapimelt, C, administration, see BNF
Zomorph, 2, C, administration, see BNF
Zonegran, 3
Zonisamide, 3
Zopiclone, 19
Zotepine, 2
Zoton FasTab, 5, 22, C, administration, see BNF
Zovirax susp and tabs, 9
Zuclopenthixol, 2
Zyban, 25, C, driving
Zydol, 2
Zydol soluble tabs, 2, 13
Zydol SR, 2, 25
Zydol XL, 2, 25
Zyloric, 8, 21, 27

Zyprexa Velotab, 2, C, administration, see BNF
Zyvox susp and tabs, 9, 10, patient information leaflet

Dental Practitioners' Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Sugar-free versions, where available, are preferred.

Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Aciclovir Tablets, BP, 800 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF[1]
Amoxicillin Oral Suspension, BP
Amphotericin Lozenges, BP
Ampicillin Capsules, BP
Ampicillin Oral Suspension, BP
Artificial Saliva Liquid, DPF
Artificial Saliva Oral Spray, DPF[2]
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS[3]):
- *AS Saliva Orthana*®
- *Glandosane*®
- *Biotene Oralbalance*®
- *BioXtra*®
- *Saliveze*®
- *Salivix*®

Aspirin Tablets, Dispersible, BP[4]
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
- *Clenil Modulite*®

Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Carmellose Gelatin Paste, DPF
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cefradine Oral Solution, DPF
Cetirizine Hydrochloride Tablets, 10 mg, DPF
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%, DPF
Chlorphenamine Oral Solution, BP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL, DPF
Co-amoxiclav Oral Suspension, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL, DPF
Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, DPF
Lidocaine 5% Ointment, DPF
Lidocaine Spray 10%, DPF
Loratadine Tablets, 10 mg, DPF
Menthol and Eucalyptus Inhalation, BP 1980[5]
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Mouthwash Solution-tablets, DPF
Nitrazepam Tablets, BP
Nystatin Oral Suspension, BP
Gastro-resistant Omeprazole Capsules, BP
Oxytetracycline Tablets, BP
Paracetamol Oral Suspension, BP[6]
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Penciclovir Cream, DPF
Phenoxymethylpenicillin Oral Solution, BP
Phenoxymethylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP

1. Amoxicillin Dispersible Tablets are no longer available
2. Supplies may be difficult to obtain
3. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome
4. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed
5. This preparation does not appear in subsequent editions of the BP
6. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed

Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP
Triamcinolone Dental Paste, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations, below

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF.

Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder PoM
amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva Liquid
(proprietary product: *Salinum*) consists of linseed extract (containing polysaccharides) with dipotassium phosphate buffer and preservatives, pH 6–7

Artificial Saliva Oral Spray
(proprietary product: *Luborant*) consists of sorbitol 1.8 g, carmellose sodium (sodium carboxymethylcellulose) 390 mg, dibasic potassium phosphate 48.23 mg, potassium chloride 37.5 mg, monobasic potassium phosphate 21.97 mg, calcium chloride 9.972 mg, magnesium chloride 3.528 mg, sodium fluoride 258 micrograms/60 mL, with preservatives and colouring agents

Azithromycin Oral Suspension 200 mg/5 mL PoM
(proprietary product: *Zithromax*); azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water

Betamethasone Soluble Tablets 500 micrograms PoM
(proprietary product: *Betnesol Soluble Tablets*), betamethasone (as sodium phosphate) 500 micrograms

Carmellose Gelatin Paste
(proprietary product: *Orabase Oral Paste*), gelatin, pectin, carmellose sodium, 16.58% of each in a suitable basis

Cefradine Oral Solution PoM
(proprietary product: *Velosef Syrup*), cefradine 250 mg/5 mL when reconstituted with water

Cetirizine Hydrochloride Tablets
cetirizine hydrochloride 10 mg

Chlorhexidine Oral Spray
(proprietary product: *Corsodyl Oral Spray*), chlorhexidine gluconate 0.2%

Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%
(proprietary product: *Periogard Oromucosal Solution*), chlorhexidine gluconate 0.2%

Co-amoxiclav Oral Suspension 125/31 PoM
amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt/5 mL when reconstituted with water

Co-amoxiclav Oral Suspension 250/62 PoM
amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt/5 mL when reconstituted with water

Doxycycline Tablets 20 mg PoM
(proprietary product: *Periostat*), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg PoM
fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL PoM
(proprietary product: *Diflucan*), fluconazole 50 mg/5 mL when reconstituted with water

Lansoprazole Capsules PoM
lansoprazole 15 mg and 30 mg capsules, enclosing e/c granules

Lidocaine 5% Ointment
lidocaine 5% in a suitable basis

Lidocaine Spray 10%
(proprietary product: *Xylocaine Spray*), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Tablets
loratadine 10 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes

Penciclovir Cream PoM
(proprietary product: *Vectavir Cream*), penciclovir 1%

Saliva Stimulating Tablets
(proprietary product: *SST*), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619% PoM
(proprietary product: *Duraphat '2800 ppm' Toothpaste*), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1% PoM
(proprietary product: *Duraphat '5000 ppm' Toothpaste*), sodium fluoride 1.1%

Changes to Dental Practitioners' Formulary since September 2008

Additions

Artificial Saliva Liquid, DPF

Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
Clenil Modulite®

Cetirizine Hydrochloride Tablets, 10 mg, DPF

Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%, DPF

Chlorphenamine Oral Solution, BP

Co-amoxiclav Oral Suspension 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL, DPF

Co-amoxiclav Oral Suspension 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL, DPF

Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)

Lansoprazole Capsules, DPF

Loratadine Tablets, 10 mg, DPF

Gastro-resistant Omeprazole Capsules, BP

Deletions

Ascorbic Acid Tablets, BP

Beclometasone Dipropionate Aerosol Inhalation 50 micrograms/metered dose, DPF

Nystatin Ointment, BP

Pethidine Tablets, BP

Vitamin B Tablets, Compound, Strong, BPC

Changes of title

Old	New
Artificial Saliva, DPF	Artificial Saliva Oral Spray, DPF
Chlorhexidine Gluconate 1% Gel, DPF	Chlorhexidine Gluconate Gel, BP
Metronidazole Oral Suspension, DPF	Metronidazole Oral Suspension, BP

Nurse Prescribers' Formulary

Nurse Prescribers' Formulary for Community Practitioners

Nurse Prescribers' Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 951

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
[1] Aspirin Tablets, Dispersible, 300 mg, BP
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Chlorhexidine, NPF
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, 'Solution G', NPF
Catheter Maintenance Solution, 'Solution R', NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthrusate Capsules, BP
Co-danthrusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP
Emollients as listed below:
- Aqueous Cream, BP
- Arachis Oil, BP
- Cetraben® Emollient Cream
- Dermamist®
- Diprobase® Cream
- Diprobase® Ointment
- Doublebase®
- E45® Cream
- Emulsifying Ointment, BP
- Hydromol® Cream
- Hydromol® Ointment
- Hydrous Ointment, BP
- Linola® Gamma Cream
- Lipobase®
- Liquid and White Soft Paraffin Ointment, NPF
- Neutrogena® Dermatological Cream
- Oilatum® Cream
- Oilatum® Junior Cream
- Paraffin, White Soft, BP
- Paraffin, Yellow Soft, BP
- QV® Cream
- QV® Lotion
- QV® Wash
- Ultrabase®
- Unguentum M®
- Zerobase® Cream

Emollient Bath Additives as listed below:
- Alpha Keri® Bath Oil
- [2] Balneum®
- Cetraben® Emollient Bath Additive
- Dermalo® Bath Emollient
- Diprobath®
- Doublebase® Emollient Bath Additive
- Doublebase® Emollient Shower Gel
- Doublebase® Emollient Wash Gel
- Hydromol® Emollient
- Imuderm® Bath Oil
- Oilatum® Emollient
- Oilatum® Junior Emollient Bath Additive
- Oilatum® Gel
- QV® Bath Oil

Folic Acid 400 micrograms/5 mL Oral Solution, NPF
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
[3] Ibuprofen Oral Suspension, BP
[3] Ibuprofen Tablets, BP
Ispaghula Husk Granules, BP
Ispaghula Husk Granules, Effervescent, BP
Ispaghula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP
Lidocaine and Chlorhexidine Gel, BP
Macrogol Oral Powder, Compound, NPF

1. Max. 96 tablets; max. pack size 32 tablets

2. Except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)
3. Except for indications and doses that are PoM

Macrogol Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulphate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, NPF
Mebendazole Tablets, NPF
Methylcellulose Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
[1] Paracetamol Tablets, BP
[1] Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets)
Permethrin Cream, NPF
Phenothrin Aqueous Lotion, NPF
Phosphate Suppositories, NPF
Phosphates Enema, BP
Piperazine and Senna Powder, NPF
Povidone–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spermicidal contraceptives as listed below:
Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Cream, BP
Zinc Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Calamine Bandage
Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may **not** be prescribed by Nurses are annotated **Nx**.

The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.centralservicesagency.com/display/ni_drug_tariff
Scottish Drug Tariff: www.isdscotland.org/isd/2245.html

Appliances (including Contraceptive Devices[2]) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

Details of NPF preparations

Preparations on the Nurse Prescribers' Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers' Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema
arachis oil 100%

Catheter Maintenance Solution, Chlorhexidine
(proprietary products: *Uro-Tainer Chlorhexidine*; *Uriflex C*), chlorhexidine 0.02%

Catheter Maintenance Solution, Sodium Chloride
(proprietary products: *OptiFlo S*; *Uro-Tainer Sodium Chloride*; *Uriflex-S*), sodium chloride 0.9%

Catheter Maintenance Solution, 'Solution G'
(proprietary products: *OptiFlo G*; *Uro-Tainer Suby G*; *Uriflex G*), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, 'Solution R'
(proprietary products: *OptiFlo R*; *Uro-Tainer Solution R*; *Uriflex R*), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions
(proprietary products: *ChloraPrep*; *Hydrex Solution*; *Hydrex spray*), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions
(proprietary product: *Unisept*) chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules PoM
co-danthramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg)

Co-danthramer Capsules, Strong PoM
co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg)

1. Max. 96 tablets; max. pack size 32 tablets

2. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic

Co-danthramer Oral Suspension PoM
(proprietary product: *Codalax*), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong PoM
(proprietary product: *Codalax Forte*), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL)

Co-danthrusate Oral Suspension PoM
(proprietary product: *Normax*), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams
(proprietary products: *Conotrane Cream*, dimeticone '350' 22%; *Siopel Barrier Cream*, dimeticone '1000' 10%; *Vasogen Barrier Cream*, dimeticone 20%), dimeticone 10–22%

Dimeticone Lotion
(proprietary product: *Hedrin*), dimeticone 4%

Docusate Enema
(proprietary product: *Norgalax Micro-enema*) docusate sodium 120 mg in 10 g

Folic Acid Oral Solution 400 micrograms/5 mL
(proprietary product: *Folicare*), folic acid 400 micrograms/5 mL

Liquid and White Soft Paraffin Ointment
liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Powder, Compound
macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet (proprietary products: *Movicol*; *Movicol Plain*; *Laxido* (orange or natural flavour)) *or* macrogol '3350' (polyethelyene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 31.7 mg/sachet (proprietary product: *Movicol Chocolate*)

Macrogol Oral Powder, Compound, Half-strength
(proprietary product: *Movicol-Half*), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions
(proprietary products: *Derbac-M Liquid*; *Quellada M Liquid*), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension PoM
(proprietary product: *Vermox*), mebendazole 100 mg/5 mL

[1]**Mebendazole Tablets** PoM
(proprietary products: *Ovex*, *Vermox*), mebendazole 100 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

[2]**Nicotine Inhalation Cartridge for Oromucosal Use**
(proprietary products: *Nicorette Inhalator*), nicotine 10 mg

Nicotine Lozenge
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: *Nicotinell Mint Lozenge*) or nicotine (as polacrilex) 2 mg or 4 mg (proprietary product: *NiQuitin Lozenges*), or nicotine (as resinate complex) 1.5 mg (proprietary product: *Nicopass Lozenge*)

Nicotine Medicated Chewing Gum
(proprietary products: *Nicorette Gum*, *Nicotinell Gum*, *NiQuitin Gum*), nicotine 2 mg or 4 mg

Nicotine Nasal Spray
(proprietary product: *Nicorette Nasal Spray*), nicotine 500 micrograms/metered spray

[3]**Nicotine Sublingual Tablets**
(proprietary product: *Nicorette Microtab*), nicotine (as a cyclodextrin complex) 2 mg

[4]**Nicotine Transdermal Patches**
releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary product: *Boots NicAssist Patch*, *Nicorette Patch*) or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: *Nicopatch*, *Nicotinell TTS*, *NiQuitin*)

Permethrin Cream
(proprietary product: *Lyclear Dermal Cream*), permethrin 5%

Phenothrin Aqueous Lotion
(proprietary product: *Full Marks Liquid*), phenothrin 0.5% in an aqueous basis

Phosphate Suppositories
(proprietary product: *Carbalax*), sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g

Piperazine and Senna Powder
(proprietary product: *Pripsen Oral Powder*), piperazine phosphate 4 g, sennosides 15.3 mg/sachet

Senna Oral Solution
(proprietary product: *Senokot Syrup*), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules
(proprietary product: *Manevac Granules*), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema
(proprietary products: *Micolette Micro-enema*; *Micralax Micro-enema*; *Relaxit Micro-enema*), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules
(proprietary products: *Dulco-lax Perles*), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir
(proprietary products: *Dulco-lax Liquid*, *Laxoberal* (NHS)), sodium picosulfate 5 mg/5 mL

Sterculia Granules
(proprietary product: *Normacol Granules*), sterculia 62%

1. For PoM exemption, see p. 370
2. For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)
3. To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)
4. Prescriber should specify the brand to be dispensed

Sterculia and Frangula Granules

(proprietary product: *Normacol Plus Granules*), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray

(proprietary product: *Sprilon*), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage

(proprietary product: *Steripaste*), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking

(proprietary product: *Zipzoc*), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

Nurse Independent Prescribing

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any licensed medicine for any medical condition, including some Controlled Drugs (see below).

Nurse Independent Prescribers must work within their own level of professional competence and expertise. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Nurse Independent Prescribers are also able to prescribe independently the Controlled Drugs in the table below, *solely for the medical conditions indicated*.

Up-to-date information and guidance on nurse independent prescribing is available on the Department of Health website at
www.dh.gov.uk/nonmedicalprescribing

Controlled drugs prescribable by Nurse Independent Prescribers solely for the medical conditions indicated

Drug	Indication	Route of Administration
Buprenorphine	Transdermal use in palliative care	Transdermal
Chlordiazepoxide hydrochloride	Treatment of initial or acute withdrawal symptoms caused by the withdrawal of alcohol from persons habituated to it	Oral
Codeine phosphate	–	Oral
Co-phenotrope	–	Oral
Diamorphine hydrochloride	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Oral, parenteral
Diazepam	Use in palliative care, treatment of initial or acute withdrawal symptoms caused by the withdrawal of alcohol from persons habituated to it, tonic-clonic seizures	Oral, parenteral, rectal
Dihydrocodeine tartrate	–	Oral
Fentanyl	Transdermal use in palliative care	Transdermal
Lorazepam	Use in palliative care, tonic-clonic seizures	Oral, parenteral
Midazolam	Use in palliative care, tonic-clonic seizures	Parenteral, buccal
Morphine hydrochloride	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Rectal
Morphine sulphate	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Oral, parenteral, rectal
Oxycodone hydrochloride	Use in palliative care	Oral, parenteral

Note For the purposes of nurse independent prescribing, palliative care means the care of patients with advanced, progressive illness

Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Up-to-date information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing.

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 3.

Nurses

For further information on Nurse Independent Prescribing, see Nurse Prescribers' Formulary, p. 953.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Pharmacists

Pharmacist Independent Prescribers can prescribe any licensed medicine, except Controlled Drugs, for any medical condition. Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Special-order Manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at www.mhra.gov.uk

Licensed **hospital manufacturing units** also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (*Pro-File*; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

> The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

England

London

Yellowcard

COMMISSION ON HUMAN MEDICINES

In Confidence

SUSPECTED ADVERSE DRUG REACTIONS

MHRA

If you suspect that an adverse reaction may be related to a drug, or a combination of drugs, you should complete this Yellow Card or complete a report on the website at www.yellowcard.gov.uk. For *intensively monitored medicines* (identified by ▼) report **all** suspected reactions (including any considered not to be serious). For *established drugs* and *herbal remedies* report **all serious** adverse reactions in adults; report **all serious and minor** adverse reactions in **children** (under 18 years). You do not have to be certain about causality: if in doubt, please report. Do not be put off reporting just because some details are not known. See BNF (page 11) or the MHRA website (www.yellowcard.gov.uk) for additional advice.

PATIENT DETAILS Patient Initials: _____ Sex: M / F Weight if known (kg): _____

Age (at time of reaction): _____ Identification (Your Practice / Hospital Ref.)*: _____

SUSPECTED DRUG(S)

Give brand name of drug and batch number if known	Route	Dosage	Date started	Date stopped	Prescribed for

SUSPECTED REACTION(S)

Please describe the reaction(s) and any treatment given:

Outcome

- Recovered ☐
- Recovering ☐
- Continuing ☐
- Other ☐

Date reaction(s) started: _____ Date reaction(s) stopped: _____

Do you consider the reaction to be serious? Yes / No

If *yes*, please indicate why the reaction is considered to be serious (please tick all that apply):

- Patient died due to reaction ☐
- Life threatening ☐
- Congenital abnormality ☐
- Involved or prolonged inpatient hospitalisation ☐
- Involved persistent or significant disability or incapacity ☐
- Medically significant; please give details:

* This is to enable you to identify the patient in any future correspondence concerning this report

Please attach additional pages if necessary

Please list other drugs taken in the last 3 months prior to the reaction (including self-medication & herbal remedies)

Was the patient on any other medication? Yes / No If *yes*, please give the following information if known:

Drug (Brand, if known)	Route	Dosage	Date started	Date stopped	Prescribed for

Additional relevant information e.g. medical history, test results, known allergies, rechallenge (if performed), suspected drug interactions. For congenital abnormalities please state all other drugs taken during pregnancy and the date of the last menstrual period.

REPORTER DETAILS

Name and Professional Address: _____

_____

_____

Post code: _____ Tel No: _____

Speciality: _____

Signature: Date:

CLINICIAN (if not the reporter)

Name and Professional Address: _____

_____

_____ Post code: _____

Tel No: _____ Speciality: _____

If you would like information about other adverse reactions associated with the suspected drug, please tick this box ☐

If you report from an area served by a Yellow Card Centre (YCC), MHRA may ask the Centre to communicate with you, on its behalf, about your report. See BNFC (page 21) for further details on YCCs. If you want only MHRA to contact you, please tick this box. ☐

Cardiovascular Risk Prediction Charts

Heart 2005; **91**(Suppl V): v1–v52

How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have **not** already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should **not replace clinical judgment**.

- The use of these charts is **not appropriate** for patients who have existing diseases which already put them at high risk such as:
  - coronary heart disease or other major atherosclerotic disease;
  - familial hypercholesterolaemia or other inherited dyslipidaemias;
  - renal dysfunction including diabetic nephropathy;
  - type 1 and 2 diabetes mellitus.
- The charts should **not** be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should **not** be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.
- To estimate an individual's absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.
- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of > 15% over the same period.
- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).
- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.
- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual's risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.

(Continued over)

- Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually ≥ 20% over 10 years and the charts will underestimate true total CVD risk.

- These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with **untreated** levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.

- CVD risk is also higher than indicated in the charts for:
  - those with a family history of premature CVD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years) which increases the risk by a factor of approximately 1.5;
  - men with HDL cholesterol < 1 mmol/litre or women with HDL cholesterol < 1.2 mmol/litre;
  - those with raised triglyceride levels (> 1.7 mmol/litre);
  - those with BMI ≥ 30 kg/m^2;
  - women with premature menopause;
  - those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/litre) or impaired glucose tolerance (2 hour glucose ≥ 7.8 mmol/litre but < 11.1 mmol/litre in an oral glucose tolerance test).

- The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).

- An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): *Lipid modification–Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease* (available at www.nice.org.uk) differs from that shown here as follows:

- estimated CVD risk increases by a factor of 1.5 in those with a family history of premature CHD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years)
- estimated CVD risk increases by a factor of 1.5–2 if more than one first-degree relative has a history of premature CHD
- estimated CVD risk for South Asian men is increased by a factor of 1.4
- CVD risk is higher than estimated in those with BMI > 40 kg/m^2

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

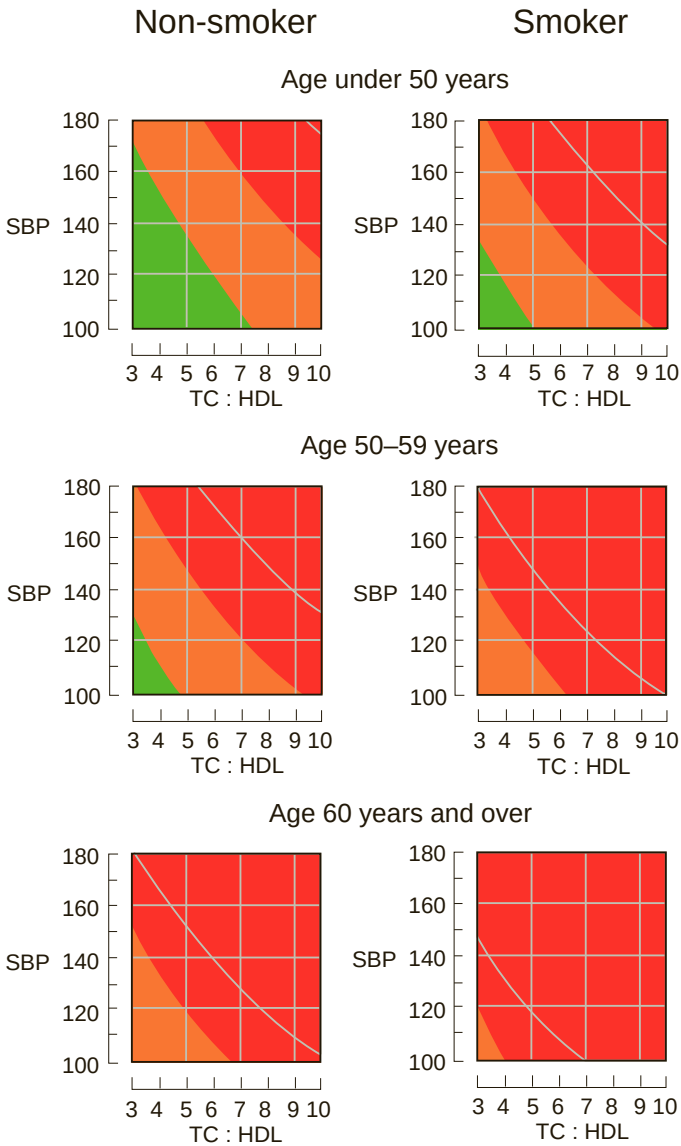
The NICE guideline advises that the following factor is also taken into account when calculating CVD risk:

- presence of left ventricular hypertrophy

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.

(Continued over)

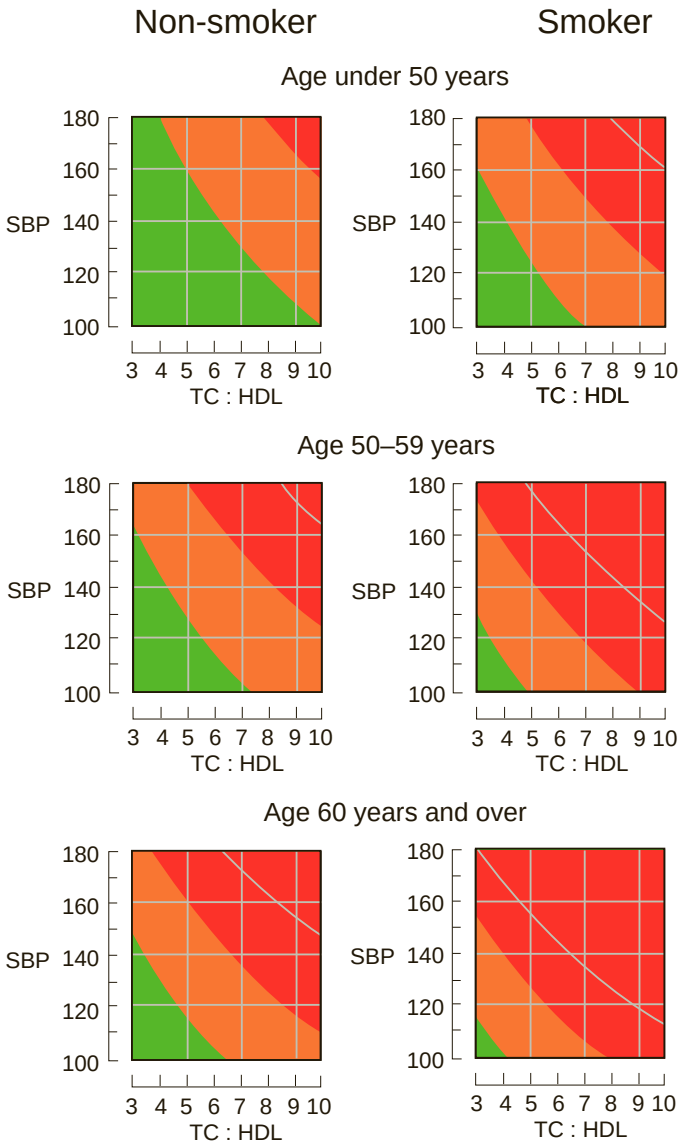
Nondiabetic Men



SBP = systolic blood pressure mmHg
TC : HDL = serum total cholesterol to HDL cholesterol ratio

(Continued over)

Nondiabetic Women



CVD risk <10% over next 10 years

CVD risk 10-20% over next 10 years

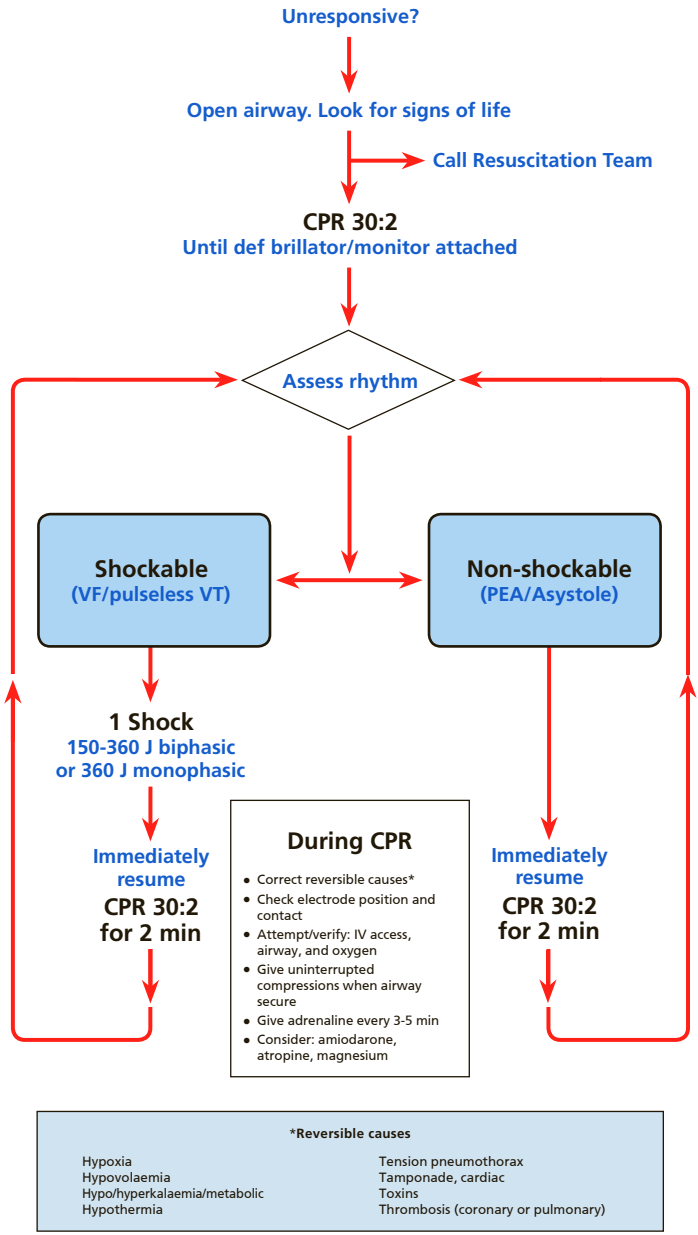
CVD risk >20% over next 10 years

SBP = systolic blood pressure mmHg

TC : HDL = serum total cholesterol to HDL cholesterol ratio

© Central Manchester and Manchester Children's University Hospitals NHS Trust

ADULT ADVANCED LIFE SUPPORT ALGORITHM



***Reversible causes**

Hypoxia	Tension pneumothorax
Hypovolaemia	Tamponade, cardiac
Hypo/hyperkalaemia/metabolic	Toxins
Hypothermia	Thrombosis (coronary or pulmonary)

Medical emergencies in the community

Drug treatment outlined below is intended for use by community healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient's condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Anaphylaxis

(section 3.4.3)

Adrenaline injection 1 mg/mL (1 in 1000)

- By intramuscular injection
  CHILD UNDER 6 YEARS 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  CHILD 6–12 YEARS 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  CHILD 12–18 YEARS 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) if CHILD is small or prepubertal
  ADULT 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

Chlorphenamine injection 10 mg/mL

- By intravenous injection over 1 minute or by intramuscular injection
  CHILD UNDER 6 MONTHS 250 micrograms/kg (max. 2.5 mg), repeated if required up to 4 times in 24 hours
  CHILD 6 MONTHS–6 YEARS 2.5 mg, repeated if required up to 4 times in 24 hours
  CHILD 6–12 YEARS 5 mg, repeated if required up to 4 times in 24 hours
  CHILD 12–18 YEARS 10 mg, repeated if required up to 4 times in 24 hours
  ADULT 10 mg, repeated if required up to 4 times in 24 hours

High-flow **oxygen** (section 3.6) and **intravenous fluids** should be given if required.

Hydrocortisone (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

Angina: unstable

(section 2.6)

Aspirin dispersible tablets 75 mg, 300 mg

- By mouth (dispersed in water or chewed)
  ADULT 300 mg

Plus

either **Glyceryl trinitrate aerosol spray 400 micrograms/metered dose**

- Sublingually
  ADULT 1–2 sprays, repeated as required

or **Glyceryl trinitrate tablets 300 micrograms, 500 micrograms, 600 micrograms**

- Sublingually
  ADULT 0.3–1 mg, repeated as required

Asthma: acute

(section 3.1)

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately **at any time** requires immediate transfer to hospital

Either **salbutamol aerosol inhaler 100 micrograms/metered inhalation**

- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
  ADULT and CHILD 4–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary

or **salbutamol nebuliser solution 1 mg/mL, 2 mg/mL**

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 2.5 mg every 10–20 minutes or as necessary
  CHILD 5–12 YEARS 2.5–5 mg every 10–20 minutes or as necessary
  ADULT 2.5–5 mg every 10–20 minutes or as necessary

or **terbutaline nebuliser solution 2.5 mg /mL**

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 5 mg every 10–20 minutes or as necessary
  CHILD 5–12 YEARS 5–10 mg every 10–20 minutes or as necessary
  ADULT 10 mg every 10–20 minutes or as necessary

Plus **(in all cases)**

either **prednisolone soluble tablets 5 mg**

- By mouth
  CHILD UNDER 12 YEARS 1–2 mg/kg (max. 40 mg) once daily for 3–5 days; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (CHILD UNDER 2 YEARS max. 40 mg, OVER 2 YEARS max. 50 mg) once daily
  ADULT 40–50 mg once daily for 5 days

or **hydrocortisone (preferably as sodium succinate)**

- By intravenous injection
  CHILD UNDER 12 YEARS 4 mg/kg every 6 hours until conversion to oral prednisolone is possible; CHILD UNDER 2 YEARS max. 25 mg, 2–5 YEARS max. 50 mg, 5–12 YEARS max. 100 mg
  ADULT 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow **oxygen** (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta$_2$ agonist** (as above) and give with

ipratropium nebuliser solution 250 micrograms/mL

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 12 YEARS 250 micrograms, repeated as necessary
  ADULT 500 micrograms, repeated as necessary

Croup

(section 3.1)

Dexamethasone oral solution 2 mg/5 mL

- By mouth
  CHILD 1 MONTH–2 YEARS 150 micrograms/kg as a single dose

Convulsions

(section 4.8.2)

***Either* diazepam rectal solution 2 mg/mL, 4 mg/mL**

- By rectum, repeated once after 10–15 minutes if necessary
  NEONATE 1.25–2.5 mg
  CHILD 1 MONTH–2 YEARS 5 mg
  CHILD 2–12 YEARS 5–10 mg
  CHILD 12–18 YEARS 10 mg
  ADULT 10–20 mg (max. 30 mg), (ELDERLY 10 mg, max. 15 mg)

***or* midazolam buccal liquid 10 mg/mL or injection solution given by buccal route**

- By buccal administration, repeated once if necessary
  NEONATE 300 micrograms/kg
  CHILD 1–6 MONTHS 300 micrograms/kg (max. 2.5 mg)
  CHILD 6 MONTHS–1 YEAR 2.5 mg
  CHILD 1–5 YEARS 5 mg
  CHILD 5–10 YEARS 7.5 mg
  CHILD 10–18 YEARS 10 mg
  ADULT 10 mg

Diabetic hypoglycaemia

(section 6.1.4)

Glucose or sucrose

- By mouth
  CHILD 2–18 YEARS approx. 10–20 g (2–4 teaspoonfuls of sugar *or* 3–6 sugar lumps *or* 55–110 mL *Lucozade® Energy Original or* 100–200 mL *Coca-Cola®*—both non-diet versions *or* *GlucoGel®* one or two 25-g tubes (containing glucose 10 g/25-g tube) *or Dextrogel®* one or two 25-g tubes (containing glucose 10-g/25-g tube)) repeated after 10–15 minutes if necessary
  ADULT approx. 10–20 g (2–4 teaspoonfuls of sugar *or* 3–6 sugar lumps *or* 55–110 mL *Lucozade® Energy Original or* 100–200 mL *Coca-Cola®*—both non-diet versions *or* *GlucoGel®* one or two 25-g tubes (containing glucose 10 g/25-g tube) *or Dextrogel®* one or two 25-g tubes (containing glucose 10-g/25-g tube)) repeated after 10–15 minutes if necessary

***or* if hypoglycaemia unresponsive *or* if oral route cannot be used**

Glucagon injection 1 mg/mL

- By subcutaneous, intramuscular, or intravenous injection
  CHILD BODY-WEIGHT UNDER 25 KG 500 micrograms (0.5 mL)
  CHILD BODY-WEIGHT OVER 25 KG 1 mg (1 mL)
  ADULT 1 mg (1 mL)

***or* if hypoglycaemia prolonged *or* unresponsive to glucagon after 10 minutes**

Glucose intravenous infusion 10%

- By intravenous injection into large vein
  CHILD 1 MONTH–18 YEARS 5 mL/kg (glucose 500 mg/kg)

Glucose intravenous infusion 20%

- By intravenous injection into large vein
  ADULT 50 mL

Febrile convulsions lasting longer than 15 minutes

(section 4.8.3)

Diazepam rectal solution 2 mg/mL, 4 mg/mL

- By rectum, repeated once after 10–15 minutes if necessary
  NEONATE 1.25–2.5 mg
  CHILD 1 MONTH–2 YEARS 5 mg
  CHILD 2–12 YEARS 5–10 mg
  CHILD 12–18 YEARS 10 mg

Meningococcal disease

(Table 1, section 5.1)

Benzylpenicillin sodium injection 600 mg, 1.2 g

- By intravenous injection (or by intramuscular injection if venous access not available)
  NEONATE 300 mg
  CHILD 1 MONTH–1 YEAR 300 mg
  CHILD 1–10 YEARS 600 mg
  CHILD 10–18 YEARS 1.2 g
  ADULT 1.2 g
  Note Give single dose and transfer urgently to hospital

***or* if history of allergy to penicillin**

Cefotaxime injection 1 g

- By intravenous injection (or by intramuscular injection if venous access not available)
  NEONATE 50 mg/kg
  CHILD 1 MONTH–12 YEARS 50 mg/kg (max. 1 g)
  CHILD 12–18 YEARS 1 g
  ADULT 1 g
  Note Give single dose and transfer urgently to hospital

***or* if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, or urticarial reaction) to penicillin or to cephalosporins**

Chloramphenicol injection 1 g

- By intravenous injection
  CHILD 1 MONTH–18 YEARS 12.5–25 mg/kg
  ADULT 12.5–25 mg/kg
  Note Give single dose and transfer urgently to hospital

Myocardial infarction

(section 2.10.1)

Aspirin dispersible tablets 75 mg, 300 mg

- By mouth (dispersed in water or chewed)
  ADULT 300 mg

Glyceryl trinitrate aerosol spray 400 micrograms/metered dose

- Sublingually
  ADULT 1–2 sprays, repeated as required

***or* Glyceryl trinitrate tablets 300 micrograms, 500 micrograms, 600 micrograms**

- Sublingually
  ADULT 0.3–1 mg, repeated as required

Metoclopramide injection 5 mg/mL

- By intravenous injection
  ADULT (UNDER 60 KG) 18–19 YEARS 5 mg
  ADULT (OVER 60 KG) 18–19 YEARS 10 mg
  ADULT OVER 19 YEARS 10 mg

Diamorphine injection (5 mg powder for reconstitution)

- By slow intravenous injection (1–2 mg/minute)
  ADULT 5 mg followed by a further 2.5–5 mg if necessary; ELDERLY or FRAIL patients, reduce dose by half

Oxygen, if appropriate

Pneumonia: uncomplicated

(Table 1, section 5.1)

Amoxicillin oral suspension 125 mg/5 mL, 250 mg/5 mL; capsules 250 mg

- By mouth
  CHILD 6 MONTHS–1 YEAR 125 mg 3 times daily
  CHILD 1–5 YEARS 250 mg 3 times daily
  CHILD 5–18 YEARS 500 mg 3 times daily
  ADULT 0.5–1 g 3 times daily

***or* if allergic to penicillin *or* atypical organism suspected**

Erythromycin oral suspension 125 mg/5 mL, 250 mg/5 mL; tablets 250 mg

- By mouth
  CHILD 6 MONTHS–2 YEARS 125 mg 4 times daily
  CHILD 2–8 YEARS 250 mg 4 times daily
  CHILD 8–18 YEARS 250–500 mg 4 times daily
  ADULT 500 mg 4 times daily

Approximate conversions and units

lb	kg	stones	kg	mL	fl oz
1	0.45	1	6.35	50	1.8
2	0.91	2	12.70	100	3.5
3	1.36	3	19.05	150	5.3
4	1.81	4	25.40	200	7.0
5	2.27	5	31.75	500	17.6
6	2.72	6	38.10	1000	35.2
7	3.18	7	44.45		
8	3.63	8	50.80		
9	4.08	9	57.15		
10	4.54	10	63.50		
11	4.99	11	69.85		
12	5.44	12	76.20		
13	5.90	13	82.55		
14	6.35	14	88.90		
		15	95.25		

Length

1 metre (m)		= 1000 millimetres (mm)
1 centimetre (cm)		= 10 mm
1 inch (in)		= 25.4 mm
1 foot (ft)	=12 inches	= 304.8 mm

Mass

1 kilogram (kg)	= 1000 grams (g)
1 gram (g)	= 1000 milligrams (mg)
1 milligram (mg)	= 1000 micrograms
1 microgram	= 1000 nanograms
1 nanogram	= 1000 picograms

Volume

1 litre	= 1000 millilitres (mL)
1 millilitre (1 mL)	= 1000 microlitres
1 pint	≈ 568 mL

Other units

1 kilocalorie (kcal)	= 4186.8 joules (J)
1000 kilocalories (kcal)	= 4.1868 megajoules (MJ)
1 megajoule (MJ)	= 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg)	= 133.3 pascals (Pa)
1 kilopascal (kPa)	= 7.5 mmHg (pressure)

Plasma-drug concentrations in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children

Weight, height, and gender

The table below shows the **mean values** for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual's weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Age	Weight kg	Height cm
Full-term neonate	3.5	51
1 month	4.3	55
2 months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year-old boy	49	163
14 year-old girl	50	159
Adult male	68	176
Adult female	58	164

Recommended wording of cautionary and advisory labels

For details see Appendix 9

1 Warning. May cause drowsiness

2 Warning. May cause drowsiness. If affected do not drive or operate machinery. Avoid alcoholic drink

3 Warning. May cause drowsiness. If affected do not drive or operate machinery

4 Warning. Avoid alcoholic drink

5 Do not take indigestion remedies at the same time of day as this medicine

6 Do not take indigestion remedies or medicines containing iron or zinc at the same time of day as this medicine

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc at the same time of day as this medicine

8 Do not stop taking this medicine except on your doctor's advice

9 Take at regular intervals. Complete the prescribed course unless otherwise directed

10 Warning. Follow the printed instructions you have been given with this medicine

11 Avoid exposure of skin to direct sunlight or sun lamps

12 Do not take anything containing aspirin while taking this medicine

13 Dissolve or mix with water before taking

14 This medicine may colour the urine

15 Caution flammable: keep away from fire or flames

16 Allow to dissolve under the tongue. Do not transfer from this container. Keep tightly closed. Discard 8 weeks after opening

17 Do not take more than ... in 24 hours

18 Do not take more than ... in 24 hours or ... in any one week

19 Warning. Causes drowsiness which may continue the next day. If affected do not drive or operate machinery. Avoid alcoholic drink

21 ... with or after food

22 ... half to one hour before food

23 ... an hour before food or on an empty stomach

24 ... sucked or chewed

25 ... swallowed whole, not chewed

26 ... dissolved under the tongue

27 ... with plenty of water

28 To be spread thinly ...

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours

30 Do not take with any other paracetamol products

31 Contains aspirin and paracetamol. Do not take with any other paracetamol products

32 Contains aspirin

33 Contains an aspirin-like medicine

Abbreviations and symbols

Internationally recognised units and symbols are used in the BNF where possible.

ACBS	Advisory Committee on Borderline Substances, *see* Appendix 7
ACE	Angiotensin-converting enzyme
ADHD	Attention deficit hyperactivity disorder
AIDS	Acquired immunodeficiency syndrome
approx.	approximately
AV	atrioventricular
BAN	British Approved Name
BMI	body mass index
BP	British Pharmacopoeia 2009, unless otherwise stated
BPC	British Pharmaceutical Codex 1973 and Supplement 1976, unless otherwise stated
CAPD	Continuous ambulatory peritoneal dialysis
CHM	Commission on Human Medicines
CHMP	Committee for Medicinal Products for Human Use
CNS	central nervous system
CPMP	Committee on Proprietary Medicinal Products
CRM	Committee on the Review of Medicines
CSM	Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
d. c.	direct current
DPF	Dental Practitioners' Formulary
e/c	enteric-coated (termed gastro-resistant in BP)
ECG	electrocardiogram
EEG	electro-encephalogram
eGFR	estimated glomerular filtration rate, see Appendix 3
EMEA	European Medicines Agency
f/c	film-coated
G6PD	glucose 6-phosphate dehydrogenase
HIV	Human immunodeficiency virus
HRT	Hormone replacement therapy
i/m	intramuscular
i/v	intravenous
INR	international normalised ratio
MAOI	Monoamine-oxidase inhibitor
max.	maximum
MCA	Medicines Control Agency, now MHRA
MHRA	Medicines and Healthcare products Regulatory Agency
m/r	modified-release
NCL	no cautionary labels, *see* Appendix 9
NHS	National Health Service
NICE	National Institute for Health and Clinical Excellence
NPF	Nurse Prescribers' Formulary
NSAID	Non-steroidal anti-inflammatory drug
PGD	patient group direction
rINN	Recommended International Non-proprietary Name
RSV	respiratory syncytial virus
s/c	sugar-coated
SLS	Selected List Scheme
SMAC	Standing Medical Advisory Committee
SMC	Scottish Medicines Consortium
SPC	Summary of Product Characteristics
spp.	species
SSRI	Selective serotonin reuptake inhibitor
UK	United Kingdom
Units	for SI units *see* Prescription Writing, p. 4
USP	United States Pharmacopeia 31 (2008), unless otherwise stated
WHO	World Health Organization

NHS	not prescribable under National Health Service (NHS)
CD	preparation subject to prescription requirements under The Misuse of Drugs Act. For regulations *see* p. 7
PoM	prescription-only medicine, *see* How to use the BNF, p. ix
®	trade mark
▼	limited experience of the use of this product and the CHM requests that all suspected adverse reactions should be reported, p. 11
◢	considered by the Joint Formulary Committee to be less suitable for prescribing, *see* How to use the BNF, p. ix

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.	= ante cibum (before food)
b. d.	= bis die (twice daily)
o. d.	= omni die (every day)
o. m.	= omni mane (every morning)
o. n.	= omni nocte (every night)
p. c.	= post cibum (after food)
p. r. n.	= pro re nata (when required)
q. d. s.	= quater die sumendum (to be taken four times daily)
q. q. h.	= quarta quaque hora (every four hours)
stat	= immediately
t. d. s.	= ter die sumendum (to be taken three times daily)
t.i.d.	= ter in die (three times daily)

E numbers

E102	Tartrazine	E223	Sodium Metabisulphite
E104	Quinoline Yellow		
E110	Sunset Yellow FCF	E320	Butylated Hydroxyanisole
E123	Amaranth		
E124	Ponceau 4R	E321	Butylated Hydroxytoluene
E127	Erythrosine BS		
E132	Indigo Carmine	E322	Lecithins
E142	Green S	E420	Sorbitol
E171	Titanium Dioxide	E421	Mannitol
E172	Iron oxides, iron hydroxides	E422	Glycerol
		E901	Beeswax (white and yellow)
E200	Sorbic Acid		
E211	Sodium Benzoate	E1520	Propylene Glycol
