RPS Publishing also supplies the BNF in digital formats suitable for standalone use or for small networks, for use over an intranet and for use on a personal digital assistant (PDA).

Distribution of BNFs
The UK health departments distribute BNFs to NHS hospitals, doctors, dental surgeons, and community pharmacies. In England, BNFs are mailed individually to NHS general practitioners and community pharmacies; contact the DH Publication Orderline for extra copies or changes relating to mailed BNFs.
Tel: 0300 123 1002
In Wales, telephone the Business Services Centre
Tel: 01495 332 000
For further information on the supply of copies of the BNF to NHS organisations, see http://tinyurl.com/2uebpp.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).

Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society of Great Britain. It is published biannually under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies and of the UK Health Departments. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association. The Nurse Prescribers' Advisory Group advises on the content relevant to nurses.

The BNF aims to provide prescribers, pharmacists and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers' product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF's recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).

It is **vital** to use the most recent edition of the BNF for making clinical decisions. The more important changes for this edition are listed on p. xi.

The BNF on the internet (bnf.org) includes additional information of relevance to healthcare professionals dealing with medicines. Other digital versions of the BNF—including intranet and personal digital assistant (PDA) versions—are produced in parallel with the paper version.

The BNF welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:
British National Formulary,
Royal Pharmaceutical Society of Great Britain,
1 Lambeth High Street, London SE1 7JN.

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this edition were:

U.J. Adderley, I.H. Ahmed-Jushuf, K.W. Ah-See, S.P. Allison, M.N. Badminton, T.P. Baglin, P.R.J. Barnes, D.N. Bateman, S.L. Bloom, D. Bowsher, E.M. Brown, R.J. Buckley, I.F. Burgess, D.J. Burn, J.J. Coleman, R. Dinwiddie, P.N. Durrington, D.A.C. Elliman, M.D. Feher, B.G. Gazzard, A.M. Geretti, A.H. Ghodse, N.J.L. Gittoes, P.J. Goadsby, J. Guillebaud, D.J. Hatch, B.G. Higgins, S.H.D. Jackson, A. Jones, J.R. Kirwan, P.G. Kopelman, A.J. Krentz, T.H. Lee, D.N.J. Lockwood, M.G. Lucas, L. Luzzatto, A. MacDonald, A.G. Marson, P.D. Mason, K.E.L. McColl, G.M. Mead, E. Miller, J.M. Neuberger, D.J. Nutt, L.P. Ormerod, W.J. Penny, A.B. Provan, M.M. Ramsay, D.J. Rowbotham, J.W. Sander, J.A.T. Sandoe, M. Schacter, G.J. Shortland, D.B. Silk, S.C.E. Sporton, M.A. Stroud, J.P. Thompson, D.A. Warrell, R.P. Walt, A.D. Weeks, A. Wilcock, C.E. Willoughby, M.M Yaqoob.

M.J. Kendall, senior medical adviser for BNF Publications, has also provided valuable assistance.

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists Therapy Guidelines Subcommittee, H.K. Bell, L.C. Fuller, J. Hughes, S. Hulley, J. Lear, N.J. Levell, A.J. McDonagh, S. Punjabi, M.J. Tidman, P.D. Yesudian, and M.F.M. Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, B.A. Bannister, R.H. Behrens, P.L. Chiodini, F. Genasi, L. Goodyer, D. Hill, R. Jecock, G. Kassianos, D.G. Lalloo, G. Lea, G. Pasvol, M. Powell, D.V. Shingadia, D.A. Warrell, C.J.M. Whitty, and C. Lucas (Secretariat) have also provided valuable advice.

The Joint British Societies' Coronary Risk Prediction Charts have been reproduced with the kind permission of P.N. Durrington who has also provided the BNF with access to the computer program for assessing coronary and stroke risk.

R. Suvarna and colleagues at the MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF. NHS Prescription Services has supplied the prices of products in the BNF.

Numerous doctors, pharmacists, nurses and others have sent comments and suggestions.

The BNF has valuable access to the *Martindale* data banks by courtesy of S. Sweetman and staff.

J.E. Macintyre and staff provided valuable technical assistance.

C. Adetola, N. Bansal, A. Breewood, K.L. d'Almeida, M. Davis, C. Fischetti, S. Foad, E.H. Glover, D.T.H. Griffiths, T. Hamp, A. Harvey, J. Humphreys, J.M. James, E. Laughton, A. McLaughlin, A. Melen, H.M.N. Neill, O. Ojeleye, A. Parkin, R.G. Taljaard, and E.J. Tong provided considerable assistance during the production of this edition of the BNF.

Xpage have provided technical assistance with the editorial database and typesetting software.

How the BNF is constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts.

Hundreds of changes are made between editions, and the most clinically significant changes are listed at the front of each edition (pp. xi–xiii).

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Publishing Group, pharmacists appointed by the Royal Pharmaceutical Society of Great Britain, and representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the UK health departments. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice. The Committee meets quarterly and each member also receives proofs of all BNF chapters for review before publication.

Editorial team

BNF staff editors are pharmacists with a sound understanding of how drugs are used in clinical practice. Each staff editor is responsible for editing, maintaining, and updating specific chapters of the BNF. During the publication cycle the staff editors review information in the BNF against a variety of sources (see below).

Amendments to the text are drafted when the editors are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Joint Formulary Committee for consideration. Additionally, for each edition, sections are chosen from every chapter for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Staff editors prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the production of each edition. The role of these expert advisers is to review existing text and to comment on amendments drafted by the staff editors. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF also works closely with a number of expert bodies that produce clinical guidelines. Drafts or prepublication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (the BNF is committed to using approved names and descriptions as laid down by the Medicines Act);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by two staff editors before submitting to a senior editor; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Expert advisers The role of expert clinical advisers in providing the appropriate clinical context for all BNF information is discussed above.

Literature Staff editors monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

Systematic reviews The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-based resources). These are used for answering specific queries, for reviewing existing text and for constructing new text. Staff editors receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNF advice.

Consensus guidelines The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Clinical Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale: The Complete Drug Reference.* The BNF has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Statutory information The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Medicines Act. The BNF itself is named as an official compendium in the Medicines Act.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society of Great Britain are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

Pricing information The Prescription Pricing Division provides information on prices of medicinal products and appliances in the BNF. The BNF also receives and processes price lists from product suppliers.

Comments from readers Readers of the BNF are invited to send in comments. Numerous letters and emails are received during the preparation of each edition. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry Each manufacturer is provided with a complimentary copy of the BNF and invited to comment on it. Close scrutiny of the BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about the BNF's presentation of the role of various drugs; this is yet another check on the balance of the BNF's advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Virtual user groups The BNF has set up virtual user groups across various healthcare professions (e.g. doctors, pharmacists, nurses, dentists). The aim of these groups will be to provide feedback to the editors and publishers to ensure that BNF publications continue to serve the needs of its users.

Market research Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

How to use the BNF

Notes on conditions, drugs and preparations

The main text consists of classified notes on clinical conditions, drugs and preparations. These notes are divided into 15 chapters, each of which is related to a particular system of the body or to an aspect of medical care. Each chapter is then divided into sections which begin with appropriate *notes for prescribers*. These notes are intended to provide information to doctors, dental surgeons, pharmacists, nurses, and other healthcare professionals to facilitate the selection of suitable treatment. Guidance on dental and oral conditions is identified by means of a relevant heading (e.g. Dental and Orofacial pain) in the appropriate sections of the BNF. The notes are followed by details of relevant drugs and preparations. Preparations which can be prescribed by dental surgeons using NHS form FP10D (GP14 in Scotland, WP10D in Wales) are identified within the BNF by means of a note headed Dental Prescribing on NHS.

For information available since publication of this edition see bnf.org

Guidance on prescribing

This part includes information on prescription writing, controlled drugs and dependence, prescribing for children and the elderly, and prescribing in palliative care. Advice is given on the reporting of adverse reactions.

DRUG NAME

Indications details of uses and indications

Cautions details of precautions required (with cross-references to appropriate Appendixes) and also any monitoring required

Counselling Verbal explanation to the patient of specific details of the drug treatment (e.g. posture when taking a medicine)

Contra-indications details of any contra-indications to use of drug

Side-effects details of common and more serious side-effects

Dose

- Dose and frequency of administration (max. dose); CHILD and ELDERLY details of dose for specific age group
- By alternative route, dose and frequency

[1]**Approved Name** (Non-proprietary) PoM

Pharmaceutical form, colour, coating, active ingredient and amount in dosage form, net price, pack size = basic NHS price. Label: (as in Appendix 9)

1.Exceptions to the prescribing status are indicated by a note or footnote.

Proprietary Name (Manufacturer) PoM NHS

Pharmaceutical form, sugar-free, active ingredient mg/mL, net price, pack size = basic NHS price. Label: (as in Appendix 9)

Excipients include clinically important excipients or electrolytes

Note Specific notes about the product e.g. handling

Drugs

Drugs appear under pharmacopoeial or other non-proprietary titles. When there is an *appropriate current monograph* (Medicines Act 1968, Section 65) preference is given to a name at the head of that monograph; otherwise a British Approved Name (BAN), if available, is used (see also Name changes).

The symbol ◢ is used to denote those preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing. Although such preparations may not be considered as drugs of first choice, their use may be justifiable in certain circumstances.

Prescription-only medicines PoM

This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available).

The symbol CD indicates that the preparation is subject to the prescription requirements of the Misuse of Drugs Act. For regulations governing prescriptions for such preparations see p. 7.

Preparations not available for NHS prescription NHS

This symbol has been placed against those preparations included in the BNF that are not prescribable under the NHS. Those prescribable only for specific disorders have a footnote specifying the condition(s) for which the preparation remains available. Some preparations which are not *prescribable* by brand name under the NHS may nevertheless be *dispensed* using the brand name providing that the prescription shows an appropriate non-proprietary name.

Prices

Prices have been calculated from the basic cost used in pricing NHS prescriptions dispensed in May 2009, see also Prices in the BNF p. x for details.

Preparations

Preparations usually follow immediately after the drug which is their main ingredient.

Preparations are included under a non-proprietary title, if they are marketed under such a title, if they are not otherwise prescribable under the NHS, or if they may be prepared extemporaneously.

If proprietary preparations are of a distinctive colour this is stated.

In the case of compound preparations the indications, cautions, contra-indications, side-effects, and interactions of all constituents should be taken into account for prescribing.

The BNF also includes advice on medical emergencies and other medical problems in dental practice, together with a review of the oral side-effects of drugs.

An index of conditions relevant to dental surgeons is included.

Emergency treatment of poisoning

This chapter provides information on the management of acute poisoning when first seen in the home, although aspects of hospital-based treatment are mentioned.

Appendixes and indexes

The appendixes include information on interactions, liver disease, renal impairment, pregnancy, breast-feeding, intravenous additives, borderline substances, wound management products, and cautionary and advisory labels for dispensed medicines. They are designed for use in association with the main body of the text.

The Dental Practitioners' List and the Nurse Prescribers' List are also included in this section. The indexes consist of the Index of Manufacturers and the Main Index.

Patient packs

Directive 92/27/EEC specifies the requirements for the labelling of medicines and outlines the format and content of patient information leaflets to be supplied with every medicine; the directive also requires the use of Recommended International Non-proprietary Names for drugs (see p. xiv).

All medicines have approved labelling and patient information leaflets; anyone who supplies a medicine is responsible for providing the relevant information to the patient (see also Appendix 9).

Many medicines are available in manufacturers' original packs complete with patient information leaflets. Where patient packs are available, the BNF shows the number of dose units in the packs. In particular clinical circumstances, where patient packs need to be split or medicines are provided in bulk dispensing packs, manufacturers will provide additional supplies of patient information leaflets on request.

During the revision of each edition of the BNF careful note is taken of the information that appears on the patient information leaflets. Where it is considered appropriate to alert a prescriber to some specific limitation appearing on the patient information leaflet (for example, in relation to pregnancy) this advice now appears in the BNF.

The patient information leaflet also includes details of all inactive ingredients in the medicine. A list of common E numbers and the inactive ingredients to which they correspond is now therefore included in the BNF (see inside back cover).

PACT and SPA

PACT (Prescribing Analyses and Cost) and SPA (Scottish Prescribing Analysis) provide prescribers with information about their prescribing.

The *PACT Standard Report*, or in Scotland SPA *Level 1 Report*, is sent to all general practitioners on a quarterly basis. The PACT Standard Report contains an analysis of the practitioner's prescribing and the practice prescribing over the last 3 months, and gives comparisons with the local Primary Care Trust equivalent practice and with a national equivalent. The report also contains details of the practice prescribing for a specific topic; a different topic is chosen each quarter.

The *PACT Catalogue*, or in Scotland SPA *Level 2 Report*, provides a full inventory of the prescriptions issued by a prescriber. The PACT catalogue is available on request for periods between 1 and 24 months. To allow the prescriber to target specific areas of prescribing, a Catalogue may be requested to cover individual preparations, BNF sections, or combinations of BNF chapters.

PACT is also available electronically (www.nhsbsa.nhs.uk). This system gives users on-line access through NHSnet to the 3 years' prescribing data held on the NHS Prescription Services' database; tools for analysing the data are also provided.

Prices in the BNF

Basic **net prices** are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient or a reduction of the length of an illness or the time spent in hospital.

Prices have generally been calculated from the net cost used in pricing NHS prescriptions dispensed in May 2009. Unless an original pack is available these prices are based on the largest pack size of the preparation in use in community pharmacies. The price for an extemporaneously prepared preparation has been omitted where the net cost of the ingredients used to make it would give a misleadingly low impression of the final price. In Appendix 8 prices stated are per dressing or bandage.

The unit of 20 is still sometimes used as a basis for comparison, but where suitable original packs or patient packs are available these are priced instead.

Gross prices vary as follows:

1. Costs to the NHS are greater than the net prices quoted and include professional fees and overhead allowances;
2. Private prescription charges are calculated on a separate basis;
3. Over-the-counter sales are at retail price, as opposed to basic net price, and include VAT.

BNF prices are not, therefore, suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales, Scotland, and Northern Ireland; prices in the different tariffs may vary.

Changes for this edition

Significant changes

The BNF is revised twice yearly and numerous changes are made between issues. All copies of BNF No. 57 (March 2009) should therefore be withdrawn and replaced by BNF No. 58 (September 2009). Significant changes have been made in the following sections for BNF No. 58:

Salicylate poisoning, Emergency treatment of poisoning

Paracetamol poisoning, Emergency treatment of poisoning

Ethylene glycol and methanol poisoning, Emergency treatment of poisoning

Infliximab for acute exacerbations of ulcerative colitis [NICE guidance], section 1.5

Management of arrhythmias [updated advice on atrial flutter, paroxysmal supraventricular tachycardia and ventricular tachycardia], section 2.3.1

Use of beta-adrenoceptor blocking drugs in patients with COPD, section 2.4

Rivaroxaban [NICE guidance], section 2.8.2

Corticosteroids [updated advice], section 3.2

Over-the-counter cough and cold medicines [MHRA/CHM advice], section 3.9.1 and section 12.2.2

Tricyclic and related antidepressant drugs [section updated and reorganised], section 4.3.1

Clostridium difficile infection, section 5.1, Table 1

Peritonitis, section 5.1, Table 1

Hospital-acquired pneumonia, section 5.1, Table 1

Antibacterial prophylaxis for endoscopic retrograde cholangiopancreatography, percutaneous endoscopic gastronomy or jejunostomy, section 5.1, Table 2

Oseltamivir and zanamivir [prophylaxis and treatment of influenza in pregnancy and breast-feeding], section 5.3.4

Oseltamivir, zanamivir, and amantadine for the prophylaxis and treatment of influenza [updated NICE guidance], section 5.3.4

Intravenous quinine to treat benign malaria in patients unable to take oral therapy, section 5.4.1

Measurement of HbA_{1c} [update on units to express HbA_{1c}], section 6.1.1

Diabetes and surgery, section 6.1.1

Use of insulin detemir and insulin glargine for type 2 diabetes [NICE guidance updated], section 6.1.1.2

Use of a thiazolidinedione for type 2 diabetes [NICE guidance updated], section 6.1.2.3

Use of sitagliptin and vildagliptin for type 2 diabetes [NICE guidance], section 6.1.2.3

Use of exenatide for type 2 diabetes [NICE guidance], section 6.1.2.3

Nocturnal enuresis [updated advice], section 7.4.2

Administration of vinca alkaloids [NPSA advice], section 8.1.4

Drugs unsafe for use in acute porphyrias, section 9.8.2

Management of rheumatoid arthritis, section 10.1

Management of osteoarthritis, section 10.1

Cytokine modulators [section reorganised], section 10.1.3

Topical oral pain relief products containing salicylates [CHM advice], section 12.3.1

Efalizumab [suspension of marketing authorisation], section 13.5.3

Isotretinoin [pregnancy prevention], section 13.6.2

Immunoglobulins [section reorganised and updated], section 14.5

Adjustment of drug dosages in renal impairment [updated advice and terminology], appendix 3

Enteral feeds and nutritional supplements for adults [new tables], appendix 7

Wound management products [table to aid choice of dressing, and all sections reorganised], appendix 8

Changes to Dental Practitioners' Formulary, p. 948

Dose changes

Changes in dose statements introduced into BNF No. 58:

Abacavir, p. 341

Aciclovir [varicella and herpes zoster], p. 349

Alprostadil, p. 437

Atracurium [surgery or intubation], p. 709

Atomoxetine, p. 221

Atropine sulphate [organophosphorous insecticide poisoning, text], p. 36

Atropine sulphate [control of muscarinic side-effects of edrophonium], p. 703

Axsain®, p. 589

Binocrit®, p. 519

Chloroquine [prophylaxis of malaria], p. 362

Ciprofloxacin, p. 329

Concerta® XL, p. 222

Cyanocobalamin [by mouth], p. 516

Daktarin® oral gel, p. 619

Dantrolene [malignant hyperthermia], p. 713

Darunavir, p. 344

Dasatinib [accelerated and blast phase chronic myeloid leukaemia, acute lymphoblastic leukaemia], p. 488

Dexamethasone injection, p. 570

Dexamfetamine [refractory ADHD], p. 221

Diamorphine [myocardial infarction], p. 239

Diazepam [status epilepticus], p. 266

Diazepam [premedication], p. 705

Efavirenz, p. 347

Efexor® XL [depression], p. 220

EMLA®, p. 715

Equasym XL®, p. 222

Estramustine phosphate, p. 471

European viper venom antiserum [text], p. 36

Fentanyl injection, p. 708

Flixotide® [by dry powder inhalation], p. 168

Folic acid [megaloblastic anaemia], p. 517

Galphenol®, p. 183

Glycopyrronium bromide [control of muscarinic side-effects of neostigmine], p. 703

Grazax®, p. 175

Halothane, p. 702

Hydrocortisone, p. 152

Hydroxyzine hydrochloride, p. 173

Levetiracetam, p. 259

Medikinet XL®, p. 222

Methylphenidate [ADHD], p. 222

Metronidazole [extra-intestinal amoebiasis], p. 366

Midazolam [status epilepticus], p. 267

Mirtazapine, p. 218

Nortriptyline [nocturnal enuresis], p. 212

Otrivine-Antistin®, p. 595

Oxytocin [induction of labour], p. 436

Palifermin, p. 469

Pancuronium [intubation], p. 710

Parecoxib, p. 707

Pizotifen [paediatric dose], p. 251

Prednisolone [inflammatory bowel disease], p. 57

Promethazine hydrochloride, p. 190

Pulmicort® [by aerosol inhalation], p. 168

Ranitidine [prophylaxis of stress ulceration], p. 46

Risperidone [psychoses], p. 203

Salbutamol [by inhalation of aerosol or nebulised solution], p. 152

Sevoflurane [induction of anaesthesia], p. 702

Sodium cromoglicate [by aerosol inhalation], p. 170

Terbutaline [by inhalation of aerosol or nebulised solution], p. 152

Timentin®, p. 302

Ursofalk® [primary biliary cirrhosis], p. 70

Varilrix®, p. 689

Varivax®, p. 689

Vecuronium, p. 711

Welldorm® elixir, p. 189

Zacin®, p. 589

Zanamivir, p. 355

Zelapar®, p. 275

Zidovudine, p. 343

Classification changes

Classification changes have been made in the following sections for BNF No. 58:

Section 1.6.5 Bowel cleansing preparations [title change]

Section 14.5.1 Normal immunoglobulin [new sub-section]

Section 14.5.2 Disease-specific immunoglobulins [new sub-section]

Section 14.5.3 Anti-D (RhO) immunoglobulin [new sub-section]

Deleted preparations

Preparations listed below have been discontinued during the compilation of BNF No. 58, or are still available but are not considered suitable for inclusion by the Joint Formulary Committee (see footnote)

Aquasept®

Beclazone Easi-Breathe®

Bonefos® concentrate

Burinex A®

Cabaser®

Carisoma®

Cedocard Retard®

Drogenil®

Effico®[1]

Endoxana®

Estracombi®

Euglucon®

Feldene® injection

Flagyl® intravenous infusion

Full Marks® lotion and mousse

Gentian mixture, Alkaline, BP[1]

Halycitrol®

Hibisol®

Hycosan®

IONSYS®

Kapake® effervescent tablets

Maxolon® paediatric liquid and syrup

Metatone®[1]

Mitoxana®

Motilium® suspension

Neo-Cortef®

Nystan® tablets

Paraldehyde injection

Paraplatin®

Prioderm® lotion

Procaine

Rapolyte®

Seconal Sodium®

Ster-Zac Bath Concentrate®

Tri-Adcortyl Otic®

Vibramycin® capsules

Vioform-Hydrocortisone®

1. Not considered suitable for inclusion by the Joint Formulary Committee

New preparations included in this edition

Preparations included in the relevant sections of BNF No. 58:

Abraxane®, p. 491

Avamys®, p. 614

Azarga®, p. 601

Berinert®, p. 178

Bramitob®, p. 312

Denzapine® suspension, p. 202

Diafalk®, p. 66

Effentora®, p. 240

Efient®, p. 137

Extavia®, p. 501

Firmagon®, p. 510

Flamascard®, p. 135

Foraven XL®, p. 220

Intanza®, p. 681

Ixiaro®, p. 681

Kuvan®, p. 540

Levofolinic acid, p. 469

LMX 4®, p. 715

Nevanac®, p. 606

Nicorette® Invisi patches, p. 281

NuvaRing®, p. 447

Periogard® oromucosal solution, p. 621

Qlaira®, p. 449

Ranexa®, p. 121

Sandocal® +D 600, p. 551

Sevikar®, p. 109

Siklos®, p. 522

Stelara®, p. 646

Targinact®, p. 244

Tifaxin XL®, p. 220

Valdoxan®, p. 218

Venaxx XL®, p. 220

Venlalic ® XL, p. 220

Vidaza®, p. 476

Virgan®, p. 593

Xerotin®, p. 622

Xomolix®, p. 227

Zeridame® SR, p. 246

Late additions

Vantas® (Orion) ▼ PoM

Implant, histrelin (as acetate) 50 mg, net price 1 pack (containing implantation device and implant) = £990.00

BNF section 8.3.4.2. For palliative treatment of advanced prostate cancer

Zarzio® (Sandoz) ▼ PoM

Injection, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £59.00; 48 million-units (480 micrograms)/0.5 mL = £94.00

Note Biosimilar medicine, p. 1

BNF section 9.1.6. (Specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes); reduction in duration of neutropenia in myeloablative therapy followed by bone-marrow transplantation; mobilisation of peripheral blood progenitor cells for harvesting and subsequent autologous or allogeneic infusion; severe congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders, consult product literature); persistent neutropenia in advanced HIV infection

Name changes

European Law requires use of the Recommended International Non-proprietary Name (rINN) for medicinal substances. In most cases the British Approved Name (BAN) and rINN were identical. Where the two differed, the BAN was modified to accord with the rINN.

The following list shows those substances for which the former BAN has been modified to accord with the rINN. Former BANs have been retained as synonyms in the BNF.

Adrenaline and noradrenaline Adrenaline and noradrenaline are the terms used in the titles of monographs in the European Pharmacopoeia and are thus the official names in the member states. For these substances, BP 2009 shows the European Pharmacopoeia names and the rINNs at the head of the monographs; the BNF has adopted a similar style.

Former BAN	New BAN
adrenaline	*see above*
amethocaine	tetracaine
aminacrine	aminoacridine
amoxycillin	amoxicillin
amphetamine	amfetamine
amylobarbitone sodium	amobarbital sodium
beclomethasone	beclometasone
bendrofluazide	bendroflumethiazide
benzhexol	trihexyphenidyl
benzphetamine	benzfetamine
busulphan	busulfan
butobarbitone	butobarbital
carticaine	articaine
cephalexin	cefalexin
cephradine	cefradine
chloral betaine	cloral betaine
chlorbutol	chlorobutanol
chlormethiazole	clomethiazole
chlorpheniramine	chlorphenamine
chlorthalidone	chlortalidone
cholecalciferol	colecalciferol
cholestyramine	colestyramine
clomiphene	clomifene
colistin sulphomethate sodium	colistimethate sodium
corticotrophin	corticotropin
cyclosporin	ciclosporin
cysteamine	mercaptamine
danthron	dantron
dexamphetamine	dexamfetamine
dibromopropamidine	dibrompropamidine
dicyclomine	dicycloverine
dienoestrol	dienestrol
dimethicone(s)	dimeticone
dimethyl sulphoxide	dimethyl sulfoxide
dothiepin	dosulepin
doxycycline hydrochloride (hemihydrate hemiethanolate)	doxycycline hyclate
eformoterol	formoterol
ethamsylate	etamsylate
ethinyloestradiol	ethinylestradiol
ethynodiol	etynodiol
flumethasone	flumetasone
flupenthixol	flupentixol
flurandrenolone	fludroxycortide
frusemide	furosemide
guaiphenesin	guaifenesin
hexachlorophane	hexachlorophene
hexamine hippurate	methenamine hippurate
hydroxyurea	hydroxycarbamide
indomethacin	indometacin
lignocaine	lidocaine
methotrimeprazine	levomepromazine
methyl cysteine	mecysteine
methylene blue	methylthioninium chloride
methicillin	meticillin
mitozantrone	mitoxantrone
nicoumalone	acenocoumarol
noradrenaline	*see above*
oestradiol	estradiol
oestriol	estriol
oestrone	estrone
oxpentifylline	pentoxifylline
phenobarbitone	phenobarbital
pipothiazine	pipotiazine
polyhexanide	polihexanide
pramoxine	pramocaine
procaine penicillin	procaine benzylpenicillin
prothionamide	protionamide
quinalbarbitone	secobarbital
riboflavine	riboflavin
salcatonin	calcitonin (salmon)
sodium calciumedetate	sodium calcium edetate
sodium cromoglycate	sodium cromoglicate
sodium ironedetate	sodium feredetate
sodium picosulphate	sodium picosulfate
sorbitan monostearate	sorbitan stearate
stibocaptate	sodium stibocaptate
stilboestrol	diethylstilbestrol
sulphacetamide	sulfacetamide
sulphadiazine	sulfadiazine
sulphamethoxazole	sulfamethoxazole
sulphapyridine	sulfapyridine
sulphasalazine	sulfasalazine
sulphathiazole	sulfathiazole
sulphinpyrazone	sulfinpyrazone
tetracosactrin	tetracosactide
thiabendazole	tiabendazole
thioguanine	tioguanine
thiopentone	thiopental
thymoxamine	moxisylyte
thyroxine sodium	levothyroxine sodium
tribavirin	ribavirin
trimeprazine	alimemazine
urofollitrophin	urofollitropin

Guidance on prescribing

General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered (for further details see Prescribing in Pregnancy, Appendix 4).

It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed (see also Taking Medicines to Best Effect, below). In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Taking medicines to best effect Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse-effects;
- patients' perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them ('concordance'). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient's acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician's instructions by the pharmacist also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biosimilar medicines A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status (▼) at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme (p. 11). For biosimilar medicines, adverse reaction reports should clearly state the brand name of the suspected medicine.

Complementary and alternative medicine An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort—see Appendix 1). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles In general, titles of drugs and preparations should be written *in full*. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles Where non-proprietary ('generic') titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer's version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should **not** be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Medicines Act (Section 65).

Proprietary titles Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice In general the *doses, indications, cautions, contra-indications,* and *side-effects* in the BNF reflect those in the manufacturers' data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing

authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies, see p. 969.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF suggests a use (or route) that is outside the licensed indication of a product ('off-label' use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines.

Oral syringes An **oral syringe** is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5-mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The *5-mL spoon* is used for doses of 5 mL (or multiples thereof).

To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate **oral** or **enteral syringe** should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should **not** be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled 'Oral' or 'Enteral' in a large font size; it is the healthcare practitioner's responsibility to label the syringe with this information if the manufacturer has not done so.

Strengths and quantities The strength or quantity to be contained in capsules, lozenges, tablets, etc. should be stated by the prescriber.

If a pharmacist receives an incomplete prescription for a systemically administered preparation and considers it would not be appropriate for the patient to return to the doctor, the following procedures will apply[1]:

(a) an attempt must always be made to contact the prescriber to ascertain the intention;

(b) if the attempt is successful the pharmacist must, where practicable, subsequently arrange for details of quantity, strength where applicable, and dosage to be inserted by the prescriber on the incomplete form;

(c) where, although the prescriber has been contacted, it has not proved possible to obtain the written intention regarding an incomplete prescription, the pharmacist may endorse the form 'p.c.' (prescriber contacted) and add details of the quantity and strength where applicable of the preparation supplied, and of the dose indicated. The endorsement should be initialled and dated by the pharmacist;

(d) where the prescriber cannot be contacted and the pharmacist has sufficient information to make a professional judgement the preparation may be dispensed. If the quantity is missing the pharmacist may supply sufficient to complete up to 5 days' treatment; except that where a combination pack (i.e. a proprietary pack containing more than one medicinal product) or oral contraceptive is prescribed by name only, the smallest pack shall be dispensed. In all cases the prescription must be endorsed 'p.n.c.' (prescriber not contacted), the quantity, the dose, and the strength (where applicable) of the preparation supplied must be indicated, and the endorsement must be initialled and dated;

(e) if the pharmacist has any doubt about exercising discretion, an incomplete prescription must be referred back to the prescriber.

Excipients Branded oral liquid preparations that do not contain *fructose*, *glucose*, or *sucrose* are described as 'sugar-free' in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of *aspartame*, *gluten*, *sulphites*, *tartrazine*, *arachis (peanut) oil* or *sesame oil* is available, this is indicated in the BNF against the relevant preparation.

Information is provided on *selected excipients* in skin preparations (section 13.1.3), in vaccines (section 14.1), and on *selected preservatives* and *excipients* in eye drops and injections. Pressurised metered aerosols containing *chlorofluorocarbons* (CFCs) have also been identified throughout the BNF (see section 3.1.1.1).

The presence of *benzyl alcohol* and *polyoxyl castor oil* (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram and metronidazole.

The *lactose* content in most medicines is too small to cause problems in most lactose intolerant patients. However, in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

In the absence of information on excipients in the BNF and in the product literature (available at www.emc.medicines.org.uk), contact the manufacturer (see Index of Manufacturers) if it is essential to check details.

Extemporaneous preparation A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

1. These recommendations are acceptable for **prescription-only medicines** (Ⓟ). For items marked Ⓒ see also Controlled Drugs and Drug Dependence, p. 7.

The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25° C.

The term **water** used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections, section 9.2.2).

Drugs and driving Prescribers should advise patients if treatment is likely to affect their ability to drive motor vehicles. This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk (see also Appendix 9).

Patents In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable *child-resistant container* unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of *unwanted medicines* by returning them to a supplier for destruction.

Name of medicine The name of the medicine should appear on the label unless the prescriber indicates otherwise.

(a) The strength is also stated on the label in the case of tablets, capsules, and similar preparations that are available in different strengths.

(b) If it is the wish of the prescriber that a description such as 'The Sedative Tablets' should appear on the label, the prescriber should write the desired description on the prescription form.

(c) The arrangement will extend to approved names, proprietary names or titles given in the BP, BPC, BNF, DPF, or NPF.

(d) The name written on the label is that used by the prescriber on the prescription.

(e) When a prescription is written other than on an NHS prescription form the name of the prescribed preparation will be stated on the label of the dispensed medicine unless the prescriber indicates otherwise.

(f) The Council of the Royal Pharmaceutical Society advises that the labels of dispensed medicines should indicate the total quantity of the product dispensed in the container to which the label refers. This requirement applies equally to solid, liquid, internal, and external preparations. If a product is dispensed in more than one container, the reference should be to the amount in each container.

Non-proprietary names of **compound preparations** which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix 'co-' should be retained.

Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different lengths of action.

Security and validity of prescriptions The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD) In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales) and at www.portal.nelm.nhs.uk/PGD.

NICE and Scottish Medicines Consortium Advice issued by the National Institute for Health and Clinical Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.uk.

Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions[1] should be written legibly in ink or otherwise so as to be indelible[2], should be dated, should state the full name and address of the patient, and should be signed in ink by the prescriber[3]. The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years.

The following should be noted:

(a) The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.

Quantities of 1 gram or more should be written as 1 g etc.

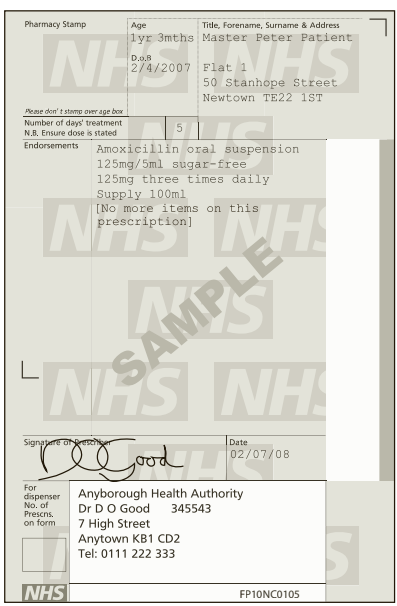
Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g.

Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.

When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.

Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.

(b) 'Micrograms' and 'nanograms' should **not** be abbreviated. Similarly 'units' should **not** be abbreviated.



(c) The term 'millilitre' (ml or mL)[4] is used in medicine and pharmacy, and cubic centimetre, c.c., or cm^3 should not be used.

(d) Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a **minimum dose interval** should be specified.

When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, see p. 2 (except for preparations intended to be measured with a pipette).

Suitable quantities:

Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL

Adult Mixtures (10-mL dose), 200 or 300 mL

Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer's pack)

Eye Lotions, Gargles, and Mouthwashes, 200 mL

(e) For suitable quantities of dermatological preparations, see section 13.1.2.

(f) The names of drugs and preparations should be written clearly and **not** abbreviated, using approved titles **only** (see also advice in box on p. 3 to **avoid** creating generic titles for modified-release preparations).

(g) The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.

When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.

(h) Although directions should preferably be in **English without abbreviation**, it is recognised that some Latin abbreviations are used (for details see Inside Back Cover).

(i) Medical and dental practitioners may prescribe unlicensed medicines (i.e. those without marketing authorisation) or withdrawn medicines. The prescriber should inform the patient or the patient's carer that the product does not have a marketing authorisation.

Prescribing by dental surgeons Until new prescribing arrangements are in place for NHS prescriptions, dental surgeons should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners' Formulary.

1. These recommendations are acceptable for **prescription-only medicines** (PoM). For items marked CD see also Controlled Drugs and Drug Dependence, p. 7.
2. It is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink.
3. Computer-generated facsimile signatures do not meet the legal requirement.
4. The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations.

The Act and Regulations do not set any limitations upon the number and variety of substances which the dental surgeon may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dental surgeon may use or order whatever is required for the clinical situation. There is no statutory requirement for the dental surgeon to communicate with a patient's medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient's interest and such communication is to be encouraged. For legal requirements relating to prescriptions for Controlled Drugs, see p. 7.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient's surname, one forename, other initials, and address, and may also print out the patient's title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.
2. The doctor's name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor's surgery address, reference number, and Primary Care Trust (PCT[1]) are also necessary. In addition, the surgery telephone number should be printed.
3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.
4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.
5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.
6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required, see (h) above.
7. The BNF recommendations should be followed as in (a), (b), (c), (d), and (e) above.
8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as 'as directed' and 'when required', the maximum daily dose should normally be specified.
9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.
10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.
11. A mechanism (such as printing a series of non-specific characters) should be incorporated to cancel out unused space, or wording such as 'no more items on this prescription' may be added after the last item. Otherwise the doctor should delete the space manually.
12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.
13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor's own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ♀ (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).
14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber's signature must be handwritten[2].
15. The strip of paper on the side of the FP10SS[3] may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient's name to appear at the top, but this should be preceded by 'confidential'.
16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.
17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

1. Health Board in Scotland, Local Health Board in Wales.
2. See Controlled Drugs and Drug Dependence p. 7; the prescriber may use a date stamp.
3. GP10SS in Scotland, WP10SS in Wales.

Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Prescription Only Medicines (Human Use) Order 1997 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

(a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:

  (i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;

  (ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;

  (iii) as to the dose that it would be appropriate for the person to take;

(b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5[1], or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:

  (i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;

  (ii) an oral contraceptive when a full cycle may be supplied;

  (iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

(c) that an entry shall be made by the pharmacist in the prescription book stating:

  (i) the date of supply;

  (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;

  (iii) the name and address of the patient;

  (iv) the nature of the emergency;

(d) that the container or package must be labelled to show:

  (i) the date of supply;

  (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;

  (iii) the name of the patient;

  (iv) the name and address of the pharmacy;

  (v) the words 'Emergency supply';

  (vi) the words 'Keep out of the reach of children' (or similar warning);

(e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)[1].

1. Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs, or drugs that do not have a UK marketing authorisation.

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

(a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;

(b) that the prescriber has undertaken to furnish a prescription within 72 hours;

(c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;

(d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)[1];

(e) that an entry shall be made in the prescription book stating:

  (i) the date of supply;

  (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;

  (iii) the name and address of the practitioner requesting the emergency supply;

  (iv) the name and address of the patient;

  (v) the date on the prescription;

  (vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's guidelines

1. The pharmacist should consider the medical consequences of *not* supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see *Medicines, Ethics and Practice*, No. 33, London Pharmaceutical Press, 2009 (and subsequent editions).

Controlled Drugs and drug dependence

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the *harmfulness attributable to a drug when it is misused* and for this purpose the drugs are defined in the following three classes:

Class A includes: alfentanil, cocaine, diamorphine (heroin), dipipanone, lysergide (LSD), methadone, methylenedioxymethamfetamine (MDMA, 'ecstasy'), morphine, opium, pethidine, phencyclidine, remifentanil, and class B substances when prepared for injection

Class B includes: oral amphetamines, barbiturates, cannabis, cannabis resin, codeine, ethylmorphine, glutethimide, pentazocine, phenmetrazine, and pholcodine

Class C includes: certain drugs related to the amphetamines such as benzfetamine and chlorphentermine, buprenorphine, diethylpropion, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, zolpidem, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin

The Misuse of Drugs Regulations 2001 define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

Schedule 1 includes drugs such as cannabis and lysergide which are not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

Schedule 2 includes drugs such as diamorphine (heroin), morphine, remifentanil, pethidine, secobarbital, glutethimide, amfetamine, and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

Schedule 3 includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine, diethylpropion, mazindol, meprobamate, midazolam, pentazocine, phentermine, and temazepam. They are subject to the special prescription requirements (except for temazepam) but not to the safe custody requirements (except for buprenorphine, diethylpropion, and temazepam) nor to the need to keep registers (although there are requirements for the retention of invoices for 2 years).

Schedule 4 includes in Part I benzodiazepines (except temazepam and midazolam, which are in Schedule 3) and zolpidem, which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

Schedule 5 includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions Preparations in Schedules 2 and 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF by the symbol CD (Controlled Drug). The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance, p. 8).

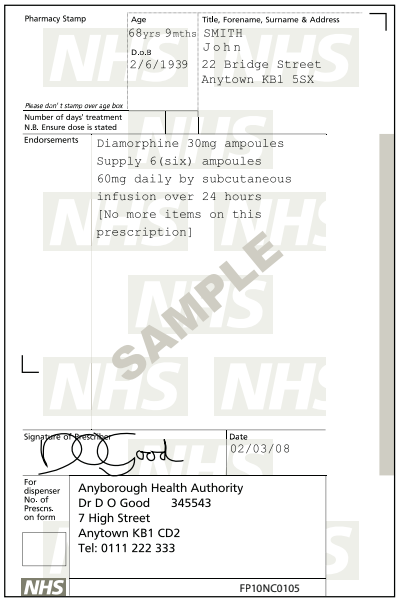
Prescription requirements

Prescriptions for Controlled Drugs that are subject to prescription requirements[1] must be indelible,[2] and must be *signed* by the prescriber, *be dated*, and specify the prescriber's *address*. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form[3] and where appropriate the strength[4] of the preparation;
- either the total quantity (in both words and figures) of the preparation[5], or the number (in both words and figures) of dosage units, as appropriate, to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose;[6]
- the words 'for dental treatment only' if issued by a dentist.

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist. Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon[7].

1. All preparations in Schedules 2 and 3, except temazepam.
2. A machine-written prescription is acceptable. The prescriber's signature must be handwritten.
3. The dosage form (e.g. tablets) must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name (e.g. *MST Continus*) or whether only one form is available.
4. When more than one strength of a preparation exists the strength required must be specified.
5. The Home Office has advised that quantities of liquid preparations, such as methadone oral solution, should be written in millilitres.
6. The instruction 'one as directed' constitutes a dose but 'as directed' does not.
7. The prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription.



Instalments and 'repeats' A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified.[1] Prescriptions ordering 'repeats' on the same form are **not** permitted for Controlled Drugs in Schedules 2 or 3.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the *prescriber's identification number*. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Department of Health guidance Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days' treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes;
- the patient's identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.dh.gov.uk/controlleddrugs. For a sample prescription, see above.

Dependence and misuse The most serious drugs of addiction are **cocaine**, **diamorphine** (heroin), **morphine**, and the **synthetic opioids**. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see p. 10.

Despite marked reduction in the prescribing of **amphetamines**, there is concern that abuse of illicit amfetamine and related compounds is widespread.

Benzodiazepines are commonly misused. The misuse of **barbiturates** is now uncommon, in line with declining medicinal use and consequent availability.

Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. **Lysergide** (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

There are concerns at an increase in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine and gamma-hydroxybutyrate (sodium oxybate, GHB).

Prescribing drugs likely to cause dependence or misuse The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics (for CSM advice see section 4.1). The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

1. A total of 14 days' treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine, and diazepam may be prescribed in England. In *England*, forms FP10(MDA) (blue) and FP10H(MDA) (blue) should be used. In *Scotland*, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In *Wales* a total of 14 days' treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs (see Prescriptions, above);
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

Travelling abroad Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.drugs.homeoffice.gov.uk/drugs-laws/licensing/personal, or from the Home Office by contacting licensing_enquiry.aadu@homeoffice.gsi.gov.uk (in cases of emergency, telephone 0207 035 0484).

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient's name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing, Peel Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to licensing_enquiry.aadu@homeoffice.gsi.gov.uk with a scanned copy of the covering letter from the prescriber. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country's consulate in the UK.

Notification of drug misusers

Doctors should report cases of drug misuse to their regional or national drug misuse database or centre—see below for contact telephone numbers. The National Drugs Treatment Monitoring System (NDTMS) was introduced in England in April 2001; regional (NDTMS) centres replace the Regional Drug Misuse Databases. A similar system has been introduced in Wales.

Notification to regional (NDTMS) or national centre should be made when a patient starts treatment for drug misuse. All types of problem drug misuse should be reported including opioid, benzodiazepine, and CNS stimulant.

The regional (NDTMS) or national centres are now the only national and local source of epidemiological data on people presenting with problem drug misuse; they provide valuable information to those working with drug misusers and those planning services for them. The databases cannot, however be used as a check on multiple prescribing for drug addicts because the data are anonymised.

Enquiries about the regional (NDTMS) or national centres (including information on how to submit data) can be made to one of the centres listed below:

In **Northern Ireland**, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regula-

tions 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:

Dr Ian McMaster
C3 Castle Buildings
Belfast, BT4 3FQ
Tel: (028) 9052 2421
Fax: (028) 9052 0718
ian.mcmaster@dhsspsni.gov.uk

Administrative contact:

Public Health Information & Research Branch
Annex 2
Castle Building
Belfast, BT4 3SQ
Tel: (028) 9052 2520

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine, dipipanone (*Diconal*®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine, dipipanone, and cocaine for patients (including addicts) for *relieving pain* from organic disease or injury.

For guidance on prescription writing, see p. 7.

Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Doctors, dentists, coroners, pharmacists, and nurses (see also self-reporting below) are urged to report suspected adverse reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in this book (inside back cover).

Medicines and Healthcare products Regulatory Agency
CHM
Freepost
London SW8 5BR
Tel: 0800 731 6789

Suspected adverse reactions to *any* therapeutic agent should be reported, including drugs *(self-medication* as well as those *prescribed)*, blood products, vaccines, radiographic contrast media, complementary and herbal products.

A 24-hour Freefone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres may *follow up* reports:

Yellow Card Centre

Edinburgh EH16 4SA
Tel: (0131) 242 2919

The MHRA's database facilitates the monitoring of adverse drug reactions.

More detailed information on reporting and a list of products currently under intensive monitoring can be found on the MHRA website: www.mhra.gov.uk.

Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.mhra.gov.uk/mhra/drugsafetyupdate.

Self-reporting Patients, parents, and carers can also report suspected adverse reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk or by telephone on 0808 100 3352. Alternatively, patient Yellow Cards are available from pharmacies.

Prescription-event monitoring In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from www.dsru.org.

Newer drugs and vaccines Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol (▼) identifies newly licensed medicines that are monitored intensively by the MHRA. Such medicines include new active substances, biosimilar medicines, medicines that have been licensed for administration by a new route or drug delivery system, or for significant new indications which may alter the established risks and benefits of that drug, or that contain a new combination of active substances. There is no standard time for which products retain a black triangle; safety data are usually reviewed after 2 years.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that **all** suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

Established drugs and vaccines Doctors, dentists, coroners, pharmacists and nurses are asked to report *all* serious suspected reactions, including those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong hospitalisation; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Adverse reactions to medical devices Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness.

In the product literature the frequency of side-effects is generally described as follows:

Very common	greater than 1 in 10
Common	1 in 100 to 1 in 10
Uncommon ['less commonly' in BNF]	1 in 1000 to 1 in 100
Rare	1 in 10 000 to 1 in 1000
Very rare	less than 1 in 10 000

Special problems

Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; **all** suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme.

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions;
- ask if the patient is already taking other drugs *including self-medication drugs, health supplements, complementary and alternative therapies*; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, notably of isoniazid and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- warn the patient if serious adverse reactions are liable to occur.

Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient's medical practitioner may be necessary.

Oral mucosa

Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind.

Aspirin tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly **essential oils**, may sensitise the skin, but mucosal swelling is not usually prominent.

The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. **methotrexate**. Other drugs capable of causing oral ulceration include **captopril** (and other ACE inhibitors), **gold**, **nicorandil**, **NSAIDs**, **pancreatin**, **penicillamine**, **proguanil**, and **protease inhibitors**.

Erythema multiforme (including Stevens-Johnson syndrome) may follow the use of a wide range of drugs including **antibacterials**, **antiretrovirals**, **sulphonamide derivatives**, and **anticonvulsants**; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of *toxic epidermal necrolysis* (Lyell's syndrome) have been reported with a similar range of drugs.

Lichenoid eruptions are associated with **ACE inhibitors**, **NSAIDs**, **methyldopa**, **chloroquine**, **oral antidiabetics**, **thiazide diuretics**, and **gold**.

Candidiasis can complicate treatment with **antibacterials** and **immunosuppressants** and is an occasional side-effect of **corticosteroid inhalers**, see also p. 166.

Teeth and Jaw

Brown staining of the teeth frequently follows the use of **chlorhexidine** mouthwash, spray or gel, but can readily be removed by polishing. **Iron** salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with **co-amoxiclav** suspension.

Intrinsic staining of the teeth is most commonly caused by **tetracyclines**. They will affect the teeth if given at any time from about the fourth month *in utero* until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey.

Excessive ingestion of **fluoride** leads to *dental fluorosis* with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child's age (taking into account the fluoride content of the local drinking water and of toothpaste).

Osteonecrosis of the jaw has been reported in patients receiving a bisphosphonate by the intravenous route and, rarely, in those taking a biphosphonate orally. If possible, dental surgical procedures should be avoided during and after bisphosphonate treatment, see also p. 422.

Periodontium

Gingival overgrowth (gingival hyperplasia) is a side-effect of **phenytoin** and sometimes of **ciclosporin** or of **nifedipine** (and some other calcium-channel blockers).

Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands

The most common effect that drugs have on the salivary glands is to *reduce flow* (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly **antimuscarinics** (anticholinergics), **antidepressants** (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), **alpha-blockers**, **antihistamines**, **antipsychotics**, **baclofen**, **bupropion**, **clonidine**, **5HT$_1$ agonists**, **opioids**, **sibutramine**, and **tizanidine**. Excessive use of **diuretics** can also result in xerostomia.

Some drugs (e.g. clozapine, neostigmine) can *increase saliva production* but this is rarely a problem unless the patient has associated difficulty in swallowing.

Pain in the salivary glands has been reported with some **antihypertensives** (e.g. clonidine, methyldopa) and with **vinca alkaloids**.

Swelling of the salivary glands can occur with **iodides**, **antithyroid drugs**, **phenothiazines**, **ritodrine**, and **sulphonamides**.

Taste

There can be *decreased* taste acuity or *alteration* in taste sensation. Drugs implicated include **amiodarone**, **calcitonin**, **captopril** (and other ACE inhibitors), **carbimazole**, **clarithromycin**, **gold**, **griseofulvin**, **lithium salts**, **metformin**, **metronidazole**, **penicillamine**, **phenindione**, **propafenone**, **protease inhibitors**, **terbinafine**, and **zopiclone**.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

Prescribing for children

For detailed advice on medicines used for children, consult *BNF for Children*

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 30 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Medicines Act does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

Adverse drug reactions in children The reporting of all suspected adverse drug reactions in children is **strongly encouraged** through the Yellow Card Scheme (see p. 11) even if the intensive monitoring symbol (▼) has been removed, because experience in children may still be limited.

The identification and reporting of adverse reactions to drugs in children is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs are not extensively tested in children;
- many drugs are not specifically licensed for use in children and are used 'off-label';
- suitable formulations may not be available to allow precise dosing in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Prescription writing Prescriptions should be written according to the guidelines in Prescription Writing (p. 4) Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for **all** prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an **oral syringe** will be supplied (for details, see p. 2). Parents should be advised not to add any medicines to the infant's feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep **all** medicines out of reach of children, see Safety in the Home, p. 3.

Rare paediatric conditions

Information on substances such as *biotin* and *sodium benzoate* used in rare metabolic conditions is included in *BNF for Children*; further information can be obtained from:

Alder Hey Children's Hospital
Drug Information Centre
Liverpool L12 2AP
Tel: (0151) 252 5381

Great Ormond Street Hospital for Children
Pharmacy
Great Ormond St
London WC1N 3JH
Tel: (020) 7405 9200

Dosage in children

Children's doses in the BNF are stated in the individual drug entries as far as possible, except where paediatric use is not recommended, information is not available, or there are special hazards.

Doses are generally based on body-weight (in kilograms) or the following age ranges:

first month (neonate)

up to 1 year (infant)

1–5 years

6–12 years

Unless the age is specified, the term 'child' in the BNF includes persons aged 12 years and younger.

Dose calculation Many children's doses are standardised by **weight** (and therefore require multiplying by the body-weight in kilograms to determine the child's dose); occasionally, the doses have been standardised by **body surface area** (in m^2). These methods should be used rather than attempting to calculate a child's dose on the basis of doses used in adults.

For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from an ideal weight, related to height and age (see inside back cover).

Body surface area (BSA) estimates are often preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*.

Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

Dose frequency Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's bedtime.

Where new or potentially toxic drugs are used, the manufacturers' recommended doses should be carefully followed.

Prescribing in palliative care

Palliative care is the active total care of patients whose disease is not responsive to curative treatment. Control of pain, of other symptoms, and of psychological, social and spiritual problems, is paramount to provide the best quality of life for patients and their families. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain

Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol (p. 234) or a **NSAID** (section 10.1.1) given regularly will often make the use of opioid analgesics unnecessary. A NSAID may also control the pain of *bone secondaries*; if necessary, flurbiprofen or indometacin can be given rectally. Radiotherapy, bisphosphonates (section 6.6.2), and radioactive isotopes of **strontium** (*Metastron*®) available from GE Healthcare) may also be useful for pain due to bone metastases.

An opioid analgesic (section 4.7.2) such as **codeine** (p. 239), alone or in combination with a non-opioid analgesic at adequate dosage, may be helpful in the control of moderate pain if non-opioid analgesics alone are not sufficient. Alternatively, **tramadol** (p. 245) can be considered for moderate pain. If these preparations do not control the pain, **morphine** (p. 242) is the most useful opioid analgesic. Alternatives to morphine, including **hydromorphone** (p. 241), **methadone** (p. 241), **oxycodone** (p. 243), and transdermal **fentanyl** (see p. 16 and p. 240) are best initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Equivalent single doses of opioid analgesics

These equivalences are intended **only** as an approximate guide; patients should be carefully monitored after **any** change in medication and dose titration may be required

Analgesic	Dose
Morphine salts (oral)	10 mg
Diamorphine hydrochloride (intramuscular)	3 mg
Hydromorphone hydrochloride	1.3 mg
Oxycodone (oral)	5 mg

Oral route Morphine (p. 242) is given *by mouth* as an oral solution or as standard ('immediate release') tablets regularly every 4 hours, the initial dose depending largely on the patient's previous treatment. A dose of 5–10 mg is enough to replace a weaker analgesic (such as paracetamol), but 10–20 mg or more is required to replace a strong one (comparable to morphine itself). If the first dose of morphine is no more effective than the previous analgesic, the next dose should be increased by 30–50%, the aim being to choose the lowest dose that prevents pain. The dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics (such as NSAIDs) should also be considered. Although morphine in a dose of 5–20 mg is usually adequate there should be no hesitation in increasing it stepwise according to response to 100 mg or occasionally up to 500 mg or higher if necessary. It may be possible to omit the overnight dose if double the usual dose is given at bedtime.

If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') should be given. An additional dose should also be given 30 minutes before an activity that causes pain (e.g. wound dressing). Fentanyl lozenges are also licensed for breakthrough pain.

When the pain is controlled and the patient's 24-hour morphine requirement is established, the daily dose can be given as a *modified-release preparation* in a single dose or in two divided doses.

Preparations suitable for twice-daily administration include *Morphgesic*® *SR* tablets (p. 243), *MST Continus*® tablets or suspension (p. 243), and *Zomorph*® capsules (p. 243). *MXL*® capsules (p. 243) allow administration of the total daily morphine requirement as a single dose.

The starting dose of modified-release morphine preparations designed for twice daily administration is usually 10–20 mg every 12 hours if no other analgesic (or only paracetamol) has been taken previously, but to replace a weaker opioid analgesic (such as co-codamol) the starting dose is usually 20–30 mg every 12 hours. Increments should be made to the dose, not to the frequency of administration, which should remain at every 12 hours.

The effective dose of modified-release preparations can alternatively be determined by giving the oral solution of morphine every 4 hours in increasing doses until the pain has been controlled, and then transferring the patient to the same total 24-hour dose of morphine given as the modified-release preparation (divided into two portions for 12-hourly administration). The first

dose of the modified-release preparation is given 4 hours after the last dose of the oral solution.[1]

Morphine, as oral solution or standard formulation tablets, should be prescribed for breakthrough pain; the dose should be about one-sixth of the total daily dose of oral morphine repeated every 4 hours if necessary (review pain management if analgesic required more frequently).

Oxycodone (p. 243) can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone should be started at a dose equivalent to the current analgesic (see Equivalent Single Doses of Opioid Analgesics table, p. 15).

Levomepromazine (methotrimeprazine, p. 197) is licensed to treat pain in palliative care, and may be of benefit in some patients. It should be reserved for use in conjunction with strong opioid analgesics in distressed patients with severe pain unresponsive to other measures.

Parenteral route If the patient becomes unable to swallow, the equivalent intramuscular dose of morphine is half the oral solution dose; in the case of the modified-release tablets it is half the total 24-hour dose (which is then divided into 6 portions to be given every 4 hours). **Diamorphine** (p. 239) is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent intramuscular (or subcutaneous) dose is approximately a third of the oral dose of morphine. *Subcutaneous infusion* of diamorphine via continuous infusion device can be useful (for details, see p. 17).

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of diamorphine. See table of approximate equivalent doses of morphine and diamorphine, p. 19.

Rectal route **Morphine** (p. 243) is also available for *rectal administration* as suppositories; alternatively **oxycodone** (p. 243) suppositories can be obtained on special order.

Transdermal route Transdermal preparations of fentanyl and buprenorphine are available (section 4.7.2); they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under Fentanyl, p. 240) because inappropriate use has caused fatalities.

The following 24-hour doses of morphine **by mouth** are considered to be approximately equivalent to the fentanyl patches shown:

Morphine salt 45 mg daily ≡ fentanyl '12' patch
Morphine salt 90 mg daily ≡ fentanyl '25' patch
Morphine salt 180 mg daily ≡ fentanyl '50' patch
Morphine salt 270 mg daily ≡ fentanyl '75' patch
Morphine salt 360 mg daily ≡ fentanyl '100' patch

Morphine (as oral solution or standard formulation tablets) is given for breakthrough pain.

Gastro-intestinal pain The pain of *bowel colic* may be reduced by loperamide 2–4 mg 4 times daily. *Hyoscine hydrobromide* (section 4.6) may also be helpful, given sublingually at a dose of 300 micrograms 3 times daily as *Kwells®* tablets. For the dose by subcutaneous infusion, see p. 18).

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent (section 1.1.1) and a prokinetic such as domperidone 10 mg 3 times daily before meals.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam 5–10 mg daily or baclofen 5–10 mg 3 times daily.

Neuropathic pain Patients with neuropathic pain (section 4.7.3) may benefit from a trial of a tricyclic antidepressant for several weeks. An anticonvulsant may be added or substituted if pain persists; gabapentin and pregabalin (both section 4.8.1) are licensed for neuropathic pain.

Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone 8 mg daily, which reduces oedema around the tumour, thus reducing compression.

Nerve blocks can be considered when pain is localised to a specific area. **Transcutaneous electrical nerve stimulation** (TENS) may also help.

Miscellaneous conditions

Unlicensed indications or routes
Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone 15–30 mg daily or dexamethasone 2–4 mg daily.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid (section 2.11) by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL or adrenaline (epinephrine) solution 1 mg/mL (1 in 1000) can be applied to the affected area.

Constipation Constipation is a very common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer) or lactulose solution with a senna preparation should be used (section 1.6.2 and section 1.6.3). Methylnaltrexone (section 1.6.6) is licensed for the treatment of opioid-induced constipation.

Convulsions Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin or carbamazepine (section 4.8.1) should be considered. When oral medication is no longer possible, diazepam as suppositories 10–20 mg every 4 to 8 hours, or phenobarbital by injection 50–200 mg twice daily is continued as prophylaxis. For the use of midazolam by subcutaneous infusion using a continuous infusion device, see below.

Dry mouth Dry mouth may be relieved by good mouth care and measures such as the sucking of ice or pineapple chunks or the use of artificial saliva (section 12.3.5); dry mouth associated with candidiasis can be treated by oral preparations of nystatin or miconazole

1. Studies have indicated that administration of the last dose of the *oral solution* with the first dose of the *modified-release tablets* is not necessary.

(section 12.3.2); alternatively, fluconazole can be given by mouth (section 5.2). Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

Dysphagia A corticosteroid such as dexamethasone 8 mg daily may help, temporarily, if there is an obstruction due to tumour. See also Dry Mouth, p. 16.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine in carefully titrated doses, starting at 5 mg every 4 hours. Diazepam 5–10 mg daily may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone 4–8 mg daily, may also be helpful if there is bronchospasm or partial obstruction.

Excessive respiratory secretion Excessive respiratory secretion (death rattle) may be reduced by subcutaneous injection of hyoscine hydrobromide 400–600 micrograms every 4 to 8 hours; however, care must be taken to avoid the discomfort of dry mouth. Alternatively glycopyrronium can be given by subcutaneous or intramuscular injection in a dose of 200 micrograms every 4 hours. For the dose by subcutaneous infusion using a continuous infusion device, see p. 18.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole (section 5.1.11) is often required but topical metronidazole (section 13.10.1.2) is also used.

Hiccup Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent (section 1.1.1). If this fails, metoclopramide 10 mg every 6 to 8 hours by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen 5 mg twice daily, or nifedipine 10 mg three times daily, or chlorpromazine 10–25 mg every 6 to 8 hours can be tried.

Hypercalcaemia see section 9.5.1.2

Insomnia Patients with advanced cancer may not sleep because of discomfort , cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam (section 4.1.1), may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine in an initial dose of 5 mg every 4 hours. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic (section 4.6) is started.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol or metoclopramide. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide has a prokinetic action and is used in a dose of 10 mg 3 times daily by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol is used by mouth in an initial dose of 1.5 mg once or twice daily (can be increased if necessary to 5–10 mg daily in divided doses) for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure).

Cyclizine is given in a dose of 50 mg up to 3 times daily by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

Levomepromazine (methotrimeprazine) can be used if first-line antiemetics are inadequate; it is given by mouth in a dose of 6–50 mg daily (6-mg tablets available from 'special-order' manufacturers or specialist importing companies, see p. 969) in 1–2 divided doses. For the dose by subcutaneous infusion, see p. 18. Dexamethasone 8–16 mg daily by mouth can be used as an adjunct.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy, see section 8.1.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients (section 13.2.1). In the case of obstructive jaundice, further measures include administration of colestyramine (section 1.9.2).

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone 16 mg daily for 4 to 5 days, subsequently reduced to 4–6 mg daily if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion Restlessness and confusion may require treatment with haloperidol 1–3 mg by mouth every 8 hours. Levomepromazine (methotrimeprazine) is also used occasionally for restlessness. For the dose by subcutaneous infusion using a continuous infusion device, see p. 18.

Continuous infusion devices

Although drugs can usually be administered *by mouth* to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of *intramuscular injections* can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a *continuous subcutaneous infusion*, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Syringe driver rate settings

Staff using syringe drivers should be **adequately trained** and different rate settings should be **clearly identified** and **differentiated**; incorrect use of syringe drivers is a common cause of medication errors.

Indications for the **parenteral route** are:

- the patient is unable to take medicines by mouth owing to *nausea and vomiting, dysphagia, severe weakness,* or *coma;*
- there is *malignant bowel obstruction* in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- occasionally when the patient *does not wish* to take regular medication by mouth.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a *subcutaneous infusion dose* of 0.6–2.4 mg/24 hours.

Hyoscine butylbromide is effective in bowel colic, is less sedative than hyoscine hydrobromide, but is not always adequate for the control of respiratory secretions; it is given in a *subcutaneous infusion dose* of 20–60 mg/24 hours (**important:** this dose of *hyoscine butylbromide* must not be confused with the much lower dose of *hyoscine hydrobromide*, above).

Glycopyrronium 0.6–1.2 mg/24 hours by subcutaneous infusion may also be used.

Convulsions If a patient has previously been receiving an antiepileptic drug *or* has a primary or secondary cerebral tumour *or* is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*, and it is given initially in a dose of 20–40 mg/24 hours.

Nausea and vomiting Haloperidol is given in a *subcutaneous infusion dose* of 2.5–10 mg/24 hours.

Levomepromazine (methotrimeprazine) is given in a *subcutaneous infusion dose* of 5–25 mg/24 hours but sedation can limit the dose.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below); it is given in a *subcutaneous infusion dose* of 150 mg/24 hours.

Metoclopramide can cause skin reactions; it is given in a *subcutaneous infusion dose* of 30–100 mg/24 hours.

Octreotide (section 8.3.4.3), which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion in a dose of 300–600 micrograms/24 hours to reduce intestinal secretions and vomiting.

Pain control Diamorphine is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table on p. 19 shows approximate equivalent doses of morphine and diamorphine.

Restlessness and confusion Haloperidol has little sedative effect; it is given in a *subcutaneous infusion dose* of 5–15 mg/24 hours.

Levomepromazine (methotrimeprazine) has a sedative effect; it is given in a *subcutaneous infusion dose* of 12.5–200 mg/24 hours.

Midazolam is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient; it is given in a *subcutaneous infusion dose* of 20–100 mg/24 hours.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine, prochlorperazine, and diazepam are **contra-indicated** as they cause skin reactions at the injection site; to a lesser extent cyclizine and levomepromazine (methotrimeprazine) also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9%) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with *diamorphine*:

Cyclizine[1]	Hyoscine hydrobromide
Dexamethasone[2]	Levomepromazine
Haloperidol[3]	Metoclopramide[4]
Hyoscine butylbromide	Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs *too slowly* check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an *injection site reaction* make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

1. Cyclizine may precipitate at concentrations above 10 mg/mL *or* in the presence of sodium chloride 0.9% *or* as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
2. Special care is needed to avoid precipitation of dexamethasone when preparing it.
3. Mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
4. Under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.

Equivalent doses of morphine sulphate and diamorphine hydrochloride

These equivalences are *approximate only* and should be adjusted according to response

MORPHINE		PARENTERAL DIAMORPHINE	
Morphine sulphate oral solution or standard tablets	Morphine sulphate by subcutaneous infusion	Diamorphine hydrochloride by intramuscular injection	Diamorphine hydrochloride by subcutaneous infusion
every 4 hours	**every 24 hours**	**every 4 hours**	**every 24 hours**
5 mg	15 mg	1.25–2.5 mg	10 mg
10 mg	30 mg	2.5–5 mg	20 mg
15 mg	45 mg	5 mg	30 mg
20 mg	60 mg	7.5 mg	40 mg
30 mg	90 mg	10 mg	60 mg
40 mg	120 mg	12.5 mg	80 mg
60 mg	180 mg	20 mg	120 mg
80 mg	240 mg	27.5 mg	160 mg
100 mg	300 mg	35 mg	200 mg
130 mg	390 mg	42.5 mg	260 mg
160 mg	480 mg	55 mg	320 mg
200 mg	600 mg	65 mg	400 mg

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection *subcutaneously*—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle).
To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. *Medicines for Older People*, a component document of the National Service Framework for Older People,[1] describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance (see Taking medicines to best effect under General guidance). The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients' medicines should be reviewed regularly and medicines which are not of benefit should be stopped.

Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and lightheadedness when associated with social stress as in widowhood, loneliness, and family dispersal.

In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as lightheadedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as antihypertensives and NSAIDs.

1. Department of Health. National Service Framework for Older People. London: Department of Health, March 2001.

Pharmacokinetics

Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients.

The most important effect of age is reduced renal clearance. Many aged patients thus *excrete drugs slowly*, and are *highly susceptible to nephrotoxic drugs*. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions

Adverse reactions often present in the elderly in a vague and non-specific fashion. *Confusion* is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are *constipation* (with antimuscarinics and many tranquillisers) and postural *hypotension* and *falls* (with diuretics and many psychotropics).

Hypnotics Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems (section 4.1.1). Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics Diuretics are overprescribed in old age and should **not** be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk.

Owing to the *increased susceptibility of the elderly* to the *side-effects of NSAIDs* the following recommendations are made:

- for *osteoarthritis, soft-tissue lesions*, and *back pain*, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for *osteoarthritis, soft-tissue lesions, back pain*, and *pain in rheumatoid arthritis*, paracetamol should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol;
- do not give two NSAIDs at the same time.

For advice on prophylaxis of NSAID-induced peptic ulcers if continued NSAID treatment is necessary, see section 1.3.

Other drugs Other drugs which commonly cause adverse reactions are *antiparkinsonian drugs, antihypertensives, psychotropics*, and *digoxin*. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily.

Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. *co-trimoxazole, mianserin*) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of *warfarin* than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines

Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide and chlorpropamide) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (*including* repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like 'as directed'. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities.

If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

Prescribing in dental practice

The following is a list of topics of particular relevance to dental surgeons.

Advice on the drug management of dental and oral conditions has been integrated into the BNF. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

General guidance
- Prescribing by dental surgeons, p. 4
- Oral side-effects of drugs, p. 12
- Medical emergencies in dental practice, below
- Medical problems in dental practice, p. 23

Drug management of dental and oral conditions

Dental Practitioners' Formulary, p. 947

Changes to Dental Practitioners' Formulary, p. 948

Medical emergencies in dental practice

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dental surgeons and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. For an **algorithm** of the procedure for **cardiopulmonary resuscitation**, see inside back cover.

The drugs referred to in this section include:
Adrenaline Injection (Epinephrine Injection), adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1-mL amps
Aspirin Dispersible Tablets 300 mg
Glucagon Injection, glucagon (as hydrochloride), 1-unit vial (with solvent)
Glucose (for administration by mouth)
Glyceryl Trinitrate Spray
Midazolam Injection, midazolam (as hydrochloride) 2 mg/mL, 5-mL amps, or 5 mg/mL, 2-mL amps
Oxygen
Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation

Adrenal insufficiency

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see also p. 395 for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management

- Lay the patient flat
- Give **oxygen** (see section 3.6)
- Transfer patient urgently to hospital

Anaphylaxis

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with *additives* and *excipients* in foods and medicines (see Excipients, p. 2). Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

Symptoms and signs

- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of **adrenaline** (epinephrine) injection. This is given **intramuscularly** in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a preparation delivering a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) is available for immediate *self-administration*. The dose is repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. **Oxygen** administration is also of primary importance (see section 3.6). Arrangements should be made to transfer the patient to hospital urgently.

For further details on the management of anaphylaxis including details of paediatric doses of adrenaline, see p. 176

Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient's short-acting $beta_2$ agonist inhaler such as **salbutamol** 100 micrograms/puff; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, **oxygen** (section 3.6) should be given with salbutamol 5 mg or terbutaline 10 mg by nebuliser; if a nebuliser is unavailable, then 4–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of **adrenaline** (as detailed under Anaphylaxis above) should be given.

For a table describing the management of acute asthma, see p. 152

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient's medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

Cardiac emergencies

If there is a history of *angina* the patient will probably carry **glyceryl trinitrate** spray or tablets (or isosorbide dinitrate tablets) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient's own medication. See also Coronary Artery Disease on p. 24.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers, p. 24.

The pain of *myocardial infarction* is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease on p. 24

Symptoms and signs of myocardial infarction

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

Initial management of myocardial infarction

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. **Oxygen** may be administered (see section 3.6).

Sublingual glyceryl trinitrate may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see p. 137.

If the patient collapses and loses consciousness attempt standard resuscitation measures. For an **algorithm** of the procedure for **cardiopulmonary resuscitation**, see inside back cover.

Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give **oxygen** (section 3.6) to support respiration if necessary.

Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused ('post-ictal confusion') and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred.

Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Midazolam injection solution can be given by the buccal route [unlicensed use] in a single dose of 10 mg. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see p. 267.

Partial seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hypoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

Symptoms and signs

- Shaking and trembling
- Sweating
- 'Pins and needles' in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from 2 teaspoons sugar, 3 sugar lumps, *GlucoGel®* (formerly known as *Hypostop® Gel*; glucose 10 g/25 g tube, available from BBI Healthcare), *Dextrogel®* (glucose 10 g/25 g tube, available from M & A Pharmachem), and non-diet versions of *Lucozade® Energy Original* 55 mL, *Coca-Cola®* 100 mL, *Ribena® Blackcurrant* 18 mL (to be diluted). If necessary this may be repeated in 10–15 minutes.

If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, **glucagon** 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope

Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs

- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management

- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes

Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope, see p. 21 and p. 24.

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient's general practitioner or hospital consultant.

For advice on adrenal insufficiency, anaphylaxis, asthma, cardiac emergencies, epileptic seizures, hypoglycaemia and syncope see under Medical Emergencies in Dental Practice.

Allergy

Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis on p. 21.

Arrhythmias

Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dental surgeons should be aware that such patients may be receiving anticoagulant therapy. The patient's medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam) may be useful in some instances for very anxious patients.

See also Cardiac emergencies, p. 22 and Dental Anaesthesia, p. 714.

Cardiac prostheses

For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis, below. For advice on patients receiving anticoagulants, see Thromboembolic disease, below.

Coronary artery disease

Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient's medical practitioner before commencing treatment. See also Cardiac Emergencies on p. 22.

Treatment with low-dose aspirin (75 mg daily), clopidogrel, or dipyridamole should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease

Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension

Patients with hypertension are likely to be receiving antihypertensive drugs such as those described in section 2.5. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia on p. 714.

Immunosuppression and indwelling intraperitoneal catheters

See Table 2, section 5.1

Infective endocarditis

While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteraemia Patients at risk of endocarditis[1] should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of 'spontaneous' bacteraemia.

Postoperative care Patients at risk of endocarditis[1] should be warned to report to the doctor or dental surgeon any unexplained illness that develops after dental treatment. Any infection in patients at risk of endocarditis[1] should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease, below.

Joint prostheses

See Table 2, section 5.1

Liver disease

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with *jaundice*, *ascites*, or evidence of *encephalopathy*.

For a table of drugs to be avoided or used with caution in liver disease see Appendix 2.

Pacemakers

Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The

1. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

manufacturer's literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation (see inside back cover) may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

A Working Party of the British Society for Antimicrobial Chemotherapy does not recommend antibacterial prophylaxis for patients with pacemakers.

Pregnancy

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester.

Appendix 4 includes information on drug treatment during pregnancy.

Breast-feeding

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant.

Appendix 5 includes information on drug treatment during breast-feeding.

Renal impairment

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For a table of drugs to be avoided or used with caution in renal impairment see Appendix 3.

Thromboembolic disease

Patients receiving **heparin** or oral anticoagulants such as **warfarin**, **acenocoumarol** (nicoumalone), **phenindione**, **dabigatran etexilate**, or **rivaroxaban** may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin, the patient's medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If possible, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin, the advice of the clinician responsible for the patient's anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are *contra-indicated* in patients on anticoagulant therapy, and in those with any disorder of haemostasis.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine, imidazole and triazole antifungals (including miconazole), erythromycin, clarithromycin, and metronidazole; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparin, phenindione, rivaroxaban, and coumarins). Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin or amoxicillin.

Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant

Drugs and sport

UK Sport advises that athletes are personally responsible should a prohibited substance be detected in their body. An advice card listing examples of permitted and prohibited substances is available from:

Drug-Free Sport
UK Sport
40 Bernard Street
London WC1N 1ST
Tel: 0800 528 0004
drug-free@uksport.gov.uk
www.uksport.gov.uk

A similar card detailing classes of drugs and doping methods prohibited in football is available from the Football Association.

General Medical Council's advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** (see below) be consulted when there is doubt about the degree of risk or about management.

Hospital admission Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, *Lomotil*®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information and advice

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org. It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the **UK National Poisons Information Service** on the following number:
Tel: 0844 892 0111

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service.

Help with identifying capsules or tablets may be available from a regional medicines information centre (see inside front cover).

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. Fortunately this is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The **National Poisons Information Service** should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Respiratory stimulants do not help and should be **avoided**.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by tilting down the head of the bed and administration of either sodium chloride intravenous infusion or a colloidal infusion. Vasoconstrictor sympathomimetics (section 2.7.2) are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities. Ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothi-

azines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia is best treated by wrapping the patient (e.g. in a 'space blanket') to conserve body heat.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation; iced water should **not** be used. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions

Single short-lived convulsions do not require treatment. If convulsions are protracted or recur frequently, lorazepam 4 mg or diazepam (preferably as emulsion) 10 mg should be given by slow intravenous injection into a large vein (section 4.8.2). Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, diazepam can be administered as a rectal solution or midazolam [unlicensed use] can be given by the buccal route (section 4.8.2).

Removal and elimination

Prevention of absorption

Given by mouth, **activated charcoal** can bind many poisons in the gastro-intestinal system, thereby *reducing their absorption*. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is relatively safe and is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

For the use of charcoal in active elimination techniques, see below.

Active elimination techniques

Repeated doses of **activated charcoal** by mouth *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdosage with:

Carbamazepine
Dapsone
Phenobarbital
Quinine
Theophylline

The usual dose of activated charcoal in adults and children over 12 years of age is 50 g initially then 50 g every 4 hours. Vomiting should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased (e.g. 25 g every 2 hours *or* 12.5 g every hour) but this may compromise efficacy.

In children under 12 years of age, activated charcoal is given in a dose of 1 g/kg (max. 50 g) every 4 hours; the dose may be reduced and the frequency increased if not tolerated.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for salicylates, phenobarbital, methyl alcohol (methanol), ethylene glycol, and lithium;
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of *emesis* (e.g. with ipecacuanha) is **not** recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

CHARCOAL, ACTIVATED

Indications reduction of absorption of poisons in the gastro-intestinal system; see also active elimination techniques, above

Cautions drowsy or comatose patient (risk of aspiration); reduced gastro-intestinal motility (risk of obstruction); **not** for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, and metal salts including iron and lithium salts

Side-effects black stools

Dose

- Reduction of absorption, ADULT and CHILD over 12 years, 50 g; CHILD under 12 years, 1 g/kg (max. 50 g)
- Active elimination, see notes above

Note Activated charcoal doses in BNF may differ from those in product literature. Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste

Actidose-Aqua® Advance (Cambridge)
Oral suspension, activated charcoal 1.04 g/5 mL, net price 50-g pack (240 mL) = £8.69

Carbomix® (Beacon)
Powder, activated charcoal, net price 25-g pack = £8.50, 50-g pack = £11.90

Charcodote® (TEVA UK)
Oral suspension, activated charcoal 1 g/5 mL, net price 50-g pack = £11.88

Specific drugs

Alcohol

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Analgesics (non-opioid)

Aspirin The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is low below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

NSAIDs Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent require treatment, see p. 28.

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Activated charcoal followed by symptomatic measures are indicated if more than 400 mg/kg has been ingested within the preceding hour.

Paracetamol Single or repeated doses totalling as little as 10–15 g (20–30 tablets) or 150 mg/kg of paracetamol taken within 24 hours may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Patients at *high-risk* of liver damage, including those taking enzyme-inducing drugs or who are malnourished (see below), may develop liver toxicity with as little as 75 mg/kg of paracetamol (equivalent to approx. 5 g (10 tablets) in a 70-kg patient) taken within 24 hours. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after ingestion and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death.

Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

Administration of activated charcoal should be considered if paracetamol in excess of 150 mg/kg or 12 g, **whichever is the smaller** (or in excess of 75 mg/kg for those considered to be at *high risk*, see below), is thought to have been ingested within the previous hour.

Acetylcysteine protects the liver if infused within 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines sharply; if more than 24 hours have elapsed advice should be sought either from the National Poisons Information Service or from a liver unit on the management of serious liver damage. Giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information service for advice. In remote areas, **methionine** by mouth is an alternative only if acetylcysteine cannot be given promptly. Once the patient reaches hospital the need to continue treatment with the antidote will be assessed from the plasma-paracetamol concentration (related to the time from ingestion).

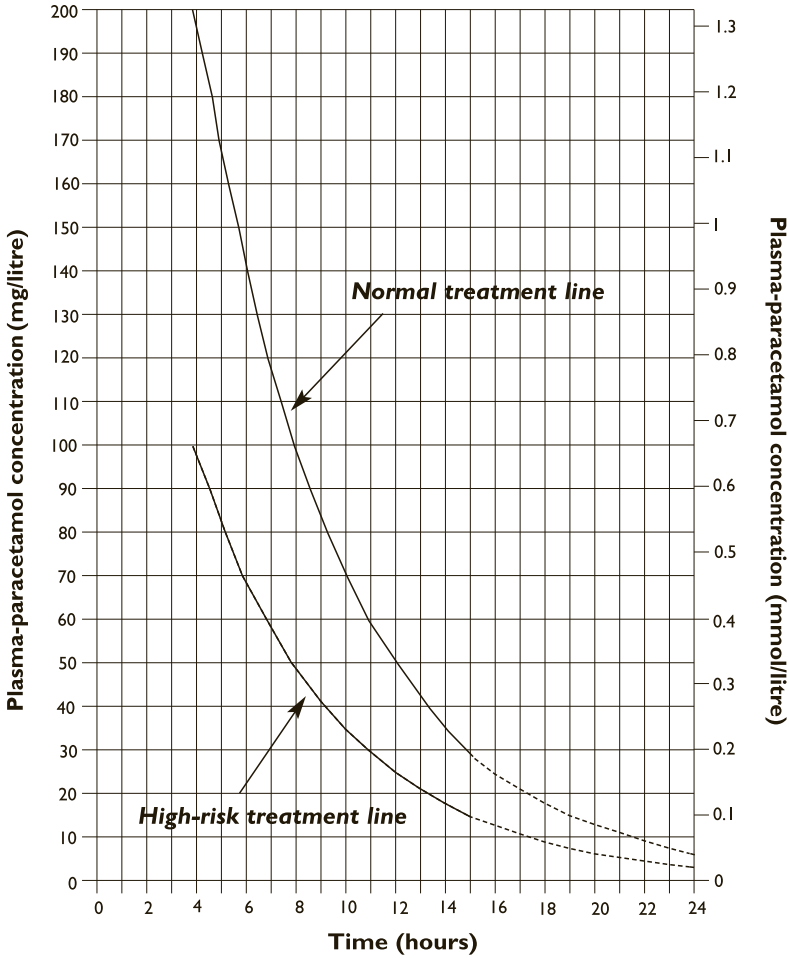
Patients at risk of liver damage and therefore requiring treatment can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line ('normal treatment line') joining plots of 200 mg/litre (1.32 mmol/litre) at 4 hours and 6.25 mg/litre (0.04 mmol/litre) at 24 hours (see p. 30). Those whose plasma-paracetamol concentration is above the *normal treatment line* are treated with acetylcysteine by intravenous infusion (or, if acetylcysteine is not available, with methionine by mouth, provided the overdose has been taken **within 10–12 hours** *and* the patient is not vomiting).

Patients at *high-risk* of liver damage include those:

- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, alcohol, and St John's wort);
- who are malnourished (e.g. in anorexia, cystic fibrosis, in alcoholism, or those who are HIV-positive);
- who have not eaten for a few days.

These patients can develop toxicity at **lower** plasma-paracetamol concentration and should be treated if the concentration is above the *high-risk treatment line* (which joins plots that are at 50% of the plasma-paracetamol concentrations of the normal treatment line).

The prognostic accuracy of plasma-paracetamol concentration taken after 15 hours is uncertain, but a



Patients whose plasma-paracetamol concentrations are above the **normal treatment line** should be treated with acetylcysteine by intravenous infusion (or, if acetylcysteine cannot be used, with methionine by mouth, provided the overdose has been taken **within 10–12 hours** and the patient is not vomiting).

Patients at *high-risk* of liver damage include those:

- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, alcohol, St John's wort);
- who are malnourished (e.g. in anorexia, cystic fibrosis, in alcoholism, or those who are HIV-positive);
- who have not eaten for a few days.

These patients should be treated if their plasma-paracetamol concentration is above the **high-risk treatment line.**

The prognostic accuracy after 15 hours is uncertain but a plasma-paracetamol concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of University of Wales College of Medicine Therapeutics and Toxicology Centre

concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

The plasma-paracetamol concentration may be difficult to interpret when paracetamol has been ingested over several hours. If there is doubt about timing or the need for treatment then the patient should be treated with an antidote.

ACETYLCYSTEINE

Indications paracetamol overdosage, see notes above

Cautions asthma (see side-effects below but do not delay acetylcysteine treatment)

Side-effects hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled—contact the National Poisons Information Service if reaction severe (rash also managed by

giving antihistamine; acute asthma managed by giving nebulised short-acting beta$_2$ agonist)

Dose

- By intravenous infusion, ADULT and CHILD, initially 150 mg/kg (max. 16.5 g) over 15 minutes, then 50 mg/kg (max. 5.5 g) over 4 hours then 100 mg/kg (max. 11 g) over 16 hours

  Administration Dilute requisite dose in glucose intravenous infusion 5% as follows: ADULT and CHILD over 12 years, initially 200 mL given over 15 minutes, then 500 mL over 4 hours, then 1 litre over 16 hours; CHILD under 12 years, body-weight over 20 kg, initially 100 mL given over 15 minutes, then 250 mL over 4 hours, then 500 mL over 16 hours; CHILD body-weight under 20 kg, initially 3 mL/kg given over 15 minutes, then 7 mL/kg over 4 hours, then 14 mL/kg over 16 hours

  Note Manufacturer also recommends other infusion fluids, but glucose 5% is preferable

Acetylcysteine (Non-proprietary) PoM

Injection, acetylcysteine 200 mg/mL, net price 10-mL amp = £2.50

Parvolex® (UCB Pharma) PoM

Injection, acetylcysteine 200 mg/mL, net price 10-mL amp = £2.25

METHIONINE

Indications paracetamol overdosage, see notes above

Cautions hepatic impairment (Appendix 2)

Side-effects nausea, vomiting, drowsiness, irritability

Dose

- ADULT and CHILD over 6 years initially 2.5 g, followed by 3 further doses of 2.5 g every 4 hours, CHILD under 6 years initially 1 g, followed by 3 further doses of 1 g every 4 hours

Methionine (Pharma Nord)

Tablets, f/c, methionine 500 mg, net price 20-tab pack = £9.95

Methionine (UCB Pharma)

Tablets, DL-methionine 250 mg, net price 200-tab pack = £87.76

With paracetamol (co-methiamol)

Section 4.7.1

Analgesics (opioid)

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote **naloxone** is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene; the long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with **sodium bicarbonate**, or **magnesium sulphate**, or both; arrhythmias may occur for up to 12 hours.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

NALOXONE HYDROCHLORIDE

Indications overdosage with opioids; reversal of opioid-induced respiratory depression and reversal of neonatal respiratory depression resulting from opioid administration to mother during labour (section 15.1.7)

Cautions physical dependence on opioids; cardiac irritability; naloxone is short-acting, see notes above

Dose

- By intravenous injection, 0.4–2 mg; if no response repeat at intervals of 2–3 minutes to a max. of 10 mg (then review diagnosis); further doses may be required if respiratory function deteriorates; CHILD 10 micrograms/kg; if no response give subsequent dose of 100 micrograms/kg (then review diagnosis); further doses may be required if respiratory function deteriorates
- By subcutaneous *or* intramuscular injection, ADULT and CHILD dose as for intravenous injection but use only if intravenous route not feasible (onset of action slower)
- By continuous intravenous infusion using an infusion pump, 4 mg diluted in 20 mL intravenous infusion solution [unlicensed concentration] at a rate adjusted according to response (initial rate may be set at 60% of initial intravenous injection dose (see above) and infused over 1 hour)

  Important Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use; see also section 15.1.7 for management of postoperative respiratory depression

[1] **Naloxone** (Non-proprietary) PoM

Injection, naloxone hydrochloride 400 micrograms/mL, net price 1-mL amp = £4.50; 1 mg/mL, 2-mL prefilled syringe = £8.36

[1] **Minijet® Naloxone** (UCB Pharma) PoM

Injection, naloxone hydrochloride 400 micrograms/mL, net price 1-mL disposable syringe = £19.90, 2-mL disposable syringe = £12.96, 5-mL disposable syringe = £12.68

Antidepressants

Tricyclic and related antidepressants Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by *tricyclic and related antidepressants* but

1. PoM restriction does not apply where administration is for saving life in emergency

symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs) Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or buccal midazolam [unlicensed use] (see p. 28). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarials

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Beta-blockers

Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions.

Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine is required to treat bradycardia and hypotension (3 mg for an adult, 40 micrograms/kg (max. 3 mg) for a child). Cardiogenic shock unresponsive to atropine is probably best treated with an intravenous injection of glucagon 2–10 mg (CHILD 50–150 micrograms/kg, max. 10 mg) [unlicensed indication and dose] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion of 50 micrograms/kg/hour. If glucagon is not available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies, see p. 969) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Activated charcoal should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride or calcium gluconate (section 9.5.1.1) is given by injection; atropine is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Hypnotics and anxiolytics

Benzodiazepines Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, and occasionally minor and short-lived depression of consciousness. Activated charcoal can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil should be used on **expert advice** only.

Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with **desferrioxamine**, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine given to chelate absorbed iron in excess of the expected iron binding capacity. In **severe toxicity** intravenous desferrioxamine should be given *immediately* without waiting for the result of the serum-iron measurement.

DESFERRIOXAMINE MESILATE
(Deferoxamine Mesilate)

Indications iron poisoning; chronic iron overload (section 9.1.3)

Cautions section 9.1.3

Side-effects section 9.1.3

Dose

- By continuous intravenous infusion, ADULT and CHILD up to 15 mg/kg/hour, reduced after 4–6 hours; max. 80 mg/kg in 24 hours (in severe cases, higher doses on advice from the National Poisons Information Service)

Preparations

Section 9.1.3

Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug due to a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic lithium concentrations are within the range of 0.4–1.0 mmol/litre; concentrations in excess of 2.0 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. The stomach should be emptied by gastric lavage if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service, p. 27.

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine (section 4.9.2) or diazepam (section 4.8.2, emulsion preferred).

Atypical antipsychotic drugs

Features of poisoning by atypical antipsychotic drugs (section 4.2.1) include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Activated charcoal can be given within 1 hour of ingesting a significant quantity of an atypical antipsychotic drug.

Stimulants

Amphetamines These cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service (p. 27) on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature, p. 27); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy Ecstasy (methylenedioxymethamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxymethamfetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraven-

tricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques, p. 28). Ondansetron (section 4.6) may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (emulsion preferred). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does **not** suffer from asthma, a short-acting beta-blocker (section 2.4) can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE, see p. 27.

Cyanides

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning. Dicobalt edetate itself is toxic, associated with anaphylactic reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite followed by sodium thiosulphate is an alternative if dicobalt edetate is not available.

Hydroxocobalamin can be considered for victims of smoke inhalation who show signs of significant cyanide poisoning. The usual dose is 5 g (70 mg/kg in children) by intravenous infusion (given once or twice according to severity). *Cyanokit®* provides hydroxocobalamin 2.5 g/bottle (no other preparation of hydroxocobalamin is suitable)—contact the National Poisons Information Service for advice.

DICOBALT EDETATE

Indications severe poisoning with cyanides

Cautions owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness; **not** to be used as a precautionary measure

Side-effects hypotension, tachycardia, and vomiting; anaphylactic reactions including facial and laryngeal oedema and cardiac abnormalities

Dose

- By intravenous injection, ADULT 300 mg over 1 minute (5 minutes if condition less serious) followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity; CHILD consult the National Poisons Information Service

[1] **Dicobalt Edetate** (Cambridge) PoM

Injection, dicobalt edetate 15 mg/mL, net price 20-mL (300-mg) amp = £13.75

SODIUM NITRITE

Indications poisoning with cyanides (used in conjunction with sodium thiosulphate)

Side-effects flushing and headache due to vasodilatation

Dose

- By intravenous injection over 5–20 minutes (as sodium nitrite injection 30 mg/mL), 300 mg; CHILD 4–10 mg/kg (max. 300 mg)

[1] **Sodium Nitrite** PoM

Injection, sodium nitrite 3% (30 mg/mL) in water for injections

Available from 'special-order' manufacturers or specialist importing companies, see p. 969

SODIUM THIOSULPHATE

Indications in conjunction with sodium nitrite for cyanide poisoning

Dose

- By intravenous injection over 10 minutes (as sodium thiosulphate injection 500 mg/mL), 12.5 g; dose may be repeated in severe cyanide poisoning if dicobalt edetate not available; CHILD 400 mg/kg (max. 12.5 g); dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

[1] **Sodium Thiosulphate** PoM

Injection, sodium thiosulphate 50% (500 mg/mL) in water for injections

Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Ethylene glycol and methanol

Fomepizole (available from 'special-order' manufacturers or specialist importing companies, see p. 969) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, **ethanol** (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals

Heavy metal antidotes include dimercaprol and sodium calcium edetate. Other antidotes include succimer (DMSA) and unithiol (DMPS) [both unlicensed]; they may be useful in certain cases of heavy metal poisoning but the advice of the National Poisons Information Service should be sought.

DIMERCAPROL
(BAL)

Indications poisoning by antimony, arsenic, bismuth, gold, mercury

Cautions hypertension, renal impairment (discontinue or use with extreme caution if impairment develops during treatment), elderly, pregnancy and breast-feeding; **interactions:** Appendix 1 (dimercaprol)

Contra-indications not indicated for iron, cadmium, or selenium poisoning; severe hepatic impairment (unless due to arsenic poisoning)

1. PoM restriction does not apply where administration is for saving life in emergency

Side-effects hypertension, tachycardia, malaise, nausea, vomiting, salivation, lacrimation, sweating, burning sensation (mouth, throat, and eyes), feeling of constriction of throat and chest, headache, muscle spasm, abdominal pain, tingling of extremities; pyrexia in children; local pain and abscess at injection site

Dose

- By intramuscular injection, ADULT and CHILD 2.5–3 mg/kg every 4 hours for 2 days, 2–4 times on the third day, then 1–2 times daily for 10 days or until recovery

Dimercaprol (Sovereign) PoM
Injection, dimercaprol 50 mg/mL. Net price 2-mL amp = £42.73
Note Contains arachis (peanut) oil as solvent

SODIUM CALCIUM EDETATE
(Sodium Calciumedetate)

Indications lead poisoning

Cautions renal impairment

Side-effects nausea, diarrhoea, abdominal pain, pain at site of injection, thrombophlebitis if given too rapidly, renal damage particularly in overdosage; hypotension, lacrimation, myalgia, nasal congestion, sneezing, malaise, thirst, fever, chills, headache, and zinc depletion also reported

Dose

- By intravenous infusion, ADULT and CHILD 40 mg/kg twice daily for up to 5 days; if necessary, a second course can be given at least 7 days after the first course, a third course can be given at least 7 days after the second course

Ledclair® (Durbin) PoM
Injection, sodium calcium edetate 200 mg/mL, net price 5-mL amp = £7.29

Noxious gases

Carbon monoxide Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow **oxygen** 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol (section 2.2.5). Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the victim is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%, or is pregnant.

Sulphur dioxide, chlorine, phosgene, ammonia All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning (see below), but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing **pralidoxime** can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Pesticides

Organophosphorus insecticides Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. **Atropine** will reverse the muscarinic effects of acetylcholine and is given by intravenous injection in a dose of 2 mg (20 micrograms/kg (max. 2 mg) in a child) as atropine sulphate every 5 to 10 minutes (according to the severity of poisoning) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service (see p. 27).

PRALIDOXIME CHLORIDE

Indications adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

Cautions renal impairment, myasthenia gravis

Contra-indications poisoning with carbamates or with organophosphorus compounds without anticholinesterase activity

Side-effects drowsiness, dizziness, disturbances of vision, nausea, tachycardia, headache, hyperventilation, and muscular weakness

Dose

- By intravenous infusion, ADULT and CHILD initially 30 mg/kg over 20 minutes, followed by 8 mg/kg/hour; usual max. 12 g in 24 hours

Note The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion; pralidoxime chloride doses in BNF may differ from those in product literature

[1] **Pralidoxime chloride** PoM

Injection, powder for reconstitution, pralidoxime chloride 1 g/vial

Available as *Protopam®* (from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres)

1. PoM restriction does not apply where administration is for saving life in emergency

Snake bites and animal stings

Snake bites Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with **adrenaline (epinephrine)** (section 3.4.3). Indications for antivenom treatment include systemic envenoming, especially hypotension (see above), ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For both **adults** and **children**, the contents of one vial (10 mL) of **European viper venom antiserum** (available from Movianto) is given *by intravenous injection* over 10–15 minutes or *by intravenous infusion* over 30 minutes after diluting in sodium chloride intravenous infusion 0.9% (use 5 mL diluent/kg bodyweight). The dose can be repeated in 1–2 hours if symptoms of **systemic envenoming** persist. For patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), an initial dose of 2 vials (20 mL) of the antiserum is recommended. Adrenaline (epinephrine) injection must be immediately to hand for treatment of anaphylactic reactions to the antivenom (for the management of anaphylaxis, see section 3.4.3).

Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service (Tel: 0844 892 0111)

Insect stings Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular **adrenaline (epinephrine)**; self-administered intramuscular adrenaline (e.g. *EpiPen®*) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions. For the management of anaphylaxis, see section 3.4.3. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings (section 3.4.2).

Marine stings The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45° C). People stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs will reduce pain and a slurry of baking soda (sodium bicarbonate), but not vinegar, may be useful for treating stings from UK species.

1 Gastro-intestinal system

1.1 Dyspepsia and gastro-oesophageal reflux disease 37
1.1.1 Antacids and simeticone 38
1.1.2 Compound alginates and proprietary indigestion preparations 40
1.2 Antispasmodics and other drugs altering gut motility 41
1.3 Antisecretory drugs and mucosal protectants 43
1.3.1 H_2-receptor antagonists 45
1.3.2 Selective antimuscarinics 47
1.3.3 Chelates and complexes 47
1.3.4 Prostaglandin analogues 47
1.3.5 Proton pump inhibitors 48
1.4 Acute diarrhoea 50
1.4.1 Adsorbents and bulk-forming drugs 51
1.4.2 Antimotility drugs 51
1.5 Chronic bowel disorders 52
1.5.1 Aminosalicylates 54
1.5.2 Corticosteroids 56
1.5.3 Drugs affecting the immune response 57
1.5.4 Food allergy 58
1.6 Laxatives 59
1.6.1 Bulk-forming laxatives 59
1.6.2 Stimulant laxatives 60
1.6.3 Faecal softeners 62
1.6.4 Osmotic laxatives 63
1.6.5 Bowel cleansing preparations 65
1.6.6 Peripheral opioid-receptor antagonists 66
1.7 Local preparations for anal and rectal disorders 67
1.7.1 Soothing haemorrhoidal preparations 67
1.7.2 Compound haemorrhoidal preparations with corticosteroids 67
1.7.3 Rectal sclerosants 68
1.7.4 Management of anal fissures 68
1.8 Stoma care 68
1.9 Drugs affecting intestinal secretions 69
1.9.1 Drugs affecting biliary composition and flow 69
1.9.2 Bile acid sequestrants 70
1.9.3 Aprotinin 70
1.9.4 Pancreatin 70

This chapter also includes advice on the drug management of the following:

Clostridium difficile infection, p. 53
constipation, p. 59
Crohn's disease, p. 52
diverticular disease, p. 53
food allergy, p. 58
Helicobacter pylori infection, p. 43
irritable bowel syndrome, p. 53
NAID-associated ulcers, p. 44
ulcerative colitis, p. 52

1.1 Dyspepsia and gastro-oesophageal reflux disease

1.1.1 Antacids and simeticone
1.1.2 Compound alginates and proprietary indigestion preparations

Dyspepsia

Dyspepsia covers pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration (section 1.3) and gastric cancer but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by 'alarm features' (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (see Gastro-oesophageal reflux disease, below). Some medications may cause dyspepsia—these should be stopped, if possible. Antacids may provide some symptomatic relief.

If symptoms persist in *uninvestigated dyspepsia*, treatment involves a **proton pump inhibitor** (section 1.3.5) for 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long-term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for *Helicobacter pylori* and given eradication therapy (section 1.3) if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the 'test and treat' strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.

If *H. pylori* is present in patients with *functional (investigated, non-ulcer) dyspepsia*, eradication therapy should be provided. If symptoms persist, treatment with either a **proton pump inhibitor** (section 1.3.5) or a **histamine H_2-receptor antagonist** (section 1.3.1) can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For *mild symptoms* of gastro-oesophageal reflux disease, initial management may include the use of **antacids** and **alginates**. Alginate-containing antacids can form a 'raft' that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. **Histamine H_2-receptor antagonists** (section 1.3.1) may relieve symptoms and permit reduction in antacid consumption. However, **proton pump inhibitors** (section 1.3.5) provide more effective relief of symptoms than H_2-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For *severe symptoms* of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. *oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett's oesophagus*), initial management involves the use of a **proton pump inhibitor** (section 1.3.5); patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H_2-receptor antagonist). However, for endoscopically confirmed *erosive, ulcerative*, or *stricturing* disease, or *Barrett's oesophagus*, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

A prokinetic drug such as **metoclopramide** (section 4.6) may improve gastro-oesophageal sphincter function and accelerate gastric emptying.

Children Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian—see Appendix 7 for suitable products). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults (see above) may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H_2-receptor antagonist (section 1.3.1) may be needed to reduce acid secretion. If the oesophagitis is resistant to H_2-receptor blockade, the proton pump inhibitor omeprazole (section 1.3.5) can be tried.

1.1.1 Antacids and simeticone

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in *non-erosive gastro-oesophageal reflux* (see also section 1.1); they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, 4 or more times daily; additional doses may be required up to once an hour. Conventional doses e.g. 10 mL 3 or 4 times daily of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs (section 1.3); proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and **magnesium-containing** antacids (e.g. aluminium hydroxide, and magnesium carbonate, hydroxide and trisilicate), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal (see also Appendix 3).

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as **hydrotalcite** confer no special advantage.

Sodium bicarbonate should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders (section 7.4.3) and acidosis (section 9.2.1.3 and section 9.2.2). Sodium bicarbonate should be avoided in patients on salt-restricted diets.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating. **Calcium-containing** antacids (section 1.1.2) can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

Simeticone (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care. **Alginates**, added as protectants, may be useful in gastro-oesophageal reflux disease (section 1.1 and section 1.1.2). The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

See also section 1.3 for drugs used in the treatment of peptic ulceration.

Interactions Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings designed to prevent dissolution in the stomach. See also **Appendix 1** (antacids, calcium salts).

Low Na^+
The words 'low Na^+' added after some preparations indicate a sodium content of less than 1 mmol per tablet or 10-mL dose.

Aluminium- and magnesium-containing antacids

ALUMINIUM HYDROXIDE

Indications dyspepsia; hyperphosphataemia (section 9.5.2.2)
Cautions see notes above; renal impairment (Appendix 3); **interactions:** Appendix 1 (antacids)
Contra-indications hypophosphataemia; neonates and infants
Side-effects see notes above

Aluminium-only preparations

Aluminium Hydroxide (Non-proprietary)
Tablets, dried aluminium hydroxide 500 mg. Net price 20 = 28p
Dose 1–2 tablets chewed 4 times daily and at bedtime or as required

Alu-Cap® (3M)
Capsules, green/red, dried aluminium hydroxide 475 mg (low Na^+). Net price 120-cap pack = £3.75
Dose antacid, 1 capsule 4 times daily and at bedtime; CHILD not recommended for antacid therapy

Co-magaldrox

Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form *x*/*y* where *x* and *y* are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively

Maalox® (Sanofi-Aventis)
Suspension, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na^+)). Net price 500 mL = £2.79
Dose ADULT and CHILD over 14 years, 10–20 mL 20–60 minutes after meals and at bedtime or when required

Mucogel® (Chemidex)
Suspension, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na^+)). Net price 500 mL = £1.71
Dose ADULT and CHILD over 12 years, 10–20 mL 3 times daily, 20–60 minutes after meals, and at bedtime or when required

MAGNESIUM CARBONATE

Indications dyspepsia
Cautions renal impairment (Appendix 3); see also notes above; **interactions:** Appendix 1 (antacids)
Contra-indications hypophosphataemia
Side-effects diarrhoea; belching due to liberated carbon dioxide

Aromatic Magnesium Carbonate Mixture, BP (Aromatic Magnesium Carbonate Oral Suspension)
Oral suspension, light magnesium carbonate 3%, sodium bicarbonate 5%, in a suitable vehicle containing aromatic cardamom tincture. Contains about 6 mmol Na^+/10 mL. Net price 200 mL = 66p
Dose 10 mL 3 times daily in water

For **preparations** also containing aluminium, see above and section 1.1.2.

MAGNESIUM TRISILICATE

Indications dyspepsia
Cautions see under Magnesium Carbonate
Contra-indications see under Magnesium Carbonate
Side-effects diarrhoea, belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

Magnesium Trisilicate Tablets, Compound, BP
Tablets, magnesium trisilicate 250 mg, dried aluminium hydroxide 120 mg
Dose 1–2 tablets chewed when required

Magnesium Trisilicate Mixture, BP (Magnesium Trisilicate Oral Suspension)
Oral suspension, 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour. Contains about 6 mmol Na^+/10 mL
Dose 10–20 mL in water 3 times daily or as required; CHILD 5–12 years, 5–10 mL in water 3 times daily or as required

For **preparations** also containing aluminium, see above and section 1.1.2.

Aluminium-magnesium complexes

HYDROTALCITE

Aluminium magnesium carbonate hydroxide hydrate

Indications dyspepsia
Cautions see notes above; **interactions:** Appendix 1 (antacids)
Side-effects see notes above

Hydrotalcite (Peckforton)
Suspension, hydrotalcite 500 mg/5 mL (low Na^+). Net price 500-mL pack = £1.96
Dose 10 mL between meals and at bedtime; CHILD 6–12 years 5 mL between meals and at bedtime
Note The brand name *Altacite®* is used for hydrotalcite suspension; for *Altacite Plus®* suspension, see below

Antacid preparations containing simeticone

Altacite Plus® (Peckforton)

Suspension, sugar-free, co-simalcite 125/500 (simeticone 125 mg, hydrotalcite 500 mg)/5 mL (low Na^+). Net price 500 mL = £1.96

Dose 10 mL between meals and at bedtime when required; CHILD 8–12 years 5 mL between meals and at bedtime when required

Asilone® (Thornton & Ross)

Suspension, sugar-free, dried aluminium hydroxide 420 mg, simeticone 135 mg, light magnesium oxide 70 mg/5 mL (low Na^+). Net price 500 mL = £1.95

Dose ADULT and CHILD over 12 years, 5–10 mL after meals and at bedtime or when required up to 4 times daily

Maalox Plus® (Sanofi-Aventis)

Suspension, sugar-free, dried aluminium hydroxide 220 mg, simeticone 25 mg, magnesium hydroxide 195 mg/5 mL (low Na^+). Net price 500 mL = £2.79

Dose 5–10 mL 4 times daily (after meals and at bedtime) or when required; CHILD under 5 years 5 mL 3 times daily, over 5 years appropriate proportion of adult dose

Simeticone alone

Simeticone (activated dimeticone) is an antifoaming agent. It is licensed for infantile colic but evidence of benefit is uncertain.

Dentinox® (DDD)

Colic drops (= emulsion), simeticone 21 mg/2.5-mL dose. Net price 100 mL = £1.73

Dose colic or wind pains, NEONATE and INFANT 2.5 mL with or after each feed (max. 6 doses in 24 hours); may be added to bottle feed

Note The brand name *Dentinox®* is also used for other preparations including teething gel

Infacol® (Forest)

Liquid, sugar-free, simeticone 40 mg/mL (low Na^+). Net price 50 mL = £2.26. Counselling, use of dropper

Dose colic or wind pains, NEONATE and INFANT 0.5–1 mL before feeds

1.1.2 Compound alginates and proprietary indigestion preparations

Alginate taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel ('raft') that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

Antacids may damage enteric coatings designed to prevent dissolution in the stomach. For **interactions**, see Appendix 1 (antacids, calcium salts).

Alginate raft-forming oral suspensions

The following preparations contain sodium alginate, sodium bicarbonate, and calcium carbonate in a suitable flavoured vehicle, and conform to the specification for Alginate Raft-forming Oral Suspension, BP.

Acidex® (Pinewood)

Liquid, sugar-free, sodium alginate 250 mg, sodium bicarbonate 133.5 mg, calcium carbonate 80 mg/5 mL. Contains about 3 mmol Na^+/5 mL. Net price 500 mL (aniseed- or peppermint-flavour) = £2.30

Dose 10–20 mL after meals and at bedtime; CHILD 6–12 years 5–10 mL after meals and at bedtime

Peptac® (IVAX)

Suspension, sugar-free, sodium bicarbonate 133.5 mg, sodium alginate 250 mg, calcium carbonate 80 mg/5 mL. Contains 3.1 mmol Na^+/5 mL. Net price 500 mL (aniseed- or peppermint-flavoured) = £2.16

Dose 10–20 mL after meals and at bedtime; CHILD 6–12 years 5–10 mL after meals and at bedtime

Other compound alginate preparations

Gastrocote® (Actavis)

Tablets, alginic acid 200 mg, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium bicarbonate 70 mg. Contains about 1 mmol Na^+/tablet. Net price 100-tab pack = £3.51

Cautions diabetes mellitus (high sugar content)

Dose ADULT and CHILD over 6 years, 1–2 tablets chewed 4 times daily (after meals and at bedtime)

Liquid, sugar-free, peach-coloured, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium alginate 220 mg, sodium bicarbonate 70 mg/5 mL. Contains 2.13 mmol Na^+/5 mL. Net price 500 mL = £2.67

Dose ADULT and CHILD over 6 years, 5–15 mL 4 times daily (after meals and at bedtime)

Gaviscon® Advance (R&C)

Tablets, sugar-free, sodium alginate 500 mg, potassium bicarbonate 100 mg. Contains 2.25 mmol Na^+, 1 mmol K^+/tablet. Net price 60-tab pack (peppermint-flavoured) = £3.13

Excipients include aspartame (section 9.4.1)

Dose ADULT and CHILD over 12 years, 1–2 tablets to be chewed after meals and at bedtime; CHILD 6–12 years, 1 tablet to be chewed after meals and at bedtime (under medical advice only)

Suspension, sugar-free, aniseed- or peppermint flavour, sodium alginate 500 mg, potassium bicarbonate 100 mg/5 mL. Contains 2.3 mmol Na^+, 1 mmol K^+/5 mL, net price 250 mL = £2.61, 500 mL = £5.21

Dose ADULT and CHILD over 12 years, 5–10 mL after meals and at bedtime; CHILD 2–12 years, 2.5–5 mL after meals and at bedtime (under medical advice only)

Gaviscon Infant® (R&C)

Oral powder, sugar-free, sodium alginate 225 mg, magnesium alginate 87.5 mg, with colloidal silica and mannitol/dose (half dual-sachet). Contains 0.92 mmol Na^+/dose. Net price 15 dual-sachets (30 doses) = £2.46

Dose INFANT body-weight under 4.5 kg, 1 'dose' (half dual-sachet) mixed with feeds (or water in breast-fed infants) when required (max. 6 times in 24 hours); body-weight over 4.5 kg, 2 'doses' (1 dual-sachet) mixed with feeds (or water in breast-fed infants) when required (max. 6 times in 24 hours); CHILD 2 'doses' (1 dual-sachet) in water after each meal (max. 6 times in 24 hours)

Note Not to be used in preterm neonates, or where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature), or if intestinal obstruction. Not to be used with other preparations containing thickening agents

Important Each half of the dual-sachet is identified as 'one dose'. To avoid errors prescribe as 'dual-sachet' with directions in terms of 'dose'

Rennie® Duo (Roche Consumer Health)

Suspension, sugar-free, calcium carbonate 600 mg, magnesium carbonate 70 mg, sodium alginate

150 mg/5 mL. Contains 2.6 mmol Na^+/5 mL. Net price 500 mL (mint flavour) = £2.67

Dose ADULT and CHILD over 12 years, 10 mL after meals and at bedtime; an additional 10 mL may be taken between doses for heartburn if necessary, max. 80 mL daily

Excipients include propylene glycol

Topal® (Fabre)

Tablets, alginic acid 200 mg, dried aluminium hydroxide 30 mg, light magnesium carbonate 40 mg with lactose 220 mg, sucrose 880 mg, sodium bicarbonate 40 mg (low Na^+). Net price 42-tab pack = £1.67

Cautions diabetes mellitus (high sugar content)

Dose ADULT and CHILD over 12 years, 1–3 tablets chewed 4 times daily (after meals and at bedtime)

1.2 Antispasmodics and other drugs altering gut motility

Drugs in this section include antimuscarinic compounds and drugs believed to be direct relaxants of intestinal smooth muscle. The smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome* and in *diverticular disease*.

The dopamine-receptor antagonists metoclopramide and domperidone (section 4.6) stimulate transit in the gut.

Antimuscarinics

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They are used for the management of *irritable bowel syndrome* and *diverticular disease*. However, their value has not been established and response varies. Other indications for antimuscarinic drugs include arrhythmias (section 2.3.1), asthma and airways disease (section 3.1.2), motion sickness (section 4.6), parkinsonism (section 4.9.2), urinary incontinence (section 7.4.2), mydriasis and cycloplegia (section 11.5), premedication (section 15.1.3) and as an antidote to organophosphorus poisoning (p. 36).

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines **atropine sulphate** and **dicycloverine hydrochloride** (dicyclomine hydrochloride) and the quaternary ammonium compounds **propantheline bromide** and **hyoscine butylbromide**. The quaternary ammonium compounds are less lipid soluble than atropine and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Cautions Antimuscarinics should be used with caution in Down's syndrome, in children and in the elderly; they should also be used with caution in gastro-oesophageal reflux disease, diarrhoea, ulcerative colitis, acute myocardial infarction, hypertension, conditions characterised by tachycardia (including hyperthyroidism, cardiac insufficiency, cardiac surgery), pyrexia, pregnancy (Appendix 4), and in individuals susceptible to angle-closure glaucoma. **Interactions:** Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinics are contra-indicated in myasthenia gravis (but may be used to decrease muscarinic side-effects of anticholinesterases—section 10.2.1), paralytic ileus, pyloric stenosis and prostatic enlargement.

Side-effects Side-effects of antimuscarinics include constipation, transient bradycardia (followed by tachycardia, palpitation and arrhythmias), reduced bronchial secretions, urinary urgency and retention, dilatation of the pupils with loss of accommodation, photophobia, dry mouth, flushing and dryness of the skin. Side-effects that occur occasionally include confusion (particularly in the elderly), nausea, vomiting, and giddiness; very rarely, angle-closure glaucoma may occur.

ATROPINE SULPHATE

Indications symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm; mydriasis and cycloplegia (section 11.5); premedication (section 15.1.3); see also notes above

Cautions see notes above; also breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- 0.6–1.2 mg at night

Atropine (Non-proprietary) PoM

Tablets, atropine sulphate 600 micrograms. Net price 28-tab pack = £13.43

Available from CP

DICYCLOVERINE HYDROCHLORIDE

(Dicyclomine hydrochloride)

Indications symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

Cautions see notes above

Contra-indications see notes above; also infants under 6 months; breast-feeding (Appendix 5)

Side-effects see notes above

Dose

- 10–20 mg 3 times daily; INFANT 6–24 months 5–10 mg 3–4 times daily, 15 minutes before feeds; CHILD 2–12 years 10 mg 3 times daily

Merbentyl® (Sanofi-Aventis) PoM

Tablets, dicycloverine hydrochloride 10 mg, net price 100-tab pack = £4.84; 20 mg (*Merbentyl 20®*), 84-tab pack = £8.14

Syrup, dicycloverine hydrochloride 10 mg/5 mL, net price 120 mL = £1.77

Note Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg

Compound preparations

Kolanticon® (Peckforton)

Gel, sugar-free, dicycloverine hydrochloride 2.5 mg, dried aluminium hydroxide 200 mg, light magnesium oxide 100 mg, simeticone 20 mg/5 mL, net price 200 mL = £2.21, 500 mL = £2.79

Dose ADULT and CHILD over 12 years, 10–20 mL every 4 hours when required

HYOSCINE BUTYLBROMIDE

Indications symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm; bowel colic and excessive respiratory secretions (see Prescribing in Palliative Care, p. 18)

Cautions see notes above; also breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- By mouth (but poorly absorbed, see notes above), smooth muscle spasm, 20 mg 4 times daily; CHILD 6–12 years, 10 mg 3 times daily

  Irritable bowel syndrome, 10 mg 3 times daily, increased if required up to 20 mg 4 times daily
- By intramuscular *or* slow intravenous injection, acute spasm and spasm in diagnostic procedures, 20 mg repeated after 30 minutes if necessary (may be repeated more frequently in endoscopy), max. 100 mg daily; CHILD 2–18 years see *BNF for Children*

Buscopan® (Boehringer Ingelheim) PoM

Tablets, coated, hyoscine butylbromide 10 mg, net price 56-tab pack = £2.25

Note Hyoscine butylbromide tablets can be sold to the public, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg

Injection, hyoscine butylbromide 20 mg/mL, net price 1-mL amp = 22p

PROPANTHELINE BROMIDE

Indications symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm; urinary frequency (section 7.4.2); gustatory sweating (section 6.1.5)

Cautions see notes above; also hepatic and renal impairment; breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- ADULT and CHILD over 12 years, 15 mg 3 times daily at least 1 hour before meals and 30 mg at night, max. 120 mg daily

Pro-Banthine® (Concord) PoM

Tablets, pink, s/c, propantheline bromide 15 mg, net price 112-tab pack = £18.38. Label: 23

Other antispasmodics

Alverine, **mebeverine**, and **peppermint oil** are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome* and *diverticular disease*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus. Peppermint oil occasionally causes heartburn.

ALVERINE CITRATE

Indications adjunct in gastro-intestinal disorders characterised by smooth muscle spasm; dysmenorrhoea

Cautions pregnancy; breast-feeding (Appendix 5)

Contra-indications paralytic ileus

Side-effects nausea; headache, dizziness; pruritus, rash; hepatitis also reported

Dose

- ADULT and CHILD over 12 years, 60–120 mg 1–3 times daily

Spasmonal® (Norgine)

Capsules, alverine citrate 60 mg (blue/grey), net price 100-cap pack = £11.48; 120 mg (*Spasmonal® Forte*, blue/grey), 60-cap pack = £13.26

MEBEVERINE HYDROCHLORIDE

Indications adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

Cautions pregnancy (Appendix 4); avoid in acute porphyria (section 9.8.2.)

Contra-indications paralytic ileus

Side-effects rarely allergic reactions (including rash, urticaria, angioedema)

Dose

- ADULT and CHILD over 10 years 135–150 mg 3 times daily preferably 20 minutes before meals; CHILD under 10 years see *BNF for Children*

[1]**Mebeverine Hydrochloride** (Non-proprietary) PoM

Tablets, mebeverine hydrochloride 135 mg, net price 100-tab pack = £9.43

Oral suspension, mebeverine hydrochloride (as mebeverine embonate) 50 mg/5 mL, net price 300 mL = £107.00

1. Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg

Colofac® (Solvay) PoM

Tablets, s/c, mebeverine hydrochloride 135 mg, net price 100-tab pack = £7.52

Modified release

Colofac® MR (Solvay) PoM

Capsules, m/r, mebeverine hydrochloride 200 mg, net price 60-cap pack = £6.67. Label: 25

Dose irritable bowel syndrome, 1 capsule twice daily preferably 20 minutes before meals; CHILD 12–18 years see *BNF for Children*

Compound preparations

[1]**Fybogel® Mebeverine** (R&C) PoM

Granules, buff, effervescent, ispaghula husk 3.5 g, mebeverine hydrochloride 135 mg/sachet. Contains 2.5 mmol K^+/sachet, net price 10 sachets = £2.50. Label: 13, 22, counselling, see below

Excipients include aspartame (section 9.4.1)

Dose irritable bowel syndrome, ADULT and CHILD over 12 years, 1 sachet in water, morning and evening 30 minutes before food; an

additional sachet may also be taken before the midday meal if necessary

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

1. 10-sachet pack can be sold to the public

PEPPERMINT OIL

Indications relief of abdominal colic and distension, particularly in irritable bowel syndrome

Cautions sensitivity to menthol

Side-effects heartburn, perianal irritation; rarely, allergic reactions (including rash, headache, bradycardia, muscle tremor, ataxia)

Local irritation Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus

Dose

- See preparations

Colpermin® (McNeil)

Capsules, m/r, e/c, light blue/dark blue, blue band, peppermint oil 0.2 mL. Net price 100-cap pack = £12.05. Label: 5, 22, 25

Excipients include arachis (peanut) oil

Dose ADULT and CHILD over 15 years, 1–2 capsules, swallowed whole with water, 3 times daily for up to 3 months if necessary

Mintec® (Shire)

Capsules, e/c, green/ivory, peppermint oil 0.2 mL. Net price 84-cap pack = £7.04. Label: 5, 22, 25

Dose ADULT over 18 years, 1–2 capsules swallowed whole with water, 3 times daily before meals for up to 2–3 months if necessary

Motility stimulants

Metoclopramide and **domperidone** (section 4.6) are dopamine receptor antagonists which stimulate gastric emptying and small intestinal transit, and enhance the strength of oesophageal sphincter contraction. They are used in some patients with *functional dyspepsia* that has not responded to a proton pump inhibitor or a H_2-receptor antagonist. Metoclopramide is also used to speed the transit of barium during intestinal follow-through examination, and as accessory treatment for *gastro-oesophageal reflux disease*. For the management of gastroparesis in patients with diabetes, see section 6.1.5. Metoclopramide and domperidone are useful in non-specific and in cytotoxic-induced nausea and vomiting. Metoclopramide and occasionally domperidone can cause acute dystonic reactions, particularly in young women and children—for further details of this and other side-effects, see section 4.6.

1.3 Antisecretory drugs and mucosal protectants

1.3.1 H2-receptor antagonists
1.3.2 Selective antimuscarinics
1.3.3 Chelates and complexes
1.3.4 Prostaglandin analogues
1.3.5 Proton pump inhibitors

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma.

Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

The management of *H. pylori* infection and of NSAID-associated ulcers is discussed below.

Helicobacter pylori infection

Eradication of *Helicobacter pylori* reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of *H. pylori* should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin, and *either* amoxicillin *or* metronidazole can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate *H. pylori* in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H_2-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of *H. pylori* eradication and are **not** recommended.

Tinidazole is also used occasionally for *H. pylori* eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

A two-week regimen comprising a proton pump inhibitor (e.g. omeprazole 20 mg twice daily) *plus* tripotassium dicitratobismuthate 120 mg four times daily, *plus* tetracycline 500 mg four times daily, *plus* metronidazole 400 mg three times daily can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

For the role of *H. pylori* eradication therapy in patients starting or taking a NSAID, see NSAID-associated Ulcers, p. 44. For *H. pylori* eradication in patients with dyspepsia, see also section 1.1.

Recommended regimens for *Helicobacter pylori* eradication in adults

Acid suppressant	Antibacterial			Price for 7-day course
	Amoxicillin	Clarithromycin	Metronidazole	
Esomeprazole 20 mg twice daily	1 g twice daily	500 mg twice daily	—	£17.89
	—	250 mg twice daily	400 mg twice daily	£13.34
Lansoprazole 30 mg twice daily	1 g twice daily	500 mg twice daily	—	£10.19
	1 g twice daily	—	400 mg twice daily	£4.40
	—	250 mg twice daily	400 mg twice daily	£5.64
Omeprazole 20 mg twice daily	1 g twice daily	500 mg twice daily	—	£9.50
	500 mg 3 times daily	—	400 mg 3 times daily	£3.61
	—	250 mg twice daily	400 mg twice daily	£4.95
Pantoprazole 40 mg twice daily	1 g twice daily	500 mg twice daily	—	£18.93
	—	250 mg twice daily	400 mg twice daily	£14.38
Rabeprazole 20 mg twice daily	1 g twice daily	500 mg twice daily	—	£17.41
	—	250 mg twice daily	400 mg twice daily	£12.86

Test for *Helicobacter pylori*

^{13}C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of ^{13}C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ^{13}C-urea breath test kit for children is available (*Helicobacter Test INFAI for children of the age 3–11*®). However, the appropriateness of testing for *H.pylori* infection in children has not been established.

diabact UBT® (MDE) PoM
Tablets, ^{13}C-urea 50 mg, net price 1 kit (including 1 tablet, 4 breath-sample containers, straws) = £19.95 (analysis included), 10-kit pack (hosp. only) = £74.50 (analysis not included)

Helicobacter Test INFAI® (Infai) PoM
Oral powder, ^{13}C-urea 75 mg, net price 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included), 1 kit (including 2 breath bags) = £14.20 (spectroscopic analysis not included), 50-test set = £855.00 (spectrometric analysis included); 45 mg (*Helicobacter Test INFAI for children of the age 3–11*®), 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included)

Pylobactell® (Torbet) PoM
Soluble tablets, ^{13}C-urea 100 mg, net price 1 kit (including 6 breath-sample containers, 30-mL mixing and administration vial, straws) = £20.75 (analysis included)

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use (section 10.1.1). The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs (see CSM advice, p. 562). Whenever possible, the NSAID should be **withdrawn** if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity. In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H_2-receptor antagonist such as ranitidine given at twice the usual dose or misoprostol are alternatives. Colic and diarrhoea may limit the dose of misoprostol.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

If the *NSAID can be discontinued* in a patient who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing, but the ulcer can be treated with a H_2-receptor antagonist or misoprostol.

If *treatment with a non-selective NSAID needs to continue*, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events, p. 561; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If *treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue*, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

1.3.1 H_2-receptor antagonists

Histamine H_2-receptor antagonists heal *gastric and duodenal ulcers* by reducing gastric acid output as a result of histamine H_2-receptor blockade; they are also used to relieve symptoms of *gastro-oesophageal reflux disease* (section 1.1). H_2-receptor antagonists should not normally be used for *Zollinger-Ellison syndrome* because proton pump inhibitors (section 1.3.5) are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens (section 1.3).

H_2-receptor antagonists are used for the treatment of *functional dyspepsia* (section 1.1). H_2-receptor antagonists may be used for the treatment of *uninvestigated dyspepsia* in patients without alarm features.

H_2-receptor antagonist therapy can promote healing of *NSAID-associated ulcers* (particularly duodenal) (section 1.3).

Treatment with a H_2-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from *gastroduodenal erosions in hepatic coma*, and possibly in other conditions requiring intensive care. H_2-receptor antagonists also reduce the risk of *acid aspiration* in obstetric patients at delivery (Mendelson's syndrome).

Cautions H_2-receptor antagonists should be used with caution in renal impairment (Appendix 3), pregnancy (Appendix 4), and in breast-feeding (Appendix 5). H_2-receptor antagonists might mask symptoms of gastric cancer; particular care is required in those whose symptoms change and in those who are middle-aged or older.

Side-effects Side-effects of the H_2-receptor antagonists include diarrhoea and other gastro-intestinal disturbances, altered liver function tests (rarely liver damage), headache, dizziness, rash, and tiredness. Rare side-effects include acute pancreatitis, bradycardia, AV block, confusion, depression, and hallucinations particularly in the elderly or the very ill, hypersensitivity reactions (including fever, arthralgia, myalgia, anaphylaxis), blood disorders (including agranulocytosis, leucopenia, pancytopenia, thrombocytopenia), and skin reactions (including erythema multiforme and toxic epidermal necrolysis). There have been occasional reports of gynaecomastia and impotence.

Interactions Cimetidine retards oxidative hepatic drug metabolism by binding to microsomal cytochrome P450. It should be avoided in patients stabilised on warfarin, phenytoin, and theophylline (or aminophylline), but other interactions (see **Appendix 1**) may be of less clinical relevance. Famotidine, nizatidine, and ranitidine do not share the drug metabolism inhibitory properties of cimetidine.

CIMETIDINE

Indications benign gastric and duodenal ulceration, stomal ulcer, reflux oesophagitis, Zollinger–Ellison syndrome, other conditions where gastric acid reduction is beneficial (see notes above and section 1.9.4)

Cautions see notes above; also hepatic impairment (Appendix 2); **interactions:** Appendix 1 (histamine H_2-antagonists) and notes above

Side-effects see notes above; also alopecia; very rarely tachycardia, galactorrhoea, interstitial nephritis

Dose

- 400 mg twice daily (with breakfast and at night) *or* 800 mg at night (benign gastric and duodenal ulceration) for at least 4 weeks (6 weeks in gastric ulceration, 8 weeks in NSAID-associated ulceration); when necessary the dose may be increased to 400 mg 4 times daily; INFANT under 1 year 20 mg/kg daily in divided doses has been used; CHILD 1–12 years, 25–30 mg/kg daily in divided doses; max. 400 mg 4 times daily

  Maintenance, 400 mg at night *or* 400 mg morning and night
- Reflux oesophagitis, 400 mg 4 times daily for 4–8 weeks
- Prophylaxis of stress ulceration, 200–400 mg every 4–6 hours
- Gastric acid reduction (prophylaxis of acid aspiration; do not use syrup), obstetrics 400 mg at start of labour, then up to 400 mg every 4 hours if required (max. 2.4 g daily); surgical procedures 400 mg 90–120 minutes before induction of general anaesthesia
- Short-bowel syndrome, 400 mg twice daily (with breakfast and at bedtime) adjusted according to response
- To reduce degradation of pancreatic enzyme supplements, 0.8–1.6 g daily in 4 divided doses 1–1½ hours before meals

[1] **Cimetidine** (Non-proprietary) PoM

Tablets, cimetidine 200 mg, net price 60-tab pack = £1.96; 400 mg, 60-tab pack = £2.30; 800 mg, 30-tab pack = £1.99

Oral solution, cimetidine 200 mg/5 mL, net price 300 mL = £14.24

Excipients may include propylene glycol (see Excipients, p. 2)

1. Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg)

Tagamet® (Chemidex) PoM

Tablets, all green, f/c, cimetidine 200 mg, net price 120-tab pack = £19.58; 400 mg, 60-tab pack = £22.62; 800 mg, 30-tab pack = £22.62

Syrup, orange, cimetidine 200 mg/5 mL. Net price 600 mL = £28.49

Excipients include propylene glycol 10%, (see Excipients, p. 2)

FAMOTIDINE

Indications see under Dose

Cautions see notes above; **interactions:** Appendix 1 (H_2-antagonists) and notes above

Side-effects see notes above; also *very rarely* anorexia, cholestatic jaundice, interstitial pneumonia, anxiety, paraesthesia, insomnia, decreased libido, dry mouth, and taste disturbances

Dose

- Benign gastric and duodenal ulceration, treatment, 40 mg at night for 4–8 weeks; maintenance (duodenal ulceration), 20 mg at night
- Reflux oesophagitis, 20–40 mg twice daily for 6–12 weeks; maintenance, 20 mg twice daily
- CHILD not recommended

[1] **Famotidine** (Non-proprietary) PoM

Tablets, famotidine 20 mg, net price 28-tab pack = £3.56; 40 mg, 28-tab pack = £4.40

1. Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg)

Pepcid® (MSD) PoM

Tablets, f/c, famotidine 20 mg (beige), net price 28-tab pack = £13.37; 40 mg (brown), 28-tab pack = £25.40

NIZATIDINE

Indications see under Dose

Cautions see notes above; also avoid rapid intravenous injection (risk of arrhythmias and postural hypotension); hepatic impairment (Appendix 2); **interactions:** Appendix 1 (H_2-antagonists) and notes above

Side-effects see notes above; also sweating; rarely hyperuricaemia

Dose

- By mouth, benign gastric, duodenal or NSAID-associated ulceration, treatment, 300 mg in the evening *or* 150 mg twice daily for 4–8 weeks; maintenance, 150 mg at night

  Gastro-oesophageal reflux disease, 150–300 mg twice daily for up to 12 weeks
- By intravenous infusion, for short-term use in peptic ulcer as alternative to oral route (for hospital inpatients), by intermittent intravenous infusion over 15 minutes, 100 mg 3 times daily, *or* by continuous intravenous infusion, 10 mg/hour; max. 480 mg daily
- CHILD not recommended

[1] **Nizatidine** (Non-proprietary) PoM

Capsules, nizatidine 150 mg, net price 30-cap pack = £3.60; 300 mg, 30-cap pack = £5.52

1. Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days

Axid® (Flynn) PoM

Capsules, nizatidine 150 mg (pale yellow/dark yellow), net price 28-cap pack (hosp. only) = £6.87, 30-cap pack = £7.97; 300 mg (pale yellow/brown), 30-cap pack = £15.80

Injection, nizatidine 25 mg/mL. For dilution and use as an intravenous infusion. Net price 4-mL amp = £1.14

RANITIDINE

Indications see under Dose, other conditions where reduction of gastric acidity is beneficial (see notes above and section 1.9.4)

Cautions see notes above; also acute porphyria; **interactions:** Appendix 1 (H_2-antagonists) and notes above

Side-effects see notes above; also *rarely* tachycardia, agitation, visual disturbances, alopecia, vasculitis; *very rarely* interstitial nephritis

Dose

- By mouth, benign gastric and duodenal ulceration, chronic episodic dyspepsia, ADULT and CHILD over 12 years, 150 mg twice daily *or* 300 mg at night for 4–8 weeks in benign gastric and duodenal ulceration, up to 6 weeks in chronic episodic dyspepsia, and up to 8 weeks in NSAID-associated ulceration (in duodenal ulcer 300 mg can be given twice daily for 4 weeks to achieve a higher healing rate); CHILD 3–12 years, (benign gastric and duodenal ulceration) 2–4 mg/kg (max. 150 mg) twice daily for 4–8 weeks

  Prophylaxis of NSAID-associated gastric or duodenal ulcer [unlicensed dose], ADULT and CHILD over 12 years, 300 mg twice daily

  Gastro-oesophageal reflux disease, ADULT and CHILD over 12 years, 150 mg twice daily *or* 300 mg at night for up to 8 weeks or if necessary 12 weeks (moderate to severe, 600 mg daily in 2–4 divided doses for up to 12 weeks); long-term treatment of healed gastro-oesophageal reflux disease, 150 mg twice daily; CHILD 3–12 years, 2.5–5 mg/kg (max. 300 mg) twice daily

  Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics, ADULT and CHILD over 12 years, by mouth, 150 mg at onset of labour, then every 6 hours; surgical procedures, by intramuscular *or* slow intravenous injection, 50 mg 45–60 minutes before induction of anaesthesia (intravenous injection diluted to 20 mL and given over at least 2 minutes), or by mouth, 150 mg 2 hours before induction of anaesthesia and also when possible on the preceding evening
- By intramuscular injection, 50 mg every 6–8 hours
- By slow intravenous injection, ADULT and CHILD over 12 years, 50 mg diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours
- Prophylaxis of stress ulceration [unlicensed dose], ADULT and CHILD over 12 years, by slow intravenous injection over at least 2 minutes, 50 mg diluted to 20 mL every 8 hours (may be changed to 150 mg twice daily by mouth when oral feeding commences)

Ranitidine (Non-proprietary) PoM

Tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.18; 300 mg, 30-tab pack = £1.28

Brands include *Ranitic®*

Effervescent tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £10.77; 300 mg, 30-tab pack = £11.27. Label: 13

Excipients may include sodium (check with supplier)

Oral solution, ranitidine (as hydrochloride) 75 mg/5 mL, net price 100 mL = £7.44, 300 mL = £21.43
Excipients may include alcohol (check with supplier)
Note Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg)

Injection, ranitidine (as hydrochloride) 25 mg/mL, net price 2-mL amp = £1.07

Zantac® (GSK) PoM

Tablets, f/c, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.30; 300 mg, 30-tab pack = £1.30

Effervescent tablets, pale yellow, ranitidine (as hydrochloride) 150 mg (contains 14.3 mmol Na^+/tablet), net price 60-tab pack = £24.93; 300 mg (contains 20.8 mmol Na^+/tablet), 30-tab pack = £24.52. Label: 13
Excipients include aspartame (section 9.4.1)

Syrup, sugar-free, ranitidine (as hydrochloride) 75 mg/5 mL, net price 300 mL = £20.76
Excipients include alcohol 8%

Injection, ranitidine (as hydrochloride) 25 mg/mL, net price 2-mL amp = 57p

1.3.2 Selective antimuscarinics

Pirenzepine is a selective antimuscarinic drug which was used for the treatment of gastric and duodenal ulcers. It has been discontinued.

1.3.3 Chelates and complexes

Tripotassium dicitratobismuthate is a bismuth chelate effective in healing gastric and duodenal ulcers. For the role of tripotassium dicitratobismuthate in a *Helicobacter pylori* eradication regimen for those who have not responded to first-line regimens, see section 1.3.

The bismuth content of tripotassium dicitratobismuthate is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulphated sucrose but has minimal antacid properties. It should be used with caution in patients under intensive care (**important:** reports of bezoar formation, see CSM advice below)

TRIPOTASSIUM DICITRATOBISMUTHATE

Indications benign gastric and duodenal ulceration; see also *Helicobacter pylori* infection, section 1.3
Cautions see notes above; **interactions:** Appendix 1 (tripotassium dicitratobismuthate)
Contra-indications renal impairment (avoid if severe); pregnancy (Appendix 4)
Side-effects may darken tongue and blacken faeces; *less commonly* nausea, vomiting, diarrhoea, constipation, rash, and pruritus reported

De-Noltab® (Astellas)

Tablets, f/c, tripotassium dicitratobismuthate 120 mg. Contains 2 mmol K^+/tablet. Net price 112-tab pack = £7.27. Counselling, see below
Dose 2 tablets twice daily *or* 1 tablet 4 times daily; taken for 28 days followed by further 28 days if necessary; maintenance not indicated but course may be repeated after interval of 1 month; CHILD not recommended
Counselling To be swallowed with half a glass of water; twice-daily dosage to be taken 30 minutes before breakfast and main evening meal; four-times-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal; milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal; antacids, fruit, or fruit juice should not be taken half an hour before or after a dose; may darken tongue and blacken faeces

SUCRALFATE

Indications see under Dose
Cautions renal impairment (Appendix 3); pregnancy and breast-feeding; administration of sucralfate and enteral feeds should be separated by 1 hour; **interactions:** Appendix 1 (sucralfate)
Bezoar formation Following reports of bezoar formation associated with sucralfate, the **CSM** has advised caution in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying
Side-effects constipation; *less frequently* diarrhoea, nausea, indigestion, flatulence, gastric discomfort, back pain, dizziness, headache, drowsiness, bezoar formation (see above), dry mouth and rash
Dose
- Benign gastric and duodenal ulceration and chronic gastritis, ADULT and CHILD over 15 years, 2 g twice daily (on rising and at bedtime) *or* 1 g 4 times daily 1 hour before meals and at bedtime, taken for 4–6 weeks or in resistant cases up to 12 weeks; max. 8 g daily
- Prophylaxis of stress ulceration, ADULT and CHILD over 15 years, 1 g 6 times daily; max. 8 g daily
- CHILD under 15 years see *BNF for Children*

Antepsin® (Chugai) PoM

Tablets, scored, sucralfate 1 g, net price 50-tab pack = £5.53. Label: 5
Note Crushed tablets may be dispersed in water

Suspension, sucralfate, 1 g/5 mL, net price 250 mL (aniseed- and caramel-flavoured) = £5.53. Label: 5

1.3.4 Prostaglandin analogues

Misoprostol, a synthetic prostaglandin analogue has antisecretory and protective properties, promoting healing of *gastric and duodenal ulcers*. It can prevent NSAID-associated ulcers, its use being most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn.

For comment on the use of misoprostol to induce abortion or labour [unlicensed indications], see section 7.1.1.

MISOPROSTOL

Indications see notes above and under Dose
Cautions conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease)

Contra-indications pregnancy or planning pregnancy (Appendix 4), (increases uterine tone)—**important:** women of childbearing age, see also below, and breast-feeding (Appendix 5)

Women of childbearing age Manufacturer advises that misoprostol should not be used in women of childbearing age unless the patient requires non-steroidal anti-inflammatory (NSAID) therapy and is at high risk of complications from NSAID-induced ulceration. In such patients it is advised that misoprostol should only be used if the patient takes *effective contraceptive measures* and has been advised of the *risks of taking misoprostol if pregnant*.

Side-effects diarrhoea (may occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids); also reported: abdominal pain, dyspepsia, flatulence, nausea and vomiting, abnormal vaginal bleeding (including intermenstrual bleeding, menorrhagia, and postmenopausal bleeding), rashes, dizziness

Dose

- Benign gastric and duodenal ulceration and NSAID-associated ulceration, ADULT over 18 years, 800 micrograms daily (in 2–4 divided doses) with breakfast (or main meals) and at bedtime; treatment should be continued for at least 4 weeks and may be continued for up to 8 weeks if required
- Prophylaxis of NSAID-induced gastric and duodenal ulcer, ADULT over 18 years, 200 micrograms 2–4 times daily taken with the NSAID

Cytotec® (Pharmacia) PoM

Tablets, scored, misoprostol 200 micrograms, net price 60-tab pack = £10.03. Label: 21

With diclofenac or naproxen

Section 10.1.1

1.3.5 Proton pump inhibitors

Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell. Proton pump inhibitors are effective short-term treatments for *gastric* and *duodenal ulcers*; they are also used in combination with antibacterials for the eradication of *Helicobacter pylori* (see p. 43 for specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery [unlicensed use]. Proton pump inhibitors can be used for the treatment of *dyspepsia* and *gastro-oesophageal reflux disease* (section 1.1).

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers (see p. 44). In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to control excessive secretion of gastric acid in *Zollinger–Ellison syndrome*; high doses are often required.

Cautions Proton pump inhibitors should be used with caution in patients with liver disease (Appendix 2), in pregnancy (Appendix 4) and in breast-feeding (Appendix 5). Proton pump inhibitors may mask the symptoms of gastric cancer; particular care is required in those presenting with 'alarm features' (see p. 37), in such cases gastric malignancy should be ruled out before treatment.

Side-effects Side-effects of the proton pump inhibitors include gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, flatulence, diarrhoea, constipation), and headache. Less frequent side-effects include dry mouth, peripheral oedema, dizziness, sleep disturbances, fatigue, paraesthesia, arthralgia, myalgia, rash, and pruritus. Other side-effects reported rarely or very rarely include taste disturbance, stomatitis, hepatitis, jaundice, hypersensitivity reactions (including anaphylaxis, bronchospasm), fever, depression, hallucinations, confusion, gynaecomastia, interstitial nephritis, hyponatraemia, blood disorders (including leucopenia, leucocytosis, pancytopenia, thrombocytopenia), visual disturbances, sweating, photosensitivity, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis. By decreasing gastric acidity, proton pump inhibitors may increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection).

ESOMEPRAZOLE

Indications see under Dose

Cautions see notes above; renal impairment (Appendix 3); **interactions:** Appendix 1 (proton pump inhibitors)

Side-effects see notes above

Dose

- By mouth duodenal ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 43

  NSAID-associated gastric ulcer, ADULT over 18 years, 20 mg once daily for 4–8 weeks; prophylaxis in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment, 20 mg daily

  Gastro-oesophageal reflux disease, ADULT and CHILD over 12 years, 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily; symptomatic treatment in the absence of oesophagitis, 20 mg daily for up to 4 weeks, then in ADULTS over 18 years 20 mg daily when required

  Zollinger–Ellison syndrome, ADULT over 18 years, initially 40 mg twice daily, adjusted according to response; usual range 80–160 mg daily (above 80 mg in 2 divided doses)

  Counselling Do not chew or crush tablets, swallow whole *or* disperse in water
- By intravenous injection over at least 3 minutes *or* by intravenous infusion, ADULT over 18 years, gastro-oesophageal reflux disease, 40 mg once daily; symptomatic reflux disease without oesophagitis, treatment of NSAID-associated gastric ulcer, prevention of NSAID-associated gastric or duodenal ulcer, 20 mg daily; continue until oral administration possible

Nexium® (AstraZeneca) PoM

Tablets, f/c, esomeprazole (as magnesium trihydrate) 20 mg (light pink), net price 28-tab pack = £18.50 (also 7-tab pack, hosp. only); 40 mg (pink), 28-tab pack = £25.19 (also 7-tab pack, hosp. only). Counselling, administration

Injection, powder for reconstitution, esomeprazole (as sodium salt), net price 40-mg vial = £5.21

LANSOPRAZOLE

Indications see under Dose

Cautions see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

Side-effects see notes above; also glossitis, pancreatitis, anorexia, restlessness, tremor, impotence, petechiae, and purpura; *very rarely* colitis, raised serum cholesterol or triglycerides

Dose

- Benign gastric ulcer, 30 mg daily in the morning for 8 weeks
- Duodenal ulcer, 30 mg daily in the morning for 4 weeks; maintenance 15 mg daily
- NSAID-associated duodenal or gastric ulcer, 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis, 15–30 mg once daily
- Eradication of *Helicobacter pylori* associated with duodenal ulcer or ulcer-like dyspepsia, see eradication regimens on p. 43
- Zollinger-Ellison syndrome (and other hypersecretory conditions), initially 60 mg once daily adjusted according to response; daily doses of 120 mg or more given in two divided doses
- Gastro-oesophageal reflux disease, 30 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg daily
- Acid-related dyspepsia, 15–30 mg daily in the morning for 2–4 weeks
- CHILD under 18 years see *BNF for Children*

Note Lansoprazole doses in BNF may differ from those in product literature

Lansoprazole (Non-proprietary) PoM

Capsules, enclosing e/c granules, lansoprazole 15 mg, net price 28-cap pack = £1.80; 30 mg, 28-cap pack = £3.09. Label: 5, 22, 25

Dental prescribing on NHS Lansoprazole capsules may be prescribed

Zoton® (Wyeth) PoM

FasTab® (= orodispersible tablet), lansoprazole 15 mg, net price 28-tab pack = £2.99; 30 mg, 14-tab pack = £2.74, 28-tab pack = £5.50. Label: 5, 22, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube

OMEPRAZOLE

Indications see under Dose

Cautions see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

Side-effects see notes above; also agitation and impotence

Dose

- By mouth, benign gastric and duodenal ulcers, 20 mg once daily for 4 weeks in duodenal ulceration or 8 weeks in gastric ulceration; in severe or recurrent cases increase to 40 mg daily; maintenance for recurrent duodenal ulcer, 20 mg once daily; prevention of relapse in duodenal ulcer, 10 mg daily increasing to 20 mg once daily if symptoms return

  NSAID-associated duodenal or gastric ulcer and gastroduodenal erosions, 20 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis in patients with a history of NSAID-associated duodenal or gastric ulcers, gastroduodenal lesions, or dyspeptic symptoms who require continued NSAID treatment, 20 mg once daily

  Duodenal or benign gastric ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 43

  Zollinger–Ellison syndrome, initially 60 mg once daily; usual range 20–120 mg daily (above 80 mg in 2 divided doses)

  Gastric acid reduction during general anaesthesia (prophylaxis of acid aspiration), 40 mg on the preceding evening then 40 mg 2–6 hours before surgery

  Gastro-oesophageal reflux disease, 20 mg once daily for 4 weeks, continued for further 4–8 weeks if not fully healed; 40 mg once daily has been given for 8 weeks in gastro-oesophageal reflux disease refractory to other treatment; maintenance 20 mg once daily

  Acid reflux disease (long-term management), 10 mg daily increasing to 20 mg once daily if symptoms return

  Acid-related dyspepsia, 10–20 mg once daily for 2–4 weeks according to response

  Severe ulcerating reflux oesophagitis, CHILD over 1 year, body-weight 10–20 kg, 10 mg once daily increased if necessary to 20 mg once daily for 4–12 weeks; body-weight over 20 kg, 20 mg once daily increased if necessary to 40 mg once daily for 4–12 weeks; to be initiated by hospital paediatrician
- By intravenous injection over 5 minutes *or* by intravenous infusion over 20–30 minutes, prophylaxis of acid aspiration, 40 mg completed 1 hour before surgery

  Benign gastric ulcer, duodenal ulcer and gastro-oesophageal reflux, 40 mg once daily until oral administration possible
- Severe peptic ulcer bleeding [unlicensed indication], initial intravenous infusion of 80 mg over 40–60 minutes, then by continuous intravenous infusion, 8 mg/hour for 72 hours (then change to oral therapy)

Counselling Swallow whole, *or* disperse *MUPS®* tablets in water, *or* mix capsule contents or *MUPS®* tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should **not** be opened

Omeprazole (Non-proprietary) PoM

Capsules, enclosing e/c granules, omeprazole 10 mg, net price 28-cap pack = £1.82; 20 mg, 28-cap pack = £1.71; 40 mg, 7-cap pack = £2.03, 28-cap pack = £58.00. Counselling, administration

Note Some preparations consist of an e/c tablet within a capsule; brands include *Mepradec®*

Dental prescribing on NHS Gastro-resistant omeprazole capsules may be prescribed

[1]Tablets, e/c, omeprazole 10 mg, net price 28-tab pack = £5.21; 20 mg, 28-tab pack = £4.70; 40 mg, 7-tab pack = £4.47. Label: 25

Intravenous infusion, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.14

1. Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets

Losec® (AstraZeneca) PoM

MUPS® (multiple-unit pellet system = dispersible tablets), f/c, omeprazole 10 mg (light pink), net price

28-tab pack = £7.75; 20 mg (pink), 28-tab pack = £11.60; 40 mg (red-brown), 7-tab pack = £5.80. Counselling, administration

Capsules, enclosing e/c granules, omeprazole 10 mg (pink), net price 28-cap pack = £7.75; 20 mg (pink/brown), 28-cap pack = £11.60; 40 mg (brown), 7-cap pack = £5.80. Counselling, administration

Intravenous infusion, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.41

Injection, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial (with solvent) = £5.41

PANTOPRAZOLE

Indications see under Dose

Cautions see notes above; also renal impairment (Appendix 3); **interactions:** Appendix 1 (proton pump inhibitors)

Side-effects see notes above; also raised serum cholesterol or triglycerides

Dose

- By mouth, benign gastric ulcer, ADULT over 18 years, 40 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed

  Gastro-oesophageal reflux disease, ADULT and CHILD over 12 years, 20–40 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 20 mg daily, increased to 40 mg daily if symptoms return

  Duodenal ulcer, ADULT over 18 years, 40 mg daily in the morning for 2 weeks, continued for further 2 weeks if not fully healed

  Duodenal ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 43

  Prophylaxis of NSAID-associated gastric or duodenal ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment, ADULT over 18 years, 20 mg daily

  Zollinger–Ellison syndrome (and other hypersecretory conditions), ADULT over 18 years, initially 80 mg once daily adjusted according to response (ELDERLY max. 40 mg daily); daily doses above 80 mg given in 2 divided doses
- By intravenous injection over at least 2 minutes *or* by intravenous infusion, ADULT over 18 years, duodenal ulcer, gastric ulcer, and gastro-oesophageal reflux, 40 mg daily until oral administration can be resumed

  Zollinger–Ellison syndrome (and other hypersecretory conditions), ADULT over 18 years, initially 80 mg (160 mg if rapid acid control required) then 80 mg once daily adjusted according to response; daily doses above 80 mg given in 2 divided doses

Pantoprazole (Non-proprietary) PoM

Tablets, e/c, pantoprazole 20 mg, net price 28-tab pack = £11.83; 40 mg, 28-tab pack = £20.57. Label: 25

Protium® (Nycomed) PoM

Tablets, yellow, e/c, pantoprazole (as sodium sesquihydrate) 20 mg, net price 28-tab pack = £11.83; 40 mg, 28-tab pack = £20.57. Label: 25

Injection, powder for reconstitution, pantoprazole (as sodium salt), net price 40-mg vial = £5.11

RABEPRAZOLE SODIUM

Indications see under Dose

Cautions see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

Side-effects see notes above; also cough, influenza-like syndrome, and rhinitis; *less commonly* chest pain and nervousness; *rarely* anorexia and weight gain

Dose

- Benign gastric ulcer, 20 mg daily in the morning for 6 weeks, continued for further 6 weeks if not fully healed
- Duodenal ulcer, 20 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed
- Gastro-oesophageal reflux disease, 20 mg once daily for 4–8 weeks; maintenance 10–20 mg daily; symptomatic treatment in the absence of oesophagitis, 10 mg daily for up to 4 weeks, then 10 mg daily when required
- Duodenal and benign gastric ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 43
- Zollinger–Ellison syndrome, initially 60 mg once daily adjusted according to response (max. 120 mg daily); doses above 100 mg daily given in 2 divided doses
- CHILD not recommended

Pariet® (Janssen-Cilag, Eisai) PoM

Tablets, e/c, rabeprazole sodium 10 mg (pink), net price 28-tab pack = £11.56; 20 mg (yellow), 28-tab pack = £17.54. Label: 25

1.4 Acute diarrhoea

1.4.1 Adsorbents and bulk-forming drugs
1.4.2 Antimotility drugs

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. For details of **oral rehydration preparations**, see section 9.2.1.2. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

Antimotility drugs (section 1.4.2) relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are **not** recommended for acute diarrhoea in young children.

Antispasmodics (section 1.2) are occasionally of value in treating abdominal cramp associated with diarrhoea but they should **not** be used for primary treatment. Antispasmodics and antiemetics should be **avoided** in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment; for drugs used in campylobacter enteritis, shigellosis, and salmonellosis, see Table 1, section 5.1. **Ciprofloxacin** is occasionally used for prophylaxis against travellers' diarrhoea, but routine use is **not** recommended. Lactobacillus preparations have not been shown to be effective.

Colestyramine (cholestyramine, section 1.9.2), binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

1.4.1 Adsorbents and bulk-forming drugs

Adsorbents such as kaolin are **not** recommended for *acute diarrhoeas*. Bulk-forming drugs, such as ispaghula, methylcellulose, and sterculia (section 1.6.1) are useful in controlling diarrhoea associated with diverticular disease.

KAOLIN, LIGHT

Indications diarrhoea but see notes above

Cautions **interactions:** Appendix 1 (kaolin)

Kaolin Mixture, BP
(Kaolin Oral Suspension)
Oral suspension, light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.
Dose 10–20 mL every 4 hours

1.4.2 Antimotility drugs

Antimotility drugs have a role in the management of uncomplicated *acute diarrhoea* in adults but not in young children; see also section 1.4. However, in severe cases, fluid and electrolyte replacement (section 9.2.1.2) are of primary importance.

For comments on the role of antimotility drugs in *chronic bowel disorders* see section 1.5. For their role in *stoma care* see section 1.8.

Loperamide can be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

CODEINE PHOSPHATE

Indications see notes above; cough suppression (section 3.9.1); pain (section 4.7.2)

Cautions see section 4.7.2; tolerance and dependence may occur with prolonged use; **interactions:** Appendix 1 (opioid analgesics)

Contra-indications see section 4.7.2; also conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in acute diarrhoeal conditions such as acute ulcerative colitis or antibiotic-associated colitis

Side-effects see section 4.7.2

Dose

- See preparations

Codeine Phosphate (Non-proprietary) PoM
Tablets, codeine phosphate 15 mg, net price 28 = £1.08; 30 mg, 28 = £1.24; 60 mg, 28 = £1.73. Label: 2
Dose ADULT and CHILD over 12 years, acute diarrhoea, 30 mg 3–4 times daily (range 15–60 mg)
Note As for schedule 2 controlled drugs, travellers needing to take codeine phosphate tablets abroad may require a doctor's letter explaining why codeine is necessary.

CO-PHENOTROPE

A mixture of diphenoxylate hydrochloride and atropine sulphate in the mass proportions 100 parts to 1 part respectively

Indications adjunct to rehydration in acute diarrhoea (but see notes above); control of faecal consistency after colostomy or ileostomy (section 1.8)

Cautions see under Codeine Phosphate (section 4.7.2); also young children are particularly susceptible to **overdosage** and symptoms may be delayed and observation is needed for at least 48 hours after ingestion; presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage (section 1.2); **interactions:** Appendix 1 (antimuscarinics, opioid analgesics)

Contra-indications see under Antimuscarinics (section 1.2) and Codeine Phosphate (section 4.7.2); also jaundice

Side-effects see under Antimuscarinics (section 1.2) and Codeine Phosphate (section 4.7.2); also fever

Dose

- See preparations

Co-phenotrope (Non-proprietary) PoM
Tablets, co-phenotrope 2.5/0.025 (diphenoxylate hydrochloride 2.5 mg, atropine sulphate 25 micrograms), net price 100 = £8.95
Brands include *Lomotil*®
Dose initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled; CHILD under 4 years see *BNF for Children*, 4–9 years 1 tablet 3 times daily, 9–12 years 1 tablet 4 times daily, 12–16 years 2 tablets 3 times daily, but see also notes above
Note Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets)

LOPERAMIDE HYDROCHLORIDE

Indications symptomatic treatment of acute diarrhoea; adjunct to rehydration in acute diarrhoea in adults and children over 4 years (but see notes above); chronic diarrhoea in adults only

Cautions see notes above; also liver disease; pregnancy (Appendix 4); **interactions:** Appendix 1 (loperamide)

Contra-indications conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in conditions such as active ulcerative colitis or antibiotic-associated colitis

Side-effects abdominal cramps, dizziness, drowsiness, and skin reactions including urticaria; paralytic ileus and abdominal bloating also reported

Dose

- Acute diarrhoea, 4 mg initially followed by 2 mg after each loose stool for up to 5 days; usual dose 6–8 mg daily; max. 16 mg daily; CHILD under 4 years not recommended; 4–8 years, 1 mg 3–4 times daily for up to *3 days only*; 8–12 years, 2 mg 4 times daily for up to 5 days
- Chronic diarrhoea in adults, initially, 4–8 mg daily in divided doses, subsequently adjusted according to response and given in 2 divided doses for maintenance; max. 16 mg daily; CHILD under 18 years see *BNF for Children*
- Faecal incontinence [unlicensed indication], initially 500 micrograms daily, adjusted according to response; max. 16 mg daily in divided doses

Loperamide (Non-proprietary) PoM

Capsules, loperamide hydrochloride 2 mg, net price 30-cap pack = £1.06

Tablets, loperamide hydrochloride 2 mg, net price 30-tab pack = £2.15

Brands include *Norimode*®

Note Loperamide can be sold to the public, for adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea

Imodium® (Janssen-Cilag) PoM

Capsules, green/grey, loperamide hydrochloride 2 mg. Net price 30-cap pack = £1.09

Syrup, sugar free, red, loperamide hydrochloride 1 mg/5 mL. Net price 100 mL = 94p

Compound preparations

Imodium® Plus (McNeil)

Caplets (= tablets), loperamide hydrochloride 2 mg, simeticone 125 mg, net price 6-tab pack = £2.27, 12-tab pack = £3.56

Dose acute diarrhoea with abdominal colic, initially 2 caplets (CHILD 12–18 years 1 caplet) then 1 caplet after each loose stool; max. 4 caplets daily for up to 2 days; CHILD under 12 years not recommended

MORPHINE

Indications see notes above; cough in terminal disease (section 3.9.1); pain (section 4.7.2)

Cautions see notes above and under Morphine Salts (section 4.7.2)

Contra-indications see notes above and under Morphine Salts (section 4.7.2)

Side-effects see notes above and under Morphine Salts (section 4.7.2); sedation and the risk of dependence are greater

Dose

- See preparation

Kaolin and Morphine Mixture, BP **(Kaolin and Morphine Oral Suspension)**

Oral suspension, light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.

Dose ADULT and CHILD over 12 years, 10 mL every 6 hours in water

1.5 Chronic bowel disorders

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Inflammatory bowel disease

Chronic inflammatory bowel diseases include *ulcerative colitis* and *Crohn's disease*. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide, mesalazine, olsalazine, and sulfasalazine), **corticosteroids** (hydrocortisone, beclometasone, budesonide, and prednisolone), and **drugs that affect the immune response** form the basis of drug treatment.

Treatment of acute ulcerative colitis and Crohn's disease

Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid (distal colitis) is treated initially with local application of an aminosalicylate (section 1.5.1); alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local corticosteroid can be used for proctitis that does not respond to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the upper colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as **prednisolone** (section 1.5.2) for 4–8 weeks. Modified-release **budesonide** is licensed for Crohn's disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. **Beclometasone dipropionate** by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease calls for hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone or methylprednisolone, section 6.3.2); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous **ciclosporin** [unlicensed indication] (section 1.5.3). Patients with unresponsive or chronically active Crohn's disease may benefit from **azathioprine** (section 1.5.3), **mercaptopurine** (section 1.5.3), or once-weekly **methotrexate** (section 1.5.3) [all unlicensed indications].

Infliximab (section 1.5.3) is licensed for the management of severe active Crohn's disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional immunosuppressant or who are intolerant of them.

NICE guidance

Infliximab for Crohn's disease (April 2002)

Infliximab is recommended for the treatment of severe active Crohn's disease (with or without fistulae) when treatment with immunomodulating drugs and corticosteroids has failed or is not tolerated and when surgery is inappropriate. Treatment may be repeated if the condition responded to the initial course but relapsed subsequently. Infliximab should be prescribed only by a gastroenterologist.

NICE guidance

Infliximab for subacute manifestations of ulcerative colitis (April 2008)

Infliximab is **not** recommended for the treatment of subacute manifestations of moderate to severe active ulcerative colitis that would normally be managed in an outpatient setting.

NICE guidance

Infliximab for acute exacerbations of ulcerative colitis (December 2008)

Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.

Adalimumab (section 1.5.3) is licensed for the treatment of severe active Crohn's disease in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional immunosuppressant, or who are intolerant of them. For inducing remission, adalimumab should be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated. Adalimumab may also be used for Crohn's disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

Maintenance of remission of acute ulcerative colitis and Crohn's disease Smoking cessation (section 4.10) reduces the risk of relapse in Crohn's disease and should be encouraged. **Aminosalicylates** are of great value in the maintenance of remission of ulcerative colitis. They are of less value in the maintenance of remission of Crohn's disease; an oral formulation of mesalazine is licensed for the long-term management of ileal disease. Corticosteroids are **not** suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either **azathioprine** (section 1.5.3) [unlicensed indication] or **mercaptopurine** (section 1.5.3) [unlicensed indication], given under close supervision may be helpful. Methotrexate (section 1.5.3) is tried in Crohn's disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab should be considered for patients with Crohn's disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. **Adalimumab** is licensed for maintenance therapy in Crohn's disease.

Fistulating Crohn's disease Treatment may not be necessary for simple, asymptomatic perianal fistulas. **Metronidazole** (section 5.1.11) or **ciprofloxacin** (section 5.1.12) can improve symptoms of fistulating Crohn's disease but complete healing occurs rarely [unlicensed indication]. Metronidazole by mouth is used at a dose of 10–20 mg/kg daily in divided doses (usual dose 400–500 mg 3 times daily); it is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given at a dose of 500 mg twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either **azathioprine** or **mercaptopurine** is used as a second-line treatment for fistulating Crohn's disease and continued for maintenance [unlicensed indication]. **Infliximab** is used for fistulating Crohn's disease refractory to conventional treatments; fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. **Adalimumab** can be used if there is intolerance to infliximab [unlicensed indication].

Adjunctive treatment of inflammatory bowel disease Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate. Irritable bowel syndrome during remission of ulcerative colitis calls for avoidance of a high-fibre diet and possible treatment with an antispasmodic (section 1.2).

Antimotility drugs such as codeine and loperamide, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. Laxatives may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with **colestyramine** (section 1.9.2), which binds bile salts.

Clostridium difficile infection

Antibiotic-associated colitis is caused by colonisation of the colon with *Clostridium difficile*, which may follow antibiotic therapy. It is usually of acute onset, but may become chronic; it is a particular hazard of ampicillin, amoxicillin, co-amoxiclav, third-generation cephalosporins, clindamycin, and quinolones, but few antibiotics are free of this side-effect. Oral **metronidazole** (see section 5.1.11) or oral **vancomycin** (see section 5.1.7) are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.

Diverticular disease

Diverticular disease is treated with a high-fibre diet, **bran supplements**, and **bulk-forming drugs** (section 1.6.1). **Antispasmodics** may provide symptomatic relief when colic is a problem (section 1.2). **Antibacterials** are used only when the diverticula in the intestinal wall become infected (specialist referral). **Antimotility** drugs which slow intestinal motility, e.g. codeine, diphenoxylate, and loperamide could possibly exacerbate the symptoms of diverticular disease and are **contra-indicated**.

Irritable bowel syndrome

Irritable bowel syndrome can present with pain, constipation, or diarrhoea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The **fibre** intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk, sterculia, or oats) is recommended; insoluble fibre (e.g. bran) may exacerbate symptoms and its use should be discouraged. A **laxative** (section 1.6) can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose may cause bloating. **Loperamide** (section 1.4.2) may relieve diarrhoea and **antispasmodic drugs** (section 1.2) may relieve pain. Opioids with a central action, such as codeine, are better avoided because of the risk of dependence.

A **tricyclic antidepressant** (section 4.3.1) can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide, or antispasmodics. Low doses of a tricyclic antidepressant are used (e.g. amitriptyline, initially 5–10 mg each night, increased if necessary in steps of 10 mg at intervals of at least 2 weeks to max. 30 mg each night). A **selective serotonin reuptake inhibitor** (section 4.3.3) may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Malabsorption syndromes

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatin supplements (section 1.9.4)

For further information on foods for special diets (ACBS), see Appendix 7.

1.5.1 Aminosalicylates

Sulfasalazine is a combination of 5-aminosalicylic acid ('5-ASA') and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, **mesalazine** (5-aminosalicylic acid), **balsalazide** (a prodrug of 5-aminosalicylic acid) and **olsalazine** (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulphonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders (see recommendation below) and lupus-like syndrome also seen with sulfasalazine.

Cautions Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment (more frequently in renal impairment). Aminosalicylates should be used with caution in renal impairment (Appendix 3), during pregnancy (Appendix 4) and breast-feeding (Appendix 5); blood disorders can occur (see recommendation below).

Blood disorders
Patients receiving aminosalicylates should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

Contra-indications Aminosalicylates should be avoided in salicylate hypersensitivity.

Side-effects Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinaemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

BALSALAZIDE SODIUM

Indications treatment of mild to moderate ulcerative colitis and maintenance of remission

Cautions see notes above; also history of asthma; **interactions:** Appendix 1 (aminosalicylates)
Blood disorders See recommendation above

Contra-indications see notes above; also severe hepatic impairment

Side-effects see notes above; also cholelithiasis

Dose

- Acute attack, 2.25 g 3 times daily until remission occurs or for up to max. 12 weeks
- Maintenance, 1.5 g twice daily, adjusted according to response (max. 6 g daily)
- CHILD under 18 years see *BNF for Children*

Colazide® (Almirall) PoM
Capsules, beige, balsalazide sodium 750 mg. Net price 130-cap pack = £39.00. Label: 21, 25, counselling, blood disorder symptoms (see recommendation above)

MESALAZINE

Indications treatment of mild to moderate ulcerative colitis and maintenance of remission; see also under preparations

Cautions see notes above; elderly; **interactions:** Appendix 1 (aminosalicylates)
Blood disorders See recommendation above

Contra-indications see notes above; also severe hepatic impairment (Appendix 2)

Side-effects see notes above

Dose

- See under preparations, below

Note The delivery characteristics of oral mesalazine preparations may vary; these preparations should not be considered interchangeable

Asacol® (Procter & Gamble Pharm.) PoM
Foam enema, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £27.26. Counselling, blood disorder symptoms (see recommendation above)
Excipients include disodium edetate, hydroxybenzoates (parabens), polysorbate 20, sodium metabisulphite
Dose acute attack affecting the rectosigmoid region, 1 metered application (mesalazine 1 g) into the rectum daily for 4–6 weeks; acute attack affecting the descending colon, 2 metered applications (mesalazine 2 g) once daily for 4–6 weeks; CHILD 12–18 years, see *BNF for Children*

Suppositories, mesalazine 250 mg, net price 20-suppos pack = £4.92; 500 mg, 10-suppos pack = £4.92. Counselling, blood disorder symptoms (see recommendation above)
Dose acute attack or maintenance, by rectum 0.75–1.5 g daily in divided doses, with last dose at bedtime; CHILD 12–18 years, see *BNF for Children*

Asacol® MR (Procter & Gamble Pharm.) PoM
Tablets, red, e/c, mesalazine 400 mg, net price 90-tab pack = £30.00, 120-tab pack = £40.00. Label: 5, 25,

counselling, blood disorder symptoms (see recommendation above)

Dose ulcerative colitis, acute attack, 2.4 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn's ileocolitis, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see *BNF for Children*

Tablets, red-brown, e/c, mesalazine 800 mg, net price 180-tab pack = £119.99. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ADULT over 18 years, ulcerative colitis, acute attack, 2.4–4.8 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn's ileo-colitis, up to 2.4 g daily in divided doses

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Ipocol® (Sandoz) PoM

Tablets, e/c, mesalazine 400 mg, net price 120-tab pack = £41.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose acute attack, 2.4 g daily in divided doses; maintenance, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see *BNF for Children*

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Mesren® MR (IVAX) PoM

Tablets, red-brown, e/c, mesalazine 400 mg, net price 90-tab pack = £19.50, 120-tab pack = £26.00. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 12 years, acute attack, 2.4 g daily in divided doses; maintenance, 1.2–2.4 g daily in divided doses

Mezavant® XL (Shire) PoM

Tablets, m/r, red-brown, e/c, mesalazine 1.2 g, net price 60-tab pack = £62.44. Label: 21, 25, counselling, blood disorder symptoms (see recommendations above)

Dose ADULT over 18 years, acute attack, 2.4 g once daily, increase if necessary to 4.8 g once daily (review treatment at 8 weeks); maintenance, 2.4 g once daily

Pentasa® (Ferring) PoM

Tablets, m/r, scored, mesalazine 500 mg (grey), net price 100-tab pack = £24.21. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 15 years, acute attack, up to 4 g daily in 2–3 divided doses; maintenance, 1.5 g daily in 2–3 divided doses; tablets may be dispersed in water, but should not be chewed; CHILD 5–15 years see *BNF for Children*

Granules, m/r, pale brown, mesalazine 1 g/sachet, net price 50-sachet pack = £28.82; 2 g/sachet, 60-sachet pack = £72.05. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 12 years, acute attack, up to 4 g daily in 2–4 divided doses; maintenance, 2 g once daily; granules should be placed on tongue and washed down with water or orange juice without chewing; CHILD 5–12 years see *BNF for Children*

Retention enema, mesalazine 1 g in 100-mL pack. Net price 7 enemas = £17.73. Counselling, blood disorder symptoms (see recommendation above)

Dose by rectum ADULT and CHILD over 12 years, 1 enema at bedtime

Suppositories, mesalazine 1 g. Net price 28-suppos pack = £40.01. Counselling, blood disorder symptoms (see recommendation above)

Dose by rectum ulcerative proctitis, ADULT and CHILD over 15 years, acute attack, 1 g daily for 2–4 weeks; maintenance, 1 g daily; CHILD 12–15 years see *BNF for Children*

Salofalk® (Dr Falk) PoM

Tablets, e/c, yellow, mesalazine 250 mg. Net price 100-tab pack = £16.50. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 15 years, acute attack, 1.5 g daily in 3 divided doses; maintenance, 0.75–1.5 g daily in divided doses; CHILD 12–15 years see *BNF for Children*

Granules, m/r, grey, e/c, vanilla-flavoured, mesalazine 500 mg/sachet, net price 100-sachet pack = £29.30; 1 g/sachet, 50-sachet pack = £29.30; 1.5 g/sachet, 60-sachet pack = £49.80. Label: 25, counselling, administration, see dose, blood disorder symptoms (see recommendation above)

Excipients include aspartame (section 9.4.1)

Dose ADULT and CHILD over 15 years, acute attack, 1.5–3 g once daily (preferably in the morning) *or* 0.5–1 g 3 times daily; maintenance, 500 mg 3 times daily; CHILD 6–15 years, body-weight under 40 kg see *BNF for Children*, body-weight over 40 kg, adult dose; granules should be placed on tongue and washed down with water without chewing

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Suppositories, mesalazine 500 mg. Net price 30-suppos pack = £15.10. Counselling, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 15 years, acute attack, by rectum, 0.5–1 g 2–3 times daily adjusted according to response; CHILD 12–15 years see *BNF for Children*

Enema, mesalazine 2 g in 59-mL pack. Net price 7 enemas = £30.50. Counselling, blood disorder symptoms (see recommendation above)

Dose acute attack *or* maintenance, by rectum, 2 g daily at bedtime; CHILD 12–18 years see *BNF for Children*

Rectal foam, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £30.75. Counselling, blood disorder symptoms (see recommendation above)

Excipients include cetostearyl alcohol, disodium edetate, polysorbate 60, propylene glycol, sodium metabisulphite

Dose mild ulcerative colitis affecting sigmoid colon and rectum, ADULT and CHILD over 12 years, 2 metered applications (mesalazine 2 g) into the rectum at bedtime increased if necessary to 2 metered applications (mesalazine 2 g) twice daily

OLSALAZINE SODIUM

Indications treatment of mild ulcerative colitis and maintenance of remission

Cautions see notes above; **interactions:** Appendix 1 (aminosalicylates)

Blood disorders See recommendation above

Contra-indications see notes above

Side-effects see notes above; watery diarrhoea common; also reported, tachycardia, palpitation, pyrexia, blurred vision, and photosensitivity

Dose

- ADULT and CHILD over 12 years, acute attack, 1 g daily in divided doses after meals increased if necessary over 1 week to max. 3 g daily (max. single dose 1 g); maintenance, 500 mg twice daily after meals
- CHILD under 12 years see *BNF for Children*

Dipentum® (UCB Pharma) PoM

Capsules, brown, olsalazine sodium 250 mg. Net price 112-cap pack = £19.77. Label: 21, counselling, blood disorder symptoms (see recommendation above)

Tablets, yellow, scored, olsalazine sodium 500 mg. Net price 60-tab pack = £21.18. Label: 21, counselling, blood disorder symptoms (see recommendation above)

SULFASALAZINE
(Sulphasalazine)

Indications treatment of mild to moderate and severe ulcerative colitis and maintenance of remission; active Crohn's disease; rheumatoid arthritis (section 10.1.3)

Cautions see notes above; also history of allergy; hepatic impairment; G6PD deficiency (section 9.1.5); slow acetylator status; risk of haematological and hepatic toxicity (differential white cell, red cell, and platelet counts initially and at monthly intervals for first 3 months; liver function tests at monthly intervals for first 3 months); upper gastro-intestinal side-effects common over 4 g daily; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (aminosalicylates)
Blood disorders See recommendation above

Contra-indications see notes above; also sulphonamide hypersensitivity; child under 2 years of age

Side-effects see notes above; also loss of appetite; fever; blood disorders (including Heinz body anaemia, megaloblastic anaemia); hypersensitivity reactions (including exfoliative dermatitis, epidermal necrolysis, pruritus, photosensitisation, anaphylaxis, serum sickness); ocular complications (including periorbital oedema); stomatitis, parotitis; ataxia, aseptic meningitis, vertigo, tinnitus, insomnia, depression, hallucinations; kidney reactions (including proteinuria, crystalluria, haematuria); oligospermia; urine may be coloured orange; some soft contact lenses may be stained

Dose

- By mouth, acute attack 1–2 g 4 times daily (but see **cautions**) until remission occurs (if necessary corticosteroids may also be given), reducing to a maintenance dose of 500 mg 4 times daily; CHILD 2–12 years see *BNF for Children*
- By rectum, in suppositories, alone or in conjunction with oral treatment 0.5–1 g morning and night after a bowel movement; CHILD 5–12 years see *BNF for Children*

Sulfasalazine (Non-proprietary) PoM

Tablets, sulfasalazine 500 mg. Net price 112 = £9.11. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Tablets, e/c, sulfasalazine 500 mg. Net price 112-tab pack = £16.15. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
Brands include *Sulazine EC®*

Salazopyrin® (Pharmacia) PoM

Tablets, yellow, scored, sulfasalazine 500 mg. Net price 112-tab pack = £6.97. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

EN-Tabs® (= tablets e/c), yellow, f/c, sulfasalazine 500 mg. Net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Suspension, yellow, sulfasalazine 250 mg/5 mL. Net price 500 mL = £18.84. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Suppositories, yellow, sulfasalazine 500 mg. Net price 10 = £3.30. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

1.5.2 Corticosteroids

For the role of corticosteroids in acute ulcerative colitis and Crohn's disease, see Inflammatory Bowel Disease, p. 52.

BECLOMETASONE DIPROPIONATE

Indications adjunct to aminosalicylates in acute mild to moderate ulcerative colitis; asthma (section 3.2); allergic and vasomotor rhinitis (section 12.2.1); oral ulceration [unlicensed indication] (section 12.3.1)

Cautions section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

Contra-indications section 6.3.2

Side-effects section 6.3.2; also nausea, constipation, headache, and drowsiness

Dose

- 5 mg in the morning; max. duration of treatment 4 weeks; CHILD safety and efficacy not established

Clipper® (Chiesi) PoM

Tablets, m/r, ivory, beclometasone dipropionate 5 mg, net price 30-tab pack = £57.66. Label: 25

BUDESONIDE

Indications see preparations

Cautions section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

Contra-indications section 6.3.2

Side-effects section 6.3.2

Dose

- See preparations

Budenofalk® (Dr Falk) PoM

Capsules, pink, enclosing e/c pellets, budesonide 3 mg, net price 100-cap pack = £76.50. Label: 5, 10, steroid card, 22, 25

Dose mild to moderate Crohn's disease affecting ileum or ascending colon, chronic diarrhoea due to collagenous colitis, ADULT over 18 years, 3 mg 3 times daily for up to 8 weeks; reduce dose for the last 2 weeks of treatment (see also section 6.3.2); CHILD 12–18 years see *BNF for Children*

Rectal foam, budesonide 2 mg/metered application, net price 14-application canister with disposable applicators and plastic bags = £58.22

Excipients include cetyl alcohol, disodium edetate, propylene glycol, sorbic acid

Dose ulcerative colitis affecting sigmoid colon and rectum, by rectum, ADULT over 18 years, 1 metered application (budesonide 2 mg) once daily for up to 8 weeks

Entocort® (AstraZeneca) PoM

CR Capsules, grey/pink, enclosing e/c, m/r granules, budesonide 3 mg, net price 100-cap pack = £99.00. Label: 5, 10, steroid card, 25

Note Dispense in original container (contains desiccant)

Dose mild to moderate Crohn's disease affecting the ileum or ascending colon, 9 mg once daily in the morning for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment (see also section 6.3.2); CHILD 12–18 years see *BNF for Children*

Enema, budesonide 2 mg/100 mL when dispersible tablet reconstituted in isotonic saline vehicle, net

price pack of 7 dispersible tablets and bottles of vehicle = £33.00

Dose ulcerative colitis involving rectal and recto-sigmoid disease, by rectum, 1 enema at bedtime for 4 weeks; CHILD 12–18 years see *BNF for Children*

HYDROCORTISONE

Indications ulcerative colitis, proctitis, proctosigmoiditis

Cautions section 6.3.2; systemic absorption may occur; prolonged use should be avoided

Contra-indications intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

Side-effects section 6.3.2; also local irritation

Dose

- By rectum see preparations

Colifoam® (Meda) PoM

Foam in aerosol pack, hydrocortisone acetate 10%, net price 14-application canister with applicator = £8.21

Excipients include cetyl alcohol, hydroxybenzoates (parabens), propylene glycol

Dose initially 1 metered application (125 mg hydrocortisone acetate) inserted into the rectum once or twice daily for 2–3 weeks, then once on alternate days; CHILD 2–18 years see *BNF for Children*

PREDNISOLONE

Indications ulcerative colitis, and Crohn's disease; other indications, see section 6.3.2, see also preparations

Cautions section 6.3.2; systemic absorption may occur with rectal preparations; prolonged use should be avoided

Contra-indications section 6.3.2; intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

Side-effects section 6.3.2

Dose

- By mouth, initially 20–40 mg daily (up to 60 mg daily in some cases), preferably taken in the morning after breakfast; continued until remission occurs, followed by reducing doses
- By rectum, see preparations

Oral preparations

Section 6.3.2

Rectal preparations

Predenema® (Forest) PoM

Retention enema, prednisolone 20 mg (as sodium metasulphobenzoate) in 100-mL single-dose disposable pack. Net price 1 (standard tube) = 71p, 1 (long tube) = £1.21

Dose ulcerative colitis, by rectum, ADULT and CHILD over 12 years, initially 20 mg at bedtime for 2–4 weeks, continued if good response

Predfoam® (Forest) PoM

Foam in aerosol pack, prednisolone 20 mg (as metasulphobenzoate sodium)/metered application, net price 14-application canister with disposable applicators = £6.32

Excipients include cetostearyl alcohol, disodium edetate, polysorbate 20, sorbic acid

Dose proctitis and distal ulcerative colitis, 1 metered application (20 mg prednisolone) inserted into the rectum once or twice daily for 2 weeks, continued for further 2 weeks if good response; CHILD not recommended

Predsol® (UCB Pharma) PoM

Retention enema, prednisolone 20 mg (as sodium phosphate) in 100-mL single-dose disposable packs fitted with a nozzle. Net price 7 = £6.00

Dose rectal and rectosigmoidal ulcerative colitis and Crohn's disease, by rectum, initially 20 mg at bedtime for 2–4 weeks, continued if good response; CHILD not recommended

Suppositories, prednisolone 5 mg (as sodium phosphate). Net price 10 = £1.35

Dose ADULT and CHILD proctitis and rectal complications of Crohn's disease, by rectum, 5 mg inserted night and morning after a bowel movement

1.5.3 Drugs affecting the immune response

For the role of **azathioprine**, **ciclosporin**, **mercaptopurine**, and **methotrexate** in the treatment of inflammatory bowel disease, see p. 52.

AZATHIOPRINE

Indications see under Inflammatory Bowel Disease, p. 52; autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3)

Cautions section 8.2.1

Contra-indications section 8.2.1

Side-effects section 8.2.1

Dose

- Severe acute Crohn's disease, maintenance of remission of Crohn's disease or ulcerative colitis [unlicensed indications], ADULT over 18 years, by mouth, 2–2.5 mg/kg daily; some patients may respond to lower doses

Preparations

Section 8.2.1

CICLOSPORIN

(Cyclosporin)

Indications severe acute ulcerative colitis refractory to corticosteroid treatment [unlicensed indication]; transplantation and graft-versus-host disease, nephrotic syndrome (section 8.2.2); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

Cautions section 8.2.2

Contra-indications section 8.2.2

Side-effects section 8.2.2

Dose

- By continuous intravenous infusion, ADULT over 18 years, 2 mg/kg daily over 24 hours; dose adjusted according to blood-ciclosporin concentration and response

Preparations

Section 8.2.2

MERCAPTOPURINE

Indications see under Inflammatory Bowel disease, p. 52; acute leukaemias and chronic myeloid leukaemia (section 8.1.3)

Cautions section 8.1.3

Contra-indications section 8.1.3

Side-effects section 8.1.3

Dose

- Severe acute Crohn's disease, maintenance of remission of Crohn's disease or ulcerative colitis [unlicensed indications], ADULT over 18 years, by mouth, 1–1.5 mg/kg daily; some patients may respond to lower doses

Preparations

Section 8.1.3

METHOTREXATE

Indications see under Inflammatory Bowel Disease, p. 52; malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

Cautions section 10.1.3

Contra-indications section 10.1.3

Side-effects section 10.1.3

Dose

- By intramuscular injection, severe Crohn's disease [unlicensed indication], ADULT over 18 years, induction of remission, 25 mg once weekly; maintenance, 15 mg once weekly
- By mouth, maintenance of remission of severe Crohn's disease [unlicensed indication], ADULT over 18 years, 10–25 mg once weekly

Important

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Preparations

Section 10.1.3

Cytokine modulators

Infliximab and **adalimumab** are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

ADALIMUMAB

Indications see under Inflammatory Bowel Disease, p. 53; ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis, juvenile idiopathic arthritis, (section 10.1.3); psoriasis (section 13.5.3)

Cautions section 10.1.3

Contra-indications section 10.1.3

Side-effects section 10.1.3

Dose

- By subcutaneous injection, severe active Crohn's disease, ADULT over 18 years, initially 80 mg, then 40 mg 2 weeks after initial dose *or* accelerated regimen, initially 160 mg in 4 divided doses over 1–2 days, then 80 mg 2 weeks after initial dose; maintenance, 40 mg on alternate weeks, increased if necessary to 40 mg weekly; review treatment if no response within 12 weeks of initial dose

Preparations

Section 10.1.3

INFLIXIMAB

Indications see under Inflammatory Bowel Disease, p. 52; ankylosing spondylitis, rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

Cautions see section 10.1.3; also history of dysplasia or colon carcinoma

Hypersensitivity reactions Risk of delayed hypersensitivity if drug-free interval exceeds 16 weeks

Contra-indications see section 10.1.3

Side-effects see section 10.1.3; also hepatosplenic T-cell lymphoma

Dose

- By intravenous infusion, severe active Crohn's disease, ADULT over 18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks after initial dose; then if the condition has responded, maintenance *either* 5 mg/kg 6 weeks after initial dose, then 5 mg/kg every 8 weeks *or* further dose of 5 mg/kg if signs and symptoms recur; CHILD 6–18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then 5 mg/kg every 8 weeks; interval between maintenance doses adjusted according to response; discontinue if no response within 10 weeks of initial dose

  Fistulating Crohn's disease, ADULT over 18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then if condition has responded, consult product literature for guidance on further doses; CHILD under 18 years, see *BNF for Children*

  Severe active ulcerative colitis, ADULT over 18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then 5 mg/kg every 8 weeks; discontinue if no response 14 weeks after initial dose

Preparations

Section 10.1.3

1.5.4 Food allergy

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as shellfish should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. **Sodium cromoglicate** (sodium cromoglycate) may be helpful as an adjunct to dietary avoidance.

SODIUM CROMOGLICATE
(Sodium cromoglycate)

Indications food allergy (in conjunction with dietary restriction); asthma (section 3.3); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

Side-effects occasional nausea, rashes, and joint pain

Dose

- 200 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response; CHILD 2–14 years 100 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response

  Counselling Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking

Nalcrom® (Sanofi-Aventis) PoM

Capsules, sodium cromoglicate 100 mg. Net price 100-cap pack = £59.75. Label: 22, counselling, see dose above

1.6 Laxatives

1.6.1 Bulk-forming laxatives
1.6.2 Stimulant laxatives
1.6.3 Faecal softeners
1.6.4 Osmotic laxatives
1.6.5 Bowel cleansing preparations
1.6.6 Peripheral opioid-receptor antagonists

Before prescribing laxatives it is important to be sure that the patient *is* constipated and that the constipation is *not* secondary to an underlying undiagnosed complaint.

It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement each day. A useful definition of constipation is the passage of hard stools less frequently than the patient's own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia.

Thus, laxatives should generally be **avoided** except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in *drug-induced constipation*, for the expulsion of *parasites* after anthelmintic treatment, and to clear the alimentary tract before *surgery and radiological procedures*. Prolonged treatment of constipation is sometimes necessary.

For the role of laxatives in the treatment of irritable bowel syndrome, see p. 53.

Children Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

If increased fluid and fibre intake is insufficient, an osmotic laxative containing macrogols or lactulose (section 1.6.4) can be used. If there is evidence of minor faecal retention, the addition of a stimulant laxative (section 1.6.2) may overcome withholding but may lead to colic or, in the presence of faecal impaction in the rectum, an increase of faecal overflow.

In children with faecal impaction, an oral preparation containing macrogols is used to clear faecal mass and to establish and maintain soft well-formed stools. Rectal administration of laxatives may be effective but this route is frequently distressing for the child and may lead to persistent withholding. If the impacted mass is not expelled following treatment with macrogols, referral to hospital may be necessary. Enemas may be administered under heavy sedation in hospital or alternatively, a bowel cleansing preparation (section 1.6.5) may be tried. In severe cases or where the child is afraid, a manual evacuation under anaesthetic may be appropriate.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort.

Pregnancy If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

The laxatives that follow have been divided into 5 main groups (sections 1.6.1–1.6.5). This simple classification disguises the fact that some laxatives have a complex action.

1.6.1 Bulk-forming laxatives

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis; patients should be advised that the full effect may take some days to develop.

Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives are useful in the management of patients with *colostomy*, *ileostomy*, *haemorrhoids*, *anal fissure*, *chronic diarrhoea associated with diverticular disease*, *irritable bowel syndrome*, and as adjuncts in *ulcerative colitis* (section 1.5). Adequate fluid intake must be

maintained to avoid intestinal obstruction. Unprocessed wheat **bran**, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose, **ispaghula**, and **sterculia** are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

ISPAGHULA HUSK

Indications see notes above

Cautions adequate fluid intake should be maintained to avoid intestinal obstruction—it may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility

Contra-indications difficulty in swallowing, intestinal obstruction, colonic atony, faecal impaction

Side-effects flatulence, abdominal distension, gastrointestinal obstruction or impaction; hypersensitivity reported

Dose

- See preparations below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Fibrelief® (Manx)

Granules, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (natural or orange flavour), net price 10 sachets = £1.23, 30 sachets = £2.07. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

Dose ADULT and CHILD over 12 years, 1–6 sachets daily in water in 1–3 divided doses

Fybogel® (R&C)

Granules, buff, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (low Na^+), net price 30 sachets (plain, lemon, or orange flavour) = £1.84. Label: 13, counselling, see above

Excipients include aspartame 16 mg/sachet (see section 9.4.1)

Dose 1 sachet or 2 level 5-mL spoonfuls in water twice daily preferably after meals; CHILD (but see section 1.6) 2–12 years ½–1 level 5-mL spoonful in water, twice daily preferably after meals (CHILD 2–6 years on specialist practitioner's advice only)

Isogel® (Potters)

Granules, brown, sugar- and gluten-free, ispaghula husk 90%. Net price 200 g = £2.67. Label: 13, counselling, see above

Dose constipation, 2 level 5-mL spoonfuls in water once or twice daily, preferably at mealtimes; CHILD (but see section 1.6) 2–12 years, 1 level 5-mL spoonful in water once or twice daily, preferably at mealtimes

Diarrhoea (section 1.4.1), 1 level 5-mL spoonful 3 times daily

Note May be difficult to obtain

Ispagel Orange® (LPC)

Granules, beige, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet, net price 30 sachets = £2.10. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

Dose 1 sachet in water 1–3 times daily; CHILD (but see section 1.6) 2–12 years see *BNF for Children*

Regulan® (Procter & Gamble)

Powder, beige, sugar- and gluten-free, ispaghula husk 3.4 g/5.85-g sachet (orange or lemon/lime flavour). Net price 30 sachets = £2.44. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

Dose 1 sachet in 150 mL water 1–3 times daily; CHILD (but see section 1.6) 2–6 years, see *BNF for Children*; 6–12 years 2.5–5 mL in water 1–3 times daily

METHYLCELLULOSE

Indications see notes above; adjunct in obesity (but see section 4.5.1)

Cautions see under Ispaghula Husk

Contra-indications see under Ispaghula Husk; also infective bowel disease

Side-effects see under Ispaghula Husk

Dose

- See preparations below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Celevac® (Amdipharm)

Tablets, pink, scored, methylcellulose '450' 500 mg, net price 112-tab pack = £3.22. Counselling, see above and dose

Dose constipation and diarrhoea, 3–6 tablets twice daily; in constipation the dose should be taken with at least 300 mL liquid; in diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose; CHILD 7–12 years see *BNF for Children*

Adjunct in obesity (but see section 4.5.1), 3 tablets with at least 300 mL warm liquid 30 minutes before food or when hungry

STERCULIA

Indications see notes above

Cautions see under Ispaghula Husk

Contra-indications see under Ispaghula Husk

Side-effects see under Ispaghula Husk

Dose

- See under preparations below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Normacol® (Norgine)

Granules, coated, gluten-free, sterculia 62%. Net price 500 g = £5.94; 60 × 7-g sachets = £4.99. Label: 25, 27, counselling, see above

Dose 1–2 heaped 5-mL spoonfuls, or the contents of 1–2 sachets, washed down without chewing with plenty of liquid once or twice daily after meals; CHILD (but see section 1.6) 6–12 years half adult dose

Normacol Plus® (Norgine)

Granules, brown, coated, gluten-free, sterculia 62%, frangula (standardised) 8%. Net price 500 g = £6.34; 60 × 7 g sachets = £5.34. Label: 25, 27, counselling, see above

Dose constipation and after haemorrhoidectomy, 1–2 heaped 5-mL spoonfuls *or* the contents of 1–2 sachets washed down without chewing with plenty of liquid once or twice daily after meals; CHILD 6–12 years see *BNF for Children*

1.6.2 Stimulant laxatives

Stimulant laxatives include **bisacodyl**, **sodium picosulfate**, and members of the **anthraquinone** group, **senna** and **dantron** (danthron). The indications for dantron are limited (see below) by its potential carcinogenicity (based on *rodent* carcinogenicity studies) and evidence

of genotoxicity. Powerful stimulants such as **cascara** (an anthraquinone) and **castor oil** are obsolete. **Docusate sodium** probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances (see section 1.6 for the use of stimulant laxatives in children).

Glycerol suppositories act as a rectal stimulant by virtue of the mildly irritant action of glycerol.

The **parasympathomimetics** bethanechol, distigmine, neostigmine, and pyridostigmine (see section 7.4.1 and section 10.2.1) enhance parasympathetic activity in the gut and increase intestinal motility. They are rarely used for their gastro-intestinal effects. Organic obstruction of the gut must first be excluded and they should not be used shortly after bowel anastomosis.

BISACODYL

Indications see under Dose

Cautions see notes above; pregnancy, see p. 59

Contra-indications see notes above, acute surgical abdominal conditions, acute inflammatory bowel disease, severe dehydration

Side-effects see notes above; nausea and vomiting; colitis also reported; *suppositories*, local irritation

Dose

- Constipation, by mouth, 5–10 mg at night; CHILD (but see section 1.6) 4–18 years see *BNF for Children*

  By rectum in suppositories, 10 mg in the morning; CHILD (but see section 1.6) 2–18 years see *BNF for Children*
- Before radiological procedures and surgery, by mouth, 10–20 mg the night before procedure and by rectum in suppositories, 10 mg the following morning; CHILD 4–10 years by mouth, 5 mg the night before procedure and by rectum in suppositories, 5 mg the following morning; over 10 years, adult dose

Note tablets act in 10–12 hours; suppositories act in 20–60 minutes

Bisacodyl (Non-proprietary)

Tablets, e/c, bisacodyl 5 mg. Net price 100 = £3.27. Label: 5, 25

Suppositories, bisacodyl 10 mg. Net price 12 = 89p

Paediatric suppositories, bisacodyl 5 mg. Net price 5 = 94p

Note The brand name *Dulcolax®* (Boehringer Ingelheim) is used for bisacodyl tablets, net price 10-tab pack = 74p; suppositories (10 mg), 10 = £1.57; paediatric suppositories (5 mg), 5 = 94p

The brand names *Dulcolax® Liquid* and *Dulcolax® Perles* are used for sodium picosulfate preparations

DANTRON

(Danthron)

Indications only for constipation in terminally ill patients of all ages

Cautions see notes above; *rodent* studies indicate potential carcinogenic risk; avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies)—risk of irritation and excoriation; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Contra-indications See notes above

Side-effects see notes above; urine may be coloured red

Dose

- See under preparations

With poloxamer '188' (as co-danthramer)

Note Co-danthramer suspension 5 mL = one co-danthramer capsule, **but** strong co-danthramer suspension 5 mL = two strong co-danthramer capsules

Co-danthramer (Non-proprietary) PoM

Capsules, co-danthramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg). Net price 60-cap pack = £12.86. Label: 14, (urine red)

Dose 1–2 capsules at bedtime; CHILD 1 capsule at bedtime (restricted indications, see notes above)

Strong capsules, co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg). Net price 60-cap pack = £15.55. Label: 14, (urine red)

Dose ADULT and CHILD over 12 years, 1–2 capsules at bedtime (restricted indications, see notes above)

Suspension, co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL). Net price 300 mL = £11.27, 1 litre = £37.57. Label: 14, (urine red)

Dose 5–10 mL at night; CHILD 2.5–5 mL (restricted indications, see notes above)

Brands include *Codalax®* SHS, *Danlax®*

Strong suspension, co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL). Net price 300 mL = £30.13. Label: 14, (urine red)

Dose ADULT and CHILD over 12 years, 5 mL at night (restricted indications, see notes above)

Brands include *Codalax Forte®* SHS

With docusate sodium (as co-danthrusate)

Co-danthrusate (Non-proprietary) PoM

Capsules, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg). Net price 63-cap pack = £14.50. Label: 14, (urine red)

Dose 1–3 capsules at night; CHILD 6–12 years 1 capsule at night (restricted indications, see notes above)

Brands include *Normax®* SHS

Suspension, yellow, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL). Net price 200 mL = £8.75. Label: 14, (urine red)

Dose 5–15 mL at night; CHILD 6–12 years 5 mL at night (restricted indications, see notes above)

Brands include *Normax®*

DOCUSATE SODIUM

(Dioctyl sodium sulphosuccinate)

Indications constipation, adjunct in abdominal radiological procedures

Cautions see notes above; do not give with liquid paraffin; rectal preparations not indicated if haemorrhoids or anal fissure; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- By mouth, chronic constipation, up to 500 mg daily in divided doses; CHILD (but see section 1.6) 6 months–2 years 12.5 mg 3 times daily, 2–12 years

12.5–25 mg 3 times daily (use paediatric oral solution only)

Note Oral preparations act within 1–2 days

With barium meal, ADULT and CHILD over 12 years, 400 mg

Dioctyl® (UCB Pharma)

Capsules, yellow/white, docusate sodium 100 mg, net price 30-cap pack = £1.92, 100-cap pack = £6.40

Docusol® (Typharm)

Adult oral solution, sugar-free, docusate sodium 50 mg/5 mL, net price 300 mL = £5.49

Paediatric oral solution, sugar-free, docusate sodium 12.5 mg/5 mL, net price 300 mL = £5.29

Rectal preparations

Norgalax Micro-enema® (Norgine)

Enema, docusate sodium 120 mg in 10-g single-dose disposable packs. Net price 10-g unit = 57p

Dose ADULT and CHILD (but see section 1.6) over 12 years, 10-g unit

GLYCEROL

(Glycerin)

Indications constipation

Dose

- See below

Glycerol Suppositories, BP
(Glycerin Suppositories)

Suppositories, gelatin 140 mg, glycerol 700 mg, purified water to 1 g, net price 12 = £1.04 (1 g), £1.02 (2 g), £1.47 (4 g)

Dose 1 suppository moistened with water before use, when required. The usual sizes are for INFANT under 1 year, small (1-g mould), CHILD 1–12 years medium (2-g mould), ADULT and CHILD over 12 years, large (4-g mould)

SENNA

Indications constipation

Cautions see notes above; pregnancy, see p. 59

Contra-indications see notes above

Side-effects see notes above

Dose

- See under preparations

Note Acts in 8–12 hours

Senna (Non-proprietary)

Tablets, total sennosides (calculated as sennoside B) 7.5 mg. Net price 60 = £1.89

Dose 2–4 tablets, usually at night; initial dose should be low then gradually increased; CHILD (but see section 1.6) 6–12 years, half adult dose in the morning (on doctor's advice only)

Note Lower dose on packs on sale to the public

Brands include *Senokot®* (SHS)

Manevac® (Galen)

Granules, coated, senna fruit 12.4%, ispaghula 54.2%, net price 400 g = £7.45. Label: 25, 27, counselling, see Ispaghula Husk

Dose 1–2 level 5-mL spoonfuls with water or warm drink after supper and, if necessary, before breakfast *or* every 6 hours in resistant cases for 1–3 days; CHILD (but see section 1.6) 5–12 years 1 level 5-mL spoonful daily

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Senokot® (R&C)

Tablets (SHS), see above

Syrup, sugar-free, brown, total sennosides (calculated as sennoside B) 7.5 mg/5 mL, net price 500 mL = £2.69

Dose 10–20 mL, usually at bedtime; CHILD (but see section 1.6) 1 month–2 years see *BNF for Children*, 2–6 years 2.5–5 mL in the morning, 6–12 years 5–10 mL at night or in the morning

Note Lower dose on packs on sale to the public

SODIUM PICOSULFATE

(Sodium picosulphate)

Indications constipation; bowel evacuation before abdominal radiological and endoscopic procedures on the colon, and surgery (section 1.6.5); acts within 6–12 hours

Cautions see notes above; active inflammatory bowel disease (avoid if fulminant); pregnancy, see p. 59; breast-feeding (Appendix 5)

Contra-indications see notes above; severe dehydration

Side-effects see notes above

Dose

- 5–10 mg at night; CHILD (but see section 1.6) 1 month–4 years 250 micrograms/kg (max. 5 mg) at night; 4–10 years 2.5–5 mg at night; over 10 years, adult dose

Sodium Picosulfate (Non-proprietary)

Elixir, sodium picosulfate 5 mg/5 mL, net price 100 mL = £1.85

Note The brand name *Dulcolax® Liquid* (Boehringer Ingelheim) is used for sodium picosulfate elixir 5 mg/5 mL

Dulcolax® (Boehringer Ingelheim)

Perles® (= capsules), sodium picosulfate 2.5 mg, net price 20-cap pack = £1.93, 50-cap pack = £2.73

Note The brand name *Dulcolax®* is also used for bisacodyl tablets and suppositories

Bowel cleansing preparations

Section 1.6.5

Other stimulant laxatives

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be **avoided** as their laxative action is unpredictable. Aloes, colocynth, and jalap should be **avoided** as they have a drastic purgative action.

1.6.3 Faecal softeners

Liquid paraffin, the traditional lubricant, has disadvantages (see below). Bulk laxatives (section 1.6.1) and non-ionic surfactant 'wetting' agents e.g. docusate sodium (section 1.6.2) also have softening properties. Such drugs are useful for oral administration in the management of haemorrhoids and anal fissure; glycerol (section 1.6.2) is useful for rectal use.

Enemas containing **arachis oil** (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.

ARACHIS OIL

Indications see notes above

Dose

- See below

Arachis Oil Enema (Non-proprietary)

Enema, arachis (peanut) oil in 130-mL single-dose disposable packs. Net price 130 mL = £7.98

Dose to soften impacted faeces, 130 mL; the enema should be warmed before use; CHILD (but see section 1.6) under 3 years not recommended; over 3 years reduce adult dose in proportion to body-weight (medical supervision only), see *BNF for Children*

LIQUID PARAFFIN

Indications constipation

Cautions avoid prolonged use; contra-indicated in children under 3 years

Side-effects anal seepage of paraffin and consequent anal irritation after prolonged use, granulomatous reactions caused by absorption of small quantities of liquid paraffin (especially from the emulsion), lipoid pneumonia, and interference with the absorption of fat-soluble vitamins

Dose

- See under preparation

Liquid Paraffin Oral Emulsion, BP

Oral emulsion, liquid paraffin 5 mL, vanillin 5 mg, chloroform 0.025 mL, benzoic acid solution 0.2 mL, methylcellulose-20 200 mg, saccharin sodium 500 micrograms, water to 10 mL

Dose ADULT over 18 years, 10–30 mL at night when required

Counselling Should not be taken immediately before going to bed

1.6.4 Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

Lactulose is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of *hepatic encephalopathy*.

Macrogols are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Saline purgatives such as **magnesium hydroxide** are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. **Magnesium salts** are useful where rapid bowel evacuation is required. **Sodium salts** should be avoided as they may give rise to sodium and water retention in susceptible individuals. **Phosphate enemas** are useful in bowel clearance before radiology, endoscopy, and surgery.

LACTULOSE

Indications constipation (may take up to 48 hours to act), hepatic encephalopathy (portal systemic encephalopathy)

Cautions lactose intolerance; **interactions:** Appendix 1 (lactulose)

Contra-indications galactosaemia, intestinal obstruction

Side-effects flatulence, cramps, and abdominal discomfort

Dose

- See under preparations below

Lactulose (Non-proprietary)

Solution, lactulose 3.1–3.7 g/5 mL with other ketoses. Net price 300-mL pack = £2.64, 500-mL pack = £2.95

Dose constipation, initially 15 mL twice daily, adjusted according to patient's needs; CHILD (adjusted according to response but see section 1.6) under 1 year 2.5 mL twice daily, 1–5 years 5 mL twice daily, 5–10 years 10 mL twice daily

Hepatic encephalopathy, 30–50 mL 3 times daily, subsequently adjusted to produce 2–3 soft stools daily; CHILD 12–18 years see *BNF for Children*

Brands include *Duphalac®* (PHS), *Lactugal®*, *Regulose®*

MACROGOLS

(Polyethylene glycols)

Indications see preparations below

Cautions pregnancy (Appendix 4); breast-feeding (Appendix 5); discontinue if symptoms of fluid and electrolyte disturbance; see also preparations below

Contra-indications intestinal perforation or obstruction, paralytic ileus, severe inflammatory conditions of the intestinal tract (such as Crohn's disease, ulcerative colitis, and toxic megacolon), see also preparations below

Side-effects abdominal distension and pain, nausea

Dose

- See preparations below

Macrogol Oral Powder, Compound (Non-proprietary)

Oral powder, macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack = £4.45, 30-sachet pack = £6.68. Label: 13

Cautions patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

Dose chronic constipation, ADULT and CHILD over 12 years, 1–3 sachets daily in divided doses usually for up to 2 weeks; contents of each sachet dissolved in half a glass (approx. 125 mL) of water; maintenance, 1–2 sachets daily

Faecal impaction, ADULT and CHILD over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Laxido® (Galen)

Oral powder, orange-flavoured, macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack = £3.56, 30-sachet pack = £5.34. Label: 13

Note Also available in natural flavour (sugar-free)

Cautions patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

Dose chronic constipation, ADULT and CHILD over 12 years, 1–3 sachets daily in divided doses usually for up to 2 weeks; contents of each sachet dissolved in half a glass (approx. 125 mL) of water; maintenance, 1–2 sachets daily

Faecal impaction, ADULT and CHILD over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Movicol® (Norgine)

Oral powder, macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack (lime and lemon flavour) = £4.45, 30-sachet pack (lime- and lemon- or

chocolate- or plain-flavoured) = £6.68, 50–sachet pack (lime- and lemon- or plain-flavoured) = £11.13. Label: 13

Note Amount of potassium chloride varies according to flavour of *Movicol®* as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K^+ 5.4 mmol/litre

Cautions patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

Dose chronic constipation, ADULT and CHILD over 12 years, 1–3 sachets daily in divided doses usually for up to 2 weeks; contents of each sachet dissolved in half a glass (approx. 125 mL) of water; maintenance, 1–2 sachets daily

Faecal impaction, ADULT and CHILD over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Movicol®-Half (Norgine)

Oral powder, sugar-free, macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet, net price 20-sachet pack (lime and lemon flavour) = £2.67, 30-sachet pack = £4.01. Label: 13

Cautions patients with cardiovascular impairment should not take more than 4 sachets in any 1 hour

Dose chronic constipation, ADULT and CHILD over 12 years, 2–6 sachets daily in divided doses usually for up to 2 weeks; content of each sachet dissolved in quarter of a glass (approx. 60–65 mL) of water; maintenance, 2–4 sachets daily

Faecal impaction, ADULT and CHILD over 12 years, 16 sachets daily dissolved in 1litre of water and drunk within 6 hours, usually for max. 3 days

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Movicol® Paediatric Plain (Norgine) PoM

Oral powder, sugar-free, macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 25.1 mg/sachet, net price 30-sachet pack = £4.45. Label: 13

Cautions *with high doses*, impaired gag reflex, reflux oesophagitis, impaired consciousness

Contra-indications cardiovascular impairment; renal impairment

Dose chronic constipation and recurrence of faecal impaction, CHILD 2–6 years 1 sachet daily; 7–11 years 2 sachets daily; adjust according to response, max. 4 sachets daily

Faecal impaction, CHILD (taken in divided doses over 12 hours each day until impaction resolves or for max. 7 days) 5–11 years 4 sachets on first day then increased in steps of 2 sachets daily to 12 sachets daily; content of each sachet dissolved in quarter of a glass (approx. 60–65 mL) of water

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours

MAGNESIUM SALTS

Indications see under preparations below

Cautions renal impairment (Appendix 3; risk of magnesium accumulation); hepatic impairment (see Appendix 2); elderly and debilitated; see also notes above; **interactions:** Appendix 1 (antacids)

Contra-indications acute gastro-intestinal conditions

Side-effects colic

Dose

- See preparations

Magnesium hydroxide

Magnesium Hydroxide Mixture, BP

Aqueous suspension containing about 8% hydrated magnesium oxide. Do not store in cold place

Dose constipation, 30–45 mL with water at bedtime when required; CHILD 3–12 years, 5–10 mL with water at bedtime when required

Magnesium hydroxide with liquid paraffin

Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP

Oral emulsion, 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide

Dose constipation, 5–20 mL when required

Note Liquid paraffin and magnesium hydroxide preparations on sale to the public include: *Milpar®* ₩H

Magnesium sulphate

Magnesium Sulphate

Label: 13, 23

Dose rapid bowel evacuation (acts in 2–4 hours) 5–10 g in a glass of water preferably before breakfast

Note Magnesium sulphate is on sale to the public as Epsom Salts

Bowel cleansing preparations

Section 1.6.5

PHOSPHATES (RECTAL)

Indications rectal use in constipation; bowel evacuation before abdominal radiological procedures, endoscopy, and surgery

Cautions elderly and debilitated; *with enema*, electrolyte disturbances, renal impairment, congestive heart failure, ascites, uncontrolled hypertension, maintain adequate hydration

Contra-indications acute gastro-intestinal conditions (including gastro-intestinal obstruction, inflammatory bowel disease, and conditions associated with increased colonic absorption)

Side-effects local irritation; *with enema*, electrolyte disturbances

Dose

- See under preparations

Carbalax® (Forest)

Suppositories, sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g, net price 12 = £2.01

Dose constipation, ADULT and CHILD over 12 years, 1 suppository, inserted 30 minutes before evacuation required; moisten with water before use

Fleet® Ready-to-use Enema (De Witt)

Enema, sodium acid phosphate 21.4 g, sodium phosphate 9.4 g/118 mL, net price 133-mL pack (delivers 118 mL dose) with standard tube = 57p

Dose ADULT and CHILD (but see section 1.6) over 12 years, 118 mL; CHILD 3–12 years, on doctor's advice only (under 3 years not recommended)

Phosphates Enema BP Formula B

Enema, sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL. Net price 128 mL with standard tube = £2.98, with long rectal tube = £3.98

Dose 128 mL; CHILD (but see section 1.6) over 3 years, reduced according to body weight see *BNF for Children*

SODIUM CITRATE (RECTAL)

Indications rectal use in constipation

Cautions elderly and debilitated; see also notes above

Contra-indications acute gastro-intestinal conditions

Dose

- See under preparations

Micolette Micro-enema® (Pinewood)

Enema, sodium citrate 450 mg, sodium lauryl sulphoacetate 45 mg, glycerol 625 mg, together with potassium sorbate and sorbitol in a viscous solution, in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 38p

Dose ADULT and CHILD over 3 years, 5–10 mL (but see section 1.6)

Micralax Micro-enema® (UCB Pharma)

Enema, sodium citrate 450 mg, sodium alkylsulphoacetate 45 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 41p

Dose ADULT and CHILD over 3 years, 5 mL (but see section 1.6)

Relaxit Micro-enema® (Crawford)

Enema, sodium citrate 450 mg, sodium lauryl sulphate 75 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 32p

Dose ADULT and CHILD (but see section 1.6) 5 mL (insert only half nozzle length in child under 3 years)

1.6.5 Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are **not** treatments for constipation.

Cautions Bowel cleansing preparations should be used with caution in patients with fluid and electrolyte disturbances. Adequate hydration should be maintained during treatment. Bowel cleansing preparations should also be used with caution in children, in the elderly, in those who are debilitated, in renal impairment (Appendix 3), or during pregnancy and breast-feeding.

Contra-indications Bowel cleansing preparations are contra-indicated in patients with gastro-intestinal obstruction or perforation, gastric retention, or toxic megacolon.

Side-effects Side-effects of bowel cleansing preparations include nausea, vomiting, abdominal pain (usually transient—reduced by taking more slowly), and abdominal distention. Less frequent side-effects include headache, dizziness, dehydration, and electrolyte disturbances.

MACROGOLS

Indications see notes above

Cautions see notes above; also heart failure; acute inflammatory bowel disease; impaired gag reflex, impaired consciousness or possibility of regurgitation or aspiration

Contra-indications see notes above; also gastro-intestinal ulceration

Side-effects see notes above; also fatigue, sleep disturbances, and anal discomfort

Dose

- See preparations

Klean-Prep® (Norgine)

Oral powder, sugar-free, macrogol '3350' (polyethylene glycol '3350') 59 g, anhydrous sodium sulphate 5.685 g, sodium bicarbonate 1.685 g, sodium chloride 1.465 g, potassium chloride 743 mg/sachet, net price 4 sachets = £8.23. Label: 10, patient information leaflet, 13, counselling

Excipients include aspartame (section 9.4.1)

Four sachets when reconstituted with water to 4 litres provides an iso-osmotic solution for bowel cleansing before surgery, colonoscopy or radiological procedures

Dose a glass (approx. 250 mL) of reconstituted solution every 10–15 minutes, or by nasogastric tube 20–30 mL/minute, until 4 litres have been consumed or watery stools are free of solid matter; CHILD not recommended

The solution from all 4 sachets should be drunk within 4–6 hours (250 mL drunk rapidly every 10–15 minutes); flavouring such as clear fruit cordials may be added if required; to facilitate gastric emptying domperidone or metoclopramide may be given 30 minutes before starting.

Alternatively the administration may be divided into two, e.g. taking the solutions from 2 sachets on the evening before examination and the remaining 2 on the morning of the examination

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours

Note 1 sachet when reconstituted with 1 litre of water provides Na^+ 125 mmol, K^+ 10 mmol

Moviprep® (Norgine)

Oral powder, lemon-flavoured, *Sachet A* (containing macrogol '3350' (polyethylene glycol '3350') 100 g, anhydrous sodium sulphate 7.5 g, sodium chloride 2.691 g, potassium chloride 1.015 g) and *Sachet B* (containing ascorbic acid 4.7 g, sodium ascorbate 5.9 g), net price 4-sachet pack (2 each of sachet A and B) = £9.87. Label: 10, patient information leaflet, 13, counselling, see below

Excipients include aspartame (section 9.4.1)

Contra-indications G6PD deficiency

Dose bowel evacuation for surgery, colonoscopy or radiological examination, ADULT over 18 years, 2 litres of reconstituted solution on the evening before procedure *or* 1 litre of reconstituted solution on the evening before procedure and 1 litre of reconstituted solution early on the morning of procedure; treatment should be completed at least 1 hour before colonoscopy

Counselling One pair of sachets (A and B) should be reconstituted in 1 litre of water (providing absorbable Na^+ 56.2 mmol, K^+ 14.2 mmol/litre) and taken over 1–2 hours. Solid food should not be taken during treatment. 1 litre of other clear fluid should also be taken during treatment

MAGNESIUM CITRATE

Reconstitution of a sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate

Indications see preparations

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- See preparations

Citramag® (Sanochemia)

Oral powder, sugar-free, effervescent, magnesium carbonate 11.57 g, anhydrous citric acid 17.79 g/sachet, net price 10-sachet pack (lemon and lime

flavour) = £17.20. Label: 10, patient information leaflet, 13, counselling, see below

Dose bowel evacuation for surgery, colonoscopy or radiological examination, on day before procedure, 1 sachet at 8 a.m. and 1 sachet between 2 and 4 p.m.; CHILD 5–10 years one-third adult dose; over 10 years and frail ELDERLY one-half adult dose

Counselling The patient information leaflet advises that hot water (200 mL) is needed to make the solution and provides guidance on the timing and procedure for reconstitution; it also mentions need for high fluid, low residue diet beforehand (according to hospital advice), and explains that only clear fluids can be taken after *Citramag®* until procedure completed

PHOSPHATES (ORAL)

Indications see preparations

Cautions see notes above; also cardiac disease (avoid in congestive cardiac failure)

Contra-indications see notes above; also acute inflammatory bowel disease; ascites; congestive cardiac failure

Side-effects see notes above; also chest pain and asthenia

Dose

- See preparations

Diafalk® (Dr Falk)

Tablets, monobasic sodium phosphate monohydrate 1.102 g, disodium phosphate 398 mg. Contains 13.6 mmol Na^+/tablet. Net price 32-tab pack = £7.20. Label: 10, patient information leaflet, counselling, see below

Dose bowel evacuation before diagnostic procedure, ADULT over 18 years, 4 tablets every 15 minutes until a total of 20 tablets have been consumed on the evening before procedure, then on the next day (starting 3–5 hours before procedure) 4 tablets every 15 minutes until a total of 12 tablets have been consumed; do not repeat course within 7 days

Counselling On the day before procedure, a light, low-fibre breakfast may be consumed in the morning, clear liquid diet recommended after 12 noon. Each dose of 4 tablets to be taken with 250 mL clear liquid. Copious intake of water or other clear liquids recommended during treatment

Fleet Phospho-soda® (De Witt)

Oral solution, sugar-free, sodium dihydrogen phosphate dihydrate 24.4 g, disodium phosphate dodecahydrate 10.8 g/45 mL. Contains about 217 mmol Na^+/45 mL. Net price 2 × 45-mL bottles = £4.79. Label: 10, patient information leaflet, counselling

Dose bowel evacuation before colonic surgery, colonoscopy or radiological examination, ADULT and CHILD over 15 years, 45 mL diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water

Timing of doses is dependent on the time of the procedure

For morning procedure, first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure

For afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

Solid food must not be taken during dosing period; clear liquids or water should be substituted for meals

Acts within half to 6 hours of first dose

SODIUM PICOSULFATE WITH MAGNESIUM CITRATE

Indications see preparations

Cautions see notes above; also inflammatory bowel disease; recent gastro-intestinal surgery; cardiac disease (avoid in congestive cardiac failure)

Contra-indications see notes above; also gastro-intestinal ulceration; ascites; congestive cardiac failure

Side-effects see notes above; also anal discomfort, sleep disturbances, fatigue, and rash

Dose

- See preparations

CitraFleet® (De Witt)

Oral powder, sodium picosulfate 10 mg/sachet, with magnesium citrate. Contains 86 mmol Mg^{2+} and 5 mmol K^+/sachet. Net price 2-sachet pack (lemon-flavoured) = £3.25. Label: 10, patient information leaflet, 13, counselling, see below

Dose bowel evacuation on day before radiological examination, endoscopy, or surgery, ADULT over 18 years, 1 sachet before 8 a.m. then 1 sachet 6–8 hours later

Acts within 3 hours of first dose

Counselling One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking. Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment

Picolax® (Ferring)

Oral powder, sugar-free, sodium picosulfate 10 mg/sachet, with magnesium citrate. Contains 87 mmol Mg^{2+} and 5 mmol K^+/sachet. Net price 2-sachet pack = £3.39. Label: 10, patient information leaflet, 13, counselling, see below

Dose bowel evacuation on day before radiological procedure, endoscopy, or surgery, ADULT and CHILD over 9 years, 1 sachet before 8 a.m. then 1 sachet 6–8 hours later; CHILD 1–2 years, quarter sachet before 8 a.m. then quarter sachet 6–8 hours later; 2–4 years, half sachet before 8 a.m. then half sachet 6–8 hours later; 4–9 years, 1 sachet before 8 a.m. then half sachet 6–8 hours later

Acts within 3 hours of first dose

Counselling One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking. Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment

1.6.6 Peripheral opioid-receptor antagonists

Methylnaltrexone is a peripherally acting opioid-receptor antagonist that is licensed for the treatment of opioid-induced constipation in patients receiving palliative care, when response to other laxatives is inadequate; it should be used as an adjunct to existing laxative therapy. Methylnaltrexone does not alter the central analgesic effect of opioids. For the prevention of opioid-induced constipation in palliative care, see p. 16.

METHYLNALTREXONE BROMIDE

Indications opioid-induced constipation in terminally ill patients, when response to other laxatives is inadequate

Cautions diverticular disease; faecal impaction; patients with colostomy or peritoneal catheter; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications gastro-intestinal obstruction; acute surgical abdominal conditions; severe hepatic impairment (Appendix 2)

Side-effects abdominal pain, nausea, diarrhoea, flatulence; dizziness; injection site reactions

Dose

- By subcutaneous injection, ADULT over 18 years, body-weight under 38 kg, 150 micrograms/kg on alternate days; body-weight 38–62 kg, 8 mg on alternate days; body-weight 62–114 kg, 12 mg on alternate days; body-weight over 114 kg, 150 micrograms/kg on alternate days; may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day; rotate sites of injection; max. duration of treatment 4 months

Note May act within 30–60 minutes

Relistor® (Wyeth) ▼ PoM

Injection, methylnaltrexone bromide 20 mg/mL, net price 0.6-mL vial = £21.05, 7-vial pack (with syringes and needles) = £147.35

1.7 Local preparations for anal and rectal disorders

1.7.1 Soothing haemorrhoidal preparations
1.7.2 Compound haemorrhoidal preparations with corticosteroids
1.7.3 Rectal sclerosants
1.7.4 Management of anal fissures

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories (section 1.7.1). These conditions occur commonly in patients suffering from haemorrhoids, fistulas, and proctitis. Cleansing with attention to any minor faecal soiling, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran (section 1.6.1) and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulfasalazine (see section 1.5).

When necessary topical preparations containing **local anaesthetics** (section 1.7.1) or **corticosteroids** (section 1.7.2) are used provided perianal thrush has been excluded. Perianal thrush is best treated with **nystatin** by mouth and by local application (see section 5.2, section 7.2.2, and section 13.10.2).

For the management of *anal fissures*, see section 1.7.4.

1.7.1 Soothing haemorrhoidal preparations

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

Local anaesthetics are used to relieve pain associated with *haemorrhoids* and *pruritus ani* but good evidence is lacking. Lidocaine (lignocaine) ointment (section 15.2) is used before emptying the bowel to relieve pain associated with *anal fissure*. Alternative local anaesthetics include tetracaine (amethocaine), cinchocaine (dibucaine), and pramocaine (pramoxine), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be **avoided**, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

1.7.2 Compound haemorrhoidal preparations with corticosteroids

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin. See section 13.4 for general comments on topical corticosteroids and section 1.7.1 for comment on local anaesthetics.

Children Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child's fear of defaecation.

Anugesic-HC® (Pfizer) PoM

Cream, benzyl benzoate 1.2%, bismuth oxide 0.875%, hydrocortisone acetate 0.5%, Peru balsam 1.85%, pramocaine hydrochloride 1%, zinc oxide 12.35%. Net price 30 g (with rectal nozzle) = £3.71

Dose apply night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Suppositories, buff, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 5 mg, Peru balsam 49 mg, pramocaine hydrochloride 27 mg, zinc oxide 296 mg, net price 12 = £2.69

Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Anusol-HC® (McNeil) PoM

Ointment, benzyl benzoate 1.25%, bismuth oxide 0.875%, bismuth subgallate 2.25%, hydrocortisone acetate 0.25%, Peru balsam 1.875%, zinc oxide 10.75%. Net price 30 g (with rectal nozzle) = £3.50

Dose apply night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Note A proprietary brand (*Anusol Plus HC®* ointment) is on sale to the public

Suppositories, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 10 mg, Peru balsam 49 mg, zinc oxide 296 mg. Net price 12 = £2.46

Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Note A proprietary brand (*Anusol Plus HC®* suppositories) is on sale to the public

Perinal® (Dermal)

Spray application, hydrocortisone 0.2%, lidocaine hydrochloride 1%. Net price 30-mL pack = £6.21

Dose ADULT and CHILD over 14 years, spray once over the affected area up to 3 times daily; do not use for longer than 7 days without medical advice; CHILD under 14 years on medical advice only

Proctofoam HC® (Meda) PoM

Foam in aerosol pack, hydrocortisone acetate 1%, pramocaine hydrochloride 1%. Net price 21.2-g pack (approx. 40 applications) with applicator = £5.06

Dose haemorrhoids and proctitis, 1 applicatorful (4–6 mg hydrocortisone acetate, 4–6 mg pramocaine hydrochloride) by rectum 2–3 times daily and after each bowel movement (max. 4 times daily); do not use for longer than 7 days; CHILD not recommended

Proctosedyl® (Aventis Pharma) PoM

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g = £10.34 (with cannula)

Dose apply morning and night and after a bowel movement, externally or by rectum; do not use for longer than 7 days

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £4.66

Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days

Scheriproct® (Valeant) PoM

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, prednisolone hexanoate 0.19%. Net price 30 g = £3.00

Dose apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

Suppositories, cinchocaine (dibucaine) hydrochloride 1 mg, prednisolone hexanoate 1.3 mg. Net price 12 = £1.41

Dose insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily)

Ultraproct® (Meadow) PoM

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, fluocortolone caproate 0.095%, fluocortolone pivalate 0.092%, net price 30 g (with rectal nozzle) = £4.57

Dose apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

Suppositories, cinchocaine (dibucaine) hydrochloride 1 mg, fluocortolone caproate 630 micrograms, fluocortolone pivalate 610 micrograms, net price 12 = £2.15

Dose insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily) then 1 suppository every other day for 1 week

Uniroid-HC® (Chemidex) PoM

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g (with applicator) = £4.23

Dose ADULT and CHILD over 12 years, apply twice daily and after a bowel movement, externally or by rectum; do not use for longer than 7 days; CHILD under 12 years on medical advice only

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £1.91

Dose ADULT and CHILD over 12 years, insert 1 suppository twice daily and after a bowel movement; do not use for longer than 7 days

Xyloproct® (AstraZeneca) PoM

Ointment (water-miscible), aluminium acetate 3.5%, hydrocortisone acetate 0.275%, lidocaine 5%, zinc oxide 18%, net price 20 g (with applicator) = £2.26

Dose apply several times daily; short-term use only

1.7.3 Rectal sclerosants

Oily phenol injection is used to inject haemorrhoids particularly when unprolapsed.

PHENOL

Indications see notes above

Side-effects irritation, tissue necrosis

Oily Phenol Injection, BP PoM

phenol 5% in a suitable fixed oil. Net price 5-mL amp = £5.00

Dose 2–3 mL into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time

Available from UCB Pharma

1.7.4 Management of anal fissures

The management of *anal fissures* requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help (section 1.7.1). If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment) may be considered. Before considering surgery, topical diltiazem 2% may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrates.

The *Scottish Medicines Consortium* (p. 3) has advised (January 2008) that glyceryl trinitrate 0.4% ointment (*Rectogesic®*) is **not** recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

GLYCERYL TRINITRATE

Indications anal fissure; angina, left ventricular failure (section 2.6.1); extravasation (section 10.3)

Cautions section 2.6.1

Contra-indications section 2.6.1

Side-effects section 2.6.1; also diarrhoea, burning, itching, and rectal bleeding

Dose

- See preparations

Rectogesic® (Strakan) ▼ PoM

Rectal ointment, glyceryl trinitrate 0.4%, net price 30 g = £34.80

Excipients include lanolin, propylene glycol

Dose ADULT over 18 years, apply 2.5 cm of ointment to anal canal every 12 hours until pain stops; max. duration of use 8 weeks

Note 2.5 cm of ointment contains glyceryl trinitrate 1.5 mg; discard tube 8 weeks after first opening

1.8 Stoma care

Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and *modified-release* preparations are **unsuitable**, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives Enemas and washouts should **not** be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. **Bulk-forming drugs** (section 1.6.1) should be tried. If they are insufficient, as small a dose as possible of senna (section 1.6.2) should be used.

Antidiarrhoeals Drugs such as **loperamide**, **codeine phosphate**, or **co-phenotrope** (diphenoxylate with atropine) are effective. Bulk-forming drugs (section 1.6.1) may be tried but it is often difficult to adjust the dose appropriately.

Antibacterials should **not** be given for an episode of acute diarrhoea.

Antacids The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

Diuretics Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a **potassium-sparing** diuretic (see section 2.2.3).

Digoxin Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin therapy and potassium supplements or a potassium-sparing diuretic may be advisable (for comment see section 9.2.1.1).

Potassium supplements Liquid formulations are preferred to modified-release formulations (see above).

Analgesics Opioid analgesics (see section 4.7.2) may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required **paracetamol** is usually suitable but anti-inflammatory analgesics may cause gastric irritation and bleeding.

Iron preparations Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated an intramuscular iron preparation (see section 9.1.1.2) should be used. Modified-release preparations should be **avoided** for the reasons given above.

Care of stoma Patients are usually given advice about the use of *cleansing agents*, *protective creams*, *lotions*, *deodorants*, or *sealants* whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1.9 Drugs affecting intestinal secretions

1.9.1 Drugs affecting biliary composition and flow
1.9.2 Bile acid sequestrants
1.9.3 Aprotinin
1.9.4 Pancreatin

1.9.1 Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid **ursodeoxycholic acid** in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment; it should be used cautiously in those with liver disease (but see below). Patients should be given dietary advice (including avoidance of excessive cholesterol and calories) and they require radiological monitoring. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment.

Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain. Ursodeoxycholic acid has also been tried in primary sclerosing cholangitis [unlicensed indication].

URSODEOXYCHOLIC ACID

Indications see under Dose and under preparations

Cautions see notes above; **interactions:** Appendix 1 (ursodeoxycholic acid)

Contra-indications radio-opaque stones, pregnancy (Appendix 4), non-functioning gall bladder, inflammatory diseases and other conditions of the small intestine, colon and liver which interfere with enterohepatic circulation of bile salts

Side-effects nausea, vomiting, diarrhoea; gallstone calcification; pruritus

Dose

- Dissolution of gallstones, 8–12 mg/kg daily as a single dose at bedtime *or* in two divided doses, for up to 2 years; treatment is continued for 3–4 months after stones dissolve
- Primary biliary cirrhosis, see under *Ursofalk®*

Ursodeoxycholic Acid (Non-proprietary) PoM

Tablets, ursodeoxycholic acid 150 mg, net price 60-tab pack = £18.51. Label: 21

Capsules, ursodeoxycholic acid 250 mg, net price 60-cap pack = £35.11. Label: 21

Destolit® (Norgine) PoM

Tablets, scored, ursodeoxycholic acid 150 mg, net price 60-tab pack = £17.67. Label: 21

Urdox® (CP) PoM

Tablets, f/c, ursodeoxycholic acid 300 mg, net price 60-tab pack = £26.50. Label: 21

Ursofalk® (Dr Falk) PoM

Capsules, ursodeoxycholic acid 250 mg, net price 60-cap pack = £30.75, 100-cap pack = £32.50. Label: 21

Suspension, sugar-free, ursodeoxycholic acid 250 mg/5 mL, net price 250 mL = £27.50. Label: 21

Dose primary biliary cirrhosis, 10–15 mg/kg daily as a single daily dose or in 2–4 divided doses

Dissolution of gallstones, see Dose, above

Ursogal® (Galen) PoM

Tablets, scored, ursodeoxycholic acid 150 mg, net price 60-tab pack = £17.05. Label: 21

Capsules, ursodeoxycholic acid 250 mg, net price 60-cap pack = £30.50. Label: 21

Other preparations for biliary disorders

A **terpene** mixture (*Rowachol®*) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.

Rowachol® (Rowa) PoM

Capsules, green, e/c, borneol 5 mg, camphene 5 mg, cineole 2 mg, menthol 32 mg, menthone 6 mg, pinene 17 mg in olive oil. Net price 50-cap pack = £7.35. Label: 22

Dose 1–2 capsules 3 times daily before food (but see notes above)

Interactions: Appendix 1 (*Rowachol®*)

1.9.2 Bile acid sequestrants

Colestyramine (cholestyramine) is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine. Colestyramine can interfere with the absorption of a number of drugs. Colestyramine is also used in hypercholesterolaemia (section 2.12).

COLESTYRAMINE
(Cholestyramine)

Indications pruritus associated with partial biliary obstruction and primary biliary cirrhosis; diarrhoea associated with Crohn's disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation; hypercholesterolaemia (section 2.12)

Cautions see section 2.12

Contra-indications see section 2.12

Side-effects see section 2.12

Dose

- Pruritus, 4–8 g daily in a suitable liquid; CHILD 1–18 years see *BNF for Children*
- Diarrhoea, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in a suitable liquid in 1–4 divided doses, then adjusted as required; max. 36 g daily; CHILD 1–18 years see *BNF for Children*

Counselling Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

Note The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content

Preparations

Section 2.12

1.9.3 Aprotinin

Aprotinin is no longer used for the treatment of acute pancreatitis.

1.9.4 Pancreatin

Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gastrectomy, or chronic pancreatitis. They assist the digestion of starch, fat, and protein. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). Gastric acid secretion may be reduced by giving cimetidine or ranitidine an hour beforehand (section 1.3). Concurrent use of antacids also reduces gastric acidity. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Higher-strength preparations are also available (**important:** see CSM advice below).

Since pancreatin is also inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour.

Dosage is adjusted according to size, number, and consistency of stools, so that the patient thrives; extra allowance will be needed if snacks are taken between meals.

Pancreatin can irritate the perioral skin and buccal mucosa if retained in the mouth, and excessive doses can cause perianal irritation. The most frequent side-effects are gastro-intestinal, including nausea, vomiting, and abdominal discomfort; hyperuricaemia and hyperuricosuria have been associated with very high doses. Hypersensitivity reactions occur occasionally and may affect those handling the powder.

PANCREATIN

Indications see above

Cautions see above and (for higher-strength preparations) see below

Side-effects see above and (for higher-strength preparations) see below

Dose

- See preparations

Creon® 10 000 (Solvay)

Capsules, brown/clear, enclosing buff-coloured e/c granules of pancreatin (pork), providing: protease 600 units, lipase 10 000 units, amylase 8000 units. Net price 100-cap pack = £14.00. Counselling, see dose

Dose ADULT and CHILD initially 1–2 capsules with each meal either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Creon® Micro (Solvay)

Gastro-resistant granules, brown, pancreatin (pork), providing: protease 200 units, lipase 5000 units, amylase 3600 units per 100 mg, net price 20 g = £31.50 Counselling, see dose

Dose ADULT and CHILD initially 100 mg with each meal either taken whole or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

Nutrizym 10® (Merck)

Capsules, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 500 units, lipase 10 000 units, amylase 9000 units. Net price 100 = £14.47. Counselling, see dose

Dose ADULT and CHILD 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing); higher doses may be required according to response

Pancrex® (Paines & Byrne)

Granules, pancreatin (pork), providing minimum of: protease 300 units, lipase 5000 units, amylase 4000 units/g. Net price 300 g = £20.39. Label: 25, counselling, see dose

Dose ADULT and CHILD 5–10 g just before meals washed down or mixed with a little milk or water

Pancrex V® (Paines & Byrne)

Capsules, pancreatin (pork), providing minimum of: protease 430 units, lipase 8000 units, amylase 9000 units. Net price 300-cap pack = £15.80. Counselling, see dose

Dose ADULT and CHILD over 1 year 2–6 capsules with each meal, swallowed whole or sprinkled on food; INFANT up to 1 year contents of 1–2 capsules mixed with feeds

Capsules '125', pancreatin (pork), providing minimum of: protease 160 units, lipase 2950 units, amylase 3300 units, net price 300-cap pack = £9.72. Counselling, see dose

Dose NEONATE contents of 1–2 capsules mixed with feeds

Tablets, e/c, pancreatin (pork), providing minimum of: protease 110 units, lipase 1900 units, amylase 1700 units. Net price 300-tab pack = £4.51. Label: 5, 25, counselling, see dose

Dose ADULT and CHILD 5–15 tablets before each meal

Tablets forte, e/c, pancreatin (pork), providing minimum of: protease 330 units, lipase 5600 units, amylase 5000 units. Net price 300-tab pack = £13.74. Label: 5, 25, counselling, see dose

Dose ADULT and CHILD 6–10 tablets before each meal

Powder, pancreatin (pork), providing minimum of: protease 1400 units, lipase 25 000 units, amylase 30 000 units/g. Net price 300 g = £24.28. Counselling, see dose

Dose ADULT and CHILD over 1 month, 0.5–2 g before each meal, washed down or mixed with liquid; NEONATE 250–500 mg with each feed

Higher-strength preparations

The **CSM** has advised of data associating the high-strength pancreatin preparations *Nutrizym 22®* and *Pancreatin HL®* with the development of large bowel strictures (fibrosing colonopathy) in children with cystic fibrosis aged between 2 and 13 years. No association was found with *Creon® 25 000*. The following was recommended:

- *Pancrease HL®*, *Nutrizym 22®*, *Panzytrat® 25 000* [now discontinued] should not be used in children aged 15 years or less with cystic fibrosis;
- the total dose of pancreatic enzyme supplements used in patients with cystic fibrosis should not usually exceed 10 000 units of lipase per kg bodyweight daily;
- if a patient on any pancreatin preparation develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

Possible risk factors are gender (boys at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years.

Counselling It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

Creon® 25 000 (Solvay) PoM

Capsules, orange/clear, enclosing brown-coloured e/c pellets of pancreatin (pork), providing: protease (total) 1000 units, lipase 25 000 units, amylase 18 000 units, net price 100-cap pack = £28.25. Counselling, see above and under dose

Dose ADULT and CHILD initially 1 capsule with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Creon® 40 000 (Solvay) PoM

Capsules, brown/clear, enclosing brown-coloured e/c granules of pancreatin (pork), providing: protease (total) 1600 units, lipase 40 000 units, amylase 25 000 units, net price 100-cap pack = £60.00. Counselling, see above and under dose

Dose ADULT and CHILD initially 1–2 capsules with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Nutrizym 22® (Merck) PoM

Capsules, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 1100 units, lipase 22 000 units, amylase 19 800 units. Net price 100-cap pack = £33.33. Counselling, see above and under dose

Dose ADULT and CHILD over 15 years, 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing)

Pancrease HL® (Janssen-Cilag) PoM

Capsules, enclosing light brown e/c minitablets of pancreatin (pork), providing minimum of: protease 1250 units, lipase 25 000 units, amylase 22 500 units. Net price 100 = £32.34. Counselling, see above and under dose

Dose ADULT and CHILD over 15 years, 1–2 capsules during each meal and 1 capsule with snacks swallowed whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

- hypertension, p. 93
- myocardial infarction, p. 137
- phaeochromocytoma, p. 101

2.1 Positive inotropic drugs

2.1.1 Cardiac glycosides
2.1.2 Phosphodiesterase inhibitors

Positive inotropic drugs increase the force of contraction of the myocardium; for sympathomimetics with inotropic activity see section 2.7.1.

2.1.1 Cardiac glycosides

Cardiac glycosides increase the force of myocardial contraction and reduce conductivity within the atrioventricular (AV) node. Digoxin is the most commonly used cardiac glycoside.

Cardiac glycosides are most useful for controlling ventricular response in persistent atrial fibrillation and atrial flutter (section 2.3.1). For reference to the role of digoxin in heart failure, see section 2.5.5.

For management of atrial fibrillation the maintenance dose of the cardiac glycoside can usually be determined by the ventricular rate at rest, which should not be allowed to fall below 60 beats per minute except in special circumstances, e.g. with the concomitant administration of a beta-blocker.

Digoxin is now rarely used for rapid control of heart rate (see section 2.3 for the management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea). **Digitoxin** also has a long half-life and maintenance doses need to be given only once daily or on alternate days. Renal function is the most important determinant of digoxin dosage, whereas elimination of digitoxin depends on metabolism by the liver.

Unwanted effects depend both on the concentration of the cardiac glycoside in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Cardiac glycosides should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

Toxicity can often be managed by discontinuing digoxin; serious manifestations require urgent specialist management. **Digoxin-specific antibody fragments** are available for reversal of life-threatening overdosage (see below).

DIGOXIN

Indications heart failure (see also section 2.5.5), supraventricular arrhythmias (particularly atrial fibrillation and atrial flutter; see also section 2.3.2)

Cautions recent myocardial infarction; sick sinus syndrome; thyroid disease; reduce dose in the elderly; severe respiratory disease; hypokalaemia, hypomagnesaemia, hypercalcaemia, and hypoxia (risk of digitalis toxicity); monitor serum electrolytes and renal function; avoid rapid intravenous administration (risk of hypertension and reduced coronary flow); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (cardiac glycosides)

Contra-indications intermittent complete heart block, second degree AV block; supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome; ventricular tachycardia or fibrillation; hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution); myocarditis; constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution)

Side-effects see notes above; also nausea, vomiting, diarrhoea; arrhythmias, conduction disturbances; dizziness; blurred or yellow vision; rash, eosinophilia; *less commonly* depression; *very rarely* anorexia, intestinal ischaemia and necrosis, psychosis, apathy, confusion, headache, fatigue, weakness, gynaecomastia on long-term use, and thrombocytopenia

Dose

- Rapid digitalisation, for atrial fibrillation or flutter, by mouth, 0.75–1.5 mg over 24 hours in divided doses
- Maintenance, for atrial fibrillation or flutter, by mouth, according to renal function and initial loading dose; usual range 125–250 micrograms daily
- Heart failure (for patients in sinus rhythm), by mouth, 62.5–125 micrograms once daily
- Emergency loading dose, for atrial fibrillation or flutter, by intravenous infusion (but rarely necessary), 0.75–1 mg over at least 2 hours (see also Cautions) then maintenance dose by mouth on the following day

Note The above doses may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. Digoxin doses in the BNF may differ from those in product literature. For plasma concentration monitoring, blood should ideally be taken at least 6 hours after a dose

Digoxin (Non-proprietary) PoM

Tablets, digoxin 62.5 micrograms, net price 28 = £1.63; 125 micrograms, 28 = £1.29; 250 micrograms, 28 = £1.29

Injection, digoxin 250 micrograms/mL, net price 2-mL amp = 70p

Available from Antigen

Paediatric injection, digoxin 100 micrograms/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Lanoxin® (GSK) PoM

Tablets, digoxin 125 micrograms, net price 20 = 32p; 250 micrograms (scored), 20 = 32p

Injection, digoxin 250 micrograms/mL, net price 2-mL amp = 66p

Lanoxin-PG® (GSK) PoM

Tablets, blue, digoxin 62.5 micrograms, net price 20 = 32p

Elixir, yellow, digoxin 50 micrograms/mL. Do not dilute, measure with pipette. Net price 60 mL = £5.35. Counselling, use of pipette

DIGITOXIN

Indications heart failure, supraventricular arrhythmias (particularly atrial fibrillation)

Cautions see under Digoxin

Contra-indications see under Digoxin

Side-effects see under Digoxin

Dose

- Maintenance, 100 micrograms daily *or* on alternate days; may be increased to 200 micrograms daily if necessary

Digitoxin (Non-proprietary) PoM

Tablets, digitoxin 100 micrograms, net price 28 = £4.11

Digoxin-specific antibody

Digoxin-specific antibody fragments are indicated for the treatment of known or strongly suspected digoxin or digitoxin overdosage when measures beyond the withdrawal of the cardiac glycoside and correction of any electrolyte abnormalities are felt to be necessary (see also notes above).

Digibind® (GSK) PoM

Injection, powder for preparation of infusion, digoxin-specific antibody fragments (F(ab)) 38 mg, net price per vial = £93.97 (hosp. and poisons centres only)

Dose consult product literature

2.1.2 Phosphodiesterase inhibitors

Enoximone and **milrinone** are selective phosphodiesterase inhibitors which exert most of their effect on the myocardium. Sustained haemodynamic benefit has been observed after administration, but there is no evidence of any beneficial effect on survival.

ENOXIMONE

Indications congestive heart failure where cardiac output reduced and filling pressures increased

Cautions heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction; monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count, hepatic enzymes; avoid extravasation; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (phosphodiesterase inhibitors)

Side-effects ectopic beats; less frequently ventricular tachycardia or supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias); hypotension; also headache, insomnia, nausea and vomiting, diarrhoea; occasionally, chills, oliguria, fever, urinary retention; upper and lower limb pain

Dose

- By slow intravenous injection (rate not exceeding 12.5 mg/minute), diluted before use, initially 0.5–1 mg/kg, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required
- By intravenous infusion, initially 90 micrograms/kg/minute over 10–30 minutes, followed by continuous or intermittent infusion of 5–20 micrograms/kg/minute

  Total dose over 24 hours should not usually exceed 24 mg/kg

Perfan® (INCA-Pharm) PoM

Injection, enoximone 5 mg/mL. For dilution before use. Net price 20-mL amp = £15.02

Excipients include alcohol, propylene glycol

Note Plastic apparatus should be used; crystal formation if glass used

MILRINONE

Indications short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction); acute heart failure, including low output states following heart surgery

Cautions see under Enoximone; also correct hypokalaemia; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (phosphodiesterase inhibitors)

Side-effects ectopic beats, ventricular tachycardia, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias), hypotension; headache; *less commonly* ventricular fibrillation, chest pain, tremor, hypokalaemia, thrombocytopenia; *very rarely* bronchospasm, anaphylaxis, and rash

Dose

- By intravenous injection over 10 minutes, either undiluted or diluted before use, 50 micrograms/kg followed by intravenous infusion at a rate of 375–750 nanograms/kg/minute, usually for up to 12 hours following surgery or for 48–72 hours in congestive heart failure; max. daily dose 1.13 mg/kg

Primacor® (Sanofi-Aventis) PoM

Injection, milrinone (as lactate) 1 mg/mL, net price 10-mL amp = £16.61

2.2 Diuretics

2.2.1 Thiazides and related diuretics
2.2.2 Loop diuretics
2.2.3 Potassium-sparing diuretics and aldosterone antagonists
2.2.4 Potassium-sparing diuretics with other diuretics
2.2.5 Osmotic diuretics
2.2.6 Mercurial diuretics
2.2.7 Carbonic anhydrase inhibitors
2.2.8 Diuretics with potassium

Thiazides (section 2.2.1) are used to relieve oedema due to chronic heart failure (section 2.5.5) and, in lower doses, to reduce blood pressure.

Loop diuretics (section 2.2.2) are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure (section 2.5.5).

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

Potassium loss Hypokalaemia may occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics (section 2.2.3) avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis; diuretics may also increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias. Spironolactone, a potassium-sparing diuretic (section 2.2.3), is chosen for oedema arising from cirrhosis of the liver.

Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension (see also section 9.2.1.1).

2.2.1 Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide, e.g. bendroflumethiazide (bendrofluazide) 2.5 mg daily, produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. For reference to the use of thiazides in chronic heart failure see section 2.5.5.

Bendroflumethiazide (bendrofluazide) is widely used for mild or moderate heart failure and for hypertension—alone in the treatment of mild hypertension or with other drugs in more severe hypertension.

Chlortalidone (chlorthalidone), a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics.

Other thiazide diuretics (including benzthiazide, clopamide, cyclopenthiazide, hydrochlorothiazide, and hydroflumethiazide) do not offer any significant advantage over bendroflumethiazide or chlortalidone.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

Xipamide and **indapamide** are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Cautions See also section 2.2. Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus. Electrolytes should be monitored, particularly with high doses, long-term use, or in renal impairment. Thiazides and related diuretics should also be used with caution in nephrotic syndrome, hyperaldosteronism, malnourishment, hepatic impairment (avoid if severe; Appendix 2), renal impairment (Appendix 3), pregnancy (Appendix 4), and breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

Contra-indications Thiazides and related diuretics should be avoided in refractory hypokalaemia, hyponatraemia and hypercalcaemia, symptomatic hyperuricaemia, and Addison's disease.

Side-effects Side-effects of thiazides and related diuretics include mild gastro-intestinal disturbances, postural hypotension, altered plasma-lipid concentrations, metabolic and electrolyte disturbances including hypokalaemia (see also notes above), hyponatraemia, hypomagnesaemia, hypercalcaemia, hyperglycaemia, hypochloraemic alkalosis, hyperuricaemia, and gout. Less common side-effects include blood disorders such as agranulocytosis, leucopenia, and thrombocytopenia, and impotence. Pancreatitis, intrahepatic cholestasis, cardiac arrhythmias, headache, dizziness, paraesthesia, visual disturbances, and hypersensitivity reactions (including pneumonitis, pulmonary oedema, photosensitivity, and severe skin reactions) have also been reported.

BENDROFLUMETHIAZIDE
(Bendrofluazide)

Indications oedema, hypertension (see also notes above)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Oedema, initially 5–10 mg daily in the morning *or* on alternate days; maintenance 5–10 mg 1–3 times weekly
- Hypertension, 2.5 mg daily in the morning; higher doses rarely necessary (see notes above)

Bendroflumethiazide (Non-proprietary) PoM

Tablets, bendroflumethiazide 2.5 mg, net price 28 = 81p; 5 mg, 28 = 85p

Brands include *Aprinox®*, *Neo-NaClex®*

CHLORTALIDONE
(Chlorthalidone)

Indications ascites due to cirrhosis in stable patients (under close supervision), oedema due to nephrotic syndrome, hypertension (see also notes above), mild to moderate chronic heart failure; diabetes insipidus (see section 6.5.2)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also *rarely* jaundice and allergic interstitial nephritis

Dose

- Oedema, up to 50 mg daily
- Hypertension, 25 mg daily in the morning, increased to 50 mg daily if necessary (but see notes above)
- Heart failure, 25–50 mg daily in the morning, increased if necessary to 100–200 mg daily (reduce to lowest effective dose for maintenance)

Hygroton® (Alliance) PoM
Tablets, yellow, scored, chlortalidone 50 mg, net price 28-tab pack = £1.52

CYCLOPENTHIAZIDE

Indications oedema, hypertension (see also notes above); heart failure
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above; also *rarely* depression
Dose

- Heart failure, 250–500 micrograms daily in the morning increased if necessary to 1 mg daily (reduce to lowest effective dose for maintenance)
- Hypertension, initially 250 micrograms daily in the morning, increased if necessary to 500 micrograms daily (but see notes above)
- Oedema, up to 500 micrograms daily for a short period

Navidrex® (Goldshield) PoM
Tablets, scored, cyclopenthiazide 500 micrograms, net price 28-tab pack = £1.27
Excipients include gluten

INDAPAMIDE

Indications essential hypertension
Cautions see notes above; also acute porphyria (section 9.8.2)
Contra-indications see notes above; also hypersensitivity to sulphonamides
Side-effects see notes above; also palpitation, diuresis with doses above 2.5 mg daily
Dose

- 2.5 mg daily in the morning

Indapamide (Non-proprietary) PoM
Tablets, s/c, indapamide 2.5 mg, net price 28-tab pack = £1.27, 56-tab pack = £1.88

Natrilix® (Servier) PoM
Tablets, f/c, indapamide 2.5 mg. Net price 30-tab pack = £4.32, 60-tab pack = £8.64

Modified release

Ethibide XL® (Genus) PoM
Tablets, m/r, indapamide 1.5 mg, net price 30-tab pack = £4.05. Label: 25
Dose hypertension, 1 tablet daily, preferably in the morning

Natrilix SR® (Servier) PoM
Tablets, m/r, indapamide 1.5 mg, net price 30-tab pack = £4.32. Label: 25
Dose hypertension, 1 tablet daily, preferably in the morning

METOLAZONE

Indications oedema, hypertension (see also notes above)
Cautions see notes above; also acute porphyria (section 9.8.2)
Contra-indications see notes above
Side-effects see notes above; also chills, chest pain
Dose

- Oedema, 5–10 mg daily in the morning, increased if necessary to 20 mg daily in resistant oedema, max. 80 mg daily
- Hypertension, initially 5 mg daily in the morning; maintenance 5 mg on alternate days

Metenix 5® (Sanofi-Aventis) PoM
Tablets, blue, metolazone 5 mg, net price 100-tab pack = £18.20

XIPAMIDE

Indications oedema, hypertension (see also notes above)
Cautions see notes above; also acute porphyria (section 9.8.2)
Contra-indications see notes above
Side-effects see notes above
Dose

- Oedema, initially 40 mg daily in the morning, increased to 80 mg in resistant cases; maintenance 20 mg in the morning
- Hypertension, 20 mg daily in the morning

Diurexan® (Viatris) PoM
Tablets, scored, xipamide 20 mg, net price 140-tab pack = £19.46

2.2.2 Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide 5–10 mg daily or metolazone 5–20 mg daily).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics. Hypokalaemia may develop, and care is needed to avoid hypotension. If there is an enlarged prostate, urinary retention may occur; this is less likely if small doses and less potent diuretics are used initially.

Furosemide (frusemide) and **bumetanide** are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration they have a peak effect within 30 minutes. The diuresis associated with these drugs is dose related. In patients with impaired renal function very large doses

may occasionally be needed; in such doses both drugs can cause deafness and bumetanide can cause myalgia.

Torasemide has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

FUROSEMIDE
(Frusemide)

Indications oedema (see notes above); resistant hypertension (see notes above)

Cautions section 2.2; also monitor electrolytes; hypotension; prostatic enlargement; impaired micturition; gout; diabetes; intravenous administration rate should not usually exceed 4 mg/minute, however single doses of up to 80 mg may be administered more rapidly; a lower infusion rate may be considered in those with renal impairment; hepatorenal syndrome; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

Contra-indications hypovolaemia, dehydration, severe hypokalaemia, severe hyponatraemia; comatose or precomatose states associated with liver cirrhosis; renal failure due to nephrotoxic or hepatotoxic drugs, anuria

Side-effects mild gastro-intestinal disturbances; hypotension; hyperglycaemia (less common than with thiazides); hyperuricaemia and gout; electrolyte disturbances including hyponatraemia, hypokalaemia (see also section 2.2), hypocalcaemia, and hypomagnesaemia, metabolic alkalosis; *rarely* paraethesia, blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia, haemolytic anaemia), bone marrow depression (withdraw treatment), tinnitus and deafness (usually with large parenteral doses and rapid administration, in renal impairment, or in hypoproteinaemia), and hypersensitivity reactions (including rashes, photosensitivity, eosinophilia, exfoliative dermatitis, purpura, and anaphylaxis), pancreatitis, intrahepatic cholestasis; temporary increase in plasma cholesterol and triglyceride concentration also reported

Dose

- By mouth, oedema, initially 40 mg in the morning; maintenance 20–40 mg daily; CHILD 1–3 mg/kg daily, max. 40 mg daily

  Resistant oedema, 80–120 mg daily

  Resistant hypertension, 40–80 mg daily
- By intramuscular injection *or* slow intravenous injection (rate of administration, see Cautions above), initially 20–50 mg, increased if necessary in steps of 20 mg not less than every 2 hours; doses greater than 50 mg by intravenous infusion only; max. 1.5 g daily; CHILD 0.5–1.5 mg/kg daily, max. 20 mg daily

Furosemide (Non-proprietary) PoM

Tablets, furosemide 20 mg, net price 28 = 81p; 40 mg, 28 = 85p; 500 mg, 28 = £3.66
Brands include *Froop®*, *Rusyde®*

Oral solution, sugar-free, furosemide, net price 20 mg/5 mL, 150 mL = £12.46; 40 mg/5 mL, 150 mL = £15.99; 50 mg/5 mL, 150 mL = £17.39
Brands include *Frusol®* (contains alcohol 10%)

Injection, furosemide 10 mg/mL, net price 2-mL amp = 55p, 5-mL amp = 66p, 25-mL amp = £2.50

Lasix® (Sanofi-Aventis) PoM

Injection, furosemide 10 mg/mL, net price 2-mL amp = 75p

Note Large-volume furosemide injections also available; brands include *Minijet®*

BUMETANIDE

Indications oedema (see notes above)

Cautions see under Furosemide; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications see under Furosemide

Side-effects see under Furosemide; also headache, dizziness, fatigue, gynaecomastia, myalgia

Dose

- By mouth, 1 mg in the morning, repeated after 6–8 hours if necessary; severe cases, 5 mg daily increased by 5 mg every 12–24 hours according to response; ELDERLY, 500 micrograms daily may be sufficient
- By intravenous injection, 1–2 mg, repeated after 20 minutes if necessary; ELDERLY, 500 micrograms daily may be sufficient
- By intravenous infusion, 2–5 mg over 30–60 minutes; ELDERLY, 500 micrograms daily may be sufficient
- By intramuscular injection, 1 mg initially then adjusted according to response; ELDERLY, 500 micrograms daily may be sufficient

Bumetanide (Non-proprietary) PoM

Tablets, bumetanide 1 mg, net price 28-tab pack = £1.25; 5 mg, 28-tab pack = £2.48

Oral liquid, bumetanide 1 mg/5 mL, net price 150 mL = £128.00

Injection, bumetanide 500 micrograms/mL, net price 4-mL amp = £1.79

Burinex® (LEO) PoM

Tablets, scored, bumetanide 1 mg, net price 28-tab pack = £1.52; 5 mg, 28 = £9.67

TORASEMIDE

Indications oedema (see notes above), hypertension

Cautions see under Furosemide; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

Contra-indications see under Furosemide

Side-effects see under Furosemide; also dry mouth; rarely limb paraesthesia

Dose

- Oedema, 5 mg once daily, preferably in the morning, increased if required to 20 mg once daily; usual max. 40 mg daily
- Hypertension, 2.5 mg daily, increased if necessary to 5 mg once daily

Torasemide (Non-proprietary) PoM

Tablets, torasemide 5 mg, net price 28-tab pack = £5.64; 10 mg, 28-tab pack = £8.10

Torem® (Roche) PoM

Tablets, torasemide 2.5 mg, net price 28-tab pack = £3.43; 5 mg (scored), 28-tab pack = £4.97; 10 mg (scored), 28-tab pack = £8.14

2.2.3 Potassium-sparing diuretics and aldosterone antagonists

Amiloride and **triamterene** on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See section 2.2.4 for compound preparations with thiazides or loop diuretics.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

AMILORIDE HYDROCHLORIDE

Indications oedema; potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension, congestive heart failure, or hepatic cirrhosis with ascites

Cautions monitor electrolytes; diabetes mellitus; elderly; renal impairment (manufacturers advise avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

Contra-indications hyperkalaemia; anuria; Addison's disease

Side-effects include gastro-intestinal disturbances, dry mouth, rashes, confusion, postural hypotension, hyperkalaemia, hyponatraemia

Dose

- Used alone, initially 10 mg daily *or* 5 mg twice daily, adjusted according to response; max. 20 mg daily
- With other diuretics, congestive heart failure and hypertension, initially 5–10 mg daily; cirrhosis with ascites, initially 5 mg daily

Amiloride (Non-proprietary) PoM

Tablets, amiloride hydrochloride 5 mg, net price 28-tab pack = 97p

Oral solution, sugar-free, amiloride hydrochloride 5 mg/5 mL, net price 150 mL = £39.73

Brands include *Amilamont®* (Excipients include propylene glycol, see Excipients, p. 2)

Compound preparations with thiazide or loop diuretics

Section 2.2.4

TRIAMTERENE

Indications oedema, potassium conservation with thiazide and loop diuretics

Cautions see under Amiloride Hydrochloride; may cause blue fluorescence of urine

Contra-indications see under Amiloride Hydrochloride

Side-effects include gastro-intestinal disturbances, dry mouth, rashes; slight decrease in blood pressure, hyperkalaemia, hyponatraemia; photosensitivity and blood disorders also reported; triamterene found in kidney stones

Dose

- Initially 150–250 mg daily, reducing to alternate days after 1 week; taken in divided doses after breakfast and lunch; lower initial dose when given with other diuretics

  Counselling Urine may look slightly blue in some lights

Dytac® (Goldshield) PoM

Capsules, maroon, triamterene 50 mg, net price 30-cap pack = £17.35 Label: 14, (see above), 21

Compound preparations with thiazides or loop diuretics

Section 2.2.4

Aldosterone antagonists

Spironolactone potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide (section 2.2.2) can be used as an adjunct. Low doses of spironolactone are beneficial in severe heart failure, see section 2.5.5.

Spironolactone is also used in primary hyperaldosteronism (Conn's syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction (see also section 2.5.5 and section 2.10.1).

Potassium supplements must **not** be given with aldosterone antagonists.

EPLERENONE

Indications adjunct in stable patients with left ventricular dysfunction with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event)

Cautions measure plasma-potassium concentration before treatment, during initiation, and when dose changed; elderly; hepatic impairment (Appendix 2); renal impairment (avoid if eGFR less than 50 mL/minute/1.73 m^2; Appendix 3); pregnancy; breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

Contra-indications hyperkalaemia; concomitant use of potassium-sparing diuretics or potassium supplements

Side-effects diarrhoea, nausea; hypotension; dizziness; hyperkalaemia; rash; *less commonly* flatulence, vomiting, atrial fibrillation, postural hypotension, arterial thrombosis, dyslipidaemia, pharyngitis, headache, insomnia, gynaecomastia, pyelonephritis, hyponatraemia, dehydration, eosinophilia, asthenia, malaise, back pain, leg cramps, impaired renal function, azotaemia, sweating and pruritus

Dose

- Initially 25 mg once daily, increased within 4 weeks to 50 mg once daily; CHILD not recommended

Inspra® (Pfizer) ▼ PoM

Tablets, yellow, f/c, eplerenone 25 mg, net price 28-tab pack = £42.72; 50 mg, 28-tab pack = £42.72

SPIRONOLACTONE

Indications oedema and ascites in cirrhosis of the liver, malignant ascites, nephrotic syndrome, congestive heart failure (section 2.5.5); primary hyperaldosteronism

Cautions potential metabolic products carcinogenic in *rodents*; elderly; monitor electrolytes (discontinue if hyperkalaemia); acute porphyria (section 9.8.2); hepatic impairment; renal impairment (manufacturers advise avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

Contra-indications hyperkalaemia, hyponatraemia; Addison's disease

Side-effects gastro-intestinal disturbances; impotence, gynaecomastia; menstrual irregularities; lethargy, headache, confusion; rashes; hyperkalaemia (discontinue); hyponatraemia; hepatotoxicity, osteomalacia, and blood disorders reported

Dose

- 100–200 mg daily, increased to 400 mg if required; CHILD initially 3 mg/kg daily in divided doses
- Heart failure, see section 2.5.5

Spironolactone (Non-proprietary) PoM

Tablets, spironolactone 25 mg, net price 28 = £1.79; 50 mg, 28 = £2.49; 100 mg, 28 = £3.38. Label: 21

Oral suspensions, spironolactone 5 mg/5 mL, 10 mg/5 mL, 25 mg/5 mL, 50 mg/5 mL, and 100 mg/5 mL. Label: 21

Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Aldactone® (Pharmacia) PoM

Tablets, f/c, spironolactone 25 mg (buff), net price 100-tab pack = £8.89; 50 mg (off-white), 100-tab pack = £17.78; 100 mg (buff), 28-tab pack = £9.96. Label: 21

With thiazides or loop diuretics

Section 2.2.4

2.2.4 Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides (section 2.2.1) and potassium-sparing diuretics (section 2.2.3) separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops. For **interactions**, see Appendix 1 (diuretics).

Amiloride with thiazides

Co-amilozide (Non-proprietary) PoM

Tablets, co-amilozide 2.5/25 (amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-tab pack = £2.43

Brands include *Moduret 25®*

Dose hypertension, initially 1 tablet daily, increased if necessary to max. 2 tablets daily

Congestive heart failure, initially 1 tablet daily, increased if necessary to max. 4 tablets daily

Oedema and ascites in cirrhosis of the liver, initially 2 tablets daily, increased if necessary to max. 4 tablets daily; reduce for maintenance if possible

Tablets, co-amilozide 5/50 (amiloride hydrochloride 5 mg, hydrochlorothiazide 50 mg), net price 28 = £1.06

Brands include *Amil-Co®*, *Moduretic®*

Dose hypertension, initially ½ tablet daily, increased if necessary to max. 1 tablet daily

Congestive heart failure, initially ½ tablet daily, increased if necessary to max. 2 tablets daily

Oedema and ascites in cirrhosis of the liver, initially 1 tablet daily, increased if necessary to max. 2 tablets daily; reduce for maintenance if possible

Navispare® (Goldshield) PoM

Tablets, f/c, orange, amiloride hydrochloride 2.5 mg, cyclopenthiazide 250 micrograms, net price 28-tab pack = £2.70

Excipients include gluten

Dose hypertension, 1–2 tablets in the morning

Amiloride with loop diuretics

Co-amilofruse (Non-proprietary) PoM

Tablets, co-amilofruse 2.5/20 (amiloride hydrochloride 2.5 mg, furosemide 20 mg), net price 28-tab pack = £1.24, 56-tab pack = £1.61

Brands include *Frumil LS®*

Dose oedema, 1 tablet in the morning

Tablets, co-amilofruse 5/40 (amiloride hydrochloride 5 mg, furosemide 40 mg), net price 28-tab pack = £1.30, 56-tab pack = £1.64

Brands include *Frumil®*

Dose oedema, 1–2 tablets in the morning

Tablets, co-amilofruse 10/80 (amiloride hydrochloride 10 mg, furosemide 80 mg), net price 28-tab pack = £9.33

Dose oedema, 1 tablet in the morning

Amiloride with bumetanide (Non-proprietary) PoM

Tablets, amiloride hydrochloride 5 mg, bumetanide 1 mg, net price 28-tab pack = £29.60

Dose oedema, 1–2 tablets daily

Triamterene with thiazides

Counselling Urine may look slightly blue in some lights

Co-triamterzide (Non-proprietary) PoM

Tablets, co-triamterzide 50/25 (triamterene 50 mg, hydrochlorothiazide 25 mg), net price 30-tab pack = 95p. Label: 14, (see above), 21

Dose hypertension, 1 tablet daily after breakfast, increased if necessary, max. 4 daily

Oedema, 2 tablets daily (1 after breakfast and 1 after midday meal) increased to 3 daily if necessary (2 after breakfast and 1 after midday meal); usual maintenance in oedema, 1 daily or 2 on alternate days; max. 4 daily

Brands include *Triam-Co®*

Dyazide® (Goldshield) PoM

Tablets, peach, scored, co-triamterzide 50/25 (triamterene 50 mg, hydrochlorothiazide 25 mg), net price 30-tab pack = 95p. Label: 14, (see above), 21

Dose hypertension, 1 tablet daily after breakfast, increased if necessary, max. 4 daily

Oedema, 2 tablets daily (1 after breakfast and 1 after midday meal) increased to 3 daily if necessary (2 after breakfast and 1 after midday meal); usual maintenance in oedema, 1 daily or 2 on alternate days; max. 4 daily

Dytide® (Goldshield) PoM

Capsules, clear/maroon, triamterene 50 mg, benzthiazide 25 mg, net price 30-cap pack = £17.35. Label: 14, (see above), 21

Dose oedema, initially 3 capsules daily (2 after breakfast and 1 after midday meal) for 1 week then 1 or 2 on alternate days

Kalspare® (DHP Healthcare) PoM

Tablets, orange, f/c, scored, triamterene 50 mg, chlortalidone 50 mg, net price 28-tab pack = £3.05. Label: 14, (see above), 21

Dose hypertension, oedema, 1–2 tablets in the morning

Triamterene with loop diuretics

Counselling Urine may look slightly blue in some lights

Frusene® (Orion) PoM

Tablets, yellow, scored, triamterene 50 mg, furosemide 40 mg, net price 56-tab pack = £4.41. Label: 14, (see above), 21

Dose oedema, ½–2 tablets daily in the morning

Spironolactone with thiazides

Co-flumactone (Non-proprietary) PoM

Tablets, co-flumactone 25/25 (hydroflumethiazide 25 mg, spironolactone 25 mg), net price 100-tab pack = £20.23

Brands include *Aldactide 25®*

Dose congestive heart failure, initially 4 tablets daily; range 1–8 tablets daily (but not recommended because spironolactone generally given in lower dose)

Tablets, co-flumactone 50/50 (hydroflumethiazide 50 mg, spironolactone 50 mg), net price 28-tab pack = £10.70

Brands include *Aldactide 50®*

Dose congestive heart failure, initially 2 tablets daily; range 1–4 tablets daily (but not recommended because spironolactone generally given in lower dose)

Spironolactone with loop diuretics

Lasilactone® (Sanofi-Aventis) PoM

Capsules, blue/white, spironolactone 50 mg, furosemide 20 mg, net price 28-cap pack = £7.97

Dose resistant oedema, 1–4 capsules daily

2.2.5 Osmotic diuretics

Mannitol is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

MANNITOL

Indications see notes above; glaucoma (section 11.6)

Cautions extravasation causes inflammation and thrombophlebitis; monitor fluid and electrolyte balance, serum osmolality, and, pulmonary and renal function; assess cardiac function before and during treatment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (mannitol)

Contra-indications severe cardiac failure; severe pulmonary oedema; intracranial bleeding (except during craniotomy); anuria; severe dehydration

Side-effects *less commonly* hypotension, thrombophlebitis, fluid and electrolyte imbalance; *rarely* dry mouth, thirst, nausea, vomiting, oedema, raised intracranial pressure, arrhythmia, hypertension, pulmonary oedema, chest pain, headache, convulsions, dizziness, chills, fever, urinary retention, focal osmotic nephrosis, dehydration, cramp, blurred vision, rhinitis, skin necrosis, and hypersensitivity reactions (including urticaria and anaphylaxis); *very rarely* congestive heart failure and acute renal failure

Dose

- Cerebral oedema and raised intra-ocular pressure, by intravenous infusion over 30–60 minutes, 0.25–2 g/kg repeated if necessary 1–2 times after 4–8 hours

Note For mannitol 20%, an in-line filter is recommended (15-micron filters have been used)

Mannitol (Baxter) PoM

Intravenous infusion, mannitol 10%, net price 500-mL *Viaflex®* bag = £1.87, 500-mL *Viaflo®* bag = £2.15; 20%, net price 250-mL *Viaflex®* bag = £2.70, 250-mL *Viaflo®* bag = £3.10, 500-mL *Viaflex®* bag = £2.72, 500-mL *Viaflo®* bag = £3.12

2.2.6 Mercurial diuretics

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

2.2.7 Carbonic anhydrase inhibitors

The carbonic anhydrase inhibitor **acetazolamide** is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide and brinzolamide inhibit the formation of aqueous humour and are used in glaucoma (section 11.6).

2.2.8 Diuretics with potassium

Many patients on diuretics do not need potassium supplements (section 9.2.1.1). For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should **not** usually be given together.

Counselling Modified-release potassium tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

Centyl K® (LEO) PoM

Tablets, green, s/c, bendroflumethiazide 2.5 mg, potassium 7.7 mmol for modified release, net price 56-tab pack = £7.50. Label: 25, 27, counselling, see above

Diumide-K Continus® (Teofarma) PoM

Tablets, white/orange, f/c, furosemide 40 mg, potassium 8 mmol for modified release, net price 30-tab pack = £3.00. Label: 25, 27, counselling, see above

Neo-NaClex-K® (Goldshield) PoM

Tablets, pink/white, f/c, bendroflumethiazide 2.5 mg, potassium 8.4 mmol for modified release, net price 100 tab-pack = £8.99. Label: 25, 27, counselling, see above

Note May be difficult to obtain

2.3 Anti-arrhythmic drugs

2.3.1 Management of arrhythmias
2.3.2 Drugs for arrhythmias

2.3.1 Management of arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation Atrial fibrillation can be managed by either controlling the ventricular rate or by attempting to restore and maintain sinus rhythm. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism, and thromboprophylaxis given if necessary (see below).

Ventricular rate can be controlled with a beta-blocker (section 2.4), or diltiazem [unlicensed indication], or verapamil. If rate control is inadequate during normal activities, digoxin can be added; in those who require additional rate control during exercise, a combination of diltiazem or verapamil with digoxin should be used, but care is required if ventricular function is diminished. Digoxin is usually only effective for controlling ventricular rate at rest, therefore digoxin monotherapy should only be used in predominantly sedentary patients; digoxin is also used if atrial fibrillation is accompanied by congestive heart failure.

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an intravenous anti-arrhythmic drug e.g. flecainide or amiodarone. If necessary, sotalol or amiodarone can be started 4 weeks before electrical cardioversion to increase success of the procedure. If drug treatment is required to maintain sinus rhythm, a beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, an oral anti-arrhythmic drug such as sotalol (section 2.4), flecainide, propafenone, or amiodarone, is required.

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a beta-blocker. Alternatively, if symptoms persist or a beta-blocker is not appropriate, an oral anti-arrhythmic drug such as sotalol, flecainide, propafenone, or amiodarone can be given (see also Paroxysmal Supraventricular Tachycardia below, and Supraventricular Arrhythmias).

All haemodynamically unstable patients with acute-onset atrial fibrillation should undergo electrical cardioversion. Intravenous amiodarone, or alternatively flecainide, can be used in non-life-threatening cases where electrical cardioversion is delayed. If urgent ventricular rate control is required, a beta-blocker, verapamil, or amiodarone can be given intravenously.

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis. Anticoagulants (section 2.8) are indicated for those with a history of ischaemic stroke, transient ischaemic attacks, or thromboembolic events, and those with valve disease, heart failure, or impaired left ventricular function; anticoagulants should be considered for those with cardiovascular disease, diabetes, hypertension, or thyrotoxicosis, and in the elderly. Anticoagulants are also indicated during cardioversion procedures. Aspirin (section 2.9) is less effective than warfarin at preventing emboli, but may be appropriate if there are no other risk factors for stroke, or if warfarin is contra-indicated.

Atrial flutter Like atrial fibrilliation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker (section 2.4), diltiazem [unlicensed indication], or verapamil (section 2.6.2); an intravenous beta-blocker or verapamil is preferred for rapid control. Digoxin (section 2.1.1) can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated (see section 2.8.2). Alternatively, anticoagulation can be commenced and a left atrial thrombus should be ruled out immediately before cardioversion.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide or propafenone can slow atrial flutter resulting in 1:1 conduction to the ventricles and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem [unlicensed indication] or verapamil. Amiodarone can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation (see notes above).

Paroxysmal supraventricular tachycardia This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine (section 2.3.2) should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil (section 2.6.2) is an alternative, but it should be avoided in patients recently treated with beta-blockers (see p. 119).

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem, verapamil, beta-blockers including sotalol (section 2.4), flecainide or propafenone (section 2.3.2).

Arrhythmias after myocardial infarction In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with 500 micrograms of atropine sulphate given intravenously; the dose may be repeated every 3–5 minutes if necessary up to a maximum total dose of 3 mg. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine, adrenaline should be given by intravenous infusion in a dose of 2–10 micrograms/minute, adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary Resuscitation, section 2.7.3).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone (section 2.3.2) should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone is the preferred drug. Sotalol (section 2.4), flecainide, propafenone (section 2.3.2), and, although less effective, lidocaine (lignocaine) (section 2.3.2) have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker (section 2.4).

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol (in place of a standard beta-blocker), or amiodarone (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulphate (section 9.5.1.3) is usually effective. A beta-blocker (but not sotalol) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

2.3.2 Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil), those that act on both supraventricular and ventricular arrhythmias (e.g. disopyramide), and those that act on ventricular arrhythmias (e.g. lidocaine (lignocaine)).

They can also be classified according to their effects on the electrical behaviour of myocardial cells during activity:

Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)

Class II: beta-blockers

Class III: amiodarone and sotalol (also Class II)

Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

This latter classification (the Vaughan Williams classification) is of less clinical significance.

Cautions The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most or all drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole), most side-effects are short lived. Unlike verapamil, adenosine can be used after a beta-blocker. Verapamil may be preferable to adenosine in asthma.

Oral administration of a **cardiac glycoside** (such as digoxin, section 2.1.1) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil (section 2.6.2) is usually effective for supraventricular tachycardias. An initial intravenous dose (**important**: serious beta-blocker interaction hazard, see p. 119) may be followed by oral treatment; hypo-

tension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil with dangerous consequences.

Intravenous administration of a **beta-blocker** (section 2.4) such as esmolol or propranolol, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include **amiodarone**, **beta-blockers** (see p. 87), **disopyramide**, **flecainide**, **procainamide** (available from 'special-order' manufacturers or specialist importing companies, see p. 969), and **propafenone**, see below under Supraventricular and Ventricular Arrhythmias.

ADENOSINE

Indications rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); aid to diagnosis of broad or narrow complex supraventricular tachycardias

Cautions atrial fibrillation or flutter with accessory pathway (conduction down anomalous pathway may increase); heart transplant (see below); **interactions**: Appendix 1 (adenosine)

Contra-indications second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); prolonged QT syndrome; severe hypotension; decompensated heart failure; chronic obstructive lung disease

Side-effects include transient facial flush, chest pain, dyspnoea, bronchospasm, choking sensation, nausea, light-headedness; severe bradycardia reported (requiring temporary pacing); ECG may show transient rhythm disturbances

Dose

- By rapid intravenous injection into central or large peripheral vein, 6 mg over 2 seconds with cardiac monitoring; if necessary followed by 12 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes; increments should not be given if high level AV block develops at any particular dose

  Important Patients with a **heart transplant** are very sensitive to effects of adenosine and should receive initial dose of 3 mg over 2 seconds, followed if necessary by 6 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes. Also, if essential to give with dipyridamole reduce initial dose to 0.5–1 mg

  Note Adenosine doses in the BNF may differ from those in product literature

Adenocor® (Sanofi-Aventis) PoM

Injection, adenosine 3 mg/mL in physiological saline, net price 2-mL vial = £4.45 (hosp. only)

Note Intravenous infusion of adenosine (*Adenoscan®*, Sanofi Winthrop) may be used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate—consult product literature

Supraventricular and ventricular arrhythmias

Amiodarone is used in the treatment of arrhythmias particularly when other drugs are ineffective or contra-indicated. It may be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It may also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone, intravenous amiodarone may act relatively rapidly.

Intravenous injection of amiodarone may be used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless tachycardia unresponsive to other interventions (section 2.7.3).

Amiodarone has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses may cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely (see also Appendix 1).

Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought. Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen (section 13.8.1) to protect against both long-wave ultraviolet and visible light should be used.

Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism may occur. Clinical assessment alone is unreliable, and laboratory tests should be performed before treatment and every 6 months. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis. The thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone. Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart, for

details see section 2.4. For special reference to the role of **sotalol** in ventricular arrhythmias, see p. 88.

Disopyramide may be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine (lignocaine)), but it impairs cardiac contractility. Oral administration of disopyramide is useful but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or prostatic hypertrophy.

Flecainide belongs to the same general class as lidocaine and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include **adenosine**, **cardiac glycosides**, and **verapamil**; see above under Supraventricular Arrhythmias. Drugs for ventricular arrhythmias include **lidocaine**; see under Ventricular Arrhythmias, p. 86.

Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies, see p. 969. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

AMIODARONE HYDROCHLORIDE

Indications see notes above (should be initiated in hospital or under specialist supervision)

Cautions liver-function and thyroid-function tests required before treatment and then every 6 months (see notes above for tests of thyroid function); hypokalaemia (measure serum-potassium concentration before treatment); chest x-ray required before treatment; heart failure; elderly; severe bradycardia and conduction disturbances in excessive dosage; intravenous use may cause moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) or severe hepatocellular toxicity (monitor transaminases closely); give by central venous catheter **only**, infusion via peripheral veins may cause pain and inflammation; ECG monitoring and resuscitation facilities must be available during intravenous use; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (amiodarone)

Contra-indications (except in cardiac arrest) sinus bradycardia, sino-atrial heart block; unless pacemaker fitted avoid in severe conduction disturbances or sinus node disease; thyroid dysfunction; iodine sensitivity; avoid *intravenous use* in severe respiratory failure, circulatory collapse, or severe arterial hypotension; avoid bolus injection in congestive heart failure or cardiomyopathy; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea, vomiting, taste disturbances, raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders), jaundice; bradycardia (see Cautions); pulmonary toxicity (including pneumonitis and fibrosis); tremor, sleep disorders; hypothyroidism, hyperthyroidism; reversible corneal microdeposits (sometimes with night glare); phototoxicity, persistent slate-grey skin discoloration (see also notes above), injection-site reactions; *less commonly* onset or worsening of arrhythmia, conduction disturbances (see Cautions), peripheral neuropathy and myopathy (usually reversible on withdrawal); *very rarely* chronic liver disease including cirrhosis, sinus arrest, bronchospasm (in patients with severe respiratory failure), ataxia, benign intracranial hypertension, headache, vertigo, epididymo-orchitis, impotence, haemolytic or aplastic anaemia, thrombocytopenia, rash (including exfoliative dermatitis), hypersensitivity including vasculitis, alopecia, impaired vision due to optic neuritis or optic neuropathy (including blindness), anaphylaxis on rapid injection, also hypotension, respiratory distress syndrome, sweating, and hot flushes

Dose

- By mouth, 200 mg 3 times daily for 1 week reduced to 200 mg twice daily for a further week; maintenance, usually 200 mg daily or the minimum required to control the arrhythmia
- By intravenous infusion via central venous catheter, initially 5 mg/kg over 20–120 minutes with ECG monitoring; subsequent infusion given if necessary according to response up to max. 1.2 g in 24 hours
- Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation, section 2.7.3

Amiodarone (Non-proprietary) PoM

Tablets, amiodarone hydrochloride 100 mg, net price 28-tab pack = £1.36; 200 mg, 28-tab pack = £1.41. Label: 11

Injection, amiodarone hydrochloride 30 mg/mL, net price 10-mL prefilled syringe = £20.90
Excipients may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

Sterile concentrate, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33, 6-mL amp = £2.86. For dilution and use as an infusion
Excipients may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

Cordarone X® (Sanofi-Aventis) PoM

Tablets, scored, amiodarone hydrochloride 100 mg, net price 28-tab pack = £4.28; 200 mg, 28-tab pack = £6.99. Label: 11

Sterile concentrate, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33. For dilution and use as an infusion
Excipients include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

DISOPYRAMIDE

Indications ventricular arrhythmias, especially after myocardial infarction; supraventricular arrhythmias

Cautions monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur); atrial flutter or atrial tachycardia with partial block, bundle branch block, heart failure (avoid if severe); prostatic enlargement; susceptibility to angle-closure glaucoma; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding

(Appendix 5); **interactions:** Appendix 1 (disopyramide)

Contra-indications second- and third-degree heart block and sinus node dysfunction (unless pacemaker fitted); cardiogenic shock; severe uncompensated heart failure

Side-effects ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval—see Cautions above), myocardial depression, hypotension, AV block; antimuscarinic effects include dry mouth, blurred vision, urinary retention, and very rarely angle-closure glaucoma; gastro-intestinal irritation; psychosis, cholestatic jaundice, hypoglycaemia also reported (see Cautions above)

Dose

- By mouth, 300–800 mg daily in divided doses
- By slow intravenous injection, 2 mg/kg over at least 5 minutes to a max. of 150 mg, with ECG monitoring, followed immediately *either* by 200 mg by mouth, then 200 mg every 8 hours for 24 hours *or* 400 micrograms/kg/hour by intravenous infusion; max. 300 mg in first hour and 800 mg daily

Disopyramide (Non-proprietary) PoM

Capsules, disopyramide (as phosphate) 100 mg, net price 84 = £21.92; 150 mg, 84 = £28.66

Rythmodan® (Sanofi-Aventis) PoM

Capsules, disopyramide 100 mg (green/beige), net price 84-cap pack = £14.14; 150 mg, 84-cap pack = £18.76

Injection, disopyramide (as phosphate) 10 mg/mL, net price 5-mL amp = £2.61

Modified release

Rythmodan Retard® (Sanofi-Aventis) PoM

Tablets, m/r, scored, f/c, disopyramide (as phosphate) 250 mg, net price 56-tab pack = £27.72. Label: 25

Dose 250–375 mg every 12 hours

FLECAINIDE ACETATE

Indications *Capsules, tablets, and injection:* AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily)

Immediate-release tablets only: symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy

Injection only: ventricular tachyarrhythmias resistant to other treatment

Cautions patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably); atrial fibrillation following heart surgery; elderly (accumulation may occur); ECG monitoring and resuscitation facilities must be available during intravenous use; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (flecainide)

Contra-indications heart failure; abnormal left ventricular function; history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia; long-standing atrial fibrillation where conversion to sinus rhythm not attempted; haemodynamically significant valvular heart disease; avoid in sinus node dysfunction, atrial conduction defects, second-degree or greater AV block, bundle branch block or distal block unless pacing rescue available

Side-effects oedema, pro-arrhythmic effects; dyspnoea; dizziness, asthenia, fatigue, fever; visual disturbances; *rarely* pneumonitis, hallucinations, depression, confusion, amnesia, dyskinesia, convulsions, peripheral neuropathy; *also reported* gastro-intestinal disturbances, anorexia, hepatic dysfunction, flushing, syncope, drowsiness, tremor, vertigo, headache, anxiety, insomnia, ataxia, paraesthesia, anaemia, leucopenia, thrombocytopenia, corneal deposits, tinnitus, increased antinuclear antibodies, hypersensitivity reactions (including rash, urticaria, and photosensitivity), increased sweating

Dose

- By mouth (initiated under direction of hospital consultant), ventricular arrhythmias, initially 100 mg twice daily (max. 400 mg daily usually reserved for rapid control or in heavily built patients), reduced after 3–5 days to the lowest dose that controls arrhythmia

  Supraventricular arrhythmias, 50 mg twice daily, increased if required to max. 300 mg daily
- By slow intravenous injection (in hospital), 2 mg/kg over 10–30 minutes, max. 150 mg, with ECG monitoring; followed if required by infusion at a rate of 1.5 mg/kg/hour for 1 hour, subsequently reduced to 100–250 micrograms/kg/hour for up to 24 hours; max. cumulative dose in first 24 hours, 600 mg; transfer to *oral* treatment, as above

Flecainide (Non-proprietary) PoM

Tablets, flecainide acetate 50 mg, net price 60-tab pack = £9.07; 100 mg, 60-tab pack = £13.59

Tambocor® (3M) PoM

Tablets, flecainide acetate 50 mg, net price 60-tab pack = £13.25; 100 mg (scored), 60-tab pack = £19.00

Injection, flecainide acetate 10 mg/mL, net price 15-mL amp = £4.40

Modified release

Tambocor® XL (Meda) PoM

Capsules, m/r, grey/pink, flecainide acetate 200 mg, net price 30-cap pack = £14.77. Label: 25

Dose supraventricular arrhythmias, 200 mg once daily

Note Not to be used to control arrhythmias in acute situations; patients stabilised on 200 mg daily immediate-release flecainide may be transferred to *Tambocor® XL*

PROPAFENONE HYDROCHLORIDE

Indications ventricular arrhythmias; paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated

Cautions heart failure; elderly; pacemaker patients; great caution in obstructive airways disease owing to beta-blocking activity (contra-indicated if severe); hepatic impairment (Appendix 2); renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (propafenone)

Contra-indications uncontrolled congestive heart failure, cardiogenic shock (except arrhythmia induced), severe bradycardia, electrolyte disturbances, severe obstructive pulmonary disease, marked hypotension; myasthenia gravis; unless adequately paced avoid in sinus node dysfunction, atrial conduction defects, second degree or greater AV block, bundle branch block or distal block

Side-effects antimuscarinic effects including constipation, blurred vision, and dry mouth; dizziness, nausea and vomiting, fatigue, bitter taste, diarrhoea, headache, and allergic skin reactions reported; postural hypotension, particularly in elderly; bradycardia, sino-atrial, atrioventricular, or intraventricular blocks; arrhythmogenic (pro-arrhythmic) effect; rarely hypersensitivity reactions (cholestasis, blood disorders, lupus syndrome), seizures; myoclonus also reported

Dose

- Body-weight 70 kg and over, initially 150 mg 3 times daily after food under direct hospital supervision with ECG monitoring and blood pressure control (if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits); may be increased at intervals of at least 3 days to 300 mg twice daily and, if necessary, to max. 300 mg 3 times daily; body-weight under 70 kg, reduce dose; ELDERLY may respond to lower doses

Arythmol® (Abbott) PoM

Tablets, f/c, propafenone hydrochloride 150 mg, net price 90-tab pack = £7.37; 300 mg, 60-tab pack = £9.34. Label: 21, 25

Ventricular arrhythmias

Lidocaine (lignocaine) is relatively safe when used by slow intravenous injection. Although it has been used in suppression of ventricular tachycardia and reducing the risk of ventricular fibrillation following myocardial infarction, it has not been shown to reduce mortality when used prophylactically in this condition. In patients with cardiac or hepatic failure doses may need to be reduced to avoid convulsions, depression of the central nervous system, or depression of the cardiovascular system.

Moracizine is available from 'special-order' manufacturers or specialist importing companies (see p. 969) for the prophylaxis and treatment of serious and life-threatening ventricular arrhythmias for patients already stabilised on moracizine.

Drugs for both supraventricular and ventricular arrhythmias include **amiodarone**, **beta-blockers**, **disopyramide**, **flecainide**, **procainamide** (available from 'special-order' manufacturers or specialist importing companies, see p. 969), and **propafenone**, see above under Supraventricular and Ventricular Arrhythmias.

Mexiletine is available from 'special-order' manufacturers or specialist importing companies (see p. 969) for treatment of life-threatening ventricular arrhythmias.

LIDOCAINE HYDROCHLORIDE
(Lignocaine hydrochloride)

Indications ventricular arrhythmias, especially after myocardial infarction

Cautions lower doses in congestive cardiac failure and following cardiac surgery; monitor ECG and have resuscitation facilities available; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (lidocaine)

Contra-indications sino-atrial disorders, all grades of atrioventricular block, severe myocardial depression; acute porphyria (section 9.8.2)

Side-effects dizziness, paraesthesia, or drowsiness (particularly if injection too rapid); other CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); *rarely* hypersensitivity reactions including anaphylaxis

Dose

- By intravenous injection, in patients without gross circulatory impairment, 100 mg as a bolus over a few minutes (50 mg in lighter patients or those whose circulation is severely impaired), followed immediately by infusion of 4 mg/minute for 30 minutes, 2 mg/minute for 2 hours, then 1 mg/minute; reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion)

  Note Following *intravenous injection* lidocaine has a short duration of action (lasting for 15–20 minutes). If an *intravenous infusion* is not immediately available the initial *intravenous injection* of 50–100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Lidocaine (Non-proprietary) PoM

Injection 2%, lidocaine hydrochloride 20 mg/mL, net price 2-mL amp = 27p; 5-mL amp = 28p; 10-mL amp = 60p; 20-mL amp = 61p

Available from Braun

Infusion, lidocaine hydrochloride 0.1% (1 mg/mL) and 0.2% (2 mg/mL) in glucose intravenous infusion 5%. 500-mL containers

Available from Baxter

Minijet® Lignocaine (UCB Pharma) PoM

Injection, lidocaine hydrochloride 1% (10 mg/mL), net price 10-mL disposable syringe = £5.34; 2% (20 mg/mL), 5-mL disposable syringe = £5.20

2.4 Beta-adrenoceptor blocking drugs

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. **Oxprenolol**, **pindolol**, **acebutolol**, and **celiprolol** have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. **Atenolol**, **celiprolol**, **nadolol**, and **sotalol** are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers such as atenolol, bisoprolol, carvedilol, celiprolol, and nadolol have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure (see also section 2.5.5). **Sotalol** may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias (**important:** particular care is required to avoid hypokalaemia in patients taking sotalol).

Labetalol, **celiprolol**, **carvedilol**, and **nebivolol** are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate asthma and this effect can be dangerous. Beta-blockers should be **avoided** in patients with a history of asthma or bronchospasm; if there is no alternative, a cardioselective beta-blocker can be used with extreme caution under specialist supervision. Patients with well-controlled chronic obstructive pulmonary disease (without significant reversible airways obstruction) can be treated with a beta-blocker for a co-existing condition if necessary; in such circumstances, a cardioselective beta-blocker should be initiated at a low dose by a specialist, and the patient monitored for adverse effects. **Atenolol**, **bisoprolol**, **metoprolol**, **nebivolol**, and (to a lesser extent) **acebutolol**, have less effect on the $beta_2$ (bronchial) receptors and are, therefore, relatively *cardioselective*, but they are **not** *cardiospecific*. They have a lesser effect on airways resistance but are **not** free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA, see above), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers, see above).

Beta-blockers are not contra-indicated in diabetes; however, they can lead to a small deterioration of glucose tolerance and interfere with metabolic and autonomic responses to hypoglycaemia. Cardioselective beta-blockers (see above) may be preferable and beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives (section 2.5) are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high; for example, atenolol is given in a dose of 25–50 mg daily and it is rarely necessary to increase the dose to 100 mg.

Beta-blockers can be used to control the pulse rate in patients with *phaeochromocytoma* (section 2.5.4). However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine should always be used together with the beta-blocker.

Angina By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with *angina* (for further details on the management of stable and unstable angina see section 2.6). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease (**important**: see p. 119).

Myocardial infarction For advice on the management of ST-segment-elevation myocardial infarction see section 2.10.1; for advice on the management of non-ST-segment-elevation myocardial infarction see section 2.6. Several studies have shown that some beta-blockers can reduce the recurrence rate of *myocardial infarction*. However, uncontrolled heart failure, hypotension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. **Atenolol** and **metoprolol** may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while **acebutolol**, **metoprolol**, **propranolol**, and **timolol** have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia.

Arrhythmias Beta-blockers act as *anti-arrhythmic drugs* principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction (see above).

Esmolol is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, where sustained beta blockade might be hazardous.

Sotalol, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine (lignocaine) in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. **Bisoprolol** and **carvedilol** reduce mortality in any grade of stable heart failure; **nebivolol** is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure (section 2.5.5).

Thyrotoxicosis Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol can reverse clinical symptoms of *thyrotoxicosis* within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier (section 6.2.2).

Other uses Beta-blockers have been used to alleviate some symptoms of *anxiety*; probably patients with palpitation, tremor, and tachycardia respond best (see also section 4.1.2 and section 4.9.3). Beta-blockers are also used in the *prophylaxis of migraine* (section 4.7.4.2). Betaxolol, carteolol, levobunolol, metipranolol and timolol are used topically in *glaucoma* (section 11.6).

PROPRANOLOL HYDROCHLORIDE

Indications see under Dose

Cautions see notes above; also avoid abrupt withdrawal especially in ischaemic heart disease; first-degree AV block; portal hypertension (risk of deterioration in liver function); diabetes; history of obstructive airways disease (introduce cautiously and monitor lung function—see also Bronchospasm below); myasthenia gravis; symptoms of hypoglycaemia and thyrotoxicosis may be masked (also see notes above); psoriasis; history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response, also may reduce response to adrenaline (epinephrine) (see also section 3.4.3); reduce dose of oral propranolol in hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (beta-blockers), **important:** verapamil interaction, see also p. 119

Contra-indications asthma (but see Bronchospasm below), uncontrolled heart failure, Prinzmetal's angina, marked bradycardia, hypotension, sick sinus syndrome, second- or third- degree AV block, cardiogenic shock, metabolic acidosis, severe peripheral arterial disease; phaeochromocytoma (apart from specific use with alpha-blockers, see also notes above)

Bronchospasm The CSM advised that beta-blockers, including those considered to be cardioselective, should not be given to patients with a history of asthma or bronchospasm. However, in rare situations when there is no alternative, a cardioselective beta-blocker can be given to these patients with extreme caution and under specialist supervision.

Side-effects see notes above; also gastro-intestinal disturbances; bradycardia, heart failure, hypotension, conduction disorders, peripheral vasoconstriction (including exacerbation of intermittent claudication and Raynaud's phenomenon); bronchospasm (see above), dyspnoea; headache, fatigue, sleep disturbances, paraesthesia, dizziness, vertigo, psychoses; sexual dysfunction; purpura, thrombocytopenia; visual disturbances; exacerbation of psoriasis, alopecia; *rarely* rashes and dry eyes (reversible on withdrawal); **overdosage:** see Emergency Treatment of Poisoning, p. 32

Dose

- By mouth, hypertension, initially 80 mg twice daily, increased at weekly intervals as required; maintenance 160–320 mg daily

  Prophylaxis of variceal bleeding in portal hypertension, initially 40 mg twice daily, increased to 80 mg twice daily according to heart rate; max. 160 mg twice daily

  Phaeochromocytoma (only with an alpha-blocker), 60 mg daily for 3 days before surgery *or* 30 mg daily in patients unsuitable for surgery

  Angina, initially 40 mg 2–3 times daily; maintenance 120–240 mg daily

  Arrhythmias, hypertrophic cardiomyopathy, anxiety tachycardia, and thyrotoxicosis (adjunct), 10–40 mg 3–4 times daily

  Anxiety with symptoms such as palpitation, sweating, tremor, 40 mg once daily, increased to 40 mg 3 times daily if necessary

  Prophylaxis after myocardial infarction, 40 mg 4 times daily for 2–3 days, then 80 mg twice daily, beginning 5 to 21 days after infarction

  Migraine prophylaxis and essential tremor, initially 40 mg 2–3 times daily; maintenance 80–160 mg daily

- By intravenous injection, arrhythmias and thyrotoxic crisis, 1 mg over 1 minute; if necessary repeat at 2-minute intervals; max. total dose 10 mg (5 mg in anaesthesia)

  Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32

Propranolol (Non-proprietary) PoM

Tablets, propranolol hydrochloride 10 mg, net price 28 = 90p; 40 mg, 28 = 95p; 80 mg, 56 = £1.65; 160 mg, 56 = £3.05. Label: 8

Brands include *Angilol®*

Oral solution, propranolol hydrochloride 5 mg/5 mL, net price 150 mL = £12.50; 10 mg/5 mL, 150 mL = £16.45; 50 mg/5 mL, 150 mL = £19.98. Label: 8

Brands include *Syprol®*

Inderal® (AstraZeneca) PoM

Injection, propranolol hydrochloride 1 mg/mL, net price 1-mL amp = 21p

Modified release

Note Modified-release preparations can be used for once daily administration

Half-Inderal LA® (AstraZeneca) PoM

Capsules, m/r, lavender/pink, propranolol hydrochloride 80 mg, net price 28-cap pack = £5.40. Label: 8, 25

Note Modified-release capsules containing propranolol hydrochloride 80 mg also available; brands include *Bedranol SR®*, *Half Beta Prograne®*

Inderal-LA® (AstraZeneca) PoM

Capsules, m/r, lavender/pink, propranolol hydrochloride 160 mg, net price 28-cap pack = £1.91. Label: 8, 25

Note Modified-release capsules containing propranolol hydrochloride 160 mg also available; brands include *Bedranol SR®*, *Beta Prograne®*, *Slo-Pro®*

ACEBUTOLOL

Indications see under Dose

Cautions see under Propranolol Hydrochloride; renal impairment (Appendix 3)

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, initially 400 mg once daily *or* 200 mg twice daily, increased after 2 weeks to 400 mg twice daily if necessary
- Angina, initially 400 mg once daily *or* 200 mg twice daily; 300 mg 3 times daily in severe angina; up to 1.2 g daily has been used
- Arrhythmias, 0.4–1.2 g daily in 2–3 divided doses

Sectral® (Sanofi-Aventis) PoM

Capsules, acebutolol (as hydrochloride) 100 mg (buff/white), net price 84-cap pack = £14.97; 200 mg (buff/pink), 56-cap pack = £19.18. Label: 8

Tablets, f/c, acebutolol 400 mg (as hydrochloride), net price 28-tab pack = £18.62. Label: 8

ATENOLOL

Indications see under Dose

Cautions see under Propranolol Hydrochloride; renal impairment (Appendix 3)

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Dose

- By mouth, hypertension, 25–50 mg daily (higher doses rarely necessary)

  Angina, 100 mg daily in 1 or 2 doses

  Arrhythmias, 50–100 mg daily
- By intravenous injection, arrhythmias, 2.5 mg at a rate of 1 mg/minute, repeated at 5-minute intervals to a max. of 10 mg

  Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32
- By intravenous infusion, arrhythmias, 150 micrograms/kg over 20 minutes, repeated every 12 hours if required

  Early intervention within 12 hours of myocardial infarction (section 2.10.1), by intravenous injection over 5 minutes, 5 mg, then by mouth, 50 mg after 15 minutes, 50 mg after 12 hours, then 100 mg daily

Atenolol (Non-proprietary) PoM

Tablets, atenolol 25 mg, net price 28-tab pack = 82p; 50 mg, 28-tab pack = 86p; 100 mg, 28-tab pack = 86p. Label: 8

Brands include *Atenix®*

Tenormin® (AstraZeneca) PoM

'25' tablets, f/c, atenolol 25 mg, net price 28-tab pack = £1.16. Label: 8

LS tablets, orange, f/c, scored, atenolol 50 mg, net price 28-tab pack = £2.04. Label: 8

Tablets, orange, f/c, scored, atenolol 100 mg, net price 28-tab pack = £3.46. Label: 8

Syrup, sugar-free, atenolol 25 mg/5 mL, net price 300 mL = £8.55. Label: 8

Injection, atenolol 500 micrograms/mL, net price 10-mL amp = 96p (hosp. only)

With diuretic

Co-tenidone (Non-proprietary) PoM

Tablets, co-tenidone 50/12.5 (atenolol 50 mg, chlortalidone 12.5 mg), net price 28-tab pack = £1.15; co-tenidone 100/25 (atenolol 100 mg, chlortalidone 25 mg), 28-tab pack = £1.25. Label: 8

Dose hypertension, 1 tablet daily (but see also under Dose above)

Kalten® (BPC 100) PoM

Capsules, red/ivory, atenolol 50 mg, co-amilozide 2.5/25 (anhydrous amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-cap pack = £10.01. Label: 8

Dose hypertension, 1 capsule daily

Tenoret 50® (AstraZeneca) PoM

Tablets, brown, f/c, co-tenidone 50/12.5 (atenolol 50 mg, chlortalidone 12.5 mg), net price 28-tab pack = £1.15. Label: 8

Dose hypertension, 1 tablet daily

Tenoretic® (AstraZeneca) PoM

Tablets, brown, f/c, co-tenidone 100/25 (atenolol 100 mg, chlortalidone 25 mg), net price 28-tab pack = £1.25. Label: 8

Dose hypertension, 1 tablet daily (but see also under Dose above)

With calcium-channel blocker

Note Only indicated when calcium-channel blocker or beta-blocker alone proves inadequate. For cautions, contra-indications, and side-effects of nifedipine see section 2.6.2

Beta-Adalat® (Bayer) PoM

Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.00. Label: 8, 25

Dose hypertension, 1 capsule daily, increased if necessary to twice daily; elderly, 1 daily

Angina, 1 capsule twice daily

Tenif® (AstraZeneca) PoM

Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.63. Label: 8, 25

Dose hypertension, 1 capsule daily, increased if necessary to twice daily; elderly, 1 daily

Angina, 1 capsule twice daily

BISOPROLOL FUMARATE

Indications see under Dose

Cautions see under Propranolol Hydrochloride; ensure heart failure not worsening before increasing dose; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications see under Propranolol Hydrochloride; also acute or decompensated heart failure requiring intravenous inotropes; sino-atrial block

Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension and angina, usually 10 mg once daily (5 mg may be adequate in some patients); max. 20 mg daily
- Adjunct in stable moderate to severe heart failure (section 2.5.5), initially 1.25 mg once daily (in the morning) for 1 week then, if well tolerated, increased to 2.5 mg once daily for 1 week, then 3.75 mg once daily for 1 week, then 5 mg once daily for 4 weeks, then 7.5 mg once daily for 4 weeks, then 10 mg once daily; max. 10 mg daily

Bisoprolol Fumarate (Non-proprietary) PoM

Tablets, bisoprolol fumarate 5 mg, net price 28-tab pack = £1.23; 10 mg, 28-tab pack = £1.31. Label: 8

Cardicor® (Merck) PoM

Tablets, f/c, bisoprolol fumarate 1.25 mg, net price 28-tab pack = £5.90; 2.5 mg (scored), 28-tab pack = £3.90; 3.75 mg (scored, white-yellow), 28-tab pack = £5.90; 5 mg (scored, light yellow), 28-tab pack = £5.90; 7.5 mg (scored, yellow), 28-tab pack = £5.90; 10 mg (scored, orange), 28-tab pack = £5.90. Label: 8

Emcor® (Merck) PoM

LS Tablets, yellow, f/c, scored, bisoprolol fumarate 5 mg, net price 28-tab pack = £11.30. Label: 8

Tablets, orange, f/c, scored, bisoprolol fumarate 10 mg, net price 28-tab pack = £12.68. Label: 8

CARVEDILOL

Indications hypertension; angina; adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure

Cautions see under Propranolol Hydrochloride; monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease

Contra-indications see under Propranolol Hydrochloride; acute or decompensated heart failure requiring intravenous inotropes; hepatic impairment

Side-effects postural hypotension, dizziness, headache, fatigue, gastro-intestinal disturbances, bradycardia; occasionally diminished peripheral circulation, peripheral oedema and painful extremities, dry mouth, dry eyes, eye irritation or disturbed vision, impotence, disturbances of micturition, influenza-like symptoms; rarely angina, AV block, exacerbation of intermittent claudication or Raynaud's phenomenon; allergic skin reactions, exacerbation of psoriasis, nasal stuffiness, wheezing, depressed mood, sleep disturbances, paraesthesia, heart failure, changes in liver enzymes, thrombocytopenia, leucopenia also reported

Dose

- Hypertension, initially 12.5 mg once daily, increased after 2 days to usual dose of 25 mg once daily; if necessary may be further increased at intervals of at least 2 weeks to max. 50 mg daily in single or divided doses; ELDERLY initial dose of 12.5 mg daily may provide satisfactory control
- Angina, initially 12.5 mg twice daily, increased after 2 days to 25 mg twice daily
- Adjunct in heart failure (section 2.5.5) initially 3.125 mg twice daily (with food), dose increased at intervals of at least 2 weeks to 6.25 mg twice daily, then to 12.5 mg twice daily, then to 25 mg twice daily; increase to highest dose tolerated, max. 25 mg twice daily in patients with severe heart failure or bodyweight less than 85 kg and 50 mg twice daily in patients over 85 kg

Carvedilol (Non-proprietary) PoM

Tablets, carvedilol 3.125 mg, net price 28-tab pack = £5.73; 6.25 mg, 28-tab pack = £6.09; 12.5 mg, 28-tab pack = £1.54; 25 mg, 28-tab pack = £2.17. Label: 8

Eucardic® (Roche) PoM

Tablets, scored, carvedilol 3.125 mg (pink), net price 28-tab pack = £7.27; 6.25 mg (yellow), 28-tab pack = £8.08; 12.5 mg (peach), 28-tab pack = £8.99; 25 mg, 28-tab pack = £11.22. Label: 8

CELIPROLOL HYDROCHLORIDE

Indications mild to moderate hypertension

Cautions see under Propranolol Hydrochloride; renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3)

Contra-indications see under Propranolol Hydrochloride

Side-effects headache, dizziness, fatigue, nausea and somnolence; also bradycardia, bronchospasm; depression and pneumonitis reported rarely

Dose

- 200 mg once daily in the morning, increased to 400 mg once daily if necessary

Celiprolol (Non-proprietary) PoM

Tablets, celiprolol hydrochloride 200 mg, net price 28-tab pack = £5.74; 400 mg, 28-tab pack = £38.58. Label: 8, 22

Celectol® (Winthrop) PoM

Tablets, f/c, scored, celiprolol hydrochloride 200 mg (yellow), net price 28-tab pack = £19.83; 400 mg, 28-tab pack = £39.65. Label: 8, 22

ESMOLOL HYDROCHLORIDE

Indications short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia); tachycardia and hypertension in peri-operative period

Cautions see under Propranolol Hydrochloride; renal impairment

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride; also on infusion venous irritation and thrombophlebitis

Dose

- By intravenous infusion, usually within range 50–200 micrograms/kg/minute (consult product literature for details of dose titration and doses during peri-operative period)

Brevibloc® (Baxter) PoM

Injection, esmolol hydrochloride 10 mg/mL, net price 10-mL vial = £7.79, 250-mL infusion bag = £89.69

LABETALOL HYDROCHLORIDE

Indications hypertension (including hypertension in pregnancy, hypertension with angina, and hypertension following acute myocardial infarction); hypertensive crisis (but see section 2.5); controlled hypotension in anaesthesia

Cautions see under Propranolol Hydrochloride; interferes with laboratory tests for catecholamines; liver damage (see below); renal impairment (Appendix 3)

Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted

Contra-indications see under Propranolol Hydrochloride

Side-effects postural hypotension (avoid upright position during and for 3 hours after intravenous administration), tiredness, weakness, headache, rashes, scalp tingling, difficulty in micturition, epigastric pain, nausea, vomiting; liver damage (see above); rarely lichenoid rash

Dose

- By mouth, initially 100 mg (50 mg in elderly) twice daily with food, increased at intervals of 14 days to usual dose of 200 mg twice daily; up to 800 mg daily in 2 divided doses (3–4 divided doses if higher); max. 2.4 g daily
- By intravenous injection, 50 mg over at least 1 minute, repeated after 5 minutes if necessary; max. total dose 200 mg

  Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32
- By intravenous infusion, 2 mg/minute until satisfactory response then discontinue; usual total dose 50–200 mg, (**not** recommended for phaeochromocytoma, see under Phaeochromocytoma, section 2.5.4)

  Hypertension of pregnancy, 20 mg/hour, doubled every 30 minutes; usual max. 160 mg/hour

  Hypertension following myocardial infarction, 15 mg/hour, gradually increased to max. 120 mg/hour

Labetalol Hydrochloride (Non-proprietary) PoM

Tablets, f/c, labetalol hydrochloride 100 mg, net price, 56 = £9.46; 200 mg, 56 = £14.64; 400 mg, 56 = £20.87. Label: 8, 21

Trandate® (UCB Pharma) PoM

Tablets, all orange, f/c, labetalol hydrochloride 50 mg, net price 56-tab pack = £3.64; 100 mg, 56-tab pack = £4.01; 200 mg, 56-tab pack = £6.51; 400 mg, 56-tab pack = £9.05. Label: 8, 21

Injection, labetalol hydrochloride 5 mg/mL, net price 20-mL amp = £2.04

METOPROLOL TARTRATE

Indications see under Dose

Cautions see under Propranolol Hydrochloride; hepatic impairment (Appendix 2)

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Dose

- By mouth, hypertension, initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses; max. 400 mg daily (but high doses rarely necessary)

  Angina, 50–100 mg 2–3 times daily

  Arrhythmias, usually 50 mg 2–3 times daily; up to 300 mg daily in divided doses if necessary

  Migraine prophylaxis, 100–200 mg daily in divided doses

  Hyperthyroidism (adjunct), 50 mg 4 times daily
- By intravenous injection, arrhythmias, up to 5 mg at rate 1–2 mg/minute, repeated after 5 minutes if necessary, total dose 10–15 mg

  Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32

  In surgery, by slow intravenous injection 2–4 mg at induction or to control arrhythmias developing during anaesthesia; 2-mg doses may be repeated to a max. of 10 mg

  Early intervention within 12 hours of infarction, by intravenous injection 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by 50 mg by mouth every 6 hours for 48 hours; maintenance 200 mg daily in divided doses

Metoprolol Tartrate (Non-proprietary) PoM

Tablets, metoprolol tartrate 50 mg, net price 28 = £1.28, 56 = £1.55; 100 mg, 28 = £1.81, 56 = £2.11. Label: 8

Betaloc® (AstraZeneca) PoM

Injection, metoprolol tartrate 1 mg/mL, net price 5-mL amp = 42p

Lopresor® (Novartis) PoM

Tablets, f/c, scored, metoprolol tartrate 50 mg (pink), net price 56-tab pack = £2.57; 100 mg (blue), 56-tab pack = £6.68. Label: 8

Modified release

Betaloc-SA® (AstraZeneca) PoM

Durules® (= tablets, m/r), metoprolol tartrate 200 mg, net price 28-tab pack = £4.56. Label: 8, 25

Dose hypertension, angina, 200 mg daily in the morning, increased to 400 mg daily if necessary; migraine prophylaxis, 200 mg daily

Lopresor SR® (Novartis) PoM

Tablets, m/r, yellow, f/c, metoprolol tartrate 200 mg, net price 28-tab pack = £9.80. Label: 8, 25

Dose hypertension, 200 mg daily; angina, 200-400 mg daily; migraine prophylaxis, 200 mg daily

NADOLOL

Indications see under Dose

Cautions see under Propranolol Hydrochloride; hepatic impairment; renal impairment (Appendix 3)

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, initially 80 mg once daily, increased in increments of up to 80 mg at weekly intervals if required; max. 240 mg daily (higher doses rarely necessary)
- Angina, initially 40 mg once daily, increased at weekly intervals if required; usual max. 160 mg daily (rarely up to 240 mg may be required)
- Arrhythmias, initially 40 mg once daily, increased at weekly intervals up to 160 mg if required; reduce to 40 mg if bradycardia occurs
- Migraine prophylaxis, initially 40 mg once daily, increased in 40 mg increments at weekly intervals according to response; usual maintenance dose 80–160 mg once daily
- Thyrotoxicosis (adjunct), 80–160 mg once daily

Corgard® (Sanofi-Synthelabo) PoM

Tablets, blue, scored, nadolol 80 mg, net price 28-tab pack = £5.00. Label: 8

NEBIVOLOL

Indications essential hypertension; adjunct in stable mild to moderate heart failure in patients over 70 years

Cautions see under Propranolol Hydrochloride; renal impairment (Appendix 3)

Contra-indications see under Propranolol Hydrochloride; also acute or decompensated heart failure requiring intravenous inotropes; hepatic impairment (Appendix 2)

Side-effects see under Propranolol Hydrochloride; also oedema and depression

Dose

- Hypertension, 5 mg daily; ELDERLY initially 2.5 mg daily, increased if necessary to 5 mg daily
- Adjunct in heart failure (section 2.5.5), initially 1.25 mg once daily, then if tolerated increased at intervals of 1–2 weeks to 2.5 mg once daily, then to 5 mg once daily, then to max. 10 mg once daily

Nebivolol (Non-proprietary) PoM

Tablets, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £9.23. Label: 8

Nebilet® (Menarini) PoM

Tablets, scored, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £9.23. Label: 8

Note Also available as *Hypoloc®*

OXPRENOLOL HYDROCHLORIDE

Indications see under Dose

Cautions see under Propranolol Hydrochloride; reduce dose in hepatic impairment

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, 80–160 mg daily in 2–3 divided doses, increased as required; max. 320 mg daily
- Angina, 80–160 mg daily in 2–3 divided doses; max. 320 mg daily
- Arrhythmias, 40–240 mg daily in 2–3 divided doses; max. 240 mg daily
- Anxiety symptoms (short-term use), 40–80 mg daily in 1–2 divided doses

Oxprenolol (Non-proprietary) PoM

Tablets, coated, oxprenolol hydrochloride 20 mg, net price 56 = £1.86; 40 mg, 56 = £3.73; 80 mg, 56 = £6.20; 160 mg, 20 = £2.36. Label: 8

Trasicor® (Amdipharm) PoM

Tablets, f/c, oxprenolol hydrochloride 20 mg (contain gluten), net price 56-tab pack = £1.86; 40 mg (contain gluten), 56-tab pack = £3.73; 80 mg (yellow), 56-tab pack = £6.20. Label: 8

Modified release

Slow-Trasicor® (Amdipharm) PoM

Tablets, m/r, f/c, oxprenolol hydrochloride 160 mg, net price 28-tab pack = £6.63. Label: 8, 25

Dose hypertension, angina, initially 160 mg once daily; if necessary may be increased to max. 320 mg daily

With diuretic

Trasidrex® (Goldshield) PoM

Tablets, red, s/c, co-prenozide 160/0.25 (oxprenolol hydrochloride 160 mg (m/r), cyclopenthiazide 250 micrograms), net price 28-tab pack = £10.66. Label: 8, 25

Dose hypertension, 1 tablet daily, increased if necessary to 2 daily as a single dose

PINDOLOL

Indications see under Dose

Cautions see under Propranolol Hydrochloride

Contra-indications see under Propranolol Hydrochloride; severe renal impairment (Appendix 3)

Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, initially 5 mg 2–3 times daily *or* 15 mg once daily, increased as required at weekly intervals; usual maintenance 15–30 mg daily; max. 45 mg daily
- Angina, 2.5–5 mg up to 3 times daily

Pindolol (Non-proprietary) PoM

Tablets, pindolol 5 mg, net price 100-tab pack = £7.81. Label: 8

Visken® (Amdipharm) PoM

Tablets, scored, pindolol 5 mg, net price 56-tab pack = £5.85; 15 mg, 28-tab pack = £8.79. Label: 8

With diuretic

Viskaldix® (Amdipharm) PoM

Tablets, scored, pindolol 10 mg, clopamide 5 mg, net price 28-tab pack = £6.70. Label: 8

Dose hypertension, 1 tablet daily in the morning, increased if necessary to 2 daily; max. 3 daily

SOTALOL HYDROCHLORIDE

Indications *Tablets and injection:* life-threatening arrhythmias including ventricular tachyarrhythmias, symptomatic non-sustained ventricular tachyarrhythmias

Tablets only: prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), paroxysmal supraventricular tachycardia

after cardiac surgery, maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

Injection only: electrophysiological study of inducible ventricular and supraventricular arrhythmias; temporary substitution for tablets

CSM advice. The use of sotalol should be limited to the treatment of ventricular arrhythmias or prophylaxis of supraventricular arrhythmias (see above). It should no longer be used for angina, hypertension, thyrotoxicosis or for secondary prevention after myocardial infarction; when stopping sotalol for these indications, the dose should be reduced gradually

Cautions see under Propranolol Hydrochloride; renal impairment (avoid if eGFR less than 10 mL/minute/1.73 m^2; Appendix 3); correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances; severe or prolonged diarrhoea; **interactions:** Appendix 1 (beta-blockers), **important:** verapamil interaction see also p. 119

Contra-indications see under Propranolol Hydrochloride; congenital or acquired long QT syndrome; torsade de pointes; renal failure

Side-effects see under Propranolol Hydrochloride; arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in women)

Dose

- By mouth with ECG monitoring and measurement of corrected QT interval, arrhythmias, initially 80 mg daily in 1–2 divided doses increased gradually at intervals of 2–3 days to usual dose of 160–320 mg daily in 2 divided doses; higher doses of 480–640 mg daily for life-threatening ventricular arrhythmias under specialist supervision
- By intravenous injection over 10 minutes, acute arrhythmias, 20–120 mg with ECG monitoring, repeated if necessary with 6-hour intervals between injections

Diagnostic use, see product literature

Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32

Sotalol (Non-proprietary) PoM

Tablets, sotalol hydrochloride 40 mg, net price 56 = £1.29; 80 mg, 56 = £1.91; 160 mg, 28 = £2.12. Label: 8

Beta-Cardone® (UCB Pharma) PoM

Tablets, scored, sotalol hydrochloride 40 mg (green), net price 56-tab pack = £1.29; 80 mg (pink), 56-tab pack = £1.91; 200 mg, 28-tab pack = £2.40. Label: 8

Sotacor® (Bristol-Myers Squibb) PoM

Tablets, scored, sotalol hydrochloride 80 mg, net price 28-tab pack = £3.12; 160 mg, 28-tab pack = £6.16. Label: 8

Injection, sotalol hydrochloride 10 mg/mL, net price 4-mL amp = £1.57

TIMOLOL MALEATE

Indications see under Dose; glaucoma (section 11.6)

Cautions see under Propranolol Hydrochloride; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, initially 10 mg daily in 1–2 divided doses; gradually increased if necessary to max. 60 mg daily, usual maintenance dose 10–30 mg daily (doses above 30 mg daily given in divided doses)
- Angina, initially 5 mg twice daily increased if necessary by 10 mg daily every 3–4 days; max. 30 mg twice daily
- Prophylaxis after myocardial infarction, initially 5 mg twice daily, increased after 2 days to 10 mg twice daily if tolerated
- Migraine prophylaxis, 10–20 mg daily in 1–2 divided doses

Betim® (Valeant) PoM

Tablets, scored, timolol maleate 10 mg, net price 30-tab pack = £2.08. Label: 8

With diuretic

Prestim® (Valeant) PoM

Tablets, scored, timolol maleate 10 mg, bendroflumethiazide 2.5 mg, net price 30-tab pack = £3.49. Label: 8

Dose hypertension, 1–2 tablets daily; max. 4 daily

2.5 Hypertension and heart failure

2.5.1 Vasodilator antihypertensive drugs
2.5.2 Centrally acting antihypertensive drugs
2.5.3 Adrenergic neurone blocking drugs
2.5.4 Alpha-adrenoceptor blocking drugs
2.5.5 Drugs affecting the renin-angiotensin system

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of the Joint British Societies (JBS2: British Societies' guidelines on prevention of cardiovascular disease in clinical practice. *Heart* 2005; **91** (Suppl V): v1–v52).

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Thresholds and targets for treatment The following thresholds for treatment[1] are recommended:

- Accelerated (malignant) hypertension (with papilloedema or fundal haemorrhages and exudates) *or* acute cardiovascular complications, admit for **immediate treatment**;

1. Thresholds and targets for treatment based on blood pressure measured in clinic may not apply to ambulatory or home blood-pressure monitoring, which usually give lower values.

- Where the initial blood pressure is systolic ≥ 220 mmHg *or* diastolic ≥ 120 mmHg, **treat immediately**;
- Where the initial blood pressure is systolic 180–219 mmHg *or* diastolic 110–119 mmHg, confirm over 1–2 weeks then **treat** if these values are sustained;
- Where the initial blood pressure is systolic 160–179 mmHg *or* diastolic 100–109 mmHg, *and* the patient has cardiovascular complications, target-organ damage (e.g. left ventricular hypertrophy, renal impairment) or diabetes mellitus (type 1 or 2), confirm over 3–4 weeks then **treat** if these values are sustained;
- Where the initial blood pressure is systolic 160–179 mmHg *or* diastolic 100–109 mmHg, but the patient has *no* cardiovascular complications, no target-organ damage, or no diabetes, advise lifestyle changes, reassess weekly initially and **treat** if these values are sustained on repeat measurements over 4–12 weeks;
- Where the initial blood pressure is systolic 140–159 mmHg *or* diastolic 90–99 mmHg *and* the patient has cardiovascular complications, target-organ damage or diabetes, confirm within 12 weeks and **treat** if these values are sustained;
- Where the initial blood pressure is systolic 140–159 mmHg *or* diastolic 90–99 mmHg and *no* cardiovascular complications, no target-organ damage, or no diabetes, advise lifestyle changes and **reassess** monthly; **treat** persistent mild hypertension if the 10-year cardiovascular disease risk is 20% or more.[1]

A target systolic blood pressure < 140 mmHg *and* diastolic blood pressure < 90 mmHg is suggested. A lower target systolic blood pressure < 130 mmHg *and* diastolic blood pressure < 80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, diabetes, or chronic renal failure. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drug treatment of hypertension Response to drug treatment for hypertension may be affected by the patient's age and ethnic background. An **ACE inhibitor** (section 2.5.5.1) or an **angiotensin-II receptor antagonist** (section 2.5.5.2) may be the most appropriate initial drug in younger Caucasians; however a **beta-blocker** may be considered if an ACE inhibitor or an angiotensin-II receptor antagonist is not tolerated or is contra-indicated (see also Hypertension in Pregnancy, p. 95). Afro-Caribbean patients and those aged over 55 years respond less well to ACE inhibitors and angiotensin-II receptor antagonists, therefore a **thiazide** (section 2.2.1) or a **calcium-channel blocker** (section 2.6.2) may be chosen for initial treatment.

Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

A single antihypertensive drug is often not adequate and other antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently, an interval of at least 4 weeks should be allowed to determine response.

Where two antihypertensive drugs are needed, an ACE inhibitor *or* an angiotensin-II receptor antagonist may be combined with *either* a thiazide *or* a calcium-channel blocker.

If control is inadequate with 2 drugs, a thiazide *and* a calcium-channel blocker may be added. The addition of an **alpha-blocker** (section 2.5.4), **spironolactone**, another diuretic, or a beta-blocker should be considered in resistant hypertension. In patients with *primary hyperaldosteronism*, spironolactone (section 2.2.3) is effective.

Other measures to reduce cardiovascular risk **Aspirin** (section 2.9) in a dose of 75 mg daily reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease or those with a 10-year cardiovascular disease risk[1] of 20% or more and aged over 50 years. Aspirin is also of benefit in those with diabetes (see also section 2.9).

Lipid-regulating drugs can also be of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease (section 2.12).

Hypertension in the elderly Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. The thresholds for treatment are diastolic pressure averaging ≥ 90 mmHg *or* systolic pressure averaging ≥ 160 mmHg over 3 to 6 months' observation (despite appropriate lifestyle interventions). Treatment with a low dose of a thiazide or a dihydropyridine calcium-channel blocker is effective. An ACE inhibitor (or an angiotensin-II receptor antagonist) (section 2.5.5) can be added if necessary.

Isolated systolic hypertension Isolated systolic hypertension (systolic pressure ≥ 160 mmHg, diastolic pressure < 90 mmHg) is associated with an increased cardiovascular disease risk, particularly in those aged over 60 years. Systolic blood pressure averaging 160 mmHg or higher over 3 to 6 months (despite appropriate lifestyle interventions) should be lowered in those over 60 years, even if diastolic hypertension is absent. Treatment with a low dose of a thiazide or a dihydropyridine calcium-channel blocker is effective. An ACE inhibitor (or an angiotensin-II receptor antagonist) (section 2.5.5) can be added if necessary. Patients with severe postural hypotension should not receive blood pressure lowering drugs.

Isolated systolic hypertension in younger patients is uncommon but treatment may be indicated in those with a threshold systolic pressure of 160 mmHg (or less if at increased risk of cardiovascular disease, see above).

Hypertension in diabetes For patients with diabetes, the aim should be to maintain systolic pressure

1. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (*Heart* 2005; **91** (Suppl V): v1–v52)—see inside back cover. The Joint British Societies' 'Cardiac Risk Assessor' computer programme may also be used to determine cardiovascular disease risk.

< 130 mmHg and diastolic pressure < 80 mmHg. However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy (section 6.1.5); in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease The threshold for antihypertensive treatment in patients with renal impairment or persistent proteinuria is a systolic blood pressure ≥ 140 mmHg *or* a diastolic blood pressure ≥ 90 mmHg. Optimal blood pressure is a systolic blood pressure < 130 mmHg and a diastolic pressure < 80 mmHg, or lower if proteinuria exceeds 1 g in 24 hours. An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment, see section 2.5.5.1. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required. A dihydropyridine calcium channel blocker can be added.

Hypertension in pregnancy High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. **Methyldopa** (section 2.5.2) is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of **nifedipine** [unlicensed] are also used for hypertension in pregnancy. Intravenous administration of **labetalol** (section 2.4) can be used to control hypertensive crises; alternatively, **hydralazine** (section 2.5.1) may be used by the intravenous route. For use of **magnesium sulphate** in pre-eclampsia and eclampsia, see section 9.5.1.3.

Accelerated or very severe hypertension Accelerated (or malignant) hypertension or very severe hypertension (e.g. diastolic blood pressure > 140 mmHg) requires urgent treatment in hospital, but it is not an indication for parenteral antihypertensive therapy. Normally treatment should be by mouth with a beta-blocker (atenolol or labetalol) or a long-acting calcium-channel blocker (e.g. amlodipine or modified-release nifedipine). Within the first 24 hours the diastolic blood pressure should be reduced to 100–110 mmHg. Over the next 2 or 3 days blood pressure should be further reduced using a calcium-channel blocker, diuretic, ACE inhibitor, beta-blocker, or vasodilator, alone or in combination. Rapid reduction in blood pressure can reduce organ perfusion leading to cerebral infarction and blindness, deterioration in renal function, and myocardial ischaemia. **Sodium nitroprusside** [unlicensed] by intravenous infusion is the drug of choice on the rare occasions when parenteral treatment is necessary.

For advice on short-term management of hypertensive episodes in phaeochromocytoma, see under Phaeochromocytoma, section 2.5.4.

2.5.1 Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** for a warning on the hazards of a very rapid fall in blood pressure, see Accelerated or Very Severe Hypertension, above.

Diazoxide has been used by intravenous injection in hypertensive emergencies.

Hydralazine is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention. The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

Sodium nitroprusside [unlicensed] is given by intravenous infusion to control severe hypertensive crises on the rare occasions when parenteral treatment is necessary.

Minoxidil should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for women.

Prazosin, doxazosin, and terazosin (section 2.5.4) have alpha-blocking and vasodilator properties.

Ambrisentan, **bosentan**, **epoprostenol** (section 2.8.1), **iloprost**, **sildenafil**, and **sitaxentan** are licensed for the treatment of some types of pulmonary hypertension and should be used under specialist supervision. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease.

The *Scottish Medicines Consortium* (p. 3) has advised (November 2005) that iloprost (*Ventavis®*) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

The *Scottish Medicines Consortium* (p. 3) has advised (October 2008) that ambrisentan (*Volibris®*) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

AMBRISENTAN

Indications pulmonary arterial hypertension

Cautions not to be initiated in significant anaemia; monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed); monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects abdominal pain, constipation; palpitation, flushing, peripheral oedema; upper respiratory-tract disorders; headache; anaemia; *less commonly* hypersensitivity reactions (including angioedema and rash)

Dose

- ADULT over 18 years, 5 mg once daily, increased if necessary to 10 mg once daily

Volibris® (GSK) ▼ PoM

Tablets, f/c, ambrisentan 5 mg (pale pink), net price 30-tab pack = £1651.07; 10 mg (dark pink), 30-tab pack = £1651.07

BOSENTAN

Indications pulmonary arterial hypertension; systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

Cautions not to be initiated if systemic systolic blood pressure is below 85 mmHg; monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly); avoid abrupt withdrawal; monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment; hepatic impairment (Appendix 2); **interactions:** Appendix 1 (bosentan)

Contra-indications acute porphyria (section 9.8.2) pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances, dry mouth, rectal haemorrhage, hepatic impairment (see Cautions, above); flushing, hypotension, palpitation, oedema, chest pain; dyspnoea; headache, dizziness, fatigue; back pain and pain in extremities; anaemia; hypersensitivity reactions (including rash, pruritus, and anaphylaxis)

Dose

- Pulmonary arterial hypertension, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily; max. 250 mg twice daily; CHILD under 12 years see *BNF for Children*
- Systemic sclerosis with ongoing digital ulcer disease, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily

Tracleer® (Actelion) ▼ PoM

Tablets, f/c, orange, bosentan (as monohydrate) 62.5 mg, net price 56-tab pack = £1493.07; 125 mg, 56-tab pack = £1493.07

DIAZOXIDE

Indications hypertensive emergency including severe hypertension associated with renal disease (but see section 2.5); hypoglycaemia (section 6.1.4)

Cautions ischaemic heart disease; renal impairment (Appendix 3); pregnancy and labour (Appendix 4); **interactions:** Appendix 1 (diazoxide)

Side-effects tachycardia, hypotension, hyperglycaemia, sodium and water retention; *rarely* cardiomegaly, hyperosmolar non-ketotic coma, leucopenia, thrombocytopenia, and hirsuitism

Dose

- By rapid intravenous injection (less than 30 seconds), 1–3 mg/kg to max. single dose of 150 mg (see below); may be repeated after 5–15 minutes if required

  Note Single doses of 300 mg have been associated with angina and with myocardial and cerebral infarction

Eudemine® (Goldshield) PoM

Injection, diazoxide 15 mg/mL, net price 20-mL amp = £30.00

Tablets, see section 6.1.4

HYDRALAZINE HYDROCHLORIDE

Indications moderate to severe hypertension (adjunct); heart failure (with long-acting nitrate, but see section 2.5.5); hypertensive crisis (including during pregnancy) (but see section 2.5)

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised), cerebrovascular disease; occasionally blood pressure reduction too rapid even with low parenteral doses; pregnancy (Appendix 4); breast-feeding (Appendix 5); manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory; **interactions:** Appendix 1 (hydralazine)

Contra-indications idiopathic systemic lupus erythematosus, severe tachycardia, high output heart failure, myocardial insufficiency due to mechanical obstruction, cor pulmonale, dissecting aortic aneurysm; acute porphyria (section 9.8.2)

Side-effects tachycardia, palpitation, flushing, hypotension, fluid retention, gastro-intestinal disturbances; headache, dizziness; systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) (see also notes above); rarely rashes, fever, peripheral neuritis, polyneuritis, paraesthesia, arthralgia, myalgia, increased lacrimation, nasal congestion, dyspnoea, agitation, anxiety, anorexia; blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia), abnormal liver function, jaundice, raised plasma creatinine, proteinuria and haematuria reported

Dose

- By mouth, hypertension, 25 mg twice daily, increased to usual max. 50 mg twice daily (see notes above)

  Heart failure (initiated in hospital) 25 mg 3–4 times daily, increased every 2 days if necessary; usual maintenance dose 50–75 mg 4 times daily
- By slow intravenous injection, hypertension with renal complications and hypertensive crisis, 5–10 mg diluted with 10 mL sodium chloride 0.9%; may be repeated after 20–30 minutes (see Cautions)
- By intravenous infusion, hypertension with renal complications and hypertensive crisis, initially 200–300 micrograms/minute; maintenance usually 50–150 micrograms/minute

Hydralazine (Non-proprietary) PoM

Tablets, hydralazine hydrochloride 25 mg, net price 56 = £12.40; 50 mg, 56 = £19.20

Apresoline® (Amdipharm) PoM

Tablets, yellow, s/c, hydralazine hydrochloride 25 mg, net price 84-tab pack = £3.38

Excipients include gluten

Injection, powder for reconstitution, hydralazine hydrochloride, net price 20-mg amp = £2.19

ILOPROST

Indications idiopathic or familial pulmonary arterial hypertension

Cautions unstable pulmonary hypertension with advanced right heart failure; hypotension (do not initiate if systolic blood pressure below 85 mmHg); acute pulmonary infection; chronic obstructive pulmonary disease; severe asthma; hepatic impairment (Appendix 2); **interactions:** Appendix 1 (iloprost)

Contra-indications unstable angina; within 6 months of myocardial infarction; decompensated cardiac failure (unless under close medical supervision); severe arrhythmias; congenital or acquired heart-valve defects; within 3 months of cerebrovascular events; pulmonary veno-occlusive disease; conditions which increase risk of bleeding; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects vasodilatation, hypotension, syncope, cough, headache, throat or jaw pain; nausea, vomiting, diarrhoea, chest pain, dyspnoea, bronchospasm, and wheezing also reported

Dose

- By inhalation of nebulised solution, initial dose 2.5 micrograms increased to 5 micrograms for second dose, if tolerated maintain at 5 micrograms 6–9 times daily according to response; reduce to 2.5 micrograms 6–9 times daily if higher dose not tolerated; CHILD 8–18 years see *BNF for Children*

Ventavis® (Schering Health) ▼ PoM

Nebuliser solution, iloprost (as trometamol) 10 micrograms/mL, net price 30 × 1-mL (10 microgram) unit-dose vials = £407.94, 168 × 1-mL = £2284.49. For use with *Prodose®* NHS or *Venta-Neb®* NHS nebuliser

MINOXIDIL

Indications severe hypertension, in addition to a diuretic and a beta-blocker

Cautions see notes above; angina; after myocardial infarction (until stabilised); lower doses in dialysis patients; acute porphyria (section 9.8.2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (vasodilator antihypertensives)

Contra-indications phaeochromocytoma

Side-effects sodium and water retention; weight gain, peripheral oedema, tachycardia, hypertrichosis; reversible rise in creatinine and blood urea nitrogen; occasionally, gastro-intestinal disturbances, breast tenderness, rashes

Dose

- Initially 5 mg (ELDERLY, 2.5 mg) daily, in 1–2 divided doses, increased in steps of 5–10 mg at intervals of at least 3 days; max. 100 mg daily (seldom necessary to exceed 50 mg daily)

Loniten® (Pharmacia) PoM

Tablets, scored, minoxidil 2.5 mg, net price 60-tab pack = £8.88; 5 mg, 60-tab pack = £15.83; 10 mg, 60-tab pack = £30.68

SILDENAFIL

Indications pulmonary arterial hypertension; erectile dysfunction (section 7.4.5)

Cautions hypotension (avoid if systolic blood pressure below 90 mmHg); intravascular volume depletion; left ventricular outflow obstruction; cardiovascular disease; autonomic dysfunction; pulmonary veno-occlusive disease; anatomical deformation of the penis, predisposition to priapism; bleeding disorders or active peptic ulceration; consider gradual withdrawal; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (sildenafil)

Contra-indications recent history of stroke or myocardial infarction, history of non-arteritic anterior ischaemic optic neuropathy; hereditary degenerative retinal disorders; avoid concomitant use of nitrates

Side-effects gastro-intestinal disturbances, dry mouth; flushing, oedema; bronchitis, cough; headache, migraine, night sweats, paraesthesia, insomnia, anxiety, tremor, vertigo; fever, influenza-like symptoms; anaemia; back and limb pain, myalgia; visual disturbances, retinal haemorrhage, photophobia, painful red eyes; nasal congestion, epistaxis; cellulitis, alopecia; *less commonly* gynaecomastia, priapism; *also reported* rash, retinal vascular occlusion and non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment), and sudden hearing loss (advise patient to seek medical help)

Dose

- 20 mg 3 times daily; CHILD under 18 years see *BNF for Children*

Revatio® (Pfizer) ▼ PoM

Tablets, f/c, sildenafil (as citrate), 20 mg, net price 90-tab pack = £373.50

Viagra® (Pfizer) PoM NHS

Section 7.4.5 (erectile dysfunction)

SITAXENTAN SODIUM

Indications pulmonary arterial hypertension

Cautions test liver function before treatment and monitor monthly during treatment (discontinue treatment if liver enzymes significantly raised); measure haemoglobin concentration before treatment, after 1–3 months, then every 3 months; pregnancy (Appendix 4); **interactions**: Appendix 1 (sitaxentan)

Contra-indications hepatic impairment; breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances; peripheral oedema, flushing; headache, insomnia, fatigue, dizziness; decreased haemoglobin, prolonged prothrombin time, increased INR; muscle cramp; nasal congestion, epistaxis

Dose

- ADULT over 18 years 100 mg once daily

Thelin® (Encysive) ▼ PoM

Tablets, f/c, yellow-orange, sitaxentan sodium 100 mg, net price 28-tab pack = £1540.00

Note All orders of Thelin should be based on a prescription from a specialist in Pulmonary Arterial Hypertension, who has received appropriate training as part of the Programmed Access to Sitaxentan Sodium (PASS) scheme. Orders should be placed with Polarspeed at 01525 217211

SODIUM NITROPRUSSIDE

Indications hypertensive crisis (but see section 2.5); controlled hypotension in anaesthesia; acute or chronic heart failure

Cautions hypothyroidism, hyponatraemia, ischaemic heart disease, impaired cerebral circulation, elderly; hypothermia; monitor blood pressure and blood-cyanide concentration and if treatment exceeds 3 days, also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (sodium nitroprusside)

Contra-indications severe vitamin B_{12} deficiency; Leber's optic atrophy; compensatory hypertension

Side-effects associated with over rapid reduction in blood pressure (reduce infusion rate): headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient phlebitis

Cyanide Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see p. 34)

Dose

- Hypertensive crisis, by intravenous infusion, initially 0.5–1.5 micrograms/kg/minute, then increased in steps of 500 nanograms/kg/minute every 5 minutes within range 0.5–8 micrograms/kg/minute (lower doses if already receiving other antihypertensives); stop if response unsatisfactory with max. dose in 10 minutes

  Note Lower initial dose of 300 nanograms/kg/minute has been used
- Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure, 20–400 micrograms/minute (lower doses for patients being treated with other antihypertensives)
- Controlled hypotension in surgery, by intravenous infusion, max. 1.5 micrograms/kg/minute
- Heart failure, by intravenous infusion, initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual range 10–200 micrograms/minute normally for max. 3 days

Sodium Nitroprusside (Non-proprietary) PoM

Intravenous infusion, powder for reconstitution, sodium nitroprusside 10 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 969

2.5.2 Centrally acting antihypertensive drugs

Methyldopa is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy. Side-effects are minimised if the daily dose is kept below 1 g.

Clonidine has the disadvantage that sudden withdrawal may cause a hypertensive crisis.

Moxonidine, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

CLONIDINE HYDROCHLORIDE

Indications hypertension; migraine (section 4.7.4.2); menopausal flushing (section 6.4.1.1)

Cautions must be withdrawn gradually to avoid hypertensive crisis; Raynaud's syndrome or other occlusive peripheral vascular disease; history of depression; avoid in acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (clonidine)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

Side-effects dry mouth, sedation, depression, fluid retention, bradycardia, Raynaud's phenomenon, headache, dizziness, euphoria, nocturnal unrest, rash, nausea, constipation, rarely impotence

Dose

- By mouth, 50–100 micrograms 3 times daily, increased every second or third day; usual max. dose 1.2 mg daily
- By slow intravenous injection, 150–300 micrograms; max. 750 micrograms in 24 hours

Catapres® (Boehringer Ingelheim) PoM

Tablets, scored, clonidine hydrochloride 100 micrograms, net price 100-tab pack = £5.32; 300 micrograms, 100-tab pack = £12.39. Label: 3, 8

Injection, clonidine hydrochloride 150 micrograms/mL, net price 1-mL amp = 28p

Dixarit® PoM

Section 4.7.4.2

METHYLDOPA

Indications hypertension

Cautions monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs; history of depression; positive direct Coombs' test in up to 20% of patients (may affect blood cross-matching); interference with laboratory tests; hepatic impairment (avoid in active liver disease; Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 (methyldopa)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

Contra-indications depression, active liver disease, phaeochromocytoma; acute porphyria (section 9.8.2)

Side-effects gastro-intestinal disturbances, dry mouth, stomatitis, sialadenitis; bradycardia, exacerbation of angina, postural hypotension, oedema; sedation, headache, dizziness, asthenia, myalgia, arthralgia, paraesthesia, nightmares, mild psychosis, depression, impaired mental acuity, parkinsonism, Bell's palsy; hepatitis, jaundice; pancreatitis; haemolytic anaemia; bone-marrow depression, leucopenia, thrombocytopenia, eosinophilia; hypersensitivity

reactions including lupus erythematosus-like syndrome, drug fever, myocarditis, pericarditis; rashes (including toxic epidermal necrolysis); nasal congestion, failure of ejaculation, impotence, decreased libido, gynaecomastia, hyperprolactinaemia, amenorrhoea

Dose

- Initially 250 mg 2–3 times daily, increased gradually at intervals of at least 2 days, max. 3 g daily; ELDERLY initially 125 mg twice daily, increased gradually, max. 2 g daily

Methyldopa (Non-proprietary) PoM

Tablets, coated, methyldopa (anhydrous) 125 mg, net price 56-tab pack = £14.32; 250 mg, 56-tab pack = £6.80; 500 mg, 56-tab pack = £10.17. Label: 3, 8

Aldomet® (MSD) PoM

Tablets, all yellow, f/c, methyldopa (anhydrous) 250 mg, net price 60 = £1.88; 500 mg, 30 = £1.90. Label: 3, 8

MOXONIDINE

Indications mild to moderate essential hypertension

Cautions avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days); susceptibility to angle-closure glaucoma; renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); **interactions:** see Appendix 1 (moxonidine)

Contra-indications history of angioedema; conduction disorders (sick sinus syndrome, sino-atrial block, second- or third-degree AV block); bradycardia; life-threatening arrhythmia; severe heart failure; severe coronary artery disease, unstable angina; severe liver disease; also on theoretical grounds: Raynaud's syndrome, intermittent claudication, epilepsy, depression, Parkinson's disease; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects dry mouth; headache, fatigue, dizziness, nausea, sleep disturbance (rarely sedation), asthenia, vasodilatation; *rarely* skin reactions; *very rarely* angle-closure glaucoma

Dose

- 200 micrograms once daily in the morning, increased if necessary after 3 weeks to 400 micrograms daily in 1–2 divided doses; max. 600 micrograms daily in 2 divided doses (max. single dose 400 micrograms)

Moxonidine (Non-proprietary) PoM

Tablets, f/c, moxonidine 200 micrograms, net price 28-tab pack = £5.12; 300 micrograms, net price 28-tab pack = £8.10; 400 micrograms, net price 28-tab pack = £5.89. Label: 3

Physiotens® (Solvay) PoM

Tablets, f/c, moxonidine 200 micrograms (pink), net price 28-tab pack = £9.72; 300 micrograms (red), 28-tab pack = £11.49; 400 micrograms (red), 28-tab pack = £13.26. Label: 3

2.5.3 Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure.

GUANETHIDINE MONOSULPHATE

Indications hypertensive crisis (but see section 2.5)

Cautions coronary or cerebral arteriosclerosis, asthma, history of peptic ulceration; renal impairment (avoid if eGFR less than 40 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (adrenergic neurone blockers)

Contra-indications phaeochromocytoma, heart failure

Side-effects postural hypotension, failure of ejaculation, fluid retention, nasal congestion, headache, diarrhoea, drowsiness

Dose

- By intramuscular injection, 10–20 mg, repeated after 3 hours if required

Ismelin® (Amdipharm) PoM

Injection, guanethidine monosulphate 10 mg/mL, net price 1-mL amp = £1.56

2.5.4 Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. **Doxazosin**, **indoramin**, and **terazosin** have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension (section 2.5).

Prostatic hyperplasia Alfuzosin, doxazosin, indoramin, prazosin, tamsulosin, and terazosin are indicated for benign prostatic hyperplasia (section 7.4.1).

DOXAZOSIN

Indications hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

Cautions care with initial dose (postural hypotension); cataract surgery (risk of intra-operative floppy iris syndrome); susceptibility to heart failure; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (alpha-blockers)

Driving May affect performance of skilled tasks e.g. driving

Side-effects gastro-intestinal disturbances; oedema, hypotension, postural hypotension; dyspnoea, rhinitis, coughing; asthenia, fatigue, vertigo, dizziness, headache, paraesthesia, sleep disturbance, anxiety, depression; respiratory-tract infection, urinary-tract infection, influenza-like symptoms; back pain, myalgia; *less commonly* weight changes, flushing, syncope, tremor, agitation, micturition disturbance, impotence,

epistaxis, arthralgia, tinnitus, hypersensitivity reactions (including pruritus, purpura, rash), alopecia; *very rarely* cholestasis, hepatitis, jaundice, bronchospasm, gynaecomastia, priapism, abnormal ejaculation, leucopenia, thrombocytopenia, blurred vision

Dose

- Hypertension, 1 mg daily, increased after 1–2 weeks to 2 mg once daily, and thereafter to 4 mg once daily, if necessary; max. 16 mg daily

Doxazosin (Non-proprietary) PoM

Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = 93p; 2 mg, 28-tab pack = £1.00; 4 mg, 28-tab pack = £1.48. Counselling, initial dose, driving

Brands include *Doxadura®*

Cardura® (Pfizer) PoM

Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £10.56; 2 mg, 28-tab pack = £14.08. Counselling, initial dose, driving

Modified-release

Doxazosin (Non-proprietary) PoM

Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £6.33. Label: 25, counselling, initial dose, driving

Dose hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

Brands include *Doxadura® XL*, *Slocinx® XL*

Cardura® XL (Pfizer) PoM

Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £5.70; 8 mg, 28-tab pack = £9.98. Label: 25, counselling, driving, initial dose

Dose hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

INDORAMIN

Indications hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

Cautions avoid alcohol (enhances rate and extent of absorption); control incipient heart failure before initiating indoramin; elderly; Parkinson's disease; epilepsy (convulsions in *animal* studies); history of depression; cataract surgery (risk of floppy iris syndrome); hepatic impairment; renal impairment; **interactions:** Appendix 1 (alpha-blockers)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

Contra-indications established heart failure

Side-effects see section 7.4.1; drowsiness, sedation; *less commonly* dry mouth, hypotension, syncope, nasal congestion, dizziness, depression, fatigue, headache, weight gain, failure of ejaculation; *rarely* hypersensitivity reactions (including rash and puritus); diarrhoea, nausea, palpitation, urinary frequency and incontinence, and priapism also reported

Dose

- Hypertension, initially 25 mg twice daily, increased by 25–50 mg daily at intervals of 2 weeks; max. daily dose 200 mg in 2–3 divided doses

Baratol® (Amdipharm) PoM

Tablets, blue, f/c, indoramin (as hydrochloride) 25 mg, net price 84-tab pack = £9.00. Label: 2

Doralese® PoM

Section 7.4.1 (prostatic hyperplasia)

PRAZOSIN

Indications hypertension (see notes above); congestive heart failure (but see section 2.5.5); Raynaud's syndrome (see also section 2.6.4); benign prostatic hyperplasia (section 7.4.1)

Cautions first dose may cause collapse due to hypotension (therefore should be taken on retiring to bed); elderly; cataract surgery (risk of intraoperative floppy iris syndrome); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (alpha-blockers)

Driving May affect performance of skilled tasks e.g. driving

Contra-indications not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

Side-effects see section 7.4.1; also gastro-intestinal disturbances; postural hypotension, oedema, palpitation; dyspnoea, nasal congestion; drowsiness, headache, depression, nervousness, vertigo; urinary frequency; weakness; blurred vision; *less commonly* tachycardia, insomnia, paraesthesia, sweating, impotence, arthralgia, eye disorders, tinnitus, epistaxis, allergic reactions including rash, pruritus, and urticaria; *rarely* pancreatitis, flushing, vasculitis, bradycardia, hallucinations, worsening of narcolepsy, gynaecomastia, priapism, urinary incontinence, and alopecia

Dose

- Hypertension (see notes above), 500 micrograms 2–3 times daily for 3–7 days, the initial dose on retiring to bed at night (to avoid collapse, see Cautions); increased to 1 mg 2–3 times daily for a further 3–7 days; further increased if necessary to max. 20 mg daily in divided doses
- Congestive heart failure (but see section 2.5.5), 500 micrograms 2–4 times daily (initial dose at bedtime, see above), increasing to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses (but rarely used)
- Raynaud's syndrome (but efficacy not established, see section 2.6.4), initially 500 micrograms twice daily (initial dose at bedtime, see above) increased, if necessary, after 3–7 days to usual maintenance 1–2 mg twice daily

Prazosin (Non-proprietary) PoM

Tablets, prazosin (as hydrochloride) 500 micrograms, net price 56-tab pack = £2.51; 1 mg, 56-tab pack = £3.23; 2 mg, 56-tab pack = £4.39; 5 mg, 56-tab pack = £8.75. Counselling, initial dose, driving

Hypovase® (Pfizer) PoM

Tablets, prazosin (as hydrochloride) 500 micrograms, net price 60-tab pack = £2.69; 1 mg, scored, 60-tab pack = £3.46. Counselling, initial dose, driving

TERAZOSIN

Indications mild to moderate hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

Cautions first dose may cause collapse due to hypotension (within 30–90 minutes, therefore should be taken on retiring to bed) (may also occur with rapid dose increase); pregnancy (Appendix 4); **interactions:** Appendix 1 (alpha-blockers)

Driving May affect performance of skilled tasks e.g. driving

Side-effects see section 7.4.1; also drowsiness, dizziness, lack of energy, peripheral oedema; urinary frequency and priapism reported

Dose

- Hypertension, 1 mg at bedtime (compliance with bedtime dose important, see Cautions); dose doubled after 7 days if necessary; usual maintenance dose 2–10 mg once daily; more than 20 mg daily rarely improves efficacy

Terazosin (Non-proprietary) PoM

Tablets, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.34; 5 mg, 28-tab pack = £2.78; 10 mg, 28-tab pack = £7.06. Counselling, initial dose, driving

Hytrin® (Amdipharm) PoM

Tablets, terazosin (as hydrochloride) 2 mg (yellow), net price 28-tab pack = £2.29; 5 mg (tan), 28-tab pack = £4.29; 10 mg (blue), 28-tab pack = £8.57; starter pack (for hypertension) of 7 × 1-mg tabs with 21 × 2-mg tabs = £13.00. Counselling, initial dose, driving

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker (section 2.4); a cardioselective beta-blocker is preferred.

Phenoxybenzamine, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. **Phentolamine** is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metirosine (available from 'special-order' manufacturers or specialist importing companies, see p. 969) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should **not** be used to treat essential hypertension.

PHENOXYBENZAMINE HYDROCHLORIDE

Indications hypertensive episodes in phaeochromocytoma

Cautions elderly; congestive heart failure; severe heart disease (see also Contra-indications); cerebrovascular disease (avoid if history of cerebrovascular accident); renal impairment; carcinogenic in *animals*; avoid in acute porphyria (section 9.8.2); avoid infusion in hypovolaemia; avoid extravasation (irritant to tissues); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications history of cerebrovascular accident; during recovery period after myocardial infarction (usually 3–4 weeks)

Side-effects postural hypotension with dizziness and marked compensatory tachycardia, lassitude, nasal congestion, miosis, inhibition of ejaculation; rarely gastro-intestinal disturbances; decreased sweating and dry mouth after intravenous infusion; idiosyncratic profound hypotension within few minutes of starting infusion

Dose

- See under preparations

Phenoxybenzamine (Goldshield) PoM

Injection concentrate, phenoxybenzamine hydrochloride 50 mg/mL. To be diluted before use, net price 2-mL amp = £57.14 (hosp. only)

Dose by *intravenous infusion* (preferably through large vein), adjunct in severe shock (but rarely used) and phaeochromocytoma, 1 mg/kg daily over at least 2 hours; do not repeat within 24 hours (intensive care facilities needed)

Caution Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands

Dibenyline® (Goldshield) PoM

Capsules, red/white, phenoxybenzamine hydrochloride 10 mg, net price 30-cap pack = £10.84

Dose phaeochromocytoma, 10 mg daily, increased by 10 mg daily; usual dose 1–2 mg/kg daily in 2 divided doses

Note May be difficult to obtain

PHENTOLAMINE MESILATE

Indications hypertensive episodes due to phaeochromocytoma e.g. during surgery; diagnosis of phaeochromocytoma

Cautions monitor blood pressure (avoid in hypotension), heart rate; renal impairment; gastritis, peptic ulcer; elderly; pregnancy (Appendix 4) and breast-feeding (Appendix 5); **interactions:** Appendix 1 (alpha-blockers)

Contra-indications hypotension; history of myocardial infarction; coronary insufficiency, angina, or other evidence of coronary artery disease

Side-effects postural hypotension, tachycardia, dizziness, flushing; nausea and vomiting, diarrhoea, nasal congestion; also acute or prolonged hypotension, angina, chest pain, arrhythmias

Dose

- Hypertensive episodes, by intravenous injection, 2–5 mg repeated if necessary
- Diagnosis of phaeochromocytoma, consult product literature

Rogitine® (Alliance) PoM

Injection, phentolamine mesilate 10 mg/mL, net price 1-mL amp = £1.53

Excipients include sulphites

2.5.5 Drugs affecting the renin-angiotensin system

2.5.5.1 Angiotensin-converting enzyme inhibitors
2.5.5.2 Angiotensin-II receptor antagonists
2.5.5.3 Renin inhibitors

Heart failure

Drug treatment of heart failure due to left ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function is not established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An **ACE inhibitor**, titrated to a 'target dose' (or the maximum tolerated dose if lower), and a **beta-blocker** is recommended to achieve these aims. A **diuretic** is also necessary in most patients to reduce symptoms of fluid overload.

An ACE inhibitor (section 2.5.5.1) is generally advised for patients with asymptomatic left ventricular dysfunction or symptomatic heart failure. An **angiotensin-II receptor antagonist** (section 2.5.5.2) may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit.

The beta-blockers bisoprolol and carvedilol (section 2.4) are of value in any grade of stable heart failure and left-ventricular systolic dysfunction; nebivolol (section 2.4) is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A **thiazide diuretic** (section 2.2.1) may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m^2, see Appendix 3) and a **loop diuretic** (section 2.2.2) is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone (section 2.2.1) may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

The aldosterone antagonist **spironolactone** (section 2.2.3) can be considered for patients with moderate to severe heart failure who are already taking an ACE inhibitor and a beta-blocker; low doses of spironolactone (usually 25 mg daily) reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone (section 2.2.3) may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular dysfunction. Close monitoring of serum creatinine and potassium is necessary with any change in treatment or in the patient's condition.

Digoxin (section 2.1.1) improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with atrial fibrillation and also for selected patients in sinus rhythm who remain symptomatic despite treatment with an ACE inhibitor, a beta-blocker, and a diuretic.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given **isosorbide dinitrate** (section 2.6.1) with **hydralazine** (section 2.5.1), but this combination may be poorly tolerated. In African-American patients, the combination of isosorbide dinitrate and hydralazine may be considered in addition to standard therapy if necessary.

2.5.5.1 Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart failure ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker (section 2.5.5). Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone may be beneficial in severe heart failure (section 2.5.5) and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision, see below. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

Hypertension An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well (see section 2.5). ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy (see also section 6.1.5). They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy (see Cautions, below); the first dose should preferably be given at bedtime.

Diabetic nephropathy For comment on the role of ACE inhibitors in the management of diabetic nephropathy, see section 6.1.5.

Prophylaxis of cardiovascular events ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction, see section 2.10.1. ACE inhibitors may also have a role in preventing cardiovascular events.

Initiation under specialist supervision ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

Renal effects Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced (Appendix 3). Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

Cautions ACE inhibitors need to be initiated with care in patients receiving diuretics (**important:** see Concomitant diuretics, below); first doses can cause hypotension especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated or with heart failure (see above). They should also be used with caution in peripheral vascular disease or generalised atherosclerosis owing to risk of clinically silent renovascular disease; for use in known renovascular disease, see Renal Effects above. The risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended). ACE inhibitors should be used with care in patients with severe or symptomatic aortic stenosis (risk of hypotension) and in hypertrophic cardiomyopathy. They should also be used with care (or avoided) in those with a history of idiopathic or hereditary angioedema. If jaundice or marked elevations of hepatic enzymes occur during treatment then the ACE inhibitor should be discontinued—risk of hepatic necrosis (see also Appendix 2; hepatic impairment). ACE inhibitors should be used with caution in breast-feeding (Appendix 5). **Interactions:** Appendix 1 (ACE inhibitors).

Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulphate; they should also be withheld before desensitisation with wasp or bee venom.

Concomitant diuretics ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Contra-indications ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema). ACE inhibitors should not be used in pregnancy (Appendix 4).

Side-effects ACE inhibitors can cause profound hypotension (see Cautions) and renal impairment (see Renal effects above), and a persistent dry cough. They can also cause angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients), rash (which may be associated with pruritus and urticaria), pancreatitis, and upper respiratory-tract symptoms such as sinusitis, rhinitis, and sore throat. Gastro-intestinal effects reported with ACE inhibitors include nausea, vomiting, dyspepsia, diarrhoea, constipation, and abdominal pain. Altered liver function tests, cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure have been reported—discontinue if marked elevation of hepatic enzymes or jaundice. Hyperkalaemia, hypoglycaemia, and blood disorders including thrombocytopenia, leucopenia, neutropenia, and haemolytic anaemia have also been reported. Other reported side-effects include headache, dizziness, fatigue, malaise, taste disturbance, paraesthesia, bronchospasm, fever, serositis, vasculitis, myalgia, arthralgia, positive antinuclear antibody, raised erythrocyte sedimentation rate, eosinophilia, leucocytosis, and photosensitivity.

Combination products Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

CAPTOPRIL

Indications mild to moderate essential hypertension alone or with thiazide therapy and severe hypertension resistant to other treatment; congestive heart failure with left ventricular dysfunction (adjunct—see section 2.5.5); following myocardial infarction, see dose; diabetic nephropathy (microalbuminuria greater than 30 mg/day) in type 1 diabetes

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; tachycardia, serum sickness, weight loss, stomatitis, maculopapular rash, photosensitivity, flushing and acidosis

Dose

- Hypertension, used alone, initially 12.5 mg twice daily; if used in addition to diuretic (see notes above), or in elderly, initially 6.25 mg twice daily (first dose at bedtime); usual maintenance dose 25 mg twice daily; max. 50 mg twice daily (rarely 3 times daily in severe hypertension)
- Heart failure (adjunct), initially 6.25–12.5 mg 2–3 times daily under close medical supervision (see notes above), increased gradually at intervals of at least 2 weeks up to max. 150 mg daily in divided doses if tolerated
- Prophylaxis after infarction in clinically stable patients with asymptomatic or symptomatic left ventricular dysfunction (radionuclide ventriculography or echocardiography undertaken before initiation), initially 6.25 mg, starting as early as 3 days after infarction, then increased over several weeks to 150 mg daily (if tolerated) in divided doses
- Diabetic nephropathy, 75–100 mg daily in divided doses; if further blood pressure reduction required, other antihypertensives may be used in conjunction with captopril; in severe renal impairment, initially 12.5 mg twice daily (if concomitant diuretic therapy required, loop diuretic rather than thiazide should be chosen)

Captopril (Non-proprietary) PoM

Tablets, captopril 12.5 mg, net price 56-tab pack = £1.53; 25 mg, 56-tab pack = £1.73; 50 mg, 56-tab pack = £2.48

Brands include *Ecopace®*, *Kaplon®*, *Tensopril®*

Capoten® (Squibb) PoM

Tablets, captopril 12.5 mg (scored), net price 56-tab pack = £9.44; 25 mg, 56-tab pack = £10.75; 50 mg (scored), 56-tab pack = £18.33 (also available as *Acepril®*)

With diuretic

Note For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Co-zidocapt (Non-proprietary) PoM

Tablets, co-zidocapt 12.5/25 (hydrochlorothiazide 12.5 mg, captopril 25 mg), net price 28-tab pack = £14.10

Brands include *Capto-co®*

Tablets, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 28-tab pack = £14.00

Brands include *Capto-co®*

Capozide® (Squibb) PoM

LS tablets, scored, co-zidocapt 12.5/25 (hydrochlorothiazide 12.5 mg, captopril 25 mg), net price 28-tab pack = £10.05

Tablets, scored, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 28-tab pack = £7.16 (also available as *Acezide®*)

CILAZAPRIL

Indications essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions see notes above

Contra-indications see notes above; ascites

Side-effects see notes above; dyspnoea and bronchitis

Dose

- Hypertension, initially 1 mg once daily (reduced to 500 micrograms daily if used in addition to diuretic (see notes above), in the elderly, and in renal impairment), then adjusted according to response; usual maintenance dose 2.5–5 mg once daily; max. 5 mg daily
- Heart failure (adjunct), initially 500 micrograms once daily under close medical supervision (see notes above), increased gradually to 1–2.5 mg once daily if tolerated; max. 5 mg once daily

Vascace® (Roche) PoM

Tablets, f/c, cilazapril 500 micrograms (white), net price 30-tab pack = £3.76; 1 mg (yellow), 30-tab pack = £6.19; 2.5 mg (pink), 28-tab pack = £7.34; 5 mg (brown), 28-tab pack = £12.76

ENALAPRIL MALEATE

Indications hypertension; symptomatic heart failure (adjunct—see section 2.5.5); prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also dyspnoea; depression, asthenia; blurred vision; *less commonly* dry mouth, peptic ulcer, anorexia, ileus; arrhythmias, palpitation, flushing; confusion, nervousness, drowsiness, insomnia, vertigo; impotence; muscle cramps; tinnitus; alopecia, sweating; hyponatraemia; *rarely* stomatitis, glossitis, Raynaud's syndrome, pulmonary infiltrates, allergic alveolitis, dream abnormalities, gynaecomastia, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, pemphigus; *very rarely* gastro-intestinal angioedema

Dose

- Hypertension, used alone, initially 5 mg once daily; if used in addition to diuretic (see notes above), or in renal impairment, lower initial doses may be required; usual maintenance dose 20 mg once daily; max. 40 mg once daily
- Heart failure (adjunct), asymptomatic left ventricular dysfunction, initially 2.5 mg once daily under close medical supervision (see notes above), increased gradually over 2–4 weeks to 10–20 mg twice daily if tolerated

Enalapril Maleate (Non-proprietary) PoM

Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £1.28; 5 mg, 28-tab pack = £1.03; 10 mg, 28-tab pack = £1.10; 20 mg, 28-tab pack = £1.21

Brands include *Ednyt®*

Innovace® (MSD) PoM

Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £5.35; 5 mg (scored), 28-tab pack = £7.51; 10 mg (red), 28-tab pack = £10.53; 20 mg (peach), 28-tab pack = £12.51

With diuretic

Note For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Innozide® (MSD) PoM

Tablets, yellow, scored, enalapril maleate 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.82

Note Non-proprietary tablets containing enalapril maleate (20 mg) and hydrochlorothiazide (12.5 mg) are available

FOSINOPRIL SODIUM

Indications hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; chest pain; musculoskeletal pain

Dose

- Hypertension, initially 10 mg daily, increased if necessary after 4 weeks; usual dose range 10–40 mg (doses over 40 mg not shown to increase efficacy); if used in addition to diuretic see notes above
- Heart failure (adjunct), initially 10 mg once daily under close medical supervision (see notes above), increased gradually to 40 mg once daily if tolerated

Fosinopril sodium (Non-proprietary) PoM

Tablets, fosinopril sodium 10 mg, net price 28-tab pack = £2.32; 20 mg, 28-tab pack = £2.65

Staril® (Squibb) PoM

Tablets, fosinopril sodium 10 mg, net price 28-tab pack = £10.76; 20 mg, 28-tab pack = £11.62

IMIDAPRIL HYDROCHLORIDE

Indications essential hypertension

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; dry mouth, glossitis, ileus; bronchitis, dyspnoea; sleep disturbances, depression, confusion, blurred vision, tinnitus, impotence

Dose

- Initially 5 mg daily before food; if used in addition to diuretic (see notes above), in elderly, in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment, initially 2.5 mg daily; if necessary increase dose at intervals of at least 3 weeks; usual maintenance dose 10 mg once daily; max. 20 mg daily (elderly, 10 mg daily)

Tanatril® (Chiesi) PoM

Tablets, scored, imidapril hydrochloride 5 mg, net price 28-tab pack = £6.52; 10 mg, 28-tab pack = £7.36; 20 mg, 28-tab pack = £8.84

LISINOPRIL

Indications hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); short-term treatment following myocardial infarction in haemodynamically stable patients; renal complications of diabetes mellitus

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also *less commonly* tachycardia, palpitation, cerebrovascular accident, myocardial infarction, Raynaud's syndrome, confusion, mood changes, vertigo, sleep disturbances, asthenia, impotence; *rarely* dry mouth, gynaecomastia, alopecia, psoriasis; *very rarely* allergic alveolitis, pulmonary infiltrates, profuse sweating, pemphigus, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- Hypertension, initially 10 mg once daily; if used in addition to diuretic (see notes above) or in cardiac decompensation or in volume depletion, initially 2.5–5 mg once daily; usual maintenance dose 20 mg once daily; max. 80 mg once daily
- Heart failure (adjunct), initially 2.5 mg once daily under close medical supervision (see notes above); increased in steps no greater than 10 mg at intervals of at least 2 weeks up to max. 35 mg once daily if tolerated
- Prophylaxis after myocardial infarction, systolic blood pressure over 120 mmHg, 5 mg within 24 hours, followed by further 5 mg 24 hours later, then 10 mg after a further 24 hours, and continuing with 10 mg once daily for 6 weeks (or continued if heart failure); systolic blood pressure 100–120 mmHg, initially 2.5 mg once daily, increased to maintenance dose of 5 mg once daily

  Note Should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg; temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)
- Renal complications of diabetes mellitus, initially 2.5–5 mg once daily adjusted according to response; usual dose range 10–20 mg once daily

Lisinopril (Non-proprietary) PoM

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = 89p; 5 mg, 28-tab pack = 97p; 10 mg, 28-tab pack = £1.05; 20 mg, 28-tab pack = £1.29

Carace® (Bristol-Myers Squibb) PoM

Tablets, scored, lisinopril 5 mg, net price 28-tab pack = £8.18; 10 mg (yellow), 28-tab pack = £10.10; 20 mg (orange), 28-tab pack = £11.43

Zestril® (AstraZeneca) PoM

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £1.78; 5 mg (pink), 28-tab pack = £1.31; 10 mg (pink), 28-tab pack = £2.05; 20 mg (pink), 28-tab pack = £2.17

With diuretic

Note For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Carace Plus® (Bristol-Myers Squibb) PoM

Carace 10 Plus tablets, blue, lisinopril 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.10

Carace 20 Plus tablets, yellow, scored, lisinopril 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.43

Lisicostad® (Genus) PoM

Lisicostad 10/12.5 mg tablets, scored, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.99

Lisicostad 20/12.5 mg tablets, scored, lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.99

Zestoretic® (AstraZeneca) PoM

Zestoretic 10 tablets, peach, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.01

Zestoretic 20 tablets, lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £14.72

MOEXIPRIL HYDROCHLORIDE

Indications essential hypertension

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; arrhythmias, angina, chest pain, syncope, cerebrovascular accident, myocardial infarction; appetite and weight changes; dry mouth, photosensitivity, flushing, nervousness, mood changes, anxiety, drowsiness, sleep disturbance, tinnitus, influenza-like syndrome, sweating and dyspnoea

Dose

- Used alone, initially 7.5 mg once daily; if used in addition to diuretic (see notes above), with nifedipine, in elderly, in renal or hepatic impairment, initially 3.75 mg once daily; usual range 15–30 mg once daily; doses above 30 mg daily not shown to increase efficacy

Perdix® (UCB Pharma) PoM

Tablets, f/c, pink, scored, moexipril hydrochloride 7.5 mg, net price 28-tab pack = £6.04; 15 mg, 28-tab pack = £6.96

PERINDOPRIL ERBUMINE

Indications hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; asthenia, mood and sleep disturbances

Dose

- Hypertension, initially 4 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2 mg once daily; max. 8 mg daily
- Heart failure (adjunct), initially 2 mg once daily in the morning under close medical supervision (see notes above), increased after at least 2 weeks to max. 4 mg once daily if tolerated
- Following myocardial infarction or revascularisation, initially 4 mg once daily in the morning increased after 2 weeks to 8 mg once daily if tolerated; ELDERLY 2 mg once daily for 1 week, then 4 mg once daily for 1 week, thereafter increased to 8 mg once daily if tolerated

Perindopril (Non-proprietary) PoM

Tablets, perindopril erbumine (= *tert*-butylamine) 2 mg, net price 30-tab pack = £3.46; 4 mg, 30-tab pack = £3.43; 8 mg, 30-tab pack = £3.52. Label: 22

Perindopril arginine

Coversyl® Arginine (Servier) PoM

Tablets, f/c, perindopril arginine 2.5 mg (white), net price 30-tab pack = £9.09; 5 mg (light green, scored), 30-tab pack = £10.22; 10 mg (green), 30-tab pack = £11.36. Label: 22

Dose Hypertension, initially 5 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2.5 mg once daily; max. 10 mg daily

Heart failure (adjunct), initially 2.5 mg once daily in the morning under close medical supervision (see notes above), increased after 2 weeks to max. 5 mg once daily if tolerated

Following myocardial infarction or revascularisation, initially 5 mg once daily in the morning increased after 2 weeks to 10 mg once daily if tolerated; ELDERLY 2.5 mg once daily for 1 week, then 5 mg once daily for 1 week, thereafter increased to 10 mg once daily if tolerated

Perindopril arginine with diuretic

Note For hypertension not adequately controlled by perindopril alone. For cautions, contra-indications, and side-effects of indapamide, see section 2.2.1

Coversyl® Arginine Plus (Servier) PoM

Tablets, f/c, perindopril arginine 5 mg, indapamide 1.25 mg, net price 30-tab pack = £13.04. Label: 22

QUINAPRIL

Indications essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; asthenia, chest pain, oedema, flatulence, nervousness, depression, insomnia, blurred vision, impotence, and back pain

Dose

- Hypertension, initially 10 mg once daily; with a diuretic (see notes above), in elderly, or in renal impairment initially 2.5 mg daily; usual maintenance dose 20–40 mg daily in single or 2 divided doses; up to 80 mg daily has been given
- Heart failure (adjunct), initial dose 2.5 mg daily under close medical supervision (see notes above), increased gradually to 10–20 mg daily in 1–2 divided doses if tolerated; max. 40 mg daily

Quinapril (Non-proprietary) PoM

Tablets, quinapril (as hydrochloride) 5 mg, net price 28-tab pack = £1.81; 10 mg, 28-tab pack = £2.10; 20 mg, 28-tab pack = £2.50; 40 mg, 28-tab pack = £3.01

Brands include *Quinil®*

Accupro® (Pfizer) PoM

Tablets, f/c, quinapril (as hydrochloride) 5 mg (brown), net price 28-tab pack = £8.60; 10 mg (brown), 28-tab pack = £8.60; 20 mg (brown), 28-tab pack = £10.79; 40 mg (red-brown), 28-tab pack = £9.75

With diuretic

Note For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Accuretic® (Pfizer) PoM

Tablets, pink, f/c, scored, quinapril (as hydrochloride) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.75

RAMIPRIL

Indications mild to moderate hypertension; congestive heart failure (adjunct—see section 2.5.5); following myocardial infarction in patients with clinical evidence of heart failure; susceptible patients over 55 years, prevention of myocardial infarction, stroke, cardiovascular death or need of revascularisation procedures (consult product literature)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; arrhythmias, angina, chest pain, syncope, cerebrovascular accident, myocardial infarction, loss of appetite, stomatitis, dry mouth, skin reactions including erythema multiforme and pemphigoid exanthema; precipitation or exacerbation of Raynaud's syndrome; conjunctivitis, onycholysis, confusion, nervousness, depression, anxiety, impotence, decreased libido, alopecia, bronchitis and muscle cramps

Dose

- Hypertension, initially 1.25 mg once daily, increased at intervals of 1–2 weeks; usual range 2.5–5 mg once daily; max. 10 mg once daily; if used in addition to diuretic see notes above
- Heart failure (adjunct), initially 1.25 mg once daily under close medical supervision (see notes above), increased gradually at intervals of 1–2 weeks to max. 10 mg daily if tolerated (daily doses of 2.5 mg or more may be taken in 1–2 divided doses)
- Prophylaxis after myocardial infarction (started in hospital 3 to 10 days after infarction), initially 2.5 mg twice daily, increased after 2 days to 5 mg twice daily; maintenance 2.5–5 mg twice daily
  Note If initial 2.5-mg dose not tolerated, give 1.25 mg twice daily for 2 days before increasing to 2.5 mg twice daily, then 5 mg twice daily
- Prophylaxis of cardiovascular events or stroke, initially 2.5 mg once daily, increased after 1 week to 5 mg once daily, then increased after a further 3 weeks to 10 mg once daily

Ramipril (Non-proprietary) PoM

Capsules, ramipril 1.25 mg, net price 28-cap pack = £1.07; 2.5 mg, 28-cap pack = £1.17; 5 mg, 28-cap pack = £1.31; 10 mg, 28-cap pack = £1.49

Tablets, ramipril 1.25 mg, net price 28-tab pack = £1.85; 2.5 mg, 28-tab pack = £1.58; 5 mg, 28-tab pack = £1.88; 10 mg, 28-tab pack = £2.30

Tritace® (Aventis Pharma) PoM

Tablets, scored, ramipril 1.25 mg (white), net price 28-tab pack = £5.09; 2.5 mg (yellow), 28-tab pack = £7.22; 5 mg (red), 28-tab pack = £10.05; 10 mg (white), 28-tab pack = £13.68

Titration pack, tablets, 35-day starter pack of ramipril 7 × 2.5 mg with 21 × 5 mg and 7 × 10 mg, net price = £13.00

With calcium-channel blocker

Note For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of felodipine, see section 2.6.2

Triapin® (Aventis Pharma) PoM

Triapin® tablets, f/c, brown, ramipril 5 mg, felodipine 5 mg (m/r), net price 28-tab pack = £16.13. Label: 25

Triapin mite® tablets, f/c, orange, ramipril 2.5 mg, felodipine 2.5 mg (m/r), net price 28-tab pack = £24.55. Label: 25

TRANDOLAPRIL

Indications mild to moderate hypertension; following myocardial infarction in patients with left ventricular dysfunction

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also ileus, dry mouth; tachycardia, palpitation, arrhythmias, angina, transient ischaemic attacks, cerebral haemorrhage, myocardial infarction, syncope; dyspnoea, bronchitis; asthenia, nervousness, sleep disturbances; hot flushes; alopecia, sweating, skin reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis, and psoriasis-like efflorescence

Dose

- Hypertension, initially 500 micrograms once daily, increased at intervals of 2–4 weeks; usual range 1–2 mg once daily; max. 4 mg daily; if used in addition to diuretic see notes above
- Prophylaxis after myocardial infarction (starting as early as 3 days after infarction), initially 500 micrograms once daily, gradually increased to max. 4 mg once daily
  Note If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril

Trandolapril (Non-proprietary) PoM

Capsules, trandolapril 500 micrograms, net price 14-cap pack = £1.39; 1 mg, 28-cap pack = £6.77; 2 mg, 28-cap pack = £6.77; 4 mg, 28-cap pack = £11.45

Gopten® (Abbott) PoM

Capsules, trandolapril 500 micrograms (red/yellow), net price 14-cap pack = £1.35; 1 mg (red/orange), 28-cap pack = £6.59; 2 mg (red/red), 28-cap pack = £6.59; 4 mg (red/maroon), 28-cap pack = £11.19

With calcium-channel blocker

Note For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of verapamil, see section 2.6.2

Tarka® (Abbott) ▼ PoM

Capsules, pink, trandolapril 2 mg, verapamil hydrochloride 180 mg (m/r), net price 28 cap-pack = £10.29. Label: 25

2.5.5.2 Angiotensin-II receptor antagonists

Candesartan, **eprosartan**, **irbesartan**, **losartan**, **olmesartan**, **telmisartan**, and **valsartan** are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin

and other kinins, and thus are unlikely to cause the persistent dry cough which commonly complicates ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure (section 2.5.5) or diabetic nephropathy (section 6.1.5).

Cautions Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal Effects under ACE Inhibitors, section 2.5.5.1). Monitoring of plasma-potassium concentration is advised, particularly in the elderly and in patients with renal impairment; lower initial doses may be appropriate in these patients. Angiotensin-II receptor antagonists should be used with caution in aortic or mitral valve stenosis and in hypertrophic cardiomyopathy. Those with primary aldosteronism, and Afro-Caribbean patients (particularly those with left ventricular hypertrophy), may not benefit from an angiotensin-II receptor antagonist. **Interactions:** Appendix 1 (angiotensin-II receptor antagonists).

Contra-indications Angiotensin-II receptor antagonists, like the ACE inhibitors, should also be avoided in pregnancy (Appendix 4) and breast-feeding (Appendix 5).

Side-effects Side-effects are usually mild. Symptomatic hypotension including dizziness may occur, particularly in patients with intravascular volume depletion (e.g. those taking high-dose diuretics). Hyperkalaemia occurs occasionally; angioedema has also been reported with some angiotensin-II receptor antagonists.

CANDESARTAN CILEXETIL

Indications hypertension; heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor, or when ACE inhibitors are not tolerated (see also section 2.5.5)

Cautions see notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications see notes above; also cholestasis

Side-effects see notes above; also vertigo, headache; *very rarely* nausea, hepatitis, blood disorders, hyponatraemia, back pain, arthralgia, myalgia, rash, urticaria, pruritus

Dose

- Hypertension, initially 8 mg (hepatic impairment 2 mg, renal impairment or intravascular volume depletion 4 mg) once daily, increased if necessary at intervals of 4 weeks to max. 32 mg once daily; usual maintenance dose 8 mg once daily
- Heart failure, initially 4 mg once daily, increased at intervals of at least 2 weeks to 'target' dose of 32 mg once daily or to max. tolerated dose

Amias® (Takeda) PoM

Tablets, candesartan cilexetil 2 mg (white), net price 7-tab pack = £2.99; 4 mg (white, scored), 7-tab pack = £3.24, 28-tab pack = £8.15; 8 mg (pink, scored), 28-tab pack = £9.89; 16 mg (pink, scored), 28-tab pack = £12.72; 32 mg (pink, scored), 28-tab pack = £16.13

EPROSARTAN

Indications hypertension (see also notes above)

Cautions see notes above; also hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications see notes above

Side-effects see notes above; also flatulence, hypertriglyceridaemia, arthralgia, rhinitis; *rarely* headache, asthenia, anaemia, hypersensitivity reactions (including rash, pruritus, urticaria); *very rarely* nausea

Dose

- 600 mg once daily (elderly over 75 years, mild to moderate hepatic impairment, renal impairment, initially 300 mg once daily); if necessary increased after 2–3 weeks to 800 mg once daily

Teveten® (Solvay) PoM

Tablets, f/c, eprosartan (as mesilate) 300 mg (white), net price 28-tab pack = £10.00; 400 mg (pink), 56-tab pack = £15.77; 600 mg (white), 28-tab pack = £14.31. Label: 21

IRBESARTAN

Indications hypertension; renal disease in hypertensive type 2 diabetes mellitus (see also notes above)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also nausea, vomiting; fatigue; musculoskeletal pain; *less commonly* diarrhoea, dyspepsia, flushing, tachycardia, chest pain, cough, and sexual dysfunction; *rarely* rash, urticaria; *very rarely* headache, myalgia, arthralgia, tinnitus, taste disturbance, hepatitis, renal dysfunction, and cutaneous vasculitis

Dose

- Hypertension, initially 150 mg once daily, increased if necessary to 300 mg once daily (in haemodialysis or in ELDERLY over 75 years, initial dose of 75 mg once daily may be used); CHILD not recommended
- Renal disease in hypertensive type 2 diabetes mellitus, initially 150 mg once daily, increased to 300 mg once daily if tolerated (in haemodialysis or in ELDERLY over 75 years, consider initial dose of 75 mg once daily); CHILD not recommended

Aprovel® (Bristol-Myers Squibb, Sanofi-Synthelabo) PoM

Tablets, f/c, irbesartan 75 mg, net price 28-tab pack = £9.89; 150 mg, 28-tab pack = £12.08; 300 mg, 28-tab pack = £16.25

With diuretic

Note For hypertension not adequately controlled with irbesartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

CoAprovel® (Bristol-Myers Squibb, Sanofi-Synthelabo) PoM

Tablets, f/c, irbesartan 150 mg, hydrochlorothiazide 12.5 mg (peach), net price 28-tab pack = £12.08; irbesartan 300 mg, hydrochlorothiazide 12.5 mg (peach), 28-tab pack = £16.25; irbesartan 300 mg, hydrochlorothiazide 25 mg (pink), 28-tab pack = £16.25

LOSARTAN POTASSIUM

Indications hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy); chronic heart failre when ACE inhi-

bitors are unsuitable or contra-indicated; diabetic nephropathy in type 2 diabetes mellitus (see also notes above)

Cautions see notes above; severe heart failure; hepatic impairment (avoid if severe; Appendix 2);

Contra-indications see notes above

Side-effects see notes above; asthenia, fatigue, vertigo; *less commonly* gastro-intestinal disturbance, angina, palpitation, dyspnoea, headache, urticaria, pruritus, rash; *rarely* atrial fibrillation, cerebrovascular accident, syncope, paraesthesia; hepatitis, anaphylaxis, cough, anaemia (in severe renal disease or following renal transplantation), thrombocytopenia, arthralgia, myalgia, and vasculitis (including Henoch-Schönlein purpura) also reported

Dose

- Hypertension, diabetic nephropathy in type 2 diabetes mellitus, usually 50 mg once daily (intravascular volume depletion, initially 25 mg once daily); if necessary increased after several weeks to 100 mg once daily; ELDERLY over 75 years initially 25 mg daily
- Chronic heart failure, 12.5 mg once daily, increased at weekly intervals to 50 mg once daily if tolerated

Cozaar® (MSD) ▼ PoM

Tablets, f/c, losartan potassium 12.5 mg (blue), net price 28-tab pack = £8.09; 25 mg (white), net price 28-tab pack = £16.18; 50 mg (white, scored), 28-tab pack = £12.80; 100 mg (white), 28-tab pack = £16.18

With diuretic

Note For hypertension not adequately controlled with losartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Cozaar-Comp® (MSD) PoM

Tablets 50/12.5, yellow, f/c, losartan potassium 50 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.80

Tablets 100/12.5, white, f/c, losartan potassium 100 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.18

Tablets 100/25, yellow, f/c, losartan potassium 100 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £16.18

OLMESARTAN MEDOXOMIL

Indications hypertension (see also notes above)

Cautions see notes above; hepatic impairment (avoid in severe impairment; Appendix 2); renal impairment (avoid if eGFR less than 20 mL/minute/1.73 m^2; Appendix 3)

Contra-indications see notes above; biliary obstruction

Side-effects see notes above; also gastro-intestinal disturbances; chest pain, peripheral oedema, hypertriglyceridaemia; fatigue; influenza-like symptoms, cough, pharyngitis, rhinitis; urinary-tract infection; haematuria, hyperuricaemia; arthritis, musculoskeletal pain; *less commonly* angina, vertigo, rash; *very rarely* headache, thrombocytopenia, myalgia, pruritus, urticaria

Dose

- Initially 10 mg once daily; if necessary increased to 20 mg once daily; max. 40 mg daily

Olmetec® (Sankyo) PoM

Tablets, f/c, olmesartan medoxomil 10 mg, net price 28-tab pack = £10.95; 20 mg, 28-tab pack = £12.95; 40 mg, 28-tab pack = £17.50

With calcium-channel blocker

Note For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of amlodipine, see section 2.6.2

Sevikar® (Daiichi Sankyo) ▼ PoM

Tablets 20/5, white, f/c, olmesartan medoxomil 20 mg, amlodipine (as besilate) 5 mg, net price 28-tab pack = £16.95

Tablets 40/5, ivory, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 5 mg, net price 28-tab pack = £16.95

Tablets 40/10, brownish-red, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 10 mg, net price 28-tab pack = £16.95

With diuretic

Note For hypertension not adequately controlled with olmesartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Olmetec Plus® (Sankyo) ▼ PoM

Tablets, f/c, olmesartan medoxomil 20 mg, hydrochlorothiazide 12.5 mg (red-yellow), net price 28-tab pack = £12.95; olmesartan medoxomil 20 mg, hydrochlorothiazide 25 mg (pink), 28-tab pack = £12.95

TELMISARTAN

Indications hypertension (see also notes above)

Cautions see notes above; hepatic impairment (Appendix 2; avoid in severe impairment); renal impairment (Appendix 3)

Contra-indications see notes above; biliary obstruction

Side-effects see notes above; also gastro-intestinal disturbances; chest pain; influenza-like symptoms including pharyngitis and sinusitis; urinary-tract infection; arthralgia, myalgia, back pain, leg cramps; eczema; *less commonly* dry mouth, flatulence, anxiety, vertigo, tendinitis-like symptoms, abnormal vision, increased sweating; *rarely* bradycardia, tachycardia, dyspnoea, insomnia, depression, blood disorders, increase in uric acid, eosinophilia, rash, and pruritus; syncope and asthenia also reported

Dose

- Usually 40 mg once daily (but 20 mg may be sufficient), increased if necessary after at least 4 weeks, to max. 80 mg once daily

Micardis® (Boehringer Ingelheim) PoM

Tablets, telmisartan 20 mg, net price 28-tab pack = £8.00; 40 mg, 28-tab pack = £12.50; 80 mg, 28-tab pack = £17.00

With diuretic

Note For patients with hypertension not adequately controlled by telmisartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Micardis Plus® (Boehringer Ingelheim) PoM

Tablets 40/12.5, red/white, telmisartan 40 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.50

Tablets 80/12.5, red/white, telmisartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £17.00

Tablets 80/25, yellow/white, telmisartan 80 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £17.00

VALSARTAN

Indications hypertension; heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used (see also section 2.5.5); myocardial infarction with left ventricular failure or left ventricular systolic dysfunction (adjunct—see section 2.5.5 and section 2.10.1)

Cautions see notes above; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3)

Contra-indications see notes above, biliary cirrhosis, cholestasis

Side-effects see notes above; renal impairment; *less commonly* gastro-intestinal disturbance, syncope, fatigue, cough, headache, acute renal failure; neutropenia, thrombocytopenia, myalgia, and hypersensitivity reactions (including rash, pruritus, vasculitis, and serum sickness) also reported

Dose

- Hypertension, usually 80 mg once daily (initially 40 mg once daily in intravascular volume depletion); if necessary increased at intervals of 4 weeks up to max. 320 mg daily
- Heart failure, initially 40 mg twice daily increased at intervals of at least 2 weeks up to max. 160 mg twice daily
- Myocardial infarction, initially 20 mg twice daily increased over several weeks to 160 mg twice daily if tolerated

Diovan® (Novartis) PoM

Capsules, valsartan 40 mg (grey), net price 28-cap pack = £13.97; 80 mg (grey/pink), 28-cap pack = £13.97; 160 mg (dark grey/pink), 28-cap pack = £18.41

Tablets, f/c, valsartan 40 mg (yellow, scored), net price 7-tab pack = £3.49; 320 mg (dark grey-violet), 28-tab pack = £20.23

With diuretic

Note For hypertension not adequately controlled by valsartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Co-Diovan® (Novartis) ▼ PoM

Tablets 80/12.5, orange, f/c, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.97

Tablets 160/12.5, red, f/c, valsartan 160 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £18.41

Tablets 160/25, brown-orange, f/c, valsartan 160 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £18.41

2.5.5.3 Renin inhibitors

Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I. **Aliskiren** is licensed for the treatment of hypertension, either alone or in combination with other antihypertensives.

ALISKIREN

Indications essential hypertension

Cautions patients taking concomitant diuretics, on a low-sodium diet, or who are dehydrated (first doses may cause hypotension—initiate with care); renal artery stenosis; patients at risk of renal impairment; renal impairment (Appendix 3); monitor plasma-potassium concentration and renal function in renal impairment, diabetes mellitus, and heart failure; **interactions:** Appendix 1 (aliskiren)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects diarrhoea; *less commonly* rash; *rarely* angioedema; acute renal failure (reversible on discontinuation of treatment), anaemia, and hyperkalaemia also reported

Dose

- ADULT over 18 years, 150 mg once daily, increased if necessary to 300 mg once daily

Rasilez® (Novartis) ▼ PoM

Tablets, f/c, aliskiren (as hemifumarate) 150 mg (pink), net price 28-tab pack = £19.80; 300 mg (red), net price 28-tab pack = £23.80. Label: 21

2.6 Nitrates, calcium-channel blockers, and other antianginal drugs

2.6.1 Nitrates
2.6.2 Calcium-channel blockers
2.6.3 Other antianginal drugs
2.6.4 Peripheral vasodilators and related drugs

Nitrates, calcium-channel blockers, and potassium-channel activators have vasodilating effects. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Angina

It is important to distinguish unstable angina from stable angina. *Stable angina* usually results from atherosclerotic plaques in the coronary arteries and is often precipitated by exertion and relieved by rest. *Unstable angina* is usually due to plaque rupture and is often characterised by new onset severe angina or sudden worsening of previously stable angina. Treatment of stable and unstable angina involves management of acute anginal pain, and long-term management to prevent angina attacks and to reduce the risk of cardiovascular events.

Stable angina Acute attacks of stable angina should be managed with sublingual **glyceryl trinitrate**; sublingual glyceryl trinitrate can also be taken before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a stepwise manner according to response.

Patients with mild or moderate stable angina should be given a **beta-blocker** (section 2.4). In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months (section 2.5.5).

For those patients in whom beta-blockers are not tolerated or are contra-indicated, a long-acting **nitrate** (section 2.6.1) or a rate-limiting **calcium-channel blocker** (diltiazem or verapamil, section 2.6.2) can be used; in patients with left-ventricular dysfunction, diltiazem and verapamil are contra-indicated because heart failure may be precipitated (**important**: see p. 114); however, a long-acting dihydropyridine calcium-channel blocker, such as amlodipine or felodipine, is suitable. Nicorandil or ivabradine (section 2.6.3) are alternatives.

When a single drug fails to control symptoms, combination treatment can be used. A calcium-channel blocker can be added to a beta-blocker, although combining verapamil with a beta-blocker should be avoided (see p. 119); combinations including diltiazem and a beta-blocker should be used with caution. Long-acting nitrates can also be used with a beta-blocker or a calcium-channel blocker, if appropriate. Combinations that include nicorandil or ranolazine (section 2.6.3) can also be considered.

Patients should be referred to a specialist if a combination of two drugs fails to control symptoms. Revascularisation procedures may be appropriate.

Unstable angina Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) are managed similarly. The aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see section 2.10.1.

Initial management **Oxygen** (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates (section 2.6.1) are used to relieve ischaemic pain. If sublingual glyceryl trinitrate is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate is given. If pain continues, **diamorphine** or **morphine** (section 4.7.2) can be given by slow intravenous injection; an antiemetic such as metoclopramide should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect in a dose of 300 mg (section 2.9). If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. **Clopidogrel** in a dose of 300 mg (section 2.9) and a **low molecular weight heparin** or **fondaparinux** (section 2.8.1) should also be given.

Patients without contra-indications should receive **beta-blockers** (section 2.4) which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, **diltiazem** or **verapamil** can be given (section 2.6.2).

The glycoprotein IIb/IIIa inhibitors **eptifibatide** and **tirofiban** (section 2.9) are recommended (with aspirin and heparin) for unstable angina or for non-ST-segment elevation myocardial infarction in patients at a high risk of either myocardial infarction or death.

Abciximab, eptifibatide, or tirofiban can also be used with aspirin and heparin in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion.

Revascularisation procedures are often appropriate for patients with unstable angina.

Long-term management The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment (see Stable angina) to prevent recurrence of symptoms.

Prevention of cardiovascular events Patients with stable and unstable angina should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Patients should take **aspirin** indefinitely in a dose of 75 mg daily. A combination of aspirin and clopidogrel is given for up to 12 months in patients with non-ST-segment elevation acute coronary syndromes (section 2.9). An **ACE inhibitor** (section 2.5.5.1) and a **statin** (section 2.12) should also be given.

2.6.1 Nitrates

Nitrates have a useful role in *angina* (for details on the management of stable angina, see section 2.6). Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual **glyceryl trinitrate** is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The *aerosol spray* provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by *modified-release* and *transdermal* preparations (but tolerance may develop, see below).

Isosorbide dinitrate is active *sublingually* and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for *modified-release* preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate. **Isosorbide mononitrate** itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by *intravenous injection* when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced

therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for several consecutive hours in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

GLYCERYL TRINITRATE

Indications prophylaxis and treatment of angina; congestive heart failure; anal fissure (section 1.7.4); extravasation (section 10.3)

Cautions hypothyroidism, malnutrition, hypothermia; recent history of myocardial infarction; hypoxaemia or other ventilation and perfusion abnormalities; susceptibility to angle-closure glaucoma; metal-containing transdermal systems should be removed before cardioversion or diathermy; avoid abrupt withdrawal; tolerance (see notes above); severe hepatic impairment; severe renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (nitrates)

Contra-indications hypersensitivity to nitrates; hypotensive conditions and hypovolaemia; hypertrophic cardiomyopathy, aortic stenosis, cardiac tamponade, constrictive pericarditis, mitral stenosis; toxic pulmonary oedema; head trauma, cerebral haemorrhage; marked anaemia

Side-effects postural hypotension, tachycardia (but paradoxical bradycardia also reported); throbbing headache, dizziness; *less commonly* nausea, vomiting, heartburn; flushing; temporary hypoxaemia; rash; application site reactions with transdermal patches; *very rarely* angle-closure glaucoma

Injection Specific side-effects following injection (particularly if given too rapidly) include severe hypotension, diaphoresis, apprehension, restlessness, muscle twitching, retrosternal discomfort, palpitation, abdominal pain, syncope; prolonged administration has been associated with methaemoglobinaemia

Dose

- Sublingually, 0.3–1 mg, repeated as required
- By intravenous infusion, 10–200 micrograms/minute
- By transdermal application, see under preparations

Short-acting tablets and sprays

Glyceryl Trinitrate (Non-proprietary)

Sublingual tablets, glyceryl trinitrate 300 micrograms, net price 100 = £2.71; 500 micrograms, 100 = £2.70; 600 micrograms, 100 = £11.33. Label: 16

Note Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.13

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Coro-Nitro Pump Spray® (Ayrton Saunders)

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.13

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Glytrin Spray® (Sanofi-Synthelabo)

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.35

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Cautions flammable

GTN 300 mcg (Martindale)

Sublingual tablets, glyceryl trinitrate 300 micrograms, net price 100 = £2.71. Label: 16

Nitrolingual Pumpspray® (Merck)

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.51

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Nitromin® (Egis)

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 180-dose unit = £2.63, 200-dose unit = £2.71

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Longer-acting tablets

Suscard® (Forest)

Buccal tablets, m/r, glyceryl trinitrate 2 mg, net price 100-tab pack = £12.70; 3 mg, 100-tab pack = £18.33; 5 mg, 100-tab pack = £24.96. Counselling, see below

Dose treatment of angina, 2 mg as required, increased to 3 mg if necessary; prophylaxis 2–3 mg 3 times daily; 5 mg in severe angina

Unstable angina (adjunct), up to 5 mg with ECG monitoring

Congestive heart failure, 5 mg 3 times daily, increased to 10 mg 3 times daily in severe cases

Acute heart failure, 5 mg repeated until symptoms abate

Counselling Tablets have rapid onset of effect; they are placed between upper lip and gum, and left to dissolve; vary site to reduce risk of dental caries

Parenteral preparations

Note Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used

Glyceryl Trinitrate (Non-proprietary) PoM

Injection, glyceryl trinitrate 5 mg/mL. To be diluted before use. Net price 5-mL amp = £6.49; 10-mL amp = £12.98

Excipients may include ethanol, propylene glycol (see Excipients, p. 2)

Nitrocine® (UCB Pharma) PoM

Injection, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 10-mL amp = £5.88; 50-mL bottle = £13.77

Excipients include propylene glycol (see Excipients, p. 2)

Nitronal® (Merck) PoM

Injection, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 5-mL vial = £1.84; 50-mL vial = £15.06

Transdermal preparations

Deponit® (UCB Pharma)

Patches, self-adhesive, transparent, glyceryl trinitrate, *'5' patch* (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £12.77; *'10' patch* (releasing approx.10 mg/24 hours), 28 = £14.06

Dose prophylaxis of angina, apply one '5' or one '10' patch to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two '10' patches every 24 hours if necessary; replace every 24 hours, siting replacement patch on different area; see also notes above (Tolerance)

Minitran® (3M)

Patches, self-adhesive, transparent, glyceryl trinitrate, *'5' patch* (releasing approx. 5 mg/24 hours when in contact with skin), net price 30 = £11.62; *'10' patch* (releasing approx. 10 mg/24 hours), 30 = £12.87; *'15' patch* (releasing approx. 15 mg/24 hours), 30 = £14.19

Dose prophylaxis of angina, apply one '5' patch to chest or upper arm; replace every 24 hours, siting replacement patch on different area; adjust dose according to response; see also notes above (Tolerance)

Maintenance of venous patency ('5' patch only), consult product literature

Nitro-Dur® (Schering-Plough)

Patches, self-adhesive, buff, glyceryl trinitrate, *'0.2 mg/h' patch* (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £10.80; *'0.4 mg/h' patch* (releasing approx. 10 mg/24 hours), 28 = £11.95; *'0.6 mg/h' patch* (releasing approx.15 mg/24 hours), 28 = £13.15

Dose prophylaxis of angina, apply one '0.2 mg/h' patch to chest or outer upper arm; replace every 24 hours, siting replacement patch on different area: adjust dose according to response; see also notes above (Tolerance)

Percutol® (TEVA UK)

Ointment, glyceryl trinitrate 2%, net price 60 g = £9.55. Counselling, see administration below

Excipients include wool fat

Dose prophylaxis of angina, usual dose 1–2 inches of ointment measured on to *Applirule®*, and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, every 3–4 hours as required; to determine dose, ½ inch on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch

Note Approx. 800 micrograms/hour absorbed from 1 inch of ointment

Transiderm-Nitro® (Novartis)

Patches, self-adhesive, pink, glyceryl trinitrate, *'5' patch* (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £21.31; *'10' patch* (releasing approx. 10 mg/24 hours), 28 = £23.43

Dose prophylaxis of angina, apply one '5' or one '10' patch to lateral chest wall; replace every 24 hours, siting replacement patch on different area; max. two '10' patches daily; see also notes above (Tolerance)

Prophylaxis of phlebitis and extravasation ('5' patch only), consult product literature

Trintek® (Goldshield)

Patches, self-adhesive, glyceryl trinitrate, '5' patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 30 = £11.84; '10' patch (releasing approx. 10 mg/24 hours), net price 30 = £13.10; '15' patch (releasing approx. 15 mg/24 hours), net price 30 = £14.42

Dose prophylaxis of angina, apply one '5' patch to lateral chest wall; replace every 24 hours, siting replacement patch on different area; adjust dose according to response, max one '15' patch daily; see also notes above (Tolerance)

ISOSORBIDE DINITRATE

Indications prophylaxis and treatment of angina; left ventricular failure

Cautions see under Glyceryl Trinitrate

Contra-indications see under Glyceryl Trinitrate

Side-effects see under Glyceryl Trinitrate

Dose

- By mouth, daily in divided doses, angina 30–120 mg, left ventricular failure 40–160 mg, up to 240 mg if required
- By intravenous infusion, 2–10 mg/hour; higher doses up to 20 mg/hour may be required

Short-acting tablets and sprays

Isosorbide Dinitrate (Non-proprietary)

Tablets, isosorbide dinitrate 10 mg, net price 56-tab pack = £9.53; 20 mg, 56-tab pack = £11.67

Angitak® (LPC)

Aerosol spray, isosorbide dinitrate 1.25 mg/metered dose, net price 200-dose unit = £3.95

Dose treatment or prophylaxis of angina, spray 1–3 doses under tongue whilst holding breath; allow 30 second interval between each dose

Modified-release preparations

Isoket Retard® (UCB Pharma)

Retard-20 tablets, m/r, scored, isosorbide dinitrate 20 mg, net price 56-tab pack = £2.58. Label: 25

Retard-40 tablets, m/r, scored, isosorbide dinitrate 40 mg, net price 56-tab pack = £6.36. Label: 25

Dose prophylaxis of angina, 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

Parenteral preparations

Isoket® (UCB Pharma) PoM

Injection 0.05%, isosorbide dinitrate 500 micrograms/mL. To be diluted before use or given undiluted with syringe pump. Net price 50-mL bottle = £7.15

Injection 0.1%, isosorbide dinitrate 1 mg/mL. To be diluted before use. Net price 10-mL amp = £2.69; 50-mL bottle = £13.36; 100-mL bottle = £25.98

Note Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used

ISOSORBIDE MONONITRATE

Indications prophylaxis of angina; adjunct in congestive heart failure

Cautions see under Glyceryl Trinitrate

Contra-indications see under Glyceryl Trinitrate

Side-effects see under Glyceryl Trinitrate

Dose

- Initially 20 mg 2–3 times daily *or* 40 mg twice daily (10 mg twice daily in those who have not previously received nitrates); up to 120 mg daily in divided doses if required

Isosorbide Mononitrate (Non-proprietary)

Tablets, isosorbide mononitrate 10 mg, net price 56 = £1.02; 20 mg, 56 = £1.04; 40 mg, 56 = £1.46. Label: 25

Brands include *Angeze®*

Elantan® (UCB Pharma)

Elantan 10 tablets, scored, isosorbide mononitrate 10 mg, net price 56-tab pack = £1.32; 84-tab pack = £4.97. Label: 25

Elantan 20 tablets, scored, isosorbide mononitrate 20 mg, net price 56-tab pack = £1.73; 84-tab pack = £6.13. Label: 25

Elantan 40 tablets, scored, isosorbide mononitrate 40 mg, net price 56-tab pack = £2.81; 84-tab pack = £10.56. Label: 25

Ismo® (Riemser)

Ismo 10 tablets, isosorbide mononitrate 10 mg, net price 60-tab pack = £3.31. Label: 25

Ismo 20 tablets, scored, isosorbide mononitrate 20 mg, net price 60-tab pack = £4.85. Label: 25

Modified release

Chemydur® 60XL (Sovereign) PoM

Tablets, m/r, scored, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.76. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet for 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Elantan LA® (UCB Pharma)

Elantan LA 25 capsules, m/r, brown/white, enclosing white micropellets, isosorbide mononitrate 25 mg, net price 28-cap pack = £2.64. Label: 25

Dose prophylaxis of angina, 1 capsule in the morning, increased if necessary to 2 capsules

Elantan LA 50 capsules, m/r, brown/pink, enclosing white micropellets, isosorbide mononitrate 50 mg, net price 28-cap pack = £3.69. Label: 25

Dose prophylaxis of angina, 1 capsule daily in the morning, increased if necessary to 2 capsules

Imdur® (AstraZeneca)

Durules® (= tablets m/r), yellow, f/c, scored, isosorbide mononitrate 60 mg, net price 28-tab pack = £10.71. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet if headache occurs), increased to 2 tablets in the morning if required

Isib 60XL® (Ranbaxy)

Tablets, m/r, scored, yellow, isosorbide mononitrate 60 mg, net price 28-tab pack = £8.15. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet for 2–4 days if headache occurs), increased if necessary to 2 tablets

Note Also available as Cibral 60XL®, Xismox 60XL®

Ismo Retard® (Riemser)

Tablets, m/r, s/c, isosorbide mononitrate 40 mg, net price 30-tab pack = £10.71. Label: 25

Dose prophylaxis of angina, 1 tablet daily in morning

Isodur® (Galen)

Isodur 25XL capsules, m/r, brown/white, isosorbide mononitrate 25 mg, net price 28-cap pack = £5.50. Label: 25

Isodur 50XL capsules, m/r, brown/pink, isosorbide mononitrate 50 mg, net price 28-cap pack = £6.50. Label: 25

Dose prophylaxis of angina, 25–50 mg daily in the morning, increased if necessary to 50–100 mg once daily

Isotard® (ProStrakan)

Isotard 25XL tablets, m/r, ivory, isosorbide mononitrate 25 mg, net price 28-tab pack = £5.95. Label: 25

Isotard 40XL tablets, m/r, ivory, isosorbide mononitrate 40 mg, net price 28-tab pack = £6.78. Label: 25

Isotard 50XL tablets, m/r, ivory, isosorbide mononitrate 50 mg, net price 28-tab pack = £6.78. Label: 25

Isotard 60XL tablets, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.75. Label: 25

Dose prophylaxis of angina, 25–60 mg daily in the morning (if headache occurs with 60-mg tablet, half a 60-mg tablet may be given for 2–4 days), increased if necessary to 50–120 mg daily

Modisal LA® (UCB Pharma)

Modisal LA25 capsules, m/r, brown/white, isosorbide mononitrate 25 mg, net price 28-cap pack = £6.22. Label: 25

Modisal LA50 capsules, m/r, brown/peach, isosorbide mononitrate 50 mg, net price 28-cap pack = £10.03. Label: 25

Dose prophylaxis of angina, 25–50 mg daily in the morning, increased if necessary to 100 mg once daily

Modisal XL® (Sandoz)

Tablets, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £10.36. Label: 25

Dose prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

Monomax® (Chiesi)

Monomax® SR, capsules, m/r, isosorbide mononitrate 40 mg, net price 28-cap pack = £8.31; 60 mg, 28-cap pack = £9.03. Label: 25

Dose prophylaxis of angina, 40–60 mg daily in the morning, increased if necessary to 120 mg daily

Note Also available as *Angeze SR®*

Monomax® XL tablets, m/r, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.75. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Monomil XL® (IVAX) PoM

Tablets, m/r, isosorbide mononitrate 60 mg, net price 28-tab pack = £4.32. Label: 25

Dose prophylaxis of angina, 1 tablet daily in the morning (half a tablet daily for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

Monosorb XL 60® (Dexcel) PoM

Tablets, m/r, f/c, isosorbide mononitrate 60 mg, net price 28-tab pack = £16.66. Label: 25

Dose prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Note Also available as *Monigen® XL, Trangina® XL*

Zemon® (Neolab)

Zemon 40XL tablets, m/r, ivory, isosorbide mononitrate 40 mg, net price 28-tab pack = £14.25. Label: 25

Zemon 60XL tablets, scored, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £11.14. Label: 25

Dose prophylaxis of angina, 40–60 mg daily in the morning (half a 60-mg tablet may be given for 2–4 days to minimise possibility of headache), increased if necessary to 80–120 mg once daily

2.6.2 Calcium-channel blockers

Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil, diltiazem, and the dihydropyridine calcium-channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine). Verapamil and diltiazem should usually be **avoided** in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil is used for the treatment of angina (section 2.6), hypertension (section 2.5), and arrhythmias (section 2.3.2). It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers (see p. 119). Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil, and unlike verapamil has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia. **Nicardipine** has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. **Amlodipine** and **felodipine** also resemble nifedipine and nicardipine in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine, amlodipine, and felodipine are used for the treatment of angina (section 2.6) or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Isradipine, **lacidipine**, and **lercanidipine** have similar effects to those of nifedipine and nicardipine; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem is effective in most forms of angina (section 2.6); the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem or verapamil should be reserved for patients resistant to treatment with beta-blockers.

Withdrawal There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of angina.

AMLODIPINE

Indications hypertension, prophylaxis of angina

Cautions hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock, unstable angina, significant aortic stenosis; acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects abdominal pain, nausea; palpitation, flushing, oedema; headache, dizziness, sleep disturbances, fatigue; *less commonly* gastro-intestinal disturbances, dry mouth, taste disturbances, hypotension, syncope, chest pain, dyspnoea, rhinitis, mood changes, asthenia, tremor, paraesthesia, urinary disturbances, impotence, gynaecomastia, weight changes, myalgia, muscle cramps, back pain, arthralgia, visual disturbances, tinnitus, pruritus, rashes (including isolated reports of erythema multiforme), sweating, alopecia, purpura, and skin discolouration; *very rarely* gastritis, pancreatitis, hepatitis, jaundice, cholestasis, gingival hyperplasia, myocardial infarction, arrhythmias, tachycardia, vasculitis, coughing, peripheral neuropathy, hyperglycaemia, thrombocytopenia, angioedema, and urticaria

Dose

- Hypertension or angina, initially 5 mg once daily; max. 10 mg once daily

Note Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable

Amlodipine (Non-proprietary) PoM

Tablets, amlodipine (as maleate or as mesilate) 5 mg, net price 28-tab pack = £1.08; 10 mg, 28-tab pack = £1.24

Brands include *Amlostin®*

Istin® (Pfizer) PoM

Tablets, amlodipine (as besilate) 5 mg, net price 28-tab pack = £11.08; 10 mg, 28-tab pack = £16.55

With valsartan

Note For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of valsartan, see section 2.5.5.2

Exforge® (Novartis) ▼ PoM

Tablets 5/80, f/c, dark yellow, amlodipine 5 mg, valsartan 80 mg, net price 28-tab pack = £13.97

Tablets 5/160, f/c, dark yellow, amlodipine 5 mg, valsartan 160 mg, net price 28-tab pack = £18.41

Tablets 10/160, f/c, light yellow, amlodipine 10 mg, valsartan 160 mg, net price 28-tab pack = £18.41

DILTIAZEM HYDROCHLORIDE

Indications prophylaxis and treatment of angina; hypertension

Cautions reduce dose in hepatic and renal impairment; heart failure or significantly impaired left ventricular function, bradycardia (avoid if severe), first degree AV block, or prolonged PR interval; **interactions:** Appendix 1 (calcium-channel blockers)

Contra-indications severe bradycardia, left ventricular failure with pulmonary congestion, second- or third-degree AV block (unless pacemaker fitted), sick sinus syndrome; acute porphyria (but see section 9.8.2); pregnancy; breast-feeding (Appendix 5)

Side-effects bradycardia, sino-atrial block, AV block, palpitation, dizziness, hypotension, malaise, asthenia, headache, hot flushes, gastro-intestinal disturbances, oedema (notably of ankles); rarely rashes (including erythema multiforme and exfoliative dermatitis), photosensitivity; hepatitis, gynaecomastia, gum

hyperplasia, extrapyramidal symptoms, depression reported

Dose

- Angina, 60 mg 3 times daily (elderly initially twice daily); increased if necessary to 360 mg daily
- Longer-acting formulations, see under preparations below

Standard formulations

Note These formulations are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release' their duration of action corresponds to that of tablets requiring administration 3 times daily

Diltiazem (Non-proprietary) PoM

Tablets, m/r (but see note above), diltiazem hydrochloride 60 mg, net price 84 = £3.34. Label: 25

Brands include *Optil®*

Tildiem® (Sanofi-Synthelabo) PoM

Tablets, m/r (but see note above), off-white, diltiazem hydrochloride 60 mg, net price 90-tab pack = £7.96. Label: 25

Longer-acting formulations

Note Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed

Adizem-SR® (Napp) PoM

Capsules, m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £8.62; 120 mg (brown/white), 56-cap pack = £9.59; 180 mg (brown/white), 56-cap pack = £14.36. Label: 25

Tablets, m/r, f/c, scored, diltiazem hydrochloride 120 mg, net price 56-tab pack = £14.72. Label: 25

Dose mild to moderate hypertension, usually 120 mg twice daily (dose form not appropriate for initial dose titration)

Angina, initially 90 mg twice daily (elderly, dose form not appropriate for initial dose titration); increased to 180 mg twice daily if required

Adizem-XL® (Napp) PoM

Capsules, m/r, diltiazem hydrochloride 120 mg (pink/blue), net price 28-cap pack = £9.28; 180 mg (dark pink/blue), 28-cap pack = £10.53; 200 mg (brown), 28-cap pack = £6.40; 240 mg (red/blue), 28-cap pack = £11.69; 300 mg (maroon/blue), 28-cap pack = £9.28. Label: 25

Dose angina and mild to moderate hypertension, initially 240 mg once daily, increased if necessary to 300 mg once daily; in elderly and in hepatic or renal impairment, initially 120 mg daily

Angitil SR® (Chiesi) PoM

Capsules, m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £7.55; 120 mg (brown), 56-cap pack = £8.39; 180 mg (brown), 56-cap pack = £13.53. Label: 25

Dose angina and mild to moderate hypertension, initially 90 mg twice daily; increased if necessary to 120 mg or 180 mg twice daily

Angitil XL® (Chiesi) PoM

Capsules, m/r, diltiazem hydrochloride 240 mg (white), net price 28-cap pack = £9.07; 300 mg (yellow), 28-cap pack = £8.24. Label: 25

Dose angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, dose form not appropriate for initial dose titration); increased if necessary to 300 mg once daily

Calcicard CR® (IVAX) PoM

Tablets, m/r, both f/c, diltiazem hydrochloride 90 mg, net price 56-tab pack = £6.33; 120 mg, 56-tab pack = £7.04. Label: 25

Dose mild to moderate hypertension, initially 90 mg or 120 mg twice daily; up to 360 mg daily may be required: ELDERLY and in hepatic and renal impairment, initially 120 mg once daily; up to 240 mg daily may be required

Angina, initially 90 mg or 120 mg twice daily; up to 480 mg daily in divided doses may be required; ELDERLY and in hepatic and renal impairment, dose form not appropriate for initial dose titration; up to 240 mg daily may be required

Dilcardia SR® (Generics) PoM

Capsules, m/r, diltiazem hydrochloride 60 mg (pink/white), net price 56-cap pack = £8.31; 90 mg (pink/yellow), 56-cap pack = £10.33; 120 mg (pink/orange), 56-cap pack = £11.49. Label: 25

Dose angina and mild to moderate hypertension, initially 90 mg twice daily; increased if necessary to 180 mg twice daily; ELDERLY and in hepatic or renal impairment, initially 60 mg twice daily, max. 90 mg twice daily

Dilzem SR® (Cephalon) PoM

Capsules, m/r, all beige, diltiazem hydrochloride 60 mg, net price 56-cap pack = £6.15; 90 mg, 56-cap pack = £11.51; 120 mg, 56-cap pack = £13.14. Label: 25

Dose angina and mild to moderate hypertension, initially 90 mg twice daily (elderly 60 mg twice daily); up to 180 mg twice daily may be required

Dilzem XL® (Cephalon) PoM

Capsules, m/r, diltiazem hydrochloride 120 mg, net price 28-cap pack = £7.93; 180 mg, 28-cap pack = £11.77; 240 mg, 28-cap pack = £11.24. Label: 25

Dose angina and mild to moderate hypertension, initially 180 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily); if necessary may be increased to 360 mg once daily

Slozem® (Merck) PoM

Capsules, m/r, diltiazem hydrochloride 120 mg (pink/clear), net price 28-cap pack = £7.00; 180 mg (pink/clear), 28-cap pack = £7.80; 240 mg (red/clear), 28-cap pack = £8.20; 300 mg (red/white), 28-cap pack = £8.50. Label: 25

Dose angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily); if necessary may be increased to 360 mg once daily

Tildiem LA® (Sanofi-Synthelabo) PoM

Capsules, m/r, diltiazem hydrochloride 200 mg (pink/grey, containing white pellets), net price 28-cap pack = £6.40; 300 mg (white/yellow, containing white pellets), 28-cap pack = £7.22. Label: 25

Dose angina and mild to moderate hypertension, initially 200 mg once daily before or with food, increased if necessary to 300–400 mg daily, max. 500 mg daily; ELDERLY and in hepatic or renal impairment, initially 200 mg daily, increased if necessary to 300 mg daily

Tildiem Retard® (Sanofi-Synthelabo) PoM

Tablets, m/r, diltiazem hydrochloride 90 mg, net price 56-tab pack = £7.27; 120 mg, 56-tab pack = £7.15. Label: 25

Counselling Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy

Dose mild to moderate hypertension, initially 90 mg or 120 mg twice daily; increased if necessary to 360 mg daily in divided doses; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily; increased if necessary to 120 mg twice daily

Angina, initially 90 mg or 120 mg twice daily; increased if necessary to 480 mg daily in divided doses; ELDERLY and in hepatic or renal impairment, dose form not appropriate for initial titration; up to 120 mg twice daily may be required

Viazem XL® (Genus) PoM

Capsules, m/r, diltiazem hydrochloride 120 mg (lavender), net price 28-cap pack = £6.60; 180 mg (white/blue-green), 28-cap pack = £7.36; 240 mg (blue-green/lavender), 28-cap pack = £7.74; 300 mg (white/lavender), 28-cap pack = £8.03; 360 mg (blue-green), 28-cap pack = £14.13. Label: 25

Dose angina and mild to moderate hypertension, initially 180 mg once daily, adjusted according to response to 240 mg once daily; max. 360 mg once daily; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily, adjusted according to response

Zemtard® (Galen) PoM

Zemtard 120XL capsules, m/r, brown/orange, diltiazem hydrochloride 120 mg, net price 28-cap pack = £6.10. Label: 25

Zemtard 180XL capsules, m/r, grey/pink, diltiazem hydrochloride 180 mg, net price 28-cap pack = £6.20 Label: 25

Zemtard 240XL capsules, m/r, blue, diltiazem hydrochloride 240 mg, net price 28-cap pack = £6.30. Label: 25

Zemtard 300XL capsules, m/r, white/blue, diltiazem hydrochloride 300 mg, net price 28-cap pack = £6.70. Label: 25

Dose angina and mild to moderate hypertension, 180–300 mg once daily, increased if necessary to 360 mg once daily in hypertension and to 480 mg once daily in angina; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily

FELODIPINE

Indications hypertension, prophylaxis of angina

Cautions withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment or if cardiogenic shock develops; severe left ventricular dysfunction; avoid grapefruit juice (may affect metabolism); reduce dose in hepatic impairment; breast-feeding (Appendix 5); **interactions:** Appendix 1 (calcium-channel blockers)

Contra-indications unstable angina, uncontrolled heart failure; significant aortic stenosis; within 1 month of myocardial infarction; acute porphyria (section 9.8.2); pregnancy (Appendix 4)

Side-effects flushing, headache, palpitation, dizziness, fatigue, gravitational oedema; rarely rash, pruritus, cutaneous vasculitis, gum hyperplasia, urinary frequency, impotence, fever

Dose

- Hypertension, initially 5 mg (elderly 2.5 mg) daily in the morning; usual maintenance 5–10 mg once daily; doses above 20 mg daily rarely needed
- Angina, initially 5 mg daily in the morning, increased if necessary to 10 mg once daily

Felodipine (Non-proprietary) PoM

Tablets, m/r, felodipine 2.5 mg, net price 28-tab pack = £6.44; 5 mg, 28-tab pack = £4.30; 10 mg, 28-tab pack = £5.78, 30-tab pack = £12.87. Label: 25

Brands include *Cardioplen XL®*, *Felogen XL®*, *Felotens XL®*, *Keloc SR®*, *Neofel XL®*, *Parmid XL®*, *Vascalpha®*

Plendil® (AstraZeneca) PoM

Tablets, m/r, f/c, felodipine 2.5 mg (yellow), net price 28-tab pack = £6.44; 5 mg (pink), 28-tab pack = £4.30; 10 mg (brown), 28-tab pack = £5.78. Label: 25

ISRADIPINE

Indications hypertension

Cautions sick sinus syndrome (if pacemaker not fitted); avoid grapefruit juice (may affect metabolism); poor cardiac reserve; reduce dose in hepatic or renal impairment; pregnancy (Appendix 4); **interactions:** Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock; symptomatic or tight aortic stenosis; during or within 1 month of myocardial infarction; unstable angina; acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects abdominal discomfort; tachycardia, palpitation, flushing, peripheral oedema; dyspnoea; headache, fatigue, dizziness; polyuria; rash; *less commonly* hypotension, weight gain; *very rarely* vomiting, nausea, gum hyperplasia, anorexia, drowsiness, arrhythmia, bradycardia, heart failure, cough, depression, paraesthesia, anxiety, erectile dysfunction, blood disorders (such as thrombocytopenia, leucopenia, anaemia), arthralgia, visual disturbance, hypersensitivity reactions; hepatitis and gynaecomastia also reported

Dose

- 2.5 mg twice daily, increased if necessary after 3–4 weeks to 5 mg twice daily (exceptionally up to 10 mg twice daily); ELDERLY (or in hepatic or renal impairment) 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response, maintenance dose of 2.5 mg or 5 mg once daily may be sufficient

Prescal® (Novartis) PoM

Tablets, yellow, scored, isradipine 2.5 mg, net price 56-tab pack = £16.54

LACIDIPINE

Indications hypertension

Cautions cardiac conduction abnormalities; poor cardiac reserve; avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); **interactions:** Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock, unstable angina, aortic stenosis; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects flushing, palpitation, oedema; headache, dizziness; *rarely* gastro-intestinal disturbances, gum hyperplasia, aggravation of angina, mood disturbances, asthenia, polyuria, muscle cramps, skin rash (including pruritus and erythema)

Dose

- Initially 2 mg as a single daily dose, preferably in the morning; increased after 3–4 weeks to 4 mg daily, then if necessary to 6 mg daily

Motens® (Boehringer Ingelheim) PoM

Tablets, both f/c, lacidipine 2 mg, net price 28-tab pack = £4.50; 4 mg (scored), 28-tab pack = £7.00

LERCANIDIPINE HYDROCHLORIDE

Indications mild to moderate hypertension

Cautions left ventricular dysfunction; sick sinus syndrome (if pacemaker not fitted); avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); **interactions:** Appendix 1 (calcium-channel blockers)

Contra-indications aortic stenosis; unstable angina, uncontrolled heart failure; within 1 month of myocardial infarction; renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2); acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding

Side-effects flushing, peripheral oedema, palpitation, tachycardia, headache, dizziness, asthenia; also gastro-intestinal disturbances, hypotension, drowsiness, myalgia, polyuria, rash

Dose

- Initially 10 mg once daily; increased, if necessary, after at least 2 weeks to 20 mg daily

Zanidip® (Recordati) PoM

Tablets, f/c, lercanidipine hydrochloride 10 mg (yellow), net price 28-tab pack = £5.70; 20 mg (pink), 28-tab pack = £10.82. Label: 22

NICARDIPINE HYDROCHLORIDE

Indications prophylaxis of angina; mild to moderate hypertension

Cautions withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose; congestive heart failure or significantly impaired left ventricular function; elderly; avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock; advanced aortic stenosis; unstable or acute attacks of angina; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects dizziness, headache, peripheral oedema, flushing, palpitation, nausea; also gastro-intestinal disturbances, drowsiness, insomnia, tinnitus, hypotension, rashes, dyspnoea, paraesthesia, frequency of micturition; thrombocytopenia, depression and impotence reported

Dose

- Initially 20 mg 3 times daily, increased, after at least three days, to 30 mg 3 times daily (usual range 60–120 mg daily)

Nicardipine (Non-proprietary) PoM

Capsules, nicardipine hydrochloride 20 mg, net price 56-cap pack = £3.00; 30 mg, 56-cap pack = £4.49

Cardene® (Astellas) PoM

Capsules, nicardipine hydrochloride 20 mg (blue/white), net price 56-cap pack = £8.57; 30 mg (blue/pale blue), 56-cap pack = £9.95

Modified release

Cardene SR® (Astellas) PoM

Capsules, m/r, nicardipine hydrochloride 30 mg, net price 56-cap pack = £10.21; 45 mg (blue), 56-cap pack = £14.86. Label: 25

Dose mild to moderate hypertension, initially 30 mg twice daily; usual effective dose 45 mg twice daily (range 30–60 mg twice daily)

NIFEDIPINE

Indications prophylaxis of angina; hypertension; Raynaud's phenomenon

Cautions see notes above; also withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment; poor cardiac reserve; heart failure or significantly impaired left ventricular function (heart failure deterioration observed); severe hypotension; elderly; diabetes mellitus; hepatic impairment (Appendix 2); may inhibit labour; pregnancy (Appendix 4); breast-feeding (Appendix 5); avoid grapefruit juice (may affect metabolism); **interactions**: Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock; advanced aortic stenosis; within 1 month of myocardial infarction; unstable or acute attacks of angina; acute porphyria (section 9.8.2)

Side-effects gastro-intestinal disturbance; hypotension, oedema, vasodilatation, palpitation; headache, dizziness, lethargy, asthenia; *less commonly* tachycardia, syncope, chills, nasal congestion, dyspnoea, anxiety, sleep disturbance, vertigo, migraine, paraesthesia, tremor, polyuria, dysuria, nocturia, erectile dysfunction, epistaxis, myalgia, joint swelling, visual disturbance, sweating, hypersensitivity reactions (including angioedema, jaundice, pruritus, urticaria, and rash); *rarely* anorexia, gum hyperplasia, mood disturbances, hyperglycaemia, male infertility, purpura, and photosensitivity reactions; also reported dysphagia, intestinal obstruction, intestinal ulcer, bezoar formation (with some modified-release preparations), gynaecomastia, agranulocytosis, and anaphylaxis

Dose

- See preparations below

Nifedipine (Non-proprietary) PoM

Capsules, nifedipine 5 mg, net price 84-cap pack = £2.89; 10 mg, 84-cap pack = £3.90

Dose angina prophylaxis (but not recommended, see notes above) and Raynaud's phenomenon, initially 5 mg 3 times daily, adjusted according to response to 20 mg 3 times daily

Hypertension, not recommended therefore no dose stated

Adalat® (Bayer) PoM

Capsules, orange, nifedipine 5 mg, net price 90-cap pack = £5.84; 10 mg, 90-cap pack = £7.44

Dose angina prophylaxis (but not recommended, see notes above) and Raynaud's phenomenon, initially 5 mg 3 times daily, adjusted according to response to max. 20 mg 3 times daily

Hypertension, not recommended therefore no dose stated

Modified release

Note Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed. Modified-release formulations may not be suitable for dose titration in hepatic disease

Adalat® LA (Bayer) PoM

LA 20 tablets, m/r, f/c, pink, nifedipine 20 mg, net price 28-tab pack = £5.06. Label: 25

LA 30 tablets, m/r, f/c, pink, nifedipine 30 mg, net price 28-tab pack = £7.13. Label: 25

LA 60 tablets, m/r, f/c, pink, nifedipine 60 mg, net price 28-tab pack = £9.31. Label: 25

Counselling Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy

Dose hypertension, 20–30 mg once daily, increased if necessary to max. 90 mg once daily

Angina prophylaxis, 30 mg once daily, increased if necessary to max. 90 mg once daily

Cautions dose form not appropriate for use in hepatic impairment or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn's disease)

Adalat® Retard (Bayer) PoM

Retard 10 tablets, m/r, f/c, grey-pink, nifedipine 10 mg, net price 56-tab pack = £7.48. Label: 25

Retard 20 tablets, m/r, f/c, grey-pink, nifedipine 20 mg, net price 56-tab pack = £8.98. Label: 25

Dose hypertension and angina prophylaxis, 10 mg twice daily, adjusted according to response to 40 mg twice daily

Adipine® MR (Chiesi) PoM

Tablets, m/r, nifedipine 10 mg (apricot), net price 56-tab pack = £5.73; 20 mg (pink), 56-tab pack = £7.14. Label: 21, 25

Dose hypertension and angina prophylaxis, 20 mg twice daily after food (initial titration 10 mg twice daily); max. 40 mg twice daily

Adipine® XL (Chiesi) PoM

Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £5.66; 60 mg, 28-tab pack = £8.50. Label: 25

Dose hypertension and angina prophylaxis, 30 mg once daily, increased if necessary; max. 90 mg once daily

Coracten SR® (UCB Pharma) PoM

Capsules, m/r, nifedipine 10 mg (grey/pink, enclosing yellow pellets), net price 60-cap pack = £3.90; 20 mg (pink/brown, enclosing yellow pellets), 60-cap pack = £5.41. Label: 25

Dose hypertension and angina prophylaxis, initially 10 mg twice daily, increased if necessary to max. 40 mg twice daily

Coracten XL® (UCB Pharma) PoM

Capsules, m/r, nifedipine 30 mg (brown), net price 28-cap pack = £4.89; 60 mg (orange), 28-cap pack = £7.34. Label: 25

Dose hypertension and angina prophylaxis, 30 mg once daily, increased if necessary; max. 90 mg once daily

Fortipine LA 40® (Goldshield) PoM

Tablets, m/r, red, nifedipine 40 mg, net price 30-tab pack = £9.60. Label: 21, 25

Dose hypertension and angina prophylaxis, 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

Hypolar® Retard 20 (Sandoz) PoM

Tablets, m/r, red, f/c, nifedipine 20 mg, net price 56-tab pack = £5.75. Label: 25

Dose hypertension and angina prophylaxis, 20 mg twice daily, increased if necessary to 40 mg twice daily

Nifedipress® MR (Dexcel) PoM

Tablets, m/r, pink, nifedipine 10 mg, net price 56-tab pack = £2.02; 20 mg, 56-tab pack = £2.02. Label: 25

Dose hypertension and angina prophylaxis, initially 10 mg twice daily adjusted according to response to 40 mg twice daily

Note Also available as *Calchan® MR, Kentipine® MR*

Tensipine MR® (Genus) PoM

Tablets, m/r, pink-grey, nifedipine 10 mg, net price 56-tab pack = £4.30; 20 mg, 56-tab pack = £5.49. Label: 21, 25

Dose hypertension and angina prophylaxis, initially 10 mg twice daily adjusted according to response to 40 mg twice daily

Valni XL® (Winthrop) PoM

Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £7.29; 60 mg, 28-tab pack = £9.31. Label: 25

Dose severe hypertension and prophylaxis of angina, 30 mg once daily, increased if necessary to max. 90 mg once daily

Cautions dose form not appropriate for use in hepatic impairment, or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy

With atenolol

Section 2.4

NIMODIPINE

Indications prevention and treatment of ischaemic neurological deficits following aneurysmal subarachnoid haemorrhage

Cautions cerebral oedema or severely raised intracranial pressure; hypotension; avoid concomitant administration of nimodipine tablets and infusion, other calcium-channel blockers, or beta-blockers; concomitant nephrotoxic drugs; avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (calcium-channel blockers, alcohol (infusion only))

Contra-indications within 1 month of myocardial infarction; unstable angina; acute porphyria (section 9.8.2)

Side-effects hypotension, variation in heart-rate, flushing, headache, gastro-intestinal disorders, nausea, sweating and feeling of warmth; thrombocytopenia and ileus reported

Dose

- Prevention, by mouth, 60 mg every 4 hours, starting within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days
- Treatment, by intravenous infusion via central catheter, initially 1 mg/hour (up to 500 micrograms/hour if body-weight less than 70 kg or if blood pressure unstable), increased after 2 hours to 2 mg/hour if no severe fall in blood pressure; continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days

Nimotop® (Bayer) PoM

Tablets, yellow, f/c, nimodipine 30 mg, net price 100-tab pack = £37.33

Intravenous infusion, nimodipine 200 micrograms/mL; also contains ethanol 20% and macrogol '400' 17%. Net price 50-mL vial (with polyethylene infusion catheter) = £7.47

Note Polyethylene, polypropylene, or glass apparatus should be used; PVC should be avoided

VERAPAMIL HYDROCHLORIDE

Indications see under Dose and preparations

Cautions first-degree AV block; acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure); patients taking beta-blockers (**important:** see below); hepatic impairment (Appendix 2); children, specialist advice only (section 2.3.2); pregnancy (Appendix 4) and breast-feeding (Appendix 5); avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

Verapamil and beta-blockers **Verapamil** injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed.

It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

Contra-indications hypotension, bradycardia, second- and third-degree AV block, sick sinus syndrome, cardiogenic shock, sino-atrial block; history of heart failure or significantly impaired left ventricular function, even if controlled by therapy; atrial flutter or

fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); acute porphyria (section 9.8.2)

Side-effects constipation; less commonly nausea, vomiting, flushing, headache, dizziness, fatigue, ankle oedema; rarely allergic reactions (erythema, pruritus, urticaria, angioedema, Stevens-Johnson syndrome); myalgia, arthralgia, paraesthesia, erythromelalgia; increased prolactin concentration; rarely gynaecomastia and gingival hyperplasia after long-term treatment; after intravenous administration or high doses, hypotension, heart failure, bradycardia, heart block, and asystole

Dose

- By mouth, supraventricular arrhythmias (but see also Contra-indications), 40–120 mg 3 times daily
  Angina, 80–120 mg 3 times daily
  Hypertension, 240–480 mg daily in 2–3 divided doses
- By slow intravenous injection over 2 minutes (3 minutes in elderly), supraventricular arrhythmias (but see also Contra-indications), 5–10 mg (preferably with ECG monitoring); in paroxysmal tachyarrhythmias a further 5 mg after 5–10 minutes if required

Verapamil (Non-proprietary) PoM

Tablets, coated, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.55; 80 mg, 84-tab pack = £1.73; 120 mg, 28-tab pack = £1.44; 160 mg, 56-tab pack = £22.42

Oral solution, verapamil hydrochloride 40 mg/5 mL, net price 150 mL = £36.90
Brands include *Zolvera®*

Cordilox® (Dexcel) PoM

Tablets, yellow, f/c, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.50; 80 mg, 84-tab pack = £2.05; 120 mg, 28-tab pack = £1.15; 160 mg, 56-tab pack = £2.80

Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.11

Securon® (Abbott) PoM

Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.08

Modified release

Half Securon SR® (Abbott) PoM

Tablets, m/r, f/c, verapamil hydrochloride 120 mg, net price 28-tab pack = £7.86. Label: 25
Dose see *Securon SR®*

Securon SR® (Abbott) PoM

Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £5.66. Label: 25
Dose hypertension, 240 mg daily (new patients initially 120 mg), increased if necessary to max. 480 mg daily (doses above 240 mg daily as 2 divided doses)
Angina, 240 mg twice daily (may sometimes be reduced to once daily)
Prophylaxis after myocardial infarction where beta-blockers not appropriate (started at least 1 week after infarction), 360 mg daily in divided doses, given as 240 mg in the morning and 120 mg in the evening *or* 120 mg 3 times daily

Univer® (Cephalon) PoM

Capsules, m/r, verapamil hydrochloride 120 mg (yellow/dark blue), net price 28-cap pack = £4.96; 180 mg (yellow), 56-cap pack = £11.98; 240 mg (yellow/dark blue), 28-cap pack = £8.08. Label: 25
Dose hypertension, 240 mg daily, max. 480 mg daily (new patients, initial dose 120 mg); angina, 360 mg daily, max. 480 mg daily

Verapress MR® (Dexcel) PoM

Tablets, m/r, pale green, f/c, verapamil hydrochloride 240 mg, net price 28-tab pack = £6.04. Label: 25
Dose hypertension, 1 tablet daily, increased to twice daily if necessary; angina, 1 tablet twice daily (may sometimes be reduced to once daily)
Note Also available as *Cordilox® MR*

Vertab® SR 240 (Chiesi) PoM

Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £8.29. Label: 25
Dose mild to moderate hypertension, 240 mg daily, increased to twice daily if necessary; angina, 240 mg twice daily (may sometimes be reduced to once daily)

2.6.3 Other antianginal drugs

Nicorandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina (section 2.6). Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients in normal sinus rhythm when beta-blockers are contra-indicated or not tolerated.

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

IVABRADINE

Indications treatment of angina in patients in normal sinus rhythm (see notes above)

Cautions mild heart failure including asymptomatic left ventricular dysfunction; monitor for atrial fibrillation or other arrhythmias (treatment ineffective); hypotension (avoid if severe); retinitis pigmentosa; elderly; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); **interactions**: Appendix 1 (ivabradine)

Contra-indications severe bradycardia (not to be initiated if heart rate below 60 beats per minute); cardiogenic shock; acute myocardial infarction; immediately after cerebrovascular accident; sick-sinus syndrome; sino-atrial block; moderate to severe heart failure; patients with pacemaker; unstable angina; second- and third-degree heart block; congenital QT syndrome; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects bradycardia, first-degree heart block, ventricular extrasystoles; headache, dizziness; visual disturbances including phosphenes and blurred vision; *less commonly* nausea, constipation, diarrhoea, palpitations, supraventricular extrasystoles, dyspnoea, vertigo, muscle cramps, eosinophilia, hyperuricaemia, and raised plasma-creatinine concentration

Dose

- Initially 5 mg twice daily, increased if necessary after 3–4 weeks to 7.5 mg twice daily (if not tolerated reduce dose to 2.5–5 mg twice daily); ELDERLY initially 2.5 mg twice daily

  Note Ventricular rate at rest should not be allowed to fall below 50 beats per minute

Procoralan® (Servier) ▼ PoM

Tablets, pink, f/c, ivabradine (as hydrochloride) 5 mg (scored), net price 56-tab pack = £39.00; 7.5 mg, 56-tab pack = £39.00

NICORANDIL

Indications prophylaxis and treatment of angina

Cautions hypovolaemia; low systolic blood pressure; acute pulmonary oedema; acute myocardial infarction with acute left ventricular failure and low filling pressures; pregnancy (Appendix 4); **interactions:** Appendix 1 (nicorandil)

Driving Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired

Contra-indications cardiogenic shock; left ventricular failure with low filling pressures; hypotension; breast-feeding

Side-effects headache (especially on initiation, usually transitory); cutaneous vasodilatation with flushing; nausea, vomiting, dizziness, weakness also reported; *rarely* oral ulceration, myalgia, and rash; at high dosage, reduction in blood pressure and/or increase in heart rate; angioedema, hepatic dysfunction, and anal ulceration also reported

Dose

- Initially 10 mg twice daily (if susceptible to headache 5 mg twice daily); usual dose 10–20 mg twice daily; up to 30 mg twice daily may be used

Ikorel® (Rhône-Poulenc Rorer) PoM

Tablets, scored, nicorandil 10 mg, net price 60-tab pack = £8.18; 20 mg, 60-tab pack = £15.54

RANOLAZINE

Indications as adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies

Cautions moderate to severe congestive heart failure; QT interval prolongation; elderly; body-weight less than 60 kg; hepatic impairment (avoid if moderate or severe;Appendix 2); renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (ranolazine)

Contra-indications breast-feeding

Side-effects constipation, nausea, vomiting; dizziness, headache, asthenia; *less commonly* abdominal pain, weight loss, dry mouth, dyspepsia, flatulence; hot flush, hypotension, syncope, prolonged QT interval, peripheral oedema; dysponea, cough, epistaxis; lethargy, hypoaesthesia, drowsiness, tremor, anxiety, insomnia, anorexia; dysuria, haematuria, chromaturia; dehydration; pain in extremities, muscle cramp, joint swelling; visual disturbance; tinnitus; pruritus, sweating; *rarely* pancreatitis, erosive duodenitis; cold extremities; throat tightness; amnesia, loss of consciousness, disorientation; erectile dysfunction; parosmia, impaired hearing; allergic dermatitis, urticaria, rash

Dose

- ADULT over 18 years, initially 375 mg twice daily, increased after 2–4 weeks to 500 mg twice daily and then adjusted according to response to max. 750 mg twice daily (reduce dose to 375–500 mg twice daily if not tolerated)

Ranexa® (Menarini) ▼ PoM

Tablets, m/r, ranolazine 375 mg (blue), net price 60-tab pack = £48.98; 500 mg (orange), 60-tab pack = £48.98; 750 mg (green), 60-tab pack = £48.98.
Label: 25, patient alert card

2.6.4 Peripheral vasodilators and related drugs

Peripheral vascular disease can be either occlusive (e.g. *intermittent claudication*) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. *Raynaud's syndrome*).

Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation (section 4.10), effective control of blood pressure (section 2.5), regulating blood lipids (section 2.12), optimising glycaemic control in diabetes (section 6.1), taking aspirin in a dose of 75 mg daily (section 2.9), and possibly weight reduction in obesity (section 4.5). Exercise training, treatment with cilostazol or naftidrofuryl (see below), and possibly statin therapy can improve symptoms of intermittent claudication.

Cilostazol is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest. Patients receiving cilostazol should be assessed for improvement after 3 months. The *Scottish Medicines Consortium* (p. 3) has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

Naftidrofuryl can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl should be assessed for improvement after 3–6 months.

Inositol nicotinate, pentoxifylline (oxpentifylline), and cinnarizine are not established as being effective for the treatment of intermittent claudication.

Management of *Raynaud's syndrome* includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud's syndrome. **Nifedipine** (section 2.6.2) is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, **naftidrofuryl** may produce symptomatic improvement; **inositol nicotinate** (a nicotinic acid derivative) may also be considered. Cinnarizine, pentoxifylline, prazosin, and moxisylyte (thymoxamine) are not established as being effective for the treatment of Raynaud's syndrome.

Vasodilator therapy is not established as being effective for *chilblains* (section 13.13).

CILOSTAZOL

Indications intermittent claudication in patients without rest pain and no peripheral tissue necrosis

Cautions atrial or ventricular ectopy, atrial fibrillation, atrial flutter; diabetes mellitus (higher risk of intra-ocular bleeding); concomitant drugs that increase risk of bleeding; hepatic impairment (Appendix 2); **interactions:** Appendix 1 (cilostazol)

Contra-indications predisposition to bleeding (e.g. active peptic ulcer, haemorrhagic stroke in previous 6 months, surgery in previous 3 months, proliferative diabetic retinopathy, poorly controlled hypertension); history of ventricular tachycardia, of ventricular fibrillation and of multifocal ventricular ectopics, prolongation of QT interval, congestive heart failure; renal impairment (if eGFR less than 25 mL/minute/1.73 m^2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances; tachycardia, palpitation, angina, arrhythmia, chest pain, oedema; rhinitis; dizziness, headache; asthenia; rash, pruritus, ecchymosis; *less commonly* gastritis, congestive heart failure, postural hypotension, dyspnoea, pneumonia, cough, insomnia, abnormal dreams, anxiety, hyperglycaemia, diabetes mellitus, anaemia, haemorrhage, myalgia, hypersensitivity reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis in rare cases); *rarely* anorexia, hypertension, paresis, increased urinary frequency, bleeding disorders, renal impairment, conjunctivitis, tinnitus, and jaundice

Dose

- 100 mg twice daily (30 minutes before or 2 hours after food)

Pletal® (Otsuka) PoM

Tablets, cilostazol 50 mg, net price 56-tab pack = £35.31; 100 mg, 56-tab pack = £35.31

INOSITOL NICOTINATE

Indications peripheral vascular disease; hyperlipidaemia (section 2.12)

Cautions cerebrovascular insufficiency, unstable angina

Contra-indications recent myocardial infarction, acute phase of a cerebrovascular accident; pregnancy (Appendix 4)

Side-effects nausea, vomiting, hypotension, flushing, syncope, oedema, headache, dizziness, paraesthesia, rash

Dose

- 3 g daily in 2–3 divided doses; max. 4 g daily

Hexopal® (Genus)

Tablets, scored, inositol nicotinate 500 mg, net price 20 = £4.10

Tablets forte, scored, inositol nicotinate 750 mg, net price 112-tab pack = £34.02

MOXISYLYTE

(Thymoxamine)

Indications primary Raynaud's syndrome (short-term treatment)

Cautions diabetes mellitus

Contra-indications active liver disease; pregnancy (Appendix 4)

Side-effects nausea, diarrhoea, flushing, headache, dizziness; hepatic reactions including cholestatic jaundice and hepatitis reported to CSM

Dose

- Initially 40 mg 4 times daily, increased to 80 mg 4 times daily if poor initial response; discontinue after 2 weeks if no response

Opilon® (Concord) PoM

Tablets, yellow, f/c, moxisylyte 40 mg (as hydrochloride), net price 112-tab pack = £95.98. Label: 21

NAFTIDROFURYL OXALATE

Indications see under Dose

Side-effects nausea, epigastric pain, rash, hepatitis, hepatic failure

Dose

- Peripheral vascular disease (see notes above), 100–200 mg 3 times daily
- Cerebral vascular disease, 100 mg 3 times daily

Naftidrofuryl (Non-proprietary) PoM

Capsules, naftidrofuryl oxalate 100 mg, net price 84-cap pack = £5.24. Label: 25, 27

Praxilene® (Merck) PoM

Capsules, pink, naftidrofuryl oxalate 100 mg, net price 84-cap pack = £8.26. Label: 25, 27

PENTOXIFYLLINE

(Oxpentifylline)

Indications peripheral vascular disease; venous leg ulcers [unlicensed indication] (Appendix A8.2.5)

Cautions hypotension, coronary artery disease; renal impairment (Appendix 3), severe hepatic impairment; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (pentoxifylline)

Contra-indications cerebral haemorrhage, extensive retinal haemorrhage, acute myocardial infarction; pregnancy and breast-feeding

Side-effects gastro-intestinal disturbances, dizziness, agitation, sleep disturbances, headache; rarely flushing, tachycardia, angina, hypotension, thrombocytopenia, intrahepatic cholestasis, hypersensitivity reactions including rash, pruritus and bronchospasm

Dose

- 400 mg 2–3 times daily

Trental® (Aventis Pharma) PoM

Tablets, m/r, pink, s/c, pentoxifylline 400 mg, net price 90-tab pack = £19.68. Label: 21, 25

Other preparations used in peripheral vascular disease

Rutosides (oxerutins, *Paroven®*) are not vasodilators and are not generally regarded as effective preparations as capillary sealants or for the treatment of cramps; side-effects include headache, flushing, rashes, mild gastro-intestinal disturbances.

Paroven® (Novartis Consumer Health)
Capsules, yellow, oxerutins 250 mg, net price 120-cap pack = £13.05
Dose relief of symptoms of oedema associated with chronic venous insufficiency, 500 mg twice daily

2.7 Sympathomimetics

2.7.1 Inotropic sympathomimetics
2.7.2 Vasoconstrictor sympathomimetics
2.7.3 Cardiopulmonary resuscitation

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Adrenaline (epinephrine) (section 2.7.3) acts on both alpha and beta receptors and increases both heart rate and contractility (beta$_1$ effects); it can cause peripheral vasodilation (a beta$_2$ effect) or vasoconstriction (an alpha effect).

2.7.1 Inotropic sympathomimetics

The cardiac stimulants **dobutamine** and **dopamine** act on beta$_1$ receptors in cardiac muscle, and increase contractility with little effect on rate.

Dopexamine acts on beta$_2$ receptors in cardiac muscle to produce its positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

Isoprenaline injection is available from 'special-order' manufacturers or specialist importing companies, see p. 969.

Shock Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline (epinephrine), dobutamine or dopamine (see notes above). In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline (norepinephrine) (section 2.7.2) may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

For advice on the management of anaphylactic shock, see section 3.4.3.

DOBUTAMINE

Indications inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, and cardiogenic shock

Cautions hyperthyroidism; pregnancy (Appendix 4); **interactions:** Appendix 1 (sympathomimetics)

Side-effects tachycardia and marked increase in systolic blood pressure indicate overdosage; phlebitis; *rarely* thrombocytopenia

Dose

- By intravenous infusion, 2.5–10 micrograms/kg/minute, adjusted according to response

Dobutamine (Non-proprietary) PoM
Strong sterile solution, dobutamine (as hydrochloride) 12.5 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL amp = £5.20

DOPAMINE HYDROCHLORIDE

Indications cardiogenic shock in infarction or cardiac surgery

Cautions correct hypovolaemia; low dose in shock due to acute myocardial infarction—see notes above; hyperthyroidism; pregnancy (Appendix 4); **interactions:** Appendix 1 (sympathomimetics)

Contra-indications tachyarrhythmia, phaeochromocytoma

Side-effects nausea and vomiting, peripheral vasoconstriction, hypotension, hypertension, tachycardia

Dose

- By intravenous infusion, 2–5 micrograms/kg/minute initially (see notes above)

Dopamine (Non-proprietary) PoM
Sterile concentrate, dopamine hydrochloride 40 mg/mL, net price 5-mL amp = £3.88; 160 mg/mL, 5-mL amp = £14.75. For dilution and use as an intravenous infusion

Intravenous infusion, dopamine hydrochloride 1.6 mg/mL in glucose 5% intravenous infusion, net price 250-mL container (400 mg) = £11.69; 3.2 mg/mL, 250-mL container (800 mg) = £22.93 (both hosp. only)

Select-A-Jet® Dopamine (UCB Pharma) PoM
Strong sterile solution, dopamine hydrochloride 40 mg/mL, net price 5-mL vial = £5.51; 10-mL vial = £8.86. For dilution and use as an intravenous infusion

DOPEXAMINE HYDROCHLORIDE

Indications inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery

Cautions myocardial infarction, recent angina, hypokalaemia, hyperglycaemia; correct hypovolaemia before starting and during treatment, monitor blood pressure, pulse, plasma potassium, and blood glucose; hyperthyroidism; avoid abrupt withdrawal; pregnancy; **interactions:** Appendix 1 (sympathomimetics)

Contra-indications left ventricular outlet obstruction such as hypertrophic cardiomyopathy or aortic stenosis; phaeochromocytoma, thrombocytopenia

Side-effects nausea, vomiting; tachycardia, bradycardia, arrhythmias, angina, myocardial infarction; tremor, headache; dyspnoea; reversible thrombocytopenia; sweating

Dose

- By intravenous infusion into central or large peripheral vein, 500 nanograms/kg/minute, may be

increased to 1 microgram/kg/minute and further increased up to 6 micrograms/kg/minute in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

Dopacard® (Cephalon) PoM
Strong sterile solution, dopexamine hydrochloride 10 mg/mL (1%). For dilution and use as an intravenous infusion. Net price 5-mL amp = £20.18
Note Contact with metal in infusion apparatus should be minimised

2.7.2 Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed (see also section 2.7.1).

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen (section 3.6), elevation of the legs, and injection of a pressor drug such as ephedrine. As well as constricting peripheral vessels **ephedrine** also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine to manage associated bradycardia (although intravenous injection of atropine sulphate 400 to 600 micrograms may also be required if bradycardia persists).

EPHEDRINE HYDROCHLORIDE

Indications see under Dose

Cautions hyperthyroidism, diabetes mellitus, ischaemic heart disease, hypertension, susceptibility to angle-closure glaucoma, elderly, pregnancy (Appendix 4); may cause acute urine retention in prostatic hypertrophy; **interactions:** Appendix 1 (sympathomimetics)

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, anorexia; tachycardia (sometimes bradycardia), arrhythmias, anginal pain, vasoconstriction with hypertension, vasodilation with hypotension, dizziness and flushing; dyspnoea; headache, anxiety, restlessness, confusion, psychoses, insomnia, tremor; difficulty in micturition, urine retention; sweating, hypersalivation; changes in blood-glucose concentration; *very rarely* angle-closure glaucoma

Dose

- Reversal of hypotension from spinal or epidural anaesthesia, by slow intravenous injection of a solution containing ephedrine hydrochloride 3 mg/mL, 3–6 mg (max. 9 mg) repeated every 3–4 minutes according to response to max. 30 mg

Ephedrine Hydrochloride (Non-proprietary) PoM
Injection, ephedrine hydrochloride 3 mg/mL, net price 10-mL amp = £2.83; 30 mg/mL, net price 1-mL amp = £1.70

METARAMINOL

Indications acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

Cautions see under Noradrenaline Acid Tartrate; longer duration of action than noradrenaline (norepinephrine), see below; cirrhosis; pregnancy (Appendix 4); breast-feeding (Appendix 5)
Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

Contra-indications see under Noradrenaline Acid Tartrate

Side-effects see under Noradrenaline Acid Tartrate; tachycardia; fatal ventricular arrhythmia reported in Laennec's cirrhosis

Dose

- By intravenous infusion, 15–100 mg, adjusted according to response
- In emergency, by intravenous injection, 0.5–5 mg then by intravenous infusion, 15–100 mg, adjusted according to response

Metaraminol (Non-proprietary) PoM
Injection, metaraminol 10 mg (as tartrate)/mL
Available from 'special-order' manufacturers or specialist importing companies, see p. 969

NORADRENALINE ACID TARTRATE/ NOREPINEPHRINE BITARTRATE

Indications see under dose

Cautions coronary, mesenteric, or peripheral vascular thrombosis; following myocardial infarction, Prinzmetal's variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypovolaemia; elderly; extravasation at injection site may cause necrosis; **interactions:** Appendix 1 (sympathomimetics)

Contra-indications hypertension (monitor blood pressure and rate of flow frequently); pregnancy (Appendix 4)

Side-effects hypertension, headache, bradycardia, arrhythmias, peripheral ischaemia

Dose

- Acute hypotension, by intravenous infusion, via central venous catheter, of a solution containing noradrenaline acid tartrate 80 micrograms/mL (equivalent to noradrenaline base 40 micrograms/mL) at an initial rate of 0.16–0.33 mL/minute, adjusted according to response
- Cardiac arrest, by rapid intravenous *or* intracardiac injection, 0.5–0.75 mL of a solution containing noradrenaline acid tartrate 200 micrograms/mL (equivalent to noradrenaline base 100 micrograms/mL)

Noradrenaline/Norepinephrine (Non-proprietary) PoM
Injection, noradrenaline acid tartrate 2 mg/mL (equivalent to noradrenaline base 1 mg/mL). For dilution before use. Net price 2-mL amp = £1.01, 4-mL amp = £1.50, 20-mL amp = £6.35

PHENYLEPHRINE HYDROCHLORIDE

Indications acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

Cautions see under Noradrenaline Acid Tartrate; longer duration of action than noradrenaline (norepinephrine), see below; coronary disease

Hypertensive response Phenylephrine has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

Contra-indications see under Noradrenaline Acid Tartrate; severe hyperthyroidism; pregnancy (Appendix 4)

Side-effects see under Noradrenaline Acid Tartrate; tachycardia or reflex bradycardia

Dose

- By subcutaneous *or* intramuscular injection, 2–5 mg, followed if necessary by further doses of 1–10 mg
- By slow intravenous injection of a 1 mg/mL solution, 100–500 micrograms repeated as necessary after at least 15 minutes
- By intravenous infusion, initial rate up to 180 micrograms/minute reduced to 30–60 micrograms/minute according to response

Phenylephrine (Sovereign) PoM

Injection, phenylephrine hydrochloride 10 mg/mL (1%), net price 1-mL amp = £5.50

2.7.3 Cardiopulmonary resuscitation

The algorithm for cardiopulmonary resuscitation (see inside back cover) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk.

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and electromechanical dissociation (pulseless electrical activity). **Adrenaline (epinephrine)** 1 in 10 000 (100 micrograms/mL) is recommended in a dose of 1 mg (10 mL) by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line is preferred, however if adrenaline is injected through a peripheral line, it must be flushed with at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of **amiodarone** 300 mg *or* 5 mg/kg (from a prefilled syringe *or* diluted in 20 mL Glucose 5%) should be considered after adrenaline to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone 150 mg (*or* 2.5 mg/kg) can be given by intravenous injection if necessary, followed by an intravenous infusion of amiodarone 900 mg over 24 hours. **Lidocaine**, in a dose of 1 mg/kg, is an alternative if amiodarone is not available; a total dose of 3 mg/kg should not be exceeded during the first hour. **Atropine** 3 mg by intravenous injection (section 15.1.3) as a single dose is also used in non-shockable cardiopulmonary resuscitation to block vagal activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be considered; if circulatory access cannot be obtained at all, the endotracheal route can be considered for some drugs.

For the management of acute anaphylaxis see section 3.4.3.

ADRENALINE/EPINEPHRINE

Indications see notes above

Cautions heart disease, hypertension, arrhythmias, cerebrovascular disease, phaeochromocytoma; diabetes mellitus, hyperthyroidism; susceptibility to angle-closure glaucoma; elderly; **interactions:** Appendix 1 (sympathomimetics)

Side-effects nausea, vomiting; tachycardia, arrhythmias, palpitation, cold extremities, hypertension (risk of cerebral haemorrhage); dyspnoea, pulmonary oedema (on excessive dosage or extreme sensitivity); anxiety, tremor, restlessness, headache, weakness, dizziness; hyperglycaemia; urinary retention; sweating; tissue necrosis at injection site and angle-closure glaucoma also reported

Dose

- See notes above

Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary) PoM

Injection, adrenaline (as acid tartrate) 100 micrograms/mL. 10-mL amp.

Brands include *Minijet® Adrenaline*

2.8 Anticoagulants and protamine

2.8.1 Parenteral anticoagulants
2.8.2 Oral anticoagulants
2.8.3 Protamine sulphate

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells. They are therefore widely used in the prevention and treatment of deep-vein thrombosis in the legs.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin. They are used to prevent thrombi forming on prosthetic heart valves.

2.8.1 Parenteral anticoagulants

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as '**standard**' or '**unfractionated heparin**' to distinguish it from the **low molecular weight heparins** (see p. 127), which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Treatment For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin is given as an intravenous loading dose, followed by continuous

intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection. Intermittent intravenous injection of heparin is no longer recommended. An oral anticoagulant (usually warfarin, section 2.8.2) is started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring, preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure. A low molecular weight heparin or, in some circumstances, heparin is also used in regimens for the management of myocardial infarction (section 2.10.1) and unstable angina (section 2.6).

Prophylaxis In patients undergoing general surgery, a low molecular weight heparin is effective for the prevention of postoperative deep-vein thrombosis and pulmonary embolism in 'high-risk' patients (i.e. those with obesity, malignant disease, history of deep-vein thrombosis or pulmonary embolism, patients over 40 years, or those with an established thrombophilic disorder or who are undergoing major or complicated surgery). Subcutaneous injection of low-dose heparin is an alternative; this regimen does not require laboratory monitoring.

To combat the increased risk in major orthopaedic surgery an adjusted dose regimen of heparin (with monitoring), low molecular weight heparin (p. 127) or fondaparinux (p. 130) can be used—a low molecular weight heparin is probably more effective.

Pregnancy Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin, enoxaparin, and tinzaparin. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits Heparin is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw heparin, but if rapid reversal of the effects of heparin is required, protamine sulphate (section 2.8.3) is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

HEPARIN

Indications see under Dose

Cautions see notes above; also elderly; concomitant use of drugs that increase risk of bleeding; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (heparin)

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Platelet counts should be measured just before treatment with heparin or low molecular weight heparins, and regular monitoring of platelet counts is recommended if given for longer than 4 days. Signs of heparin-induced thrombocytopenia include a 50% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, heparin should be **stopped** and an alternative anticoagulant, such as lepirudin or danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin

Hyperkalaemia Inhibition of aldosterone secretion by heparin (including low molecular weight heparins) can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy and the CSM has recommended that plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting heparin and monitored regularly thereafter, particularly if heparin is to be continued for longer than 7 days

Contra-indications haemophilia and other haemorrhagic disorders, thrombocytopenia (including history of heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension; severe liver disease (including oesophageal varices), peptic ulcer; after major trauma or recent surgery to eye or nervous system; acute bacterial endocarditis; spinal or epidural anaesthesia with treatment doses of heparin; hypersensitivity to heparin or to low molecular weight heparins

Side-effects haemorrhage (see notes above), thrombocytopenia (see Cautions), *rarely* rebound hyperlipidaemia following heparin withdrawal, priapism, hyperkalaemia (see Cautions), osteoporosis (risk lower with low molecular weight heparins), alopecia on prolonged use, injection-site reactions, skin necrosis, and hypersensitivity reactions (including urticaria, angioedema, and anaphylaxis)

Dose

- Treatment of deep-vein thrombosis, pulmonary embolism, unstable angina, and acute peripheral arterial occlusion, by intravenous injection, loading dose of 5000 units *or* 75 units/kg (10 000 units in severe pulmonary embolism), followed by continuous intravenous infusion of 18 units/kg/hour *or* treatment of deep-vein thrombosis, by subcutaneous injection of 15 000 units every 12 hours (laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly); CHILD under 18 years *see* BNF for Children
- Prophylaxis in orthopaedic surgery, see notes above
- Prophylaxis in general and gynaecological surgery (see notes above), by subcutaneous injection, 5000 units 2 hours before surgery, then every 8–12 hours for 7–10 days or until patient is ambulant (monitoring not needed); during pregnancy (with monitoring), 5000–10 000 units every 12 hours (**important:** prevention of prosthetic heart-valve thrombosis in pregnancy calls for **specialist management**)
- Haemodialysis by intravenous injection initially 1000–5000 units, followed by continuous intravenous infusion of 250–1000 units/hour
- Myocardial infarction, see section 2.10.1
- Prevention of clotting in extracorporeal circuits, consult product literature

Doses above reflect the guidelines of the British Society for Haematology; for doses of the low molecular weight heparins, see p. 127

Heparin Sodium (Non-proprietary) PoM

Injection, heparin sodium 1000 units/mL, net price 1-mL amp = 37p, 5-mL amp = 93p, 5-mL vial = 92p, 10-mL amp = £1.60, 20-mL amp = £2.63; 5000 units/mL,

1-mL amp = 72p, 5-mL amp = £1.87, 5-mL vial = £2.09; 25 000 units/mL, 0.2-mL amp = 92p, 1-mL amp = £1.90, 5-mL vial = £3.68

Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Heparin Calcium (Non-proprietary) PoM

Injection, heparin calcium 25 000 units/mL, net price 0.2-mL amp = 73p

Low molecular weight heparins

Low molecular weight heparins (**bemiparin**, **dalteparin**, **enoxaparin**, and **tinzaparin**) are usually preferred over unfractionated heparin in the *prevention* of venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. Also, the standard prophylactic regimen does not require monitoring. In orthopaedic practice low molecular weight heparins are probably more effective than unfractionated heparin; fondaparinux (p. 130) can also be used. The duration of action of low molecular weight heparins is longer than that of unfractionated heparin and *once-daily subcutaneous* administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are also used in the *treatment* of deep-vein thrombosis, pulmonary embolism, myocardial infarction (section 2.10.1), unstable coronary artery disease (section 2.6) and for the prevention of clotting in extracorporeal circuits.

Dalteparin is also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months.

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with low molecular weight heparins, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

Haemorrhage See under Heparin.

Pregnancy See under Heparin.

BEMIPARIN SODIUM

Indications see notes above and under preparations

Cautions see under Heparin and notes above

Contra-indications see under Heparin; breast-feeding (Appendix 5)

Side-effects see under Heparin

Dose

- See under preparations below

Zibor® (Amdipharm) ▼ PoM

Injection, bemiparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) prefilled syringe = £1.86; 17 500 units/mL, 3500-unit (0.2-mL) prefilled syringe = £2.75

Dose prophylaxis of deep-vein thrombosis, by subcutaneous injection, moderate risk, 2500 units 2 hours before or 6 hours after surgery then 2500 units every 24 hours for 7–10 days; high risk, 3500 units 2 hours before or 6 hours after surgery then 3500 units every 24 hours for 7–10 days

Prevention of clotting in extracorporeal circuits, consult product literature

Injection, bemiparin sodium 25 000 units/mL, net price 0.2-mL (5000-unit) prefilled syringe = £4.22, 0.3-mL (7500-unit) prefilled syringe = £5.34, 0.4-mL (10 000-unit) prefilled syringe = £8.44

Dose treatment of deep-vein thrombosis (with or without pulmonary embolism), by subcutaneous injection, 115 units/kg every 24 hours for 5–9 days (and until adequate oral anticoagulation established)

DALTEPARIN SODIUM

Indications see notes above and under preparations

Cautions see under Heparin and notes above

Contra-indications see under Heparin

Side-effects see under Heparin

Dose

- See under preparations below

Fragmin® (Pharmacia) PoM

Injection (single-dose syringe), dalteparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) syringe = £1.86; 25 000 units/mL, 5000-unit (0.2-mL) syringe = £2.82, 7500-unit (0.3-mL) syringe = £4.23, 10 000-unit (0.4-mL) syringe = £5.65, 12 500-unit (0.5-mL) syringe = £7.06, 15 000-unit (0.6-mL) syringe = £8.47, 18 000-unit (0.72-mL) syringe = £10.16

Dose prophylaxis of deep-vein thrombosis, in surgical patients, by subcutaneous injection, moderate risk, 2500 units 1–2 hours before surgery then 2500 units every 24 hours for 5–7 days or longer; high risk, 2500 units 1–2 hours before surgery, then 2500 units 8–12 hours later (*or* 5000 units on the evening before surgery, then 5000 units on the following evening), then 5000 units every 24 hours for 5–7 days or longer (5 weeks in hip replacement)

Prophylaxis of deep-vein thrombosis in medical patients, by subcutaneous injection, 5000 units every 24 hours

Treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, as a single daily dose, ADULT body-weight under 46 kg, 7500 units daily; body-weight 46–56 kg, 10 000 units daily; body-weight 57–68 kg, 12 500 units daily; body-weight 69–82 kg, 15 000 units daily; body-weight 83 kg and over, 18 000 units daily, with oral anticoagulant treatment until prothrombin complex concentration in therapeutic range (usually for at least 5 days); monitoring of anti-Factor Xa not usually required; for patients at increased risk of haemorrhage, see below

Treatment of venous thromboembolism in pregnancy [unlicensed indication], by subcutaneous injection, early pregnancy body-weight under 50 kg, 5000 units twice daily; body-weight 50–70 kg, 6000 units twice daily; body-weight 70–90 kg, 8000 units twice daily; body-weight over 90 kg, 10 000 units twice daily

Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours, by subcutaneous injection, ADULT body-weight over 40 kg, 200 units/kg (max.18 000 units) as a single daily dose for 30 days, followed by 150 units/kg (max. 18 000 units) as a single daily dose for a further 5 months; interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Injection, dalteparin sodium 2500 units/mL (for subcutaneous or intravenous use), net price 4-mL (10 000-unit) amp = £5.12; 10 000-units/mL (for subcutaneous or intravenous use), 1-mL (10 000-unit) amp = £5.12; 25 000 units/mL (for subcutaneous use only), 4-mL (100 000-unit) vial = £48.66

Excipients include benzyl alcohol (in 100 000-unit/4 mL multidose vial) (avoid in neonates, see Excipients, p. 2)

Dose treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, 200 units/kg (max. 18 000 units) as a single daily dose (*or* 100 units/kg twice daily if increased risk of haemorrhage) with oral anticoagulant treatment until prothrombin complex concentration in therapeutic range (usually for at least 5 days)

Note For monitoring, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen

Unstable coronary artery disease, by subcutaneous injection, 120 units/kg every 12 hours (max. 10 000 units twice daily) for 5–8 days

Prevention of clotting in extracorporeal circuits, consult product literature

Injection (graduated syringe), dalteparin sodium 10 000 units/mL, net price 1-mL (10 000-unit) syringe = £5.65

Dose unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction), by subcutaneous injection, 120 units/kg every 12 hours (max. 10 000 units twice daily) for up to 8 days; beyond 8 days (if awaiting angiography or revascularisation) women body-weight less than 80 kg and men less than 70 kg, 5000 units every 12 hours, women body-weight greater than 80 kg and men greater than 70 kg, 7500 units every 12 hours, until day of procedure (max. 45 days)

ENOXAPARIN SODIUM

Indications see notes above and under preparations

Cautions see under Heparin and notes above; low body-weight (increased risk of bleeding)

Contra-indications see under Heparin; breast-feeding (Appendix 5)

Side-effects see under Heparin

Dose

- See under preparation below

Clexane® (Rhône-Poulenc Rorer) PoM

Injection, enoxaparin sodium 100 mg/mL, net price 20-mg (0.2-mL, 2000-units) syringe = £3.03, 40-mg (0.4-mL, 4000-units) syringe = £4.04, 60-mg (0.6-mL, 6000-units) syringe = £4.57, 80-mg (0.8-mL, 8000-units) syringe = £5.19, 100-mg (1-mL, 10 000-units) syringe = £6.43; 300 mg (3-mL, 30 000-units) vial (*Clexane® Multidose*) = £21.33; 150 mg/mL (*Clexane® Forte*), 120-mg (0.8-mL, 12 000-units) syringe = £9.77, 150-mg (1-mL, 15 000-units) syringe = £11.10

Excipients include benzyl alcohol (in 300 mg multidose vials) (avoid in neonates, see Excipients, p. 2)

Dose prophylaxis of deep-vein thrombosis especially in surgical patients, by subcutaneous injection, *moderate risk*, 20 mg (2000 units) approx. 2 hours before surgery then 20 mg (2000 units) every 24 hours for 7–10 days; *high risk* (e.g. orthopaedic surgery), 40 mg (4000 units) 12 hours before surgery then 40 mg (4000 units) every 24 hours for 7–10 days

Prophylaxis of deep-vein thrombosis in medical patients, by subcutaneous injection, 40 mg (4000 units) every 24 hours for at least 6 days and continued until patient ambulant (max. 14 days)

Treatment of deep-vein thrombosis or pulmonary embolism, by subcutaneous injection, 1.5 mg/kg (150 units/kg) every 24 hours, usually for at least 5 days (and until adequate oral anticoagulation established)

Treatment of acute ST-segment elevation myocardial infarction, ADULT under 75 years, by intravenous injection, 30 mg (3000 units) followed by subcutaneous injection, 1 mg/kg (100 units/kg), then by subcutaneous injection, 1 mg/kg every 12 hours for up to 8 days (max. 100 mg (10 000 units) for first two subcutaneous doses only); ELDERLY over 75 years, by subcutaneous injection *only*, 750 micrograms/kg (75 units/kg) every 12 hours (max. 75 mg (7500 units) for first two doses only); patients undergoing percutaneous coronary intervention, additional dose, by intravenous injection, 300 micrograms/kg (30 units/kg) at time of procedure if last subcutaneous dose given more than 8 hours previously

Note When administered in conjunction with a thrombolytic, enoxaparin should be given between 15 minutes before and 30 minutes after the start of thrombolytic therapy

Unstable angina and non-ST-segment-elevation myocardial infarction, by subcutaneous injection, 1 mg/kg (100 units/kg) every 12 hours usually for 2–8 days (minimum 2 days)

Prevention of clotting in extracorporeal circuits, consult product literature

Treatment of venous thromboembolism in pregnancy [unlicensed indication], by subcutaneous injection, early pregnancy body-weight under 50 kg, 40 mg (4000 units) twice daily; body-weight 50–70 kg, 60 mg (6000 units) twice daily; body-weight 70–90 kg, 80 mg (8000 units) twice daily; body-weight over 90 kg, 100 mg (10 000 units) twice daily

TINZAPARIN SODIUM

Indications see notes above and under preparations

Cautions see under Heparin and notes above; elderly with renal impairment (avoid if age over 90 years with renal impairment)

Contra-indications see under Heparin; breast-feeding (Appendix 5)

Side-effects see under Heparin

Dose

- See under preparations below

Innohep® (LEO) PoM

Injection, tinzaparin sodium 10 000 units/mL, net price 2500-unit (0.25-mL) syringe = £1.98, 3500-unit (0.35-mL) syringe = £2.77, 4500-unit (0.45-mL) syringe = £3.56, 20 000-unit (2-mL) vial = £10.56

Excipients include benzyl alcohol (in vial) (avoid in neonates, see Excipients, p. 2)

Dose prophylaxis of deep-vein thrombosis, by subcutaneous injection, general surgery, 3500 units 2 hours before surgery, then 3500 units every 24 hours for 7–10 days; orthopaedic surgery, 50 units/kg 2 hours before surgery, then 50 units/kg every 24 hours for 7–10 days *or* 4500 units 12 hours before surgery, then 4500 units every 24 hours for 7–10 days

Prevention of clotting in extracorporeal circuits, consult product literature

Injection, tinzaparin sodium 20 000 units/mL, net price 0.5-mL (10 000-unit) syringe = £8.63, 0.7-mL (14 000-unit) syringe = £12.08, 0.9-mL (18 000-unit) syringe = £15.53, 2-mL (40 000-unit) vial = £34.20

Excipients include benzyl alcohol (in vial) (avoid in neonates, see Excipients, p. 2), sulphites (in 20 000 units/mL vial and syringe)

Dose treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, 175 units/kg once daily for at least 6 days (and until adequate oral anticoagulation established)

Treatment of venous thromboembolism in pregnancy [unlicensed indication], by subcutaneous injection, 175 units/kg once daily (based on early pregnancy body-weight)

Note Treatment regimens do not require anticoagulation monitoring

Heparinoids

Danaparoid is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop thrombocytopenia in association with heparin.

DANAPAROID SODIUM

Indications prevention of deep-vein thrombosis in general or orthopaedic surgery; thromboembolic disease in patients with history of heparin-induced thrombocytopenia

Cautions recent bleeding or risk of bleeding; concomitant use of drugs that increase risk of bleeding; antibodies to heparins (risk of antibody-induced thrombocytopenia); body-weight over 90 kg (monitor anti factor Xa activity); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications haemophilia and other haemorrhagic disorders, thrombocytopenia (unless patient has heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension, active peptic ulcer (unless this is the reason for operation), diabetic retinopathy, acute bacterial endocarditis,

spinal or epidural anaesthesia with treatment doses of danaparoid

Side-effects bleeding; hypersensitivity reactions (including rash)

Dose

- Prevention of deep-vein thrombosis, by subcutaneous injection, 750 units twice daily for 7–10 days; initiate treatment before operation (with last preoperative dose 1–4 hours before surgery)
- Thromboembolic disease in patients with history of heparin-induced thrombocytopenia, by intravenous injection, 2500 units (1250 units if body-weight under 55 kg, 3750 units if over 90 kg), followed by intravenous infusion of 400 units/hour for 2 hours, *then* 300 units/hour for 2 hours, *then* 200 units/hour for 5 days

Orgaran® (Organon) PoM

Injection, danaparoid sodium 1250 units/mL, net price 0.6-mL amp (750 units) = £27.19

Hirudins

Lepirudin, a recombinant hirudin, is licensed for anticoagulation in patients with Type II (immune) heparin-induced thrombocytopenia who require parenteral antithrombotic treatment. The dose of lepirudin is adjusted according to activated partial thromboplastin time (APTT). **Bivalirudin**, a hirudin analogue, is a thrombin inhibitor which is licensed for acute coronary syndromes in patients planned for urgent or early intervention in combination with aspirin and clopidogrel, and as an anticoagulant for patients undergoing percutaneous coronary intervention. The *Scottish Medicines Consortium* (p. 3) has advised (November 2008) that bivalirudin is accepted for restricted use for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin combined with a glycoprotein IIb/IIIa inhibitor.

BIVALIRUDIN

Indications acute coronary syndromes in patients planned for urgent or early intervention; anticoagulation for patients undergoing percutaneous coronary intervention (PCI)

Cautions exposure to lepirudin (theoretical risk from lepirudin antibodies); brachytherapy procedures; concomitant use of drugs that increase risk of bleeding; renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications severe hypertension; subacute bacterial endocarditis; active bleeding; bleeding disorders

Side-effects bleeding (discontinue); *less commonly* nausea, vomiting, tachycardia, bradycardia, hypotension, angina, dyspnoea, allergic reactions (including isolated reports of anaphylaxis), headache, thrombocytopenia, anaemia, back and chest pain, and injection-site reactions; *very rarely* thrombosis

Dose

- Acute coronary syndromes (in addition to aspirin and clopidogrel), initially by intravenous injection, 100 micrograms/kg then by intravenous infusion 250 micrograms/kg/hour (for up to 72 hours in medically managed patients); patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery *without* cardiopulmonary bypass, additional bolus dose by intravenous injection 500 micrograms/kg, then by intravenous infusion 1.75 mg/kg/hour for duration of procedure; following percutaneous coronary intervention, reduce infusion rate to 250 micrograms/kg/hour for 4–12 hours as necessary; patients proceeding to coronary artery bypass surgery *with* cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin
- Anticoagulation in patients undergoing percutaneous coronary intervention, initially by intravenous injection, 750 micrograms/kg then by intravenous infusion 1.75 mg/kg/hour for up to 4 hours after procedure

Angiox® (The Medicines Company) ▼ PoM

Injection, powder for reconstitution, bivalirudin, net price 250-mg vial = £310.00

LEPIRUDIN

Indications thromboembolic disease requiring parenteral anticoagulation in patients with heparin-induced thrombocytopenia type II

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); recent bleeding or risk of bleeding including recent puncture of large vessels, organ biopsy, recent major surgery, stroke, bleeding disorders, severe hypertension, bacterial endocarditis; concomitant use of drugs that increase risk of bleeding; determine activated partial thromboplastin time 4 hours after start of treatment (or after infusion rate altered) and at least once daily thereafter

Contra-indications pregnancy and breast-feeding

Side-effects bleeding; reduced haemoglobin concentration without obvious source of bleeding; fever, hypersensitivity reactions (including rash); injection-site reactions

Dose

- Initially by slow intravenous injection (of 5 mg/mL solution), 400 micrograms/kg followed by continuous intravenous infusion of 150 micrograms/kg/hour (max. 16.5 mg/hour), adjusted according to activated partial thromboplastin time, for 2–10 days (longer if necessary)

Refludan® (Celgene) PoM

Injection, powder for reconstitution, lepirudin, net price 50-mg vial = £57.00

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Heparin Sodium (Non-proprietary) PoM

Solution, heparin sodium 10 units/mL, net price 5-mL amp = 25p; 100 units/mL, 2-mL amp = 28p

Dose to maintain patency of catheters, cannulas, etc. 10–200 units flushed through every 4–8 hours. Not for therapeutic use

Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Epoprostenol

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis either alone or with heparin. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation. Since its half-life is only about 3 minutes it must be given by continuous intravenous infusion. It is a potent vasodilator and therefore its side-effects include flushing, headache, and hypotension.

EPOPROSTENOL

Indications see notes above

Cautions anticoagulant monitoring required when given with heparin; haemorrhagic diathesis; dose titration for pulmonary hypertension should be in hospital (risk of pulmonary oedema); concomitant use of drugs that increase risk of bleeding; pregnancy (Appendix 4)

Contra-indications severe left ventricular dysfunction

Side-effects see notes above; also bradycardia, tachycardia, pallor, sweating with higher doses; gastro-intestinal disturbances; lassitude, anxiety, agitation; dry mouth, jaw pain, chest pain; also reported, hyperglycaemia and injection-site reactions

Dose

- See product literature

Flolan® (GSK) PoM

Infusion, powder for reconstitution, epoprostenol (as sodium salt), net price 500-microgram vial (with diluent) = £62.05; 1.5-mg vial (▼) (with diluent) = £125.00

Fondaparinux

Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

FONDAPARINUX SODIUM

Indications prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness, and patients undergoing major orthopaedic surgery of the legs or abdominal surgery; treatment of deep-vein thrombosis and of pulmonary embolism; treatment of unstable angina or non-ST-segment elevation myocardial infarction; treatment of ST-segment elevation myocardial infarction

Cautions bleeding disorders, active gastro-intestinal ulcer disease; recent intracranial haemorrhage; brain, spinal, or ophthalmic surgery; spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses); risk of catheter thrombus during percutaneous coronary intervention; low body-weight; elderly patients; concomitant use of drugs that increase risk of bleeding; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications active bleeding; bacterial endocarditis

Side-effects bleeding, purpura, anaemia; *less commonly* gastro-intestinal disturbances, oedema, hepatic impairment, chest pain, dyspnoea, thrombocytopenia, thrombocythaemia, rash, pruritus; *rarely* hypotension, flushing, cough, vertigo, dizziness, anxiety, drowsiness, confusion, headache, hypokalaemia, hyperbilirubinaemia, injection-site reactions; also reported atrial fibrillation, tachycardia, and pyrexia

Dose

- See under preparation below

Arixtra® (GSK) ▼ PoM

Injection, fondaparinux sodium 5 mg/mL, net price 0.3-mL (1.5-mg) prefilled syringe = £6.41

Dose prophylaxis of venous thromboembolism after surgery, by subcutaneous injection, 2.5 mg 6 hours after surgery then 2.5 mg once daily for 5–9 days (longer after hip surgery); CHILD under 17 years not recommended

Prophylaxis of venous thromboembolism in medical patients, by subcutaneous injection, 2.5 mg once daily usually for 6–14 days; CHILD under 17 years not recommended

Injection, fondaparinux sodium 5 mg/mL, net price 0.5-mL (2.5-mg) prefilled syringe = £6.41

Dose prophylaxis of venous thromboembolism after surgery, by subcutaneous injection, 2.5 mg 6 hours after surgery then 2.5 mg once daily for 5–9 days (longer after hip surgery); CHILD under 17 years not recommended

Prophylaxis of venous thromboembolism in medical patients, by subcutaneous injection, 2.5 mg once daily usually for 6–14 days; CHILD under 17 years not recommended

Unstable angina and non-ST-segment elevation myocardial infarction, by subcutaneous injection, 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner); CHILD under 17 years not recommended

ST-segment elevation myocardial infarction, initially by intravenous injection or infusion, 2.5 mg for first day, thereafter by subcutaneous injection 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner); CHILD under 17 years not recommended

Injection, fondaparinux sodium 12.5 mg/mL, net price 0.4-mL (5-mg) prefilled syringe = £11.89, 0.6-mL (7.5-mg) prefilled syringe = £11.89, 0.8-mL (10-mg) prefilled syringe = £11.89

Dose treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, ADULT body-weight under 50 kg, 5 mg every 24 hours; body-weight 50–100 kg, 7.5 mg every 24 hours; body-weight over 100 kg, 10 mg every 24 hours; usually for at least 5 days (and until adequate oral anticoagulation established); CHILD under 17 years not recommended

2.8.2 Oral anticoagulants

Coumarins and phenindione

The oral anticoagulants, **warfarin**, **acenocoumarol** (nicoumalone) and **phenindione**, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, heparin must be given concomitantly.

Uses The main indication for these oral anticoagulants is *deep-vein thrombosis*. Patients with *pulmonary embolism* should also be treated, as should those with *atrial fibrillation who are at risk of embolisation* (see also section 2.3.1), and those with *mechanical prosthetic heart valves* (to prevent emboli developing on the valves); an antiplatelet drug may also be useful in these patients but this combination increases the risk of bleeding.

Warfarin is the drug of choice; acenocoumarol (nicoumalone) and phenindione are seldom required.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin (section 2.9) is more appropriate for reduction of risk in transient ischaemic attacks. Heparin

or a low molecular weight heparin (section 2.8.1) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin can be continued in selected patients currently taking long-term warfarin and who are at high risk of thromboembolism (seek expert advice).

Dose Whenever possible, the base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

For patients who require rapid anticoagulation the usual adult induction dose of warfarin is 10 mg[1] on the first day; subsequent doses depend upon the prothrombin time, reported as INR (international normalised ratio). For patients who do not require rapid anticoagulation, a lower loading dose can be used over 3–4 weeks. The daily maintenance dose of warfarin is usually 3–9 mg (taken at the **same time** each day). The following indications and target INRs[2] take into account recommendations of the British Society for Haematology[3]:

- INR 2.5 for treatment of deep-vein thrombosis and pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin), for atrial fibrillation, cardioversion (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR; anticoagulation should continue for at least 4 weeks following the procedure), dilated cardiomyopathy, mural thrombus, symptomatic inherited thrombophilia, coronary artery thrombosis (if anticoagulated), and paroxysmal nocturnal haemoglobinuria;
- INR 3.5 for recurrent deep-vein thrombosis and pulmonary embolism (in patients currently receiving warfarin with INR above 2);
- For mechanical prosthetic heart valves, the recommended target INR depends on the type and location of the valve. Generally, a target INR of 3 is recommended for mechanical aortic valves, and 3.5 for mechanical mitral valves.

Monitoring It is essential that the INR be determined daily or on alternate days in early days of treatment, *then* at longer intervals (depending on response[4]) *then* up to every 12 weeks.

Haemorrhage The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The following recommendations (which take into account the recommendations of the British Society for Haematology[3]) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to patients taking warfarin:

- Major bleeding—stop warfarin; give phytomenadione (vitamin K_1) 5–10 mg by slow intravenous injection; give dried prothrombin complex (factors II, VII, IX, and X—section 2.11), 30–50 units/kg *or* fresh frozen plasma 15 mL/kg (if dried prothrombin complex not available)
- INR > 8.0, no bleeding or minor bleeding—stop warfarin, restart when INR < 5.0; if there are other risk factors for bleeding give phytomenadione (vitamin K_1) 500 micrograms by slow intravenous injection or 5 mg by mouth (for partial reversal of anticoagulation give smaller oral doses of phytomenadione e.g. 0.5–2.5 mg using the intravenous preparation orally); repeat dose of phytomenadione if INR still too high after 24 hours
- INR 6.0–8.0, no bleeding or minor bleeding—stop warfarin, restart when INR < 5.0
- INR < 6.0 but more than 0.5 units above target value—reduce dose or stop warfarin, restart when INR < 5.0
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Pregnancy Warfarin, acenocoumarol, and phenindione are teratogenic and should not be given in the first trimester of pregnancy. Women of child-bearing age should be warned of this danger since stopping warfarin before the sixth week of gestation may largely avoid the risk of fetal abnormality. These oral anticoagulants cross the placenta with risk of placental or fetal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters. Difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism.

Treatment booklets Anticoagulant treatment booklets should be issued to patients, and are available for distribution to local healthcare professionals from Health Authorities and from:

3M Security Printing and
Systems Limited
Gorse Street
Chadderton
Oldham
OL9 9QH
0845 610 1112
nhsforms@spsl.uk.com

These booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. Electronic copies and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

WARFARIN SODIUM

Indications prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophylaxis after insertion of prosthetic heart valve; prophylaxis and

1. First dose reduced if base-line prothrombin time prolonged, if liver-function tests abnormal, or if patient in cardiac failure, on parenteral feeding, less than average body weight, elderly, or receiving other drugs known to potentiate oral anticoagulants.
2. An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.
3. Guidelines on Oral Anticoagulation (warfarin): third edition—2005 update. *Br J Haematol* 2005; **132**: 277–285.
4. Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. See also **interactions**, Appendix 1 (warfarin). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect warfarin control.

treatment of venous thrombosis and pulmonary embolism; transient ischaemic attacks

Cautions see notes above; also recent surgery; concomitant use of drugs that increase risk of bleeding; bacterial endocarditis (increased risk of bleeding; use only if warfarin otherwise indicated); hepatic impairment (Appendix 2); renal impairment (avoid if severe); breast-feeding; (Appendix 5); avoid cranberry juice; **interactions:** Appendix 1 (coumarins)

Contra-indications peptic ulcer, severe hypertension; pregnancy (see notes above and Appendix 4)

Side-effects haemorrhage—see notes above; other side-effects reported include hypersensitivity, rash, alopecia, diarrhoea, unexplained drop in haematocrit, 'purple toes', skin necrosis, jaundice, hepatic dysfunction; also nausea, vomiting, and pancreatitis

Dose

- See notes above

Warfarin (Non-proprietary) PoM

Tablets, warfarin sodium 500 micrograms (white), net price 28-tab pack = £1.17; 1 mg (brown), 28-tab pack = £1.05; 3 mg (blue), 28-tab pack = £1.15; 5 mg (pink), 28-tab pack = £1.21. Label: 10, anticoagulant card

Brands include *Marevan®*

ACENOCOUMAROL

(Nicoumalone)

Indications see under Warfarin Sodium

Cautions see under Warfarin Sodium

Contra-indications see under Warfarin Sodium

Side-effects see under Warfarin Sodium

Dose

- 4 mg on first day, 4–8 mg on second day; maintenance dose usually 1–8 mg daily adjusted according to response

Sinthrome® (Alliance) PoM

Tablets, acenocoumarol 1 mg, net price 100-tab pack = £4.27. Label: 10, anticoagulant card

PHENINDIONE

Indications prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophylaxis after insertion of prosthetic heart valve; prophylaxis and treatment of venous thrombosis and pulmonary embolism

Cautions see under Warfarin Sodium; **interactions:** Appendix 1 (phenindione)

Contra-indications see under Warfarin Sodium; breast-feeding (Appendix 5)

Side-effects see under Warfarin Sodium; also hypersensitivity reactions including rashes, exfoliative dermatitis, exanthema, fever, leucopenia, agranulocytosis, eosinophilia, diarrhoea, renal and hepatic damage; urine coloured pink or orange

Dose

- 200 mg on day 1; 100 mg on day 2; maintenance dose usually 50–150 mg daily

Phenindione (Non-proprietary) PoM

Tablets, phenindione 10 mg, net price 28-tab pack = £14.75; 25 mg, 28-tab pack = £17.96; 50 mg, 28-tab pack = £21.22. Label: 10, anticoagulant card, 14, (urine pink or orange)

Dabigatran etexilate

Dabigatran etexilate, a direct thrombin inhibitor, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. Dabigatran etexilate has a rapid onset of action and does not require therapeutic monitoring. The most common side-effect is haemorrhage and patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

NICE guidance

Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008)

Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

DABIGATRAN ETEXILATE

Indications see notes above

Cautions see notes above; also elderly; body-weight less than 50 kg; recent surgery; anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs); bacterial endocarditis (increased risk of bleeding); bleeding disorders; active gastro-intestinal ulceration; concomitant use of drugs that increase risk of bleeding; renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); **interactions**: Appendix 1 (dabigatran etexilate)

Contra-indications active bleeding; impaired haemostasis; severe hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects haemorrhage—see notes above; *less commonly* hepatobiliary disorders

Dose

- Prophylaxis of venous thromboembolism following total knee replacement surgery, ADULT over 18 years, 110 mg (ELDERLY over 75 years, 75 mg) 1–4 hours after surgery, *then* 220 mg (ELDERLY over 75 years, 150 mg) once daily for 9 days
- Prophylaxis of venous thromboembolism following total hip replacement surgery, ADULT over 18 years, 110 mg (ELDERLY over 75 years, 75 mg) 1–4 hours after surgery, *then* 220 mg (ELDERLY over 75 years, 150 mg) once daily for 27–34 days

Pradaxa® (Boehringer Ingelheim) ▼ PoM

Capsules, blue/ivory, dabigatran etexilate (as mesilate) 75 mg, net price 10-cap pack = £21.00, 60-cap pack = £126.00; 110 mg 10-cap pack = £21.00, 60-cap pack = £126.00 (all hosp. only). Label: 25

Rivaroxaban

Rivaroxaban, a direct inhibitor of activated factor X, is given orally for prophylaxis of venous thromboembolism in adults after hip or knee replacement surgery. Rivaroxaban does not require therapeutic monitoring. The common side-effects are nausea and haemorrhage and patients should be monitored for signs of bleeding

or anaemia; treatment should be stopped if severe bleeding occurs.

NICE guidance

Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009)

Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

RIVAROXABAN

Indications see notes above

Cautions see notes above; also bleeding disorders; concomitant use of drugs that increase risk of bleeding; severe hypertension; active or recent gastrointestinal ulceration; vascular retinopathy; anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal); recent surgery; hepatic impairment (Appendix 2); renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3); **interactions**: (Appendix 1)

Contra-indications active bleeding; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea; haemorrhage (see notes above); *less commonly* constipation, diarrhoea, dyspepsia, dry mouth, vomiting, hypotension, oedema, tachycardia, thrombocythaemia, syncope, dizziness, headache, renal impairment, pain in extremities, pruritus, and rash; jaundice also reported

Dose

- Prophylaxis of venous thromboembolism following knee replacement surgery, ADULT over 18 years, 10 mg once daily for 2 weeks starting 6–10 hours after surgery
- Prophylaxis of venous thromboembolism following hip replacement surgery, ADULT over 18 years, 10 mg once daily for 5 weeks starting 6–10 hours after surgery

Xarelto® (Bayer) ▼ PoM

Tablets, red, f/c, rivaroxaban 10 mg, net price 10-tab pack = £45.00, 30-tab pack = £135.00, 100-tab pack = £450.00

2.8.3 Protamine sulphate

Protamine sulphate is used to treat overdosage of heparin, and low molecular weight heparins. The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulphate; the effects of low molecular weight heparins can persist for up to 24 hours after administration. Excessive doses of protamine sulphate can have an anticoagulant effect.

PROTAMINE SULPHATE

(Protamine Sulfate)

Indications see above

Cautions see above; also monitor activated partial thromboplastin time or other appropriate blood clotting parameters; increased risk of allergic reaction to protamine (including previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy)

Side-effects nausea, vomiting, lassitude, flushing, hypotension, hypertension, bradycardia, dyspnoea, rebound bleeding, back pain; hypersensitivity reactions (including angioedema, anaphylaxis) and pulmonary oedema reported

Dose

- Overdosage with intravenous injection of heparin, by intravenous injection (rate not exceeding 5 mg/minute), 1 mg neutralises 80–100 units heparin when given within 15 minutes of heparin; if longer than 15 minutes since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; max. 50 mg
- Overdosage with intravenous infusion of heparin, by intravenous injection (rate not exceeding 5 mg/minute), 25–50 mg once heparin infusion stopped
- Overdosage with subcutaneous injection of heparin, 1 mg neutralises 100 units heparin; give 25–50 mg by intravenous injection (rate not exceeding 5 mg/minute) then any remaining dose given by intravenous infusion over 8–16 hours; max. total dose 50 mg
- Overdosage with subcutaneous injection of low molecular weight heparin, by intermittent intravenous injection (rate not exceeding 5 mg/minute) or by continuous intravenous infusion, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); max. 50 mg

Protamine Sulphate (Non-proprietary) PoM

Injection, protamine sulphate 10 mg /mL, net price 5-mL amp = £1.43, 10-mL amp = £4.15

2.9 Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and may inhibit thrombus formation in the arterial circulation, where anticoagulants have little effect.

A single dose of **aspirin** 300 mg is given as soon as possible after an ischaemic event, preferably dispersed in water or chewed. The initial dose is followed by long-term treatment of aspirin 75 mg daily in order to prevent further cardiovascular disease events.

Long-term use of aspirin, in a dose of 75 mg daily, is also of benefit for all patients with established cardiovascular disease, for patients with a 10-year cardiovascular disease risk[1] of 20% or more and aged over 50 years, for patients with diabetes aged over 50 years or who have

1. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (*Heart* 2005; **91** (Suppl V): v1–v52)—see inside back cover. The Joint British Societies' 'Cardiac Risk Assessor' computer programme may also be used to determine cardiovascular disease risk.

had diabetes for more than 10 years, and for patients with diabetes who are receiving antihypertensive treatment. Unduly high blood pressure must be controlled before aspirin is given.

Aspirin in a dose of 75 mg daily is also given following coronary bypass surgery. For details on the use of aspirin in atrial fibrillation see section 2.3.1, for stable angina see section 2.6 and for intermittent claudication see section 2.6.4.

If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor (section 1.3.5) can be added.

Clopidogrel is licensed for the prevention of ischaemic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation (section 2.6); in these circumstances the combination is usually given for 12 months (there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation (section 2.10.1); the combination should be continued for at least 4 weeks. Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy is an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor.

The *Scottish Medicines Consortium* (p. 3) has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. The *Scottish Medicines Consortium* has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only. Clopidogrel should be initiated in hospital inpatients **only**.

NICE guidance

Clopidogrel in the treatment of non-ST-segment elevation acute coronary syndrome (July 2004)

Clopidogrel in combination with low-dose aspirin is recommended for the management of non-ST-segment elevation acute coronary syndrome in those at moderate to high risk of myocardial infarction or of death.

Clopidogrel in combination with low-dose aspirin may be used for up to 12 months after the last event of non-ST-segment elevation acute coronary syndrome.

Dipyridamole is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

A combination of modified-release dipyridamole and low-dose aspirin is used after an ischaemic stroke or transient ischaemic attack, and may reduce the risk of recurrent stroke and other cardiovascular events compared to aspirin alone (see also NICE guidance below).

NICE guidance

Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (May 2005)

The combination of modified-release dipyridamole and aspirin is recommended to prevent occlusive vascular events in those who have had a transient ischaemic attack or an ischaemic stroke; this combination should be used for 2 years after the last event. Long-term treatment with low-dose aspirin is continued after this period.

Clopidogrel monotherapy may be used for those who cannot tolerate low-dose aspirin and have had an occlusive vascular event or have symptomatic peripheral arterial disease.

Prasugrel, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Glycoprotein IIb/IIIa inhibitors Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. **Abciximab** is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). **Eptifibatide** and **tirofiban** also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use with heparin and aspirin to prevent early myocardial infarction in patients with unstable angina (section 2.6) or non-ST-segment-elevation myocardial infarction. Abciximab, eptifibatide and tirofiban should be used by specialists only.

For use of epoprostenol, see section 2.8.1.

NICE guidance

Glycoprotein IIb/IIIa inhibitors for acute coronary syndromes (September 2002)

A glycoprotein IIb/IIIa inhibitor (abciximab, eptifibatide, and tirofiban) should be considered for the management of unstable angina or non-ST-segment-elevation myocardial infarction.

A glycoprotein IIb/IIIa inhibitor is recommended for patients at high risk of myocardial infarction or death when early percutaneous coronary intervention is desirable but does not occur immediately; either eptifibatide or tirofiban is recommended in addition to other appropriate drug treatment.

A glycoprotein IIb/IIIa inhibitor is recommended as an adjunct to percutaneous coronary intervention:

- when early percutaneous coronary intervention is indicated but it is delayed;
- in patients with diabetes;
- if the procedure is complex.

Note Only abciximab is licensed as an adjunct to percutaneous coronary intervention

ABCIXIMAB

Indications prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention; short-term prevention of myocardial

infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (use under specialist supervision)

Cautions measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit; monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment; concomitant use of drugs that increase risk of bleeding; discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed; consult product literature for details of procedures to minimise bleeding; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

Contra-indications active internal bleeding; major surgery, intracranial or intraspinal surgery or trauma within last 2 months; stroke within last 2 years; intracranial neoplasm, arteriovenous malformation or aneurysm, severe hypertension, haemorrhagic diathesis, thrombocytopenia, vasculitis, hypertensive retinopathy; breast-feeding (Appendix 5)

Side-effects bleeding manifestations; nausea, vomiting, hypotension, bradycardia, chest pain, back pain, headache, fever, puncture site pain, thrombocytopenia; *rarely* cardiac tamponade, adult respiratory distress, hypersensitivity reactions

Dose

- ADULT initially by intravenous injection over 1 minute, 250 micrograms/kg, then by intravenous infusion, 125 nanograms/kg/minute (max. 10 micrograms/minute); for prevention of ischaemic complications start 10–60 minutes before percutaneous coronary intervention and continue infusion for 12 hours; for unstable angina start up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

ReoPro® (Lilly) PoM

Injection, abciximab 2 mg/mL, net price 5-mL vial = £250.24

ASPIRIN (antiplatelet)

(Acetylsalicylic Acid)

Indications prophylaxis of cerebrovascular disease or myocardial infarction (see section 2.10.1 and notes above)

Cautions asthma; uncontrolled hypertension; previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration); concomitant use of drugs that increase risk of bleeding; G6PD deficiency (section 9.1.5); hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if severe; Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (aspirin)

Contra-indications use other than as an antiplatelet in children and adolescents under 16 years (Reye's syndrome, section 4.7.1); active peptic ulceration; haemophilia and other bleeding disorders; breast-feeding (Appendix 5)

Hypersensitivity Aspirin and other NSAIDs are **contra-indicated** in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID

Side-effects bronchospasm; gastro-intestinal irritation, gastro-intestinal haemorrhage (occasionally major), also other haemorrhage (e.g. subconjunctival)

Dose

- See notes above

[1] **Aspirin** (Non-proprietary) PoM

Dispersible tablets, aspirin 75 mg, net price 28 = 82p; 300 mg, see section 4.7.1. Label: 13, 21, 32

Tablets, e/c, aspirin 75 mg, net price 28-tab pack = 94p; 56-tab pack = £1.07; 300 mg, see section 4.7.1. Label: 5, 25, 32

Brands include *Micropirin®*

Angettes 75® (Bristol-Myers Squibb)

Tablets, aspirin 75 mg, net price 28-tab pack = 84p. Label: 32

Caprin® (Pinewood) PoM

Tablets, e/c, pink, aspirin 75 mg, net price 28-tab pack = £1.55, 56-tab pack = £3.08, 100-tab pack = £5.24; 300 mg, see section 4.7.1. Label: 5, 25, 32

Nu-Seals® Aspirin (Alliance) PoM

Tablets, e/c, aspirin 75 mg, net price 56-tab pack = £3.12; 300 mg, see section 4.7.1. Label: 5, 25, 32

Note Tablets may be chewed at diagnosis for rapid absorption

Modified release

Note Modified release aspirin should **not** be used in acute situations when a rapid onset of action is required

Flamasacard® (Abbey) PoM

Capsules, m/r, white/red, aspirin 162.5 mg, net price 30-cap pack = £2.70. Label: 25, 32

Dose secondary prophylaxis following a coronary or cerebrovascular ischaemic event, 1 capsule once daily

CLOPIDOGREL

Indications prevention of atherosclerotic events in peripheral arterial disease, or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke; prevention of artherosclerotic events in acute coronary syndrome without ST-segment elevation (given with aspirin—see notes above) and in acute myocardial infarction with ST-segment elevation (given with aspirin—see notes above)

Cautions patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; discontinue 7 days before elective surgery if antiplatelet effect not desirable; liver impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (clopidogrel)

Contra-indications active bleeding, breast-feeding (Appendix 5)

Side-effects dyspepsia, abdominal pain, diarrhoea; bleeding disorders (including gastro-intestinal and intracranial); *less commonly* nausea, vomiting, gastritis, flatulence, constipation, gastric and duodenal ulcers, headache, dizziness, paraesthesia, leucopenia, decreased platelets (very rarely severe thrombocytopenia), eosinophilia, rash, and pruritus; *rarely* vertigo; *very rarely* colitis, pancreatitis, hepatitis, acute liver

1. Aspirin tablets 75 mg may be sold to the public in packs of up to 100 tablets; for details relating to other strengths see section 4.7.1 and *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)

failure, vasculitis, confusion, hallucinations, taste disturbance, stomatitis, bronchospasm, interstitial pneumonitis, blood disorders (including thrombocytopenic purpura, agranulocytosis and pancytopenia), and hypersensitivity-like reactions (including fever, glomerulonephritis, arthralgia, Stevens-Johnson syndrome, toxic epidermal necrolysis, lichen planus)

Dose

- Prevention of artherosclerotic events in peripheral arterial disease or after myocardial infarction or ischaemic stroke, 75 mg once daily
- Acute coronary syndrome (without ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above)
- Acute myocardial infarction (with ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above); initial dose omitted if patient over 75 years

Plavix® (Bristol-Myers Squibb, Sanofi-Synthelabo) PoM

Tablets, pink, f/c, clopidogrel (as hydrogen sulphate) 75 mg, net price 30-tab pack = £36.35; 300 mg, 30-tab pack = £145.42

DIPYRIDAMOLE

Indications see notes above and under Dose

Cautions rapidly worsening angina, aortic stenosis, recent myocardial infarction, left ventricular outflow obstruction, heart failure; may exacerbate migraine; hypotension; myasthenia gravis (risk of exacerbation); coagulation disorders; concomitant use of drugs that increase risk of bleeding; breast-feeding (Appendix 5); **interactions:** Appendix 1 (dipyridamole)

Side-effects gastro-intestinal effects, dizziness, myalgia, throbbing headache, hypotension, hot flushes and tachycardia; worsening symptoms of coronary heart disease; hypersensitivity reactions such as rash, urticaria, severe bronchospasm and angioedema; increased bleeding during or after surgery; thrombocytopenia reported

Dose

- By mouth, 300–600 mg daily in 3–4 divided doses
  Modified-release preparations, see under preparation below
- By intravenous injection, diagnostic only, consult product literature

Dipyridamole (Non-proprietary) PoM

Tablets, coated, dipyridamole 25 mg, net price 84 = £3.53; 100 mg, 84 = £3.19. Label: 22

Oral suspension, dipyridamole 50 mg/5 mL, net price 150 mL = £37.38

Persantin® (Boehringer Ingelheim) PoM

Tablets, s/c, dipyridamole 25 mg (orange), net price 84-tab pack = £1.49; 100 mg, 84-tab pack = £4.16. Label: 22

Injection, dipyridamole 5 mg/mL, net price 2-mL amp = 12p

Modified release

Persantin® Retard (Boehringer Ingelheim) PoM

Capsules, m/r, red/orange containing yellow pellets, dipyridamole 200 mg, net price 60-cap pack = £7.50. Label: 21, 25

Dose secondary prevention of ischaemic stroke and transient ischaemic attacks (used alone or with aspirin), adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves, 200 mg twice daily preferably with food

Note Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening

With aspirin

For cautions, contra-indications and side-effects of aspirin, see under Aspirin, above

Asasantin® Retard (Boehringer Ingelheim) PoM

Capsules, red/ivory, aspirin 25 mg, dipyridamole 200 mg (m/r), net price 60-cap pack = £7.79. Label: 21, 25

Dose secondary prevention of ischaemic stroke and transient ischaemic attacks, 1 capsule twice daily

Note Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening

EPTIFIBATIDE

Indications prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (use under specialist supervision)

Cautions risk of bleeding, concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding; measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine; monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary; hepatic impairment (Appendix 2); renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications abnormal bleeding within 30 days, major surgery or severe trauma within 6 weeks, stroke within last 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia, significant hepatic impairment; breast-feeding

Side-effects bleeding manifestations; *very rarely* anaphylaxis and rash

Dose

- Initially by intravenous injection, 180 micrograms/kg, then by intravenous infusion, 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

Integrilin® (GSK) PoM

Injection, eptifibatide 2 mg/mL, net price 10-mL (20-mg) vial = £13.89

Infusion, eptifibatide 750 micrograms/mL, net price 100-mL (75-mg) vial = £43.65

PRASUGREL

Indications in combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

Cautions patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease); concomitant use of

drugs that increase risk of bleeding; discontinue at least 7 days before elective surgery if antiplatelet effect not desirable; elderly; body-weight less than 60 kg; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (prasugrel)

Contra-indications active bleeding; history of stroke or transient ischaemic attack

Side-effects haemorrhage (including gastro-intestinal and intracranial), haematoma; haematuria; anaemia; rash

Dose

- ADULT over 18 years, (with aspirin—see notes above) initially 60 mg as a single dose then body-weight over 60 kg, 10 mg once daily *or* body-weight under 60 kg or ELDERLY over 75 years, 5 mg once daily

Efient® (Lilly) ▼ PoM

Tablets, f/c, prasugrel (as hydrochloride) 5 mg (yellow), net price 28-tab pack = £47.56; 10 mg (beige), 28-tab pack = £47.56

TIROFIBAN

Indications prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 12 hours (use under specialist supervision)

Cautions major surgery or severe trauma within 3 months (avoid if within 6 weeks); traumatic or protracted cardiopulmonary resuscitation, organ biopsy or lithotripsy within last 2 weeks; risk of bleeding including active peptic ulcer within 3 months; acute pericarditis, aortic dissection, haemorrhagic retinopathy, vasculitis, haematuria, faecal occult blood; severe heart failure, cardiogenic shock, anaemia; puncture of non-compressible vessel within 24 hours; concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration); monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary; discontinue immediately if serious bleeding uncontrolled by pressure occurs; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (tirofiban)

Contra-indications abnormal bleeding within 30 days, stroke within 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia; breast-feeding (Appendix 5)

Side-effects bleeding manifestations; reversible thrombocytopenia

Dose

- By intravenous infusion, initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention); max. duration of treatment 108 hours

Aggrastat® (MSD) PoM

Concentrate for intravenous infusion, tirofiban (as hydrochloride) 250 micrograms/mL. For dilution before use, net price 50-mL (12.5-mg) vial = £146.11

Intravenous infusion, tirofiban (as hydrochloride) 50 micrograms/mL, net price 250-mL *Intravia®* bag = £160.72

2.10 Myocardial infarction and fibrinolysis

2.10.1 Management of myocardial infarction
2.10.2 Fibrinolytic drugs

2.10.1 Management of myocardial infarction

Local guidelines for the management of myocardial infarction should be followed where they exist

Myocardial infarction is part of the spectrum of acute coronary syndromes which includes unstable angina, and myocardial infarction with or without ST-segment elevation.

These notes give an overview of the initial and long-term management of myocardial infarction with ST-segment elevation. For advice on the management of non-ST-segment elevation myocardial infarction and unstable angina, see section 2.6. The aims of management of ST-segment elevation myocardial infarction are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Initial management **Oxygen** (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of **diamorphine** or **morphine** (section 4.7.2); an antiemetic such as metoclopramide (or, if left ventricular function is not compromised, cyclizine) by intravenous injection should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect (section 2.9); a dose of 300 mg is suitable. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. **Clopidogrel**, in a dose of 300 mg, should also be given (section 2.9).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a **thrombolytic drug** (section 2.10.2), unless contra-indicated. Percutaneous coronary intervention is the preferred method and patients should receive a **glycopro-**

tein IIb/IIIa inhibitor (section 2.9) to reduce the risk of immediate vascular occlusion. In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered. A **low molecular weight heparin** or **fondaparinux** (section 2.8.1) should also be given to all patients; anticoagulant treatment should be continued for up to 8 days, or until percutaneous coronary intervention, or hospital discharge.

Heparin [unfractionated] can be considered for use in myocardial infarction if there is a high risk of systemic or pulmonary embolism. It should also be considered as initial therapy during the first 48 hours in patients treated with thrombolytics (consult thrombolytic product literature and local protocols (where they exist) for details of heparin dosage).

Nitrates (section 2.6.1) are used to relieve ischaemic pain. If sublingual glyceryl trinitrate is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate is given.

Early administration of some **beta-blockers** (section 2.4) has been shown to be of benefit and should be given to patients without contra-indications.

ACE inhibitors (section 2.5.5.1), and angiotensin-II receptor antagonists (section 2.5.5.2) if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment).

All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive **insulin**.

Long-term management Long-term management involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin (section 2.9) should be given to all patients, unless contra-indicated, at a dose of 75 mg daily. The addition of **clopidogrel** (section 2.9) has been shown to reduce morbidity and mortality. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of **warfarin** (section 2.8.2) and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin alone can be used. Warfarin should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin increases the risk of bleeding.

Beta-blockers (section 2.4) should be given to all patients in whom they are not contra-indicated. Acebutolol, metoprolol, propranolol, and timolol are suitable; for patients with left ventricular dysfunction, carvedilol, bisoprolol, or long-acting metoprolol may be appropriate (section 2.5.5).

Diltiazem [unlicensed] or **verapamil** (section 2.6.2) can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** (section 2.5.5.1) should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

Nitrates (section 2.6.1) are used for patients with angina.

Eplerenone (section 2.2.3) is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

For the role of **statins** in preventing recurrent cardiovascular events, see section 2.12.

2.10.2 Fibrinolytic drugs

Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

The value of thrombolytic drugs for the treatment of *myocardial infarction* has been established (section 2.10.1). **Streptokinase** and **alteplase** have been shown to reduce mortality. **Reteplase** and **tenecteplase** are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients.

Alteplase, reteplase and streptokinase need to be given within 12 hours of symptom onset, ideally within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase, and **urokinase** can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke. Treatment must be started promptly.

Urokinase is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

NICE guidance

Alteplase for the treatment of acute ischaemic stroke (June 2007)

Alteplase, used in accordance with the licence for *Actilyse®*, is recommended for the treatment of acute ischaemic stroke.

Cautions Thrombolytic drugs should be used with caution if there is a risk of bleeding including that from venepuncture or invasive procedures. They should also be used with caution in external chest compression, pregnancy (Appendix 4), elderly, hypertension, conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent

embolisation), and recent or concurrent use of drugs that increase the risk of bleeding.

Contra-indications Thrombolytic drugs are contra-indicated in recent haemorrhage, trauma, or surgery (including dental extraction), coagulation defects, bleeding diatheses, aortic dissection, aneurysm, coma, history of cerebrovascular disease especially recent events or with any residual disability, recent symptoms of possible peptic ulceration, heavy vaginal bleeding, severe hypertension, active pulmonary disease with cavitation, acute pancreatitis, pericarditis, bacterial endocarditis, severe liver disease, and oesophageal varices; also in the case of streptokinase, previous allergic reactions to either streptokinase or anistreplase (no longer available).

Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

Side-effects Side-effects of thrombolytics are mainly nausea and vomiting and bleeding. When thrombolytics are used in myocardial infarction, reperfusion arrhythmias and recurrent ischaemia and angina may occur. Reperfusion may also cause cerebral and pulmonary oedema. Hypotension can also occur and can usually be controlled by elevating the patient's legs, or by reducing the rate of infusion or stopping it temporarily. Back pain, fever, and convulsions have been reported. Bleeding is usually limited to the site of injection, but intracerebral haemorrhage or bleeding from other sites can occur. Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli). Thrombolytics can cause allergic reactions (including rash, flushing and uveitis) and anaphylaxis has been reported (for details of management see Allergic Emergencies, section 3.4.3). Guillain-Barré syndrome has been reported rarely after streptokinase treatment.

ALTEPLASE

(rt-PA, tissue-type plasminogen activator)

Indications acute myocardial infarction (see notes above and section 2.10.1); pulmonary embolism; acute ischaemic stroke (treatment under specialist neurology physician **only**)

Cautions see notes above; *in acute stroke*, monitor for intracranial haemorrhage, monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg)

Contra-indications see notes above; *in acute stroke*, convulsion accompanying stroke, severe stroke, history of stroke in patients with diabetes, stroke in last 3 months, hypoglycaemia, hyperglycaemia

Side-effects see notes above; also risk of cerebral bleeding increased in acute stroke

Dose

- Myocardial infarction, accelerated regimen (initiated within 6 hours of symptom onset), 15 mg by intravenous injection, followed by intravenous infusion of 50 mg over 30 minutes, then 35 mg over 60 minutes (total dose 100 mg over 90 minutes); in patients less than 65 kg, 15 mg by intravenous injection, followed by intravenous infusion of 0.75 mg/kg over 30 minutes, then 0.5 mg/kg over 60 minutes (max. total dose 100 mg over 90 minutes)
- Myocardial infarction, initiated within 6–12 hours of symptom onset, 10 mg by intravenous injection, followed by intravenous infusion of 50 mg over 60 minutes, then 4 infusions each of 10 mg over 30 minutes (total dose 100 mg over 3 hours; max. 1.5 mg/kg in patients less than 65 kg)
- Pulmonary embolism, 10 mg by intravenous injection over 1–2 minutes, followed by intravenous infusion of 90 mg over 2 hours; max. 1.5 mg/kg in patients less than 65 kg
- Acute stroke (treatment **must** begin within 3 hours of symptom onset), by intravenous administration over 60 minutes, 900 micrograms/kg (max. 90 mg); initial 10% of dose by intravenous injection, remainder by intravenous infusion; ELDERLY over 80 years not recommended

Actilyse® (Boehringer Ingelheim) PoM

Injection, powder for reconstitution, alteplase 10 mg (5.8 million units)/vial, net price per vial (with diluent) = £120.00; 20 mg (11.6 million units)/vial (with diluent and transfer device) = £180.00; 50 mg (29 million units)/vial (with diluent, transfer device, and infusion bag) = £300.00

RETEPLASE

Indications acute myocardial infarction (see notes above and section 2.10.1)

Cautions see notes above; breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- By intravenous injection (initiated within 12 hours of symptom onset), 10 units over not more than 2 minutes, followed after 30 minutes by a further 10 units

Rapilysin® (Actavis) PoM

Injection, powder for reconstitution, reteplase 10 units/vial, net price pack of 2 vials (with 2 prefilled syringes of diluent and transfer device) = £640.13

STREPTOKINASE

Indications acute myocardial infarction (see notes above and section 2.10.1); deep-vein thrombosis, pulmonary embolism, acute arterial thromboembolism, and central retinal venous or arterial thrombosis

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Myocardial infarction (initiated within 12 hours of symptom onset), by intravenous infusion, 1.5 million units over 60 minutes
- Deep-vein thrombosis, pulmonary embolism, acute arterial thromboembolism, central retinal venous or arterial thrombosis, by intravenous infusion, 250 000 units over 30 minutes, then 100 000 units every hour for up to 12–72 hours according to

condition with monitoring of clotting parameters (consult product literature)

Streptase® (CSL Behring) PoM
Injection, powder for reconstitution, streptokinase, net price 250 000-unit vial = £15.91; 750 000-unit vial = £41.72; 1.5 million-unit vial = £83.44 (hosp. only)

TENECTEPLASE

Indications acute myocardial infarction (see notes above and section 2.10.1)

Cautions see notes above; breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- By intravenous injection over 10 seconds (initiated within 6 hours of symptom onset), 30–50 mg according to body-weight—consult product literature; max. 50 mg

Metalyse® (Boehringer Ingelheim) PoM
Injection, powder for reconstitution, tenecteplase, net price 40-mg (8000-unit) vial = £502.25; 50-mg (10 000-unit) vial = £502.25 (both with prefilled syringe of water for injection)

UROKINASE

Indications thromboembolic occlusive vascular disease including deep-vein thrombosis, pulmonary embolism, and peripheral vascular occlusion; occluded intravenous catheters and cannulas blocked by fibrin clots

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Deep-vein thrombosis, by intravenous infusion, initially 4400 units/kg in 15 mL sodium chloride 0.9% over 10 minutes, followed by 4400 units/kg/hour for 12–24 hours
- Pulmonary embolism, by intravenous infusion, initially 4400 units/kg in 15 mL sodium chloride 0.9% over 10 minutes, followed by 4400 units/kg/hour for 12 hours *or* by injection into pulmonary artery, initially 15 000 units/kg, subsequent doses adjusted according to response; max. 3 doses in 24 hours
- Peripheral vascular occlusion, consult product literature
- Occluded catheters and cannulas, by injection directly into catheter or cannula, 5000–25 000 units in 2 mL sodium chloride 0.9%; leave for up to 4 hours then aspirate the lysate

Syner-KINASE® (Syner-Med) PoM
Injection, powder for reconstitution, urokinase, net price 25 000 unit vial = £45.95; 100 000 unit vial = £112.95
Note 10 000-unit vial, 50 000-unit vial, and 250 000-unit vial also available from 'special-order' manufacturers or specialist importing companies, see p. 969

2.11 Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of **tranexamic acid**, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in prostatectomy, bladder surgery, in dental extraction in patients with haemophilia, in conisation of the cervix, and in traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin (section 6.5.2) is used in the management of mild to moderate haemophilia and von Willebrand's disease. It is also used for fibrinolytic response testing.

Etamsylate (ethamsylate) reduces capillary bleeding in the presence of a normal number of platelets. It does not act by fibrin stabilisation, but probably by correcting abnormal adhesion.

ETAMSYLATE
(Ethamsylate)

Indications blood loss in menorrhagia

Contra-indications acute porphyria (see section 9.8.2)

Side-effects nausea, headache, rashes

Dose

- 500 mg 4 times daily during menstruation

Dicynene® (Sanofi-Synthelabo) PoM
Tablets, scored, etamsylate 500 mg, net price 100-tab pack = £8.44

TRANEXAMIC ACID

Indications see notes above

Cautions renal impairment (Appendix 3); massive haematuria (avoid if risk of ureteric obstruction); not for use in disseminated intravascular coagulation; irregular menstrual bleeding (establish cause before initiating therapy); pregnancy (Appendix 4); regular liver function tests in long-term treatment of hereditary angioedema

Contra-indications thromboembolic disease

Side-effects nausea, vomiting, diarrhoea (reduce dose); *rarely* disturbances in colour vision (discontinue), thromboembolic events, allergic skin reactions; giddiness and hypotension on rapid intravenous injection

Dose

- By mouth, local fibrinolysis, 1–1.5 g (*or* 15–25 mg/kg) 2–3 times daily
  Menorrhagia (initiated when menstruation has started), 1 g 3 times daily for up to 4 days; max. 4 g daily
  Hereditary angioedema, 1–1.5 g 2–3 times daily
  Epistaxis, 1 g 3 times daily for 7 days
- By slow intravenous injection, local fibrinolysis, 0.5–1 g 3 times daily
- By continuous intravenous infusion, local fibrinolysis, following initial treatment by intravenous injection, 25–50 mg/kg over 24 hours

Tranexamic acid (Non-proprietary) PoM
Tablets, tranexamic acid 500 mg, net price 60-tab pack = £6.90

Cyklokapron® (Meda) PoM
Tablets, f/c, scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

Cyklokapron® (Pfizer) PoM
Injection, tranexamic acid 100 mg/mL, net price 5-mL amp = £1.55

Blood products

ANTITHROMBIN III CONCENTRATE

Dried antithrombin III is prepared from human plasma

Indications congenital deficiency of antithrombin III

Side-effects nausea, flushing, headache, dizziness; *rarely* allergic reactions and fever

Available from BPL (Dried Antithrombin III)

Note Preparation of recombinant human antithrombin (antithrombin alfa) available from LEO (*ATryn®* ▼) indicated for the prophylaxis of venous thromboembolism in surgery in patients with congenital antithrombin deficiency

DRIED PROTHROMBIN COMPLEX

(Human Prothrombin Complex)

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X

Indications treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available; treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment—see section 2.8.2)

Cautions risk of thrombosis; disseminated intravascular coagulation; history of myocardial infarction or coronary heart disease; hepatic disease; postoperative use

Contra-indications angina; recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy); history of heparin-induced thrombocytopenia

Side-effects thrombotic events (including disseminated intravascular coagulation); *very rarely* pyrexia, antibody formation, hypersensitivity reactions (including anaphylaxis); nephrotic syndrome also reported

Available from CSL Behring (*Beriplex® P/N* ▼)

DROTRECOGIN ALFA (ACTIVATED)

Recombinant activated protein C

Indications adjunctive treatment of severe sepsis with multiple organ failure—start treatment within 24 hours (and no later than 48 hours) after onset of organ failure

Cautions increased risk of bleeding, concomitant use of drugs that increase risk of bleeding; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (drotrecogin alfa)

Contra-indications internal bleeding; intracranial neoplasm or cerebral herniation; chronic severe hepatic disease; thrombocytopenia; not recommended for use in children under 18 years or in single organ failure

Side-effects bleeding; headache; ecchymosis; pain

Available from Lilly (*Xigris®*)

NICE guidance

Drotrecogin alfa (activated) for severe sepsis (September 2004)

Drotrecogin alfa (activated) should be considered for adults with severe sepsis that has resulted in the failure of two or more major organs and who are receiving optimum intensive care support. Drotrecogin alfa (activated) should be initiated and supervised only by a specialist consultant with intensive care skills and experience in the care of patients with sepsis.

FACTOR VIIa (RECOMBINANT)

Eptacog alfa (activated)

Indications treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

Cautions risk of thrombosis or disseminated intravascular coagulation

Side-effects *very rarely* nausea, thrombotic events (including myocardial infarction and cerebrovascular accident), coagulation disorders, fever, pain, and allergic reactions including rash

Available from Novo Nordisk (*NovoSeven®* ▼)

FACTOR VIII FRACTION, DRIED

(Human Antihaemophilic Fraction, Dried)

Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique

Indications treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency, von Willebrand's disease

Cautions monitor for development of factor VIII inhibitors; intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates

Side-effects gastro-intestinal disturbances, taste disturbances; flushing, palpitation; dyspnoea, coughing; headache, dizziness, paraesthesia, drowsiness; blurred vision; antibody formation; hypersensitivity reactions including hypotension, angioedema, chills, fever, urticaria, and anaphylaxis

Available from Biotest UK (*Haemoctin®* ▼), CSL Behring (*Haemate® P*), BPL (*Optivate®*, High Purity Factor VIII and von Willebrand factor concentrate; *8Y®*), Grifols (*Alphanate®*; *Fanhdi®*), Octapharma (*Octanate®* ▼)

Note Preparation of recombinant human antihaemophilic factor VIII (octocog alfa) available from CSL Behring (*Helixate® NexGen*), Baxter (*Advate®*), Bayer (*Kogenate® Bayer*); preparation of recombinant human antihaemophilic factor VIII (moroctocog alfa) available from Wyeth (*ReFacto AF®* ▼); octocog alfa and moroctocog alfa are not indicated for use in von Willebrand's disease

FACTOR VIII INHIBITOR BYPASSING FRACTION

Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma

Indications treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors; treatment of haemorrhage in non-haemophiliac patients with acquired factor VIII inhibitors

Contra-indications disseminated intravascular coagulation

Side-effects paraesthesia; pyrexia; allergic reactions including hypotension, flushing, urticaria, rash, and anaphylaxis

Available from Baxter (*FEIBA®*)

FACTOR IX FRACTION, DRIED

Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X

Indications treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

Cautions risk of thrombosis—principally with former low purity products

Contra-indications disseminated intravascular coagulation

Side-effects gastro-intestinal disturbances; headache, dizziness; allergic reactions, including chills, fever

Available from CSL Behring (*Mononine®*), BPL (*Replenine®-VF*, Dried Factor IX Fraction), Grifols (*AlphaNine®*)

Note Preparation of recombinant coagulation factor IX (nonacog alfa) available from Wyeth (*BeneFIX®*)

FACTOR XIII FRACTION, DRIED

(Human Fibrin-stabilising Factor, Dried)

Indications congenital factor XIII deficiency

Side-effects rarely, allergic reactions and fever

Available from CSL Behring (*Fibrogammin® P*)

FRESH FROZEN PLASMA

Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood

Indications to replace coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced, e.g. to reverse warfarin effect

Cautions need for compatibility

Contra-indications circulatory overload; avoid use as a volume expander

Side-effects allergic reactions including chills, fever, bronchospasm; adult respiratory distress syndrome

Available from Regional Blood Transfusion Services and BPL

Note A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (*Octaplas®*)

PROTEIN C CONCENTRATE

Protein C is prepared from human plasma

Indications congenital protein C deficiency

Cautions hypersensitivity to heparin

Side-effects fever, arrhythmia, bleeding and thrombosis reported; *rarely* allergic reactions

Available from Baxter (*Ceprotin®*)

2.12 Lipid-regulating drugs

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Individuals at high risk include those who already have atherosclerotic disease, those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Preventative measures are also required for other individuals who may be at high risk of developing atherosclerotic cardiovascular disease; those with a 10-year risk of cardiovascular disease[1] of 20% or more stand to benefit most from drug treatment. The risk is assessed on the basis of lipid concentration as well as smoking status, blood pressure, gender, and age; other risk factors, such as premature menopause, ethnicity, obesity, triglyceride concentration, chronic kidney disease, impaired glucose tolerance, and a family history of premature cardiovascular disease, should also be taken into account when assessing risk in individual patients.

Lowering the concentration of low-density lipoprotein (LDL) cholesterol and raising high-density lipoprotein (HDL) cholesterol slows the progression of atherosclerosis and may even induce regression. All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation. Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, lowering of raised blood pressure (section 2.5), the use of low-dose aspirin (section 2.9), and management of diabetes (section 6.1).

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

A **statin** (see p. 143) reduces the risk of cardiovascular disease events, irrespective of serum cholesterol concentration, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. If statins are contra-indicated or not tolerated, a **fibrate** (p. 147) or a **bile acid sequestrant** (p. 145) may be considered for *primary* or *secondary* prevention; **nicotinic acid** (p. 148) is also an option for *secondary* prevention. Fibrates, bile acid sequestrants, or nicotinic acid should not be used in combination with a statin for *primary* prevention of cardiovascular disease. In secondary prevention of cardiovascular events, consider adjusting doses of lipid-regulating drugs if a total

1. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (*Heart* 2005; **91** (Suppl V): v1–v52)—see inside back cover. The Joint British Societies' 'Cardiac Risk Assessor' computer programme may also be used to determine cardiovascular disease risk.

cholesterol concentration of less than 4 mmol/litre *or* a LDL-cholesterol concentration of less than 2 mmol/litre is not achieved with initial treatment.

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as **ezetimibe** or **colestyramine**; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. A **fibrate** is added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; **nicotinic acid** may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis—see CSM advice below) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should **not** be used.

Patients with hypothyroidism should receive adequate thyroid replacement therapy before assessing the requirement for lipid-regulating treatment because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

CSM advice (muscle effects)

The CSM has advised that rhabdomyolysis associated with lipid-regulating drugs such as the fibrates and statins appears to be rare (approx. 1 case in every 100 000 treatment years) but may be increased in those with renal impairment and possibly in those with hypothyroidism (see also notes above). Concomitant treatment with drugs that increase plasma-statin concentration increase the risk of muscle toxicity; concomitant treatment with a fibrate and a statin may also be associated with an increased risk of serious muscle toxicity.

Statins

The statins (**atorvastatin**, **fluvastatin**, **pravastatin**, **rosuvastatin**, and **simvastatin**) competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver. Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

Statins should be considered for all patients, including the elderly, with symptomatic cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

In patients with diabetes mellitus, the risk of developing cardiovascular disease depends on the duration and complications of diabetes, age, and concomitant risk factors. Statin therapy should be considered for *all* patients over 40 years with diabetes mellitus (type 1 and 2). In younger patients with diabetes, treatment with a statin should be considered if there is target-organ damage, poor glycaemic control (HbA_{1c} greater than 9%), low HDL-cholesterol and raised triglyceride concentration, hypertension, or a family history of premature cardiovascular disease.

Statins are also used for the prevention of cardiovascular disease events in asymptomatic individuals who are at increased risk (see p. 142). Statin treatment should also be considered if the total cholesterol concentration to HDL-cholesterol ratio exceeds 6.

Cautions Statins should be used with caution in those with a history of liver disease or with a high alcohol intake (use should be avoided in active liver disease). Hypothyroidism should be managed adequately before starting treatment with a statin (see above). There is little information available on a rational approach to liver-function monitoring; however, a NICE guideline[1] suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity. Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should **not** be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy. Statins should be used with caution in those with risk factors for myopathy or rhabdomyolysis; patients should be advised to report unexplained muscle pain (see Muscle Effects below). Statins should be avoided in acute porphyria (section 9.8.2) but rosuvastatin is thought to be safe. **Interactions:** Appendix 1 (statins).

Contra-indications Statins are contra-indicated in active liver disease (or persistently abnormal liver function tests), in pregnancy (adequate contraception required during treatment and for 1 month afterwards) and during breast-feeding (see Appendix 4 and Appendix 5).

Side-effects The statins can cause various muscular side-effects, including myositis, which can lead to rhabdomyolysis. Muscular effects are rare but often significant (see below and CSM advice (Muscle Effects) above). Statins can cause gastro-intestinal disturbances, and very rarely pancreatitis. They can also cause altered liver function tests, and rarely hepatitis and jaundice; hepatic failure has been reported very rarely. Other side-effects include sleep disturbance, headache, dizziness, depression, paraesthesia, asthenia, peripheral neuropathy, amnesia, fatigue, sexual dysfunction, thrombocytopenia, arthralgia, visual disturbance, alopecia, and hypersensitivity reactions (including rash, pruritus, urticaria, and very rarely lupus erythematosus-like reactions). In very rare cases, statins can cause interstitial lung disease; if patients develop symptoms such as

1. NICE clinical guideline 67 (May 2008). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease

dyspnoea, cough, and weight loss, they should seek medical attention.

Muscle effects Myalgia, myositis, and myopathy have been reported with the statins; if myopathy is suspected and creatine kinase is markedly elevated (more than 5 times upper limit of normal), or muscular symptoms are severe, treatment should be discontinued; in patients at high risk of muscle effects, a statin should not be started if creatine kinase is elevated. Patients at high risk of myopathy include those with a personal or family history of muscular disorders, previous history of muscular toxicity or liver disease, and the elderly (see also CSM advice p. 143). There is also an increased incidence of myopathy if a statin is given at a high dose or given with a fibrate, with lipid-lowering doses of nicotinic acid, or with immunosuppressants such as ciclosporin; close monitoring of liver function and, if symptomatic, of creatine kinase is required in patients receiving these drugs. Rhabdomyolysis with acute renal impairment secondary to myoglobinuria has also been reported.

Counselling Advise patient to report promptly unexplained muscle pain, tenderness, or weakness.

ATORVASTATIN

Indications primary hypercholesterolaemia, heterozygous familial hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with type 2 diabetes and at least one additional risk factor for cardiovascular disease

Cautions see notes above; also haemorrhagic stroke

Contra-indications see notes above

Side-effects see notes above; also chest pain; back pain; *less commonly* anorexia, malaise, weight gain, hypoglycaemia, hyperglycaemia, tinnitus; *rarely* cholestatic jaundice, peripheral oedema; *very rarely* taste disturbances, gynaecomastia, hearing loss, Stevens-Johnson Syndrome, and toxic epidermal necrolysis

Dose

- Primary hypercholesterolaemia and combined hyperlipidaemia, usually 10 mg once daily; if necessary, may be increased at intervals of at least 4 weeks to max. 80 mg once daily; CHILD 10–17 years usually 10 mg once daily (limited experience with doses above 20 mg daily)
- Familial hypercholesterolaemia, initially 10 mg daily, increased at intervals of at least 4 weeks to 40 mg once daily; if necessary, further increased to max. 80 mg once daily (or 40 mg once daily combined with anion-exchange resin in heterozygous familial hypercholesterolaemia); CHILD 10–17 years initially 10 mg daily, increased if necessary after at least 4 weeks to 20 mg once daily (limited experience with higher doses)
- Prevention of cardiovascular events in type 2 diabetes, 10 mg once daily

Note Max. 10 mg daily with concomitant ciclosporin; max. 20 mg daily (or temporarily discontinue atorvastatin) with concomitant clarithromycin; max. 40 mg daily (or temporarily discontinue atorvastatin) with concomitant itraconazole

Lipitor® (Pfizer) PoM

Tablets, all f/c, atorvastatin (as calcium trihydrate) 10 mg, net price 28-tab pack = £18.03; 20 mg, 28-tab pack = £24.64; 40 mg 28-tab pack = £24.64; 80 mg, 28-tab pack = £28.21. Counselling, muscle effects, see notes above

FLUVASTATIN

Note The *Scottish Medicines Consortium* (p. 3) has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin

Indications adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIa and IIb); adjunct to diet to slow progression of coronary atherosclerosis in primary hypercholesterolaemia and concomitant coronary heart disease; prevention of coronary events after percutaneous coronary intervention

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also *very rarely* vasculitis

Dose

- Hypercholesterolaemia or combined hyperlipidaemia, initially 20–40 mg daily in the evening, adjusted at intervals of at least 4 weeks; up to 80 mg daily may be required; CHILD under 18 years, not recommended
- Prevention of progression of coronary atherosclerosis, 40 mg daily in the evening
- Following percutaneous coronary intervention, 80 mg daily

Lescol® (Novartis) PoM

Capsules, fluvastatin (as sodium salt) 20 mg (brown/yellow), net price 28-cap pack = £15.26; 40 mg (brown/orange), 28-cap pack = £15.26, 56-cap pack = £30.53. Counselling, muscle effects, see notes above

Modified release

Lescol® XL (Novartis) PoM

Tablets, m/r, yellow, fluvastatin (as sodium salt) 80 mg, net price 28-tab pack = £19.20. Label: 25, counselling, muscle effects, see notes above

Dose 80 mg once daily (dose form not appropriate for initial dose titration in hypercholesterolaemia or combined hyperlipidaemia)

PRAVASTATIN SODIUM

Indications adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control; adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia; prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina; reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

Cautions see notes above; renal impairment (Appendix 3)

Contra-indications see notes above

Side-effects see notes above; *less commonly* abnormal urination (including dysuria, nocturia and frequency); *very rarely* fulminant hepatic necrosis

Dose

- Hypercholesterolaemia or combined hyperlipidaemias, 10–40 mg once daily at night, adjusted at intervals of at least 4 weeks
- Familial hypercholesterolaemia, CHILD 8–14 years 10–20 mg once daily at night, 14–18 years 10–40 mg once daily at night

- Prevention of cardiovascular events, 40 mg once daily at night
- Post-transplantation hyperlipidaemia, initially 20 mg once daily at night, increased if necessary (under close medical supervision) to max. 40 mg once daily at night

Pravastatin (Non-proprietary) PoM

Tablets, pravastatin sodium 10 mg, net price 28-tab pack = £1.71; 20 mg, 28-tab pack = £2.13; 40 mg, 28-tab pack = £2.78. Counselling, muscle effects, see notes above

Lipostat® (Squibb) PoM

Tablets, all yellow, pravastatin sodium 10 mg, net price 28-tab pack = £14.46; 20 mg, 28-tab pack = £26.53; 40 mg, 28-tab pack = £26.53. Counselling, muscle effects, see notes above

ROSUVASTATIN

Indications primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

Cautions see notes above; patients of Asian origin (see under Dose); max. dose 20 mg in patients with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity); renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3)

Contra-indications see notes above

Side-effects see notes above; also proteinuria; *very rarely* haematuria

Dose

- Initially 5–10 mg once daily increased if necessary at intervals of at least 4 weeks to 20 mg once daily, increased after further 4 weeks to 40 mg daily only in severe hypercholesterolaemia with high cardiovascular risk and under specialist supervision; ELDERLY initially 5 mg once daily; patient of ASIAN origin, initially 5 mg once daily increased if necessary to max. 20 mg daily

Note Initially 5 mg once daily with concomitant fibrate increased if necessary to max. 20 mg daily

Crestor® (AstraZeneca) PoM

Tablets, f/c, rosuvastatin (as calcium salt) 5 mg (yellow), net price 28-tab pack = £18.03; 10 mg (pink), 28-tab pack = £18.03; 20 mg (pink), 28-tab pack = £26.02; 40 mg (pink), 28-tab pack = £29.69. Counselling, muscle effects, see notes above

SIMVASTATIN

Indications primary hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus

Cautions see notes above; renal impairment (Appendix 3)

Contra-indications see notes above

Side-effects see notes above; also *rarely* anaemia

Dose

- Primary hypercholesterolaemia, combined hyperlipidaemia, 10–20 mg daily at night, adjusted at intervals of at least 4 weeks; usual range 10–80 mg once daily at night
- Homozygous familial hypercholesterolaemia, 40 mg daily at night *or* 80 mg daily in 3 divided doses (with largest dose at night)
- Prevention of cardiovascular events, initially 20–40 mg once daily at night, adjusted at intervals of at least 4 weeks; max. 80 mg once daily at night

Note Max. 10 mg daily with concomitant ciclosporin, danazol, or fibrate (except fenofibrate). Max. 20 mg daily with concomitant amiodarone or verapamil. Max. 40 mg daily with diltiazem

[1] **Simvastatin** (Non-proprietary) PoM

Tablets, simvastatin 10 mg, net price 28-tab pack = 84p, 20 mg, 28-tab pack = 94p; 40 mg, 28-tab pack = £1.32; 80 mg, 28-tab pack = £2.87. Counselling, muscle effects, see notes above

Brands include *Simvador®*

[1] **Zocor®** (MSD) PoM

Tablets, all f/c, simvastatin 10 mg (peach), net price 28-tab pack = £18.03; 20 mg (tan), 28-tab pack = £29.69; 40 mg (red), 28-tab pack = £29.69; 80 mg (red), 28-tab pack = £29.69. Counselling, muscle effects, see notes above

With ezetimibe

Note For homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone. For cautions, contra-indications, and side-effects of ezetimibe, see Ezetimibe

Inegy® (MSD, Schering-Plough) ▼ PoM

Tablets, simvastatin 20 mg, ezetimibe 10 mg, net price 28-tab pack = £33.42; simvastatin 40 mg, ezetimibe 10 mg, 28-tab pack = £38.98; simvastatin 80 mg, ezetimibe 10 mg, 28-tab pack = £41.21. Counselling, muscle effects, see notes above

Bile acid sequestrants

Colesevelam, **colestipol**, and **colestyramine** (cholestyramine) are bile acid sequestrants used in the management of hypercholesterolaemia. They act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma. Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia.

Cautions Bile acid sequestrants interfere with the absorption of fat-soluble vitamins; supplements of vitamins A, D, and K may be required when treatment is prolonged. **Interactions:** Appendix 1 (bile acid sequestrants)

1. Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease; a proprietary brand *Zocor Heart-Pro®* is on sale to the public

Side-effects As bile acid sequestrants are not absorbed, gastro-intestinal side-effects predominate. Constipation is common, but diarrhoea has occurred, as have nausea, vomiting, and gastro-intestinal discomfort. Hypertriglyceridaemia may be aggravated. An increased bleeding tendency has been reported due to hypoprothrombinaemia associated with vitamin K deficiency.

Counselling Other drugs should be taken at least 1 hour before or 4–6 hours after bile acid sequestrants to reduce possible interference with absorption. Colesevelam and a statin can be taken at the same time.

COLESEVELAM HYDROCHLORIDE

Indications primary hypercholesterolaemia as an adjunct to dietary measures, either alone or with a statin

Cautions see notes above; also gastro-intestinal motility disorders, major gastro-intestinal surgery, inflammatory bowel disease, hepatic impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications bowel or biliary obstruction

Side-effects see notes above; also headache; myalgia

Dose

- Monotherapy, 3.75 g daily in 1–2 divided doses; max. 4.375 g daily
- Combination therapy with statin, 2.5–3.75 g daily in 1–2 divided doses

Cholestagel® (Genzyme) ▼ PoM

Tablets, f/c, colesevelam hydrochloride 625 mg, net price 180-cap pack = £89.05. Label: 21, counselling, avoid other drugs at same time (see notes above)

COLESTYRAMINE
(Cholestyramine)

Indications hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures; primary prevention of coronary heart disease in men aged 35–59 years with primary hypercholesterolaemia who have not responded to diet and other appropriate measures; pruritus associated with partial biliary obstruction and primary biliary cirrhosis (section 1.9.2); diarrhoeal disorders (section 1.9.2)

Cautions see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (colestyramine)

Contra-indications complete biliary obstruction (not likely to be effective)

Side-effects see notes above; intestinal obstruction reported rarely and hyperchloraemic acidosis reported on prolonged use

Dose

- Lipid reduction, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in 1–4 divided doses, then adjusted as required; max. 36 g daily
- Pruritus, see section 1.9.2
- Diarrhoeal disorders, see section 1.9.2
- CHILD 6–12 years, see *BNF for Children*

Note The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content

Colestyramine (Non-proprietary) PoM

Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £17.59. Label: 13, counselling, avoid other drugs at same time (see notes above)

Excipients may include aspartame (section 9.4.1)

Questran® (Bristol-Myers Squibb) PoM

Powder, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £10.97. Label: 13, counselling, avoid other drugs at same time (see notes above)

Excipients include sucrose 3.79 g/sachet

Questran Light® (Bristol-Myers Squibb) PoM

Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £16.47. Label: 13, counselling, avoid other drugs at same time (see notes above)

Excipients include aspartame (section 9.4.1)

COLESTIPOL HYDROCHLORIDE

Indications hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

Cautions see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (colestipol)

Side-effects see notes above

Dose

- Initially 5 g 1–2 times daily in liquid increased if necessary in 5-g increments at intervals of 1 month to max. 30 g daily (in 1–2 divided doses)

Note The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, yoghurt, and pulpy fruits with a high moisture content

Colestid® (Pharmacia) PoM

Granules, yellow, colestipol hydrochloride 5 g/sachet, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

Colestid Orange, granules, yellow/orange, colestipol hydrochloride 5 g/sachet, with aspartame, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

Ezetimibe

Ezetimibe inhibits the intestinal absorption of cholesterol. It is licensed as an adjunct to dietary manipulation in patients with primary hypercholesterolaemia in combination with a statin or alone (if a statin is inappropriate), in patients with homozygous familial hypercholesterolaemia in combination with a statin, and in patients with homozygous familial sitosterolaemia (phytosterolaemia). If ezetimibe is used in combination with a statin, there is an increased risk of rhabdomyolysis (see also CSM advice on p. 143).

NICE guidance

Ezetimibe for the treatment of primary hypercholesterolaemia (November 2007)

Ezetimibe, used in accordance with the licensed indications for *Ezetrol®*, is an option for the treatment of adults with primary hypercholesterolaemia.

EZETIMIBE

Indications adjunct to dietary measures and statin treatment in primary hypercholesterolaemia and homozygous familial hypercholesterolaemia (ezetimibe alone in primary hypercholesterolaemia if statin inappropriate or not tolerated); adjunct to dietary measures in homozygous sitosterolaemia

Cautions hepatic impairment (avoid if moderate or severe; Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (ezetimibe)

Side-effects gastro-intestinal disturbances; headache, fatigue; myalgia; *rarely* arthralgia, hypersensitivity reactions (including rash, angioedema, and anaphylaxis), hepatitis; *very rarely* pancreatitis, cholelithiasis, cholecystitis, thrombocytopenia, raised creatine kinase, myopathy, and rhabdomyolysis

Dose

- ADULT and CHILD over 10 years, 10 mg once daily

Ezetrol® (MSD, Schering-Plough) ▼ PoM
Tablets, ezetimibe 10 mg, net price 28-tab pack = £26.31

With simvastatin

See under Simvastatin

Fibrates

Bezafibrate, **ciprofibrate**, **fenofibrate**, and **gemfibrozil** act mainly by decreasing serum triglycerides; they have variable effects on LDL-cholesterol. Although a fibrate can reduce the risk of coronary heart disease events in those with low HDL-cholesterol or with raised triglycerides, a statin should be used first. Fibrates are first-line therapy only in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin. In type 2 diabetes a fibrate can be added to a statin for those with a serum-triglyceride concentration exceeding 2.3 mmol/litre, despite 6 months of treatment with a statin and optimal glycaemic control.

Fibrates can cause a myositis-like syndrome, especially if renal function is impaired. Also, combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution (see CSM advice on p. 143) and monitoring of liver function and creatinine kinase should be considered; gemfibrozil and statins should **not** be used concomitantly.

BEZAFIBRATE

Indications hyperlipidaemias of types IIa, IIb, III, IV, and V in patients who have not responded adequately to diet and other appropriate measures; also see notes above

Cautions correct hypothyroidism before initiating treatment (see p. 143); hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3; see also under Myotoxicity below); **interactions:** Appendix 1 (fibrates)

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly

Contra-indications hypoalbuminaemia, primary biliary cirrhosis, gall bladder disease, nephrotic syndrome, pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances, anorexia; *less commonly* cholestasis, weight gain, dizziness, headache, fatigue, drowsiness, renal impairment, raised serum creatinine (unrelated to renal impairment), erectile dysfunction, myotoxicity (with myasthenia or myalgia)—special risk in renal impairment (see Cautions), urticaria, pruritus, photosensitivity reactions; *very rarely* gallstones, hypoglycaemia, anaemia, leucopenia, thrombocytopenia, increased platelet count, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- See preparations below

Bezafibrate (Non-proprietary) PoM
Tablets, bezafibrate 200 mg, net price 100-tab pack = £10.25. Label: 21
Dose 200 mg 3 times daily; CHILD over 10 years, see *BNF for Children*

Bezalip® (Roche) PoM
Tablets, f/c, bezafibrate 200 mg, net price 100-tab pack = £8.79. Label: 21
Dose 200 mg 3 times daily; CHILD over 10 years, see *BNF for Children*

Modified release

Bezafibrate (Non-proprietary) PoM
Tablets, m/r, bezafibrate 400 mg, net price 28-tab pack = £7.68. Label: 21, 25
Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)
Brands include *Fibrazate® XL*, *Zimbacol® XL*

Bezalip® Mono (Roche) PoM
Tablets, m/r, f/c, bezafibrate 400 mg, net price 30-tab pack = £7.77. Label: 21, 25
Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)

CIPROFIBRATE

Indications hyperlipidaemias of types IIa, IIb, III, and IV in patients who have not responded adequately to diet; also see notes above

Cautions see under Bezafibrate; renal impairment (avoid if severe; Appendix 3)

Contra-indications see under Bezafibrate

Side-effects see under Bezafibrate

Dose

- 100 mg daily

Modalim® (Winthrop) PoM
Tablets, scored, ciprofibrate 100 mg. Net price 28-tab pack = £17.66

FENOFIBRATE

Indications hyperlipidaemias of types IIa, IIb, III, IV, and V in patients who have not responded adequately to diet and other appropriate measures; also see notes above

Cautions see under Bezafibrate; liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised); renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3)

Contra-indications gall bladder disease; photosensitivity to ketoprofen; severe hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see under Bezafibrate; also *very rarely* hepatitis, pancreatitis, and interstitial pneumopathies

Dose

- See preparations below

Fenofibrate (Non-proprietary) PoM

Capsules, fenofibrate (micronised) 200 mg, net price 28-cap pack = £14.23. Label: 21

Dose 1 capsule daily (dose form not appropriate for children or in renal impairment)

Capsules, fenofibrate (micronised) 267 mg, net price 28-cap pack = £21.75. Label: 21

Dose severe hyperlipidaemia, 1 capsule daily (dose form not appropriate for children or in renal impairment)

Lipantil® (Solvay) PoM

Lipantil® Micro 67 capsules, yellow, fenofibrate (micronised) 67 mg, net price 90-cap pack = £23.30. Label: 21

Dose initially 3 capsules daily in divided doses; usual range 2–4 capsules daily; CHILD 4–15 years 1 capsule/20 kg daily

Lipantil® Micro 200 capsules, orange, fenofibrate (micronised) 200 mg, net price 28-cap pack = £17.95. Label: 21

Dose initially 1 capsule daily (dose form not appropriate for children or in renal impairment)

Lipantil® Micro 267 capsules, orange/cream, fenofibrate (micronised) 267 mg, net price 28-cap pack = £21.75. Label: 21

Dose severe hyperlipidaemia, 1 capsule daily (dose form not appropriate for children or in renal impairment)

Supralip® 160 (Solvay) PoM

Tablets, f/c, fenofibrate (micronised) 160 mg, net price 28-tab pack = £7.50. Label: 21

Dose 160 mg daily (dose form not appropriate for children or in renal impairment)

GEMFIBROZIL

Indications hyperlipidaemias of types IIa, IIb, III, IV and V in patients who have not responded adequately to diet and other appropriate measures; primary prevention of cardiovascular disease in men with hyperlipidaemias that have not responded to diet and other appropriate measures; also see notes above

Cautions lipid profile, blood counts, and liver-function tests before initiating long-term treatment; preferably avoid use with statins (high risk of rhabdomyolysis); correct hypothyroidism before initiating treatment (see p. 143); elderly; renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); **interactions:** Appendix 1 (fibrates)

Contra-indications alcoholism, biliary-tract disease including gallstones; photosensitivity to fibrates; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances; headache, fatigue, vertigo; eczema, rash; *less commonly* atrial fibrillation; *rarely* pancreatitis, appendicitis, disturbances in liver function including hepatitis and cholestatic jaundice, dizziness, paraesthesia, sexual dysfunction, thrombocytopenia, anaemia, leucopenia, eosinophilia, bone-marrow suppression, myalgia, myopathy, myasthenia, myositis accompanied by increase in creatine kinase (discontinue if raised significantly), blurred vision, exfoliative dermatitis, alopecia, and photosensitivity)

Dose

- 1.2 g daily, usually in 2 divided doses; range 0.9–1.2 g daily; CHILD not recommended

Gemfibrozil (Non-proprietary) PoM

Capsules, gemfibrozil 300 mg, net price 112-cap pack = £46.70. Label: 22

Tablets, gemfibrozil 600 mg, net price 30-tab pack = £12.28, 56-tab pack = £33.34. Label: 22

Lopid® (Pfizer) PoM

'300' capsules, white/maroon, gemfibrozil 300 mg, net price 112-cap pack = £35.57. Label: 22

'600' tablets, f/c, gemfibrozil 600 mg, net price 56-tab pack = £35.57. Label: 22

Nicotinic acid group

The value of **nicotinic acid** is limited by its side-effects, especially vasodilatation. In doses of 1.5 to 3 g daily it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol. Nicotinic acid is licensed for use with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol); it can be used alone if the patient is intolerant of statins (for advice on treatment of dyslipidaemia, including use of combination treatment, see p. 142).

Acipimox seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-modulating capabilities.

ACIPIMOX

Indications hyperlipidaemias of types IIb and IV in patients who have not responded adequately to diet and other appropriate measures

Cautions renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3)

Contra-indications peptic ulcer; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects vasodilatation, flushing, itching, rashes, urticaria, erythema; heartburn, epigastric pain, nausea, diarrhoea, headache, malaise, dry eyes; rarely angioedema, bronchospasm, anaphylaxis

Dose

- Usually 500–750 mg daily in divided doses

Olbetam® (Pharmacia) PoM

Capsules, brown/pink, acipimox 250 mg, net price 90-cap pack = £46.33. Label: 21

NICOTINIC ACID

Indications adjunct to statin in dyslipidaemia or used alone if statin not tolerated (see also p. 142)

Cautions unstable angina, acute myocardial infarction, diabetes mellitus, gout, history of peptic ulceration; hepatic impairment (Appendix 2); renal impairment; pregnancy (Appendix 4); **interactions:** Appendix 1 (nicotinic acid)

Contra-indications arterial bleeding; active peptic ulcer disease; breast-feeding

Side-effects diarrhoea, nausea, vomiting, abdominal pain, dyspepsia; flushing; pruritus, rash; *less commonly* tachycardia, palpitation, shortness of breath, periph-

eral oedema, headache, dizziness, increase in uric acid, hypophosphataemia, prolonged prothrombin time, and reduced platelet count; *rarely* hypotension, syncope, rhinitis, insomnia, reduced glucose tolerance, myalgia, myopathy, and myasthenia; *very rarely* anorexia, rhabdomyolysis

Note Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid

Dose

- See under preparation

Modified release

Niaspan® (Abbott) PoM

Tablets, m/r, nicotinic acid 500 mg, net price 56-tab pack = £18.98; 750 mg, 56-tab pack = £28.88; 1 g, 56-tab pack = £38.23; 21-day starter pack of 7 × 375-mg tab with 7 × 500-mg tab and 7 × 750-mg tab = £15.40. Label: 21, 25

Dose 375 mg once daily at night (after a low-fat snack) for 1 week, then 500 mg once daily at night for 1 week, then 750 mg once daily at night for 1 week, then 1 g once daily at night for 4 weeks, increased if necessary in steps of 500 mg at intervals of at least 4 weeks to max. 2 g daily; usual maintenance dose 1–2 g once daily at night

Omega-3 fatty acid compounds

The omega-3 fatty acid compounds comprise omega-3-acid ethyl esters (*Omacor®*) and omega-3-marine triglycerides (*Maxepa®*). Omega-3 fatty acid compounds may be used to reduce triglycerides, as an alternative to a fibrate and in addition to a statin, in patients with combined (mixed) hyperlipidaemia not adequately controlled with a statin alone. A triglyceride concentration exceeding 10 mmol/litre is associated with acute pancreatitis and lowering the concentration reduces this risk. The fat content of omega-3 fatty acid compounds (including excipients in the preparations) should be taken into consideration when treating hypertriglyceridaemia. There is little clinical trial evidence that the triglyceride lowering effect decreases the risk of cardiovascular disease.

The *Scottish Medicines Consortium* (p. 3) has advised (November 2002) that omega-3-acid ethyl esters (*Omacor®*) is **not** recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

OMEGA-3-ACID ETHYL ESTERS

Indications adjunct to diet and statin in type IIb or III hypertriglyceridaemia; adjunct to diet in type IV hypertriglyceridaemia; adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

Cautions haemorrhagic disorders, anticoagulant treatment (bleeding time increased); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

Contra-indications breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances; *less commonly* taste disturbances, dizziness, and hypersensitivity reactions; *rarely* hepatic disorders, headache, hyperglycaemia, acne, and rash; *very rarely* hypotension, nasal dryness, urticaria, and increased white cell count

Dose

- See under preparation below

Omacor® (Solvay)

Capsules, 1 g of omega-3-acid ethyl esters 90 containing eicosapentaenoic acid 460 mg and decosahexaenoic acid 380 mg, net price 28-cap pack = £14.24, 100-cap pack = £50.84. Label: 21

Dose hypertriglyceridaemia, initially 2 capsules daily with food, increased if necessary to 4 capsules daily

Secondary prevention after myocardial infarction, 1 capsule daily with food

OMEGA-3-MARINE TRIGLYCERIDES

Indications adjunct in the reduction of plasma triglycerides in severe hypertriglyceridaemia

Cautions haemorrhagic disorders, anticoagulant treatment; aspirin-sensitive asthma; type 2 diabetes

Side-effects occasional nausea and belching

Dose

- See under preparations below

Maxepa® (Seven Seas)

Capsules, 1 g (approx. 1.1 mL) concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg. Vitamin A content less than 100 units/g, vitamin D content less than 10 units/g, net price 200-cap pack = £27.28. Label: 21

Dose 5 capsules twice daily with food

Liquid, golden-coloured, concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg/g (1.1 mL). Vitamin A content less than 100 units/g, vitamin D content less than 10 units/g, net price 150 mL = £20.46. Label: 21

Dose 5 mL twice daily with food

2.13 Local sclerosants

Ethanolamine oleate and sodium tetradecyl sulphate are used in sclerotherapy of varicose veins, and phenol is used in haemorrhoids (section 1.7.3).

ETHANOLAMINE OLEATE

(Monoethanolamine Oleate)

Indications sclerotherapy of varicose veins

Cautions extravasation may cause necrosis of tissues

Contra-indications inability to walk, acute phlebitis, oral contraceptive use, obese legs

Side-effects allergic reactions (including anaphylaxis)

Ethanolamine Oleate (UCB Pharma) PoM

Injection, ethanolamine oleate 5%, net price 2-mL amp = £3.19, 5-mL amp = £2.28

Dose by slow injection into empty isolated segment of vein, 2–5 mL divided between 3–4 sites; repeated at weekly intervals

SODIUM TETRADECYL SULPHATE

Indications sclerotherapy of varicose veins

Cautions see under Ethanolamine Oleate

Contra-indications see under Ethanolamine Oleate

Side-effects see under Ethanolamine Oleate

Fibro-Vein® (STD Pharmaceutical) PoM

Injection, sodium tetradecyl sulphate 0.2%, net price 5-mL amp = £5.51; 0.5%, 2-mL amp = £2.87; 1%, 2-mL amp = £3.31; 3%, 2-mL amp = £4.07, 5-mL vial = £10.25

Dose by slow injection into empty isolated segment of vein, 0.1–1 mL according to site and condition being treated (consult product literature)

This chapter also includes advice on the drug management of the following:

- acute severe asthma, p. 153
- anaphylaxis, p. 176
- angioedema, p. 178
- chronic asthma, p. 151
- chronic obstructive pulmonary disease, p. 153
- croup, p. 154

3.1 Bronchodilators

3.1.1 Adrenoceptor agonists
3.1.2 Antimuscarinic bronchodilators
3.1.3 Theophylline
3.1.4 Compound bronchodilator preparations
3.1.5 Peak flow meters, inhaler devices and nebulisers

Asthma

Drugs used in the management of asthma include beta$_2$ agonists (section 3.1.1), antimuscarinic bronchodilators (section 3.1.2), theophylline (section 3.1.3), corticosteroids (section 3.2), cromoglicate and nedocromil (section 3.3.1), leukotriene receptor antagonists (section 3.3.2), and, in specialist centres, omalizumab (section 3.4.2).

For tables outlining the management of chronic and acute asthma, see p. 151 and p. 152. For advice on the management of medical emergencies in dental practice, see p. 22.

Administration of drugs for asthma

Inhalation This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced. See also Inhaler devices, section 3.1.5.

Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital. See also Nebulisers, section 3.1.5.

Oral The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta$_2$ agonists, corticosteroids, theophylline, and leukotriene receptor antagonists.

Parenteral Drugs such as beta$_2$ agonists, corticosteroids, and aminophylline can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

Pregnancy and breast-feeding

It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the

Management of chronic asthma

Start at **step most appropriate** to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations

Adult and Child over 5 years

Step 1: occasional relief bronchodilator

Inhaled short-acting $beta_2$ agonist as required (up to once daily)

Note Move to step 2 if needed more than twice a week, or if night-time symptoms more than once a week, or if exacerbation in the last 2 years

Step 2: regular inhaled preventer therapy

Inhaled short-acting $beta_2$ agonist as required

plus

Regular standard-dose[1] inhaled corticosteroid (alternatives[2] are considerably less effective)

Step 3: inhaled corticosteroid + long-acting inhaled $beta_2$ agonist

Inhaled short-acting $beta_2$ agonist as required

plus

Regular standard-dose[1] inhaled corticosteroid

plus

Regular inhaled long-acting $beta_2$ agonist (salmeterol *or* formoterol)

If asthma not controlled

Increase dose of inhaled corticosteroid to upper end of standard dose range[1]

and

Either stop long-acting $beta_2$ agonist if of no benefit
Or continue long-acting $beta_2$ agonist if of some benefit

If asthma still not controlled and long-acting $beta_2$ agonist stopped, add one of

- Leukotriene receptor antagonist
- Modified-release oral theophylline
- Modified-release oral $beta_2$ agonist

Step 4: high-dose inhaled corticosteroid + regular bronchodilators

Inhaled short-acting $beta_2$ agonist as required

with

Regular high-dose[3] inhaled corticosteroid

plus

Inhaled long-acting $beta_2$ agonist

plus

In adults 6-week sequential therapeutic trial of one or more of

- Leukotriene receptor antagonist
- Modified-release oral theophylline
- Modified-release oral $beta_2$ agonist

Step 5: regular corticosteroid tablets

Refer to a respiratory specialist

Inhaled short-acting $beta_2$ agonist as required

with

Regular high-dose[3] inhaled corticosteroid

and

One or more long-acting bronchodilators (see step 4)

plus

Regular prednisolone tablets (as single daily dose)

Note In addition to regular prednisolone, continue high-dose inhaled corticosteroid (in exceptional cases may exceed licensed doses); these patients should normally be referred to an asthma clinic

Stepping down

Review treatment every 3 months; if control achieved stepwise reduction may be possible; reduce dose of *inhaled* corticosteroid slowly (consider reduction every 3 months, decreasing dose by up to 50% each time)

Child under 5 years[4]

Step 1: occasional relief bronchodilator

Short-acting $beta_2$ agonist as required (not more than once daily)

Note Preferably by inhalation (less effective and more side-effects when given by mouth)

Move to step 2 if needed more than twice a week, or if night-time symptoms more than once a week, or if exacerbation in the last 2 years

Step 2: regular preventer therapy

Inhaled short-acting $beta_2$ agonist as required

plus

Either regular standard-dose[1] inhaled corticosteroid
Or (if inhaled corticosteroid cannot be used) leukotriene receptor antagonist

Step 3: add-on therapy

Child under 2 years:

Refer to respiratory paediatrician

Child 2–5 years:

Inhaled short-acting $beta_2$ agonist as required

plus

Regular inhaled corticosteroid in standard dose[1]

plus

Leukotriene receptor antagonist

Step 4: persistent poor control

Refer to respiratory paediatrician

Stepping down

Regularly review need for treatment

1. Standard-dose inhaled corticosteroids (given through a metered-dose inhaler and in children a large-volume spacer):

   Beclometasone dipropionate or **budesonide** 100–400 micrograms twice daily; CHILD under 12 years 100–200 micrograms twice daily

   Fluticasone propionate 50–200 micrograms twice daily; CHILD 4–12 years 50–100 micrograms twice daily

   Mometasone furoate (given through a dry-powder inhaler) 200 micrograms twice daily

2. Alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled cromoglicate, or inhaled nedocromil

3. High-dose inhaled corticosteroids (given through a metered-dose inhaler and a large-volume spacer):

   Beclometasone dipropionate or budesonide 0.4–1 mg twice daily; CHILD 5–12 years 200–400 micrograms twice daily

   Fluticasone propionate 200–500 micrograms twice daily; CHILD 5–12 years 100–200 micrograms twice daily

   Mometasone furoate (given through a dry powder inhaler) 200–400 micrograms twice daily

   Note. Doses of inhaled corticosteroids here are for CFC-free metered-dose inhalers; dose adjustments may be required for other inhaler devices, see under individual preparations, section 3.2.
   Failure to achieve control with these doses is unusual, see also Side-effects of Inhaled Corticosteroids, section 3.2

4. Lung-function measurements cannot be used to guide management in those under 5 years

Advice on the management of chronic asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated June 2009); updates available at www.brit-thoracic.org.uk

Management of acute asthma

Important Patients with severe or life-threatening acute asthma may not be distressed and may not have all of these abnormalities; the presence of any should alert the doctor. Regard each emergency consultation as being for **severe acute asthma** until shown otherwise

Moderate acute asthma

- Able to talk
- Respiration (breaths/minute) < 25; CHILD 2–5 years ≤ 40, 5–12 years ≤ 30
- Pulse (beats/minute) < 110; CHILD 2–5 years ≤ 140, 5–12 years ≤ 125
- Arterial oxygen saturation ≥ 92%
- Peak flow > 50% of predicted or best; CHILD 5–12 years ≥ 50%

Treat at home or in surgery and assess response to treatment

Treatment

- Inhaled **short-acting beta$_2$ agonist** via a large-volume spacer or oxygen-driven nebuliser (if available); give 4–10 puffs of **salbutamol** 100 micrograms/metered inhalation each inhaled separately, and repeat at 10–20 minute intervals if necessary *or* give nebulised **salbutamol** 5 mg (CHILD under 5 years 2.5 mg, 5–12 years 2.5–5 mg) or **terbutaline** 10 mg (CHILD under 5 years 5 mg, 5–12 years 5–10 mg), and repeat at 10–20 minute intervals if necessary
- **Prednisolone** 40–50 mg by mouth for at least 5 days; CHILD 1–2 mg/kg by mouth for 3–5 days, if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (CHILD under 2 years max. 40 mg, over 2 years max. 50 mg)

Monitor response for 15–30 minutes

If response is poor or a relapse occurs in 3–4 hours, send immediately to hospital for assessment and further treatment

Severe acute asthma

- Cannot complete sentences in one breath; CHILD too breathless to talk or feed
- Respiration (breaths/minute) ≥ 25; CHILD 2–5 years > 40; 5–12 years > 30
- Pulse (beats/minute) ≥ 110; CHILD 2–5 years > 140; 5–12 years > 125
- Arterial oxygen saturation < 92%
- Peak flow 33–50% of predicted or best; CHILD 5–12 years 33–50%

Send immediately to hospital

Treatment

- High-flow **oxygen** (if available)
- Inhaled **short-acting beta$_2$ agonist** via a large-volume spacer or oxygen-driven nebuliser (if available); give 4–10 puffs of **salbutamol** 100 micrograms/metered inhalation each inhaled separately, and repeat at 10–20 minute intervals or as necessary *or* give nebulised **salbutamol** 5 mg (CHILD under 5 years 2.5 mg, 5–12 years 2.5–5 mg) or **terbutaline** 10 mg (CHILD under 5 years 5 mg, 5–12 years 5–10 mg), and repeat at 10–20 minute intervals or as necessary
- **Prednisolone** by mouth as for moderate acute asthma *or* intravenous **hydrocortisone** (preferably as sodium succinate) 100 mg every 6 hours until conversion to oral prednisolone is possible; CHILD 4 mg/kg (under 2 years max. 25 mg, 2–5 years 50 mg, 6–12 years 100 mg)

Monitor response for 15–30 minutes

If response is poor:

- Inhaled **ipratropium bromide** via oxygen-driven nebuliser (if available) 500 micrograms (CHILD under 12 years 250 micrograms)

Refer those who fail to respond and require ventilatory support to an intensive care or high-dependency unit

- Consider intravenous **beta$_2$ agonists**, **aminophylline** (p. 161) or **magnesium sulphate** [unlicensed indication] (p. 153) only after consultation with senior medical staff

Life-threatening acute asthma

- Silent chest, feeble respiratory effort, cyanosis
- Hypotension, bradycardia, arrhythmia, exhaustion, agitation (in children), or reduced level of consciousness
- Arterial oxygen saturation < 92%
- Peak flow < 33% of predicted or best; CHILD 5–12 years < 33%

Send immediately to hospital; consult with senior medical staff and refer to intensive care

Treatment

- High-flow **oxygen** (if available)
- **Short-acting beta$_2$ agonist** via oxygen-driven nebuliser (if available); give **salbutamol** 5 mg (CHILD under 5 years 2.5 mg, 5–12 years 2.5–5 mg) or **terbutaline** 10 mg (CHILD under 5 years 5 mg, 5–12 years 5–10 mg), and repeat at 10–20 minute intervals or as necessary; reserve intravenous beta$_2$ agonists for those in whom inhaled therapy cannot be used reliably
- **Prednisolone** by mouth as for moderate acute asthma *or* intravenous **hydrocortisone** (preferably as sodium succinate) 100 mg every 6 hours until conversion to oral prednisolone is possible; CHILD 4 mg/kg (under 2 years max. 25 mg, 2–5 years 50 mg, 6–12 years 100 mg)
- Inhaled **ipratropium bromide** via oxygen-driven nebuliser (if available) 500 micrograms (CHILD under 12 years 250 micrograms)

Monitor response for 15–30 minutes

- Consider **aminophylline** (p. 161) or **magnesium sulphate** [unlicensed indication] (p. 153) only after consultation with senior medical staff

Follow up in all cases

Monitor symptoms and peak flow. Set up asthma action plan and check inhaler technique

Review by general practitioner or asthma nurse within 48 hours; modify treatment according to the Management of Chronic Asthma table, p. 151

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated June 2009); updates available at www.brit-thoracic.org.uk

fetus. Inhaled drugs, theophylline, and prednisolone can be taken as normal during pregnancy and breast-feeding. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

Severe acute exacerbations of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including oral or parenteral administration of a corticosteroid and nebulisation of a beta$_2$ agonist; prednisolone is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia.

Management of severe acute asthma

> **Important**
> Regard each emergency consultation as being for severe acute asthma until shown otherwise.
> Failure to respond adequately at any time requires immediate transfer to hospital.

Severe acute asthma can be fatal and **must** be treated promptly and energetically. All patients with severe acute asthma should be given high-flow **oxygen** (if available) and an inhaled **short-acting beta$_2$ agonist** via a large-volume spacer or nebuliser; give 4–10 puffs of **salbutamol** 100 micrograms/metered inhalation, each puff inhaled separately via a large-volume spacer, and repeat at 10–20 minute intervals or as necessary. If there are life-threatening features, give salbutamol or **terbutaline** via an oxygen-driven nebuliser every 10–20 minutes or as necessary, see p. 156 and p. 158. In all cases, a systemic **corticosteroid** (section 6.3.2) should be given. For adults, give prednisolone 40–50 mg by mouth for at least 5 days, or intravenous hydrocortisone 100 mg (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. For children, give prednisolone 1–2 mg/kg by mouth (max. 40 mg) for 3–5 days or intravenous hydrocortisone 4 mg/kg (under 2 years max. 25 mg, 2–5 years 50 mg, 6–12 years 100 mg) (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. If the child has been taking an oral corticosteroid for more than a few days, then give prednisolone 2 mg/kg (CHILD under 2 years max. 40 mg, over 2 years max. 50 mg). In life-threatening asthma, also consider initial treatment with **ipratropium** by nebuliser (section 3.1.2).

Most patients do not require and do not benefit from the addition of **intravenous aminophylline** or of **intravenous beta$_2$ agonist**; both cause more adverse effects than nebulised beta$_2$ agonists. Nevertheless, an occasional patient who has not been taking theophylline may benefit from aminophylline infusion (see p. 161). Patients with severe acute asthma may be helped by **magnesium sulphate** [unlicensed indication] 1.2–2 g given by intravenous infusion over 20 minutes, but evidence of benefit is limited.

Treatment of severe acute asthma is safer in hospital where resuscitation facilities are immediately available. Treatment should **never** be delayed for investigations, patients should **never** be sedated, and the possibility of a pneumothorax should be considered.

If the patient's condition deteriorates despite pharmacological treatment, intermittent positive pressure ventilation may be needed.

For a table outlining the management of acute asthma, see p. 152.

Chronic obstructive pulmonary disease

Smoking cessation (section 4.10) reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine and influenza vaccine, section 14.4).

A trial of a high-dose inhaled corticosteroid *or* an oral corticosteroid is recommended for patients with moderate airflow obstruction to ensure that asthma has not been overlooked.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled **short-acting beta$_2$ agonist** (section 3.1.1.1) or a **short-acting antimuscarinic bronchodilator** (section 3.1.2) used as required.

When the airways obstruction is more severe, an inhaled **short-acting antimuscarinic bronchodilator** (section 3.1.2) given regularly should be added. In those who remain symptomatic or have two or more exacerbations in a year, a **long-acting beta$_2$ agonist** or a **long-acting antimuscarinic bronchodilator** given regularly should be added; a short-acting antimuscarinic bronchodilator should be discontinued when a long-acting antimuscarinic bronchodilator is started. If symptoms persist or if the patient is unable to use an inhaler, oral modified-release **aminophylline** or **theophylline** (section 3.1.3) can be used.

In moderate or severe chronic obstructive pulmonary disease, either a combination of a long-acting beta$_2$ agonist with an **inhaled corticosteroid** (section 3.2) or a long-acting antimuscarinic bronchodilator should be tried.

A **mucolytic** drug (section 3.7) may be considered for a patient with a chronic productive cough.

Long-term **oxygen** therapy (section 3.6) prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. **Aminophylline** can be given intravenously if response to nebulised bronchodilators is poor. A short course of **oral corticosteroid** (section 6.3.2), such as prednisolone 30 mg daily for 7–14 days, should be given if increased breathlessness interferes with daily activities. **Antibacterial** treatment (Table 1, section 5.1) is required when sputum becomes purulent or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an *oxygen alert card* (see p. 154) endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation, see also section 3.6.

Oxygen alert card

Name: _____

I am at risk of type II respiratory failure with a raised CO_2 level.

Please use my ____% Venturi mask to achieve an oxygen saturation of _____% to _____% during exacerbations.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008); available at www.brit-thoracic.org.uk

Croup

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg or prednisolone 1–2 mg/kg by mouth, section 6.3.2) should be administered before transfer to hospital. In hospital, dexamethasone 150 micrograms/kg (by mouth or by injection) or budesonide 2 mg (by nebulisation, section 3.2) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring in a dose of 400 micrograms/kg (max. 5 mg) repeated after 30 minutes if necessary; the effects of nebulised adrenaline last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction

3.1.1 Adrenoceptor agonists (Sympathomimetics)

3.1.1.1 Selective beta$_2$ agonists
3.1.1.2 Other adrenoceptor agonists

The selective beta$_2$ agonists (selective beta$_2$-adrenoceptor agonists, selective beta$_2$ stimulants) (section 3.1.1.1) such as salbutamol or terbutaline are the safest and most effective short-acting beta$_2$ agonists for asthma. Less selective beta$_2$ agonists such as orciprenaline (section 3.1.1.2) should be avoided whenever possible.

Adrenaline (epinephrine) (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of allergic and anaphylactic reactions (section 3.4.3) and in the management of croup (see above).

3.1.1.1 Selective beta$_2$ agonists

Selective beta$_2$ agonists produce bronchodilation. A short-acting beta$_2$ agonist is used for immediate relief of asthma symptoms while a long-acting beta$_2$ agonist is added to an inhaled corticosteroid in patients requiring prophylactic treatment.

Chronic Asthma table, see p. 151
Acute Asthma table, see p. 152.

Short-acting beta$_2$ agonists Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta$_2$ agonist such as **salbutamol** or **terbutaline**. If beta$_2$ agonist inhalation is needed more often than once daily, prophylactic treatment should be considered, using a stepped approach as outlined in the Management of Chronic Asthma table, p. 151. Regular treatment with an inhaled short-acting beta$_2$ agonist is less effective than 'as required' inhalation and is not appropriate prophylactic treatment.

A short-acting beta$_2$ agonist inhaled immediately before exertion reduces *exercise-induced asthma*; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta$_2$ agonists **Formoterol** (eformoterol) and **salmeterol** are longer-acting beta$_2$ agonists which are administered by inhalation. Added to regular inhaled corticosteroid treatment, they have a role in the long-term control of chronic asthma (see Chronic Asthma table, p. 151) and they can be useful in nocturnal asthma. Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline. Formoterol is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

CHM advice

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta$_2$ agonists (formoterol and salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta$_2$ agonist, see Management of Chronic Asthma table, p. 151.

Inhalation *Pressurised-metered dose inhalers* are an effective and convenient method of drug administration in mild to moderate asthma. A spacer device (section 3.1.5) may improve drug delivery. At recommended inhaled doses the duration of action of salbutamol, terbutaline and fenoterol is about 3 to 5 hours and for salmeterol and formoterol 12 hours. The **dose**, the frequency, and the maximum number of inhalations in 24 hours of the beta$_2$ agonist should be **stated explicitly** to the patient. The patient should be advised to seek medical advice when the prescribed dose of beta$_2$

agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug such as an inhaled corticosteroid (see Chronic Asthma table, p. 151).

Nebuliser (or respirator) solutions of salbutamol and terbutaline are used for the treatment of severe acute asthma in hospital or in general practice. Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta$_2$ agonists can increase arterial hypoxaemia. For the use of nebulisers in chronic obstructive pulmonary disease, see section 3.1.5. The dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution, see also section 3.1.5.

CFC-free inhalers Chlorofluorocarbon (CFC) propellants in pressurised metered-dose inhalers are being replaced by hydrofluoroalkane (HFA) propellants. Patients receiving CFC-free inhalers should be reassured about the efficacy of the new inhalers and counselled that the aerosol may feel and taste different; any difficulty with the new inhaler should be discussed with the doctor or pharmacist.

Oral Oral preparations of beta$_2$ agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta$_2$ agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta$_2$ agonists are usually preferred.

Parenteral Salbutamol or terbutaline are given by slow intravenous injection or intravenous infusion for severe acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta$_2$ agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. Beta$_2$ agonists may also be given by intramuscular injection.

Children Selective beta$_2$ agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years (see NICE guidance, section 3.1.5). A beta$_2$ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta$_2$ agonist may be used where appropriate (see Chronic Asthma table, p. 151). In severe attacks nebulisation using a selective beta$_2$ agonist or ipratropium is advisable (see also Asthma tables, p. 151 and p. 152).

Cautions Beta$_2$ agonists should be used with caution in hyperthyroidism, cardiovascular disease, arrhythmias, susceptibility to QT-interval prolongation, and hypertension. If high doses are needed during pregnancy they should be given by inhalation because a parenteral beta$_2$ agonist can affect the myometrium (section 7.1.3) and possibly cause cardiac problems; see also Pregnancy and Breast-feeding, section 3.1. Beta$_2$ agonists should be used with caution in diabetes—monitor blood glucose (risk of ketoacidosis, especially when beta$_2$ agonist given intravenously). **Interactions:** Appendix 1 (sympathomimetics, beta$_2$).

Hypokalaemia The CSM has advised that potentially serious hypokalaemia may result from beta$_2$ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Side-effects Side-effects of the beta$_2$ agonists include fine tremor (particularly in the hands), nervous tension, headache, muscle cramps, and palpitation. Other side-effects include tachycardia, arrhythmias, peripheral vasodilation, myocardial ischaemia, and disturbances of sleep and behaviour. Paradoxical bronchospasm (occasionally severe), urticaria, angioedema, hypotension, and collapse have also been reported. High doses of beta$_2$ agonists are associated with hypokalaemia (for CSM advice, see Hypokalaemia) above.

BAMBUTEROL HYDROCHLORIDE

Note Bambuterol is a pro-drug of terbutaline

Indications asthma and other conditions associated with reversible airways obstruction

Cautions see notes above; hepatic impairment (avoid if severe); renal impairment (Appendix 3); pregnancy (Appendix 4 and notes above)

Side-effects see notes above

Dose

- 20 mg once daily at bedtime if patient has previously tolerated beta$_2$ agonists; other patients, initially 10 mg once daily at bedtime, increased if necessary after 1–2 weeks to 20 mg once daily; CHILD not recommended

Bambec® (AstraZeneca) PoM

Tablets, both scored, bambuterol hydrochloride 10 mg, net price 28-tab pack = £12.05; 20 mg, 28-tab pack = £13.14

FENOTEROL HYDROBROMIDE

Indications reversible airways obstruction

Cautions see notes above

Side-effects see notes above

Compound preparations

For **compound preparation** containing fenoterol, see section 3.1.4

FORMOTEROL FUMARATE

(Eformoterol fumarate)

Indications reversible airways obstruction (including nocturnal asthma and prevention of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy, see also Chronic Asthma table, p. 151; chronic obstructive pulmonary disease

Cautions see notes above; hepatic impairment (Appendix 2); pregnancy (Appendix 4 and notes above); breast-feeding (Appendix 5)

Side-effects see notes above; taste disturbances, nausea, dizziness, rash, and pruritus also reported

Dose

- See under preparations below

Counselling Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible

Formoterol (Non-proprietary) PoM

Dry powder for inhalation, formoterol fumarate 12 micrograms/metered inhalation, net price 120-dose unit = £24.11. Counselling, dose

Brands include *Easyhaler® Formoterol*

Dose by inhalation of powder, asthma, ADULT and CHILD over 6 years, 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction

Chronic obstructive pulmonary disease, 12 micrograms twice daily

Atimos Modulite® (Chiesi) ▼ PoM

Aerosol inhalation, formoterol fumarate 12 micrograms/metered inhalation, net price 100-dose unit = £30.06. Counselling, dose

Excipients include HFA-134a (a non-CFC propellant)

Dose by aerosol inhalation, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to max. 24 micrograms twice daily in more severe airways obstruction

Chronic obstructive pulmonary disease, ADULT over 18 years, 12 micrograms twice daily; for symptom relief additional doses may be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

Foradil® (Novartis) PoM

Dry powder for inhalation, formoterol fumarate 12 micrograms/capsule, net price 60-cap pack (with inhaler device) = £30.06. Counselling, dose

Dose by inhalation of powder, asthma, ADULT and CHILD over 5 years, 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction

Chronic obstructive pulmonary disease, 12 micrograms twice daily

Oxis® (AstraZeneca) PoM

Turbohaler® (= dry powder inhaler), formoterol fumarate 6 micrograms/metered inhalation, net price 60-dose unit = £24.80; 12 micrograms/metered inhalation, 60-dose unit = £24.80. Counselling, dose

Dose by inhalation of powder, chronic asthma, 6–12 micrograms 1–2 times daily, increased up to 24 micrograms twice daily if necessary; occasionally up to 72 micrograms daily may be needed (max. single dose 36 micrograms); reassess treatment if additional doses required on more than 2 days a week; CHILD 6–18 years, 6–12 micrograms 1–2 times daily; occasionally up to 48 micrograms daily may be needed (max. single dose 12 micrograms)

Relief of bronchospasm, ADULT and CHILD over 6 years, 6–12 micrograms

Prevention of exercise-induced bronchospasm, 12 micrograms before exercise; CHILD 6–18 years, 6–12 micrograms before exercise

Chronic obstructive pulmonary disease, 12 micrograms 1–2 times daily; for symptom relief additional doses can be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

Compound preparations

For **compound preparations** containing formoterol, see section 3.2

SALBUTAMOL

(Albuterol)

Indications asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

Cautions see notes above

Side-effects see notes above

Dose

- By mouth (but use by inhalation preferred), 4 mg (elderly and sensitive patients initially 2 mg) 3–4 times daily; max. single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated); CHILD under 2 years 100 micrograms/kg 4 times daily [unlicensed]; 2–6 years 1–2 mg 3–4 times daily, 6–12 years 2 mg 3–4 times daily
- By subcutaneous *or* intramuscular injection, 500 micrograms, repeated every 4 hours if necessary
- By slow intravenous injection (but see also Management of Acute Asthma table, p. 152), (dilute to a concentration of 50 micrograms/mL), 250 micrograms, repeated if necessary; CHILD see *BNF for Children*
- By intravenous infusion (but see also Management of Acute Asthma table, p. 152), initially 5 micrograms/minute, adjusted according to response and heart-rate usually in range 3–20 micrograms/minute, or more if necessary; CHILD see *BNF for Children*
- By aerosol inhalation (but see also Management of Acute Asthma table, p. 152, *or* Management of Chronic Asthma table, p. 151), 100–200 micrograms (1–2 puffs); for persistent symptoms up to 4 times daily; CHILD 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary; for persistent symptoms up to 4 times daily

  Prophylaxis of allergen- or exercise-induced bronchospasm, 200 micrograms (2 puffs); CHILD 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary
- By inhalation of powder (but see also Management of Chronic Asthma table, p. 151), 200–400 micrograms; for persistent symptoms up to 4 times daily; CHILD over 5 years 200 micrograms; for persistent symptoms up to 4 times daily (for *Asmasal Clickhaler®*, *Salbulin Novolizer®*, and *Ventolin Accuhaler®* doses, see under preparations)

  Prophylaxis of allergen- or exercise-induced bronchospasm, 400 micrograms; CHILD 200 micrograms
- By inhalation of nebulised solution (but see also Management of Acute Asthma table, p. 152) ADULT and CHILD over 18 months 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases; max. 40 mg daily; CHILD under 18 months (transient hypoxaemia may occur—consider supplemental oxygen), 2.5 mg up to 4 times daily or more frequently in severe cases

Oral

Salbutamol (Non-proprietary) PoM

Tablets, salbutamol (as sulphate) 2 mg, net price 28-tab pack = £13.27; 4 mg, 28-tab pack = £12.18

Oral solution, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = £1.35

Brands include *Salapin®* (sugar-free)

Ventmax® SR (Chiesi) PoM

Capsules, m/r, salbutamol (as sulphate) 4 mg (green/grey), net price 56-cap pack = £8.24; 8 mg (white), 56-cap pack = £9.88. Label: 25

Dose 8 mg twice daily; CHILD 3–12 years 4 mg twice daily

Ventolin® (A&H) PoM

Syrup, sugar-free, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = 60p

Parenteral

Ventolin® (A&H) PoM

Injection, salbutamol (as sulphate) 500 micrograms/mL, net price 1-mL amp = 38p

Solution for intravenous infusion, salbutamol (as sulphate) 1 mg/mL. Dilute before use. Net price 5-mL amp = £2.48

Inhalation

Counselling Advise patients not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible.

Patients receiving CFC-free inhalers should be reassured about their efficacy and counselled that aerosol may feel and taste different

Salbutamol (Non-proprietary) PoM

Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £2.88. Counselling, dose

Excipients include CFC propellants

Aerosol inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £2.99. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Brands include *Salamol®*

Note Can be supplied against a generic prescription but if CFC-free not specified will be reimbursed at price for CFC-containing inhaler

Dry powder for inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £3.46; 200 micrograms/metered inhalation, 100-dose unit = £4.85, 200-dose unit = £6.92. Counselling, dose

Brands include *Easyhaler® Salbutamol*, *Pulvinal® Salbutamol*

Inhalation powder, *hard capsule* (for use with *Cyclohaler®* device), salbutamol 200 micrograms, net price 120-cap pack = £8.99; 400 micrograms, 120-cap pack = £12.99. Counselling, dose

Brands include *Salbutamol Cyclocaps®*

Nebuliser solution, salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.91; 2 mg/mL, 20 × 2.5 mL (5 mg) = £3.82. May be diluted with sterile sodium chloride 0.9%

Brands include *Salamol Steri-Neb®*

Airomir® (IVAX) PoM

Aerosol inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.97. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Note Can be supplied against a generic prescription but if 'CFC-free' not specified will be reimbursed at price for CFC-containing inhaler

Autohaler (breath-actuated aerosol inhalation), salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £6.02. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Asmasal Clickhaler® (UCB Pharma) PoM

Dry powder for inhalation, salbutamol (as sulphate) 95 micrograms/metered inhalation, net price 200-dose unit = £5.65. Counselling, dose

Dose acute bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 1–2 puffs; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma, p. 151)

Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 1–2 puffs

Salamol Easi-Breathe® (IVAX) PoM

Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose breath-actuated unit = £6.30. Counselling, dose

Excipients include HFA-134a (a non-CFC propellant)

Salbulin Novolizer® (Meda) PoM

Dry powder for inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price refillable 200-dose unit = £4.95; 200-dose refill = £2.75. Counselling, dose

Dose acute bronchospasm, by inhalation of powder, ADULT 100–200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma, p. 151); CHILD 6–12 years 100–200 micrograms; for persistent symptoms up to 400 micrograms daily (but see also Management of Chronic Asthma, p. 151)

Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT 200 micrograms; CHILD 6–12 years 100–200 micrograms

Ventolin® (A&H) PoM

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of salbutamol (as sulphate) 200 micrograms/blister with *Accuhaler®* device, net price = £4.92. Counselling, dose

Dose acute bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 200 micrograms; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma, p. 151)

Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 200 micrograms

Evohaler® (aerosol inhalation), salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.50. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Note Can be supplied against a generic prescription but if CFC-free not specified will be reimbursed at price for CFC-containing inhaler

Nebules® (for use with nebuliser), salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.68; 2 mg/mL, 20 × 2.5 mL (5 mg) = £2.83. May be diluted with sterile sodium chloride 0.9% if administration time in excess of 10 minutes is required

Respirator solution (for use with a nebuliser or ventilator), salbutamol (as sulphate) 5 mg/mL. Net price 20 mL = £2.18 (hosp. only). May be diluted with sterile sodium chloride 0.9%

Compound preparations

For **compound preparations** containing salbutamol, see section 3.1.4

Chronic Asthma table, see p. 151
Acute Severe Asthma table, see p. 152.

SALMETEROL

Indications reversible airways obstruction (including nocturnal asthma and prevention of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy, see also Chronic Asthma table, p. 151; chronic obstructive pulmonary disease

Note Not for immediate relief of acute asthma attacks; existing corticosteroid therapy should not be reduced or withdrawn

Cautions see notes above

Side-effects see notes above; nausea, dizziness, arthralgia, and rash also reported

Dose

- By inhalation, asthma, 50 micrograms (2 puffs or 1 blister) twice daily; up to 100 micrograms (4 puffs or 2 blisters) twice daily in more severe airways obstruction; CHILD 5–12 years, 50 micrograms (2 puffs or 1 blister) twice daily

  Chronic obstructive pulmonary disease 50 micrograms (2 puffs or 1 blister) twice daily

  Counselling Advise patients that salmeterol should **not** be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible

Serevent® (A&H) PoM

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of salmeterol (as xinafoate) 50 micrograms/blister with *Accuhaler®* device, net price = £29.26. Counselling, dose

Evohaler® aerosol inhalation ▼, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £29.26. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Diskhaler® (dry powder for inhalation), disks containing 4 blisters of salmeterol (as xinafoate) 50 micrograms/blister, net price 15 disks with *Diskhaler®* device = £35.79, 15-disk refill = £35.15. Counselling, dose

Compound preparations

For **compound preparations** containing salmeterol, see section 3.2

TERBUTALINE SULPHATE

Indications asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

Cautions see notes above

Side-effects see notes above

Dose

- By mouth (but use by inhalation preferred), initially 2.5 mg 3 times daily for 1–2 weeks, then up to 5 mg 3 times daily; CHILD 1 month–7 years 75 micrograms/kg 3 times daily; 7–15 years 2.5 mg 2–3 times daily
- By subcutaneous *or* slow intravenous injection, 250–500 micrograms up to 4 times daily; CHILD 2–15 years 10 micrograms/kg to a max. of 300 micrograms
- By continuous intravenous infusion as a solution containing 3–5 micrograms/mL, 90–300 micrograms/hour for 8–10 hours; CHILD 1 month–18 years, initially 2–4 micrograms/kg as a loading dose, then 1–10 micrograms/kg/hour according to response and heart rate (max. 300 micrograms/hour); high doses with close monitoring
- By inhalation of powder (*Turbohaler®*), ADULT and CHILD over 5 years, 500 micrograms (1 inhalation); for persistent symptoms up to 4 times daily (but see Management of Chronic Asthma table, p. 151)
- By inhalation of nebulised solution (but see also Management of Acute Asthma table, p. 152, 5–10 mg 2–4 times daily; additional doses may be necessary in severe acute asthma; CHILD under 5 years 5 mg 2–4 times daily, 5–12 years 5–10 mg 2–4 times daily [unlicensed dose]

Oral and parenteral

Bricanyl® (AstraZeneca) PoM

Tablets, scored, terbutaline sulphate 5 mg, net price 20 = 82p

Syrup, sugar-free, terbutaline sulphate 1.5 mg/5 mL, net price 100 mL = £2.00

Injection, terbutaline sulphate 500 micrograms/mL, net price 1-mL amp = 30p; 5-mL amp = £1.40

Inhalation

Counselling Advise patients not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible

Bricanyl® (AstraZeneca) PoM

Turbohaler® (= dry powder inhaler), terbutaline sulphate 500 micrograms/metered inhalation, net price 100-dose unit = £6.92. Counselling, dose

Respules® (= single-dose units for nebulisation), terbutaline sulphate 2.5 mg/mL, net price 20 × 2-mL units (5-mg) = £4.04

3.1.1.2 Other adrenoceptor agonists

Ephedrine and the partially selective beta agonist, orciprenaline, are less suitable and less safe for use as bronchodilators than the selective beta$_2$ agonists, because they are more likely to cause arrhythmias and other side-effects. They should be avoided whenever possible.

Adrenaline (epinephrine) injection (1 in 1000) is used in the emergency treatment of acute allergic and anaphylactic reactions (section 3.4.3), in angioedema (section 3.4.3), and in cardiopulmonary resuscitation (section 2.7.3). Adrenaline solution (1 in 1000) is used by nebulisation in the management of severe croup (section 3.1).

EPHEDRINE HYDROCHLORIDE

Indications reversible airways obstruction, but see notes above

Cautions hyperthyroidism, diabetes mellitus, ischaemic heart disease, hypertension, renal impairment, elderly; prostatic hypertrophy (risk of acute retention); interaction with MAOIs a disadvantage; **interactions:** Appendix 1 (sympathomimetics)

Side-effects tachycardia, anxiety, restlessness, insomnia common; also tremor, arrhythmias, dry mouth, cold extremities

Dose

- 15–60 mg 3 times daily; CHILD up to 1 year 7.5 mg 3 times daily, 1–5 years 15 mg 3 times daily, 6–12 years 30 mg 3 times daily

[1] **Ephedrine Hydrochloride** (Non-proprietary) PoM

Tablets, ephedrine hydrochloride 15 mg, net price 28 = £4.59; 30 mg, 28 = £6.95

1. For exemptions see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)

ORCIPRENALINE SULPHATE

Indications reversible airways obstruction, but see notes above

Cautions see section 3.1.1.1 and notes above; **interactions:** Appendix 1 (sympathomimetics)

Side-effects see section 3.1.1.1 and notes above

Dose

- 20 mg 4 times daily; CHILD up to 1 year 5–10 mg 3 times daily, 1–3 years 5–10 mg 4 times daily, 3–12 years 40–60 mg daily in divided doses

Alupent® (Boehringer Ingelheim) PoM

Syrup, sugar-free, orciprenaline sulphate 10 mg/5 mL, net price 300 mL = £2.00

3.1.2 Antimuscarinic bronchodilators

Ipratropium can provide short-term relief in chronic asthma, but short-acting beta$_2$ agonists act more quickly and are preferred. Ipratropium by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy (see Acute Asthma table, p. 152).

The aerosol inhalation of ipratropium can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Tiotropium, a long-acting antimuscarinic bronchodilator, is effective for the management of chronic obstructive pulmonary disease; it is not suitable for the relief of acute bronchospasm.

Cautions Antimuscarinic bronchodilators should be used with caution in patients with prostatic hyperplasia, bladder outflow obstruction, and those susceptible to angle-closure glaucoma (see below); **interactions:** Appendix 1 (antimuscarinics)

Glaucoma *Acute angle-closure glaucoma* reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta$_2$ agonists); care needed to protect patient's eyes from nebulised drug or from drug powder.

Side-effects Dry mouth is the most common side-effect of antimuscarinic bronchodilators; less commonly nausea and headache occur. Constipation, tachycardia, palpitation, paradoxical bronchospasm, urinary retention, blurred vision, angle-closure glaucoma, and hypersensitivity reactions including rash, urticaria, pruritus, and angioedema occur rarely.

IPRATROPIUM BROMIDE

Indications reversible airways obstruction, particularly in chronic obstructive pulmonary disease; rhinitis (section 12.2.2)

Cautions see notes above; pregnancy (see p. 153 and Appendix 4); breast-feeding (see p. 153 and Appendix 5)

Side-effects see notes above

Dose

- By aerosol inhalation, 20–40 micrograms, 3–4 times daily; CHILD up to 6 years 20 micrograms 3 times daily, 6–12 years 20–40 micrograms 3 times daily
- By inhalation of powder, ADULT and CHILD over 12 years, 40 micrograms 3–4 times daily (may be doubled in less responsive patients)
- By inhalation of nebulised solution, reversible airways obstruction in chronic obstructive pulmonary disease, 250–500 micrograms 3–4 times daily

  Acute bronchospasm (see also Acute Asthma table, p. 152), 500 micrograms repeated as necessary; CHILD under 5 years 125–250 micrograms, max. 1 mg daily; 6–12 years 250 micrograms, max. 1 mg daily

  Counselling Advise patient not to exceed prescribed dose and to follow manufacturer's directions

Ipratropium Bromide (Non-proprietary) PoM

Nebuliser solution, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £6.75, 60 × 1-mL = £21.78; 20 × 2-mL (500-microgram) = £7.43, 60 × 2-mL = £26.97. If dilution is necessary use only sterile sodium chloride 0.9%

Atrovent® (Boehringer Ingelheim) PoM

Aerocaps® (dry powder for inhalation; for use with *Atrovent Aerohaler®*), green, ipratropium bromide 40 micrograms, net price pack of 100 caps with *Aerohaler®* = £14.53; 100 caps = £10.53. Counselling, dose

Note One *Atrovent Aerocap®* is equivalent to 2 puffs of *Atrovent®* metered aerosol inhalation

Aerosol inhalation ▼, ipratropium bromide 20 micrograms/metered inhalation, net price 200-dose unit = £5.05. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL unit-dose vials = £4.14, 60 × 1-mL vials = £12.44; 20 × 2-mL vials = £4.87, 60 × 2-mL vials = £14.59. If dilution is necessary use only sterile sodium chloride 0.9%

Ipratropium Steri-Neb® (IVAX) PoM

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £8.72; 20 × 2-mL (500-microgram) = £9.94. If dilution is necessary use only sterile sodium chloride 0.9%

Respontin® (A&H) PoM

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £4.87; 20 × 2-mL (500-microgram) = £5.72. If dilution is necessary use only sterile sodium chloride 0.9%

Compound ipratropium preparations
Section 3.1.4

TIOTROPIUM

Indications maintenance treatment of chronic obstructive pulmonary disease

Cautions see notes above; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; *less commonly* taste disturbance, dysphonia, and dizziness; *rarely* gastrointestinal reflux, and epistaxis

Dose

- See under preparations below

Spiriva® (Boehringer Ingelheim) PoM

Inhalation powder, hard capsule (for use with *HandiHaler®* device), green, tiotropium (as tiotropium bromide monohydrate) 18 micrograms, net price 30-cap pack with *HandiHaler®* device = £36.27, 30-cap refill = £33.17

Dose by inhalation of powder, ADULT over 18 years, 18 micrograms once daily

Respimat® (solution for inhalation) ▼, tiotropium (as tiotropium bromide monohydrate) 2.5 micrograms/metered inhalation, net price 60-dose unit = £36.27

Dose by inhalation, ADULT over 18 years, 5 micrograms (2 puffs) once daily

Note The *Scottish Medicines Consortium* has advised (November 2007) that *Spiriva Respimat®* is restricted for use in chronic obstructive pulmonary disease in patients who have poor manual dexterity and difficulty using the *Handihaler®* device

3.1.3 Theophylline

Theophylline is a xanthine used as a bronchodilator in *asthma* and stable *chronic obstructive pulmonary disease*; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. It may have an additive effect when used in conjunction with small doses of beta$_2$ agonists; the combination may increase the risk of side-effects, including hypokalaemia (for CSM advice see p. 155).

Theophylline is metabolised in the liver; there is considerable variation in plasma-theophylline concentration particularly in smokers, in patients with hepatic impairment or heart failure, or if certain drugs are taken concurrently. The plasma-theophylline concentration is *increased* in heart failure, cirrhosis, viral infections, in the elderly, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is *decreased* in smokers and in chronic alcoholism and by drugs that induce liver metabolism. For other interactions of theophylline see Appendix 1.

Differences in the half-life of theophylline are important because its toxic dose is close to the therapeutic dose; particular care is required when introducing or withdrawing drugs that interact with theophylline. In most individuals a plasma-theophylline concentration of between 10–20 mg/litre is required for satisfactory bronchodilation, although a plasma-theophylline concentration of 10 mg/litre (or less) may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Theophylline is given by injection as **aminophylline**, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe attacks of asthma. It must be given by **very slow** intravenous injection (over at least 20 minutes); it is too irritant for intramuscular use. Measurement of plasma theophylline concentration may be helpful, and is **essential** if aminophylline is to be given to patients who have been taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.

Caffeine is a xanthine derivative used as a respiratory stimulant in neonatal apnoea, see section 3.5.1.

THEOPHYLLINE

Indications reversible airways obstruction, acute severe asthma; see also Management of Chronic and Acute Asthma (p. 151 and p. 152)

Cautions cardiac disease, hypertension, hyperthyroidism; peptic ulcer; epilepsy; elderly; fever; **CSM** advice on hypokalaemia risk, p. 155; avoid in acute porphyria (section 9.8.2); monitor plasma-theophylline concentration (see notes above); hepatic impairment (Appendix 2); pregnancy (see p. 153 and Appendix 4); breast-feeding (see p. 153 and Appendix 5); **interactions:** Appendix 1 (theophylline) and notes above

Side-effects tachycardia, palpitation, nausea and other gastro-intestinal disturbances, headache, CNS stimulation, insomnia, arrhythmias, and convulsions especially if given rapidly by intravenous injection; **overdosage:** see Emergency Treatment of Poisoning, p. 33

Dose

- See below

Note Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); 4–6 hours after a dose and at least 5 days after starting treatment; narrow margin between therapeutic and toxic dose, see also notes above

Modified release

Note The rate of absorption from modified-release preparations can vary between brands. The Council of the Royal Pharmaceutical Society of Great Britain advises pharmacists that if a general practitioner prescribes a modified-release oral theophylline preparation without specifying a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

Nuelin SA® (3M)

SA tablets, m/r, theophylline 175 mg, net price 60-tab pack = £3.19. Label: 21, 25

Dose 175–350 mg every 12 hours; CHILD 6–12 years 175 mg every 12 hours

SA 250 tablets, m/r, scored, theophylline 250 mg, net price 60-tab pack = £4.46. Label: 21, 25

Dose 250–500 mg every 12 hours; CHILD 6–12 years 125–250 mg every 12 hours

Slo-Phyllin® (Merck)

Capsules, m/r, theophylline 60 mg (white/clear, enclosing white pellets), net price 56-cap pack = £2.76; 125 mg (brown/clear, enclosing white pellets), 56-cap pack = £3.48; 250 mg (blue/clear, enclosing white pellets), 56-cap pack = £4.34. Label: 25, or counselling, see below

Dose 250–500 mg every 12 hours; CHILD 2–6 years 60–120 mg every 12 hours, 6–12 years 125–250 mg every 12 hours

Counselling Swallow whole with fluid *or* swallow enclosed granules with soft food (e.g. yoghurt)

Uniphyllin Continus® (Napp)

Tablets, m/r, scored, theophylline 200 mg, net price 56-tab pack = £3.00; 300 mg, 56-tab pack = £4.77; 400 mg, 56-tab pack = £5.42. Label: 25

Dose 200 mg every 12 hours, increased according to response to 400 mg every 12 hours; CHILD 2–12 years, 9 mg/kg (up to 200 mg) every 12 hours; some children with chronic asthma may require 10–16 mg/kg (max. 400 mg) every 12 hours

Note May be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

AMINOPHYLLINE

Note Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water

Indications reversible airways obstruction, acute severe asthma

Cautions see under Theophylline

Side-effects see under Theophylline; also allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis

Dose

- See under preparations, below

Note Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); measure plasma-theophylline concentration 4–6 hours after dose by mouth and at least 5 days after starting oral treatment; measure plasma-theophylline concentration 4–6 hours after the start of intravenous infusion; narrow margin between therapeutic and toxic dose, see also notes above

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height

Aminophylline (Non-proprietary) PoM

Injection, aminophylline 25 mg/mL, net price 10-mL amp = 90p

Brands include *Minijet® Aminophylline*

Dose acute severe asthma or acute exacerbation of chronic obstructive pulmonary disease **not** previously treated with theophylline, by slow intravenous injection over at least 20 minutes (with close monitoring), 250–500 mg (5 mg/kg), then see below; CHILD 5 mg/kg, then see below

Acute severe asthma or acute exacerbation of chronic obstructive pulmonary disease, by intravenous infusion (with close monitoring), 500 micrograms/kg/hour, adjusted according to plasma-theophylline concentration; CHILD 6 months–9 years 1 mg/kg/hour, 10–16 years 800 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Note Patients taking oral theophylline or aminophylline should not normally receive intravenous aminophylline unless plasma-theophylline concentration is available to guide dosage

Modified release

Note Advice about modified-release theophylline preparations on p. 160 also applies to modified-release aminophylline preparations

Phyllocontin Continus® (Napp)

Tablets, m/r, yellow, f/c, aminophylline hydrate 225 mg, net price 56-tab pack = £2.44. Label: 25

Dose ADULT and CHILD body-weight over 40 kg initially 1 tablet twice daily, increased after 1 week to 2 tablets twice daily according to plasma-theophylline concentration

Note Brands of modified-release tablets containing aminophylline 225 mg include *Norphyllin® SR*

Forte tablets, m/r, yellow, f/c, aminophylline hydrate 350 mg, net price 56-tab pack = £4.22. Label: 25

Dose initially 1 tablet twice daily, increased after 1 week to 2 tablets twice daily if necessary

Note *Phyllocontin Continus® Forte* tablets are for smokers and other patients with shorter theophylline half-life (see notes above)

3.1.4 Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta$_2$ agonist (section 3.1.1.1) or ipratropium bromide (section 3.1.2), so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

For **cautions, contra-indications** and **side-effects** see under individual drugs.

Combivent® (Boehringer Ingelheim) PoM

Nebuliser solution, isotonic, ipratropium bromide 500 micrograms, salbutamol (as sulphate) 2.5 mg/2.5-mL vial, net price 60 unit-dose vials = £24.10

Dose bronchospasm in chronic obstructive pulmonary disease, by inhalation of nebulised solution, ADULT and CHILD over 12 years, 1 vial (2.5 mL) 3–4 times daily

Glaucoma In addition to other potential side-effects acute angle-closure glaucoma has been reported with nebulised ipratropium—for details, see p. 159

Duovent® (Boehringer Ingelheim) PoM

Nebuliser solution, isotonic, fenoterol hydrobromide 1.25 mg, ipratropium bromide 500 micrograms/4-mL vial, net price 20 unit-dose vials = £8.00

Dose acute severe asthma or acute exacerbation of chronic asthma, by inhalation of nebulised solution, ADULT and CHILD over 14 years, 1 vial (4 mL); may be repeated up to max. 4 vials in 24 hours

Glaucoma In addition to other potential side-effects acute angle-closure glaucoma has been reported with nebulised ipratropium—for details, see p. 159

3.1.5 Peak flow meters, inhaler devices and nebulisers

Peak flow meters

Measurement of peak flow is particularly helpful for patients who are 'poor perceivers' and hence slow to detect deterioration in their asthma, and for those with moderate or severe asthma.

Standard-range peak flow meters are suitable for both adults and children; low-range peak flow meters are appropriate for severely restricted airflow in adults and children. Patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Standard Range Peak Flow Meter

Conforms to standard EN 13826

MicroPeak®, range 60–800 litres/minute, net price = £6.50, replacement mouthpiece = 38p (Micro Medical)

Mini-Wright®, range 60–800 litres/minute, net price = £6.86, replacement mouthpiece = 38p (Clement Clarke)

Personal Best®, range 60–800 litres/minute, net price = £6.48, replacement mouthpiece = 25p (Respironics)

Piko-1®, range 15–999 litres/minute, net price = £9.50, replacement mouthpiece = 38p (nSPIRE Health)

Pocketpeak®, range 60–800 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health)

Vitalograph®, range 50–800 litres/minute, net price = £4.50 (children's coloured version also available), replacement mouthpiece = 40p (Vitalograph)

Note Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used

Low Range Peak Flow Meter

Compliant to standard EN 13826 except for scale range

Mini-Wright®, range 30–400 litres/minute, net price = £6.90, replacement mouthpiece = 38p (Clement Clarke)

Pocketpeak®, range 50–400 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health)

Note Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used

Drug delivery devices

Inhaler devices These include *pressurised metered-dose inhalers*, *breath-actuated inhalers*, and *dry powder inhalers*. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. *Spacer devices* (see below) can help such patients because they remove the need to coordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

NICE guidance

Inhaler devices for children with chronic asthma (children under 5 years, August 2000; children 5–15 years, March 2002)

A child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

For children aged under 5 years:

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered [but see notes above].

For children aged 5–15 years:

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

Spacer devices Spacer devices remove the need for co-ordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 151), for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (*Volumatic®*) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleansed once a month by washing in mild detergent and then allowed to dry in air; the mouthpiece should be wiped clean of detergent before use. More frequent cleaning should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Able Spacer® (Clement Clarke)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price standard device = £4.20; with infant, child or adult mask = £6.86

AeroChamber® Plus (GSK)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price standard device (blue) = £4.43, with mask (blue) = £7.40; infant device (orange) with mask = £7.40; child device (yellow) with mask = £7.40

Babyhaler® (A&H) NHS

Spacer device, for paediatric use with *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers, net price = £11.34

Haleraid® (A&H) NHS

Inhalation aid, device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers. Available as *Haleraid®-120* for 120-dose inhalers and *Haleraid®-200* for 200-dose inhalers, net price = 80p

Nebuchamber® (AstraZeneca)

Spacer device, for use with *Pulmicort®* aerosol inhalers, net price = £8.56

Optichamber® (Respironics)

Spacer device, for use with all pressurised (aerosol) inhalers, net price = £4.28; with small or medium mask = £7.40 NHS

PARI Vortex Spacer® (Pari)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price with mouthpiece = £6.07 NHS; with mask for infant or child = £7.91; with adult mask = £9.97 NHS

Pocket Chamber® (nSPIRE Health)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price = £4.18; with infant, small, medium, or large mask = £9.75

Volumatic® (A&H)

Spacer inhaler, large-volume device. For use with *Clenil Modulite®*, *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers, net price = £2.75; with paediatric mask = £2.75

Nebulisers

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta$_2$ agonist or ipratropium to a patient with an *acute exacerbation* of asthma or of chronic obstructive pulmonary disease;
- to deliver a beta$_2$ agonist or ipratropium on a *regular basis* to a patient with severe asthma or reversible airways obstruction who has been shown to benefit from regular treatment with higher doses;
- to deliver *prophylactic medication* such as a corticosteroid to a patient unable to use other inhalational devices (particularly to a young child);
- to deliver an antibiotic (such as colistin) to a patient with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide to a child with severe croup;
- to deliver pentamidine for the prophylaxis and treatment of pneumocystis pneumonia.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution (antibiotic solutions usually being more viscous).

Some jet nebulisers are able to increase drug output during inspiration and hence increase efficiency.

The patient should be aware that the dose of a bronchodilator given by nebulisation is usually **much higher** than that from an aerosol inhaler.

The British Thoracic Society has advised that nebulised bronchodilators are appropriate for patients with chronic persistent asthma or those with severe acute asthma. In chronic persistent asthma, nebulised bronchodilators should only be used to relieve persistent daily wheeze (see Chronic Asthma table p. 151). The British Thoracic Society has recommended that the use of nebulisers in chronic persistent asthma should be considered only:

- after a review of the diagnosis;
- if the airflow obstruction is significantly reversible by bronchodilators without unacceptable side-effects;
- after the patient has been using the usual hand-held inhaler correctly;
- after a larger dose of bronchodilator from a hand-held inhaler (with a spacer if necessary) has been tried for at least 2 weeks;
- if the patient is complying with the prescribed dose and frequency of anti-inflammatory treatment including regular use of high-dose inhaled corticosteroid.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor peak flow for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from doctor, specialist nurse or pharmacist on the use of the nebuliser and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- receive an education program;
- have regular follow up including peak-flow monitoring and be seen by doctor, specialist nurse or physiotherapist.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients with *chronic obstructive pulmonary disease and hypercapnia*, oxygen can be dangerous and the nebuliser should be driven by air (see also p. 155). In exacerbations of chronic obstructive pulmonary disease, the nebuliser should be driven by compressed air in hypercapnia or acidosis. If oxygen is required, it should be given simultaneously by nasal cannula.

Important: the Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Medix Lifecare Nebuliser Chamber® (Medix) NHS

Jet nebuliser, disposable; for use with bronchodilators, antimuscarinics, corticosteroids, and antibacterials, replacement recommended every 2–3 months if used 4 times a day. Compatible with *AC 2000 Hi Flo®* NHS, *World Traveller Hi Flo®* NHS, and *Econoneb®* NHS, net price = £1.00

Medix Lifecare Nebuliser System® (Medix) NHS

Jet nebuliser, consisting of mouthpiece, tubing, and nebuliser chamber, net price = £2.00; mask kits with tubing and nebuliser chamber also available, net price (adult) = £2.00; (child) = £2.10

PARI LC® SPRINT (Pari) NHS

Jet nebuliser, non-disposable, for hospital or home use; for use with bronchodilators, antibacterials, and corticosteroids, replacement recommended yearly if used 4 times a day. Compatible with *PARI TurboBOY® S* NHS, *PARI JuniorBOY® S* NHS, *PARI BOY® Mobile S* NHS, and *PARI WALK BOY®* NHS compressors, net price = £16.05

PARI LC® SPRINT BABY (Pari) NHS

Jet nebuliser, non-disposable, for hospital or home use; for use with bronchodilators, antibacterials and corticosteroids; replacement recommended yearly if used 4 times a day. Compatible with *PARI TurboBOY® S* NHS, *PARI JuniorBOY® S* NHS, *PARI BOY® Mobile S* NHS, *PARI WALK BOY®* NHS compressors. Available separately for children aged less than 1 year, 1–4 years or 4–7 years, net price (with mask and connection tube) = £32.15

Sidestream Durable® (Profile Respiratory) NHS

Jet nebuliser, non-disposable, for home use; for use with bronchodilators; yearly replacement recommended if 4 six-minute treatments used per day. Compatible with *Freeway Freedom®* NHS and *Porta-Neb®* NHS, net price year pack = £20.40 (*Porta-Neb®*), £29.00 (*Freeway Freedom®*). *Disposable Sidestream®* NHS nebuliser also available

Ventstream® (Profile Respiratory) NHS

Jet nebuliser, closed-system, for use with low flow compressors, compatible with *Porta-Neb®* NHS, and *Freeway Freedom®* NHS compressors; for use with antibacterials, bronchodilators, and corticosteroids, replacement recommended yearly if used 3 times a day, net price year pack with filter = £39.00 (*Porta-Neb®*), £41.00 (*Freeway Freedom®*)

Home compressors with nebulisers

AC 2000 HI FLO® (Medix) NHS

Home and hospital use, containing 1 *Jet Nebuliser®* NHS set with mouthpiece, 1 adult and 1 child mask,1 spare inlet filter, filter spanner. Mains operated. Nebulises bronchodilators, corticosteroids, and antibacterials, net price = £117.00; carrying case available

AC 4000® (Medix) NHS

Home and hospital use, containing 1 *Jet Nebuliser®* NHS set with mouthpiece, 1 adult and 1 child face mask, 1 spare inlet filter, filter spanner. Mains operated. Nebulises bronchodilators, corticosteroids, and antibacterials, net price = £80.10

Aquilon® (Henleys) NHS

Portable, home use, with 1 adult or 1 child mask and tubing. Mains operated; for use with bronchodilators, corticosteroids and antibacterials, net price = £82.50

Econoneb® (Medix) NHS

Home, clinic and hospital use, used with 1 *Jet Nebuliser®* NHS set with mouthpiece, 1 adult and 1 child mask, 1 spare inlet filter, filter spanner. Nebulises bronchodilators, corticosteroids, and antibacterials. Mains operated, net price = £99.00

Freeway Freedom® (Profile Respiratory) NHS

Portable, containing *Sidestream Durable®* NHS nebuliser, 1 adult mask, 1 child mask, 1 angled mouthpiece, 1 coiled *Duratube®*, 4 inlet filters, charger and power lead, net price = £203.20; with *Ventstream®* NHS nebuliser, 1 straight mouthpiece, 1 coiled *Duratube®*, 4 inlet filters, 1 aerosol hose, charger and power lead, net price = £203.20

PARI JuniorBOY® S (Pari) NHS

Portable, for hospital or home use, containing *PARI LC® SPRINT Junior* NHS nebuliser with child mouthpiece, mask, connection tube, and mains cable. Filter replacement recommended every 12 months. Compatible with *PARI LC® SPRINT* NHS, and *PARI LC® SPRINT BABY* NHS nebulisers, net price = £70.00

PARI TurboBOY® S (Pari) NHS

Portable, for hospital or home use, containing *PARI® SPRINT* NHS nebuliser with adult mouthpiece, mask, connection tube and mains cable. Filter replacement recommended every 12 months. Compatible with *PARI LC® SPRINT* NHS, and *PARI LC® SPRINT BABY* NHS nebulisers, net price = £65.00

PARI BOY® Mobile S (Pari) NHS

Portable, containing *PARI LC® SPRINT* NHS nebuliser with connection tube, mains cable, rechargeable battery, car battery adaptor, and carrying case. Compatible with *PARI LC® SPRINT BABY* NHS nebuliser. Nebulises bronchodilators, corticosteroids, and antibacterials, net price = £180.00

Porta-Neb® (Profile Respiratory) NHS

Portable, containing *Sidestream Durable®* NHS nebuliser, 1 adult mask, 1 child mask, 1 angled mouthpiece, 1 coiled *Duratube®*, 4 inlet filters. Mains operated, net price = £94.00; with *Ventstream®* NHS nebuliser, 1 straight mouthpiece, 1 coiled *Duratube®*, 4 inlet filters, aerosol hose. Mains operated, net price = £104.80

De Vilbiss 5650® (De Vilbiss) NHS

Home, clinic use, containing disposable nebuliser set, mouthpiece, mask, mains lead, tubing, thumb-valve. For use with bronchodilators, net price = £142.14

De Vilbiss 4650® (De Vilbiss) NHS

Home, clinic and hospital use, with mouthpiece. Mains operated, net price = £93.95

Tourer® (Henleys) NHS

Portable, home use, mains/car battery operated; for use with bronchodilators, corticosteroids and antibacterials, net price = £101.25

Ultima® (Henleys) NHS

Portable, home use, rechargable or mains/car battery operated. Nebulises bronchodilators and corticosteroids, net price = £156.00 (includes case)

World Traveller HI FLO® (Medix) NHS

Portable, containing 1 *Jet Nebuliser®* NHS set with mouthpiece, 1 adult and 1 child mask, 1 spare inlet filter, filter spanner. Battery, car, and mains operated; rechargeable battery pack available. Nebulises bronchodilators, corticosteroids, and antibacterials, net price excluding battery = £166.00; with battery = £216.00; carrying case available

Compressors

Omron CX3® (Omron) NHS

Home and hospital use, mains operated, net price = £48.75

Omron compAIR CX^{Pro}® (Omron) NHS

Home and hospital use, mains operated, net price = £56.78 (includes 1 adult mask, child mask, 5 spare filters, and carrying case)

System 22 CR60® (Profile Respiratory) NHS

Hospital use, high flow compressor. Mains operated, net price = £199.90. Also compatible with *System 22 Antibiotic Tee®* NHS for nebulisation of high viscosity drugs such as antibacterials

Turboneb® (Medix) NHS

Hospital use, high flow compressor. Nebulises bronchodilators, corticosteroids, antibacterials, and pentamidine. Mains operated, net price = £125.00

Ultrasonic nebulisers

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow

F16 Wave® (Parkside) NHS

Portable, adjustable delivery rate. Mains/car battery operated or rechargeable battery pack (supplied), net price = £130.00

Liberty® (Medix) NHS

Portable, home and clinic use, containing disposable mouthpiece and chamber cover. Mains and car battery operated. Nebulises bronchodilators and antibacterials, net price £112.49

Omron MicroAIR® (Omron) NHS

Portable, battery operated, net price = £149.96 (includes 1 adult mask, 1 child mask, and carrying case; mains adaptor also available)

Omron NE-U17® (Omron) NHS

Clinic and hospital use, mains operated, net price = £650.17

Ultra Neb 2000® (De Vilbiss) NHS

Hospital, clinic, and home use, delivery rate adjustable. Supplied with stand, net price = £1205.00

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

Sodium Chloride (Non-proprietary) PoM

Nebuliser solution, sodium chloride 0.9%, net price 20 × 2.5 mL = £8.95

Brands include *Saline Steripoule®*, *Saline Steri-Neb®*

3.2 Corticosteroids

Corticosteroids are used for the management of reversible and irreversible airways disease. An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

Asthma Corticosteroids are effective in *asthma*; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta$_2$ agonist more than twice a week, or if symptoms disturb sleep more than once a week, or if the patient has suffered exacerbations in the last 2 years requiring a systemic corticosteroid or a nebulised bronchodilator (see Management of Chronic Asthma table, p. 151). *Regular use* of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. **Beclometasone dipropionate** (beclomethasone dipropionate), **budesonide**, **fluticasone propionate**, and **mometasone furoate** appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta$_2$ agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta$_2$ agonist for the prophylaxis of asthma, but who are poorly controlled, (see step 3 of the table on p. 151) *Symbicort*® (budesonide with formoterol) can be used as a reliever (instead of a short-acting beta$_2$ agonist), in addition to its regular use for the prophylaxis of asthma. *Symbicort*® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily[1], but who are poorly controlled (see step 2 of the table on p. 151). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy, see *Symbicort*® p. 168. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. This management approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta$_2$ agonists.

Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta$_2$ agonist or another long-acting bronchodilator (see Management of Chronic Asthma table, p. 151). High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Systemic corticosteroid therapy may be necessary during episodes of infection or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of tablets.

Chronic obstructive pulmonary disease In *chronic obstructive pulmonary disease* inhaled corticosteroid treatment may reduce exacerbations. An inhaled corticosteroid [unlicensed indication] should be considered (in addition to bronchodilator treatment) if the forced expiratory volume in 1 second (FEV_1) is less than 50% of the predicted value and if the patient has had 2 or more exacerbations in a year which require antibacterial treatment or an oral corticosteroid.

Cautions of inhaled corticosteroids Systemic therapy may be required during periods of stress or when either airways obstruction or mucus prevent drug access to smaller airways. For advice on the use of corticosteroids in women with asthma who are pregnant or breast-feeding, see p. 153, and Appendix 4 and Appendix 5; **interactions:** Appendix 1 (corticosteroids)

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta$_2$ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

CFC-free inhalers Chlorofluorocarbon (CFC) propellants in pressurised aerosol inhalers are being replaced by hydrofluoroalkane (HFA) propellants. Patients receiving CFC-free inhalers should be reassured about the efficacy of the new inhalers and counselled that the aerosol may feel and taste different; any difficulty with the new inhaler should be discussed with the doctor or pharmacist.

Doses for CFC-free corticosteroid inhalers may be different from those that contain CFCs, see also MHRA/CHM advice below.

MHRA/CHM advice (July 2008)

- Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (*Qvar*® and *Clenil Modulite*®) are **not** interchangeable and should be prescribed by brand name; *Qvar*® has extra-fine particles, is more potent than traditional CFC-containing inhalers, and is approximately twice as potent as *Clenil Modulite*®;
- *Fostair*® is a combination beclometasone dipropionate and formoterol fumarate CFC-free pressurised metered-dose inhaler; *Fostair*® has extra-fine particles and is more potent than traditional beclometasone dipropionate CFC-free inhalers.

Side-effects of inhaled corticosteroids Inhaled corticosteroids have considerably fewer systemic

1. For standard doses of other inhaled corticosteroids, see Management of Chronic Asthma table, p. 151.

effects than oral corticosteroids (section 6.3.2), but adverse effects have been reported.

High doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 151) used for prolonged periods can induce adrenal suppression. Inhaled corticosteroids have been associated with adrenal crisis and coma in children; excessive doses should be **avoided**. Patients using high doses of inhaled corticosteroids should be given a 'steroid card' (section 6.3.2) and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation.

High doses of inhaled corticosteroid have been associated with lower respiratory tract infections, including pneumonia, in older patients with chronic obstructive pulmonary disease.

Bone mineral density may be reduced following long-term inhalation of higher doses of corticosteroids, predisposing patients to osteoporosis (section 6.6). It is therefore sensible to ensure that the dose of an inhaled corticosteroid is no higher than necessary to keep a patient's asthma under good control. Treatment with an inhaled corticosteroid can usually be stopped after a mild exacerbation as long as the patient knows that it is necessary to reinstate it should the asthma deteriorate or the peak flow rate fall.

In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. However, the CSM has recommended that the height of children receiving prolonged treatment of inhaled corticosteroid is monitored; if growth is slowed, referral to a paediatrician should be considered. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 5 years (see NICE guidance, section 3.1.5); they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

A small risk of glaucoma with prolonged high doses of inhaled corticosteroids has been reported; cataracts have also been reported with inhaled corticosteroids. Hoarseness and candidiasis of the mouth or throat have been reported, usually only with large doses (see also below). Hypersensitivity reactions (including rash and angioedema) have been reported rarely. Other side-effects that have been reported very rarely include paradoxical bronchospasm, anxiety, depression, sleep disturbances, and behavioural changes including hyperactivity and irritability.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water (or cleaning a child's teeth) after inhalation of a dose may also be helpful. Antifungal oral suspension or lozenges (section 12.3.2) can be used to treat oral candidiasis without discontinuing therapy.

Oral An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose, e.g. prednisolone 40–50 mg daily for a few days. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly in a mild exacerbation of asthma (see also Withdrawal of Corticosteroids, section 6.3.2) but it should be reduced gradually in those with poorer asthma control, to reduce the possibility of serious relapse. For the use of corticosteroids in the emergency treatment of acute severe asthma, see Management of Acute Asthma table, p. 152.

In chronic continuing asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. In chronic obstructive pulmonary disease prednisolone 30 mg daily should be given for 7–14 days; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

Parenteral For the use of hydrocortisone injection in the emergency treatment of acute severe asthma, see Management of Acute Asthma table, p. 152.

BECLOMETASONE DIPROPIONATE

(Beclomethasone Dipropionate)

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 151)

Cautions see notes above

Side-effects see notes above

Dose

- By aerosol inhalation, see Management of Chronic Asthma table, p. 151 (**important:** for *Clenil Modulite®* and *Qvar®*, see under preparations)
- By inhalation of dry powder (**important:** for *Asmabec®* and *Becodisks®*, see under preparations), 200–400 micrograms twice daily; adjusted as necessary up to 800 micrograms twice daily; CHILD over 5 years 100–200 micrograms twice daily, adjusted as necessary

Beclometasone (Non-proprietary) PoM

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £4.57; 100 micrograms/metered inhalation, 200-dose unit = £5.95; 200 micrograms/metered inhalation, 200-dose unit = £16.58; 250 micrograms/metered inhalation, 200-dose unit = £12.58. Label: 8, counselling, dose; also 10 and steroid card with high doses

Excipients include CFC propellants

Brands include *Beclazone®*

Dry powder for inhalation, beclometasone dipropionate 100 micrograms/metered inhalation, net price 100-dose unit = £5.36; 200 micrograms/metered inhalation, 100-dose unit = £9.89, 200-dose unit = £15.60; 400 micrograms/metered inhalation, 100-dose unit = £19.61. Label: 8, counselling, dose; also 10 and steroid card with high doses

Brands include *Pulvinal® Beclometasone Dipropionate, Easyhaler® Beclometasone Dipropionate*

Inhalation powder, hard capsule (for use with *Cyclohaler®* device), beclometasone dipropionate 100 micrograms, net price 120-cap pack = £15.99; 200 micrograms, 120-cap pack = £25.00; 400 micrograms, 120-cap pack = £32.25. Label: 8, counselling, dose; also 10 and steroid card with high doses
Brands include *Beclometasone Cyclocaps®*

Asmabec Clickhaler® (UCB Pharma) PoM
Dry powder for inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £6.42; 100 micrograms/metered inhalation, 200-dose unit = £9.43; 250 micrograms/metered inhalation, 100-dose unit = £11.83. Label: 8, counselling, dose; also 10 and steroid card with high doses
Dose by inhalation of powder, prophylaxis of asthma, 100–400 micrograms twice daily, adjusted as necessary; max. 1 mg twice daily; CHILD 6–12 years 50–200 micrograms twice daily, adjusted as necessary

Becodisks® (A&H) PoM
Dry powder for inhalation, disks containing 8 blisters of beclometasone dipropionate 100 micrograms/blister, net price 15 disks with *Diskhaler®* device = £11.53, 15-disk refill = £10.97; 200 micrograms/blister, 15 disks with *Diskhaler®* device = £21.98, 15-disk refill = £21.41; 400 micrograms/blister, 15 disks with *Diskhaler®* device = £43.38, 15-disk refill = £42.83. Label: 8, counselling, dose; also 10 and steroid card with high doses
Dose by inhalation of powder, prophylaxis of asthma, 400 micrograms twice daily, adjusted as necessary to 800 micrograms twice daily; CHILD 5–12 years 100–200 micrograms twice daily, adjusted as necessary

Clenil Modulite® (Chiesi) ▼ PoM
Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £3.70; 100 micrograms/metered inhalation = £7.42; 200 micrograms/metered inhalation = £16.17; 250 micrograms/metered inhalation = £16.29. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)
Dose by aerosol inhalation, 200–400 micrograms twice daily, adjusted as necessary up to 1 mg twice daily; CHILD under 12 years 100–200 micrograms twice daily
Note *Clenil Modulite®* is not interchangeable with other CFC-free beclometasone dipropionate inhalers; the MHRA has advised (August 2006 and July 2008) that CFC-free beclometasone dipropionate inhalers should be prescribed by brand name
Dental prescribing on NHS *Clenil Modulite®* 50 micrograms/metered inhalation may be prescribed

Qvar® (IVAX) PoM
Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)
Autohaler® (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)
Easi-Breathe® (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose = £7.74; 100 micrograms/metered inhalation, 200-dose = £16.95. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)
Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 50–200 micrograms twice daily, increased if necessary to max. 400 micrograms twice daily
Important When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar®* should be prescribed for:

- 200–250 micrograms of beclometasone dipropionate or budesonide
- 100 micrograms of fluticasone propionate

When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar®* should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of *Qvar®* should be adjusted according to response
Note The MHRA has advised (August 2006 and July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name

Compound preparations

Fostair® (Chiesi) ▼ PoM
Aerosol inhalation, beclometasone dipropionate 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £29.32. Label: 8, counselling, dose, 10, steroid card
Excipients include HFA-134a (a non-CFC propellant)
Dose by aerosol inhalation, asthma, ADULT over 18 years, 1–2 puffs twice daily; max. 4 puffs daily
When switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, *Fostair® 100/6* can be prescribed for patients already using beclometasone dipropionate 250 micrograms in a CFC-containing inhaler; the dose of *Fostair®* should be adjusted according to response
Note The MHRA has advised (August 2006 and July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name

BUDESONIDE

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 151); croup
Cautions see notes above
Side-effects see notes above
Dose

- See preparations below

Budesonide (Non-proprietary) PoM
Dry powder for inhalation, budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £9.25; 200 micrograms/metered inhalation, 200-dose unit = £18.50; 400 micrograms/metered inhalation, 100-dose unit = £18.50. Label: 8, counselling, dose; also 10 and steroid card with high doses
Brands include *Easyhaler® Budesonide*
Inhalation powder, hard capsule (for use with *Cyclohaler®* device), budesonide 200 micrograms, net price 100-cap pack = £15.48; 400 micrograms, 50-cap pack = £15.48. Label: 8, counselling, dose; also 10 and steroid card with high doses
Brands include *Budesonide Cyclocaps®*
Dose by inhalation of powder, ADULT and CHILD over 12 years, 100–800 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms (max. 800 micrograms) as a single dose in the evening; CHILD 6–12 years 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Novolizer® (Viatris) ▼ PoM

Dry powder for inhalation, budesonide 200 micrograms, net price refillable inhaler device and 100-dose cartridge = £14.86; 100-dose refill cartridge = £9.59. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose by inhalation of powder, ADULT and CHILD over 12 years, 200–800 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms (max. 800 micrograms) as a single dose in the evening; CHILD 6–12 years 200–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Pulmicort ® (AstraZeneca) PoM

Aerosol inhalation ▼, budesonide 100 micrograms/metered inhalation, net price 120-dose unit = £9.60; 200 micrograms/metered inhalation, 120-dose unit = £13.20. Label: 8, counselling, dose, change to CFC-free inhaler; also 10 and steroid card with high doses

Excipients include HFA–134a (a non-CFC propellant)

Dose by aerosol inhalation, ADULT and CHILD over 12 years, 100–400 micrograms twice daily, adjusted as necessary; max. 800 micrograms twice daily; CHILD 2–12 years, 100–400 micrograms twice daily adjusted as necessary

Turbohaler® (= dry powder inhaler), budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £18.50; 200 micrograms/metered inhalation, 100-dose unit = £18.50; 400 micrograms/metered inhalation, 50-dose unit = £18.50. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose by inhalation of powder, ADULT and CHILD over 12 years, 100–800 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms (max. 800 micrograms) as a single dose in the evening; CHILD 5–12 years 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Respules® (= single-dose units for nebulisation), budesonide 250 micrograms/mL, net price 20 × 2-mL (500-microgram) unit = £32.00; 500 micrograms/mL, 20 × 2-mL (1-mg) unit = £44.64. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, dose, 10, steroid card

Dose prophylaxis of asthma, by inhalation of nebulised suspension, ADULT and CHILD over 12 years, 1–2 mg twice daily, reduced to 0.5–1 mg twice daily; CHILD 3 months–12 years, 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily

Croup, by inhalation of nebulised solution, 2 mg as a single dose (*or* as two 1-mg doses separated by 30 minutes)

Compound preparations

Symbicort® (AstraZeneca) PoM

Symbicort 100/6 Turbohaler® (= dry powder inhaler), budesonide 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £33.00. Label: 8, counselling, dose

Dose by inhalation of powder, asthma maintenance therapy, 1–2 puffs twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained; CHILD 6–12 years, 2 puffs twice daily reduced to 1 puff once daily if control maintained; 12–17 years, 1–2 puffs twice daily reduced to 1 puff once daily if control maintained

Asthma, maintenance and reliever therapy, (but see notes above, p. 165) ADULT over 18 years, 2 puffs daily in 1–2 divided doses; for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs can be used for a limited time but medical assessment should be considered

Symbicort 200/6 Turbohaler® (= dry powder inhaler), budesonide 200 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £38.00. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose by inhalation of powder, asthma maintenance therapy, 1–2 puffs twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained; CHILD 12–17 years 1–2 puffs twice daily reduced to 1 puff once daily if control maintained

Asthma, maintenance and reliever therapy, (but see notes above, p. 165.) ADULT over 18 years, 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs can be used for a limited time but medical assessment should be considered

Chronic obstructive pulmonary disease, 2 puffs twice daily

Symbicort 400/12 Turbohaler® (= dry powder inhaler), budesonide 400 micrograms, formoterol fumarate 12 micrograms/metered inhalation, net price 60-dose unit = £38.00. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose by inhalation of powder, asthma maintenance therapy, 1 puff twice daily increased if necessary to max. 2 puffs twice daily, reduced to 1 puff once daily if control maintained; CHILD 12–17 years 1 puff twice daily reduced to 1 puff once daily if control maintained

Chronic obstructive pulmonary disease, 1 puff twice daily

CICLESONIDE

Indications prophylaxis of asthma

Cautions see notes above

Side-effects see notes above

Dose

- By aerosol inhalation, ADULT and CHILD over 12 years, 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained

Alvesco® (Nycomed) ▼ PoM

Aerosol inhalation, ciclesonide 80 micrograms/metered inhalation, net price 120-dose unit = £28.56; 160 micrograms/metered inhalation, 60-dose unit = £16.80, 120-dose unit = £33.60. Label: 8, counselling, dose

Excipients include HFA-134a (a non-CFC propellant)

FLUTICASONE PROPIONATE

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 151)

Cautions see notes above

Side-effects see notes above; also *very rarely* dyspepsia, hyperglycaemia, and arthralgia

Dose

- See preparations below

Flixotide® (A&H) PoM

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 50 micrograms/blister with *Accuhaler®* device, net price = £6.38; 100 micrograms/blister with *Accuhaler®* device = £8.93; 250 micrograms/blister with *Accuhaler®* device = £21.26; 500 micrograms/blister with *Accuhaler®* device = £36.14. Label: 8, counselling, dose; also label 10 and steroid card with high doses

Note *Flixotide Accuhaler®* 250 micrograms and 500 micrograms are not indicated for children

Dose by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily, increased according to severity of asthma (max. 1 mg twice daily); CHILD 5–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Diskhaler® (dry powder for inhalation), fluticasone propionate 100 micrograms/blister, net price 15 disks of 4 blisters with *Diskhaler®* device = £12.71, 15-disk refill = £12.18; 250 micrograms/blister, 15 disks of 4 blisters with *Diskhaler®* device = £24.11, 15-disk refill = £23.58; 500 micrograms/blister, 15 disks of 4 blisters with *Diskhaler®* device = £40.05, 15-disk refill = £39.52. Label: 8, counselling, dose; also label 10 and steroid card with high doses

Note *Flixotide Diskhaler®* 250 micrograms and 500 micrograms are not indicated for children

Dose by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily, increased according to severity of asthma (max. 1 mg twice daily); CHILD 5–16 years, 100–200 micrograms twice daily

Evohaler® *aerosol inhalation*, fluticasone propionate 50 micrograms/metered inhalation, net price 120-dose unit = £5.44; 125 micrograms/metered inhalation, 120-dose unit = £21.26; 250 micrograms/metered inhalation, 120-dose unit = £36.14. Label: 8, counselling, dose, change to CFC-free inhaler; also label 10 and steroid card with high doses

Excipients include HFA-134a (a non-CFC propellant)

Note *Flixotide Evohaler®* 125 micrograms and 250 micrograms not indicated for children

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily, increased according to severity of asthma (max. 1 mg twice daily); CHILD 4–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Nebules® (= single-dose units for nebulisation), fluticasone propionate 250 micrograms/mL, net price 10 × 2-mL (500-microgram) unit = £9.34; 1 mg/mL, 10 × 2-mL (2-mg) unit = £37.35. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, dose, 10, steroid card

Dose by inhalation of nebulised suspension, prophylaxis of asthma, ADULT and CHILD over 16 years, 0.5–2 mg twice daily; CHILD 4–16 years, 1 mg twice daily

Compound preparations

Seretide® (A&H) PoM

Seretide 100 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 100 micrograms, salmeterol (as xinafoate) 50 micrograms/blister with *Accuhaler®* device, net price = £31.19. Label: 8, counselling, dose

Dose by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 5 years, 1 blister twice daily, reduced to 1 blister once daily if control maintained

Seretide 250 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 250 micrograms, salmeterol (as xinafoate) 50 micrograms/blister with *Accuhaler®* device, net price = £35.00. Label: 8, counselling, dose, 10, steroid card

Dose by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 12 years, 1 blister twice daily

Seretide 500 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 500 micrograms, salmeterol (as xinafoate) 50 micrograms/blister with *Accuhaler®* device, net price = £40.92. Label: 8, counselling, dose, 10, steroid card

Dose by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 12 years, 1 blister twice daily

Chronic obstructive pulmonary disease, ADULT 1 blister twice daily

Note The *Scottish Medicines Consortium* has advised (February 2008) that *Seretide 500 Accuhaler®* is **not** recommended for use within NHS Scotland for chronic obstructive pulmonary disease in patients with a forced expiratory volume in 1 second (FEV_1) less than 60% and greater than 50% of the predicted normal value, with significant symptoms despite regular bronchodilator therapy, and a history of repeated exacerbations

Seretide 50 Evohaler® (aerosol inhalation), fluticasone propionate 50 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £18.00. Label: 8, counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 5 years, 2 puffs twice daily, reduced to 2 puffs once daily if control maintained

Seretide 125 Evohaler® (aerosol inhalation), fluticasone propionate 125 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £35.00. Label: 8, counselling, dose, change to CFC-free inhaler, 10, steroid card

Excipients include HFA-134a (a non-CFC propellant)

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 2 puffs twice daily

Seretide 250 Evohaler® (aerosol inhalation), fluticasone propionate 250 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £59.48. Label: 8, counselling, dose, change to CFC-free inhaler, 10, steroid card

Excipients include HFA-134a (a non-CFC propellant)

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 2 puffs twice daily

MOMETASONE FUROATE

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 151)

Cautions see notes above

Side-effects see notes above; also pharyngitis, headache; *less commonly* palpitation

Dose

- By inhalation of powder, 200–400 micrograms as a single dose in the evening or in 2 divided doses; dose increased to 400 micrograms twice daily if necessary; CHILD not recommended

Asmanex® (Schering-Plough) ▼ PoM

Twisthaler (= dry powder inhaler), mometasone furoate 200 micrograms/metered inhalation, net price 30-dose unit = £15.70, 60-dose unit = £23.54; 400 micrograms/metered inhalation, 30-dose unit = £21.78, 60-dose unit = £36.05. Label: 8, counselling, dose, 10, steroid card

Note The *Scottish Medicines Consortium* has advised (November 2003) that *Asmanex®* is restricted for use following failure of first-line inhaled corticosteroids

3.3 Cromoglicate and related therapy and leukotriene receptor antagonists

3.3.1 Cromoglicate and related therapy
3.3.2 Leukotriene receptor antagonists

3.3.1 Cromoglicate and related therapy

The mode of action of **sodium cromoglicate** and **nedocromil** is not completely understood. They may be of

value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, *prophylaxis* with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations (see Chronic Asthma table, p. 151). There is evidence of efficacy of nedocromil in children aged 5–12 years. Sodium cromoglicate is of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be assessed.

If inhalation of sodium cromoglicate causes bronchospasm, a selective beta$_2$ agonist such as salbutamol or terbutaline should be inhaled a few minutes beforehand.

SODIUM CROMOGLICATE

(Sodium Cromoglycate)

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 151); food allergy (section 1.5.4); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

Cautions discontinue if eosinophilic pneumonia occurs

Side-effects coughing, transient bronchospasm, and throat irritation; *very rarely* hypersensitivity reactions (including angioedema); rhinitis and headache also reported

Dose

- By aerosol inhalation, ADULT and CHILD over 5 years, 10 mg (2 puffs) 4 times daily, increased if necessary to 6–8 times daily; or additional dose may also be taken before exercise; maintenance, 5 mg (1 puff) 4 times daily

Intal® (Sanofi-Aventis) PoM

Aerosol inhalation, sodium cromoglicate 5 mg/metered inhalation, net price 112-dose unit = £14.84. Label: 8, counselling, change to CFC-free inhaler

Excipients include HFA-227 (a non-CFC propellant)

NEDOCROMIL SODIUM

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 151)

Side-effects see under Sodium Cromoglicate; also headache, nausea, vomiting, dyspepsia and abdominal pain; bitter taste (masked by mint flavour)

Dose

- By aerosol inhalation, ADULT and CHILD over 6 years 4 mg (2 puffs) 4 times daily, when control achieved may be possible to reduce to twice daily

Counselling Regular use is necessary

Tilade CFC-free Inhaler® (Sanofi-Aventis) ▼ PoM

Aerosol inhalation, mint-flavoured, nedocromil sodium 2 mg/metered inhalation. Net price 112-dose unit = £39.94. Label: 8, counselling, change to CFC-free inhaler

Excipients include HFA-227 (a non-CFC propellant)

3.3.2 Leukotriene receptor antagonists

The leukotriene receptor antagonists, **montelukast** and **zafirlukast**, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid (see Chronic Asthma table, p. 151). Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Churg-Strauss syndrome has occurred very rarely in association with the use of leukotriene receptor antagonists; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. The CSM has advised that prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

MONTELUKAST

Indications prophylaxis of asthma, see notes above and Chronic Asthma table, p. 151; symptomatic relief of seasonal allergic rhinitis in patients with asthma

Cautions pregnancy (see p. 150 and Appendix 4); breast-feeding (see p. 150 and Appendix 5); **interactions:** Appendix 1 (leukotriene receptor antagonists)

Side-effects abdominal pain, thirst; hyperkinesia (in young children), headache; *very rarely* Churg-Strauss syndrome (see notes above); dry mouth, diarrhoea, dyspepsia, nausea, vomiting, hepatic disorders, palpitation, oedema, increased bleeding, hypersensitivity reactions (including anaphylaxis and skin reactions), depression, suicidal thoughts and behaviour, tremor, asthenia, dizziness, hallucinations, paraesthesia, hypoaesthesia, sleep disturbances, abnormal dreams, agitation, aggression, seizures, arthralgia, and myalgia, also reported

Dose

- Prophylaxis of asthma, ADULT and CHILD over 15 years, 10 mg once daily in the evening; CHILD 6 months–6 years 4 mg once daily in the evening, 6–15 years 5 mg once daily in the evening
- Seasonal allergic rhinitis, ADULT and CHILD over 15 years, 10 mg once daily in the evening

Singulair® (MSD) PoM

Chewable tablets, pink, cherry-flavoured, montelukast (as sodium salt) 4 mg, net price 28-tab pack = £25.69; 5 mg, 28-tab pack = £25.69. Label: 23, 24

Excipients include aspartame equivalent to phenylalanine 674 micrograms/4-mg tablet and 842 micrograms/5-mg tablet (section 9.4.1)

Granules, montelukast (as sodium salt) 4 mg, net price 28-sachet pack = £25.69. Counselling, administration

Counselling Granules may be swallowed or mixed with cold food (but not fluid) and taken immediately

Tablets, beige, f/c, montelukast (as sodium salt) 10 mg, net price 28-tab pack = £26.97

Note The *Scottish Medicines Consortium* has advised (June 2007) that *Singulair®* chewable tablets and granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent

asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; *Singulair®* chewable tablets and granules should be initiated by a specialist in paediatric asthma

ZAFIRLUKAST

Indications prophylaxis of asthma, see notes above and Chronic Asthma table, p. 151

Cautions elderly, renal impairment (Appendix 3); pregnancy (see p. 153 and Appendix 4); **interactions:** Appendix 1 (leukotriene receptor antagonists)

Hepatic disorders Patients or their carers should be told how to recognise development of liver disorder and advised to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise, or jaundice develop

Contra-indications hepatic impairment; breast-feeding (see p. 153 and Appendix 5)

Side-effects gastro-intestinal disturbances, headache, insomnia, malaise; *rarely* bleeding disorders, hypersensitivity reactions including angioedema and skin reactions, arthralgia, myalgia, hepatitis, hyperbilirubinaemia, thrombocytopenia; *very rarely* Churg-Strauss syndrome (see notes above), agranulocytosis

Dose

- ADULT and CHILD over 12 years, 20 mg twice daily

Accolate® (AstraZeneca) PoM

Tablets, f/c, zafirlukast 20 mg, net price 56-tab pack = £17.75. Label: 23

3.4 Antihistamines, hyposensitisation, and allergic emergencies

3.4.1 Antihistamines
3.4.2 Allergen Immunotherapy
3.4.3 Allergic emergencies

3.4.1 Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye (section 11.4.2), in the nose (section 12.2.1), and on the skin (section 13.3).

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine (chlorpheniramine) or promethazine are used as an adjunct to adrenaline (epinephrine) in the emergency treatment of anaphylaxis and angioedema (section 3.4.3). For the use of antihistamines (including cinnarizine, cyclizine, and promethazine teoclate) in nausea and vomiting, see section 4.6. Buclizine is included as an anti-emetic in a preparation for migraine (section 4.7.4.1). For reference to the use of antihistamines for occasional insomnia, see section 4.1.1.

All older antihistamines cause sedation but **alimemazine** (trimeprazine) and **promethazine** may be more sedating whereas **chlorphenamine** and **cyclizine** (section 4.6) may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, 'sedating' antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as **cetirizine**, **desloratadine** (an active metabolite of loratadine), **fexofenadine** (an active metabolite of terfenadine), **levocetirizine** (an isomer of cetirizine), **loratadine**, and **mizolastine** cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

Cautions and contra-indications Sedating antihistamines have significant antimuscarinic activity and they should therefore be used with caution in prostatic hypertrophy, urinary retention, susceptibility to angle-closure glaucoma, and pyloroduodenal obstruction. Antihistamines should be used with caution in hepatic disease (Appendix 2). Caution may be required in epilepsy. Children and the elderly are more susceptible to side-effects. Many antihistamines should be avoided in acute porphyria but some are thought to be safe, see section 9.8.2. **Interactions:** Appendix 1 (antihistamines).

Side-effects Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines (see also notes above). Side-effects that are more common with the older antihistamines include headache, psychomotor impairment, and antimuscarinic effects such as urinary retention, dry mouth, blurred vision, and gastro-intestinal disturbances.

Other rare side-effects of antihistamines include hypotension, palpitation, arrhythmias, extrapyramidal effects, dizziness, confusion, depression, sleep disturbances, tremor, convulsions, hypersensitivity reactions (including bronchospasm, angioedema, and anaphylaxis, rashes, and photosensitivity reactions), blood disorders, liver dysfunction, and angle-closure glaucoma.

Non-sedating antihistamines

Driving Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. driving); excess alcohol should be avoided.

CETIRIZINE HYDROCHLORIDE

Indications symptomatic relief of allergy such as hay fever, chronic idiopahtic urticaria

Cautions see notes above; also renal impairment (Appendix 3)

Contra-indications see notes above; also pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above

Dose

- ADULT and CHILD over 6 years, 10 mg once daily *or* 5 mg twice daily; CHILD 1–2 years see *BNF for Children*, 2–6 years, hay fever, 5 mg once daily *or* 2.5 mg twice daily

Cetirizine (Non-proprietary)

Tablets, cetirizine hydrochloride 10 mg, net price 30-tab pack = 97p. Counselling, driving

Dental prescribing on NHS Cetirizine 10 mg tablets may be prescribed

Oral solution, cetirizine hydrochloride 5 mg/5 mL, net price 200 mL = £2.20. Counselling, driving

DESLORATADINE

Note Desloratadine is a metabolite of loratadine

Indications symptomatic relief of allergic rhinitis and urticaria

Cautions see notes above; also renal impairment (Appendix 3)

Contra-indications see notes above; also hypersensitivity to loratadine; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; *rarely* myalgia; *very rarely* hallucinations

Dose

- 5 mg once daily; CHILD 1–6 years 1.25 mg once daily, 6–12 years 2.5 mg once daily

Neoclarityn® (Schering-Plough) PoM

Tablets, blue, f/c, desloratadine 5 mg, net price 30-tab pack = £6.90. Counselling, driving

Oral solution, desloratadine 2.5 mg/5 mL, net price 100 mL (bubblegum-flavour) = £6.90, 150 mL = £10.35. Counselling, driving

FEXOFENADINE HYDROCHLORIDE

Note Fexofenadine is a metabolite of terfenadine

Indications see under Dose

Cautions see notes above; also pregnancy (Appendix 4)

Contra-indications see notes above; also breast-feeding (Appendix 5)

Side-effects see notes above

Dose

- Seasonal allergic rhinitis, 120 mg once daily; CHILD 6–12 years, 30 mg twice daily
- Chronic idiopathic urticaria, ADULT and CHILD over 12 years, 180 mg once daily

Fexofenadine (Non-proprietary) PoM

Tablets, f/c, fexofenadine hydrochloride 120 mg, net price 30-tab pack = £6.00; 180 mg, 30-tab pack = £7.60. Label: 5, counselling, driving

Telfast® (Aventis Pharma) PoM

Tablets, f/c, peach, fexofenadine hydrochloride 30 mg, net price 60-tab pack = £5.46; 120 mg, 30-tab pack = £5.99; 180 mg, 30-tab pack = £7.58. Label: 5, counselling, driving

LEVOCETIRIZINE HYDROCHLORIDE

Note Levocetirizine is an isomer of cetirizine

Indications symptomatic relief of allergy such as hay fever, urticaria

Cautions see notes above; also renal impairment (avoid if eGFR less than 10 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above; *very rarely* weight gain

Dose

- ADULT and CHILD over 6 years, 5 mg once daily; CHILD 2–6 years 1.25 mg twice daily

Xyzal® (UCB Pharma) PoM

Tablets, f/c, levocetirizine hydrochloride 5 mg, net price 30-tab pack = £4.39. Counselling, driving

Oral solution, levocetirizine hydrochloride 2.5 mg/5 mL, net price 200 mL = £6.00. Counselling, driving

LORATADINE

Indications symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

Cautions see notes above

Contra-indications see notes above; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Side-effects see notes above

Dose

- ADULT and CHILD over 6 years 10 mg once daily; CHILD 2–6 years 5 mg once daily

Loratadine (Non-proprietary)

Tablets, loratadine 10 mg, net price 30-tab pack = £1.28. Counselling, driving

Dental prescribing on NHS Loratadine 10 mg may be prescribed

Syrup, loratadine 5 mg/5 mL, net price 100 mL = £5.16. Counselling, driving

MIZOLASTINE

Indications symptomatic relief of allergy such as hay fever, urticaria

Cautions see notes above

Contra-indications see notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia); significant hepatic impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Side-effects see notes above; weight gain; anxiety, asthenia; *less commonly* arthralgia and myalgia

Dose

- ADULT and CHILD over 12 years, 10 mg once daily

Mizollen® (Sanofi-Aventis) PoM

Tablets, m/r, f/c, scored, mizolastine 10 mg, net price 30-tab pack = £5.77. Label: 25, counselling, driving

Sedating antihistamines

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); sedating effects enhanced by alcohol.

ALIMEMAZINE TARTRATE
(Trimeprazine tartrate)

Indications urticaria and pruritus, premedication

Cautions see notes above; pregnancy (Appendix 4); see also section 4.2.1

Contra-indications see notes above; also renal impairment; breast-feeding (Appendix 5); see also section 4.2.1

Side-effects see notes above; see also section 4.2.1

Dose

- Urticaria and pruritus, 10 mg 2–3 times daily, in severe cases up to max. 100 mg daily has been used; ELDERLY 10 mg 1–2 times daily; CHILD under 2 years, see *BNF for Children*, 2–5 years 2.5 mg 3–4 times daily, 5–12 years 5 mg 3–4 times daily
- Premedication, CHILD 2–7 years up to 2 mg/kg 1–2 hours before operation

Vallergan® (Sanofi-Aventis) PoM

Tablets, blue, f/c, alimemazine tartrate 10 mg, net price 28-tab pack = £4.28. Label: 2

Syrup, straw-coloured, alimemazine tartrate 7.5 mg / 5 mL, net price 100 mL = £4.88. Label: 2

Syrup forte, alimemazine tartrate 30 mg/5 mL, net price 100 mL = £7.55. Label: 2

CHLORPHENAMINE MALEATE
(Chlorpheniramine maleate)

Indications symptomatic relief of allergy such as hay fever, urticaria; emergency treatment of anaphylactic reactions (section 3.4.3)

Cautions see notes above; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above; also exfoliative dermatitis and tinnitus reported; injections may cause transient hypotension or CNS stimulation and may be irritant

Dose

- By mouth, 4 mg every 4–6 hours, max. 24 mg daily; CHILD under 1 year see *BNF for Children*, 1–2 years 1 mg twice daily; 2–6 years 1 mg every 4–6 hours, max. 6 mg daily; 6–12 years 2 mg every 4–6 hours, max. 12 mg daily
- By intramuscular injection *or* by intravenous injection over 1 minute, 10 mg, repeated if required up to 4 times in 24 hours; CHILD under 6 months 250 micrograms/kg (max. 2.5 mg), repeated if required up to 4 times in 24 hours; 6 months–6 years 2.5 mg, repeated if required up to 4 times in 24 hours; 6–12 years 5 mg, repeated if required up to 4 times in 24 hours

Chlorphenamine (Non-proprietary)

Tablets, chlorphenamine maleate 4 mg, net price 28 = £1.09. Label: 2

Dental prescribing on NHS Chlorphenamine tablets may be prescribed

Oral solution, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.39. Label: 2

Dental prescribing on NHS Chlorphenamine oral solution may be prescribed

Injection PoM[1], chlorphenamine maleate 10 mg/mL, net price 1-mL amp = £1.62

1. PoM restriction does not apply where administration is for saving life in emergency

Piriton® (GSK Consumer Healthcare)

Tablets, yellow, scored, chlorphenamine maleate 4 mg, net price 28 = £1.62. Label: 2

Syrup, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.39. Label: 2

CLEMASTINE

Indications symptomatic relief of allergy such as hay fever, urticaria

Cautions see notes above; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above

Dose

- 1 mg twice daily, increased up to 6 mg daily if required; INFANT under 1 year not recommended, CHILD 1–3 years 250–500 micrograms twice daily; 3–6 years 500 micrograms twice daily; 6–12 years 0.5–1 mg twice daily

Tavegil® (Novartis Consumer Health)

Tablets, scored, clemastine (as hydrogen fumarate) 1 mg. Net price 60-tab pack = £2.35. Label: 2

CYPROHEPTADINE HYDROCHLORIDE

Indications symptomatic relief of allergy such as hay fever, urticaria; migraine (section 4.7.4.2)

Cautions see notes above; also pregnancy (Appendix 4)

Contra-indications see notes above; also breast-feeding (Appendix 5)

Side-effects see notes above

Dose

- Allergy, usual dose 4 mg 3–4 times daily; usual range 4–20 mg daily, max. 32 mg daily; INFANT under 2 years not recommended, CHILD 2–6 years 2 mg 2–3 times daily, max. 12 mg daily; 7–14 years 4 mg 2–3 times daily, max. 16 mg daily
- Migraine, 4 mg with a further 4 mg after 30 minutes if necessary; maintenance, 4 mg every 4–6 hours

Periactin® (MSD)

Tablets, scored, cyproheptadine hydrochloride 4 mg, net price 30-tab pack = 86p. Label: 2

HYDROXYZINE HYDROCHLORIDE

Indications pruritus; anxiety (short-term)

Cautions see notes above

Contra-indications see notes above; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Side-effects see notes above

Dose

- Pruritus, initially 25 mg at night increased if necessary to 25 mg 3–4 times daily; CHILD 1–6 years initially 5–15 mg at night increased if necessary to 50 mg daily in 3–4 divided doses; 6–12 years initially 15–25 mg at night increased if necessary to 50–100 mg daily in 3–4 divided doses; CHILD under 1 year see *BNF for Children*
- Anxiety (but not recommended), 50–100 mg 4 times daily; CHILD not recommended

Atarax® (Alliance) PoM

Tablets, both s/c, hydroxyzine hydrochloride 10 mg (orange), net price 84-tab pack = £2.18; 25 mg (green), 28-tab pack = £1.17. Label: 2

Ucerax® (UCB Pharma) PoM

Tablets NHS, f/c, scored, hydroxyzine hydrochloride 25 mg, net price 25-tab pack = £1.22. Label: 2

Syrup, hydroxyzine hydrochloride 10 mg/5 mL, net price 200-mL pack = £1.78. Label: 2

KETOTIFEN

Indications allergic rhinitis

Cautions see notes above

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; also excitation, irritability, nervousness; *less commonly* cystitis; *rarely* weight gain; *very rarely* Stevens-Johnson syndrome

Dose

- 1 mg twice daily with food increased if necessary to 2 mg twice daily; initial treatment in readily sedated patients 0.5–1 mg at night; CHILD 3 years and over, 1 mg twice daily

Zaditen® (Novartis) PoM

Tablets, scored, ketotifen (as hydrogen fumarate) 1 mg, net price 60-tab pack = £10.75. Label: 2, 21

Elixir, ketotifen (as hydrogen fumarate), 1 mg/5 mL, net price 300 mL (strawberry-flavoured) = £12.73. Label: 2, 21

PROMETHAZINE HYDROCHLORIDE

Indications symptomatic relief of allergy such as hay fever and urticaria; emergency treatment of anaphylactic reactions; sedation (section 4.1.1); nausea and vomiting (section 4.6)

Cautions see notes above; severe coronary artery disease; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications see notes above

Side-effects see notes above; also restlessness; intramuscular injection may be painful

Dose

- By mouth, 10–20 mg 2–3 times daily; CHILD under 2 years not recommended, 2–5 years 5–15 mg daily in 1–2 divided doses, 5–10 years 10–25 mg daily in 1–2 divided doses
- By deep intramuscular injection, 25–50 mg; max. 100 mg; CHILD 5–10 years 6.25–12.5 mg
- By slow intravenous injection in emergencies, 25–50 mg as a solution containing 2.5 mg/mL in water for injections; max. 100 mg

Phenergan® (Sanofi-Aventis)

Tablets, both blue, f/c, promethazine hydrochloride 10 mg, net price 56-tab pack = £2.85; 25 mg, 56-tab pack = £4.34. Label: 2

Dental prescribing on NHS May be prescribed as Promethazine Hydrochloride Tablets 10 mg or 25 mg

Elixir, golden, promethazine hydrochloride 5 mg/5 mL, net price 100 mL = £2.67. Label: 2

Dental prescribing on NHS May be prescribed as Promethazine Hydrochloride Oral Solution 5 mg/5 mL

Injection PoM[1], promethazine hydrochloride 25 mg/mL, net price 1-mL amp = 67p

Promethazine hydrochloride injection 25 mg/mL (1-mL and 2-mL ampoules) also available from Antigen

1. PoM restriction does not apply where administration is for saving life in emergency

3.4.2 Allergen Immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

Desensitising vaccines should be avoided in pregnant women, in children under five years old, and in those taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore patients need to be monitored for 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have **resolved completely**.

For details of the management of anaphylactic shock, see section 3.4.3.

Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

BEE AND WASP ALLERGEN EXTRACTS

Indications hypersensitivity to wasp or bee venom (see notes above)

Cautions see notes above and consult product literature

CSM advice The CSM has advised that facilities for cardiopulmonary resuscitation must be immediately available and patients monitored closely for one hour after each injection

Contra-indications see notes above and consult product literature

Side-effects consult product literature

Dose

- By subcutaneous injection, consult product literature

Pharmalgen® (ALK-Abelló) PoM

Bee venom extract (*Apis mellifera*) or wasp venom extract (*Vespula* spp.), net price initial treatment set = £59.77 (bee), £73.28 (wasp); maintenance treatment set = £69.54 (bee), £89.45 (wasp)

GRASS AND TREE POLLEN EXTRACTS

Indications treatment of seasonal allergic hay fever due to grass or tree pollen in patients who have failed to respond to anti-allergy drugs (see notes above)

Cautions see notes above and consult product literature

CSM advice The CSM has advised that facilities for cardiopulmonary resuscitation must be immediately available and patients monitored closely for one hour after each injection

Contra-indications see notes above and consult product literature

Side-effects see notes above and consult product literature

Dose

- See under preparations, below

Pollinex® (Allergy) PoM

Grasses and rye or tree pollen extract, net price initial treatment set (3 vials) and extension course treatment (1 vial) = £320.00

Dose By subcutaneous injection, consult product literature

Grass pollen extract

Grazax® (ALK-Abelló) ▼ PoM

Oral lyophilisates (= freeze-dried tablets), grass pollen extract 75 000 units, net price 30-tab pack = £67.50. Counselling, administration

Dose ADULT and CHILD over 5 years, 1 tablet daily; start treatment at least 4 months before start of pollen season and continue for up to 3 years

Counselling Tablets should be placed under the tongue and allowed to disperse

Omalizumab

Omalizumab is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta$_2$ agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma.

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy. Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

For details on the management of anaphylactic shock, see section 3.4.3.

NICE guidance

Omalizumab for severe persistent allergic asthma (November 2007)

Omalizumab is recommended as additional therapy for the prophylaxis of severe persistent allergic asthma in adults and children over 12 years, who cannot be controlled adequately with high-dose inhaled corticosteroids and long-acting beta$_2$ agonists in addition to leukotriene receptor antagonists, theophylline, oral corticosteroids, oral beta$_2$ agonists, and smoking cessation where clinically appropriate. The following conditions apply:

- confirmation of IgE-mediated allergy to a perennial allergen by clinical history and allergy skin testing;
- either 2 or more severe exacerbations of asthma requiring hospital admission within the previous year, or 3 or more severe exacerbations of asthma within the previous year, at least one of which required hospital admission, and a further 2 which required treatment or monitoring in excess of the patient's usual regimen, in an accident and emergency unit.

Omalizumab should be initiated and monitored by a physician experienced in both allergy and respiratory medicine in a specialist centre, and discontinued at 16 weeks in patients who have not shown an adequate response to therapy.

OMALIZUMAB

Indications prophylaxis of allergic asthma (see notes above)

Cautions autoimmune disease; susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic; hepatic impairment; renal impairment; pregnancy (Appendix 4)

Contra-indications breast-feeding (Appendix 5)

Side-effects headache; injection-site reactions; *less commonly* nausea, diarrhoea, dyspepsia, flushing, fatigue, dizziness, drowsiness, paraesthesia, weight gain, influenza-like symptoms, photosensitivity, hypersensitivity reactions (including hypotension, bronchospasm, laryngoedema, rash, pruritus, serum sickness, and anaphylaxis); Churg-Strauss syndrome (see notes above), thrombocytopenia, arthralgia, myalgia, and alopecia also reported

Dose

- By subcutaneous injection, ADULT and CHILD over 12 years, according to immunoglobulin E concentration and body-weight, consult product literature

Xolair® (Novartis) ▼ PoM

Injection, powder for reconstitution, omalizumab, net price 150-mg vial = £256.15 (with solvent)

Excipients include sucrose 108 mg/vial

3.4.3 Allergic emergencies

Adrenaline (epinephrine) provides physiological reversal of the immediate symptoms (such as laryngeal oedema, bronchospasm, and hypotension) associated with hypersensitivity reactions such as *anaphylaxis* and *angioedema*.

Anaphylaxis

Anaphylactic shock requires prompt treatment of *laryngeal oedema*, *bronchospasm*, and *hypotension*. Atopic individuals are particularly susceptible. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow's milk protein, peanuts, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, heparin, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with *additives and excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils.

First-line treatment of anaphylaxis includes securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseated and at risk of vomiting) and administration of **adrenaline** (epinephrine) injection. Adrenaline is given **intramuscularly** in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for *immediate self-administration*. The dose is repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function (**important:** possible need for *intravenous route* using *dilute solution*, see below). High-flow **oxygen** administration (section 3.6) and intravenous fluids (section 9.2.2) are also of primary importance. An antihistamine (e.g. **chlorphenamine**, given by slow intravenous injection or intramuscular injection in a dose of 10 mg, see p. 173) is a useful adjunctive treatment, given after adrenaline injection and continued for 24 to 48 hours according to clinical response to prevent relapse. Patients receiving beta-blockers require special consideration (see under Adrenaline, p. 177).

Continuing respiratory deterioration requires further treatment with **bronchodilators** including inhaled or intravenous salbutamol (see p. 156), inhaled ipratropium (see p. 159), intravenous aminophylline (see p. 161), or intravenous magnesium sulphate [unlicensed indication] (see under Acute Severe Asthma, p. 153); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

An intravenous corticosteroid e.g. **hydrocortisone** (as sodium succinate) in a dose of 200 mg (section 6.3.2) is of secondary value in the initial management of anaphylactic shock because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients and continued for 24 to 48 hours according to clinical response.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline may need to be given as a *dilute solution by the intravenous route*; for details of cautions, dose, and strength, see under Intravenous Adrenaline (Epinephrine), below.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately (see p. 125).

For advice on the management of medical emergencies in dental practice, see p. 21.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis; avoidance of the allergen is the principal treatment.

Intramuscular adrenaline (epinephrine)

The *intramuscular route* is the *first choice route* for the administration of adrenaline (epinephrine) in the management of anaphylactic shock. Adrenaline has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site (the intravenous route should be reserved for extreme emergency when there is doubt about the adequacy of the circulation; for details of cautions, dose and strength see under Intravenous Adrenaline (Epinephrine), below).

Patients with severe allergy should ideally be instructed in the self-administration of adrenaline by intramuscular injection (for details see under Self-administration of Adrenaline (Epinephrine), below).

Prompt injection of adrenaline is of paramount importance. The following adrenaline doses are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

Dose of intramuscular injection of adrenaline (epinephrine) for anaphylactic shock

Age	Dose	Volume of adrenaline **1 in 1000** (1 mg/mL)
Child under 6 years	150 micrograms	0.15 mL[1]
Child 6–12 years	300 micrograms	0.3 mL
Adult and child 12–18 years	500 micrograms	0.5 mL[2]

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

Intravenous adrenaline (epinephrine)

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline (epinephrine) can be given by **slow** *intravenous injection* in a dose of 50 micrograms (0.5 mL of the dilute 1 in 10 000 adrenaline injection) repeated according to response; if multiple doses are required, adrenaline should be given as a **slow** intravenous infusion *stopping when a response has been obtained*; children may respond to as little as 1 microgram/kg (0.01 mL/kg of the dilute 1 in 10 000 adrenaline injection) by **slow** *intravenous injection* over several minutes.

Intravenous adrenaline should be given only by those experienced in its use, in a setting where patients can be carefully monitored; it should only be given to children when intravenous access is already available.

Great vigilance is needed to ensure that the *correct strength* of adrenaline injection is used; anaphylactic shock kits need to make a *very clear distinction* between the 1 in 10 000 strength and the 1 in 1000 strength. It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

For reference to the use of the intravenous route for *cardiac resuscitation*, see section 2.7.3.

Self-administration of adrenaline (epinephrine)

Individuals at considerable risk of anaphylaxis need to carry adrenaline (epinephrine) at all times and need to be *instructed in advance* how to inject it. In addition, the packs need to be labelled so that in the case of rapid collapse someone else is able to administer the adrenaline. It is important to ensure that an adequate supply is provided to treat symptoms until medical assistance is available.

Adrenaline for administration by intramuscular injection is available in 'auto-injectors', pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available). *Anapen®* and *EpiPen®* consist of a fully assembled syringe and needle delivering a dose of 300 micrograms of adrenaline by *intramuscular injection*; 150-microgram versions (*Anapen® Junior*, *EpiPen® Jr*) are also available for use in children.

ADRENALINE/EPINEPHRINE

Indications emergency treatment of acute anaphylaxis; angioedema; cardiopulmonary resuscitation (section 2.7.3); priapism [unlicensed indication] (section 7.4.5)

Cautions heart disease, hypertension, arrhythmias, cerebrovascular disease, phaeochromocytoma; diabetes mellitus, hyperthyroidism; susceptibility to angle-closure glaucoma; elderly

Interactions Severe anaphylaxis in patients taking non-cardioselective beta-blockers may not respond to adrenaline, calling for intravenous salbutamol (see p. 156); adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers. Other **interactions**, see Appendix 1 (sympathomimetics).

Side-effects nausea, vomiting; tachycardia, arrhythmias, palpitation, cold extremities, hypertension (risk of cerebral haemorrhage); dyspnoea, pulmonary oedema (on excessive dosage or extreme sensitivity); anxiety, tremor, restlessness, headache, weakness, dizziness; hyperglycaemia; urinary retention; sweating; tissue necrosis at injection site and angle-closure glaucoma also reported

Dose

- Acute anaphylaxis, by intramuscular injection (preferably midpoint in anterolateral thigh) of 1 in 1000 (1 mg/mL) solution, see notes and table above
- Acute anaphylaxis when there is doubt as to the adequacy of the circulation, by slow intravenous injection of 1 in 10 000 (100 micrograms/mL) solution (extreme caution—specialist use only), see notes above

Important Intravenous route should be used with **extreme care** by specialists only, see p. 176

Intramuscular or subcutaneous

[1]Adrenaline/Epinephrine 1 in 1000 (Non-proprietary) PoM

Injection, adrenaline (as acid tartrate) 1 mg/mL, net price 0.5-mL amp = 49p; 1-mL amp = 52p

[1]Minijet® Adrenaline 1 in 1000 (UCB Pharma) PoM

Injection, adrenaline (as hydrochloride) 1 in 1000 (1 mg/mL), net price 1 mL (with 25 gauge × 0.25 inch needle for subcutaneous injection) = £10.79, 1 mL (with 21 gauge × 1.5 inch needle for intramuscular injection) = £6.36 (both disposable syringes)

Excipients include sulphites

Intravenous

Extreme caution, see notes above

Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary) PoM

Injection, adrenaline (as acid tartrate) 100 micrograms/mL, 10-mL amp, 1-mL and 10-mL prefilled syringe

Minijet® Adrenaline 1 in 10 000 (UCB Pharma) PoM

Injection, adrenaline (as hydrochloride) 1 in 10 000 (100 micrograms/mL), net price 3-mL prefilled syringe = £6.27; 10-mL prefilled syringe = £6.15

Excipients include sulphites

Intramuscular injection for self-administration

Anapen® (Lincoln Medical) PoM

[1]Anapen® 0.3 mg solution for injection (delivering a single dose of adrenaline 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 1.05-mL auto-injector device = £30.67

Excipients include sulphites

Note 0.75 mL of the solution remains in the auto-injector device after use

Dose by intramuscular injection, ADULT and CHILD over 30 kg, 300 micrograms repeated after 10–15 minutes as necessary

Anapen® Junior 0.15 mg solution for injection (delivering a single dose of adrenaline 150 micrograms), adrenaline 500 micrograms/mL (1 in 2000), net price 1.05-mL auto-injector device = £30.67

Excipients include sulphites

Note 0.75 mL of the solution remains in the auto-injector device after use

Dose by intramuscular injection, CHILD 15–30 kg, 150 micrograms repeated after 10–15 minutes as necessary

EpiPen® (ALK-Abelló) PoM

[1]EpiPen® Auto-injector 0.3 mg (delivering a single dose of adrenaline 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 2-mL auto-injector = £29.15

Excipients include sulphites

Note 1.7 mL of the solution remains in the *Auto-injector* after use

Dose by intramuscular injection, ADULT and CHILD over 30 kg, 300 micrograms repeated after 5–15 minutes as necessary

Epipen® Jr Auto-injector 0.15 mg (delivering a single dose of adrenaline 150 micrograms), adrenaline 500 micrograms/mL (1 in 2000), net price 2-mL auto-injector = £29.18

Excipients include sulphites

Note 1.7 mL of the solution remains in the *Auto-injector* after use

Dose by intramuscular injection, CHILD 15–30 kg, 150 micrograms (but on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children) repeated after 5–15 minutes as necessary

1. PoM restriction does not apply to adrenaline injection 1 mg/mL where administration is for saving life in emergency

Angioedema

Angioedema is dangerous if *laryngeal oedema* is present. In this circumstance **adrenaline (epinephrine)** injection and **oxygen** should be given as described under Anaphylaxis (see p. 176); antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

Hereditary angioedema The administration of **C1-esterase inhibitor**, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of *hereditary angioedema*, but is not practical for long-term prophylaxis. **Icatibant** is licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid (section 2.11) and **danazol** (section 6.7.2) [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

C1-ESTERASE INHIBITOR

Indications acute attacks of hereditary angioedema

Cautions pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects *rarely* injection-site reactions, hypersensitivity reactions (including anaphylaxis)

Dose

- By slow intravenous injection or intravenous infusion, ADULT and CHILD 20 units/kg

Berinert® (CSL Behring) ▼ PoM
Injection, powder for reconstitution C1-esterase inhibitor, net price 500-unit vial = £550.00
Electrolytes Na^+ 2.1 mmol/10 mL vial

ICATIBANT

Indications acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency

Cautions ischaemic heart disease, stroke; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea, abdominal pain; nasal congestion; headache, dizziness; asthenia; rash, injection-site reactions; *less commonly* vomiting, weight gain, cough, asthma, fatigue, pyrexia, pharyngitis, flushing, and pruritus

Dose

- By subcutaneous injection, ADULT over 18 years, 30 mg as a single dose, repeated after 6 hours if necessary; a third dose may be given after a further 6 hours (max. 3 doses in 24 hours)

Firazyr® (Jerini) ▼ PoM
Injection, icatibant (as acetate) 10 mg/mL, net price 3-mL prefilled syringe = £1395.00

3.5 Respiratory stimulants and pulmonary surfactants

3.5.1 Respiratory stimulants
3.5.2 Pulmonary surfactants

3.5.1 Respiratory stimulants

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under **expert supervision** in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

Doxapram is given by continuous intravenous infusion. Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

For the use of **caffeine** in the management of neonatal apnoea, see *BNF for Children*.

DOXAPRAM HYDROCHLORIDE

Indications see under Dose

Cautions give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing); give with $beta_2$ agonist in bronchoconstriction; hypertension (avoid if severe), impaired cardiac reserve; hepatic impairment, pregnancy (compelling reasons only); **interactions:** Appendix 1 (doxapram)

Contra-indications severe hypertension, status asthmaticus, coronary artery disease, thyrotoxicosis, epilepsy, physical obstruction of respiratory tract

Side-effects perineal warmth, dizziness, sweating, moderate increase in blood pressure and heart rate; side-effects reported in postoperative period (causal effect not established) include muscle fasciculation, hyperactivity, confusion, hallucinations, cough, dyspnoea, laryngospasm, bronchospasm, sinus tachycardia, bradycardia, extrasystoles, nausea, vomiting and salivation

Dose

- Postoperative respiratory depression, by intravenous injection over at least 30 seconds, 1–1.5 mg/kg repeated if necessary after intervals of 1 hour *or* alternatively by intravenous infusion, 2–3 mg/minute adjusted according to response; CHILD not recommended
- Acute respiratory failure, by intravenous infusion, 1.5–4 mg/minute adjusted according to response (given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions); CHILD not recommended
- Neonatal apnoea, see *BNF for Children*

Dopram® (Anpharm) PoM

Injection, doxapram hydrochloride 20 mg/mL. Net price 5-mL amp = £3.00

Intravenous infusion, doxapram hydrochloride 2 mg/mL in glucose 5%. Net price 500-mL bottle = £21.33

3.5.2 Pulmonary surfactants

Pulmonary surfactants are used in the management of respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. They may also be given prophylactically to those considered at risk of developing the syndrome.

Cautions Continuous monitoring is required to avoid hyperoxaemia caused by rapid improvement in arterial oxygen concentration.

Side-effects Pulmonary haemorrhage has been rarely associated with pulmonary surfactants, especially in more preterm neonates; obstruction of the endotracheal tube by mucous secretions has also been reported.

BERACTANT

Indications treatment of respiratory distress syndrome in preterm neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates less than 32 weeks post-menstrual age

Cautions see notes above

Side-effects see notes above

Dose

- By endotracheal tube, phospholipid 100 mg/kg equivalent to a volume of 4 mL/kg, preferably within 8 hours of birth; may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses

Survanta® (Abbott) PoM

Suspension, beractant (bovine lung extract) providing phospholipid 25 mg/mL, with lipids and proteins, net price 8-mL vial = £306.43

PORACTANT ALFA

Indications treatment of respiratory distress syndrome or hyaline membrane disease in neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates

Cautions see notes above

Side-effects see notes above

Dose

- By endotracheal tube, treatment, 100–200 mg/kg; further doses of 100 mg/kg may be repeated 12 hours later and after further 12 hours if still intubated; max. total dose 300–400 mg/kg; prophylaxis, 100–200 mg/kg soon after birth (preferably within 15 minutes); further doses of 100 mg/kg may be repeated 6–12 hours later and after further 12 hours if still intubated; max. total dose 300–400 mg/kg

Curosurf® (Chiesi) PoM

Suspension, poractant alfa (porcine lung phospholipid fraction) 80 mg/mL, net price 1.5-mL vial = £298.74; 3-mL vial = £580.64

3.6 Oxygen

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near–normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (P_aCO_2), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning (see also Emergency Treatment of Poisoning, p. 35) it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure, see below.

High concentration oxygen therapy, with concentrations of up to 60%, is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (P_aO_2) is usually associated with low or normal arterial carbon dioxide (P_aCO_2), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide (P_aCO_2) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide (P_aCO_2) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently. Where facilities for blood gas measurement are not immediately available, for example while transferring the patient to hospital, 40–60% oxygen delivered through a high-flow mask is recommended.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- cystic fibrosis;
- non-cystic fibrosis bronchiectasis;

- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculsosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Treatment should be initiated in hospital because repeated blood gas measurements are required to determine the correct concentration. Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an *oxygen alert card*, see section 3.1.

Domiciliary oxygen Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts.

Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy (section 4.10) should be tried before home oxygen prescription.

Air travel Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient's requirement should be discussed with the airline before travel.

Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with $P_aO_2 < 7.3$ kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with P_aO_2 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with $P_aO_2 < 7.3$ kPa or persistent disabling breathlessness;
- interstitial lung disease with $P_aO_2 < 8$ kPa and in patients with $P_aO_2 > 8$ kPa with disabling dyspnoea;
- cystic fibrosis when $P_aO_2 < 7.3$ kPa *or* if P_aO_2 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when $P_aO_2 < 8$ kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime $P_aO_2 < 7.3$ kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with 'medium' (2 litres/minute) and 'high' (4 litres/minute) settings.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis (see p. 181). A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is

not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The supplier will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient's consent to pass on the patient's details to the supplier and the fire brigade. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient to use the equipment.

The clinician should send order forms to the supplier by facsimile (see below); a copy of the HOOF should be sent to the Primary Care Trust or Local Health Board. The supplier will continue to provide the service until a revised order is received, or until notified that the patient no longer requires the home oxygen service.

England Eastern South West	BOC Medical *to order*: Tel: 0800 136 603 Fax: 0800 169 9989
North East South East London Kent, Surrey and Sussex South West London Thames Valley, Hampshire and Isle of Wight	Air Liquide *to order*: Tel: 0500 823 773 Fax: 0800 781 4610
North West Yorkshire and Humberside East Midlands West Midlands North London Wales	Air Products *to order*: Tel: 0800 373 580 Fax: 0800 214 709

In **Scotland** refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In **Scotland** and **Northern Ireland** prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

3.7 Mucolytics

Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Mucolytics should be used with caution in those with a history of peptic ulceration because they may disrupt the gastric mucosal barrier.

For reference to dornase alfa and hypertonic saline, see below.

CARBOCISTEINE

Indications reduction of sputum viscosity, see notes above

Cautions see notes above; pregnancy (Appendix 4)

Contra-indications active peptic ulceration

Side-effects *rarely* gastro-intestinal bleeding; hypersensitivity reactions (including rash and anaphylaxis) also reported

Dose

- Initially 2.25 g daily in divided doses, then 1.5 g daily in divided doses as condition improves; CHILD 2–5 years 62.5–125 mg 4 times daily, 5–12 years 250 mg 3 times daily

Carbocisteine (Sanofi-Aventis) PoM

Capsules, carbocisteine 375 mg, net price 120-cap pack = £16.03

Brands include *Mucodyne®*

Oral liquid, carbocisteine 125 mg/5 mL, net price 300 mL = £4.39; 250 mg/5 mL, 300 mL = £5.61

Brands include *Mucodyne® Paediatric* 125 mg/5 mL (cherry- and raspberry-flavoured) and *Mucodyne®* 250 mg/5 mL (cinnamon- and rum-flavoured)

ERDOSTEINE

Indications symptomatic treatment of acute exacerbations of chronic bronchitis

Cautions see notes above; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

Contra-indications breast-feeding (Appendix 5)

Side-effects *very rarely* nausea, vomiting, diarrhoea, abdominal pain, taste disturbance, headache, rash, and urticaria

Dose

- ADULT over 18 years, 300 mg twice daily for up to 10 days

Erdotin® (KoGEN) ▼ PoM

Capsules, yellow/green, erdosteine 300 mg, net price 20-cap pack = £5.75

Note The *Scottish Medicines Consortium* (October 2007) has advised that erdosteine (*Erdotin®*) is not recommended for the symptomatic treatment of acute exacerbations of chronic bronchitis

MECYSTEINE HYDROCHLORIDE
(Methyl Cysteine Hydrochloride)

Indications reduction of sputum viscosity

Cautions see notes above

Contra-indications pregnancy; breast-feeding

Dose

- 200 mg 4 times daily for 2 days, then 200 mg 3 times daily for 6 weeks, then 200 mg twice daily; CHILD 5–12 years 100 mg 3 times daily

Visclair® (Ranbaxy)

Tablets, yellow, s/c, e/c, mecysteine hydrochloride 100 mg, net price 100 = £17.65. Label: 5, 22, 25

Dornase alfa

Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA). It is used in cystic fibrosis and is administered by inhalation using a jet nebuliser (section 3.1.5).

DORNASE ALFA
Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase)

Indications management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

Cautions pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects pharyngitis, voice changes, chest pain; occasionally laryngitis, rashes, urticaria, conjunctivitis

Dose

- ADULT and CHILD over 5 years, by inhalation of nebulised solution (by jet nebuliser), 2500 units (2.5 mg) once daily (patients over 21 years may benefit from twice daily dosage)

Pulmozyme® (Roche) PoM

Nebuliser solution, dornase alfa 1000 units (1 mg)/mL. Net price 2.5-mL (2500 units) vial = £16.88

Note For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable

Hypertonic sodium chloride

Nebulised hypertonic sodium chloride solution is used to mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis).

MucoClear 6%® (Pari)

Nebuliser solution, sodium chloride 6%, net price 20 × 4 mL = £12.98; 60 × 4 mL = £29.98

Dose by inhalation of nebulised solution, 4 mL twice daily

3.8 Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. Inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. Menthol and eucalyptus inhalation is used to relieve sinusitis affecting the maxillary antrum (section 12.2.2)

Children The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% given as nasal drops is preferred.

Benzoin Tincture, Compound, BP (Friars' Balsam)

Tincture, balsamic acids approx. 4.5%. Label: 15

Dose add one teaspoonful to a pint of hot, **not** boiling, water and inhale the vapour

Menthol and Eucalyptus Inhalation, BP 1980

Inhalation, racementhol or levomenthol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL

Dose add one teaspoonful to a pint of hot, **not** boiling, water and inhale the vapour

Dental prescribing on the NHS Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed

Karvol® (Crookes) NHS

Inhalation capsules, levomenthol 35.55 mg, with chlorobutanol, pine oils, terpineol, and thymol, net price 10-cap pack = £2.25; 20-cap pack = £4.06

Inhalation solution, levomenthol 7.9%, with chlorobutanol, pine oils, terpineol, and thymol, net price 12-mL dropper bottle = £1.90

Dose express into handkerchief or add to a pint of hot, **not** boiling, water the contents of 1 capsule or 6 drops of solution; avoid in infants under 3 months

3.9 Cough preparations

3.9.1 Cough suppressants
3.9.2 Expectorant and demulcent cough preparations

3.9.1 Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma (section 3.1.1), gastro-oesophageal reflux disease (section 1.1), or rhinitis (section 12.2.1), which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor (section 2.5.5.1), or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

Codeine may be effective but it is constipating and can cause dependence; **dextromethorphan** and **pholcodine** have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Children The use of cough suppressants containing codeine or similar opioid analgesics is not generally recommended in children and should be avoided altogether in children under 6 years.

MHRA/CHM advice (March 2008 and February 2009) Over-the-counter cough and cold medicines for children

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine, pseudoephedrine, ephedrine, oxymetazoline, or xylometazoline (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

CODEINE PHOSPHATE

Indications dry or painful cough; diarrhoea (section 1.4.2); pain (section 4.7.2)

Cautions see notes above and section 4.7.2

Contra-indications see section 4.7.2

Side-effects see section 4.7.2

[1]Codeine Linctus, BP POM

Linctus (= oral solution), codeine phosphate 15 mg/5 mL. Net price 100 mL = 62p (diabetic, 33p)

Brands include *Galcodine®*

Dose 5–10 mL 3–4 times daily; CHILD (but not generally recommended) 5–12 years, 2.5–5 mL

Note BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied

1. Can be sold to the public provided the maximum single dose does not exceed 5 mL

Codeine Linctus, Paediatric, BP

Linctus (= oral solution), codeine phosphate 3 mg/5 mL. Net price 100 mL = 18p

Brands include *Galcodine® Paediatric* (sugar-free)

Dose CHILD (but not generally recommended) 2–5 years 5 mL 3–4 times daily

Note BP directs that Paediatric Codeine Linctus may be prepared extemporaneously by diluting Codeine Linctus with a suitable vehicle in accordance with the manufacturer's instructions

Other preparations

Tablets, syrup, and injection section 4.7.2

PHOLCODINE

Indications dry or painful cough

Cautions see under Codeine Phosphate

Contra-indications see under Codeine Phosphate

Side-effects see under Codeine Phosphate

Pholcodine Linctus, BP

Linctus (= oral solution), pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1%. Net price 100 mL = 43p

Brands include *Pavacol-D®* (sugar-free), *Galenphol®* (sugar-free)

Dose 5–10 mL 3–4 times daily; CHILD (but not generally recommended, see notes above) 6–12 years 2.5–5 mL

Pholcodine Linctus, Strong, BP

Linctus (= oral solution), pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%. Net price 100 mL = 38p

Dose 5 mL 3–4 times daily

Brands include *Galenphol®*

Galenphol® (Thornton & Ross)

Paediatric linctus (= oral solution), orange, sugar-free, pholcodine 2 mg/5 mL. Net price 90-mL pack = £1.11

Dose CHILD (but not generally recommended, see notes above) 6–12 years 10 mL 3 times daily

Palliative care

Diamorphine and methadone have been used to control distressing cough in terminal lung cancer although morphine is now preferred (see p. 17). In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

METHADONE HYDROCHLORIDE

Indications cough in terminal disease

Cautions see notes in section 4.7.2

Contra-indications see notes in section 4.7.2

Side-effects see notes in section 4.7.2; longer-acting than morphine therefore effects may be cumulative

Dose

- See below

Methadone Linctus CD

Linctus (= oral solution), methadone hydrochloride 2 mg/5 mL in a suitable vehicle with a tolu flavour. Label: 2

Dose 2.5–5 mL every 4–6 hours, reduced to twice daily on prolonged use

MORPHINE HYDROCHLORIDE

Indications cough in terminal disease (see also Prescribing in Palliative Care p. 17)

Cautions see notes in section 4.7.2

Contra-indications see notes in section 4.7.2

Side-effects see notes in section 4.7.2

Dose

- Initially 5 mg every 4 hours

Preparation

Section 4.7.2

3.9.2 Expectorant and demulcent cough preparations

Expectorants are claimed to promote expulsion of bronchial secretions but there is no evidence that any drug can specifically facilitate expectoration. The assumption that sub-emetic doses of expectorants, such as ammonium chloride, ipecacuanha, and squill promote expectoration is a myth. However, a simple expectorant mixture may serve a useful placebo function and has the advantage of being inexpensive.

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as **simple linctus** have the advantage of being harmless and inexpensive; **paediatric simple linctus** is particularly useful in children.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time, see MHRA/CHM advice, p. 183.

Ammonia and Ipecacuanha Mixture, BP

Mixture, ammonium bicarbonate 200 mg, liquorice liquid extract 0.5 mL, ipecacuanha tincture 0.3 mL, concentrated camphor water 0.1 mL, concentrated anise water 0.05 mL, double-strength chloroform water 5 mL, water to 10 mL. It should be recently prepared

Dose ADULT and CHILD over 12 years, 10–20 mL up to 4 times daily

Simple Linctus, BP

Linctus (= oral solution), citric acid monohydrate 2.5% in a suitable vehicle with an anise flavour. Net price 200 mL = 42p

Dose ADULT and CHILD over 12 years 5 mL 3–4 times daily

A sugar-free version is also available

Simple Linctus, Paediatric, BP

Linctus (= oral solution), citric acid monohydrate 0.625% in a suitable vehicle with an anise flavour. Net price 200 mL = 72p

Dose CHILD 1 month–12 years 5–10 mL 3–4 times daily

A sugar-free version is also available

3.10 Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application (section 12.2.2) but they do not give rise to rebound nasal congestion on withdrawal. **Pseudoephedrine** is available over the counter; it has few sympathomimetic effects.

Systemic decongestants should be used with **caution** in diabetes, hypertension, hyperthyroidism, susceptibility to angle-closure glaucoma, prostatic hypertrophy, renal impairment (Appendix 3), pregnancy (Appendix 4), and ischaemic heart disease, and should be **avoided** in patients taking monoamine oxidase inhibitors; **interactions:** Appendix 1 (sympathomimetics).

PSEUDOEPHEDRINE HYDROCHLORIDE

Indications see notes above

Cautions see notes above

Side-effects tachycardia, anxiety, restlessness, insomnia; *rarely* hallucinations, rash; *very rarely* angle-closure glaucoma; urinary retention also reported

Dose

- 60 mg 3–4 times daily; CHILD 6–12 years 30 mg 3–4 times daily

[1] **Galpseud®** (Thornton & Ross)

Tablets, pseudoephedrine hydrochloride 60 mg, net price 20 = £1.06

Linctus, orange, sugar-free, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = 69p

[1] **Sudafed®** (Pfizer Consumer)

Tablets, red, f/c, pseudoephedrine hydrochloride 60 mg, net price 24 = £2.12

Elixir, red, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = £1.55

1. Can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)

4.10 Drugs used in substance dependence 279
4.11 Drugs for dementia 285

4.1 Hypnotics and anxiolytics

4.1.1 Hypnotics
4.1.2 Anxiolytics
4.1.3 Barbiturates

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occurs. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks (see Dependence and Withdrawal, below). Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate and barbiturates (section 4.1.3) are **not** recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

Driving Hypnotics and anxiolytics may impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. See also Drugs and Driving under General Guidance, p. 3.

Dependence and withdrawal Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. Abrupt withdrawal of a barbiturate (section 4.1.3) is even more likely to have serious effects.

The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

A benzodiazepine can be withdrawn in steps of about one-eighth (range one-tenth to one-quarter) of the daily dose every fortnight. A suggested withdrawal protocol for patients who have difficulty is as follows:

1. Transfer patient to equivalent daily dose of diazepam[1] preferably taken at night
2. Reduce diazepam dose every 2–3 weeks in steps of 2 or 2.5 mg; if withdrawal symptoms occur, maintain this dose until symptoms improve
3. Reduce dose further, if necessary in smaller steps;[2] it is better to reduce too slowly rather than too quickly
4. Stop completely; time needed for withdrawal can vary from about 4 weeks to a year or more

Counselling may help; beta-blockers should **only** be tried if other measures fail; antidepressants should be used **only** where depression or panic disorder co-exist or emerge; **avoid** antipsychotics (which may aggravate withdrawal symptoms).

CSM advice

1. Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or subjecting the individual to unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
2. The use of benzodiazepines to treat short-term 'mild' anxiety is inappropriate and unsuitable.
3. Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or subjecting the individual to extreme distress.

4.1.1 Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia.

1. Approximate equivalent doses, diazepam 5 mg
   ≡ chlordiazepoxide 15 mg
   ≡ loprazolam 0.5–1 mg
   ≡ lorazepam 500 micrograms
   ≡ lormetazepam 0.5–1 mg
   ≡ nitrazepam 5 mg
   ≡ oxazepam 15 mg
   ≡ temazepam 10 mg
2. Steps may be adjusted according to initial dose and duration of treatment and can range from diazepam 500 micrograms (one-quarter of a 2-mg tablet) to 2.5 mg

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A rapidly eliminated drug is generally appropriate.

Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine or mirtazapine prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should **not** be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome (section 4.1).

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

Children The prescribing of hypnotics to children, except for occasional use such as for night terrors and somnambulism (sleep-walking), is not justified.

Elderly Hypnotics should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused and so liable to fall and injure themselves.

Dental procedures Some anxious patients may benefit from the use of a hypnotic for 1 to 3 nights before the dental appointment. Hypnotics do not relieve pain, and if pain interferes with sleep an appropriate analgesic should be given. **Diazepam** (section 4.1.2), **nitrazepam** or **temazepam** are used at night for dental patients. Temazepam is preferred when it is important to minimise any residual effect the following day. For information on anxiolytics for dental procedures, see section 15.1.4.1.

Benzodiazepines

Benzodiazepines used as hypnotics include **nitrazepam** and **flurazepam** which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Loprazolam, **lormetazepam**, and **temazepam** act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as **diazepam** given as a single dose at night may effectively treat both symptoms.

For general guidelines on benzodiazepine prescribing see section 4.1.2 and for benzodiazepine withdrawal see section 4.1.

NITRAZEPAM

Indications insomnia (short-term use; see CSM advice, p. 186)

Cautions respiratory disease, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, marked personality disorder, pregnancy (Appendix 4), breast-feeding (Appendix 5); reduce dose in elderly and debilitated, and in hepatic impairment (avoid if severe; Appendix 2) and renal impairment (Appendix 3); avoid prolonged use (and abrupt withdrawal thereafter); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; severe hepatic impairment; sleep apnoea syndrome; not for use alone to treat depression (or anxiety associated with depression) or chronic psychosis

Side-effects drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia may occur; dependence; see also under Diazepam (section 4.1.2); **overdosage:** see Emergency Treatment of Poisoning, p. 32

Dose

- 5–10 mg at bedtime; ELDERLY (or debilitated) 2.5–5 mg; CHILD 1 month–2 years (infantile spasms) see *BNF for Children*

Nitrazepam (Non-proprietary) PoM

Tablets, nitrazepam 5 mg, net price 28 = 96p. Label: 19

Brands include *Mogadon®* NHS, *Remnos®* NHS

Dental prescribing on NHS Nitrazepam Tablets may be prescribed

Oral suspension, nitrazepam 2.5 mg/5 mL. Net price 150 mL = £5.09. Label: 19

Brands include *Somnite®* NHS

FLURAZEPAM

Indications insomnia (short-term use; see CSM advice, p. 186)

Cautions see under Nitrazepam

Contra-indications see under Nitrazepam

Side-effects see under Nitrazepam

Dose

- 15–30 mg at bedtime; ELDERLY (or debilitated) 15 mg; CHILD not recommended

Dalmane® (Valeant) PoM NHS

Capsules, flurazepam (as hydrochloride), 15 mg (grey/yellow), net price 30-cap pack = £5.44; 30 mg (black/grey), 30-cap pack = £6.98. Label: 19

LOPRAZOLAM

Indications insomnia (short-term use; see CSM advice, p. 186)

Cautions see under Nitrazepam

Contra-indications see under Nitrazepam

Side-effects see under Nitrazepam; shorter acting

Dose

- 1 mg at bedtime, increased to 1.5 or 2 mg if required; ELDERLY (or debilitated) 0.5 or 1 mg; CHILD not recommended

Loprazolam (Non-proprietary) PoM

Tablets, loprazolam 1 mg (as mesilate). Net price 28-tab pack = £18.00. Label: 19

LORMETAZEPAM

Indications insomnia (short-term use; see CSM advice, p. 186)

Cautions see under Nitrazepam

Contra-indications see under Nitrazepam

Side-effects see under Nitrazepam; shorter acting

Dose

- 0.5–1.5 mg at bedtime; ELDERLY (or debilitated) 500 micrograms; CHILD not recommended

Lormetazepam (Non-proprietary) PoM

Tablets, lormetazepam 500 micrograms, net price 30-tab pack = £61.76; 1 mg, 30-tab pack = £68.23. Label: 19

TEMAZEPAM

Indications insomnia (short-term use; see CSM advice, p. 186); see also section 15.1.4.1 for perioperative use

Cautions see under Nitrazepam

Contra-indications see under Nitrazepam

Side-effects see under Nitrazepam; shorter acting

Dose

- 10–20 mg at bedtime, exceptional circumstances 30–40 mg; ELDERLY (or debilitated) 10 mg at bedtime, exceptional circumstances 20 mg; CHILD not recommended

Temazepam (Non-proprietary) CD

Tablets, temazepam 10 mg, net price 28-tab pack = £4.62; 20 mg, 28-tab pack = £1.60. Label: 19

Oral solution, sugar-free, temazepam 10 mg/5 mL, net price 300 mL = £24.02. Label: 19

Dental prescribing on NHS Temazepam Tablets or Oral Solution may be prescribed

Zaleplon, zolpidem, and zopiclone

Zaleplon, **zolpidem** and **zopiclone** are non-benzodiazepine hypnotics, but they act at the benzodiazepine receptor. Zolpidem and zopiclone have a short duration of action; zaleplon is very short acting. All three drugs are not licensed for long-term use; dependence has been reported in a small number of patients.

ZALEPLON

Indications insomnia (short-term use—up to 2 weeks)

Cautions respiratory insufficiency (avoid if severe); muscle weakness and myasthenia gravis, history of drug or alcohol abuse; depression (risk of suicidal ideation); avoid prolonged use (risk of tolerance and withdrawal symptoms); hepatic impairment (avoid if severe; Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications sleep apnoea syndrome, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects amnesia, paraesthesia, drowsiness; dysmenorrhea; *less commonly* nausea, anorexia, asthenia, incoordination, confusion, impaired concentration, depression, depersonalisation, dizziness, hallucinations, disturbances of smell, hearing, speech, and vision; photosensitivity; paradoxical effects (see p. 185) and sleep-walking also reported

Dose

- ADULT over 18 years, 10 mg at bedtime or after going to bed if difficulty falling asleep; ELDERLY 5 mg

  Note Patients should be advised not to take a second dose during a single night

Sonata® (Meda) PoM

Capsules, zaleplon 5 mg (white/light brown), net price 14-cap pack = £2.46; 10 mg (white), 14-cap pack = £2.86. Label: 2

ZOLPIDEM TARTRATE

Indications insomnia (short-term use—up to 4 weeks)

Cautions depression, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, hepatic impairment (avoid if severe; Appendix 2); renal impairment; elderly; avoid prolonged use (and abrupt withdrawal thereafter); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, severe hepatic impairment, psychotic illness, pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects diarrhoea, nausea, vomiting, vertigo, dizziness, headache, drowsiness, asthenia, amnesia; dependence, memory disturbances, nightmares, nocturnal restlessness, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 185) and sleep-walking also reported

Dose

- ADULT over 18 years, 10 mg at bedtime; ELDERLY (or debilitated) 5 mg

Zolpidem (Non-proprietary) PoM

Tablets, zolpidem tartrate 5 mg, net price 28-tab pack = £1.63; 10 mg, 28-tab pack = £1.65. Label: 19

Stilnoct® (Sanofi-Synthelabo) PoM

Tablets, both f/c, zolpidem tartrate 5 mg, net price 28-tab pack = £2.96; 10 mg, 28-tab pack = £4.31. Label: 19

ZOPICLONE

Indications insomnia (short-term use—up to 4 weeks)

Cautions elderly; muscle weakness and myasthenia gravis, history of drug abuse, psychiatric illness; avoid prolonged use (risk of tolerance and withdrawal symptoms); hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications marked neuromuscular respiratory weakness including unstable myasthenia gravis, respiratory failure, severe sleep apnoea syndrome; breast-feeding (Appendix 5)

Side-effects taste disturbance; *less commonly* nausea, vomiting; dizziness, drowsiness, dry mouth, headache; *rarely* amnesia, confusion, depression, hallucinations, nightmares; *very rarely* light headedness, incoordination; paradoxical effects (see p. 185) and sleep-walking also reported

Dose

- ADULT over 18 years, 7.5 mg at bedtime; ELDERLY initially 3.75 mg at bedtime increased if necessary

Zopiclone (Non-proprietary) PoM

Tablets, zopiclone 3.75 mg, net price 28-tab pack = £1.56; 7.5 mg, 28-tab pack = £1.54. Label: 19

Zimovane® (Rhône-Poulenc Rorer) PoM

Tablets, f/c, zopiclone 3.75 mg (*Zimovane® LS*), net price 28-tab pack = £2.24; 7.5 mg (scored), 28-tab pack = £3.26. Label: 19

Chloral and derivatives

Chloral hydrate and derivatives were formerly popular hypnotics for children (but the use of hypnotics in children is not usually justified). There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited. **Triclofos** causes fewer gastro-intestinal disturbances than chloral hydrate.

CHLORAL HYDRATE

Indications insomnia (short-term use)

Cautions reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); avoid contact with skin and mucous membranes; hepatic impairment (avoid if severe—Appendix 2); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe cardiac disease, gastritis, severe renal impairment; pregnancy; breast-feeding (Appendix 5); acute porphyria (section 9.8.2)

Side-effects gastric irritation (nausea and vomiting reported), abdominal distention, flatulence, headache, tolerance, dependence, excitement, delirium (especially on abrupt withdrawal), ketonuria, and rash

Dose

- See under preparations below

Chloral Mixture, BP 2000 PoM
(Chloral Oral Solution)
Mixture, chloral hydrate 500 mg/5 mL in a suitable vehicle. Label: 19, 27
Dose 5–20 mL; CHILD 1–12 years 30–50 mg/kg (max. 1 g), taken well diluted with water at bedtime
Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Chloral Elixir, Paediatric, BP 2000 PoM
(Chloral Oral Solution, Paediatric)
Elixir, chloral hydrate 200 mg/5 mL (4%) in a suitable vehicle with a black currant flavour. Label: 1, 27
Dose CHILD 1 month–1 year 30–50 mg/kg, taken well diluted with water at bedtime
Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Cloral betaine

Welldorm® (Alphashow) PoM
Tablets, blue-purple, f/c, cloral betaine 707 mg (≡ chloral hydrate 414 mg). Net price 30-tab pack = £12.10. Label: 19, 27
Dose ADULT and CHILD over 12 years, 1–2 tablets with water or milk at bedtime, max. 5 tablets (chloral hydrate 2 g) daily

Elixir, red, chloral hydrate 143.3 mg/5 mL. Net price 150-mL pack = £8.70. Label: 19, 27
Dose 15–45 mL (chloral hydrate 0.4–1.3 g) with water or milk, at bedtime, max. 70 mL (chloral hydrate 2 g) daily; CHILD 2–12 years, 1–1.75 mL/kg (chloral hydrate 30–50 mg/kg), max. 35 mL (chloral hydrate 1 g) daily

TRICLOFOS SODIUM

Indications insomnia (short-term use)

Cautions avoid prolonged use (and abrupt withdrawal thereafter); elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions**: Appendix 1 (anxiolytics and hypnotics)
Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications cardiac disease; gastritis; acute porphyria (section 9.8.2); pregnancy; breast-feeding (Appendix 5)

Side-effects abdominal distension, flatulence, gastric irritation including nausea and vomiting, dependence, malaise, ataxia, drowsiness, headache, lightheadedness, vertigo, confusion, paranoia, excitement, nightmares, delirium (especially on abrupt withdrawal), ketonuria, blood disorders, skin reactions, and urticaria

Dose
- See under preparation below

Triclofos Oral Solution, BP PoM
(Triclofos Elixir)
Oral solution, triclofos sodium 500 mg/5 mL. Net price 300 mL = £28.23. Label: 19
Dose 10–20 mL (1–2 g triclofos sodium) at bedtime; CHILD up to 1 year 25–30 mg/kg, 1–5 years 2.5–5 mL (250–500 mg triclofos sodium), 6–12 years 5–10 mL (0.5–1 g triclofos sodium)

Clomethiazole

Clomethiazole (chlormethiazole) may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs. It is licensed for use as a hypnotic only in the elderly (and for *very short-term use* in younger adults to attenuate alcohol withdrawal symptoms, section 4.10).

CLOMETHIAZOLE
(Chlormethiazole)

Indications see under Dose; alcohol withdrawal (section 4.10)

Cautions cardiac and respiratory disease (confusional state may indicate hypoxia), chronic pulmonary insufficiency, sleep apnoea syndrome; history of drug abuse; avoid prolonged use (and abrupt withdrawal thereafter); marked personality disorder; elderly; excessive sedation may occur (particularly with higher doses); hepatic impairment (especially if severe because sedation can mask hepatic coma; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (anxiolytics and hypnotics)
Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications acute pulmonary insufficiency; alcohol-dependent patients who continue to drink

Side-effects nasal congestion and irritation (increased nasopharyngeal and bronchial secretions), conjunctival irritation, headache; *rarely* gastro-intestinal disturbances, paradoxical excitement, confusion, dependence, rash, urticaria, bullous eruption, anaphylaxis, alterations in liver enzymes

Dose
- Severe insomnia in the elderly (short-term use), 1–2 capsules (*or* 5–10 mL syrup) at bedtime; CHILD not recommended
- Restlessness and agitation in the elderly, 1 capsule (*or* 5 mL syrup) 3 times daily
- Alcohol withdrawal, initially 2–4 capsules, if necessary repeated after some hours; day 1 (first 24 hours), 9–12 capsules in 3–4 divided doses; day 2, 6–8 capsules in 3–4 divided doses; day 3, 4–6 capsules in 3–4 divided doses; then gradually reduced over days 4–6; total treatment for not more than 9 days

Heminevrin® (AstraZeneca) PoM
Capsules, grey-brown, clomethiazole base 192 mg in an oily basis. Net price 60-cap pack = £4.78. Label: 19
Syrup, sugar-free, clomethiazole edisilate 250 mg/5 mL. Net price 300-mL pack = £4.00. Label: 19
Note For an equivalent therapeutic effect 1 capsule ≡ 5 mL syrup

Antihistamines

Some **antihistamines** (section 3.4.1) such as promethazine are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Promethazine is also popular for use in children, but the use of hypnotics in children is not usually justified.

PROMETHAZINE HYDROCHLORIDE

Indications sedation (short-term use); allergy and urticaria (section 3.4.1); nausea and vomiting (section 4.6)

Cautions section 3.4.1

Contra-indications section 3.4.1

Side-effects section 3.4.1

Dose

- By mouth, 25–50 mg; CHILD 2–5 years 15–20 mg, 5–10 years 20–25 mg
- By deep intramuscular injection, 25–50 mg; CHILD 5–10 years 6.25–12.5 mg

Preparations

Section 3.4.1

Alcohol

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders; **interactions:** Appendix 1 (alcohol).

Sodium oxybate

Sodium oxybate is a central nervous system depressant that is licensed for the treatment of narcolepsy with cataplexy.

SODIUM OXYBATE

Indications narcolepsy with cataplexy (under specialist supervision)

Cautions history of drug abuse or depression; epilepsy; elderly; respiratory disorders; heart failure and hypertension (high sodium content); risk of discontinuation effects including rebound cataplexy and withdrawal symptoms; acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); breast-feeding (Appendix 5); **interactions:** Appendix 1 (sodium oxybate)

Contra-indications pregnancy (Appendix 4)

Side-effects nausea, vomiting, diarrhoea, abdominal pain, anorexia; hypertension, peripheral oedema; dyspnoea; sleep disorders, confusion, disorientation, paraesthesia, hypoesthesia, impaired attention, depression, drowsiness, anxiety, dizziness, headache, tremor, asthenia, fatigue; urinary incontinence, nocturnal enuresis; arthralgia, muscle cramps; blurred vision; sweating; *less commonly* faecal incontinence, myoclonus, psychosis, paranoia, hallucination, agitation, amnesia, and rash; respiratory depression, dependence, seizures, suicidal ideation, and urticaria also reported

Dose

- ADULT over 18 years, initially 2.25 g on retiring and repeated 2.5–4 hours later, increased according to response in steps of 1.5 g daily in 2 divided doses at intervals of 1–2 weeks; max. 9 g daily in two divided doses

  Note Dose titration should be repeated if restarting after interval of more than 14 days

  Counselling Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose

Xyrem® (UCB Pharma) ▼ PoM

Oral solution, sugar-free, sodium oxybate 500 mg/mL, net price 180 mL = £360.00. Label: 13, 19, counselling, administration

Electrolytes Na^+ 3.96 mmol/mL

Melatonin

Melatonin is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

MELATONIN

Indications insomnia (short-term use)

Cautions renal impairment (Appendix 3); **interactions:** Appendix 1 (melatonin)

Contra-indications autoimmune disease; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects pharyngitis; back pain, headache, asthenia; *less commonly* abdominal pain, constipation, dry mouth, weight gain, drowsiness, dizziness, sleep disorders, restlessness, nervousness, irritability, and sweating; *rarely* flatulence, halitosis, hypersalivation, vomiting, hypertriglyceridaemia, aggression, agitation, fatigue, impaired memory, mood changes, hot flushes, priapism, increased libido, leucopenia, thrombocytopenia, muscle cramp, skin reaction, lacrimation, and visual disturbances

Dose

- ADULT over 55 years, 2 mg once daily 1–2 hours before bedtime for 3 weeks; CHILD 1 month–18 years see *BNF for Children*

Circadin® (Lundbeck) ▼ PoM

Tablets, m/r, melatonin 2 mg, net price 21-tab pack = £10.77. Label: 2, 21, 25

4.1.2 Anxiolytics

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines. In children, anxiolytic treatment should be used only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery).

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time (see CSM advice, section 4.1). Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressants (section 4.3) are licensed for use in anxiety and related disorders; see section 4.3 for a comment on their role in chronic anxiety. Some anti-

psychotics, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects (section 4.2.1). The use of antihistamines (e.g. hydroxyzine, section 3.4.1) for their sedative effect in anxiety is not appropriate.

Beta-blockers (section 2.4) do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

Benzodiazepines

Benzodiazepines are indicated for the *short-term relief of severe anxiety*; long-term use should be avoided (see CSM advice, p. 186). Diazepam, alprazolam, chlordiazepoxide, and clobazam have a sustained action. Shorter-acting compounds such as **lorazepam** and **oxazepam** may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In *panic disorders* (with or without agoraphobia) resistant to antidepressant therapy (section 4.3), a benzodiazepine (lorazepam 3–5 mg daily or clonazepam 1–2 mg daily (section 4.8.1) [both unlicensed]) may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the *control of panic attacks*. This route is the most rapid but the procedure is not without risk (section 4.8.2) and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

For guidelines on benzodiazepine withdrawal, see p. 185.

DIAZEPAM

Indications short-term use in anxiety or insomnia (see CSM advice, p. 186); adjunct in acute alcohol withdrawal; status epilepticus (section 4.8.2); febrile convulsions (section 4.8.3); muscle spasm (section 10.2.2); peri-operative use (section 15.1.4.1)

Cautions respiratory disease, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, marked personality disorder, pregnancy (Appendix 4), breast-feeding (Appendix 5); reduce dose in elderly and debilitated, and in hepatic impairment (avoid if severe; Appendix 2), renal impairment (Appendix 3); avoid prolonged use (and abrupt withdrawal thereafter); special precautions for intravenous injection (section 4.8.2); acute porphyria (section 9.8.2); when given parenterally, close observation required until full recovery from sedation; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; sleep apnoea syndrome; severe hepatic impairment; not for chronic psychosis; should not be used alone in depression or in anxiety with depression; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Side-effects drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia; dependence; paradoxical increase in aggression (see also section 4.1); muscle weakness; *occasionally:* headache, vertigo, hypotension, salivation changes, gastro-intestinal disturbances, visual disturbances, dysarthria, tremor, changes in libido, incontinence, urinary retention; blood disorders and jaundice reported; skin reactions; on intravenous injection, pain, thrombophlebitis, and rarely apnoea; **overdosage:** see Emergency Treatment of Poisoning, p. 32

Dose

- By mouth, anxiety, 2 mg 3 times daily increased if necessary to 15–30 mg daily in divided doses; ELDERLY (or debilitated) half adult dose

  Insomnia associated with anxiety, 5–15 mg at bedtime
- By intramuscular injection *or* slow intravenous injection (into a large vein, at a rate of not more than 5 mg/minute), for severe acute anxiety, control of acute panic attacks, and acute alcohol withdrawal, 10 mg, repeated if necessary after not less than 4 hours

  Note Only use intramuscular route when oral and intravenous routes not possible; special precautions for intravenous injection section 4.8.2
- By rectum as rectal solution, acute anxiety and agitation, 500 micrograms/kg repeated after 12 hours as required; ELDERLY 250 micrograms/kg; CHILD not recommended

  As suppositories, anxiety when oral route not appropriate, 10–30 mg (higher dose divided); dose form not appropriate for less than 10 mg

Diazepam (Non-proprietary) PoM

Tablets, diazepam 2 mg, net price 28 = 96p; 5 mg, 28 = 99p; 10 mg, 28 = £1.03. Label: 2 or 19
Brands include *Rimapam®* NHS, *Tensium®* NHS

Oral solution, diazepam 2 mg/5 mL, net price 100 mL = £6.75. Label: 2 or 19
Brands include *Dialar®* NHS

Strong oral solution, diazepam 5 mg/5 mL, net price 100-mL pack = £6.38. Label: 2 or 19 NHS
Brands include *Dialar®* NHS

Injection (solution), diazepam 5 mg/mL. Do not dilute (except for intravenous infusion, see Appendix 6). Net price 2-mL amp = 45p
Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2), ethanol, propylene glycol

Injection (emulsion), diazepam 5 mg/mL. For intravenous injection or infusion, see Appendix 6. Net price 2-mL amp = 92p
Brands include *Diazemuls®*

Rectal tubes (= rectal solution), diazepam 2 mg/mL, net price 1.25-mL (2.5-mg) tube = 90p, 2.5-mL (5-mg) tube = £1.27; 4 mg/mL, 2.5-mL (10-mg) tube = £1.65. Label: 2 or 19
Brands include *Diazepam Rectubes®*, *Stesolid®*

Suppositories, diazepam 10 mg, net price 6 = £10.20. Label: 2 or 19
Brands include *Valclair®*

Dental prescribing on NHS Diazepam Tablets or Diazepam Oral Solution 2 mg/5 mL may be prescribed

ALPRAZOLAM

Indications anxiety (short-term use; see CSM advice, p. 186)

Cautions see under Diazepam

Contra-indications see under Diazepam

Side-effects see under Diazepam

Dose

- 250–500 micrograms 3 times daily (ELDERLY or debilitated 250 micrograms 2–3 times daily), increased if necessary to a total of 3 mg daily; CHILD not recommended

Alprazolam (Non-proprietary) PoM SHS

Tablets, alprazolam 250 micrograms, net price 60-tab pack = £2.97; 500 micrograms, 60-tab pack = £5.69. Label: 2

Brands include *Xanax*® SHS

CHLORDIAZEPOXIDE HYDROCHLORIDE

Indications anxiety (short-term use; see CSM advice, p. 186); adjunct in acute alcohol withdrawal (section 4.10)

Cautions see under Diazepam

Contra-indications see under Diazepam

Side-effects see under Diazepam

Dose

- Anxiety, 10 mg 3 times daily increased if necessary to 60–100 mg daily in divided doses; ELDERLY (or debilitated) half adult dose; CHILD not recommended

Chlordiazepoxide (Non-proprietary) PoM

Capsules, chlordiazepoxide hydrochloride 5 mg, net price 100-cap pack = £3.60; 10 mg, 100-cap pack = £10.39. Label: 2

Brands include *Librium*® SHS, *Tropium*® SHS

Chlordiazepoxide Hydrochloride (Non-proprietary) PoM

Tablets, chlordiazepoxide hydrochloride 5 mg, net price 100 = £4.24; 10 mg, 100 = £11.34. Label: 2

LORAZEPAM

Indications short-term use in anxiety or insomnia (see CSM advice, p. 186); status epilepticus (section 4.8.2); peri-operative (section 15.1.4.1)

Cautions see under Diazepam; short acting; when given parenterally, facilities for managing respiratory depression with mechanical ventilation must be at hand

Contra-indications see under Diazepam

Side-effects see under Diazepam

Dose

- By mouth, anxiety, 1–4 mg daily in divided doses; ELDERLY (or debilitated) half adult dose

  Insomnia associated with anxiety, 1–2 mg at bedtime; CHILD not recommended
- By intramuscular *or* slow intravenous injection (into a large vein), acute panic attacks, 25–30 micrograms/kg (usual range 1.5–2.5 mg), repeated every 6 hours if necessary; CHILD not recommended

  Note Only use intramuscular route when oral and intravenous routes not possible

Lorazepam (Non-proprietary) PoM

Tablets, lorazepam 1 mg, net price 28-tab pack = £8.14; 2.5 mg, 28-tab pack = £13.72. Label: 2 or 19

Injection, lorazepam 4 mg/mL. Net price 1-mL amp = 35p

Excipients include benzyl alcohol, propylene glycol (see Excipients, p. 2)

Brands include *Ativan*® SHS

Note For intramuscular injection it should be diluted with an equal volume of water for injections or physiological saline (but only use when oral and intravenous routes not possible)

OXAZEPAM

Indications anxiety (short-term use; see CSM advice, p. 186)

Cautions see under Diazepam; short acting

Contra-indications see under Diazepam

Side-effects see under Diazepam

Dose

- Anxiety, 15–30 mg (elderly or debilitated 10–20 mg) 3–4 times daily; CHILD not recommended
- Insomnia associated with anxiety, 15–25 mg (max. 50 mg) at bedtime; CHILD not recommended

Oxazepam (Non-proprietary) PoM

Tablets, oxazepam 10 mg, net price 28-tab pack = £6.01; 15 mg, 28-tab pack = £6.29. Label: 2

Buspirone

Buspirone is thought to act at specific serotonin ($5HT_{1A}$) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone. The dependence and abuse potential of buspirone is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

BUSPIRONE HYDROCHLORIDE

Indications anxiety (short-term use)

Cautions does not alleviate benzodiazepine withdrawal (see notes above); hepatic impairment (Appendix 2); renal impairment (avoid if eGFR less than 20 mL/minute/1.73 m^2; Appendix 3); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Driving May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

Contra-indications epilepsy; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea; dizziness, headache, nervousness, excitement; *rarely* dry mouth, tachycardia, palpitation, chest pain, drowsiness, confusion, seizures, fatigue, and sweating

Dose

- ADULT over 18 years, 5 mg 2–3 times daily, increased as necessary every 2–3 days; usual range 15–30 mg daily in divided doses; max. 45 mg daily

Buspirone Hydrochloride (Non-proprietary) PoM
Tablets, buspirone hydrochloride 5 mg, net price 30-tab pack = £14.81; 10 mg, 30-tab pack = £16.59.
Counselling, driving

Buspar® (Bristol-Myers Squibb) PoM
Tablets, buspirone hydrochloride 5 mg, net price 90-tab pack = £25.09; 10 mg, 90-tab pack = £37.64.
Counselling, driving

Meprobamate

Meprobamate is **less effective** than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is **not** recommended.

Important: meprobamate is to be withdrawn from the UK market; MHRA/CHM have advised that treatment with meprobamate should **no longer** be initiated.

MEPROBAMATE

Indications short-term use in anxiety, but see notes above

Cautions respiratory disease, muscle weakness, epilepsy (may induce seizures), history of drug or alcohol abuse, marked personality disorder, pregnancy (Appendix 4); elderly and debilitated; hepatic impairment (Appendix 2), renal impairment (Appendix 3); avoid prolonged use, abrupt withdrawal may precipitate convulsions; **interactions:** Appendix 1 (anxiolytics and hypnotics)
Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications acute pulmonary insufficiency; respiratory depression; acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects see under Diazepam, but incidence greater and drowsiness most common side-effect; also gastro-intestinal disturbances, hypotension, paraesthesia, weakness, CNS effects including headache, paradoxical excitement, disturbances of vision; rarely agranulocytosis and rashes

Dose

- 400 mg 3–4 times daily; elderly patients half adult dose or less; CHILD not recommended
  Note Meprobamate treatment should not be initiated in new patients, see notes above

Meprobamate (Non-proprietary) CD
Tablets, scored, meprobamate 400 mg. Net price 84-tab pack = £19.95. Label: 2

BARBITURATES

Indications severe intractable insomnia **only** in patients already taking barbiturates; see also notes above

Cautions avoid use where possible; dependence and tolerance readily occur; abrupt withdrawal may precipitate serious withdrawal syndrome (rebound insomnia, anxiety, tremor, dizziness, nausea, convulsions, delirium, and death); repeated doses are cumulative and can cause excessive sedation; depression and suicidal ideation; shock; respiratory disease (avoid if dyspnoea or obstruction present); hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 (barbiturates)
Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications insomnia caused by pain; acute porphyria (section 9.8.2); children, young adults, elderly and debilitated patients, also patients with history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects drowsiness, incoordination; *less commonly* nausea, vomiting, constipation, liver damage, bradycardia, hypotension, syncope, hypoventilation, apnoea, respiratory depression, agitation, confusion, hyperkinesia, ataxia, CNS depression, sleep disorders, hallucinations, anxiety, dizziness, headache, paradoxical excitement, impaired memory, fever, and megaloblastic anaemia

Dose

- See under preparations below

Sodium Amytal® (Flynn) CD
Capsules, amobarbital (amylobarbitone) sodium 60 mg; 200 mg. Label: 19
Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Soneryl® (Flynn) CD
Tablets, pink, scored, butobarbital (butobarbitone) 100 mg. Net price 56-tab pack = £10.65. Label: 19
Dose 100–200 mg at bedtime (**important:** but see also contra-indications)

Tuinal® (Flynn) CD
Capsules, orange/blue, amobarbital (amylobarbitone) sodium 50 mg, secobarbital (quinalbarbitone) sodium 50 mg, net price 100 = £19.40. Label: 19
Dose 1–2 capsules at bedtime (**important:** but see also contra-indications)
Note Prescriptions need only specify 'Tuinal capsules'

4.1.3 Barbiturates

The intermediate-acting **barbiturates** have a place only in the treatment of severe intractable insomnia in patients **already taking** barbiturates; they should be **avoided** in the elderly. The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy (section 4.8.1) but its use as a sedative is unjustified. The very short-acting barbiturate thiopental is used in anaesthesia (section 15.1.1).

4.2 Drugs used in psychoses and related disorders

4.2.1 Antipsychotic drugs
4.2.2 Antipsychotic depot injections
4.2.3 Antimanic drugs

Advice of Royal College of Psychiatrists on doses above BNF upper limit. Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is

therefore **unlicensed** (for an explanation of the significance of this, see p. 1).

1. Consider alternative approaches including adjuvant therapy and newer or atypical neuroleptics such as clozapine.
2. Bear in mind risk factors, including obesity—particular caution is indicated in older patients especially those over 70.
3. Consider potential for drug interactions—see **interactions:** Appendix 1 (antipsychotics).
4. Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse abnormality develops.
5. Increase dose slowly and not more often than once weekly.
6. Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
7. Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for **each route** and should **not** imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

4.2.1 Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'. Antipsychotic drugs generally tranquillise without impairing consciousness and without causing paradoxical excitement but they should not be regarded merely as tranquillisers. For conditions such as schizophrenia the tranquillising effect is of secondary importance.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia Antipsychotic drugs relieve florid psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse. Although they are usually less effective in apathetic withdrawn patients, they sometimes appear to have an activating influence. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definite diagnosis of schizophrenia may be necessary even after the first episode of illness in order to prevent the illness from becoming chronic. Withdrawal of drug treatment requires careful surveillance because the patient who appears well on medication may suffer a disastrous relapse if treatment is withdrawn inappropriately. In addition the need for continuation of treatment may not become immediately evident because relapse is often delayed for several weeks after cessation of treatment.

Antipsychotic drugs are considered to act by interfering with dopaminergic transmission in the brain by blocking dopamine D_2 receptors, which may give rise to the extrapyramidal effects described below, and also to hyperprolactinaemia. Antipsychotic drugs may also affect cholinergic, alpha-adrenergic, histaminergic, and serotonergic receptors.

Cautions and contra-indications Antipsychotic drugs should be used with **caution** in patients with hepatic impairment (Appendix 2), renal impairment (Appendix 3), cardiovascular disease, Parkinson's disease (may be exacerbated by antipsychotics), epilepsy (and conditions predisposing to epilepsy), depression, myasthenia gravis, prostatic hypertrophy, or a susceptibility to angle-closure glaucoma. Caution is also required in severe respiratory disease and in patients with a history of jaundice or who have blood dyscrasias (perform blood counts if unexplained infection or fever develops). As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Antipsychotic drugs may be **contra-indicated** in comatose states, CNS depression, and phaeochromocytoma. Most antipsychotic drugs are best avoided during pregnancy, unless essential (Appendix 4) and it is advisable to discontinue breast-feeding during treatment (Appendix 5); **interactions:** Appendix 1 (antipsychotics).

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Treatment should be reviewed regularly.

Driving Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

Withdrawal Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects Extrapyramidal symptoms are the most troublesome. They occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- *parkinsonian symptoms* (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- *dystonia* (abnormal face and body movements) and *dyskinesia*, which occur more commonly in children or young adults and appear after only a few doses;
- *akathisia* (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated; and
- *tardive dyskinesia* (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of **anti-muscarinic** drugs (section 4.9.2). However, routine administration of such drugs is not justified because not all patients are affected and because they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Hypotension and interference with temperature regulation are dose-related side-effects and are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly.

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of some drugs. Discontinuation of the antipsychotic is essential because there is no proven effective treatment, but cooling, bromocriptine, and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Other side-effects include: drowsiness; apathy; agitation, excitement and insomnia; convulsions; dizziness; headache; confusion; gastro-intestinal disturbances; nasal congestion; antimuscarinic symptoms (such as dry mouth, constipation, difficulty with micturition, and blurred vision; *very rarely*, precipitation of angle-closure glaucoma); cardiovascular symptoms (such as hypotension, tachycardia, and arrhythmias); ECG changes (cases of sudden death have occurred); endocrine effects such as menstrual disturbances, galactorrhoea, gynaecomastia, impotence, and weight gain; blood dyscrasias (such as agranulocytosis and leucopenia), photosensitisation, contact sensitisation and rashes, and jaundice (including cholestatic); corneal and lens opacities, and purplish pigmentation of the skin, cornea, conjunctiva, and retina.

Overdosage: for poisoning with phenothiazines and related compounds, see Emergency Treatment of Poisoning, p. 33.

Classification of antipsychotics The **phenothiazine** derivatives can be divided into 3 main groups.

Group 1: chlorpromazine, levomepromazine (methotrimeprazine), and promazine, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.

Group 2: pericyazine and pipotiazine, generally characterised by moderate sedative effects, marked antimuscarinic effects, but fewer extrapyramidal side-effects than groups 1 or 3.

Group 3: fluphenazine, perphenazine, prochlorperazine, and trifluoperazine, generally characterised by fewer sedative effects, fewer antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Drugs of other chemical groups resemble the phenothiazines of *group 3* in their clinical properties. They include the **butyrophenones** (benperidol and haloperidol); **diphenylbutylpiperidines** (pimozide); **thioxanthenes** (flupentixol and zuclopenthixol); and the **substituted benzamides** (sulpiride).

For details of the newer antipsychotic drugs amisulpride, clozapine, olanzapine, quetiapine, risperidone, sertindole, and zotepine, see under Atypical Antipsychotic Drugs, p. 199.

Choice As indicated above, the various drugs differ somewhat in predominant actions and side-effects. Selection is influenced by the degree of sedation required and the patient's susceptibility to extrapyramidal side-effects. However, the differences between antipsychotic drugs are less important than the great variability in patient response; moreover, tolerance to secondary effects such as sedation usually develops. The atypical antipsychotics may be appropriate if extrapyramidal side-effects are a particular concern (see under Atypical Antipsychotics, below). Clozapine is used for schizophrenia when other antipsychotics are ineffective or not tolerated.

Prescribing of more than one antipsychotic drug at the same time is **not** recommended; it may constitute a hazard and there is no significant evidence that side-effects are minimised.

Chlorpromazine is still widely used despite the wide range of adverse effects associated with it. It has a marked sedating effect and is useful for treating violent patients without causing stupor. Agitated states in the elderly can be controlled without confusion, a dose of 10 to 25 mg once or twice daily usually being adequate.

Flupentixol (flupenthixol) and **pimozide** (see CSM warning, p. 198) are less sedating than chlorpromazine.

Sulpiride in high doses controls florid positive symptoms, but in lower doses it can have an alerting effect on apathetic withdrawn schizophrenics.

Fluphenazine, **haloperidol**, and **trifluoperazine** are also of value but their use is limited by the high incidence of extrapyramidal symptoms. Haloperidol may be preferred for the rapid control of hyperactive psychotic states; it causes less hypotension than chlorpromazine and is therefore also popular for agitation and restlessness in the elderly, despite the high incidence of extrapyramidal side-effects.

Promazine is not sufficiently active by mouth to be used as an antipsychotic drug; it has been used to treat agitation and restlessness in the elderly (see Other uses, below).

Other uses Nausea and vomiting (section 4.6), choreas, motor tics (section 4.9.3), and intractable hiccup (see under Chlorpromazine Hydrochloride and under Haloperidol). **Benperidol** is used in deviant antisocial sexual behaviour but its value is not established; see also section 6.4.2 for the role of cyproterone acetate.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly (but see p. 194).

Equivalent doses of oral antipsychotics

These equivalences are intended **only** as an approximate guide; individual dosage instructions should **also** be checked; patients should be carefully monitored after **any** change in medication

Antipsychotic drug	Daily dose
Chlorpromazine	100 mg
Clozapine	50 mg
Haloperidol	2–3 mg
Pimozide	2 mg
Risperidone	0.5–1 mg
Sulpiride	200 mg
Trifluoperazine	5 mg

Important These equivalences must **not** be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate

Dosage

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 193.

BENPERIDOL

Indications control of deviant antisocial sexual behaviour (but see notes above)

Cautions see notes above; also manufacturer advises regular blood counts and liver function tests during long-term treatment

Contra-indications see notes above

Side-effects see notes above

Dose

- 0.25–1.5 mg daily in divided doses, adjusted according to response; ELDERLY (or debilitated) initially half adult dose; CHILD not recommended

Anquil® (Concord) PoM

Tablets, scored, benperidol 250 micrograms, net price 112-tab pack = £124.80. Label: 2

Note The proprietary name *Benquil®* has been used for benperidol tablets

CHLORPROMAZINE HYDROCHLORIDE

Warning Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care

Indications see under Dose; antiemetic in palliative care (section 4.6)

Cautions see notes above; also patients should remain supine and the blood pressure monitored for 30 minutes after intramuscular injection

Contra-indications see notes above

Side-effects see notes above; also intramuscular injection may be painful, cause hypotension and tachycardia, and give rise to nodule formation

Dose

- By mouth, schizophrenia and other psychoses, mania, short-term adjunctive management of severe anxiety, psychomotor agitation, excitement, and violent or dangerously impulsive behaviour initially 25 mg 3 times daily (*or* 75 mg at night), adjusted according to response, to usual maintenance dose of 75–300 mg daily (but up to 1 g daily may be required in psychoses); ELDERLY (or debilitated) third to half adult dose; CHILD (childhood schizophrenia and autism) 1–6 years 500 micrograms/kg every 4–6 hours (max. 40 mg daily); 6–12 years 10 mg 3 times daily (max. 75 mg daily)

  Intractable hiccup, 25–50 mg 3–4 times daily
- By deep intramuscular injection, (for relief of acute symptoms but see also Cautions and Side-effects), 25–50 mg every 6–8 hours; CHILD, 1–6 years 500 micrograms/kg every 6–8 hours (max. 40 mg daily); 6–12 years 500 micrograms/kg every 6–8 hours (max. 75 mg daily)

  Induction of hypothermia (to prevent shivering), 25–50 mg every 6–8 hours; CHILD 1–12 years, initially 0.5–1 mg/kg, followed by maintenance 500 micrograms/kg every 4–6 hours
- By rectum in suppositories as chlorpromazine base 100 mg every 6–8 hours [unlicensed]

  Note For equivalent therapeutic effect 100 mg chlorpromazine base given *rectally* as a suppository ≡ 20–25 mg chlorpromazine hydrochloride *by intramuscular injection* ≡ 40–50 mg of chlorpromazine base or hydrochloride *by mouth*

Chlorpromazine (Non-proprietary) PoM

Tablets, coated, chlorpromazine hydrochloride 25 mg, 28-tab pack = £3.09; 50 mg, 28-tab pack = £3.32; 100 mg, 28-tab pack = £3.43. Label: 2, 11

Brands include *Chloractil®*

Oral solution, chlorpromazine hydrochloride 25 mg/5 mL, net price 150 mL = £1.50, 100 mg/5 mL, 150 mL = £3.75. Label: 2, 11

Injection, chlorpromazine hydrochloride 25 mg/mL, net price 1-mL amp = 60p; 2-mL amp = 63p

Suppositories, chlorpromazine 25 mg and 100 mg. Label: 2, 11

Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Largactil® (Sanofi-Aventis) PoM

Injection, chlorpromazine hydrochloride 25 mg/mL. Net price 2-mL amp = 60p

FLUPENTIXOL
(Flupenthixol)

Indications schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity; depression (section 4.3.4)

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above; also excitable and overactive patients

Side-effects see notes above; less sedating but extrapyramidal symptoms frequent

Dose

- Psychosis, initially 3–9 mg twice daily adjusted according to the response; max. 18 mg daily; ELDERLY (or debilitated) initially quarter to half adult dose; CHILD not recommended

Depixol® (Lundbeck) PoM
Tablets, yellow, s/c, flupentixol 3 mg (as dihydrochloride), net price 100 = £9.74. Label: 2

Depot preparation
Section 4.2.2

HALOPERIDOL

Indications see under Dose; motor tics (section 4.9.3)

Cautions see notes above; also subarachnoid haemorrhage and metabolic disturbances such as hypokalaemia, hypocalcaemia, or hypomagnesaemia

Contra-indications see notes above

Side-effects see notes above, but less sedating and fewer antimuscarinic or hypotensive symptoms; pigmentation and photosensitivity reactions rare; extrapyramidal symptoms, particularly dystonic reactions and akathisia especially in thyrotoxic patients; rarely weight loss; hypoglycaemia; inappropriate antidiuretic hormone secretion

Dose

- Schizophrenia and other psychoses, mania, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, ADULT and CHILD over 12 years, by mouth, initially 0.5–3 mg 2–3 times daily *or* 3–5 mg 2–3 times daily in severely affected or resistant patients; in resistant schizophrenia up to 30 mg daily may be needed; adjusted according to response to lowest effective maintenance dose (as low as 5–10 mg daily); ELDERLY (or debilitated) initially half adult dose

  By intramuscular *or* by intravenous injection, ADULT over 18 years, initially 2–10 mg, then every 4–8 hours according to response to total max. 18 mg daily; severely disturbed patients may require initial dose of up to 18 mg; ELDERLY (or debilitated) initially half adult dose
- Agitation and restlessness in the elderly, by mouth, initially 0.5–1.5 mg once or twice daily
- Short-term adjunctive management of severe anxiety, by mouth, ADULT over 18 years, 500 micrograms twice daily
- Intractable hiccup, by mouth, ADULT over 18 years, 1.5 mg 3 times daily adjusted according to response
- Nausea and vomiting, see Prescribing in Palliative Care, p. 17

  By intramuscular *or* intravenous injection, 1–2 mg

Haloperidol (Non-proprietary) PoM
Tablets, haloperidol 500 micrograms, net price 28-tab pack = 91p; 1.5 mg, 28-tab pack = £1.62; 5 mg, 28-tab pack = £3.93; 10 mg, 28-tab pack = £4.27; 20 mg, 28-tab pack = £11.17. Label: 2

Dozic® (Rosemont) PoM
Oral liquid, sugar-free, haloperidol 1 mg/mL, net price 100-mL pack = £6.86. Label: 2

Haldol® (Janssen-Cilag) PoM
Tablets, both scored, haloperidol 5 mg (blue), net price 100 = £7.35; 10 mg (yellow), 100 = £14.37. Label: 2

Oral liquid, sugar-free, haloperidol 2 mg/mL, net price 100-mL pack (with pipette) = £4.54. Label: 2

Injection, haloperidol 5 mg/mL, net price 1-mL amp = 29p

Serenace® (IVAX) PoM
Capsules, green, haloperidol 500 micrograms, net price 30-cap pack = 98p. Label: 2

Tablets, haloperidol 1.5 mg, net price 30-tab pack = £1.37; 5 mg (pink), 30-tab pack = £3.95; 10 mg (pale pink), 30-tab pack = £6.76. Label: 2

Oral liquid, sugar-free, haloperidol 2 mg/mL, net price 500-mL pack = £34.48. Label: 2

Depot preparation
Section 4.2.2

LEVOMEPROMAZINE
(Methotrimeprazine)

Indications see under Dose

Cautions see notes above; patients receiving large initial doses should remain supine
Elderly Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed

Contra-indications see notes above

Side-effects see notes above; occasionally raised erythrocyte sedimentation rate occurs

Dose

- Schizophrenia, by mouth initially 25–50 mg daily in divided doses increased as necessary; bedpatients initially 100–200 mg daily usually in 3 divided doses, increased if necessary to 1 g daily; ELDERLY, see Cautions
- Pain in palliative care, see p. 16
- Restlessness and confusion in palliative care, see p. 18; CHILD 1–18 years, see *BNF for Children*
- Nausea and vomiting in palliative care, by mouth, see p. 17, or by subcutaneous infusion, see p. 18; CHILD 1 month–18 years, see *BNF for Children*

Nozinan® (Link) PoM
Tablets, scored, levomepromazine maleate 25 mg, net price 84-tab pack = £20.26. Label: 2

Injection, levomepromazine hydrochloride 25 mg/mL, net price 1-mL amp = £2.01

PERICYAZINE
(Periciazine)

Indications see under Dose

Cautions see notes above

Contra-indications see notes above; renal impairment

Side-effects see notes above; more sedating; hypotension common when treatment initiated; respiratory depression

Dose

- Schizophrenia and other psychoses, initially 75 mg daily in divided doses increased at weekly intervals by steps of 25 mg according to response; usual max. 300 mg daily (elderly initially 15–30 mg daily); CHILD and INFANT over 1 year (schizophrenia or behavioural disorders only), initially, 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg body-weight to max. total daily dose of 10 mg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose
- Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour, initially 15–30 mg (elderly 5–10 mg) daily divided into 2 doses, taking the larger dose at bedtime, adjusted according to response; CHILD not recommended

Neulactil® (Winthrop) PoM

Tablets, yellow, scored, pericyazine 2.5 mg, net price 84-tab pack = £9.23; 10 mg, 84-tab pack = £24.95. Label: 2

Syrup forte, brown, pericyazine 10 mg/5 mL. Net price 100-mL pack = £12.08. Label: 2

PERPHENAZINE

Indications see under Dose; antiemetic (section 4.6)

Cautions see notes above

Contra-indications see notes above; also agitation and restlessness in the elderly

Side-effects see notes above; less sedating; extrapyramidal symptoms, especially dystonia, more frequent, particularly at high dosage; rarely systemic lupus erythematosus

Dose

- Schizophrenia and other psychoses, mania, short-term adjunctive management of anxiety, severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, initially 4 mg 3 times daily adjusted according to the response; max. 24 mg daily; ELDERLY quarter to half adult dose (but see Cautions); CHILD under 14 years not recommended

Fentazin® (Goldshield) PoM

Tablets, s/c, perphenazine 2 mg, net price 100 = £22.38; 4 mg, 100 = £26.34. Label: 2

PIMOZIDE

Indications see under Dose

Cautions see notes above

CSM warning Following reports of sudden unexplained death, the CSM recommends ECG before treatment. The CSM also recommends that patients on pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should **not** be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarrhythmic drugs and certain antihistamines and should **not** be given with drugs which cause electrolyte disturbances (especially diuretics)

Contra-indications see notes above; history of arrhythmias or congenital QT prolongation

Side-effects see notes above; less sedating; serious arrhythmias reported; glycosuria and, rarely, hyponatraemia reported

Dose

- Schizophrenia, ADULT and CHILD over 12 years, initially 2 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; usual dose range 2–20 mg daily; ELDERLY half usual starting dose
- Monosymptomatic hypochondriacal psychosis, paranoid psychosis, ADULT and CHILD over 12 years, initially 4 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; max. 16 mg daily; ELDERLY half usual starting dose

Orap® (Janssen-Cilag) PoM

Tablets, scored, green, pimozide 4 mg, net price 100 = £27.41. Label: 2

PROCHLORPERAZINE

Indications see under Dose; antiemetic (section 4.6)

Cautions see notes above; also hypotension more likely after intramuscular injection

Contra-indications see notes above; children, but see section 4.6 for use as antiemetic

Side-effects see notes above; less sedating; extrapyramidal symptoms, particularly dystonias, more frequent; respiratory depression may occur in susceptible patients

Dose

- By mouth, schizophrenia and other psychoses, mania, prochlorperazine maleate or mesilate, 12.5 mg twice daily for 7 days adjusted at intervals of 4–7 days to usual dose of 75–100 mg daily according to response; CHILD not recommended

  Short-term adjunctive management of severe anxiety, 15–20 mg daily in divided doses; max. 40 mg daily; CHILD not recommended
- By deep intramuscular injection, psychoses, mania, prochlorperazine mesilate 12.5–25 mg 2–3 times daily; CHILD not recommended

Preparations
Section 4.6

PROMAZINE HYDROCHLORIDE

Indications see under Dose

Cautions see notes above; also cerebral arteriosclerosis

Contra-indications see notes above

Side-effects see notes above; also haemolytic anaemia

Dose

- Short-term adjunctive management of psychomotor agitation, 100–200 mg 4 times daily; CHILD not recommended
- Agitation and restlessness in elderly, 25–50 mg 4 times daily

Promazine (Non-proprietary) PoM

Tablets, coated, promazine hydrochloride 25 mg, net price 100 = £6.58; 50 mg, 100 = £16.27. Label: 2

Oral solution, promazine hydrochloride 25 mg/5 mL, net price 150 mL = £4.08; 50 mg/5 mL, 150 mL = £4.18. Label: 2

SULPIRIDE

Indications schizophrenia

Cautions see notes above; also excited, agitated, or aggressive patients (even low doses may aggravate symptoms); renal impairment (avoid if severe)

Contra-indications see notes above; also acute porphyria (section 9.8.2)

Side-effects see notes above; also hepatitis

Dose

- ADULT and CHILD over 14 years, 200–400 mg twice daily; max. 800 mg daily in predominantly negative symptoms, and 2.4 g daily in mainly positive symptoms; ELDERLY, lower initial dose, increased gradually according to response

Sulpiride (Non-proprietary) PoM
Tablets, sulpiride 200 mg, net price 30-tab pack = £7.32, 56-tab pack = £6.46; 400 mg, 30-tab pack = £12.55. Label: 2

Dolmatil® (Sanofi-Synthelabo) PoM
Tablets, both scored, sulpiride 200 mg, net price 100-tab pack = £13.31; 400 mg (f/c), 100-tab pack = £34.87. Label: 2

Sulpor® (Rosemont) PoM
Oral solution, sugar-free, lemon- and aniseed-flavoured, sulpiride 200 mg/5 mL, net price 150 mL = £25.38. Label: 2

TRIFLUOPERAZINE

Indications see under Dose; antiemetic (section 4.6)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; extrapyramidal symptoms more frequent, especially at doses exceeding 6 mg daily; pancytopenia; thrombocytopenia; hyperthermia; anorexia

Dose

- Schizophrenia and other psychoses, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, ADULT and CHILD over 12 years, initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to the response; ELDERLY reduce initial dose by at least half
- Short-term adjunctive management of severe anxiety, ADULT and CHILD over 12 years, 2–4 mg daily in divided doses, increased if necessary to 6 mg daily; CHILD 3–5 years up to 1 mg daily, 6–12 years up to 4 mg daily; ELDERLY reduce initial dose by at least half

Trifluoperazine (Non-proprietary) PoM
Tablets, coated, trifluoperazine (as hydrochloride) 1 mg, net price 100 = £6.10; 5 mg, 100 = £5.32. Label: 2

Oral solution, trifluoperazine (as hydrochloride) 5 mg/5 mL, net price 150-mL = £9.46. Label: 2

Stelazine® (Goldshield) PoM
Tablets, both blue, f/c, trifluoperazine (as hydrochloride) 1 mg, net price 112 = £3.43; 5 mg, 112 = £4.89. Label: 2

Syrup, sugar-free, yellow, trifluoperazine (as hydrochloride) 1 mg/5 mL, net price 200-mL pack = £2.95. Label: 2

ZUCLOPENTHIXOL ACETATE

Indications short-term management of acute psychosis, mania, or exacerbations of chronic psychosis

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above

Side-effects see notes above

Dose

- By deep intramuscular injection into the gluteal muscle or lateral thigh, 50–150 mg (ELDERLY 50–100 mg), if necessary repeated after 2–3 days (1 additional dose may be needed 1–2 days after the first injection); max. cumulative dose 400 mg per course and max. 4 injections; max. duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, *or* to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; CHILD not recommended

Clopixol Acuphase® (Lundbeck) PoM
Injection (oily), zuclopenthixol acetate 50 mg/mL, net price 1-mL amp = £3.39; 2-mL amp = £6.53

Depot preparation
Section 4.2.2

ZUCLOPENTHIXOL

Indications schizophrenia and other psychoses

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above; apathetic or withdrawn states

Side-effects see notes above; urinary frequency or incontinence; weight loss (less common than weight gain)

Dose

- By mouth, initially 20–30 mg daily in divided doses, increasing to a max. of 150 mg daily if necessary; usual maintenance dose 20–50 mg daily; ELDERLY (or debilitated) initially quarter to half adult dose; CHILD not recommended

Clopixol® (Lundbeck) PoM
Tablets, f/c, zuclopenthixol (as dihydrochloride) 2 mg (red), net price 100 = £2.09; 10 mg (light red-brown), 100 = £5.64; 25 mg (red-brown), 100 = £11.28. Label: 2

Depot preparation
Section 4.2.2

Atypical antipsychotic drugs

The 'atypical' antipsychotic drugs **amisulpride**, **aripiprazole**, **clozapine**, **olanzapine**, **paliperidone**, **quetiapine**, **risperidone**, and **zotepine** may be better tolerated than other antipsychotic drugs; extrapyramidal symptoms may be less frequent than with older antipsychotic drugs.

Aripiprazole, clozapine, olanzapine, quetiapine, and sertindole cause little or no elevation of prolactin concentration; when changing from other antipsychotic drugs, a reduction in prolactin may increase fertility.

Clozapine is licensed for the treatment of schizophrenia only in patients unresponsive to, or intolerant of, conventional antipsychotic drugs. It can cause agranulocytosis and its use is restricted to patients registered with a clozapine patient monitoring service (see under Clozapine).

Sertindole has been reintroduced following an earlier suspension of the drug because of concerns about arrhythmias; its use is restricted to patients who are enrolled in clinical studies and who are intolerant of at least one other antipsychotic.

The *Scottish Medicines Consortium* (p. 3) has advised (March 2008) that paliperidone (*Invega®*) is **not** recommended for use within NHS Scotland.

NICE guidance

Atypical antipsychotics for schizophrenia (June 2002)

NICE has recommended that:

- the atypical antipsychotics (amisulpride, olanzapine, quetiapine, risperidone, and zotepine) should be considered when choosing first-line treatment of *newly diagnosed schizophrenia*;
- an atypical antipsychotic is considered the treatment option of choice for managing an *acute schizophrenic episode* when discussion with the individual is not possible;
- an atypical antipsychotic should be considered for an individual who is suffering unacceptable side-effects from a conventional antipsychotic;
- an atypical antipsychotic should be considered for an individual in relapse whose symptoms were previously inadequately controlled;
- changing to an atypical antipsychotic is not necessary if a conventional antipsychotic controls symptoms adequately and the individual does not suffer unacceptable side-effects;
- clozapine should be introduced if schizophrenia is inadequately controlled despite the sequential use of two or more antipsychotics (one of which should be an atypical antipsychotic) each for at least 6–8 weeks.

Cautions and contra-indications While atypical antipsychotic drugs have not generally been associated with clinically significant prolongation of the QT interval, they should be used with care if prescribed with other drugs that increase the QT interval. Atypical antipsychotic drugs should be used with caution in patients with cardiovascular disease, or a history of epilepsy; they should be used with great caution in the elderly (see p. 194); **interactions:** Appendix 1 (antipsychotics).

Driving Atypical antipsychotic drugs may affect performance of skilled tasks (e.g. driving); effects of alcohol are enhanced.

Withdrawal Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects Side-effects of the atypical antipsychotic drugs include weight gain, dizziness, postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients, extrapyramidal symptoms (usually mild and transient and which respond to dose reduction or to an antimuscarinic drug), and occasionally tardive dyskinesia on long-term administration (discontinue drug on appearance of early signs). Hyperglycaemia and sometimes diabetes can occur, particularly with clozapine, olanzapine, and risperidone; monitoring weight and plasma-glucose concentration may identify the development of hyperglycaemia. Neuroleptic malignant syndrome has been reported rarely. Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication] (p. 231), provided that patients are not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

AMISULPRIDE

Indications schizophrenia

Cautions see notes above; also Parkinson's disease; renal impairment (Appendix 3)

Contra-indications see notes above; also phaeochromocytoma, prolactin-dependent tumours; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; also insomnia, anxiety, agitation, drowsiness, gastro-intestinal disorders such as constipation, nausea, vomiting, and dry mouth; hyperprolactinaemia; *occasionally* bradycardia; *rarely* seizures

Dose

- Acute psychotic episode, 400–800 mg daily in 2 divided doses, adjusted according to response; max. 1.2 g daily; CHILD under 15 years not recommended
- Predominantly negative symptoms, 50–300 mg daily; CHILD under 15 years not recommended

Amisulpride (Non-proprietary) PoM

Tablets, amisulpride 50 mg, net price 60-tab pack = £16.52; 100 mg, 60-tab pack = £33.42; 200 mg, 60-tab pack = £55.87; 400 mg, 60-tab pack = £111.36. Label: 2

Solian® (Sanofi-Synthelabo) PoM

Tablets, scored, amisulpride 50 mg, net price 60-tab pack = £22.76; 100 mg, 60-tab pack = £35.29; 200 mg, 60-tab pack = £58.99; 400 mg, 60-tab pack = £117.97. Label: 2

Solution, 100 mg/mL, net price 60 mL (caramel flavour) = £33.76. Label: 2

ARIPIPRAZOLE

Indications see under Dose

Cautions see notes above; cerebrovascular disease; elderly (reduce initial dose); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

Contra-indications see notes above; breast-feeding (Appendix 5)

Side-effects see notes above; gastro-intestinal disturbances; tachycardia; fatigue, insomnia, akathisia, drowsiness, restlessness, tremor, headache, asthenia; blurred vision; *less commonly* depression; *very rarely* anorexia, dysphagia, oropharyngeal spasm, laryngospasm, hepatitis, jaundice, hypersalivation, pancreatitis, oedema, thromboembolism, arrhythmias, bradycardia, hypertension, chest pain, agitation, anxiety, speech disorder, suicidal ideation, seizures, hyponatraemia, stiffness, myalgia, rhabdomyolysis, priapism, urinary retention and incontinence, blood

disorders, sweating, alopecia, photosensitivity reactions, rash, weight loss, and impaired temperature regulation; *with injection*, dry mouth

Dose

- Schizophrenia, by mouth, ADULT over 18 years 10–15 mg once daily, usual maintenance 15 mg once daily; max. 30 mg once daily
- Mania, by mouth, ADULT over 18 years, 15 mg once daily, increased if necessary; max. 30 mg once daily
- Control of agitation and disturbed behaviour in schizophrenia, by intramuscular injection, ADULT over 18 years, initially 5.25–15 mg (usual dose 9.75 mg) as a single dose followed by 5.25–15 mg after 2 hours if necessary; max. 3 injections daily; max. daily combined oral and parenteral dose 30 mg

Abilify® (Bristol-Myers Squibb) PoM

Tablets, aripiprazole 5 mg (blue), net price 28-tab pack = £97.67; 10 mg (pink), 28-tab pack = £97.67; 15 mg (yellow), 28-tab pack = £97.67; 30 mg (pink), 28-tab pack = £195.33. Label: 2

Orodispersible tablets, aripiprazole 10 mg (pink), net price 28-tab pack = £97.67; 15 mg (yellow), 28-tab pack = £97.67. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed

Oral solution, aripiprazole 1 mg/mL, net price 150 mL with measuring cup = £104.64. Label: 2

Injection ▼, aripiprazole 7.5 mg/mL, net price 1.3-mL (9.75-mg) vial = £3.49

CLOZAPINE

Indications schizophrenia (including psychosis in Parkinson's disease) in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

Cautions see notes above; elderly; monitor leucocyte and differential blood counts (see Agranulocytosis, below); prostatic hypertrophy, susceptibility to angle-closure glaucoma; taper off other antipsychotics before starting; close medical supervision during initiation (risk of collapse because of hypotension); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

Withdrawal On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm^3 or if absolute neutrophil count below 1500/mm^3 discontinue permanently and refer to haematologist. Patients who have low white blood cell counts because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness

Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- Perform physical examination and take full medical history before starting
- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

Gastro-intestinal obstruction Reactions resembling gastro-intestinal obstruction reported. Clozapine should be used cautiously with drugs which cause constipation (e.g. antimuscarinic drugs) or in history of colonic disease or bowel surgery. Monitor for constipation and prescribe laxative if required

Contra-indications severe cardiac disorders (e.g. myocarditis; see Cautions); severe renal impairment; history of neutropenia or agranulocytosis (see Cautions); bone-marrow disorders; paralytic ileus (see Cautions); alcoholic and toxic psychoses; history of circulatory collapse; drug intoxication; coma or severe CNS depression; uncontrolled epilepsy; breast-feeding (Appendix 5)

Side-effects see notes above; also constipation (see Cautions), hypersalivation, dry mouth, nausea, vomiting, anorexia; tachycardia, ECG changes, hypertension; drowsiness, dizziness, headache, tremor, seizures, fatigue, impaired temperature regulation; urinary incontinence and retention; leucopenia, eosinophilia, leucocytosis; blurred vision; sweating; *less commonly* agranulocytosis (**important:** see Cautions); *rarely* dysphagia, hepatitis, cholestatic jaundice, pancreatitis, circulatory collapse, arrhythmia, myocarditis (**important:** see Cautions), pericarditis, thromboembolism, agitation, confusion, delirium, anaemia; *very rarely* parotid gland enlargement, intestinal obstruction (see Cautions), cardiomyopathy, myocardial infarction, respiratory depression, priapism, interstitial nephritis, thrombocytopenia, thrombocythaemia, hypertriglyceridaemia, hypercholesterolaemia, hyperlipidaemia, angle-closure glaucoma, fulminant hepatic necrosis, and skin reactions

Dose

- Schizophrenia, ADULT over 16 years, 12.5 mg once or twice (ELDERLY 12.5 mg once) on first day then 25–50 mg (ELDERLY 25–37.5 mg) on second day then increased gradually (if well tolerated) in steps of 25–50 mg daily (ELDERLY max. increment 25 mg daily) over 14–21 days up to 300 mg daily in divided doses (larger dose at night, up to 200 mg daily may be taken as a single dose at bedtime); if necessary may be further increased in steps of 50–100 mg once (preferably) or twice weekly; usual dose 200–450 mg daily (max. 900 mg daily)

  Note *Restarting* after *interval of more than 2 days*, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
- Psychosis in Parkinson's disease, ADULT over 16 years, 12.5 mg at bedtime then increased according to response in steps of 12.5 mg up to twice weekly; usual dose range 25–37.5 mg at bedtime, usual max. 50 mg daily; exceptionally, dose may be increased further in steps of 12.5 mg weekly to max. 100 mg daily in 1–2 divided doses

Clozaril® (Novartis) PoM

Tablets, yellow, clozapine 25 mg (scored), net price 28-tab pack = £6.17, 84-tab pack (hosp. only) = £18.49; 100 mg, 28-tab pack = £24.64, 84-tab pack

(hosp. only) = £73.92. Label: 2, 10, patient information leaflet

Note Patient, prescriber, and supplying pharmacist must be registered with the Clozaril Patient Monitoring Service—takes several days to do this

Denzapine® (Merz) PoM

Tablets, yellow, scored, clozapine 25 mg, net price 28-tab pack = £6.17, 84-tab pack = £18.49; 50 mg, 50-tab pack = £22.00; 100 mg, 28-tab pack = £24.64, 84-tab pack = £73.92; 200 mg, 50-tab pack = £88.00. Label: 2, 10, patient information leaflet

Suspension, clozapine 50 mg/mL, net price 100 mL = £44.00. Label: 2, 10, patient information leaflet, counselling, administration

Counselling Shake well for 90 seconds when dispensing or if visibly settled; otherwise shake well for 10 seconds before use

Note May be diluted with water

Note Patient, prescriber, and supplying pharmacist must be registered with the Denzapine Patient Monitoring Service—takes several days to do this

Zaponex® (IVAX) PoM

Tablets, yellow, scored, clozapine 25 mg, net price 84-tab pack = £8.28; 100 mg, 84-tab pack = £33.88. Label: 2, 10, patient information leaflet

Note Patient, prescriber, and supplying pharmacist must be registered with the Zaponex Treatment Access System—takes several days to do this

OLANZAPINE

Indications see under Dose

Cautions see notes above; also prostatic hypertrophy, susceptibility to angle-closure glaucoma, paralytic ileus, diabetes mellitus (risk of exacerbation or ketoacidosis), low leucocyte or neutrophil count, bone-marrow depression, hypereosinophilic disorders, myeloproliferative disease, Parkinson's disease; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

CNS and respiratory depression Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving another antipsychotic or benzodiazepine

Contra-indications breast-feeding (Appendix 5); *for injection*, acute myocardial infarction, unstable angina, severe hypotension or bradycardia, sick sinus syndrome, recent heart surgery

Side-effects see notes above; also mild, transient antimuscarinic effects (*very rarely* precipitation of angle-closure glaucoma); drowsiness, speech difficulty, exacerbation of Parkinson's disease, abnormal gait, hallucinations, akathisia, asthenia, fatigue, increased appetite, increased body temperature, raised triglyceride concentration, oedema, hyperprolactinaemia (but clinical manifestations rare); urinary incontinence; eosinophilia; *less commonly* hypotension, bradycardia, QT interval prolongation, photosensitivity; *rarely* seizures, leucopenia, rash; *very rarely* thromboembolism, hypercholesterolaemia, hypothermia, urinary retention, priapism, thrombocytopenia, neutropenia, rhabdomyolysis, hepatitis, pancreatitis and alopecia; *with injection*, injection-site reactions, sinus pause, hypoventilation

Dose

- Schizophrenia, combination therapy for mania, preventing recurrence in bipolar disorder, by mouth, ADULT over 18 years, 10 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 10 mg daily only after reassessment; max. 20 mg daily; CHILD 12–18 years, see *BNF for Children*
- Monotherapy for mania, by mouth, ADULT over 18 years, 15 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 15 mg only after reassessment; max. 20 mg daily; CHILD 12–18 years, see *BNF for Children*
- Control of agitation and disturbed behaviour in schizophrenia or mania, by intramuscular injection, ADULT over 18 years, initially 5–10 mg (usual dose 10 mg) as a single dose followed by 5–10 mg after 2 hours if necessary; ELDERLY initially 2.5–5 mg as a single dose followed by 2.5–5 mg after 2 hours if necessary; max. 3 injections daily for 3 days; max. daily combined oral and parenteral dose 20 mg

Note When one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

Zyprexa® (Lilly) PoM

Tablets, f/c, olanzapine 2.5 mg, net price 28-tab pack = £21.85; 5 mg, 28-tab pack = £43.70; 7.5 mg, 56-tab pack = £131.10; 10 mg, 28-tab pack = £79.45, 15 mg (blue), 28-tab pack = £119.18; 20 mg (pink), 28-tab pack = £158.90. Label: 2

Orodispersible tablet (*Velotab®*), yellow, olanzapine 5 mg, net price 28-tab pack = £43.70; 10 mg, 28-tab pack = £79.45; 15 mg, 28-tab pack = £119.18; 20 mg, 28-tab pack = £158.90. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling *Velotab®* may be placed on the tongue and allowed to dissolve or dispersed in water, orange juice, apple juice, milk, or coffee

Injection ▼, powder for reconstitution, olanzapine 5 mg/mL, net price 10-mg vial = £3.48

PALIPERIDONE

Note Paliperidone is a metabolite of risperidone

Indications schizophrenia

Cautions see notes above; predisposition to gastrointestinal obstruction; elderly patients with dementia and risk factors for stroke; Parkinson's disease; severe hepatic impairment; renal impairment (avoid if eGFR less than 10 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4)

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also abdominal pain, dry mouth, hypersalivation, vomiting; tachycardia, bradycardia, first-degree AV block, bundle branch block; drowsiness, headache, asthenia; *less commonly* palpitation, arrhythmias, ischaemia, oedema, seizures, nightmare, syncope, menstrual disturbances, erectile dysfunction, galactorrhoea, and gynaecomastia

Dose

- ADULT over 18 years, 6 mg once daily in the morning, adjusted if necessary in increments of 3 mg over at least 5 days; usual range 3–12 mg daily

Counselling Always take with breakfast or always take on an empty stomach

Invega® (Janssen-Cilag) ▼ PoM

Tablets, m/r, paliperidone 3 mg (white), net price 28-tab pack = £97.28; 6 mg (beige), 28-tab pack = £97.28; 9 mg (pink), 28-tab pack = £145.92. Label: 2, 25, counselling, administration

QUETIAPINE

Indications schizophrenia; treatment of episodes of mania either alone or with mood stabilisers

Cautions see notes above; also hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); cerebrovascular disease

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also dry mouth, constipation, dyspepsia; tachycardia, elevated plasma-triglyceride and cholesterol concentrations, peripheral oedema; drowsiness, headache, asthenia; leucopenia, neutropenia; rhinitis; *less commonly* seizures, restless legs syndrome, and eosinophilia; *rarely* jaundice and priapism; *very rarely* hepatitis, angioedema, and Stevens-Johnson syndrome

Dose

- Schizophrenia, ADULT over 18 years, 25 mg twice daily on day 1, 50 mg twice daily on day 2, 100 mg twice daily on day 3, 150 mg twice daily on day 4, then adjusted according to response, usual range 300–450 mg daily in 2 divided doses; max. 750 mg daily; ELDERLY initially 25 mg daily as a single dose, increased in steps of 25–50 mg daily in 2 divided doses; CHILD 12–18 years, see *BNF for Children*
- Mania, ADULT over 18 years, 50 mg twice daily on day 1, 100 mg twice daily on day 2, 150 mg twice daily on day 3, 200 mg twice daily on day 4, then adjusted according to response in steps of up to 200 mg daily to max. 800 mg daily; usual range 400–800 mg daily in 2 divided doses; ELDERLY initially 25 mg daily as a single dose, increased in steps of 25–50 mg daily in 2 divided doses

Seroquel® (AstraZeneca) PoM

Tablets, f/c, quetiapine (as fumarate) 25 mg (peach), net price 60-tab pack = £33.83; 100 mg (yellow), 60-tab pack = £113.10; 150 mg (pale yellow), 60-tab pack = £113.10; 200 mg (white), 60-tab pack = £113.10; 300 mg (white), 60-tab pack = £170.00. Label: 2

Modified release

Seroquel® XL (AstraZeneca) ▼ PoM

Tablets, m/r, quetiapine (as fumarate) 50 mg (peach), net price 60-tab pack = £67.66; 200 mg (yellow), 60-tab pack = £113.10; 300 mg (pale yellow), 60-tab pack = £170.00; 400 mg (white), 60-tab pack = £226.20. Label: 2, 23, 25

Dose schizophrenia, mania, ADULT over 18 years, 300 mg once daily on day 1, then 600 mg once daily on day 2, then adjusted according to response; dose range 400–800 mg once daily; ELDERLY initially 50 mg once daily adjusted according to response in steps of 50 mg daily

RISPERIDONE

Indications acute and chronic psychoses, mania; short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer's dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others; short-term treatment (up to 6 weeks) of persistent aggression in conduct disorder (under specialist supervision)

Cautions see notes above; Parkinson's disease; dementia with Lewy bodies; dehydration; avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; also gastro-intestinal disturbances (including diarrhoea, constipation, nausea and vomiting, dyspepsia, abdominal pain), dry mouth; dyspnoea; drowsiness, asthenia, tremor, sleep disturbances, agitation, anxiety, headache; urinary incontinence; arthralgia, myalgia; abnormal vision; epistaxis; rash; *less commonly* anorexia, ECG changes, hypoaesthesia, impaired concentration, hyperprolactinaemia (with galactorrhoea, menstrual disturbances, gynaecomastia), sexual dysfunction, blood disorders, tinnitus, angioedema; *rarely* intestinal obstruction, pancreatitis, jaundice, seizures, hyponatraemia, abnormal temperature regulation; oedema and priapism also reported

Dose

- Psychoses, 2 mg in 1–2 divided doses on first day *then* 4 mg in 1–2 divided doses on second day (slower titration appropriate in some patients); usual dose range 4–6 mg daily; doses above 10 mg daily only if benefit considered to outweigh risk (max. 16 mg daily); ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily; CHILD 12–18 years see *BNF for Children*
- Mania, initially 2 mg once daily, increased if necessary in steps of 1 mg daily; usual dose range 1–6 mg daily; ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily
- Persistent aggression in Alzheimer's dementia, initially 250 micrograms twice daily, increased according to response in steps of 250 micrograms twice daily on alternate days; usual dose 500 micrograms twice daily (up to 1 mg twice daily has been required)
- Persistent aggression in conduct disorder, CHILD over 5 years, body-weight under 50 kg, initially 250 micrograms once daily, increased according to response in steps of 250 micrograms on alternate days; usual dose 500 micrograms daily (up to 750 micrograms once daily has been required); CHILD over 5 years, body-weight over 50 kg, initially 500 micrograms once daily, increased according to response in steps of 500 micrograms on alternate days; usual dose 1 mg daily (up to 1.5 mg once daily has been required)

Risperidone (Non-proprietary) ▼ PoM

Tablets, risperidone 500 micrograms, net price 20-tab pack = £3.08; 1 mg, 20-tab pack = £4.96, 60-tab pack = £14.44; 2 mg, 60-tab pack = £27.84; 3 mg, 60-tab pack = £39.90; 4 mg, 60-tab pack = £54.31; 6 mg, 28-tab pack = £39.55. Label: 2

Orodispersible tablets, risperidone 0.5 mg, net price 28-tab pack = £8.69; 1 mg, 28-tab pack = £18.39; 2 mg, 28-tab pack = £33.30. Label: 2, counselling, administration

Counselling Tablets should be placed on the tongue, allowed to dissolve and swallowed

Liquid, risperidone 1 mg/mL, net price 100-mL pack = £55.23. Label: 2, counselling, use of dose syringe

Note Liquid may be diluted with mineral water, orange juice or black coffee (should be taken immediately)

Risperdal® (Janssen-Cilag) ▼ PoM

Tablets, f/c, scored, risperidone 500 micrograms (brown-red), net price 20-tab pack = £6.78; 1 mg (white), 20-tab pack = £11.16, 60-tab pack = £33.48; 2 mg (orange), 60-tab pack = £66.01; 3 mg (yellow), 60-tab pack = £97.07; 4 mg (green), 60-tab pack = £128.14; 6 mg (yellow), 28-tab pack = £90.60. Label: 2

Orodispersible tablets (*Quicklet*®), pink, risperidone 500 micrograms, net price 28-tab pack = £10.98; 1 mg, 28-tab pack = £17.67; 2 mg, 28-tab pack = £33.31; 3 mg, 28-tab pack = £48.38; 4 mg, 28-tab pack = £62.31. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to dissolve and swallowed

Liquid, risperidone 1 mg/mL, net price 100 mL = £53.93. Label: 2, counselling, use of dose syringe

Note Liquid may be diluted with mineral water, orange juice or black coffee (should be taken immediately)

Depot preparation

Section 4.2.2

SERTINDOLE

Indications schizophrenia, see also notes above

Cautions see notes above; hepatic impairment (Appendix 2); correct hypokalaemia or hypomagnesaemia before treatment; monitor ECG during treatment; monitor blood pressure during dose titration and early maintenance therapy (risk of postural hypotension)

Contra-indications see notes above; pregnancy (Appendix 4), breast-feeding (Appendix 5), severe hepatic impairment, QT interval prolongation (ECG required before and during treatment—consult product literature); concomitant administration of drugs which prolong QT interval (see interactions); uncorrected hypokalaemia or hypomagnesaemia

Side-effects see notes above; prolonged QT interval, peripheral oedema, dry mouth, rhinitis, nasal congestion, dyspnoea, paraesthesia, abnormal ejaculation (decreased volume); *rarely* seizures, hyperglycaemia

Dose

- Initially 4 mg daily increased in steps of 4 mg at intervals of 4–5 days to usual maintenance of 12–20 mg as a single daily dose; max. 24 mg daily; ELDERLY consider slower dose titration and lower maintenance dose; CHILD and ADOLESCENT not recommended

Serdolect® (Lundbeck) ▼ PoM

Tablets, f/c, sertindole 4 mg, 30-tab pack; 12 mg 28-tab pack; 16 mg, 28-tab pack; 20 mg 28-tab pack

Available only on named-patient basis (see notes above)

ZOTEPINE

Indications schizophrenia

Cautions see notes above; personal or close family history of epilepsy; withdrawal of concomitantly prescribed CNS depressants; QT interval prolongation—ECG required (before treatment and at each dose increase) in patients at risk of arrhythmias; monitor plasma electrolytes particularly before treatment and at each dose increase; hepatic impairment (Appendix 2); renal impairment (Appendix 3); prostatic hypertrophy, urinary retention, susceptibility to angle-closure glaucoma, paralytic ileus, pregnancy (Appendix 4)

Contra-indications acute intoxication with CNS depressants; high doses of concomitantly prescribed antipsychotics; acute gout (avoid for 3 weeks after episode resolves), history of nephrolithiasis; breast-feeding (Appendix 5)

Side-effects see notes above; constipation, dyspepsia, dry mouth, tachycardia, QT interval prolongation, rhinitis, agitation, anxiety, depression, asthenia, headache, EEG abnormalities, insomnia, drowsiness, hyperthermia or hypothermia, increased salivation, blood dyscrasias (including leucocytosis, leucopenia), raised erythrocyte sedimentation rate, blurred vision, sweating; less frequently anorexia, diarrhoea, nausea and vomiting, abdominal pain, hypertension, influenza-like syndrome, cough, dyspnoea, confusion, convulsions, decreased libido, speech disorder, vertigo, hyperprolactinaemia, anaemia, thrombocythaemia, increased serum creatinine, hypoglycaemia and hyperglycaemia, hyperlipidaemia, hypouricaemia, oedema, thirst, impotence, urinary incontinence, arthralgia, myalgia, conjunctivitis, acne, dry skin, rash; rarely bradycardia, epistaxis, abdominal enlargement, amnesia, ataxia, coma, delirium, hypaesthesia, myoclonus, thrombocytopenia, abnormal ejaculation, urinary retention, menstrual irregularities, myasthenia, alopecia, photosensitivity; *very rarely* angle-closure glaucoma

Dose

- Initially 25 mg 3 times daily increased according to response at intervals of 4 days to max. 100 mg 3 times daily; ELDERLY initially 25 mg twice daily increased according to response to max. 75 mg twice daily; CHILD and ADOLESCENT under 18 years not recommended

Zoleptil® (Healthcare Logistics) PoM

Tablets, s/c, zotepine 25 mg (white), net price 30-tab pack = £21.50, 90-tab pack = £42.98; 50 mg (yellow), 30-tab pack = £28.65, 90-tab pack = £57.30; 100 mg (pink), 30-tab pack = £47.28, 90-tab pack = £94.55. Label: 2

4.2.2 Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with atypical antipsychotics such as risperidone.

Administration Depot antipsychotics are administered by deep intramuscular injection at intervals of 1 to 4 weeks. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged. In general not more than 2–3 mL of oily injection should be administered at any one site; correct injection technique (including the use of z-track technique) and rotation of injection sites are essential. If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

Dosage Individual responses to neuroleptic drugs are very variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient's response. For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 193.

Equivalent doses of depot antipsychotics

These equivalences are intended **only** as an approximate guide; individual dosage instructions should **also** be checked; patients should be carefully monitored after **any** change in medication

Antipsychotic drug	Dose (mg)	Interval
Flupentixol decanoate	40	2 weeks
Fluphenazine decanoate	25	2 weeks
Haloperidol (as decanoate)	100	4 weeks
Pipotiazine palmitate	50	4 weeks
Zuclopenthixol decanoate	200	2 weeks

Important These equivalences must **not** be extrapolated beyond the maximum dose for the drug

Choice There is no clear-cut division in the use of the conventional antipsychotics, but **zuclopenthixol** may be suitable for the treatment of agitated or aggressive patients whereas **flupentixol** can cause over-excitement in such patients. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

Cautions See section 4.2.1. Treatment requires careful monitoring for optimum effect. When transferring from oral to depot therapy, dosage by mouth should be reduced gradually.

Contra-indications See section 4.2.1. Do not use in children.

Side-effects See section 4.2.1. Pain may occur at injection site and occasionally erythema, swelling, and nodules. For side-effects of specific antipsychotics see under the relevant drug.

FLUPENTIXOL DECANOATE

(Flupenthixol Decanoate)

Indications maintenance in schizophrenia and other psychoses

Cautions see notes on p. 194 and also under Flupentixol (section 4.2.1) and notes above; an alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear

Contra-indications see notes on p. 194 and also under Flupentixol (section 4.2.1) and notes above

Side-effects see notes on p. 194 and also under Flupentixol (section 4.2.1) and notes above, but may have a mood elevating effect

Dose

- By deep intramuscular injection into the upper outer buttock or lateral thigh, test dose 20 mg, then after at least 7 days 20–40 mg repeated at intervals of 2–4 weeks, adjusted according to response; max. 400 mg weekly; usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; ELDERLY initially quarter to half adult dose; CHILD not recommended

Depixol® (Lundbeck) PoM
Injection (oily), flupentixol decanoate 20 mg/mL. Net price 1-mL amp = £1.06; 2-mL amp = £1.78

Depixol Conc.® (Lundbeck) PoM
Injection (oily), flupentixol decanoate 100 mg/mL. Net price 0.5-mL amp = £2.39; 1-mL amp = £4.38

Depixol Low Volume® (Lundbeck) PoM
Injection (oily), flupentixol decanoate 200 mg/mL. Net price 1-mL amp = £13.66

FLUPHENAZINE DECANOATE

Indications maintenance in schizophrenia and other psychoses

Cautions see notes on p. 194 and also notes above

Contra-indications see notes on p. 194 and also notes above; also marked cerebral atherosclerosis

Side-effects see notes on p. 194 and notes above; less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent; systemic lupus erythematosus, inappropriate antidiuretic hormone secretion, oedema, also reported; extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed

Dose

- By deep intramuscular injection into the gluteal muscle, test dose 12.5 mg (6.25 mg in elderly), then after 4–7 days 12.5–100 mg repeated at intervals of 14–35 days, adjusted according to response; CHILD not recommended

Fluphenazine decanoate (Non-proprietary) PoM
Injection (oily), fluphenazine decanoate 25 mg/mL, net price 1-mL amp = £2.35; 100 mg/mL, 0.5-mL amp = £4.50, 1-mL amp = £8.79
Excipients include sesame oil

Modecate® (Sanofi-Synthelabo) PoM
Injection (oily), fluphenazine decanoate 25 mg/mL. Net price 0.5-mL amp = £1.30, 1-mL amp = £2.26, 2-mL amp = £4.44
Excipients include sesame oil

Modecate Concentrate® (Sanofi-Synthelabo) PoM
Injection (oily), fluphenazine decanoate 100 mg/mL. Net price 0.5-mL amp = £4.47, 1-mL amp = £8.75
Excipients include sesame oil

HALOPERIDOL

Indications maintenance in schizophrenia and other psychoses

Cautions see notes on p. 194 and also under Haloperidol (section 4.2.1) and notes above

Contra-indications see notes on p. 194 and also under Haloperidol (section 4.2.1) and notes above

Side-effects see notes on p. 194 and also under Haloperidol (section 4.2.1) and notes above

Dose

- By deep intramuscular injection into the gluteal muscle, initially 50 mg every 4 weeks, if necessary increasing by 50-mg increments to 300 mg every 4 weeks; higher doses may be needed in some patients; ELDERLY, initially 12.5–25 mg every 4 weeks; CHILD not recommended

Note If 2-weekly administration preferred, doses should be halved

Haldol Decanoate® (Janssen-Cilag) PoM
Injection (oily), haloperidol (as decanoate) 50 mg/mL, net price 1-mL amp = £3.89; 100 mg/mL, 1-mL amp = £5.15
Excipients include sesame oil

PIPOTIAZINE PALMITATE
(Pipothiazine Palmitate)

Indications maintenance in schizophrenia and other psychoses

Cautions see notes on p. 194 and notes above

Contra-indications see notes on p. 194 and notes above

Side-effects see notes on p. 194 and notes above

Dose

- By deep intramuscular injection into the gluteal muscle, test dose 25 mg, then a further 25–50 mg after 4–7 days, then adjusted according to response at intervals of 4 weeks; usual maintenance range 50–100 mg (max. 200 mg) every 4 weeks; ELDERLY initially 5–10 mg; CHILD not recommended

Piportil Depot® (Sanofi-Aventis) PoM
Injection (oily), pipotiazine palmitate 50 mg/mL. Net price 1-mL amp = £16.29; 2-mL amp = £26.65
Excipients include sesame oil

RISPERIDONE

Indications schizophrenia and other psychoses in patients tolerant to risperidone by mouth

Cautions see under Risperidone (section 4.2.1) and notes above

Side-effects see under Risperidone (section 4.2.1); also hypertension; depression, paraesthesia; *less commonly* apathy, weight loss, injection-site reactions, and pruritus

Dose

- By deep intramuscular injection into the gluteal muscle, patients taking oral risperidone up to 4 mg daily, initially 25 mg every 2 weeks; patients taking oral risperidone over 4 mg daily, initially 37.5 mg every 2 weeks; dose adjusted at intervals of at least 4 weeks in steps of 12.5 mg to max. 50 mg (ELDERLY 25 mg) every 2 weeks; CHILD and ADOLESCENT under 18 years not recommended

Note During initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Risperdal Consta® (Janssen-Cilag) ▼ PoM
Injection, powder for reconstitution, risperidone 25-mg vial, net price = £79.69; 37.5-mg vial = £111.32; 50-mg vial = £142.76 (all with diluent)

ZUCLOPENTHIXOL DECANOATE

Indications maintenance in schizophrenia and paranoid psychoses

Cautions see notes on p. 194 and notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes on p. 194 and notes above

Side-effects see notes on p. 194 and notes above

Dose

- By deep intramuscular injection into the upper outer buttock or lateral thigh, test dose 100 mg, followed after at least 7 days by 200–500 mg or more, repeated at intervals of 1–4 weeks, adjusted according to response; max. 600 mg weekly; ELDERLY quarter to half usual starting dose; CHILD not recommended

Clopixol® (Lundbeck) PoM
Injection (oily), zuclopenthixol decanoate 200 mg/mL, net price 1-mL amp = £2.21

Clopixol Conc.® (Lundbeck) PoM
Injection (oily), zuclopenthixol decanoate 500 mg/mL, net price 1-mL amp = £5.21

4.2.3 Antimanic drugs

Drugs are used in mania to control acute attacks and to prevent their recurrence.

Benzodiazepines

Use of benzodiazepines (section 4.1) may be helpful in the initial stages of treatment until lithium achieves its full effect; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

In an acute attack of mania, treatment with an antipsychotic drug (section 4.2.1) is usually required because it may take a few days for lithium to exert its antimanic effect. Lithium may be given concurrently with the antipsychotic drug, and treatment with the antipsychotic gradually tailed off as lithium becomes effective. Alternatively, lithium therapy may be commenced once the patient's mood has been stabilised with the antipsychotic. The adjunctive use of atypical antipsychotics such as olanzapine (section 4.2.1) and risperidone with either lithium or valproic acid may also be of benefit.

High doses of haloperidol or flupentixol may be hazardous when used with lithium; irreversible toxic encephalopathy has been reported.

Carbamazepine

Carbamazepine (section 4.8.1) may be used for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to lithium; it seems to be particularly effective in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year).

Valproic acid

Valproic acid (as the semisodium salt) is licensed for the treatment of manic episodes associated with bipolar disorder. It may be useful in patients unresponsive to lithium.

Sodium valproate (section 4.8.1) has also been used, but it is unlicensed for this indication.

VALPROIC ACID

Indications treatment of manic episodes associated with bipolar disorder

Cautions see Sodium Valproate (section 4.8.1); monitor closely if dose greater than 45 mg/kg daily

Contra-indications see Sodium Valproate (section 4.8.1)

Side-effects see Sodium Valproate (section 4.8.1)

Dose

- Initially 750 mg daily in 2–3 divided doses, increased according to response, usual dose 1–2 g daily; CHILD and ADOLESCENT under 18 years not recommended

Depakote® (Sanofi-Aventis) PoM

Tablets, e/c, valproic acid (as semisodium valproate) 250 mg, net price 90-tab pack = £12.17; 500 mg, 90-tab pack = £24.29. Label: 25

Note Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid

Convulex® (Pharmacia) PoM

Section 4.8.1 (epilepsy)

Lithium

Lithium salts are used in the prophylaxis and treatment of mania, in the prophylaxis of bipolar disorder (manic-depressive disorder) and in the prophylaxis of recurrent depression (unipolar illness or unipolar depression). Lithium is unsuitable for children.

The decision to give prophylactic lithium usually requires *specialist advice*, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit weighed against the risks. In long-term use lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with regular monitoring of thyroid function. The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available. There seem few if any reasons for preferring one or other of the salts of lithium available. Doses are adjusted to achieve serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients) on samples taken 12 hours after the preceding dose. It is important to determine the optimum range for each individual patient.

Overdosage, usually with serum-lithium concentration of over 1.5 mmol/litre, may be fatal and toxic effects include tremor, ataxia, dysarthria, nystagmus, renal impairment, and convulsions. If these potentially hazardous signs occur, treatment should be stopped, serum-lithium concentrations redetermined, and steps taken to reverse lithium toxicity. In mild cases withdrawal of lithium and administration of generous amounts of sodium salts and fluid will reverse the toxicity. Serum-lithium concentration in excess of 2 mmol/litre require urgent treatment as indicated under Emergency Treatment of Poisoning, p. 33.

Interactions Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided. For other **interactions** with lithium, see Appendix 1 (lithium).

Withdrawal While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of a few weeks and patients should be warned of possible relapse if it is discontinued abruptly.

Lithium cards

A lithium treatment card available from pharmacies tells patients how to take lithium preparations, what to do if a dose is missed, and what side-effects to expect. It also explains why regular blood tests are important and warns that some medicines and illnesses can change serum-lithium concentration. Cards may be purchased from the National Pharmacy Association.
Tel: (01727) 858 687
sales@npa.co.uk

LITHIUM CARBONATE

Indications treatment and prophylaxis of mania, bipolar disorder, and recurrent depression (see also notes above); aggressive or self-mutilating behaviour

Cautions measure serum-lithium concentration regularly (every 3 months on stabilised regimens), measure renal function and thyroid function every 6–12 months on stabilised regimens and advise patient to seek attention if symptoms of hypothyroidism develop (women at greater risk) e.g. lethargy, feeling cold; maintain adequate sodium and fluid intake; test renal function before initiating and if evidence of toxicity, avoid in renal impairment (Appendix 3), cardiac disease, and conditions with sodium imbalance such as Addison's disease; reduce dose or discontinue in diarrhoea, vomiting and intercurrent infection (especially if sweating profusely); psoriasis (risk of exacerbation); pregnancy (Appendix 4), breast-feeding (Appendix 5), elderly (reduce dose), diuretic treatment, myasthenia gravis; surgery (section 15.1); avoid abrupt withdrawal (see notes above); **interactions:** Appendix 1 (lithium)

Counselling Patients should maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above)

Side-effects gastro-intestinal disturbances, fine tremor, renal impairment (particularly impaired urinary concentration and polyuria), polydipsia, leucocytosis; also weight gain and oedema (may respond to dose reduction); hyperparathyroidism and hypercalcaemia reported; signs of intoxication are blurred vision, increasing gastro-intestinal disturbances (anorexia, vomiting, diarrhoea), muscle weakness, increased CNS disturbances (mild drowsiness and sluggishness increasing to giddiness with ataxia, coarse tremor, lack of co-ordination, dysarthria), and require withdrawal of treatment; with severe **overdosage** (serum-lithium concentration above 2 mmol/litre) hyperreflexia and hyperextension of limbs, convulsions, toxic psychoses, syncope, renal failure, circulatory failure, coma, and occasionally, death; goitre, raised antidiuretic hormone concentration, hypothyroidism, hypokalaemia, ECG changes, and kidney changes may also occur; see also Emergency Treatment of Poisoning, p. 33

Dose

- See under preparations below, adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then

every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Note **Preparations vary widely in bioavailability**; changing the preparation requires the same precautions as initiation of treatment

Note Lithium carbonate 200 mg ≡ lithium citrate 509 mg

Camcolit® (Norgine) PoM

Camcolit 250® tablets, f/c, scored, lithium carbonate 250 mg (Li^+ 6.8 mmol), net price 100-tab pack = £3.09. Label: 10, lithium card, counselling, see above

Camcolit 400® tablets, m/r, f/c, scored, lithium carbonate 400 mg (Li^+ 10.8 mmol), net price 100-tab pack = £4.13. Label: 10, lithium card, 25, counselling, see above

Dose (see Dose above for advice on bioavailability and serum monitoring):
ADULT and CHILD over 12 years, treatment, initially 1–1.5 g daily; prophylaxis, initially 300–400 mg daily

Note *Camcolit 400®* also available as *Lithonate®* (TEVA UK)

Liskonum® (GSK) PoM

Tablets, m/r, f/c, scored, lithium carbonate 450 mg (Li^+ 12.2 mmol), net price 60-tab pack = £2.88. Label: 10, lithium card, 25, counselling, see above

Dose (see Dose above for advice on bioavailability and serum monitoring):
ADULT and CHILD over 12 years, treatment, initially 450–675 mg twice daily (elderly initially 225 mg twice daily); prophylaxis, initially 450 mg twice daily (elderly 225 mg twice daily)

Priadel® (Sanofi-Aventis) PoM

Tablets, m/r, both scored, lithium carbonate 200 mg (Li^+ 5.4 mmol), net price 100-tab pack= £2.30; 400 mg (Li^+ 10.8 mmol), 100-tab pack = £3.35. Label: 10, lithium card, 25, counselling, see above

Dose (see Dose above for advice on bioavailability and serum monitoring):
Treatment and prophylaxis, initially 0.4–1.2 g daily as a single dose or in 2 divided doses (elderly or patients less than 50 kg, 400 mg daily); CHILD not recommended

Liquid, see under Lithium Citrate below

LITHIUM CITRATE

Indications see under Lithium Carbonate and notes above

Cautions see under Lithium Carbonate and notes above

Counselling Patients should maintain an adequate fluid intake and should avoid dietary changes which might reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above)

Side-effects see under Lithium Carbonate and notes above

Dose

- See under preparations below, adjusted to achieve serum-lithium concentration of 0.4–1 mmol/litre as described under Lithium Carbonate

Note **Preparations vary widely in bioavailability**; changing the preparation requires the same precautions as initiation of treatment

Note Lithium carbonate 200 mg ≡ lithium citrate 509 mg

Li-Liquid® (Rosemont) PoM

Oral solution, lithium citrate 509 mg/5 mL (Li^+ 5.4 mmol/5 mL), yellow, net price 150-mL pack = £5.79; 1.018 g/5 mL (Li^+ 10.8 mmol/5 mL), orange, 150-mL pack = £11.58. Label: 10, lithium card, counselling, see above

Dose (see Dose above for advice on bioavailability and serum monitoring):
Treatment and prophylaxis, initially 1.018–3.054 g daily in 2 divided doses (elderly or patients less than 50 kg, initially 509 mg twice daily); CHILD not recommended

Priadel® (Sanofi-Aventis) PoM

Tablets, see under Lithium Carbonate

Liquid, sugar-free, lithium citrate 520 mg/5 mL (approx. Li^+ 5.4 mmol/5 mL), net price 150-mL pack = £5.61. Label: 10, lithium card, counselling, see above

Dose (see Dose above for advice on bioavailability and serum monitoring, see above):
Treatment and prophylaxis, initially 1.04–3.12 g daily in 2 divided doses (elderly or patients less than 50 kg, 520 mg twice daily); CHILD not recommended

4.3 Antidepressant drugs

4.3.1 Tricyclic and related antidepressant drugs
4.3.2 Monoamine-oxidase inhibitors
4.3.3 Selective serotonin re-uptake inhibitors
4.3.4 Other antidepressant drugs

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. They are also effective for dysthymia (lower grade chronic depression). Antidepressant drugs are not generally effective in mild depression, and cognitive behavioural therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice The major classes of antidepressant drugs include the tricyclics and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification; these are included in section 4.3.4.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-

effects; toxicity in overdosage is also a problem. See section 4.3.1 for more details.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics (section 4.1.2) or antipsychotic drugs (section 4.2.1) should therefore be used with caution in depression but they are useful adjuncts in agitated patients.

See also section 4.2.3 for references to the management of bipolar disorders.

St John's wort (*Hypericum perforatum*) is a popular herbal remedy on sale to the public for treating mild depression. However, preparations of St John's wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs have been identified, see Appendix 1 (St John's wort). The amount of active ingredient can vary between different preparations of St John's wort and switching from one to another can change the degree of enzyme induction. Furthermore, when a patient stops taking St John's wort, concentrations of interacting drugs may increase, leading to toxicity. Antidepressant drugs should **not** be used with St John's wort because of the potential for interaction.

Hyponatraemia and antidepressant therapy

Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. The CSM has advised that hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Management Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly). Patients with a history of recurrent depression should continue to receive maintenance treatment for at least 2 years.

Failure to respond Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine; in patients with atypical depression, an MAOI such as phenelzine may be effective. Other second-line choices include lofepramine, moclobemide, and reboxetine. Other tricyclic antidepressants and venlafaxine should be considered for more severe forms of depression; dosulepin (dothiepin) and irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or an augmenting agent such as lithium, but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Withdrawal Gastro-intestinal symptoms of nausea, vomiting, and anorexia, accompanied by headache, giddiness, 'chills', and insomnia, and sometimes by hypomania, panic-anxiety, and extreme motor restlessness may occur if an antidepressant (particularly an MAOI) is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). SSRIs have been associated with a specific withdrawal syndrome (section 4.3.3).

Anxiety disorders and obsessive-compulsive disorder Management of acute anxiety generally involves the use of a benzodiazepine or buspirone (section 4.1.2). For chronic anxiety (of longer than 4 weeks' duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. *Generalised anxiety disorder*, a form of chronic anxiety, is treated with an SSRI such as escitalopram or paroxetine; pregabalin and venlafaxine are also licensed for the treatment of generalised anxiety disorder.

Panic disorder, *obsessive-compulsive disorder*, *post-traumatic stress disorder*, and phobic states such as *social anxiety disorder* are treated with SSRIs. Clomipramine or imipramine can be used second-line in panic disorder [unlicensed]; clomipramine can also be used second-line for obsessive-compulsive disorder. Moclobemide is licensed for the treatment of social anxiety disorder.

4.3.1 Tricyclic and related antidepressant drugs

This section covers tricyclic antidepressants and also 1-, 2-, and 4-ring structured drugs with broadly similar properties.

Some tricyclic antidepressants are used in the management of *panic disorder* (section 4.3). For reference to the role of some tricyclic antidepressants in some forms of *neuralgia*, see section 4.7.3, and in *nocturnal enuresis* in children, see section 7.4.2.

Cautions Tricyclic and related antidepressant drugs should be used with caution in patients with cardiovascular disease (see also Contra-indications, below); because of the risk of arrhythmias, patients with concomitant conditions such as hyperthyroidism and phaeochromocytoma should be treated with care.

Care is also needed in patients with epilepsy and hepatic impairment (avoid if severe; Appendix 2).

Tricyclic antidepressant drugs have antimuscarinic activity, and therefore caution is needed in patients with prostatic hypertrophy, chronic constipation, increased intra-ocular pressure, urinary retention, or those with a susceptibility to angle-closure glaucoma. Tricyclic and related antidepressant drugs should be used with caution in patients with a history of psychosis or bipolar disorder, because antidepressant therapy may aggravate these conditions; treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

For use in pregnancy or breast-feeding, see Appendix 4 and Appendix 5.

Overdosage Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular effects are dangerous in overdosage. In particular, overdosage with dosulepin (dothiepin) and amitriptyline is associated with a relatively high rate of fatality. For advice on **overdosage** see Emergency Treatment of Poisoning, p. 31.

Withdrawal If possible tricyclic and related antidepressants should be withdrawn slowly (see also section 4.3).

Interactions A tricyclic or related antidepressant (or an SSRI or related antidepressant) should not be started until 2 weeks after stopping an MAOI (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped. For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see p. 214. For other tricyclic antidepressant **interactions**, see Appendix 1 (antidepressants, tricyclic and antidepressants, tricyclic (related)).

Driving Drowsiness may affect the performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Contra-indications Tricyclic and related antidepressants are contra-indicated in the immediate recovery period after myocardial infarction, in arrhythmias (particularly heart block), in the manic phase of bipolar disorder, and in severe liver disease. Avoid treatment with tricyclic antidepressant drugs in acute porphyria (section 9.8.2).

Side-effects Arrhythmias and heart block occasionally follow the use of tricyclic antidepressants, particularly amitriptyline, and may be a factor in the sudden death of patients with cardiac disease; other cardiovascular side-effects include postural hypotension, tachycardia, and ECG changes. The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdosage.

Central nervous system side-effects are common, particularly in the elderly, and include anxiety, dizziness, agitation, confusion, sleep disturbances, irritability, and paraesthesia; drowsiness is associated with some of the tricyclic antidepressants (see under Choice, below). Convulsions, hallucinations, delusions, mania, and hypomania may occur (see also under Cautions), and, rarely, extrapyramidal symptoms including tremor and dysarthria.

Antimuscarinic side-effects include dry mouth, blurred vision (very rarely precipitation of angle-closure glaucoma), constipation (rarely leading to paralytic ileus, particularly in the elderly), and urinary retention. Tricyclic-related antidepressant drugs have a lower incidence of antimuscarinic side-effects than older tricyclics.

Endocrine effects include breast enlargement, galactorrhoea, and gynaecomastia. Sexual dysfunction may occur. Changes in blood sugar, increased appetite, and weight gain can accompany treatment with tricyclic antidepressant drugs, but anorexia and weight loss are also seen. Hepatic and haematological reactions may occur and have been particularly associated with mianserin. Another side-effect to which the elderly are particularly susceptible is hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 209). Other class side-effects include nausea, vomiting, taste disturbance, tinnitus, rash, urticaria, pruritus, photosensitivity, alopecia, and sweating.

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Neuroleptic malignant syndrome (section 4.2.1) may, very rarely, occur in the course of antidepressant drug treatment.

Suicidal behaviour has been linked with antidepressants (see p. 209).

Dosage About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the **elderly** (see under Side-effects, below).

In most patients the long half-life of tricyclic antidepressant drugs allows **once-daily** administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Choice Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine is more selective for serotonergic transmission, and imipramine is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with **sedative** properties include amitriptyline, clomipramine, dosulepin (dothiepin), doxepin, mianserin, trazodone, and trimipramine. Those with **less sedative** properties include imipramine, lofepramine, and nortriptyline.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdosage, which may be important in individual patients. **Lofepramine** has a lower incidence of

side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. **Imipramine** is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. **Amitriptyline** and **dosulepin** (dothiepin) are effective but they are particularly dangerous in overdosage (see Overdosage, below) and are not recommended for the treatment of depression; dosulepin (dothiepin) should only be prescribed by specialists.

Children and adolescents Evidence of the efficacy of tricyclic antidepressants for depression in children has not been established; see also CSM advice, p. 215.

Tricyclic antidepressants

AMITRIPTYLINE HYDROCHLORIDE

Indications depressive illness (but not recommended, see notes above); nocturnal enuresis in children (section 7.4.2); neuropathic pain [unlicensed] (section 4.7.3); migraine prophylaxis [unlicensed] (section 4.7.4.2)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, stomatitis, palpitation, oedema, hypertension, restlessness, fatigue, mydriasis, and increased intra-ocular pressure; high rate of fatality in overdose—see notes above

Dose

- Depression (but not recommended, see notes above), ADULT and CHILD over 16 years, initially 75 mg (elderly and adolescents 30–75 mg) daily in divided doses *or* as a single dose at bedtime increased gradually as necessary to 150–200 mg
- Nocturnal enuresis, CHILD 7–10 years 10–20 mg, 11–16 years 25–50 mg at night; max. period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Neuropathic pain [unlicensed indication], initially 10–25 mg daily at night, increased if necessary to 75 mg daily; higher doses under specialist supervision
- Migraine prophylaxis [unlicensed indication], initially 10 mg at night, increased if necessary to maintenance of 50–75 mg at night

Amitriptyline (Non-proprietary) PoM

Tablets, coated, amitriptyline hydrochloride 10 mg, net price 28-tab pack = 94p; 25 mg, 28-tab pack = 94p; 50 mg, 28-tab pack = £1.13. Label: 2

Oral solution, amitriptyline hydrochloride 25 mg/5 mL, net price 150 mL = £13.53; 50 mg/5 mL, 150 mL = £14.72. Label: 2

Compound preparations

Triptafen® (Goldshield) PoM

Tablets, pink, s/c, amitriptyline hydrochloride 25 mg, perphenazine 2 mg, net price 100-tab pack = £25.49. Label: 2

Dose depression with anxiety, ADULT and CHILD over 14 years, 1 tablet 3 times daily, increased if necessary to 4 tablets daily (with last dose at bedtime); review treatment if no response within 4 weeks; discontinue after 3 months

Triptafen-M® (Goldshield) PoM

Tablets, pink, s/c, amitriptyline hydrochloride 10 mg, perphenazine 2 mg, net price 100-tab pack = £22.80. Label: 2

Dose mild to moderate depression with anxiety, ADULT and CHILD over 14 years, 1 tablet 3 times daily, increased if necessary to 4 tablets daily (with last dose at bedtime); review treatment if no response within 4 weeks; discontinue after 3 months

CLOMIPRAMINE HYDROCHLORIDE

Indications depressive illness, phobic and obsessional states; adjunctive treatment of cataplexy associated with narcolepsy

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, diarrhoea, hypertension, flushing, restlessness, fatigue, aggression, impaired memory, muscle weakness, muscle hypertonia, myoclonus, mydriasis, and yawning; *very rarely* allergic alveolitis

Dose

- Depressive illness, ADULT over 18 years, initially 10 mg daily, increased gradually as necessary to 30–150 mg daily in divided doses *or* as a single dose at bedtime; max. 250 mg daily; ELDERLY initially 10 mg daily increased carefully over approx. 10 days to 30–75 mg daily
- Phobic and obsessional states, ADULT over 18 years, initially 25 mg daily (ELDERLY 10 mg daily) increased over 2 weeks to 100–150 mg daily; max. 250 mg daily
- Adjunctive treatment of cataplexy associated with narcolepsy, ADULT over 18 years, initially 10 mg daily, gradually increased until satisfactory response (range 10–75 mg daily)

Clomipramine (Non-proprietary) PoM

Capsules, clomipramine hydrochloride 10 mg, net price 28-cap pack = £2.49; 25 mg, 28-cap pack = £2.93; 50 mg, 28-cap pack = £3.75. Label: 2

Anafranil® (Novartis) PoM

Capsules, clomipramine hydrochloride 10 mg (yellow/caramel), net price 84-cap pack = £3.23; 25 mg (orange/caramel), 84-cap pack = £6.35; 50 mg (grey/caramel), 56-cap pack = £8.06. Label: 2

Modified release

Anafranil SR® (Novartis) PoM

Tablets, m/r, grey-red, f/c, clomipramine hydrochloride 75 mg, net price 28-tab pack = £8.83. Label: 2, 25

Dose see above; to be taken once daily

DOSULEPIN HYDROCHLORIDE

(Dothiepin hydrochloride)

Indications depressive illness, particularly where sedation is required

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also increased intra-ocular pressure; high rate of fatality in overdose—see notes above

Dose

- Initially 75 mg (ELDERLY 50–75 mg) daily in divided doses *or* as a single dose at bedtime, increased gradually as necessary to 150 mg daily (ELDERLY 75 mg may be sufficient); up to 225 mg daily in some circumstances (e.g. hospital use); CHILD not recommended

Dosulepin (Non-proprietary) PoM

Capsules, dosulepin hydrochloride 25 mg, net price 28-cap pack = £1.16. Label: 2

Tablets, dosulepin hydrochloride 75 mg, net price 28-tab pack = £1.60. Label: 2

Prothiaden® (Teofarma) PoM

Capsules, red/red-brown, dosulepin hydrochloride 25 mg, net price 28-cap pack = £1.70. Label: 2

Tablets, red, s/c, dosulepin hydrochloride 75 mg, net price 28-tab pack = £2.97. Label: 2

DOXEPIN

Indications depressive illness, particularly where sedation is required; pruritus in eczema (section 13.3)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, stomatitis, diarrhoea, flushing, and oedema

Dose

- ADULT and CHILD over 12 years, initially 75 mg daily in divided doses *or* as a single dose at bedtime, adjusted according to response; usual maintenance 30–300 mg daily (doses above 100 mg given in 3 divided doses); ELDERLY initially 10–50 mg daily adjusted according to response (usual maintenance 30–50 mg daily)

Sinepin® (Marlborough) PoM

Capsules, doxepin (as hydrochloride) 25 mg, net price 28-cap pack = £3.77; 50 mg, 28-cap pack = £5.71. Label: 2

IMIPRAMINE HYDROCHLORIDE

Indications depressive illness; nocturnal enuresis in children (section 7.4.2)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also palpitation, flushing, restlessness, fatigue; *very rarely* abdominal pain, stomatitis, hypertension, oedema, cardiac decompensation, allergic alveolitis, aggression, myoclonus, peripheral vasospasm, and mydriasis

Dose

- Depression, initially up to 75 mg daily in divided doses increased gradually to 150–200 mg (up to 300 mg in hospital patients); up to 150 mg may be given as a single dose at bedtime; ELDERLY initially 10 mg daily, increased gradually to 30–50 mg daily; CHILD not recommended for depression
- Nocturnal enuresis, CHILD 7–8 years 25 mg, 8–11 years 25–50 mg, over 11 years 50–75 mg at bedtime; max. period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Imipramine (Non-proprietary) PoM

Tablets, coated, imipramine hydrochloride 10 mg, net price 28-tab pack = £1.15; 25 mg, 28-tab pack = £1.17. Label: 2

LOFEPRAMINE

Indications depressive illness

Cautions see notes above

Contra-indications see notes above; also severe renal impairment

Side-effects see notes above; also oedema and hepatic disorders reported

Dose

- 140–210 mg daily in divided doses; ELDERLY may respond to lower doses; CHILD not recommended

Lofepramine (Non-proprietary) PoM

Tablets, lofepramine 70 mg (as hydrochloride), net price 56-tab pack = £16.28. Label: 2

Brands include *Feprapax®*

Oral suspension, lofepramine 70 mg/5 mL (as hydrochloride), net price 150 mL = £22.22. Label: 2

Brands include *Lomont®* (sugar-free)

NORTRIPTYLINE

Indications depressive illness; nocturnal enuresis in children (section 7.4.2); neuropathic pain [unlicensed] (section 4.7.3)

Cautions see notes above; manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, stomatitis, diarrhoea, hypertension, oedema, flushing, restlessness, fatigue, and mydriasis

Dose

- Depression, low dose initially increased as necessary to 75–100 mg daily in divided doses *or* as a single dose (max. 150 mg daily); ADOLESCENT and ELDERLY 30–50 mg daily in divided doses; CHILD not recommended for depression
- Nocturnal enuresis, CHILD 7 years 10 mg, 8–11 years 10–20 mg, over 11 years 25–35 mg, 30 minutes before bedtime; max period of treatment (including gradual withdrawal) 3 months—full physical examination and ECG before further course
- Neuropathic pain [unlicensed], initially 10–25 mg daily at night, increased if necessary to 75 mg daily; higher doses under specialist supervision

Allegron® (King) PoM

Tablets, nortriptyline (as hydrochloride) 10 mg, net price 100-tab pack = £12.06; 25 mg (orange, scored), 100-tab pack = £24.02. Label: 2

TRIMIPRAMINE

Indications depressive illness, particularly where sedation required

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Initially 50–75 mg daily in divided doses *or* as a single dose at bedtime, increased as necessary to 150–300 mg daily; ELDERLY initially 10–25 mg 3 times daily, maintenance half adult dose may be sufficient; CHILD not recommended

Surmontil® (Aventis Pharma) PoM

Capsules, green/white, trimipramine 50 mg (as maleate), net price 28-cap pack = £7.60. Label: 2

Tablets, trimipramine (as maleate) 10 mg, net price 28-tab pack = £3.43, 84-tab pack = £10.27; 25 mg, 28-tab pack = £4.53, 84-tab pack = £13.55. Label: 2

Related antidepressants

MIANSERIN HYDROCHLORIDE

Indications depressive illness, particularly where sedation is required

Cautions see notes above

Blood counts A full **blood count** is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if *fever, sore throat, stomatitis,* or other signs of infection develop

Contra-indications see notes above

Side-effects see notes above; also arthritis and arthralgia

Dose

- ADULT over 18 years, initially 30–40 mg (elderly 30 mg) daily in divided doses *or* as a single dose at bedtime, increased gradually as necessary; usual dose range 30–90 mg

Mianserin (Non-proprietary) PoM

Tablets, mianserin hydrochloride 10 mg, net price 28-tab pack = £7.36; 30 mg, 28-tab pack = £11.58. Label: 2, 25

TRAZODONE HYDROCHLORIDE

Indications depressive illness, particularly where sedation is required; anxiety

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; *rarely* priapism (discontinue immediately)

Dose

- Depression, initially 150 mg (elderly 100 mg) daily in divided doses after food *or* as a single dose at bedtime; may be increased to 300 mg daily; hospital patients up to max. 600 mg daily in divided doses; CHILD not recommended
- Anxiety, 75 mg daily, increasing if necessary to 300 mg daily; CHILD not recommended

Trazodone (Non-proprietary) PoM

Capsules, trazodone hydrochloride 50 mg, net price 84-cap pack = £7.17; 100 mg, 56-cap pack = £7.06. Label: 2, 21

Tablets, trazodone hydrochloride 150 mg, net price 28-tab pack = £6.61. Label: 2, 21

Molipaxin® (Sanofi-Aventis) PoM

Capsules, trazodone hydrochloride 50 mg (violet/green), net price 84-cap pack = £23.92; 100 mg (violet/fawn), 56-cap pack = £28.14. Label: 2, 21

Tablets, pink, f/c, trazodone hydrochloride 150 mg, net price 28-tab pack = £16.08. Label: 2, 21

Liquid, sugar-free, trazodone hydrochloride 50 mg/5 mL, net price 120 mL = £13.37. Label: 2, 21

4.3.2 Monoamine-oxidase inhibitors (MAOIs)

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa. **Tranylcypromine** is the most **hazardous** of the MAOIs because of its stimulant action. The drugs of choice are **phenelzine** or **isocarboxazid** which are less stimulant and therefore safer.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Withdrawal If possible MAOIs should be withdrawn slowly (see also section 4.3).

Interactions MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters. The metabolism of some amine drugs such as *indirect-acting sympathomimetics* (present in many cough and decongestant preparations, section 3.10) is also inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and *Bovril®*, *Oxo®*, *Marmite®* or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or 'going off'. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also avoid alcoholic drinks or dealcoholised (low alcohol) drinks.

Other antidepressants should **not** be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Some psychiatrists use selected tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone. The combination of tranylcypromine with clomipramine is particularly **dangerous**.

Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped.

In addition, an MAOI should not be started for at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose).

For other interactions with MAOIs including those with opioid analgesics (notably pethidine), see Appendix 1

(MAOIs). For guidance on interactions relating to the reversible monoamine oxidase inhibitor, moclobemide, see below; for guidance on interactions relating to SSRIs, see p. 215.

PHENELZINE

Indications depressive illness

Cautions diabetes mellitus, cardiovascular disease, epilepsy, blood disorders, concurrent electroconvulsive therapy; elderly (great caution); monitor blood pressure (risk of postural hypotension and hypertensive responses—discontinue if palpitations or frequent headaches); if possible avoid abrupt withdrawal; severe hypertensive reactions to certain drugs and foods; avoid in agitated patients; acute porphyria (section 9.8.2); pregnancy (Appendix 4) and breast-feeding; surgery (section 15.1); **interactions:** Appendix 1 (MAOIs)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications hepatic impairment or abnormal liver function tests (Appendix 2), cerebrovascular disease, phaeochromocytoma; not indicated in manic phase

Side-effects commonly postural hypotension (especially in elderly) and dizziness; less common side-effects include drowsiness, insomnia, headache, weakness and fatigue, dry mouth, constipation and other gastro-intestinal disturbances, oedema, myoclonic movement, hyperreflexia, elevated liver enzymes; agitation and tremors, nervousness, euphoria, arrhythmias, blurred vision, nystagmus, difficulty in micturition, sweating, convulsions, rashes, purpura, leucopenia, sexual disturbances, and weight gain with inappropriate appetite may also occur; psychotic episodes with hypomanic behaviour, confusion, and hallucinations may be induced in susceptible persons; suicidal behaviour (see p. 209); jaundice has been reported and, on rare occasions, fatal progressive hepatocellular necrosis; paraesthesia, peripheral neuritis, peripheral neuropathy may be due to pyridoxine deficiency; hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 209)

Dose

- 15 mg 3 times daily, increased if necessary to 4 times daily after 2 weeks (hospital patients, max. 30 mg 3 times daily), then reduced gradually to lowest possible maintenance dose (15 mg on alternate days may be adequate); CHILD not recommended

Nardil® (Concord) PoM

Tablets, orange, f/c, phenelzine (as sulphate) 15 mg, net price 100 = £23.94. Label: 3, 10, patient information leaflet

ISOCARBOXAZID

Indications depressive illness

Cautions see under Phenelzine

Contra-indications see under Phenelzine

Side-effects see under Phenelzine

Dose

- Initially 30 mg daily in single or divided doses until improvement occurs (increased after 4 weeks if necessary to max. 60 mg daily for 4–6 weeks under close supervision), then reduced to usual maintenance dose 10–20 mg daily (but up to 40 mg daily may be required); ELDERLY 5–10 mg daily; CHILD not recommended

Isocarboxazid (Non-proprietary) PoM

Tablets, pink, scored, isocarboxazid 10 mg. Net price 56-tab pack = £50.05. Label: 3, 10, patient information leaflet

TRANYLCYPROMINE

Indications depressive illness

Cautions see under Phenelzine

Contra-indications see under Phenelzine; hyperthyroidism

Side-effects see under Phenelzine; insomnia if given in evening; hypertensive crises with throbbing headache requiring discontinuation of treatment more frequent than with other MAOIs; liver damage less frequent than with phenelzine

Dose

- Initially 10 mg twice daily not later than 3 p.m., increasing the second daily dose to 20 mg after 1 week if necessary; doses above 30 mg daily under close supervision only; usual maintenance dose 10 mg daily; CHILD not recommended

Tranylcypromine (Non-proprietary) PoM

Tablets, tranylcypromine (as sulphate) 10 mg. Net price 28-tab pack = £32.62. Label: 3, 10, patient information leaflet

Reversible MAOIs

Moclobemide is indicated for major depression and social anxiety disorder; it is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line treatment.

Interactions Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

The risk of drug interactions is also claimed to be less but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (2 weeks in the case of sertraline, and at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped. For other interactions, see Appendix 1 (moclobemide).

MOCLOBEMIDE

Indications depressive illness; social anxiety disorder

Cautions avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks), thyrotoxicosis, hepatic impairment (Appendix 2), may provoke manic episodes in bipolar disorders, pregnancy (Appendix 4) and breast-feeding (Appendix 5—patient information leaflet advises avoid); **interactions:** see notes above and Appendix 1 (moclobemide)

Contra-indications acute confusional states, phaeochromocytoma

Side-effects sleep disturbances, dizziness, gastro-intestinal disorders, headache, restlessness, agitation; paraesthesia, dry mouth, visual disturbances, oedema, skin reactions, confusional states reported; *rarely* raised liver enzymes, galactorrhoea; hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 209)

Dose

- Depression, initially 300 mg daily usually in divided doses after food, adjusted according to response; usual range 150–600 mg daily; CHILD not recommended
- Social anxiety disorder, initially 300 mg daily increased on fourth day to 600 mg daily in 2 divided doses, continued for 8–12 weeks to assess efficacy; CHILD not recommended

Moclobemide (Non-proprietary) PoM

Tablets, moclobemide 150 mg, net price 30-tab pack = £2.52; 300 mg, 30-tab pack = £3.60. Label: 10, patient information leaflet, 21

Manerix® (Roche) PoM

Tablets, yellow, f/c, scored, moclobemide 150 mg, net price 30-tab pack = £7.43; 300 mg, 30-tab pack = £13.14. Label: 10, patient information leaflet, 21

4.3.3 Selective serotonin re-uptake inhibitors

Citalopram, **escitalopram**, **fluoxetine**, **fluvoxamine**, **paroxetine**, and **sertraline** selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT); they are termed selective serotonin re-uptake inhibitors (SSRIs). For a general comment on the management of depression and on the comparison between *tricyclic and related antidepressants* and the *SSRIs and related antidepressants*, see section 4.3.

CSM advice (depressive illness in children and adolescents)

The CSM has advised that the balance of risks and benefits for the treatment of depressive illness in individuals under 18 years is considered unfavourable for the SSRIs citalopram, escitalopram, paroxetine, and sertraline, and for mirtazapine and venlafaxine. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment.

Only fluoxetine has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

Cautions SSRIs should be used with caution in patients with epilepsy (avoid if poorly controlled, discontinue if convulsions develop), cardiac disease, diabetes mellitus, susceptibility to angle-closure glaucoma, a history of mania or bleeding disorders (especially gastro-intestinal bleeding), and if used with other drugs that increase the risk of bleeding, hepatic impairment (Appendix 2), renal impairment (Appendix 3), pregnancy (Appendix 4), and breast-feeding (Appendix 5). They should also be used with caution in those receiving concurrent electroconvulsive therapy (prolonged seizures reported with fluoxetine). SSRIs may also impair performance of skilled tasks (e.g. driving). **Interactions:** see below and Appendix 1 (antidepressants, SSRI).

Withdrawal Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; the dose should be tapered over a few weeks to avoid these effects.

Interactions An SSRI or related antidepressant should not be started until 2 weeks after stopping an MAOI. Conversely, an MAOI should not be started until at least a week after an SSRI or related antidepressant has been stopped (2 weeks in the case of sertraline, at least 5 weeks in the case of fluoxetine). For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see above. For other SSRI antidepressant interactions, see Appendix 1 (antidepressants, SSRI).

Contra-indications SSRIs should not be used if the patient enters a manic phase.

Side-effects SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants (section 4.3). Side-effects of the SSRIs include gastro-intestinal effects (dose-related and fairly common—include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, constipation), anorexia with weight loss (increased appetite and weight gain also reported) and hypersensitivity reactions including rash (consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis), urticaria, angioedema, anaphylaxis, arthralgia, myalgia and photosensitivity; other side-effects include dry mouth, nervousness, anxiety, headache, insomnia, tremor, dizziness, asthenia, hallucinations, drowsiness, convulsions (see Cautions above), galactorrhoea, sexual dysfunction, urinary retention, sweating, hypomania or mania (see Cautions above), movement disorders and dyskinesias, visual disturbances, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 209), and bleeding disorders including ecchymoses and purpura. Suicidal behaviour has been linked with antidepressants (see p. 209). Angle-closure glaucoma may very rarely be precipitated by treatment with SSRIs.

CITALOPRAM

Indications depressive illness, panic disorder

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also palpitation, tachycardia, postural hypotension, coughing, yawning, confusion, impaired concentration, malaise, amnesia, migraine, paraesthesia, abnormal dreams, taste dis-

turbance, increased salivation, rhinitis, tinnitus, polyuria, micturition disorders, euphoria; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

Dose

- By mouth as tablets, depressive illness, 20 mg once daily increased if necessary in steps of 20 mg daily at intervals of 3–4 weeks; max. 60 mg daily (ELDERLY over 65 years, max. 40 mg daily); CHILD under 18 years see *BNF for Children* and CSM advice, p. 215

  Panic disorder, ADULT over 18 years, initially 10 mg daily increased gradually if necessary in steps of 10 mg daily, usual dose 20–30 mg daily; max. 60 mg daily (ELDERLY over 65 years, max. 40 mg daily)
- By mouth as oral drops, depressive illness, 16 mg daily as a single dose increased if necessary in steps of 16 mg daily at intervals of 3–4 weeks; max. 48 mg daily (ELDERLY over 65 years, max. 32 mg daily); CHILD under 18 years see *BNF for Children* and CSM advice, p. 215

  Panic disorder, ADULT over 18 years, initially 8 mg daily as a single dose increased gradually if necessary in steps of 8 mg, usual dose 16–24 mg daily; max. 48 mg daily (ELDERLY over 65 years, max. 32 mg daily)

Citalopram (Non-proprietary) PoM

Tablets, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £1.08; 20 mg, 28-tab pack = £1.26; 40 mg, 28-tab pack = £1.44. Counselling, driving

Oral drops, citalopram (as hydrochloride) 40 mg/mL, net price 15 mL = £19.66. Counselling, driving, administration

Note 4 drops (8 mg) is equivalent in therapeutic effect to 10-mg tablet

Mix with water, orange juice, or apple juice before taking

Cipramil® (Lundbeck) PoM

Tablets, f/c, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £8.97; 20 mg (scored), 28-tab pack = £14.91; 40 mg, 28-tab pack = £25.20. Counselling, driving

Oral drops, sugar-free, citalopram (as hydrochloride) 40 mg/mL, net price 15 mL = £20.16. Counselling, driving, administration

Excipients include alcohol

Note 4 drops (8 mg) is equivalent in therapeutic effect to 10-mg tablet

Mix with water, orange juice, or apple juice before taking

ESCITALOPRAM

Note Escitalopram is the active enantiomer of citalopram

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also sinusitis, yawning; fatigue, restlessness, abnormal dreams, paraesthesia; pyrexia; *less commonly* taste disturbance, bruxism, syncope, tachycardia, oedema, confusion, menstrual disturbances, epistaxis, mydriasis, tinnitus, pruritus, and alopecia; *rarely* bradycardia, aggression, and depersonalisation; hepatitis, postural hypotension, QT interval prolongation, and thrombocytopenia also reported; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

Dose

- ADULT over 18 years, depressive illness, generalised anxiety disorder, and obsessive-compulsive disorder, 10 mg once daily increased if necessary to max. 20 mg daily; ELDERLY initially half adult dose, lower maintenance dose may be sufficient; CHILD not recommended (see CSM advice, p. 215)
- ADULT over 18 years, panic disorder, initially 5 mg once daily increased to 10 mg daily after 7 days; max. 20 mg daily; ELDERLY initially half adult dose, lower maintenance dose may be sufficient
- ADULT over 18 years, social anxiety disorder, initially 10 mg once daily adjusted after 2–4 weeks; usual dose 5–20 mg daily

Cipralex® (Lundbeck) PoM

Tablets, f/c, escitalopram (as oxalate) 5 mg, net price 28-tab pack = £8.97; 10 mg (scored), 28-tab pack = £14.91; 20 mg (scored), 28-tab pack = £25.20. Counselling, driving

Oral drops, sugar-free, escitalopram (as oxalate) 10 mg/mL, net price 28 mL = £18.82. Counselling, driving, administration

Note Can be mixed with water, orange juice, or apple juice before taking

The *Scottish Medicines Consortium* (p. 3) has advised that escitalopram (*Cipralex®*) is **not** recommended within NHS Scotland for the treatment of social anxiety disorder (April 2008)

FLUOXETINE

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also vasodilatation, postural hypotension, pharyngitis, dyspnoea, chills, taste disturbances, sleep disturbances, euphoria, confusion, yawning, impaired concentration, changes in blood sugar, alopecia, urinary frequency; *rarely* pulmonary inflammation and fibrosis; *very rarely* hepatitis, toxic epidermal necrolysis, and neuroleptic malignant syndrome-like event

Dose

- Major depression, 20 mg once daily increased after 3–4 weeks if necessary, and at appropriate intervals thereafter; max. 60 mg once daily (ELDERLY usual max. 40 mg once daily but 60 mg can be used); CHILD 8–18 years, 10 mg once daily increased after 1–2 weeks if necessary, max. 20 mg once daily (but see also CSM advice, p. 215)
- Bulimia nervosa, ADULT over 18 years, 60 mg once daily
- Obsessive-compulsive disorder, ADULT over 18 years, 20 mg once daily; if inadequate response after 2 weeks increase gradually to max. 60 mg once daily (ELDERLY usual max. 40 mg once daily but 60 mg can be used)

Long duration of action Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage)

Fluoxetine (Non-proprietary) PoM

Capsules, fluoxetine (as hydrochloride) 20 mg, net price 30-cap pack = £1.02; 60 mg, 30-cap pack = £55.73. Counselling, driving

Brands include *Oxactin®*

Liquid, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £7.27. Counselling, driving

Brands include *Prozep®*

Prozac® (Lilly) PoM

Capsules, fluoxetine (as hydrochloride) 20 mg (green/yellow), net price 30-cap pack = £1.53. Counselling, driving

Liquid, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £11.12. Counselling, driving

FLUVOXAMINE MALEATE

Indications depressive illness, obsessive-compulsive disorder

Cautions see notes above

CSM advice The CSM has advised that concomitant use of fluvoxamine and theophylline or aminophylline should usually be avoided; see also **interactions:** Appendix 1 (antidepressants, SSRIs)

Contra-indications see notes above

Side-effects see notes above; palpitation, tachycardia (may also cause bradycardia); *rarely* postural hypotension, confusion, ataxia, paraesthesia, malaise, taste disturbance, neuroleptic malignant syndrome-like event, abnormal liver function tests, usually symptomatic (discontinue treatment)

Dose

- Depression, ADULT over 18 years, initially 50–100 mg daily in the evening, increased gradually if necessary to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100 mg daily
- Obsessive-compulsive disorder, initially 50 mg in the evening increased gradually if necessary after some weeks to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100–300 mg daily; CHILD over 8 years initially 25 mg daily increased if necessary in steps of 25 mg every 4–7 days to max. 200 mg daily (over 50 mg in 2 divided doses)

Note If no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

Fluvoxamine (Non-proprietary) PoM

Tablets, fluvoxamine maleate 50 mg, net price 60-tab pack = £6.17; 100 mg, 30-tab pack = £8.22. Counselling, driving

Faverin® (Solvay) PoM

Tablets, f/c, scored, fluvoxamine maleate 50 mg, net price 60-tab pack = £17.10; 100 mg, 30-tab pack = £17.10. Counselling, driving

PAROXETINE

Indications major depression, obsessive-compulsive disorder, panic disorder; social anxiety disorder; post-traumatic stress disorder; generalised anxiety disorder

Cautions see notes above; also achlorhydria or high gastric pH (reduced absorption of oral suspension)

CSM advice Extrapyramidal reactions (including orofacial dystonias) and withdrawal syndrome are reported to the CSM more commonly with paroxetine than with other SSRIs

Contra-indications see notes above

Side-effects see notes above; also yawning; raised cholesterol; *less commonly* arrhythmias, transient changes in blood pressure, confusion, urinary incontinence; *rarely* panic attacks and paradoxical increased anxiety during initial treatment of panic disorder (reduce dose), depersonalisation, and neuroleptic malignant syndrome-like event; *very rarely* peripheral oedema, acute glaucoma, hepatic disorders (e.g. hepatitis), and priapism

Dose

- Major depression, social anxiety disorder, post-traumatic stress disorder, generalised anxiety disorder, ADULT over 18 years, usually 20 mg each morning, higher doses on specialist advice only (see also CSM advice, below); max. 50 mg daily (ELDERLY 40 mg daily); CHILD not recommended (see CSM advice, p. 215)
- Obsessive-compulsive disorder, ADULT over 18 years, initially 20 mg each morning, increased gradually in steps of 10 mg to usual dose of 40 mg daily, higher doses on specialist advice only (see also CSM advice, below); max. 60 mg daily (ELDERLY 40 mg daily)
- Panic disorder, ADULT over 18 years, initially 10 mg each morning, increased gradually in steps of 10 mg to usual dose of 40 mg daily, higher doses on specialist advice only (see also CSM advice, below); max. 60 mg daily (ELDERLY 40 mg daily)

CSM advice The recommended dose for the treatment of depression, social anxiety disorder, generalised anxiety disorder, and post-traumatic stress disorder is 20 mg daily and for obsessive-compulsive disorder and panic disorder it is 40 mg daily. There is no evidence that higher doses are more effective

Paroxetine (Non-proprietary) PoM

Tablets, paroxetine (as hydrochloride) 20 mg, net price 30-tab pack = £2.84; 30 mg, 30-tab pack = £6.21. Label: 21, counselling, driving

Seroxat® (GSK) PoM

Tablets, f/c, scored, paroxetine (as hydrochloride) 10 mg, net price 28-tab pack = £11.84; 20 mg, 30-tab pack = £12.69; 30 mg (blue), 30-tab pack = £22.28. Label: 21, counselling, driving

Oral suspension, orange, sugar-free, paroxetine (as hydrochloride) 10 mg/5 mL. Net price 150-mL pack = £9.12. Label: 5, 21, counselling, driving

SERTRALINE

Indications depressive illness, obsessive-compulsive disorder (under specialist supervision in children), post-traumatic stress disorder in women

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; pancreatitis, hepatitis, jaundice, liver failure, tachycardia, postural hypotension, amnesia, paraesthesia, aggression, urinary incontinence, and menstrual irregularities also reported

Dose

- Depressive illness, initially 50 mg daily, increased if necessary by increments of 50 mg over several weeks to max. 200 mg daily; usual maintenance dose 50 mg daily; CHILD under 18 years, see *BNF for Children* and CSM advice, p. 215
- Obsessive-compulsive disorder, ADULT and CHILD over 12 years initially 50 mg daily, increased if necessary in steps of 50 mg over several weeks; usual dose range 50–200 mg daily; CHILD 6–12 years initially 25 mg daily, increased to 50 mg daily after 1 week, further increased if necessary in steps of 50 mg at intervals of at least 1 week (max. 200 mg daily)
- Post-traumatic stress disorder, ADULT over 18 years, initially 25 mg daily, increased after 1 week to 50 mg daily; if response is partial and if drug tolerated, dose increased in steps of 50 mg over several weeks to max. 200 mg daily

Sertraline (Non-proprietary) PoM

Tablets, sertraline (as hydrochloride) 50 mg, net price 28-tab pack = £1.36; 100 mg, 28-tab pack = £1.67. Counselling, driving

Lustral® (Pfizer) PoM

Tablets, f/c, sertraline (as hydrochloride) 50 mg (scored), net price 28-tab pack = £17.82; 100 mg, 28-tab pack = £29.16. Counselling, driving

4.3.4 Other antidepressant drugs

Agomelatine is a melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

Duloxetine inhibits the re-uptake of both serotonin and noradrenaline and is licensed to treat major depressive disorder.

The thioxanthene **flupentixol** (*Fluanxol®*) has antidepressant properties, and low doses (1 to 3 mg daily) are given by mouth for this purpose. Flupentixol is also used for the treatment of psychoses (section 4.2.1 and section 4.2.2)

Mirtazapine, a presynaptic alpha$_2$-adrenoreceptor antagonist, increases central noradrenergic and serotonergic neurotransmission. It has few antimuscarinic effects, but causes sedation during initial treatment.

Reboxetine, a selective inhibitor of noradrenaline re-uptake, has been introduced for the treatment of depressive illness.

Tryptophan is licensed as adjunctive therapy for depression resistant to standard antidepressants; it has been associated with eosinophilia-myalgia syndrome. Tryptophan should be initiated under specialist supervision.

Venlafaxine is a serotonin and noradrenaline re-uptake inhibitor (SNRI); it lacks the sedative and antimuscarinic effects of the tricyclic antidepressants.

AGOMELATINE

Indications major depression

Cautions elderly; mania or hypomania; concomitant use of drugs associated with hepatic injury; excessive alcohol consumption; monitor liver function before treatment and after 6, 12 and 24 weeks of treatment, then as appropriate (discontinue if serum transaminases exceed 3 times the upper limit of reference range); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (agomelatine)

Contra-indications dementia; hepatic impairment; breast feeding (Appendix 5)

Side-effects nausea, diarrhoea, constipation, abdominal pain, increased serum transaminases (see Cautions); headache, dizziness, drowsiness, insomnia, fatigue, anxiety; back pain; sweating; *less commonly* paraesthesia, blurred vision, and eczema; *rarely* hepatitis and rash; suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 209) also reported

Dose

- ADULT over 18 years, 25 mg at bedtime, increased if necessary after 2 weeks to 50 mg at bedtime

Valdoxan® (Servier) ▼ PoM

Tablets, orange-yellow, f/c, agomelatine 25 mg, net price 28-tab pack = £38.53

DULOXETINE

Indications major depressive disorder; generalised anxiety disorder; diabetic neuropathy (section 6.1.5); stress urinary incontinence (section 7.4.2)

Cautions section 7.4.2; pregnancy (Appendix 4)

Contra-indications section 7.4.2

Side-effects section 7.4.2

Dose

- Major depression, ADULT over 18 years, 60 mg once daily
- Generalised anxiety disorder, ADULT over 18 years, initially 30 mg daily, increased if necessary to 60 mg once daily; max. 120 mg daily
- Diabetic neuropathy, ADULT over 18 years, 60 mg once daily; max. 120 mg daily in divided doses

  Note In diabetic neuropathy, discontinue if inadequate response after 2 months; review treatment at least every 3 months

Cymbalta® (Lilly) ▼ PoM

Capsules, duloxetine (as hydrochloride) 30 mg (white/blue), net price 28-cap pack = £22.40; 60 mg (green/blue), 28-cap pack = £27.72. Label: 2

Note The *Scottish Medicines Consortium* has advised (September 2006) that duloxetine (*Cymbalta®*) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate

Yentreve® (Lilly) ▼ PoM

Section 7.4.2 (stress urinary incontinence)

FLUPENTIXOL

(Flupenthixol)

Indications depressive illness; psychoses (section 4.2.1)

Cautions cardiovascular disease (including cardiac disorders and cerebral arteriosclerosis), QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval); diabetes; senile confusional states, parkinsonism; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); acute porphyria (section 9.8.2); see also section 4.2.1; **interactions**: Appendix 1 (antipsychotics)

Contra-indications excitable and overactive patients; impaired consciousness; circulatory collapse; coma

Side-effects section 4.2.1; also hypersalivation, dyspnoea, asthenia, hyperglycaemia, myalgia; torsade de pointes and sudden death also reported

Dose

- ADULT over 18 years, initially 1 mg (elderly 500 micrograms) in the morning, increased after 1 week to 2 mg (elderly 1 mg) if necessary; max. 3 mg (elderly 2 mg) daily, doses above 2 mg (elderly 1 mg) being divided in 2 portions, second dose not after 4 p.m. Discontinue if no response after 1 week at max. dosage

  Counselling Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening

Fluanxol® (Lundbeck) PoM

Tablets, yellow, s/c, flupentixol (as dihydrochloride) 500 micrograms, net price 60-tab pack = £2.02; 1 mg, 60-tab pack = £3.40. Label: 2, counselling, administration

MIRTAZAPINE

Indications major depression

Cautions elderly, cardiac disorders, hypotension, history of urinary retention, susceptibility to angle-closure glaucoma, diabetes mellitus, psychoses (may aggravate psychotic symptoms), history of seizures or bipolar depression; hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (mirtazapine)

Blood disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected

Withdrawal Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks

Side-effects increased appetite, weight gain, dry mouth; postural hypotension, peripheral oedema; drowsiness, fatigue, tremor, dizziness, abnormal dreams, confusion, anxiety, insomnia; arthralgia, myalgia; *less commonly* syncope, hypotension, mania, hallucinations, movement disorders; *rarely* myoclonus; *very rarely* blood disorders (see Cautions), convulsions, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 209), suicidal behaviour (see p. 209), and angle-closure glaucoma

Dose

- Initially 15–30 mg daily at bedtime increased within 2–4 weeks according to response; max. 45 mg daily as a single dose at bedtime or in 2 divided doses; CHILD under 18 years not recommended (see CSM advice, p. 215)

Mirtazapine (Non-proprietary) PoM

Tablets, mirtazapine 15 mg, net price 28-tab pack = £17.47; 30 mg, 28-tab pack = £2.69; 45 mg, 28-tab pack = £15.03. Label: 2, 25

Orodispersible tablets, mirtazapine 15 mg, net price 30-tab pack = £11.94; 30 mg, 30-tab pack = £11.94; 45 mg, 30-tab pack = £11.96. Label: 2, counselling, administration

Oral solution, mirtazapine 15 mg/mL, net price 66 mL = £47.00. Label: 2

Zispin SolTab® (Organon) PoM

Orodispersible tablets, mirtazapine 15 mg, net price 6-tab pack = £3.84, 30-tab pack = £18.83; 30 mg, 30-tab pack = £18.83; 45 mg, 30-tab pack = £18.83. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling *Zispin SolTab®* should be placed on the tongue, allowed to disperse and swallowed

REBOXETINE

Indications major depression

Cautions history of cardiovascular disease and epilepsy; bipolar disorder; urinary retention; prostatic hypertrophy; susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 (reboxetine)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea, dry mouth, constipation, anorexia; tachycardia, palpitation, vasodilation, postural hypotension; headache, insomnia, dizziness; chills; impotence; urinary retention; impaired visual accommodation; sweating; lowering of plasma-potassium concentration on prolonged administration in the elderly; *very rarely* angle-closure glaucoma; *also reported* vomiting, hypertension, paraesthesia, agitation, anxiety, irritability, hallucinations, aggression, cold extremities, and rash; suicidal behaviour (see p. 209)

Dose

- 4 mg twice daily increased if necessary after 3–4 weeks to 10 mg daily in divided doses, max. 12 mg daily; CHILD under 18 years and ELDERLY not recommended

Edronax® (Pharmacia) PoM

Tablets, scored, reboxetine (as mesilate) 4 mg, net price 60-tab pack = £18.91. Counselling, driving

TRYPTOPHAN

(L-Tryptophan)

Indications see notes above

Cautions eosinophilia-myalgia syndrome has been reported (withhold treatment if increased eosinophil count, myalgia, arthralgia, fever, dyspnoea, neuropathy, oedema or skin lesions develop until possibility of eosinophilia-myalgia syndrome excluded); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (tryptophan)

Contra-indications history of eosinophilia-myalgia syndrome following use of tryptophan

Side-effects drowsiness, nausea, headache, lightheadedness, suicidal behaviour (see p. 209); eosinophilia-myalgia syndrome, see Cautions

Dose

- 1 g 3 times daily; max. 6 g daily; ELDERLY lower dose may be appropriate especially in renal or hepatic impairment; CHILD not recommended

Optimax® (Merck) PoM

Tablets, scored, tryptophan 500 mg. Net price 84-tab pack = £23.47. Label: 3

VENLAFAXINE

Indications major depression, generalised anxiety disorder

Cautions heart disease (monitor blood pressure); history of epilepsy; susceptibility to angle-closure glaucoma; concomitant use of drugs that increase risk of bleeding, history of bleeding disorders; hepatic impairment (avoid if severe—Appendix 2); renal impairment (avoid if eGFR less than 10 mL/minute/1.73 m^2—Appendix 3); breast-feeding (Appendix 5); **interactions:** Appendix 1 (venlafaxine)

Driving May affect performance of skilled tasks (e.g. driving)

Withdrawal Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks

Contra-indications conditions associated with high risk of cardiac arrhythmia, uncontrolled hypertension; pregnancy (Appendix 4)

Side-effects constipation, nausea, anorexia, weight changes, diarrhoea, dyspepsia, vomiting, abdominal pain; hypertension, palpitation, vasodilatation, changes in serum cholesterol; chills, pyrexia, dyspnoea, yawning; dizziness, dry mouth, insomnia,

nervousness, drowsiness, asthenia, headache, abnormal dreams, agitation, anxiety, confusion, hypertonia, paraesthesia, tremor; urinary frequency, sexual dysfunction, menstrual disturbances; arthralgia, myalgia; visual disturbances, mydriasis (very rarely angle-closure glaucoma); tinnitus; sweating, pruritus, rash; *less commonly* bruxism, taste disturbance, hypotension and postural hypotension, arrhythmias, syndrome of inappropriate anti-diuretic hormone secretion (see Hyponatraemia and Antidepressant Therapy, p. 209), apathy, hallucinations, myoclonus, urinary retention, bleeding disorders (including ecchymosis and rarely haemorrhage), alopecia, hypersensitivity reactions including angioedema, urticaria, photosensitivity; *rarely* hepatitis, ataxia, incoordination, speech disorder, mania and hypomania, seizures, and neuroleptic malignant syndrome, Stevens-Johnson syndrome; *very rarely* pancreatitis, QT interval prolongation, aggression, delirium, extrapyramidal symptoms including akathisia, hyperprolactinaemia, blood dyscrasias, rhabdomyolysis; suicidal behaviour (doses over 300 mg under specialist supervision; see also p. 209)

Dose

- Depression, ADULT over 18 years, initially 75 mg daily in 2 divided doses increased if necessary after at least 3–4 weeks to 150 mg daily in 2 divided doses; severely depressed or hospitalised patients, increased further if necessary in steps of up to 75 mg every 2–3 days; max. 375 mg daily; CHILD under 18 years not recommended (see CSM advice, p. 215)
- Generalised anxiety disorder and social anxiety disorder, see under preparations below

Venlafaxine (Non-proprietary) PoM

Tablets, venlafaxine (as hydrochloride) 37.5 mg, net price 56-tab pack = £18.95; 75 mg, 56-tab pack = £30.04. Label: 3, counselling, driving

Efexor® (Wyeth) PoM

Tablets, peach, venlafaxine (as hydrochloride) 37.5 mg, net price 56-tab pack = £22.50; 75 mg, 56-tab pack = £37.51. Label: 3, counselling, driving

Modified release

Efexor® XL (Wyeth) PoM

Capsules, m/r, venlafaxine (as hydrochloride) 75 mg (peach), net price 28-cap pack = £22.50; 150 mg (orange), 28-cap pack = £37.51. Label: 3, 25, counselling, driving

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary after at least 3 weeks to 150 mg once daily; max. 225 mg once daily; CHILD under 18 years not recommended (see CSM advice, p. 215)

Generalised anxiety disorder, ADULT over 18 years, 75 mg once daily; discontinue if no response after 8 weeks

Social anxiety disorder, ADULT over 18 years, 75 mg once daily; discontinue if no response after 12 weeks

Foraven XL® (Forum) PoM

Capsules, m/r, venlafaxine (as hydrochloride) 75 mg (peach), net price 28-cap pack = £23.41; 150 mg (orange), 28-cap pack = £39.03. Label: 3, 25, counselling, driving

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary after at least 3 weeks to 150 mg once daily; max. 375 mg once daily (doses over 300 mg under specialist supervision); CHILD under 18 years not recommended (see CSM advice, p. 215)

Tifaxin XL® (Genus) PoM

Capsules, m/r, venlafaxine (as hydrochloride) 75 mg (yellow/transparent), net price 28-cap pack = £16.39; 150 mg (buff/transparent), 28-cap pack = £27.32. Label: 3, 25, counselling, driving

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary after at least 2 weeks to 150 mg once daily; increased according to response, max. 375 mg once daily (doses over 225 mg under specialist supervision); CHILD under 18 years not recommended (see CSM advice, p. 215)

Social anxiety disorder, ADULT over 18 years, 75 mg once daily; increased if necessary in steps of 75 mg after intervals of at least 4 days; max. 225 mg once daily; discontinue if no response after 12 weeks

Venaxx XL® (Goldshield) PoM

Capsules, m/r, venlafaxine (as hydrochloride) 75 mg (beige), net price 28-cap pack = £10.40; 150 mg (red), 28-cap pack = £17.40. Label: 3, 25, counselling, driving

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary after at least 2 weeks to 150 mg once daily; increased according to response, max. 375 mg once daily (doses over 225 mg under specialist supervision); CHILD under 18 years not recommended (see CSM advice, p. 215)

Venlalic® XL (Dallas Burston Ashbourne) PoM

Tablets, m/r, venlafaxine (as hydrochloride) 75 mg, net price 30-tab pack = £12.27; 150 mg, 30-tab pack = £19.85; 225 mg 30-tab pack = £36.16. Label: 3, 25, counselling, driving

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary after at least 2 weeks to 150 mg once daily; increased according to response, max. 375 mg once daily (doses over 225 mg under specialist supervision); CHILD under 18 years not recommended (see CSM advice, p. 215)

4.4 CNS stimulants and drugs used for attention deficit hyperactivity disorder

Central nervous system stimulants include the **amphetamines** (notably dexamfetamine) **and related drugs** (e.g. methylphenidate). They have very few indications and in particular, should **not** be used to treat depression, obesity, senility, debility, or for relief of fatigue.

CNS stimulants should only be prescribed to children with severe and persistent symptoms of *attention deficit hyperactivity disorder* (ADHD), when the diagnosis has been confirmed by a specialist; treatment may be continued by general practitioners, under a shared-care arrangement. Treatment often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome and epilepsy), the adverse effect profile, potential for drug misuse, and preferences of the patient and carers. **Methylphenidate** and **atomoxetine** are used for the management of ADHD; **dexamfetamine** (dexamphetamine) is an alternative in children who do not respond to these drugs. Growth is not generally affected by treatment with CNS stimulants but it is advisable to monitor growth during treatment.

Modafinil is used for the treatment of daytime sleepiness associated with narcolepsy or obstructive sleep apnoea syndrome; dependence with long-term use can-

not be excluded and it should therefore be used with caution.

Dexamfetamine and methylphenidate [unlicensed indication] are also used to treat narcolepsy.

ATOMOXETINE

Indications attention deficit hyperactivity disorder (initiated by a specialist physician experienced in managing the condition)

Cautions cardiovascular disease including hypertension and tachycardia; structural cardiac abnormalities; monitor growth in children; QT interval prolongation (avoid concomitant administration of drugs that prolong QT interval); psychosis or mania; history of seizures; aggressive behaviour, hostility, or emotional lability; susceptibility to angle-closure glaucoma; hepatic impairment (see Hepatic Disorders below; Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (atomoxetine)

Hepatic disorders Following rare reports of hepatic disorders, the CSM has advised that patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine or jaundice

Suicidal ideation Following reports of suicidal thoughts and behaviour, the CSM has advised that patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression

Side-effects anorexia, dry mouth, nausea, vomiting, abdominal pain, constipation, dyspepsia, flatulence; palpitation, tachycardia, increased blood pressure, postural hypotension, hot flushes; sleep disturbance, dizziness, headache, fatigue, lethargy, depression, psychotic or manic symptoms, aggression, hostility, emotional lability, drowsiness, anxiety, irritability, tremor, rigors; urinary retention, enuresis, prostatitis, sexual dysfunction, menstrual disturbances; mydriasis, conjunctivitis; dermatitis, pruritus, rash, sweating, weight changes; *less commonly* suicidal ideation (see Suicidal Ideation, above), cold extremities; *very rarely* hepatic disorders (see Hepatic Disorders, above), seizures, angle-closure glaucoma, and Raynaud's phenomenon

Dose

- ADULT over 18 years, body-weight over 70 kg, initially 40 mg daily for 7 days, increased according to response; usual maintenance 80–100 mg daily, but may be increased to max. 120 mg daily [unlicensed] under the direction of a specialist; CHILD 6–18 years, body-weight over 70 kg, initially 40 mg daily for 7 days, increased according to response; usual maintenance 80 mg daily, but may be increased to max. 120 mg daily [unlicensed] under the direction of a specialist; ADULT and CHILD over 6 years, body-weight under 70 kg, initially 500 micrograms/kg daily for 7 days, increased according to response; usual maintenance 1.2 mg/kg daily, but may be increased to 1.8 mg/kg daily (max. 120 mg daily) [unlicensed] under the direction of a specialist

  Note Total daily dose may be given *either* as a single dose in the morning *or* in 2 divided doses with last dose no later than early evening

Strattera® (Lilly) ▼ PoM

Capsules, atomoxetine (as hydrochloride) 10 mg (white), net price 7-cap pack = £15.02, 28-cap pack = £60.06; 18 mg (gold/white), 7-cap pack = £15.02, 28-cap pack = £60.06; 25 mg (blue/white), 7-cap pack = £15.02, 28-cap pack = £60.06; 40 mg (blue), 7-cap pack = £15.02, 28-cap pack = £60.06; 60 mg (blue/gold), 28-cap pack = £60.06; 80 mg (brown/white), 28-cap pack = £80.08. Label: 3

DEXAMFETAMINE SULPHATE

(Dexamphetamine sulphate)

Indications narcolepsy; refractory attention deficit hyperactivity disorder (under specialist supervision)

Cautions anorexia; mild hypertension (contra-indicated if moderate or severe)—monitor blood pressure; psychosis or bipolar disorder; monitor for aggressive behaviour or hostility during initial treatment; renal impairment; history of epilepsy (discontinue if convulsions occur); tics and Tourette syndrome (use with caution)—discontinue if tics occur; monitor growth in children (see also below); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; data on safety and efficacy of long-term use not complete; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (sympathomimetics)

Special cautions in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity)

Driving May affect performance of skilled tasks (e.g. driving); effects of alcohol unpredictable

Contra-indications cardiovascular disease including moderate to severe hypertension, structural cardiac abnormalities, advanced arteriosclerosis, hyperexcitability or agitated states, hyperthyroidism, history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects insomnia, restlessness, irritability and excitability, night terrors, euphoria, tremor, dizziness, aggression, paranoia, anxiety, confusion, depression, fatigue, headache; convulsions (see also Cautions); dependence and tolerance, psychosis; anorexia, gastro-intestinal symptoms, growth restriction in children (see also under Cautions); dry mouth, sweating, tachycardia (and anginal pain), palpitation, myocardial infarction, hypertension, hypotension; impotence; visual disturbances; alopecia, rash; cardiomyopathy reported with chronic use; cardiovascular collapse; cerebral vasculitis; central stimulants have provoked choreoathetoid movements and dyskinesia, tics and Tourette syndrome in predisposed individuals (see also Cautions above); *very rarely* angle-closure glaucoma; **overdosage:** see Emergency Treatment of Poisoning, p. 33

Dose

- Narcolepsy, 10 mg (ELDERLY, 5 mg) daily in divided doses increased by 10 mg (ELDERLY, 5 mg) daily at intervals of 1 week to a max. of 60 mg daily
- Refractory attention deficit hyperactivity disorder, ADULT over 18 years [unlicensed use], 5 mg twice daily, increased according to response; max. 60 mg daily; maintenance dose given in 2–4 divided doses; CHILD 4–6 years, 2.5 mg daily, increased if necessary by 2.5 mg daily at intervals of 1 week, usual max. 20 mg daily; CHILD 6–18 years 5–10 mg daily, increased if necessary by 5 mg daily at intervals of 1 week, usual max. 20 mg daily, but up to 40 mg daily occasionally required

Dexedrine® (UCB Pharma) CD

Tablets, scored, dexamfetamine sulphate 5 mg. Net price 28-tab pack = £3.00. Counselling, driving

METHYLPHENIDATE HYDROCHLORIDE

Indications attention deficit hyperactivity disorder (under specialist supervision); narcolepsy [unlicensed indication]

Cautions monitor growth (if prolonged treatment), blood pressure and full blood count; anxiety or agitation; tics or a family history of Tourette syndrome; epilepsy (discontinue if increased seizure frequency); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; pregnancy (Appendix 4); **interactions:** Appendix 1 (sympathomimetics)

Contra-indications anxiety or agitation; severe depression, suicidal ideation; drug or alcohol dependence; psychosis; hyperthyroidism; cardiovascular disease (including severe hypertension and arrhythmias), structural cardiac abnormalities; breast-feeding (Appendix 5)

Side-effects abdominal pain, nausea, vomiting, dyspepsia, dry mouth, anorexia, reduced weight gain; tachycardia, palpitation, arrhythmias, changes in blood pressure; cough, nasopharyngitis; tics (*very rarely* Tourette syndrome), insomnia, nervousness, asthenia, depression, irritability, aggression, headache, drowsiness, dizziness, movement disorders; fever; arthralgia; rash, pruritus, alopecia; *less commonly* diarrhoea, dyspnoea, abnormal dreams, confusion, suicidal ideation, urinary frequency, haematuria, muscle cramps, epistaxis; *rarely* angina, growth restriction, visual disturbances; *very rarely* hepatic dysfunction, myocardial infarction, cerebral arteritis, psychosis, neuroleptic malignant syndrome, tolerance and dependence, blood disorders including leucopenia and thrombocytopenia, angle-closure glaucoma, exfoliative dermatitis, erythema multiforme

Dose

- Attention deficit hyperactivity disorder, ADULT over 18 years [unlicensed use], 5 mg 3 times daily increased if necessary according to response, max. 100 mg daily; CHILD 6–18 years, initially 5 mg 1–2 times daily, increased if necessary at weekly intervals by 5–10 mg daily; usual max. 60 mg daily in divided doses but may be increased to 2.1 mg/kg daily (max. 90 mg daily) under the direction of a specialist; discontinue if no response after 1 month, also suspend treatment every 1–2 years to assess condition; CHILD 4–6 years see *BNF for Children*

  Evening dose If effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose)

  Note Treatment may be started using a modified-release preparation
- Narcolepsy [unlicensed indication], 10–60 mg (usually 20–30 mg) daily in divided doses before meals

Methylphenidate Hydrochloride (Non-proprietary) CD

Tablets, methylphenidate hydrochloride 5 mg, net price 30-tab pack = £2.67; 10 mg, 30-tab pack = £5.80; 20 mg, 30-tab pack = £9.59

Brands include *Equasym®*, *Medikinet®*

Ritalin® (Novartis) CD

Tablets, scored, methylphenidate hydrochloride 10 mg, net price 30-tab pack = £5.57

Modified release

Concerta® XL (Janssen-Cilag) CD

Tablets, m/r, methylphenidate hydrochloride 18 mg (yellow), net price 30-tab pack = £31.19; 27 mg (grey), 30-tab pack = £36.81; 36 mg (white), 30-tab pack = £42.45. Label: 25

Counselling Tablet membrane may pass through gastro-intestinal tract unchanged

Cautions dose form not appropriate for use in dysphagia or if gastro-intestinal lumen restricted

Dose CHILD 6–18 years, initially 18 mg once daily (in the morning), increased if necessary in weekly steps of 18 mg according to response, usual max. 54 mg once daily, but may be increased to 2.1 mg/kg daily (max. 108 mg daily) [unlicensed] under the direction of a specialist; discontinue if no response after 1 month; suspend treatment every 1–2 years to assess condition

Note Total daily dose of 15 mg of standard-release formulation is equivalent to *Concerta® XL* 18 mg once daily

Equasym XL® (Shire) CD

Capsules, m/r, methylphenidate hydrochloride 10 mg (white/green), net price 30-cap pack = £25.00; 20 mg (white/blue), 30-cap pack = £30.00; 30 mg (white/brown), 30-cap pack = £35.00. Label: 25

Dose ADULT over 18 years [unlicensed use], initially 10 mg once daily in the morning before breakfast, increased gradually if necessary, max.100 mg daily; CHILD 6–18 years, initially 10 mg once daily in the morning before breakfast, increased gradually if necessary, usual max. 60 mg daily but may be increased to 2.1 mg/kg daily (max. 90 mg daily) [unlicensed] under the direction of a specialist; discontinue if no response after 1 month; suspend treatment every 1–2 years to assess condition

Note Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing)

Medikinet XL® (Flynn) CD

Capsules, m/r, methylphenidate hydrochloride 10 mg (lilac/white), net price 28-cap pack = £20.18; 20 mg (lilac), 28-cap pack = £26.91; 30 mg (purple/light grey), 28-cap pack = £31.39; 40 mg (purple/grey), 28-cap pack = £43.20. Label: 25

Dose ADULT over 18 years [unlicensed use], initially 10 mg once daily in the morning with breakfast, adjusted according to response, max. 100 mg daily; CHILD 6–18 years, initially 10 mg once daily in the morning with breakfast, adjusted according to response, usual max. 60 mg daily but may be increased to 2.1 mg/kg daily (max. 90 mg daily) [unlicensed] under the direction of a specialist; discontinue if no response after 1 month; suspend treatment every 1–2 years to assess condition

Note Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing)

MODAFINIL

Indications daytime sleepiness associated with narcolepsy, obstructive sleep apnoea syndrome, and chronic shift work

Cautions monitor blood pressure and heart rate in hypertensive patients (but see Contra-indications); history of psychosis, depression, mania, alcohol or drug abuse; discontinue treatment if psychiatric symptoms develop; possibility of dependence; discontinue treatment if rash develops; hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 (modafinil)

Contra-indications moderate to severe uncontrolled hypertension, arrhythmia; history of left ventricular hypertrophy, cor pulmonale, or of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects dry mouth, appetite changes, gastrointestinal disturbances (including nausea, diarrhoea,

constipation, and dyspepsia), abdominal pain; tachycardia, vasodilatation, chest pain, palpitation; headache (uncommonly migraine), anxiety, sleep disturbances, dizziness, drowsiness, depression, confusion, paraesthesia, asthenia; visual disturbances; *less commonly* flatulence, reflux, vomiting, mouth ulcers, glossitis, dysphagia, taste disturbance, weight changes, hypertension, hypotension, bradycardia, arrhythmia, peripheral oedema, hypercholesterolaemia, rhinitis, dyspnoea, epistaxis, dyskinesia, amnesia, emotional lability, tremor, decreased libido, agitation, aggression, hyperglycaemia, thirst, urinary frequency, menstrual disturbances, eosinophilia, leucopenia, myasthenia, muscle cramps, hypertonia, myalgia, arthralgia, dry eye, sinusitis, acne, sweating, rash, and pruritus; *also reported* psychosis, mania, delusions, hallucinations, suicidal ideation, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- Narcolepsy and obstructive sleep apnoea syndrome, ADULT over 12 years, initially 200 mg daily, *either* in 2 divided doses morning and at noon *or* as a single dose in the morning, dose adjusted according to response to 200–400 mg daily in 2 divided doses or as a single dose; ELDERLY initiate at 100 mg daily; CHILD 5–12 years, see *BNF for Children*
- Chronic shift work sleep disorder, 200 mg taken 1 hour before the start of the work shift

Provigil® (Cephalon) ▼ PoM

Tablets, modafinil 100 mg, net price 30-tab pack = £53.62; 200 mg (scored), 30 tab-pack = £107.25

Cocaine

Cocaine is a drug of addiction which causes central nervous stimulation. Its clinical use is mainly as a topical local anaesthetic (section 15.2). It has been included in analgesic elixirs for the relief of pain in palliative care but this use is obsolete. For management of cocaine poisoning, see p. 33.

4.5 Drugs used in the treatment of obesity

4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract
4.5.2 Centrally acting appetite suppressants

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual, with appropriate support and encouragement; the individual should also be advised to increase physical activity. Smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss since cigarette smoking may be more harmful than obesity. Attendance at groups (e.g. 'weight-watchers') helps some individuals.

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity; the individual should receive advice on diet and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions.

An anti-obesity drug should be considered only for those with a body mass index (BMI, individual's bodyweight divided by the square of the individual's height) of 30 kg/m^2 or greater in whom at least 3 months of managed care involving supervised diet, exercise and behaviour modification fails to achieve a realistic reduction in weight. In the presence of risk factors (such as diabetes, coronary heart disease, hypertension, and obstructive sleep apnoea), it may be appropriate to prescribe a drug to individuals with a BMI of 27 kg/m^2 or greater, provided that such use is permitted by the drug's marketing authorisation. Drugs should **never** be used as the sole element of treatment. The individual should be monitored on a regular basis; drug treatment should be discontinued if the individual regains weight at any time whilst receiving drug treatment.

Drugs specifically licensed for the management of obesity are **orlistat** (section 4.5.1), **sibutramine** and **rimonabant** (both section 4.5.2). There is little evidence to guide selection between these drugs, but it may be appropriate to choose orlistat for those who have a high intake of fats whereas sibutramine or rimonabant may be chosen for those who cannot control their eating.

Combination therapy involving more than one anti-obesity drug is **contra-indicated** until further information about efficacy and long-term safety is available.

Thyroid hormones have **no** place in the treatment of obesity except in biochemically proven hypothyroid patients. The use of diuretics, chorionic gonadotrophin, or amphetamines is **not** appropriate for weight reduction.

4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract

Orlistat, a lipase inhibitor, reduces the absorption of dietary fat. It is used in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m^2 or more *or* in individuals with a BMI of 28 kg/m^2 in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia.

Orlistat should be used in conjunction with other lifestyle measures to manage obesity (section 4.5); treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss.

Some of the weight loss in those taking orlistat probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea. Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

The most commonly used bulk-forming drug is **methylcellulose** (section 1.6.1). It is claimed to reduce intake by producing a feeling of satiety but there is little evidence to support its use in the management of obesity.

ORLISTAT

Indications adjunct in obesity (see notes above)

Cautions may impair absorption of fat-soluble vitamins; epilepsy; pregnancy (Appendix 4); **interactions:** Appendix 1 (orlistat)

Multivitamins If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime

Contra-indications chronic malabsorption syndrome; cholestasis; breast-feeding (Appendix 5)

Side-effects oily leakage from rectum, flatulence, faecal urgency, liquid or oily stools, faecal incontinence, abdominal distension and pain (gastro-intestinal effects minimised by reduced fat intake), tooth and gingival disorders; respiratory infections; fatigue, anxiety, headache; menstrual disturbances, urinary-tract infection; hypoglycaemia; *rarely* rectal bleeding, hypothyroidism; *very rarely* diverticulitis, cholelithiasis, hepatitis, and bullous eruptions; oxalate nephropathy also reported

Dose

- ADULT over 18 years, 120 mg taken immediately before, during, or up to 1 hour after each main meal (up to max. 360 mg daily); continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes); CHILD over 12 years, initiated by specialist only [unlicensed use]

Note If a meal is missed or contains no fat, the dose of orlistat should be omitted

Xenical® (Roche) PoM

Capsules, turquoise, orlistat 120 mg, net price 84-cap pack = £32.27

4.5.2 Centrally acting appetite suppressants

Sibutramine inhibits the re-uptake of noradrenaline and serotonin. It is used in the adjunctive management of obesity in individuals with a body mass index (BMI) of 30 kg/m^2 or more (and no associated co-morbidity) or in individuals with a BMI of 27 kg/m^2 or more in the presence of other risk factors such as type 2 diabetes or dyslipidaemia. Sibutramine is not licensed for use for longer than 1 year; on stopping sibutramine, there may be a gradual reversal of weight loss.

Rimonabant is a cannabinoid receptor antagonist for the adjunctive management of obesity in individuals with a BMI of 30 kg/m^2 or more, or in individuals with a BMI above 27 kg/m^2 in the presence of other risk factors such as type 2 diabetes or dyslipidaemia. On stopping rimonabant, there may be a gradual reversal of weight loss.

Rimonabant

The marketing authorisation for rimonabant has been suspended following a review by the CHMP. The CHMP concluded that the benefits of rimonabant treatment do not outweigh the risks of psychiatric adverse reactions. Prescribers should not issue prescriptions for rimonabant; treatment of patients who are taking rimonabant should be reviewed.

Dexfenfluramine, diethylpropion, fenfluramine, and phentermine have been associated with valvular heart disease and the rare but serious risk of pulmonary hypertension.

RIMONABANT

Indications adjunct in obesity (see notes above)

Cautions epilepsy; history of suicidal ideation or of depressive disorder (avoid unless no alternative); elderly over 75 years; hepatic impairment (avoid if severe—Appendix 2); **interactions:** Appendix 1 (rimonabant)

Contra-indications major depressive illness, concomitant treatment with antidepressant; uncontrolled psychiatric illness; severe renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Depression Patients and carers should be informed of the risk of depression and advised to stop treatment and seek medical attention if symptoms occur

Side-effects nausea, vomiting, diarrhoea, dry mouth, anorexia; depression (see above), anxiety, irritability, nervousness, sleep disorders, impaired memory, dizziness, paraesthesia, hypoaesthesia, sciatica, hot flush, asthenia, impaired attention; tendonitis, muscle cramp; pruritus, hyperhidrosis; *less commonly* hiccups, anger, aggression, suicidal ideation; *rarely* hallucinations

Dose

- See Rimonabant, above; ADULT over 18 years 20 mg daily before breakfast

Acomplia® (Sanofi-Aventis) ▼ PoM

Tablets, f/c, rimonabant 20 mg, net price 28-tab pack = £44.00. Counselling, depression (see above)

SIBUTRAMINE HYDROCHLORIDE

Indications adjunct in obesity (see notes above)

Cautions monitor blood pressure and pulse rate (every 2 weeks for first 3 months *then* monthly for 3 months *then* at least every 3 months)—discontinue if blood pressure exceeds 145/90 mmHg or if systolic or diastolic pressure raised by more than 10 mmHg or if pulse rate raised by 10 beats per minute at 2 consecutive visits; sleep apnoea syndrome (increased risk of hypertension); epilepsy; open-angle glaucoma, susceptibility to angle-closure glaucoma, history of ocular hypertension; monitor for pulmonary hypertension; family history of motor or vocal tics, history of depression; predisposition to bleeding, concomitant use of drugs that increase risk of bleeding; hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if eGFR less than 30 mL/minute/1.73 m^2; Appendix 3); **interactions:** Appendix 1 (sibutramine)

Contra-indications history of major eating disorders; psychiatric illness, Tourette syndrome; history of coronary artery disease, congestive heart failure, tachycardia, peripheral arterial occlusive disease, arrhythmias, and of cerebrovascular disease; uncontrolled hypertension; hyperthyroidism; prostatic hypertrophy; phaeochromocytoma; history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects constipation, dry mouth, nausea, taste disturbances, diarrhoea, vomiting, gastro-intestinal haemorrhage, haemorrhoid aggravation; tachycardia, palpitation, arrhythmias, hypertension, flushing; insomnia, lightheadedness, paraesthesia, headache, anxiety, depression, seizures, transient memory dis-

turbance; sexual dysfunction, menstrual disturbances, urinary retention; thrombocytopenia; blurred vision; sweating, alopecia, cutaneous bleeding disorders, hypersensitivity reactions including Henoch-Schönlein purpura, rash, urticaria, angioedema and anaphylaxis; interstitial nephritis, glomerulonephritis; *rarely* headache and increased appetite on withdrawal; *very rarely* angle-closure glaucoma

Dose

- Initially 10 mg daily in the morning, increased if weight loss less than 2 kg after 4 weeks to 15 mg daily; discontinue if weight loss less than 2 kg after 4 weeks at higher dose (see also Discontinuation of Treatment below); max. period of treatment 1 year; CHILD over 12 years, initiated by specialist only [unlicensed use]; ELDERLY over 65 years not recommended

  Discontinuation of treatment Discontinue treatment if:
  - weight loss after 3 months less than 5% of initial bodyweight;
  - weight loss stabilises at less than 5% of initial bodyweight;
  - individuals regain 3 kg or more after previous weight loss

  In individuals with co-morbid conditions, treatment should be continued only if weight loss is associated with other clinical benefits

Reductil® (Abbott) PoM

Capsules, sibutramine hydrochloride 10 mg (blue/yellow), net price 28-cap pack = £25.00; 15 mg (blue/white), 28-cap pack = £25.00

4.6 Drugs used in nausea and vertigo

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. **Prochlorperazine**, **perphenazine**, and **trifluoperazine** are less sedating than **chlorpromazine**; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

Other antipsychotic drugs including **haloperidol** and **levomepromazine** (methotrimeprazine) are used for the relief of nausea and vomiting in terminal illness (see Palliative Care, p. 17).

Metoclopramide is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. In postoperative nausea and vomiting, metoclopramide in a dose of 10 mg has limited efficacy. High-dose metoclopramide injection is now less commonly used for cytotoxic-induced nausea and vomiting. As with the phenothiazines, metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine (section 4.9.2) will abort dystonic attacks.

Domperidone acts at the chemoreceptor trigger zone; it is used for the relief of nausea and vomiting, especially when associated with cytotoxic therapy. It has the advantage over metoclopramide and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson's disease, it is used to prevent nausea and vomiting during treatment with apomorphine and also to treat nausea caused by other dopaminergic drugs (section 4.9.1). Domperidone is also used to treat vomiting due to emergency hormonal contraception (section 7.3.5).

Dolasetron, **granisetron**, and **ondansetron** are specific $5HT_3$ antagonists which block $5HT_3$ receptors in the gastro-intestinal tract and in the CNS. They are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. **Palonosetron** is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

Dexamethasone (section 6.3.2) has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide, prochlorperazine, lorazepam, or a $5HT_3$ antagonist (section 8.1).

Aprepitant and **fosaprepitant** are neurokinin 1 receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a $5HT_3$ antagonist.

Nabilone is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics. Side-effects such as drowsiness and dizziness occur frequently with standard doses.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as **promethazine**, may be required. **Prochlorperazine** or **metoclopramide** may be consid-

ered as second-line treatments. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine must be considered in order to reduce the risk of Wernicke's encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, the type and duration of surgery, and the patient's sex. The aim is to prevent postoperative nausea and vomiting from occurring. Drugs used include some **phenothiazines** (e.g. prochlorperazine), **droperidol**, **metoclopramide** (but 10-mg dose has limited efficacy and higher parenteral doses associated with greater side-effects), **5HT$_3$ antagonists**, **antihistamines** (such as cyclizine), and **dexamethasone**. A combination of two antiemetic drugs acting at different sites may be needed in resistant postoperative nausea and vomiting.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is **hyoscine**. A transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired **promethazine** is useful, but generally a slightly less sedating antihistamine such as **cyclizine** or **cinnarizine** is preferred. The 5HT$_3$ antagonists, domperidone, metoclopramide, and the phenothiazines (except the antihistamine phenothiazine promethazine) are **ineffective** in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière's disease and middle-ear surgery can be difficult to treat.

Betahistine is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine is licensed for vertigo, tinnitus, and hearing loss associated with Ménière's disease.

A **diuretic** alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière's disease; **antihistamines** (such as cinnarizine), and **phenothiazines** (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

For advice to avoid the inappropriate prescribing of drugs (notably phenothiazines) for dizziness in the elderly, see Prescribing for the Elderly, p. 19.

Cytotoxic chemotherapy

For the management of nausea and vomiting induced by cytotoxic chemotherapy, see section 8.1.

Palliative care

For the management of nausea and vomiting in palliative care, see p. 17 and p. 18.

Migraine

For the management of nausea and vomiting associated with migraine, see p. 251.

Antihistamines

CINNARIZINE

Indications vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease; motion sickness

Cautions section 3.4.1; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications section 3.4.1

Side-effects section 3.4.1; also *rarely* weight gain, sweating, lichen planus, and lupus-like skin reactions

Dose

- Vestibular disorders, 30 mg 3 times daily; CHILD 5–12 years 15 mg 3 times daily
- Motion sickness, 30 mg 2 hours before travel then 15 mg every 8 hours during journey if necessary; CHILD 5–12 years, 15 mg 2 hours before travel then 7.5 mg every 8 hours during journey if necessary

Cinnarizine (Non-proprietary)
Tablets, cinnarizine 15 mg, net price 84-tab pack = £17.35. Label: 2

Stugeron® (Janssen-Cilag)
Tablets, scored, cinnarizine 15 mg, net price 15-tab pack = £1.55, 100-tab pack = £3.35. Label: 2

With dimenhydrinate

Arlevert® (Hampton) PoM
Tablets, cinnarizine 20 mg, dimenhydrinate 40 mg, net price 100-tab pack = £24.00. Label: 2
Dose ADULT over 18 years, 1 tablet 3 times daily

CYCLIZINE

Indications nausea, vomiting, vertigo, motion sickness, labyrinthine disorders

Cautions section 3.4.1; severe heart failure; may counteract haemodynamic benefits of opioids; **interactions:** Appendix 1 (antihistamines)

Contra-indications section 3.4.1

Side-effects section 3.4.1

Dose

- By mouth, cyclizine hydrochloride 50 mg up to 3 times daily; CHILD 6–12 years 25 mg up to 3 times daily
- By intramuscular *or* intravenous injection, cyclizine lactate 50 mg 3 times daily

Valoid® (Amdipharm)
Tablets, scored, cyclizine hydrochloride 50 mg. Net price 100 = £7.41. Label: 2
Injection PoM, cyclizine lactate 50 mg/mL. Net price 1-mL amp = 52p

PROMETHAZINE HYDROCHLORIDE

Indications nausea, vomiting, vertigo, labyrinthine disorders, motion sickness; allergy and urticaria (section 3.4.1); sedation (section 4.1.1)

Cautions section 3.4.1

Contra-indications section 3.4.1

Side-effects section 3.4.1 but more sedating

Dose

- By mouth, 20–25 mg at bedtime on night before travel, repeat following morning if necessary; CHILD 2–5 years 5 mg at night, and following morning if necessary, 5–10 years 10 mg at night, and following morning if necessary

Preparations

Section 3.4.1

PROMETHAZINE TEOCLATE

Indications nausea, vertigo, labyrinthine disorders, motion sickness (acts longer than the hydrochloride)

Cautions section 3.4.1; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Contra-indications section 3.4.1

Side-effects section 3.4.1

Dose

- 25–75 mg, max. 100 mg, daily; CHILD 5–10 years, 12.5–37.5 mg daily
- Motion sickness prevention, ADULT and CHILD over 10 years, 25 mg at bedtime on night before travel *or* 25 mg 1–2 hours before travel; CHILD 5–10 years, 12.5 mg at bedtime on night before travel *or* 12.5 mg 1–2 hours before travel
- Severe vomiting during pregnancy [unlicensed], 25 mg at bedtime, increased if necessary to max. 100 mg daily (but see also Vomiting During Pregnancy, p. 225)

Avomine® (Manx)

Tablets, scored, promethazine teoclate 25 mg. Net price 10-tab pack = £1.13; 28-tab pack = £3.13. Label: 2

Phenothiazines and related drugs

CHLORPROMAZINE HYDROCHLORIDE

Indications nausea and vomiting of terminal illness (where other drugs have failed or are not available); other indications (section 4.2.1 and section 15.1.4.1)

Cautions see Chlorpromazine Hydrochloride, section 4.2.1

Contra-indications see Chlorpromazine Hydrochloride, section 4.2.1

Side-effects see Chlorpromazine Hydrochloride, section 4.2.1

Dose

- By mouth, 10–25 mg every 4–6 hours; CHILD 500 micrograms/kg every 4–6 hours (1–5 years max. 40 mg daily, 6–12 years max. 75 mg daily)
- By deep intramuscular injection initially 25 mg then 25–50 mg every 3–4 hours until vomiting stops; CHILD 500 micrograms/kg every 6–8 hours (1–5 years max. 40 mg daily, 6–12 years max. 75 mg daily)
- By rectum in suppositories, chlorpromazine 100 mg every 6–8 hours [unlicensed]

Preparations

Section 4.2.1

DROPERIDOL

Indications prevention and treatment of postoperative nausea and vomiting

Cautions see section 4.2.1 also chronic obstructive pulmonary disease or respiratory failure; electrolyte disturbances; history of alcohol abuse; continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (droperidol)

Contra-indications see section 4.2.1; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT-interval); hypokalaemia; hypomagnesaemia; bradycardia

Side-effects see section 4.2.1; also anxiety, cardiac arrest, hallucinations, and inappropriate antidiuretic hormone secretion

Dose

- Prevention and treatment of postoperative nausea and vomiting, by intravenous injection, 0.625–1.25 mg (ELDERLY 625 micrograms) 30 minutes before end of surgery, repeated every 6 hours as required; CHILD over 2 years (second-line use only) 20–50 micrograms/kg (max. 1.25 mg)
- Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA), by intravenous injection, 15–50 micrograms of droperidol for every 1 mg of morphine in PCA (max. 5 mg droperidol daily); ELDERLY reduce dose

Xomolix® (ProStrakan) ▼ PoM

Injection, droperidol 2.5 mg/mL, net price 1–mL amp = £3.94

PERPHENAZINE

Indications severe nausea, vomiting (see notes above); other indications (section 4.2.1)

Cautions see Perphenazine (section 4.2.1)

Contra-indications see Perphenazine (section 4.2.1)

Side-effects see Perphenazine (section 4.2.1); extrapyramidal symptoms particularly in young adults, elderly, and debilitated

Dose

- 4 mg 3 times daily, adjusted according to response; max. 24 mg daily (chemotherapy-induced); ELDERLY quarter to half adult dose; CHILD under 14 years not recommended

Preparations

Section 4.2.1

PROCHLORPERAZINE

Indications severe nausea, vomiting, vertigo, labyrinthine disorders (see notes above); other indications section 4.2.1

Cautions see under Prochlorperazine (section 4.2.1); oral route only for children (avoid if under 10 kg); elderly (see notes above)

Contra-indications see under Prochlorperazine (section 4.2.1)

Side-effects see under Prochlorperazine (section 4.2.1); extrapyramidal symptoms, particularly in children, elderly, and debilitated

Dose

Note Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate ≡ 1 mg prochlorperazine mesilate

- By mouth, nausea and vomiting, acute attack, 20 mg initially then 10 mg after 2 hours; prevention 5–10 mg 2–3 times daily; CHILD (over 10 kg only) 250 micrograms/kg 2–3 times daily

  Labyrinthine disorders, 5 mg 3 times daily, gradually increased if necessary to 30 mg daily in divided doses, then reduced after several weeks to 5–10 mg daily; CHILD not recommended
- By deep intramuscular injection, nausea and vomiting, 12.5 mg when required followed if necessary after 6 hours by an oral dose, as above; CHILD and ADOLESCENT under 18 years, see *BNF for Children*

Prochlorperazine (Non-proprietary) PoM

Tablets, prochlorperazine maleate 5 mg, net price 28 = £1.83, 84 = £4.15. Label: 2

Stemetil® (Castlemead) PoM

Tablets, prochlorperazine maleate 5 mg (off-white), net price 84-tab pack = £5.94. Label: 2

Syrup, straw-coloured, prochlorperazine mesilate 5 mg/5 mL. Net price 100-mL pack = £3.34. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Buccal preparation

[1] **Buccastem®** (R&C) PoM

Tablets (buccal), pale yellow, prochlorperazine maleate 3 mg, net price 5 × 10-tab pack = £4.91. Label: 2, counselling, administration, see under Dose below

Dose ADULT and CHILD over 12 years, 1–2 tablets twice daily; tablets are placed high between upper lip and gum and left to dissolve

1. Prochlorperazine maleate can be sold to the public for adults over 18 years (provided packs do not contain more than 24 mg) for the treatment of nausea and vomiting in previously diagnosed migraine only (max. daily dose 12 mg)

TRIFLUOPERAZINE

Indications severe nausea and vomiting (see notes above); other indications (section 4.2.1)

Cautions section 4.2.1

Contra-indications section 4.2.1

Side-effects section 4.2.1; extrapyramidal symptoms, particularly in children, elderly, and debilitated

Dose

- 2–4 mg daily in divided doses *or* as a single dose of a modified-release preparation; max. 6 mg daily; CHILD 3–5 years up to 1 mg daily, 6–12 years up to 4 mg daily

Preparations

Section 4.2.1

Domperidone and metoclopramide

DOMPERIDONE

Indications nausea and vomiting, dyspepsia, gastro-oesophageal reflux

Cautions children; renal impairment (Appendix 3); breast-feeding (Appendix 5); **interactions:** Appendix 1 (domperidone)

Contra-indications prolactinoma, hepatic impairment; where increased gastro-intestinal motility harmful; pregnancy (Appendix 4)

Side-effects *rarely* gastro-intestinal disturbances (including cramps) and hyperprolactinaemia; *very rarely* extrapyramidal effects and rashes

Dose

- By mouth, ADULT and CHILD body-weight over 35 kg, 10–20 mg 3–4 times daily; max. 80 mg daily; CHILD body-weight up to 35 kg (nausea and vomiting only), 250–500 micrograms/kg 3–4 times daily; max. 2.4 mg/kg daily
- By rectum, ADULT and CHILD body-weight over 35 kg, 60 mg twice daily; CHILD 15–35 kg (nausea and vomiting only), 30 mg twice daily; CHILD body-weight under 15 kg, not recommended

[1] **Domperidone** (Non-proprietary) PoM

Tablets, 10 mg (as maleate), net price 30-tab pack = £1.35; 100-tab pack = £2.50

Suspension, domperidone 5 mg/5 mL, net price 200-mL pack = £7.00

1. Domperidone can be sold to the public (provided packs do not contain more than 200 mg) for the relief of postprandial symptoms of excessive fullness, nausea, epigastric bloating and belching occasionally accompanied by epigastric discomfort and heartburn (max. single dose 10 mg, max. daily dose 40 mg)

Motilium® (Sanofi-Synthelabo) PoM

Tablets, f/c, domperidone 10 mg (as maleate), net price 30-tab pack = £2.71; 100-tab pack = £9.04

Suppositories domperidone 30 mg, net price 10 = £3.06

METOCLOPRAMIDE HYDROCHLORIDE

Indications adults, nausea and vomiting, particularly in gastro-intestinal disorders (section 1.2) and treatment with cytotoxics or radiotherapy; migraine (section 4.7.4.1)

Patients under 20 years Use restricted to severe intractable vomiting of known cause, vomiting of radiotherapy and cytotoxics, aid to gastro-intestinal intubation, premedication; dose should be determined on the basis of body-weight

Cautions elderly, young adults, and children; atopic allergy (including asthma); may mask underlying disorders such as cerebral irritation; acute porphyria (section 9.8.2); epilepsy; hepatic impairment (Appendix 2), renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (metoclopramide)

Contra-indications gastro-intestinal obstruction, perforation or haemorrhage; 3–4 days after gastro-intestinal surgery; phaeochromocytoma; breast-feeding (Appendix 5)

Side-effects extrapyramidal effects (especially in children and young adults—see p. 225), hyperprolac-

tinaemia, occasionally tardive dyskinesia on prolonged administration; also reported, anxiety, confusion, drowsiness, restlessness, diarrhoea, depression, neuroleptic malignant syndrome, rashes, pruritus, oedema; cardiac conduction abnormalities reported following intravenous administration; *rarely* methaemoglobinaemia (more severe in G6PD deficiency)

Dose

- By mouth *or* by intramuscular injection *or* by intravenous injection over 1–2 minutes, nausea and vomiting, 10 mg (5 mg in young adults 15–19 years under 60 kg) 3 times daily; CHILD up to 1 year (up to 10 kg) 100 micrograms/kg (max. 1 mg) twice daily, 1–3 years (10–14 kg) 1 mg 2–3 times daily, 3–5 years (15–19 kg) 2 mg 2–3 times daily, 5–9 years (20–29 kg) 2.5 mg 3 times daily, 9–15 years (30 kg and over) 5 mg 3 times daily

  Note Daily dose of metoclopramide should not normally exceed 500 micrograms/kg, particularly for children and young adults (restricted use, see above)

  For diagnostic procedures, as a single dose 5–10 minutes before examination, 10–20 mg (10 mg in young adults 15–19 years); CHILD under 3 years 1 mg, 3–5 years 2 mg, 5–9 years 2.5 mg, 9–14 years 5 mg

Metoclopramide (Non-proprietary) PoM

Tablets, metoclopramide hydrochloride 10 mg, net price 28-tab pack = 93p

Oral solution, metoclopramide hydrochloride 5 mg/5 mL, net price 200-mL pack = £3.83. Counselling, use of pipette

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Injection, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 26p

Maxolon® (Shire) PoM

Tablets, scored, metoclopramide hydrochloride 10 mg, net price 84-tab pack = £5.24

Injection, metoclopramide hydrochloride 5 mg/mL. Net price 2-mL amp = 27p

High-dose (with cytotoxic chemotherapy only)

Maxolon High Dose® (Shire) PoM

Injection, metoclopramide hydrochloride 5 mg/mL, net price 20-mL amp = £2.67.

For dilution and use as an intravenous infusion in nausea and vomiting associated with cytotoxic chemotherapy only

Dose by continuous intravenous infusion (preferred method), initially (before starting chemotherapy), 2–4 mg/kg over 15–20 minutes, then 3–5 mg/kg over 8–12 hours; max. in 24 hours, 10 mg/kg

By intermittent intravenous infusion, initially (before starting chemotherapy), up to 2 mg/kg over at least 15 minutes then up to 2 mg/kg over at least 15 minutes every 2 hours; max. in 24 hours, 10 mg/kg

Modified release

Maxolon SR® (Shire) PoM

Capsules, m/r, clear, enclosing white granules, metoclopramide hydrochloride 15 mg, net price 56-cap pack = £7.01. Label: 25

Dose patients over 20 years, 1 capsule twice daily

Compound preparations (for migraine)

Section 4.7.4.1

5HT$_3$ antagonists

DOLASETRON MESILATE

Indications see under Dose

Cautions concomitant administration of drugs that prolong QT interval, congestive heart failure; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (dolasetron)

Contra-indications prolonged QT interval, cardiac conduction disorders

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, flatulence, anorexia, taste disturbance; tachycardia, bradycardia, ECG changes, flushing; fever, shivering; headache, sleep disorder, fatigue, dizziness, drowsiness, hypersensitivity reactions including rash, *rarely* intestinal obstruction, pancreatitis, jaundice, oedema, cardiac arrhythmia, bronchospasm, seizures, *very rarely* severe hypotension following intravenous injection

Dose

- Prevention of nausea and vomiting induced by cytotoxic chemotherapy, by intravenous injection (over 30 seconds) *or* by intravenous infusion, ADULT over 18 years, 100 mg 30 minutes before treatment
- Prevention of postoperative nausea and vomiting by intravenous injection (over 30 seconds) *or* by intravenous infusion, ADULT over 18 years, 12.5 mg at cessation of anaesthesia,
- Treatment of postoperative nausea and vomiting, by intravenous injection (over 30 seconds) *or* by intravenous infusion, ADULT over 18 years, 12.5 mg

Anzemet® (Amdipharm) ▼ PoM

Injection, dolasetron mesilate 20 mg/mL, net price 0.625-mL (12.5-mg) amp = £4.00, 5-mL (100-mg) amp = £13.00

GRANISETRON

Indications see under Dose

Cautions pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects constipation, nausea, diarrhoea, vomiting, abdominal pain; headache, drowsiness, asthenia; fever; *rarely* hepatic dysfunction, chest pain, arrhythmia; *very rarely* anorexia, dizziness, insomnia, agitation, movement disorders, rash

Dose

- Nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy, by mouth, 1–2 mg within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses during treatment; when intravenous infusion also used, max. combined total 9 mg in 24 hours; CHILD 20 micrograms/kg (max. 1 mg) within 1 hour before start of treatment, then 20 micrograms/kg (max. 1 mg) twice daily for up to 5 days during treatment

  By intravenous injection (diluted in 15 mL sodium chloride 0.9% and given over not less than 30 seconds) *or* by intravenous infusion (over 5 minutes), prevention, 3 mg before start of cytotoxic therapy (up to 2 additional 3-mg doses may be given within 24 hours); treatment, as for prevention (the two additional doses must not be given less than 10 minutes apart); max. 9 mg in 24 hours; CHILD, by intravenous infusion, (over 5 minutes), prevention,

40 micrograms/kg (max. 3 mg) before start of cytotoxic therapy; treatment, as for prevention—one additional dose of 40 micrograms/kg (max. 3 mg) may be given within 24 hours (not less than 10 minutes after initial dose)

- Postoperative nausea and vomiting, by intravenous injection (diluted to 5 mL and given over 30 seconds), prevention, 1 mg before induction of anaesthesia; treatment, 1 mg, given as for prevention; max. 2 mg in one day; CHILD not recommended

Granisetron (Non-proprietary) PoM

Tablets, granisetron (as hydrochloride) 1 mg, net price 10-tab pack = £65.49

Injection, granisetron (as hydrochloride) 1 mg/mL, for dilution before use, net price 1-mL amp = £1.60, 3-mL amp = £4.80

Kytril® (Roche) PoM

Tablets, f/c, granisetron (as hydrochloride) 1 mg, net price 10-tab pack = £62.94; 2 mg, 5-tab pack = £62.94

Injection, granisetron (as hydrochloride) 1 mg/mL, for dilution before use, net price 1-mL amp = £8.26, 3-mL amp = £24.78

ONDANSETRON

Indications see under Dose

Cautions QT interval prolongation (avoid concomitant administration of drugs that prolong QT interval); hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (ondansetron)

Side-effects constipation; headache; flushing; injection site-reactions; *less commonly* hiccups, hypotension, bradycardia, chest pain, arrhythmias, movement disorders, seizures; *on intravenous administration, rarely* dizziness, transient visual disturbances (*very rarely* transient blindness); suppositories may cause rectal irritation

Dose

- Moderately emetogenic chemotherapy or radiotherapy, by mouth, 8 mg 1–2 hours before treatment *or* by rectum, 16 mg 1–2 hours before treatment *or* by intramuscular injection *or* slow intravenous injection, 8 mg immediately before treatment

  then by mouth, 8 mg every 12 hours for up to 5 days *or* by rectum, 16 mg daily for up to 5 days; CHILD, by slow intravenous injection *or* by intravenous infusion over 15 minutes, 5 mg/m^2 immediately before chemotherapy then 4 mg by mouth every 12 hours for up to 5 days
- Severely emetogenic chemotherapy, by intramuscular injection *or* slow intravenous injection, 8 mg immediately before treatment, where necessary followed by 2 further doses of 8 mg at intervals of 2–4 hours (*or* followed by 1 mg/hour by continuous intravenous infusion for up to 24 hours)

  then by mouth, 8 mg every 12 hours for up to 5 days *or* by rectum, 16 mg daily for up to 5 days;

  alternatively, by intravenous infusion over at least 15 minutes, 32 mg immediately before treatment *or* by rectum, 16 mg 1–2 hours before treatment

  then by mouth, 8 mg every 12 hours for up to 5 days *or* by rectum, 16 mg daily for up to 5 days; CHILD, by slow intravenous injection, 5 mg/m^2 immediately before chemotherapy then 4 mg by mouth every 12 hours for up to 5 days
- Prevention of postoperative nausea and vomiting, by mouth, 16 mg 1 hour before anaesthesia *or* 8 mg 1 hour before anaesthesia followed by 8 mg at intervals of 8 hours for 2 further doses

  alternatively, by intramuscular *or* slow intravenous injection, 4 mg at induction of anaesthesia; CHILD over 2 years, by slow intravenous injection, 100 micrograms/kg (max. 4 mg) before, during, or after induction of anaesthesia
- Treatment of postoperative nausea and vomiting, by intramuscular *or* slow intravenous injection, 4 mg; CHILD over 2 years, by slow intravenous injection, 100 micrograms/kg (max. 4 mg)

Ondansetron (Non-proprietary) PoM

Tablets, ondansetron (as hydrochloride) 4 mg, net price 30-tab pack = £88.71; 8 mg, 10-tab pack = £59.08

Brands include *Ondemet®*

Injection, ondansetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.39, 4-mL amp = £10.79

Brands include *Ondemet®*

Zofran® (GSK) PoM

Tablets, yellow, f/c, ondansetron (as hydrochloride) 4 mg, net price 30-tab pack = £107.91; 8 mg, 10-tab pack = £71.94

Oral lyophilisates (*Zofran Melt®*), ondansetron 4 mg, net price 10-tab pack = £35.97; 8 mg, 10-tab pack = £71.94. Counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed

Syrup, sugar-free, strawberry-flavoured, ondansetron (as hydrochloride) 4 mg/5 mL, net price 50-mL pack = £35.97

Injection, ondansetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.99; 4-mL amp = £11.99

Suppositories, ondansetron 16 mg, net price 1 = £14.39

PALONOSETRON

Indications prevention of nausea and vomiting induced by moderately and severely emetogenic chemotherapy

Cautions history of constipation; intestinal obstruction; concomitant administration of drugs that prolong QT interval; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Driving Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving)

Side-effects diarrhoea, constipation; headache, dizziness; *less commonly* dyspepsia, abdominal pain, dry mouth, flatulence, changes in blood pressure, tachycardia, bradycardia, arrhythmia, myocardial ischaemia, hiccups, drowsiness, asthenia, insomnia, anxiety, euphoria, paraesthesia, peripheral neuropathy, anorexia, motion sickness, influenza-like symptoms, urinary retention, glycosuria, hyperglycaemia, electrolyte disturbance, arthralgia, eye irritation, amblyopia, tinnitus, rash, pruritus

Dose

- By intravenous injection (over 30 seconds), 250 micrograms as a single dose 30 minutes before treatment; do not repeat dose within 7 days; CHILD and ADOLESCENT under 18 years not recommended

Aloxi® (IS Pharmaceuticals) ▼ PoM

Injection, palonosetron (as hydrochloride) 50 micrograms/mL, net price 5-mL amp = £55.89

Neurokinin receptor antagonist

APREPITANT

Indications adjunct to dexamethasone and a $5HT_3$ antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

Cautions hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (aprepitant)

Contra-indications breast-feeding (Appendix 5)

Side-effects hiccups, dyspepsia, diarrhoea, constipation, anorexia; asthenia, headache, dizziness; *less commonly* weight changes, dry mouth, colitis, flatulence, stomatitis, abdominal pain, gastro-oesophageal reflux, duodenal ulcer, oedema, bradycardia, cough, disorientation, euphoria, anxiety, confusion, thirst, abnormal dreams, hyperglycaemia, polyuria, anaemia, dysuria, haematuria, myalgia, conjunctivitis, pharyngitis, sneezing, tinnitus, sweating, oily skin, pruritus, rash, acne, photosensitivity, flushing, hyponatraemia

Dose

- ADULT over 18 years 125 mg 1 hour before chemotherapy, then 80 mg daily as a single dose for the next 2 days; consult product literature for dose of concomitant corticosteroid and $5HT_3$ antagonist

Emend® (MSD) PoM

Capsules, aprepitant 80 mg (white), net price 2-cap pack = £31.61; 125 mg (white/pink), 5-cap pack = £79.03; 3-day pack of one 125-mg capsule and two 80-mg capsules = £47.42

FOSAPREPITANT

Note Fosaprepitant is a prodrug of aprepitant

Indications adjunct to dexamethasone and a $5HT_3$ antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

Cautions hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (aprepitant)

Contra-indications breast-feeding (Appendix 5)

Side-effects anorexia, constipation, diarrhoea, dyspepsia, hiccups; asthenia, dizziness, headache; *less commonly* weight changes, abdominal pain, colitis, dry mouth, duodenal ulcer, flatulence, gastro-oesophageal reflux, stomatitis, taste disturbances, bradycardia, oedema, cough, abnormal dreams, anxiety, disorientation, confusion, euphoria, thirst, hyperglycaemia, dysuria, polyuria, flushing, neutropenia, anaemia, haematuria, hyponatraemia, myalgia, conjunctivitis, pharyngitis, sneezing, tinnitus, acne, photosensitivity, flushing, pruritus, oily skin, rash, sweating

Dose

- By intravenous infusion, over 15 minutes, ADULT over 18 years, 115 mg 30 minutes before chemotherapy on day 1 of cycle (followed by aprepitant on days 2 and 3 of cycle); consult product literature for dose of concomitant corticosteroid and $5HT_3$ antagonist

Ivemend® (MSD) ▼ PoM

Injection, powder for reconstitution, fosaprepitant (as dimeglumine), net price 115-mg vial = £20.55

The *Scottish Medicines Consortium* (p. 3) has advised (September 2008) that fosaprepitant (*Ivemend®*) is accepted for restricted use for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy

Cannabinoid

NABILONE

Indications nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

Cautions history of psychiatric disorder; elderly; hypertension; heart disease; adverse effects on mental state can persist for 48–72 hours after stopping; pregnancy (Appendix 4); **interactions:** Appendix 1 (nabilone)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe hepatic impairment; breast-feeding (Appendix 5)

Side-effects drowsiness, vertigo, euphoria, dry mouth, ataxia, visual disturbance, concentration difficulties, sleep disturbance, dysphoria, hypotension, headache and nausea; also confusion, disorientation, hallucinations, psychosis, depression, decreased coordination, tremors, tachycardia, decreased appetite, and abdominal pain

Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects

Dose

- Initially 1 mg twice daily, increased if necessary to 2 mg twice daily, throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle; max. 6 mg daily given in 3 divided doses. The first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug; ADOLESCENT and CHILD under 18 years consult local treatment protocol [unlicensed use]

Nabilone (Valeant) PoM

Capsules, blue/white, nabilone 1 mg. Net price 20-cap pack = £125.84. Label: 2, counselling, behavioural effects

Hyoscine

HYOSCINE HYDROBROMIDE
(Scopolamine Hydrobromide)

Indications motion sickness; hypersalivation associated with clozapine therapy; premedication (section 15.1.3); excessive respiratory secretions (see Prescribing in Palliative Care, p. 17)

Cautions section 1.2

Contra-indications section 1.2

Side-effects section 1.2

Dose

- Motion sickness, by mouth, ADULT and CHILD over 10 years, 150–300 micrograms up to 30 minutes before

start of journey repeated every 6 hours if required; max. 900 micrograms daily; CHILD 3–4 years 75 micrograms up to 30 minutes before start of journey repeated after 6 hours if required, max. 150 micrograms daily; 4–10 years 75–150 micrograms up to 30 minutes before start of journey repeated every 6 hours if required; max. 450 micrograms daily

- Hypersalivation associated with clozapine therapy [unlicensed indication], by mouth, 300 micrograms up to 3 times daily; max. 900 micrograms daily; CHILD under 18 years, see *BNF for Children*

Joy Rides® (GSK Consumer Healthcare)
Tablets, chewable, raspberry-flavoured, hyoscine hydrobromide 150 micrograms, net price 12-tab pack = £1.49. Label: 2, 24

Kwells® (Bayer Consumer Care)
Tablets, chewable, scored, hyoscine hydrobromide 150 micrograms (*Kwells® Kids*) (white), net price 12-tab pack = £1.67; 300 micrograms (pink), 12-tab pack = £1.67. Label: 2

Patches

Scopoderm TTS® (Novartis Consumer Health) PoM
Patch, self-adhesive, pink, releasing hyoscine approx. 1 mg/72 hours when in contact with skin. Net price 2 = £4.30. Label: 19, counselling, see below
Dose motion sickness prevention, apply 1 patch to hairless area of skin behind ear 5–6 hours before journey; replace if necessary after 72 hours, siting replacement patch behind other ear; CHILD under 10 years not recommended
Counselling Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time

Parenteral preparations

Section 15.1.3

Other drugs for Ménière's disease

Betahistine has been promoted as a specific treatment for Ménière's disease.

BETAHISTINE DIHYDROCHLORIDE

Indications vertigo, tinnitus and hearing loss associated with Ménière's disease
Cautions asthma, history of peptic ulcer; pregnancy and breast-feeding; **interactions:** Appendix 1 (betahistine)
Contra-indications phaeochromocytoma
Side-effects gastro-intestinal disturbances; headache, rashes and pruritus reported
Dose

- Initially 16 mg 3 times daily, preferably with food; maintenance 24–48 mg daily; CHILD not recommended

Betahistine Dihydrochloride (Non-proprietary) PoM
Tablets, betahistine dihydrochloride 8 mg, net price 84-tab pack = £2.58 120-tab pack = £1.47; 16 mg, 84-tab pack = £2.06. Label: 21

Serc® (Solvay) PoM
Tablets, betahistine dihydrochloride 8 mg (*Serc®-8*), net price 120-tab pack = £9.04; 16 mg (*Serc®-16*) (scored), 84-tab pack = £12.65. Label: 21

4.7 Analgesics

4.7.1 Non-opioid analgesics
4.7.2 Opioid analgesics
4.7.3 Neuropathic pain
4.7.4 Antimigraine drugs

The non-opioid drugs (section 4.7.1), paracetamol and aspirin (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics (section 4.7.2) are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in palliative care For advice on pain relief in palliative care, see p. 15.

Pain in sickle-cell disease The pain of mild sickle-cell crises is managed with paracetamol, a NSAID (section 10.1.1), codeine, or dihydrocodeine. Severe crises may require the use of morphine or diamorphine; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine necessitates frequent injections.

Dental and orofacial pain Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis (dry socket) or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by **benzydamine** mouthwash or spray (p. 617) until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of **paracetamol** (p. 234) or **ibuprofen** (p. 565) is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include **ibuprofen**, **diclofenac**, and **aspirin**; for further details see section 4.7.1 and section 10.1.1. **Paracetamol** has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics (section 4.7.2) such as **dihydrocodeine** and **pethidine** act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given

alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, **diazepam** (section 4.1.2), which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin (section 4.7.1) or ibuprofen (section 10.1.1) may also be required.

For the management of neuropathic pain, persistent idiopathic facial pain, and trigeminal neuralgia, see section 4.7.3.

Dysmenorrhoea Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID (section 10.1.1) will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate, section 1.2) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

4.7.1 Non-opioid analgesics

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties (section 2.9). Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin is a **special hazard**, see **interactions:** Appendix 1 (aspirin).

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days (see Emergency Treatment of Poisoning, p. 29).

Nefopam may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs, section 10.1.1) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly (see also p. 20). They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins (see Prescribing in Palliative Care, p. 15). Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. NSAIDs including ketorolac are also used for peri-operative analgesia (section 15.1.4.2).

A non-opioid analgesic administered by intrathecal infusion (**ziconotide** (*Prialt*® ▼), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Dental and orofacial pain Most dental pain is relieved effectively by NSAIDs (section 10.1.1). **Aspirin** (p. 234) is effective against mild to moderate dental pain; dispersible tablets provide a rapidly absorbed form of aspirin suitable for most purposes.

The analgesic effect of **paracetamol** in mild to moderate dental pain is probably less than that of aspirin, but it does not affect bleeding time or interact significantly with warfarin. Moreover, it is less irritant to the stomach. Paracetamol is a suitable analgesic for children; sugar-free versions can be requested by specifying 'sugar-free' on the prescription.

For further information on the management of dental and orofacial pain, see p. 232.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** (see p. 31) yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated

with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration). For details of the **side-effects** of opioid analgesics, see p. 237 (**important:** the elderly are particularly susceptible to opioid side-effects and should receive lower doses).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

For information on the use of combination analgesic preparations in dental and orofacial pain, see p. 233.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because, for example, alternatives are not effective or suitable.

ASPIRIN

(Acetylsalicylic Acid)

Indications mild to moderate pain, pyrexia; antiplatelet (section 2.9)

Cautions asthma, allergic disease, hepatic impairment (Appendix 2), renal impairment (Appendix 3), dehydration; preferably avoid during fever or viral infection in children (risk of Reye's syndrome, see below); pregnancy (Appendix 4); elderly; G6PD-deficiency (section 9.1.5); concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (aspirin)

Contra-indications children under 16 years and in breast-feeding (Reye's syndrome, see below; Appendix 5); previous or active peptic ulceration, haemophilia; not for treatment of gout

Hypersensitivity Aspirin and other NSAIDs are **contra-indicated** in patients with a history of hypersensitivity to aspirin or any other NSAID—*which includes those* in whom attacks of *asthma, angioedema, urticaria or rhinitis* have been precipitated by aspirin or any other NSAID

Reye's syndrome Owing to an association with Reye's syndrome, the CSM has advised that aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki syndrome

Side-effects generally mild and infrequent but high incidence of gastro-intestinal irritation with slight asymptomatic blood loss, increased bleeding time, bronchospasm and skin reactions in hypersensitive patients. Prolonged administration, see section 10.1.1. **Overdosage:** see Emergency Treatment of Poisoning, p. 29

Dose

- By mouth, 300–900 mg every 4–6 hours when necessary; max. 4 g daily; CHILD under 16 years not recommended (see Reye's Syndrome, above)
- By rectum, 450–900 mg every 4 hours (max. 3.6 g daily); CHILD under 16 years not recommended (see Reye's Syndrome, above)

Aspirin (Non-proprietary)

Tablets (PoM)[1], aspirin 300 mg. Net price 32-tab pack = 31p. Label: 21, 32

Tablets (PoM)[1], e/c, aspirin 300 mg, net price 100-tab pack = £4.72; 75 mg, see section 2.9. Label: 5, 25, 32

Dispersible tablets (PoM)[1], aspirin 300 mg, net price 100-tab pack = £5.68; 75 mg, see section 2.9. Label: 13, 21, 32

Note BP directs that when no strength is stated the 300-mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

Dental prescribing on NHS Aspirin Dispersible Tablets 300 mg may be prescribed

Suppositories (PoM), aspirin 150 mg, net price 10 = £9.52; 300 mg, 12 = £59.28. Label: 32

Brands include *Resprin®*

Caprin® (Pinewood)

Tablets (PoM)[1], e/c, f/c, pink, aspirin 300 mg, net price 100-tab pack = £4.89; 75 mg, see section 2.9. Label: 5, 25, 32

Nu-Seals® Aspirin (Alliance)

Tablets (PoM)[1], e/c, aspirin 300 mg, net price 100-tab pack = £4.15; 75 mg, see section 2.9. Label: 5, 25, 32

With codeine phosphate 8 mg

[1]Co-codaprin (Non-proprietary) (PoM)

Dispersible tablets, co-codaprin 8/400 (codeine phosphate 8 mg, aspirin 400 mg). Net price 100-tab pack = £26.20. Label: 13, 21, 32

Dose 1–2 tablets in water every 4–6 hours; max. 8 tablets daily

When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed

Other compound preparations

Aspav® (Alpharma) (PoM)

Dispersible tablets, aspirin 500 mg, papaveretum 7.71 mg (providing the equivalent of 5 mg of anhydrous morphine). Net price 30-tab pack = £5.98. Label: 2, 13, 21, 32

Dose 1–2 tablets in water every 4–6 hours if necessary; max. 8 tablets daily

PARACETAMOL

(Acetaminophen)

Indications mild to moderate pain, pyrexia

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3), alcohol dependence; **interactions:** Appendix 1 (paracetamol)

Side-effects side-effects rare, but rashes, blood disorders (including thrombocytopenia, leucopenia, neutropenia) reported; hypotension also reported on infusion; **important:** liver damage (and less frequently renal damage) following **overdosage**, see Emergency Treatment of Poisoning, p. 29

Dose

- By mouth, 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD 2 months 60 mg for post-immunisation pyrexia, repeated once after 6 hours if necessary; otherwise under 3 months, see *BNF for Children*;

1. Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances; for details see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)

3 months–1 year 60–120 mg, 1–5 years 120–250 mg, 6–12 years 250–500 mg; these doses may be repeated every 4–6 hours when necessary (max. of 4 doses in 24 hours)

- By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily
- By rectum, ADULT and CHILD over 12 years 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD under 3 months, see *BNF for Children*, 3 months–1 year 60–125 mg, 1–5 years 125–250 mg, 5–12 years 250–500 mg; these doses may be repeated every 4–6 hours as necessary (max. 4 doses in 24 hours)

Note For full Joint Committee on Vaccination and Immunisation recommendation on post-immunisation pyrexia, see section 14.1

Paracetamol (Non-proprietary)

Tablets (and caplets) PoM [1], paracetamol 500 mg. Net price 16 = 17p, 32 = £1.18, 100 = £1.65. Label: 29, 30
Brands include *Panadol*® NHS

Capsules PoM [1], paracetamol 500 mg, net price 32-cap pack = £1.03. Label: 29, 30
Brands include *Panadol Capsules*® NHS

Soluble tablets (= Dispersible tablets) PoM [2], paracetamol 500 mg. Net price 60-tab pack = £3.96. Label: 13, 29, 30
Brands include *Panadol Soluble*® NHS (contains Na^+ 18.6 mmol/tablet)

Paediatric soluble tablets (= Paediatric dispersible tablets), paracetamol 120 mg. Net price 16-tab pack = 89p. Label: 13, 30
Brands include *Disprol*® *Soluble Paracetamol* NHS

Oral suspension 120 mg/5 mL (= Paediatric Mixture), paracetamol 120 mg/5 mL. Net price 100 mL = 42p. Label: 30

Note BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed; sugar-free versions can be ordered by specifying 'sugar-free' on the prescription
Brands include *Calpol*® *Paediatric*, *Calpol*® *Paediatric* sugar-free, *Disprol*® *Paediatric*, *Medinol*® *Paediatric* sugar-free, *Paldesic*®, *Panadol*® sugar-free

Oral suspension 250 mg/5 mL (= Mixture), paracetamol 250 mg/5 mL. Net price 100 mL = 66p. Label: 30
Brands include *Calpol*® *6 Plus* NHS, *Medinol*® *Over 6* NHS, *Paldesic*®

Suppositories, paracetamol 60 mg, net price 10 = £9.96; 125 mg, 10 = £11.50; 250 mg, 10 = £23.00; 500 mg, 10 = £11.17. Label: 30
Brands include *Alvedon*®

Note Other strengths available from 'special-order' manufacturers or specialist importing companies, see p. 969

Dental prescribing on NHS Paracetamol Tablets, Paracetamol Soluble Tablets 500 mg, and Paracetamol Oral Suspension may be prescribed

1. Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances; for details see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)
2. Can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, No. 33, London, Pharmaceutical Press, 2009 (and subsequent editions as available)

Perfalgan® (Bristol-Myers Squibb) ▼ PoM
Intravenous infusion, paracetamol 10 mg/mL, net price 50-mL vial = £1.44, 100-mL vial = £1.59

Co-codamol 8/500

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate **8 mg** and paracetamol **500 mg** should be dispensed.

Co-codamol 8/500 (Non-proprietary) PoM [2]
Tablets, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 30-tab pack = £1.05. Label: 29, 30
Brands include *Panadeine*® NHS

Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD 6–12 years ½–1 tablet, max. 4 tablets daily

Effervescent *or* dispersible tablets, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg). Net price 100-tab pack = £4.62. Label: 13, 29, 30
Brands include *Paracodol*® NHS

Note The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and *vice versa*

Dose 1–2 tablets in water every 4–6 hours, max. 8 tablets daily; CHILD 6–12 years ½–1 tablet, max. 4 tablets daily

Capsules, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg). Net price 10-cap pack = £1.10, 20-cap pack = £1.66. Label: 29, 30
Brands include *Paracodol*® NHS

Dose 1–2 capsules every 4 hours; max. 8 capsules daily

Co-codamol 15/500

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate **8 mg** and paracetamol **500 mg** should be dispensed (see preparations above).

See warnings and notes on p. 233 (**important:** special care in elderly—reduce dose)

Codipar® (Goldshield) PoM
Caplets (= tablets), co-codamol 15/500 (codeine phosphate 15 mg, paracetamol 500 mg). Net price 100-tab pack = £8.25. Label: 2, 29, 30

Dose 1–2 tablets every 4 hours; max. 8 tablets daily; CHILD not recommended

Co-codamol 30/500

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate **8 mg** and on paracetamol **500 mg** should be dispensed (see preparations above).

See warnings and notes on p. 233 (**important:** special care in elderly—reduce dose)

Co-codamol 30/500 (Non-proprietary) PoM
Tablets (and caplets), co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £3.97. Label: 2, 29, 30

Dose 1–2 tablets every 4 hours; max. 8 tablets daily; CHILD not recommended

Capsules, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £5.32. Label: 2, 29, 30
Brands include *Medocodene®*, *Zapain®*
Dose 1–2 capsules every 4 hours; max. 8 capsules daily; CHILD not recommended

Effervescent tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £9.89. Label: 2, 13, 29, 30
Brands include *Medocodene® Effervescent* (contains Na^+ 13.6 mmol/tablet)
Dose 1–2 tablets in water every 4 hours; max. 8 tablets daily; CHILD not recommended

Kapake® (Galen) PoM
Tablets, scored, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 30-tab pack = £2.26 (hosp. only), 100-tab pack = £7.10. Label: 2, 29, 30
Dose 1–2 tablets every 4 hours; max. 8 tablets daily; CHILD not recommended

Capsules, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £7.10. Label: 2, 29, 30
Dose 1–2 capsules every 4 hours; max. 8 capsules daily; CHILD not recommended

Solpadol® (Sanofi-Synthelabo) PoM
Caplets (= tablets), co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Net price 100-tab pack = £6.74. Label: 2, 29, 30
Dose 2 tablets every 4 hours; max. 8 tablets daily; CHILD not recommended

Capsules, grey/purple, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Net price 100-cap pack = £6.74. Label: 2, 29, 30
Dose 1–2 capsules every 4 hours; max. 8 capsules daily; CHILD not recommended

Effervescent tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Contains Na^+ 16.9 mmol/tablet; avoid in *renal impairment*. Net price 32-tab pack = £2.59, 100-tab pack = £8.09. Label: 2, 13, 29, 30
Dose 2 tablets in water every 4 hours; max. 8 tablets daily; CHILD not recommended

Tylex® (UCB Pharma) PoM
Capsules, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Net price 100-cap pack = £8.01. Label: 2, 29, 30
Dose 1–2 capsules every 4 hours; max. 8 capsules daily; CHILD not recommended

Effervescent tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Contains Na^+ 13.6 mmol/tablet; avoid in *renal impairment*. Net price 100-tab pack = £8.80. Label: 2, 13, 29, 30
Excipients include aspartame 25 mg/tablet (section 9.4.1)
Dose 1–2 tablets in water every 4 hours; max. 8 tablets daily; CHILD not recommended

With methionine (co-methiamol)

A mixture of methionine and paracetamol; methionine has no analgesic activity but may prevent paracetamol-induced liver toxicity if overdose taken

Paradote® (Penn)
Tablets, f/c, co-methiamol 100/500 (DL-methionine 100 mg, paracetamol 500 mg). Net price 24-tab pack = £1.05, 96-tab pack = £2.77. Label: 29, 30
Dose 2 tablets every 4 hours; max. 8 tablets daily; CHILD 12 years and under, not recommended

With dihydrocodeine tartrate 10 mg

See notes on p. 233

Co-dydramol (Non-proprietary) PoM
Tablets, scored, co-dydramol 10/500 (dihydrocodeine tartrate 10 mg, paracetamol 500 mg). Net price 30-tab pack = £1.14. Label: 21, 29, 30
Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD not recommended
When co-dydramol tablets are prescribed and no strength is stated tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.
Note Tablets containing paracetamol 500 mg and dihydrocodeine 7.46 mg (*Paramol®* DHS) are on sale to the public. The name *Paramol®* was formerly applied to a brand of co-dydramol tablets

With dihydrocodeine tartrate 20 or 30 mg

See warnings and notes on p. 233 (**important:** special care in elderly—reduce dose)

Remedeine® (Napp) PoM
Tablets, paracetamol 500 mg, dihydrocodeine tartrate 20 mg. Net price 112-tab pack = £10.79. Label: 2, 21, 29, 30
Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD not recommended

Forte tablets, paracetamol 500 mg, dihydrocodeine tartrate 30 mg. Net price 56-tab pack = £6.66. Label: 2, 21, 29, 30
Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD not recommended

With isometheptene mucate

Isometheptene mucate (in combination with paracetamol) is licensed for the treatment of acute attacks of migraine; other more effective treatments are available.

[1]**Midrid®** (Manx) PoM
Capsules, red, isometheptene mucate 65 mg, paracetamol 325 mg. Net price 30-cap pack = £5.50. Label: 30, counselling, dosage
Dose migraine, 2 capsules at onset of attack, followed by 1 capsule every hour if necessary; max. 5 capsules in 12 hours; CHILD not recommended

1. A pack containing 15 capsules may be sold to the public

NEFOPAM HYDROCHLORIDE

Indications moderate pain
Cautions hepatic or renal disease, elderly, urinary retention; pregnancy (Appendix 4) and breast-feeding; **interactions:** Appendix 1 (nefopam)
Contra-indications convulsive disorders; not indicated for myocardial infarction
Side-effects nausea, nervousness, urinary retention, dry mouth, lightheadedness; less frequently vomiting, blurred vision, drowsiness, sweating, insomnia, tachycardia, headache; confusion and hallucinations also reported; may colour urine (pink)
Dose
- By mouth, initially 60 mg (elderly, 30 mg) 3 times daily, adjusted according to response; usual range 30–90 mg 3 times daily; CHILD not recommended

Acupan® (3M) PoM
Tablets, f/c, nefopam hydrochloride 30 mg. Net price 90-tab pack = £9.58. Label: 2, 14

4.7.2 Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness, for guidelines see Prescribing in Palliative Care, p. 15. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Cautions Opioids should be used with caution in patients with impaired respiratory function (avoid in chronic obstructive pulmonary disease) and asthma (avoid during an acute attack), hypotension, shock, myasthenia gravis, prostatic hypertrophy, obstructive or inflammatory bowel disorders, diseases of the biliary tract, and convulsive disorders. A reduced dose is recommended in elderly or debilitated patients, in hepatic impairment (avoid if severe; Appendix 2) and renal impairment (avoid if severe; Appendix 3), in hypothyroidism, and in adrenocortical insufficiency. Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence. Avoid abrupt withdrawal after long-term treatment. Transdermal preparations (fentanyl or buprenorphine patches) are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. For prescribing in pregnancy and breast-feeding, see Appendix 4 and Appendix 5, respectively. **Interactions**: Appendix 1 (opioid analgesics; **important:** special hazard with *pethidine and possibly other opioids* and MAOIs).

Palliative care In the control of pain in terminal illness, the cautions listed above should not necessarily be a deterrent to the use of opioid analgesics.

Contra-indications Opioid analgesics should be avoided in patients with acute respiratory depression and when there is a risk of paralytic ileus. They are also contra-indicated in conditions associated with raised intracranial pressure and in head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment). Comatose patients should not be treated with opioid analgesics.

Side-effects Opioid analgesics share many side-effects, although qualitative and quantitative differences exist. The most common side-effects include nausea and vomiting (particularly in initial stages), constipation, dry mouth, and biliary spasm; larger doses produce muscle rigidity, hypotension, and respiratory depression (for reversal of opioid-induced respiratory depression, see section 15.1.7). Other common side-effects of opioid analgesics include bradycardia, tachycardia, palpitation, oedema, postural hypotension, hallucinations, vertigo, euphoria, dysphoria, mood changes, dependence, dizziness, confusion, drowsiness, sleep disturbances, headache, sexual dysfunction, difficulty with micturition, urinary retention, ureteric spasm, miosis, visual disturbances, sweating, flushing, rash, urticaria, and pruritus. **Overdosage**: see Emergency Treatment of Poisoning, p. 31.

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Choice **Morphine** remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of *severe pain in palliative care*. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations). For guidelines on dosage adjustment in palliative care, see p. 15 .

A modified-release epidural preparation of morphine is available from Flynn Pharma Ltd (*Depodur®*).

Buprenorphine has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone.

Codeine is used for the relief of mild to moderate pain but is too constipating for long-term use.

Diphenoxylate (in combination with atropine, as co-phenotrope) is used in acute diarrhoea (section 1.4.2).

Dipipanone used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Dihydrocodeine has an analgesic efficacy similar to that of codeine. The dose of dihydrocodeine by mouth is usually 30 mg every 4 hours; doubling the dose to 60 mg may provide some additional pain relief but this may be at the cost of more nausea and vomiting. A 40-mg tablet is now also available.

Alfentanil, **fentanyl** and **remifentanil** are used by injection for intra-operative analgesia (section 15.1.4.3); fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Meptazinol is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Methadone is less sedating than morphine and acts for longer periods. In prolonged use, methadone should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of *pain in palliative care*.

Papaveretum is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine or codeine, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine, are often preferred for obstetric pain.

Tramadol produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Dose The dose of opioids in the BNF may need to be **adjusted individually** according to the degree of analgesia and side-effects; patients' response to opioids varies widely.

Postoperative analgesia The use of intra-operative opioids affects the prescribing of postoperative analgesics and in many cases delays the need for a postoperative analgesic. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression (for the treatment of opioid-induced respiratory depression, see section 15.1.7). Non-opioid analgesics are also used for postoperative pain (section 15.1.4.2).

Morphine is used most widely. **Tramadol** is not as effective in severe pain as other opioid analgesics. **Buprenorphine** may antagonise the analgesic effect of previously administered opioids and is generally not recommended. **Pethidine** is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

For details of patient-controlled analgesia (PCA) to relieve postoperative pain, consult hospital protocols. Formulations specifically designed for PCA are available (*Pharma-Ject® Morphine Sulphate*).

Dental and orofacial pain Opioid analgesics are **relatively ineffective** in dental pain. Like other opioids, **dihydrocodeine** often causes nausea and vomiting which limits its value in dental pain; if taken for more than a few doses it is also liable to cause constipation. Dihydrocodeine is not very effective in postoperative dental pain.

Pethidine can be taken by mouth, but for optimal effect, it needs to be given by injection. Its efficacy in postoperative dental pain is not proven and its use in dentistry is likely to be minimal. The side-effects of pethidine are similar to those of dihydrocodeine and, apart from constipation, pethidine is also more likely to cause them. Dependence is unlikely if very few tablets are prescribed on very few occasions; nevertheless, dental surgeons need to be aware of the possibility that addicts may seek to acquire supplies.

For the management of dental and orofacial pain, see p. 232.

Addicts Although caution is necessary, addicts (and ex-addicts) may be treated with analgesics in the same way as other people when there is a real clinical need. Doctors do not require a special licence to prescribe opioid analgesics for addicts for relief of pain due to organic disease or injury.

BUPRENORPHINE

Indications see under Dose and under Patches; opioid dependence (section 4.10)

Cautions see notes above; also impaired consciousness; effects only partially reversed by naloxone

Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

Contra-indications see notes above

Side-effects see notes above; can induce mild withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, anorexia, dyspepsia; vasodilatation; dyspnoea; paraesthesia, asthenia, fatigue, agitation, anxiety; *less commonly* flatulence, taste disturbance, angina, hypertension, syncope, hypoxia, wheezing, cough, restlessness, depersonalisation, dysarthria, impaired memory, hypoaesthesia, tremor, influenza-like symptoms, pyrexia, rhinitis, rigors, muscle cramp, myalgia, tinnitus, dry eye, and dry skin; *rarely* paralytic ileus, dysphagia, impaired concentration, and psychosis; *very rarely* retching, hyperventilation, hiccups, and muscle fasciculation

Dose

- Moderate to severe pain, by sublingual administration, 200–400 micrograms every 6–8 hours; CHILD over 6 years, 16–25 kg, 100 micrograms every 6–8 hours; 25–37.5 kg, 100–200 micrograms every 6–8 hours; 37.5–50 kg, 200–300 micrograms every 6–8 hours

  By intramuscular *or* slow intravenous injection, 300–600 micrograms every 6–8 hours; CHILD over 6 months 3–6 micrograms/kg every 6–8 hours (max. 9 micrograms/kg)
- Premedication, by sublingual administration, 400 micrograms

  By intramuscular injection, 300 micrograms
- Intra-operative analgesia, by slow intravenous injection, 300–450 micrograms

Temgesic® (Schering-Plough) CD

Tablets (sublingual), buprenorphine (as hydrochloride), 200 micrograms, net price 50-tab pack = £5.23; 400 micrograms, 50-tab pack = £10.46. Label: 2, 26

Injection, buprenorphine (as hydrochloride) 300 micrograms/mL, net price 1-mL amp = 48p

Patches

BuTrans® (Napp) CD

Patches, self-adhesive, beige, buprenorphine, '5' patch (releasing 5 micrograms/hour for 7 days), net price 2 = £8.80; '10' patch (releasing 10 micrograms/

hour for 7 days), 4 = £32.02; '20' patch (releasing 20 micrograms/hour for 7 days), 4 = £58.31. Label: 2

Dose moderate, non-malignant pain unresponsive to non-opioid analgesics, ADULT over 18 years, initially one '5 micrograms/hour' patch; apply to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks)

Dose adjustment When starting, analgesic effect should **not** be evaluated until the system has been worn for **72 hours** (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at 3-day intervals using a patch of the next strength or 2 patches of the same strength (applied at *same time* to avoid confusion). Max. 2 patches can be used at any one time

Long duration of action In view of the long duration of action, other opioids should not be administered within 24 hours of patch removal

Transtec® (Napp) CD

Patches, self-adhesive, skin-coloured, buprenorphine, '35' patch (releasing 35 micrograms/hour for 96 hours), net price 4 = £16.03; '52.5' patch (releasing 52.5 micrograms/hour for 96 hours), 4 = £24.06; '70' patch (releasing 70 micrograms/hour for 96 hours), 4 = £32.06. Label: 2

Dose moderate to severe chronic cancer pain and severe pain unresponsive to non-opioid analgesics, ADULT over 18 years, apply to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days). Patients who have not previously received strong opioid analgesic, initially, one '35 micrograms/hour' patch replaced after no longer than 96 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature

Dose adjustment When starting, analgesic effect should **not** be evaluated until the system has been worn for **24 hours** (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength *or* using 2 patches of the same strength (applied at *same time* to avoid confusion). Max. 2 patches can be used at any one time. For breakthrough pain, consider 200–400 micrograms buprenorphine sublingually. **Important:** it may take approx. 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed

Long duration of action In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch

CODEINE PHOSPHATE

Indications mild to moderate pain; diarrhoea (section 1.4.2); cough suppression (section 3.9.1)

Cautions see notes above; also cardiac arrhythmias; acute abdomen; gallstones

Variation in metabolism The capacity to metabolise codeine can vary considerably and lead to either reduced therapeutic effect or marked increase in side-effects

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, anorexia, seizures, malaise, hypothermia, and muscle fasciculation; pancreatitis also reported

Dose

- By mouth, 30–60 mg every 4 hours when necessary, to a max. of 240 mg daily; CHILD 1–12 years, 3 mg/kg daily in divided doses
- By intramuscular injection, 30–60 mg every 4 hours when necessary

Codeine Phosphate (Non-proprietary)

Tablets PoM, codeine phosphate 15 mg, net price 28 = £1.08; 30 mg, 28 = £1.19; 60 mg, 28 = £1.73. Label: 2

Syrup PoM, codeine phosphate 25 mg/5 mL. Net price 100 mL = 90p. Label: 2

Injection CD, codeine phosphate 60 mg/mL. Net price 1-mL amp = £2.44

Linctus

Section 3.9.1

DIAMORPHINE HYDROCHLORIDE

(Heroin Hydrochloride)

Indications see under Dose

Cautions see notes above; also severe diarrhoea; toxic psychosis, CNS depression; severe cor pulmonale

Contra-indications see notes above; also delayed gastric emptying; phaeochromocytoma

Side-effects see notes above; also anorexia, taste disturbance; syncope; asthenia, raised intracranial pressure; myocardial infarction also reported

Dose

- Acute pain, by subcutaneous *or* intramuscular injection, 5 mg repeated every 4 hours if necessary (up to 10 mg for heavier well-muscled patients); by slow intravenous injection, quarter to half corresponding intramuscular dose
- Myocardial infarction, by slow intravenous injection (1–2 mg/minute), 5 mg followed by a further 2.5–5 mg if necessary; elderly or frail patients, reduce dose by half
- Acute pulmonary oedema, by slow intravenous injection (1 mg/minute) 2.5–5 mg
- Chronic pain, by mouth *or* by subcutaneous *or* intramuscular injection, 5–10 mg regularly every 4 hours; dose may be increased according to needs; intramuscular dose should be approx. half corresponding oral dose, and approx. one third corresponding oral *morphine* dose—see also Prescribing in Palliative Care, p. 15; by subcutaneous infusion (using syringe driver), see Prescribing in Palliative Care, p. 18

Diamorphine (Non-proprietary) CD

Tablets, diamorphine hydrochloride 10 mg. Net price 100-tab pack = £14.65. Label: 2

Injection, powder for reconstitution, diamorphine hydrochloride. Net price 5-mg amp = £2.69, 10-mg amp = £3.37, 30-mg amp = £3.60, 100-mg amp = £9.80, 500-mg amp = £42.91

DIHYDROCODEINE TARTRATE

Indications moderate to severe pain

Cautions see notes above; also pancreatitis; severe cor pulmonale

Contra-indications see notes above

Side-effects see notes above; also paralytic ileus, abdominal pain, and paraesthesia

Dose

- By mouth, 30 mg every 4–6 hours when necessary (see also notes above); CHILD over 4 years 0.5–1 mg/kg every 4–6 hours
- By deep subcutaneous *or* intramuscular injection, up to 50 mg repeated every 4–6 hours if necessary; CHILD over 4 years 0.5–1 mg/kg every 4–6 hours

Dihydrocodeine (Non-proprietary)

Tablets PoM, dihydrocodeine tartrate 30 mg. Net price 28 = £1.49. Label: 2, 21

Dental prescribing on NHS Dihydrocodeine Tablets 30 mg may be prescribed

Oral solution PoM, dihydrocodeine tartrate 10 mg/5 mL. Net price 150 mL = £3.08. Label: 2, 21

Injection CD, dihydrocodeine tartrate 50 mg/mL. Net price 1-mL amp = £2.58

DF118 Forte® (Martindale) PoM

Tablets, dihydrocodeine tartrate 40 mg. Net price 100-tab pack = £11.51. Label: 2, 21

Dose ADULT and CHILD over 12 years, severe pain, 40–80 mg 3 times daily; max. 240 mg daily

Modified release

DHC Continus® (Napp) PoM

Tablets, m/r, dihydrocodeine tartrate 60 mg, net price 56-tab pack = £5.28; 90 mg, 56-tab pack = £8.66; 120 mg, 56-tab pack = £11.11. Label: 2, 25

Dose ADULT and CHILD over 12 years, chronic severe pain, 60–120 mg every 12 hours

Note Dihydrocodeine is an ingredient of some compound analgesic preparations, section 4.7.1

DIPIPANONE HYDROCHLORIDE

Indications moderate to severe pain

Cautions see notes above; also diabetes mellitus; phaeochromocytoma

Contra-indications see notes above

Side-effects see notes above; also psychosis, restlessness, raised intracranial pressure

Dose

- See preparation below

Diconal® (Amdipharm) CD

Tablets, pink, scored, dipipanone hydrochloride 10 mg, cyclizine hydrochloride 30 mg. Net price 50-tab pack = £9.57. Label: 2

Dose *acute pain*, 1 tablet gradually increased to 3 tablets every 6 hours; CHILD not recommended

Caution **Not recommended** in palliative care, see Nausea and Vomiting, p. 18

FENTANYL

Indications severe chronic pain, breakthrough pain; parenteral indications (section 15.1.4.3)

Cautions see notes above; also diabetes mellitus, impaired consciousness, cerebral tumour

Transdermal fentanyl

Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

Respiratory depression Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, anorexia, dyspepsia, dysphagia, mouth ulceration, taste disturbance, dry mouth; vasodilatation; apnoea; anxiety; myoclonus; *less commonly* flatulence, diarrhoea, laryngospasm, dyspnoea, hypoventilation, depersonalisation, dysarthria, amnesia, incoordination, paraesthesia, malaise, agitation, tremor, thirst and muscle weakness; *rarely* hiccups and arrhythmia; *very rarely* paralytic ileus, haemoptysis, psychosis, and seizures; shock, asystole, pyrexia, ataxia, and muscle fasciculation also reported

Dose

- Chronic intractable pain, by transdermal route, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days). ADULT over 16 years **not currently treated** with a strong opioid analgesic (but see Cautions), initial dose, one '12' or '25 micrograms/hour' patch replaced after 72 hours; ADULT and CHILD over 2 years **currently treated** with a strong opioid analgesic, initial dose based on previous 24-hour opioid requirement (consult product literature)

  Dose adjustment When starting, evaluation of the analgesic effect should **not** be made before the system has been worn for **24 hours** (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application; if necessary dose should be adjusted at 72-hour intervals in steps of 12–25 micrograms/hour. More than one patch may be used at a time for doses greater than 100 micrograms/hour (but applied at the *same time* to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (**important:** it may take up to 25 hours for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually).

  Long duration of action In view of the long duration of action, patients who have had severe side-effects should be monitored for up to 24 hours after patch removal

- Breakthrough pain, see under oral preparations

Conversion (from oral morphine to transdermal fentanyl) see Prescribing in Palliative Care, p. 16

Tablets

Abstral® (ProStrakan) ▼ CD

Tablets (sublingual), fentanyl (as citrate) 100 micrograms, net price 10-tab pack = £49.99, 30-tab pack = £149.70; 200 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70; 300 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70; 400 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70; 600 micrograms, 30-tab pack = £149.70. Label: 2, 26

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 100 micrograms repeated if necessary after 15–30 minutes; adjust dose according to response; no more than 2 dose units, 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain

Note If more than 4 episodes of breakthrough pain each day, adjust background analgesia

The *Scottish Medicines Consortium* (p. 3) has advised (January 2009) that *Abstral®* sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable

Effentora® (Cephalon) ▼ CD

Tablets (buccal), fentanyl (as citrate) 100 micrograms, net price 4-tab pack = £20.56; 200 micrograms, 4-tab pack = £20.56; 400 micrograms, 4-tab pack = £20.56; 600 micrograms, 4-tab pack = £20.56; 800 micrograms, 4-tab pack = £20.56. Label: 2, counselling, administration

Electrolytes Na^+ 0.35 mmol/100 microgram tablet, Na^+ 0.70 mmol/tablet (all other strengths)

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 100 micrograms repeated if necessary 30 minutes after first dose (no more than 2 dose units for each pain episode); adjust dose according to response; max. 800 micrograms per episode of breakthrough pain;

leave at least 4 hours between treatment of episodes of breakthrough pain during titration

Counselling Place tablet between cheek and gum above upper molar and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth

The *Scottish Medicines Consortium* (p. 3) has advised that *Effentora®* buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable

Lozenges

Actiq® (Cephalon) CD

Lozenge (buccal), with oromucosal applicator, fentanyl (as citrate) 200 micrograms, net price 3 = £17.86, 30 = £178.55; 400 micrograms, 3 = £17.86, 30 = £178.55; 600 micrograms, 3 = £17.86, 30 = £178.55; 800 micrograms, 3 = £17.86, 30 = £178.55; 1.2 mg, 3 = £17.86, 30 = £178.55; 1.6 mg, 3 = £17.86, 30 = £178.55. Label: 2

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, initially 200 micrograms (over 15 minutes) repeated if necessary 15 minutes after first dose (no more than 2 dose units for each pain episode); adjust dose according to response; max. 4 dose units daily

Note If more than 4 episodes of breakthrough pain each day, adjust background analgesia

Patches

Prescriptions Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write '*Fentanyl 25 patches*' to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. '*one patch to be applied every 72 hours*'. The total quantity of patches to be supplied should be written in words and figures.

Fentanyl (Non-proprietary) CD

Patches, self-adhesive, fentanyl, '12' patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £18.11; '25' patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £25.89; '50' patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £48.36; '75' patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £67.41; '100' patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £83.09. Label: 2, counselling, administration

Brands include *Fentalis®*, *Matrifen®*, *Mezolar®*, *Osmanil®*, *Tilofyl®*, *Victanyl®*

Durogesic DTrans® (Janssen-Cilag) CD

Patches, self-adhesive, transparent, fentanyl, '12' patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £18.11; '25' patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £25.89; '50' patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £48.36; '75' patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £67.41; '100' patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £83.09. Label: 2, counselling, administration

HYDROMORPHONE HYDROCHLORIDE

Indications severe pain in cancer

Cautions see notes above; also pancreatitis; toxic psychosis

Contra-indications see notes above; also acute abdomen

Side-effects see notes above; also paralytic ileus, peripheral oedema, seizures, asthenia, dyskinesia, agitation, and tremor

Dose

- See under preparations below

Palladone® (Napp) CD

Capsules, hydromorphone hydrochloride 1.3 mg (orange/clear), net price 56-cap pack = £8.82; 2.6 mg (red/clear), 56-cap pack = £17.64. Label: 2, counselling, see below

Dose 1.3 mg every 4 hours, increased if necessary according to severity of pain; CHILD under 12 years not recommended

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Modified release

Palladone® SR (Napp) CD

Capsules, m/r, hydromorphone hydrochloride 2 mg (yellow/clear), net price 56-cap pack = £20.98; 4 mg (pale blue/clear), 56-cap pack = £28.75; 8 mg (pink/clear), 56-cap pack = £56.08; 16 mg (brown/clear), 56-cap pack = £106.53; 24 mg (dark blue/clear), 56-cap pack = £159.82. Label: 2, counselling, see below

Dose 4 mg every 12 hours, increased if necessary according to severity of pain; CHILD under 12 years not recommended

Counselling Swallow whole or open capsule and sprinkle contents on soft food

MEPTAZINOL

Indications moderate to severe pain, including postoperative and obstetric pain and renal colic; perioperative analgesia, section 15.1.4.3

Cautions see notes above; effects only partially reversed by naloxone

Contra-indications see notes above; also myocardial infarction; phaeochromocytoma

Side-effects see notes above; can induce withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, dyspepsia, and hypothermia

Dose

- By mouth, 200 mg every 3–6 hours as required; CHILD not recommended
- By intramuscular injection, 75–100 mg every 2–4 hours if necessary; obstetric analgesia, 100–150 mg according to patient's weight (2 mg/kg); CHILD not recommended
- By slow intravenous injection, 50–100 mg every 2–4 hours if necessary; CHILD not recommended

Meptid® (Almirall) PoM

Tablets, orange, f/c, meptazinol 200 mg, net price 112-tab pack = £22.11. Label: 2

Injection, meptazinol 100 mg (as hydrochloride)/mL, net price 1-mL amp = £1.92

METHADONE HYDROCHLORIDE

Indications severe pain, see notes above; cough in terminal disease (section 3.9.1); adjunct in treatment of opioid dependence (section 4.10)

Cautions see notes above; also history of cardiac conduction abnormalities, family history of sudden

death (ECG monitoring recommended; see also QT Interval Prolongation, below)

QT interval prolongation The CHM has recommended that patients with the following risk factors for QT interval prolongation are carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored

Contra-indications see notes above; also phaeochromocytoma

Side-effects see notes above; also QT interval prolongation, torsade de pointes, hypothermia, restlessness, raised intracranial pressure, dysmenorrhoea, dry eyes, and hyperprolactinaemia

Dose

- By mouth *or* by subcutaneous *or* intramuscular injection, 5–10 mg every 6–8 hours, adjusted according to response; on prolonged use not to be given more frequently than every 12 hours; CHILD not recommended

Methadone (Non-proprietary) CD

Tablets, methadone hydrochloride 5 mg. Net price 50 = £2.88. Label: 2

Brands include *Physeptone®*

Injection ▼, methadone hydrochloride, 10 mg/mL, net price 1-mL amp = 90p, 2-mL amp = £1.51, 3.5-mL amp = £1.90, 5-mL amp = £2.05

Brands include *Physeptone®*, *Synastone®*

Linctus

Section 3.9.1

Oral solution and oral concentrate

Section 4.10

MORPHINE SALTS

Indications see notes above and under Dose; acute diarrhoea (section 1.4.2); cough in terminal care (section 3.9.1)

Cautions see notes above; also pancreatitis, cardiac arrhythmias, severe cor pulmonale

Contra-indications see notes above; also delayed gastric emptying, acute abdomen; heart failure secondary to chronic lung disease; phaeochromocytoma

Side-effects see notes above; also paralytic ileus, abdominal pain, anorexia, dyspepsia, exacerbation of pancreatitis, taste disturbance; hypertension, hypothermia, syncope, bronchospasm, inhibition of cough reflex; restlessness, seizures, paraesthesia, asthenia, malaise, disorientation, excitation, agitation, delirium, raised intracranial pressure; amenorrhoea, myoclonus, muscle fasciculation, and rhabdomyolysis

Dose

The patient should be closely monitored for pain relief as well as for side-effects especially respiratory depression. See also notes above.

- Acute pain, by subcutaneous injection (not suitable for oedematous patients) *or* by intramuscular injection, initially 10 mg (ELDERLY or frail 5 mg) every 4 hours (or more frequently during titration), adjusted according to response; NEONATE initially 100 micrograms/kg every 6 hours, adjusted according to response; CHILD 1–6 months initially 100–200 micrograms/kg every 6 hours, adjusted according to response; CHILD 6 months–2 years initially 100–200 micrograms/kg every 4 hours, adjusted according to response; CHILD 2–12 years initially 200 micrograms/kg every 4 hours, adjusted according to response; CHILD 12–18 years initially 2.5–10 mg every 4 hours, adjusted according to response

  By slow intravenous injection, initially 2.5 mg (reduce dose in ELDERLY or frail) every 4 hours (or more frequently during titration), adjusted according to response; NEONATE initially 40–100 micrograms/kg every 6 hours, adjusted according to response; CHILD 1–6 months initially 100–200 micrograms/kg every 6 hours, adjusted according to response; CHILD 6 months–12 years initially 100–200 micrograms/kg every 4 hours, adjusted according to response
- Premedication, by subcutaneous *or* intramuscular injection, up to 10 mg 60–90 minutes before operation; CHILD, by intramuscular injection, 150 micrograms/kg
- Patient controlled analgesia (PCA), consult hospital protocols
- Myocardial infarction, by slow intravenous injection (2 mg/minute), 10 mg followed by a further 5–10 mg if necessary; ELDERLY or frail patients, reduce dose by half
- Acute pulmonary oedema, by slow intravenous injection (2 mg/minute) 5–10 mg; ELDERLY or frail patients, reduce dose by half
- Chronic pain, by mouth *or* by subcutaneous injection (not suitable for oedematous patients) *or* by intramuscular injection, initially 5–20 mg every 4 hours, adjusted according to response; see also Prescribing in Palliative Care, p. 15

  By rectum, initially 15–30 mg every 4 hours, adjusted according to response

Note The doses stated above refer equally to morphine hydrochloride and sulphate

Oral solutions

Note For advice on transfer from oral solutions of morphine to modified-release preparations of morphine, see Prescribing in Palliative Care, p. 15

Morphine Oral Solutions

PoM or CD

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg
Chloroform water to 5 mL

Note The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes CD. For sample prescription see Controlled Drugs and Drug Dependence, p. 7. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oramorph® (Boehringer Ingelheim)

Oramorph® oral solution PoM, morphine sulphate 10 mg/5 mL. Net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

Oramorph® concentrated oral solution CD, sugar-free, morphine sulphate 100 mg/5 mL. Net price 30-mL pack = £4.98; 120-mL pack = £18.59 (both with calibrated dropper). Label: 2

Tablets

Sevredol® (Napp) CD

Tablets, f/c, scored, morphine sulphate 10 mg (blue), net price 56-tab pack = £5.61; 20 mg (pink), 56-tab pack = £11.21; 50 mg (pale green), 56-tab pack = £28.02. Label: 2

Modified-release 12-hourly oral preparations

Morphgesic® SR (Amdipharm) CD

Tablets, m/r, f/c, morphine sulphate 10 mg (buff), net price 60-tab pack = £3.91; 30 mg (violet), 60-tab pack = £9.37; 60 mg (orange), 60-tab pack = £18.30; 100 mg (grey), 60-tab pack = £28.98. Label: 2, 25

Dose every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Note Prescriptions must also specify 'tablets' (i.e. Morphgesic SR tablets)

MST Continus® (Napp) CD

Tablets, m/r, f/c, morphine sulphate 5 mg (white), net price 60-tab pack = £3.29; 10 mg (brown), 60-tab pack = £5.26; 15 mg (green), 60-tab pack = £9.61; 30 mg (purple), 60-tab pack = £12.65; 60 mg (orange), 60-tab pack = £24.68; 100 mg (grey), 60-tab pack = £39.07; 200 mg (green), 60-tab pack = £78.16. Label: 2, 25

Suspension (= sachet of granules to mix with water), m/r, pink, morphine sulphate 20 mg/sachet, net price 30-sachet pack = £24.58; 30 mg/sachet, 30-sachet pack = £25.54; 60 mg/sachet, 30-sachet pack = £51.09; 100 mg/sachet, 30-sachet pack = £85.15; 200 mg/sachet pack, 30-sachet pack = £170.30. Label: 2, 13

Dose every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Note Prescriptions must also specify 'tablets' or 'suspension' (i.e. 'MST Continus tablets' or 'MST Continus suspension')

Zomorph® (Link) CD

Capsules, m/r, morphine sulphate 10 mg (yellow/clear enclosing pale yellow pellets), net price 60-cap pack = £4.08; 30 mg (pink/clear enclosing pale yellow pellets), 60-cap pack = £9.77; 60 mg (orange/clear enclosing pale yellow pellets), 60-cap pack = £19.06; 100 mg (white/clear enclosing pale yellow pellets), 60-cap pack = £30.18; 200 mg (clear enclosing pale yellow pellets), 60-cap pack = £60.35. Label: 2, counselling, see below

Dose every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining doses, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Note Prescriptions must also specify 'capsules' (i.e. 'Zomorph capsules')

Modified-release 24-hourly oral preparations

MXL® (Napp) CD

Capsules, m/r, morphine sulphate 30 mg (light blue), net price 28-cap pack = £10.91; 60 mg (brown), 28-cap pack = £14.95; 90 mg (pink), 28-cap pack = £22.04; 120 mg (green), 28-cap pack = £29.15; 150 mg (blue), 28-cap pack = £36.43; 200 mg (red-brown), 28-cap pack = £46.15. Label: 2, counselling, see below

Dose every 24 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Note Prescriptions must also specify 'capsules' (i.e. 'MXL capsules')

Suppositories

Morphine (Non-proprietary) CD

Suppositories, morphine hydrochloride or sulphate 10 mg, net price 12 = £8.69; 15 mg, 12 = £8.50; 20 mg, 12 = £33.22; 30 mg, 12 = £12.36. Label: 2

Available from Aurum, Martindale

Note Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber

Injections

Morphine Sulphate (Non-proprietary) CD

Injection, morphine sulphate 10, 15, 20, and 30 mg/mL, net price 1- and 2-mL amp (all) = 72p–£1.40

Intravenous infusion, morphine sulphate 1 mg/mL, net price 50-mL vial = £5.00; 2 mg/mL, 50-mL vial = £5.89

Minijet® Morphine Sulphate (UCB Pharma) CD

Injection, morphine sulphate 1 mg/mL, net price 10-mL disposable syringe = £8.34

Injection with antiemetic

Caution In myocardial infarction cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids, section 4.6. **Not recommended** in palliative care, see Nausea and Vomiting, p. 17

Cyclimorph® (Amdipharm) CD

Cyclimorph-10® Injection, morphine tartrate 10 mg, cyclizine tartrate 50 mg/mL. Net price 1-mL amp = £1.75

Dose ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more often than every 4 hours; max. 3 doses in any 24-hour period

Cyclimorph-15® Injection, morphine tartrate 15 mg, cyclizine tartrate 50 mg/mL. Net price 1-mL amp = £1.82

Dose ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more often than every 4 hours; max. 3 doses in any 24-hour period

OXYCODONE HYDROCHLORIDE

Indications moderate to severe pain in patients with cancer; postoperative pain; severe pain

Cautions see notes above; also toxic psychosis; pancreatitis

Contra-indications see notes above; also acute abdomen; delayed gastric emptying; chronic constipation; cor pulmonale; acute porphyria (section 9.8.2)

Side-effects see notes above; also diarrhoea, abdominal pain, anorexia, dyspepsia; bronchospasm, dyspnoea, impaired cough reflex; asthenia, anxiety; chills; muscle fasciculation; *less commonly* paralytic ileus, gastritis, flatulence, dysphagia, taste disturbance, belching, hiccups, vasodilatation, supraventricular tachycardia, syncope, amnesia, hypoaesthesia, restlessness, seizures, pyrexia, amenorrhoea, hypotonia, paraesthesia, disorientation, malaise, agitation, speech disorder, tremor, and dry skin

Dose

- By mouth, initially 5 mg every 4–6 hours, increased if necessary according to severity of pain, usual max. 400 mg daily, but some patients may require

higher doses; CHILD under 18 years, see *BNF for Children*

- By slow intravenous injection, 1–10 mg every 4 hours when necessary; CHILD under 18 years, not recommended
- By intravenous infusion, initially 2 mg/hour, adjusted according to response; CHILD under 18 years not recommended
- By subcutaneous injection, initially 5 mg every 4 hours when necessary; CHILD under 18 years, not recommended
- By subcutaneous infusion, initially 7.5 mg/24 hours adjusted according to response; CHILD under 18 years, not recommended
- Patient controlled analgesia (PCA), consult hospital protocols

Note 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone

OxyNorm® (Napp) CD

Capsules, oxycodone hydrochloride 5 mg (orange/beige), net price 56-cap pack = £11.59; 10 mg (white/beige), 56-cap pack = £23.19; 20 mg (pink/beige), 56-cap pack = £46.38. Label: 2

Liquid (= oral solution), sugar-free, oxycodone hydrochloride 5 mg/5 mL, net price 250 mL = £9.85. Label: 2

Concentrate (= concentrated oral solution), sugar-free, oxycodone hydrochloride 10 mg/mL, net price 120 mL = £47.32. Label: 2

Injection, oxycodone hydrochloride 10 mg/mL, net price 1-mL amp = £1.60, 2-mL amp = £3.20

Note The *Scottish Medicines Consortium* has advised (October 2004) that *OxyNorm®* injection is used only in patients with cancer who have difficulty in tolerating morphine or diamorphine

Modified release

OxyContin® (Napp) CD

Tablets, f/c, m/r, oxycodone hydrochloride 5 mg (blue), net price 28-tab pack = £12.71; 10 mg (white), 56-tab pack = £25.41; 20 mg (pink), 56-tab pack = £50.82; 40 mg (yellow), 56-tab pack = £101.67; 80 mg (green), 56-tab pack = £203.35. Label: 2, 25

Dose initially, 10 mg every 12 hours, increased if necessary according to severity of pain, usual max. 200 mg every 12 hours, but some patients may require higher doses; CHILD under 18 years, see *BNF for Children*

With naloxone

Targinact® (Napp) ▼ CD

Tablets 10 mg/5 mg, f/c, m/r, oxycodone hydrochloride 10 mg, naloxone hydrochloride 5 mg (white), net price 56-tab pack = £35.11. Label: 2, 25

Tablets 20 mg/10 mg, f/c, m/r, oxycodone hydrochloride 20 mg, naloxone hydrochloride 10 mg (pink), net price 56-tab pack = £70.22. Label: 2, 25

Dose severe pain responsive only to opioid analgesics, ADULT over 18 years not currently treated with opioid analgesics, initially 10 mg/5 mg every 12 hours, increased according to response; patients already receiving opioid analgesics may start with 20 mg/10 mg every 12 hours; max. *Targinact®* 20 mg/10 mg every 12 hours

Note Supplemental modified-release oxycodone (without naloxone) can be prescribed for patients that need higher doses—consult product literature

The *Scottish Medicines Consortium* (p. 3) has advised (February 2009) that *Targinact®* is **not** recommended for use within NHS Scotland

PAPAVERETUM

Important Do **not** confuse with papaverine (section 7.4.5)

A mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride

The CSM has advised that to avoid confusion the figures of 7.7 mg/ml or 15.4 mg/ml should be used for prescribing purposes

Indications premedication; enhancement of anaesthesia (but see section 15.1.4.3); postoperative analgesia; severe chronic pain

Cautions see notes above; supraventricular tachycardia

Contra-indications see notes above; heart failure secondary to chronic lung disease; phaeochromocytoma

Side-effects see notes above; also hypothermia

Dose

- By subcutaneous, intramuscular, *or* intravenous injection, 7.7–15.4 mg repeated every 4 hours if necessary (ELDERLY initially 7.7 mg); CHILD up to 1 month 115 micrograms/kg, 1–12 months 154 micrograms/kg, 1–5 years 1.93–3.85 mg, 6–12 years, 3.85–7.7 mg

Intravenous dose In general the intravenous dose should be 25–50% of the corresponding subcutaneous or intramuscular dose

Papaveretum (Non-proprietary) CD

Injection, papaveretum 15.4 mg/mL (providing the equivalent of 10 mg of anhydrous morphine/mL), net price 1-mL amp = £1.64

Note The name *Omnopon®* was formerly used for papaveretum preparations

With hyoscine

Papaveretum and Hyoscine Injection (Non-proprietary) CD

Injection, papaveretum 15.4 mg (providing the equivalent of 10 mg of anhydrous morphine), hyoscine hydrobromide 400 micrograms/mL. Net price 1-mL amp = £3.57

Dose premedication, by subcutaneous or intramuscular injection, 0.5–1 mL

With aspirin

Section 4.7.1

PENTAZOCINE

Indications moderate to severe pain, but see notes above

Cautions see notes above; also pancreatitis, arterial or pulmonary hypertension, cardiac arrhythmias, myocardial infarction, phaeochromocytoma; effects only partially reversed by naloxone

Contra-indications see notes above; patients dependent on opioids (can precipitate withdrawal); heart failure secondary to chronic lung disease; acute porphyria (section 9.8.2)

Side-effects see notes above; also abdominal pain, hypertension, syncope, seizures, paraesthesia, tremor, raised intracranial pressure, disorientation, hypothermia, chills, blood disorders, myalgia, and toxic epidermal necrolysis

Dose

- By mouth, pentazocine hydrochloride 50 mg every 3–4 hours preferably after food (range 25–100 mg); max. 600 mg daily; CHILD 6–12 years 25 mg

- By subcutaneous, intramuscular, or intravenous injection, moderate pain, pentazocine 30 mg, severe pain 45–60 mg every 3–4 hours when necessary; CHILD over 1 year, by subcutaneous *or* intramuscular injection, up to 1 mg/kg, by intravenous injection up to 500 micrograms/kg

Pentazocine (Non-proprietary) CD

Capsules, pentazocine hydrochloride 50 mg. Net price 28-cap pack = £13.84. Label: 2, 21
Brands include *Fortral®* NHS

Tablets, pentazocine hydrochloride 25 mg. Net price 28-tab pack = £11.99. Label: 2, 21
Brands include *Fortral®* NHS

Injection, pentazocine 30 mg (as lactate)/mL. Net price 1-mL amp = £1.67; 2-mL amp = £3.21
Brands include *Fortral®* NHS

PETHIDINE HYDROCHLORIDE

Indications moderate to severe pain, obstetric analgesia; peri-operative analgesia

Cautions see notes above; not suitable for severe continuing pain; accumulation of metabolites may result in neurotoxicity; cardiac arrhythmias, severe cor pulmonale

Contra-indications see notes above; phaeochromocytoma

Side-effects see notes above; also restlessness and hypothermia; convulsions reported in **overdosage**

Dose

- Acute pain, by mouth, 50–150 mg every 4 hours; CHILD 0.5–2 mg/kg

  By subcutaneous *or* intramuscular injection, 25–100 mg, repeated after 4 hours; CHILD, by intramuscular injection, 0.5–2 mg/kg

  By slow intravenous injection, 25–50 mg, repeated after 4 hours
- Obstetric analgesia, by subcutaneous *or* intramuscular injection, 50–100 mg, repeated 1–3 hours later if necessary; max. 400 mg in 24 hours
- Premedication, by intramuscular injection, 25–100 mg 1 hour before operation; CHILD 0.5–2 mg/kg
- Postoperative pain, by subcutaneous *or* intramuscular injection, 25–100 mg, every 2–3 hours if necessary; CHILD, by intramuscular injection, 0.5–2 mg/kg
  Note In the postoperative period, the patient should be closely monitored for pain relief as well as for side-effects especially respiratory depression

Pethidine (Non-proprietary) CD

Tablets, pethidine hydrochloride 50 mg, net price 50 = £5.86. Label: 2

Injection, pethidine hydrochloride 50 mg/mL, net price 1-mL amp = 53p, 2-mL amp = 56p; 10 mg/mL, 5-mL amp = £3.17, 10-mL amp = £2.18

With promethazine

Pamergan P100® (Martindale) CD

Injection, pethidine hydrochloride 50 mg, promethazine hydrochloride 25 mg/mL. Net price 2-mL amp = £1.44

Dose by intramuscular injection, premedication, 2 mL 60–90 minutes before operation; CHILD 8–12 years 0.75 mL, 13–16 years 1 mL

Obstetric analgesia, 1–2 mL every 4 hours if necessary

Severe pain, 1–2 mL every 4–6 hours if necessary

Note Although usually given intramuscularly, may be given intravenously after dilution to at least 10 mL with water for injections

TRAMADOL HYDROCHLORIDE

Indications moderate to severe pain

Cautions see notes above; impaired consciousness; excessive bronchial secretions; not suitable as a substitute in opioid-dependent patients
General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported)

Contra-indications see notes above; uncontrolled epilepsy; acute porphyria (section 9.8.2)

Side-effects see notes above; also diarrhoea; fatigue; *less commonly* retching, gastritis, and flatulence; *rarely* anorexia, syncope, hypertension, bronchospasm, dyspnoea, wheezing, seizures, paraesthesia, and muscle weakness; blood disorders also reported

Dose

- ADULT and CHILD over 12 years, by mouth, 50–100 mg not more often than every 4 hours; total of more than 400 mg daily not usually required
- ADULT and CHILD over 12 years, by intramuscular injection *or* by intravenous injection (over 2–3 minutes) *or* by intravenous infusion, 50–100 mg every 4–6 hours

  Postoperative pain, 100 mg initially then 50 mg every 10–20 minutes if necessary during first hour to total max. 250 mg (including initial dose) in first hour, *then* 50–100 mg every 4–6 hours; max. 600 mg daily

Tramadol Hydrochloride (Non-proprietary) PoM

Capsules, tramadol hydrochloride 50 mg. Net price 30-cap pack = £1.39, 100-cap pack = £2.41. Label: 2
Brands include *Tramake®*

Injection, tramadol hydrochloride 50 mg/mL. Net price 2-mL amp = 98p

Zamadol® (Meda) PoM

Capsules, tramadol hydrochloride 50 mg, net price 100-cap pack = £8.00. Label: 2

Orodispersible tablets (*Zamadol Melt®*), tramadol hydrochloride 50 mg, net price 60-tab pack = £7.12. Label: 2, counselling, administration
Excipients include aspartame (section 9.4.1)
Counselling *Zamadol Melt®* should be sucked and then swallowed. May also be dispersed in water

Injection, tramadol hydrochloride 50 mg/mL, net price 2-mL amp = £1.10

Zydol® (Grünenthal) PoM

Capsules, green/yellow, tramadol hydrochloride 50 mg, net price 30-cap pack = £3.22, 100-cap pack = £10.71. Label: 2

Soluble tablets, tramadol hydrochloride 50 mg, net price 20-tab pack = £2.95, 100-tab pack = £13.95. Label: 2, 13

Injection, tramadol hydrochloride 50 mg/mL. Net price 2-mL amp = 90p

Modified-release 12-hourly preparations

Dromadol® SR (IVAX) PoM

Tablets, m/r, tramadol hydrochloride 100 mg (white), net price 60-tab pack = £12.78; 150 mg (beige), 60-tab pack = £19.17; 200 mg (orange), 60-tab pack = £25.56. Label: 2, 25

Dose ADULT and CHILD over 12 years, initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Larapam® SR (Sandoz) PoM
Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £17.55; 150 mg, 60-tab pack = £27.35; 200 mg, 60-tab pack = £36.50. Label: 2, 25
Dose ADULT and CHILD over 12 years, initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Mabron® (Morningside) PoM
Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg, 60-tab pack = £27.39; 200 mg, 60-tab pack = £36.52. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Maxitram SR® (Chiesi) PoM
Capsules, m/r, tramadol hydrochloride 50 mg (white), net price 60-cap pack = £4.55; 100 mg (yellow), 60-cap pack = £12.14; 150 mg (yellow), 60-cap pack = £18.21; 200 mg (yellow), 60-cap pack = £24.28. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100–200 mg twice daily; total of more than 400 mg daily not usually required

Tramquel® SR (Meda) PoM
Capsules, m/r, tramadol hydrochloride 50 mg (dark green), net price 60-cap pack = £7.64; 100 mg (white), 60-cap pack = £15.28; 150 mg (dark green), 60-cap pack = £22.92; 200 mg (yellow), 60-cap pack = £30.55. Label: 2, counselling, administration
Dose ADULT and CHILD over 12 years, 50–100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required
Counselling Swallow whole or open capsule and swallow contents immediately without chewing

Zamadol® SR (Meda) PoM
Capsules, m/r, tramadol hydrochloride 50 mg (green), net price 60-cap pack = £7.64; 100 mg, 60-cap pack = £15.28; 150 mg (dark green), 60-cap pack = £22.92; 200 mg (yellow), 60-cap pack = £30.55. Label: 2, counselling, administration
Dose ADULT and CHILD over 12 years, 50–100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required
Counselling Swallow whole or open capsule and swallow contents without chewing

Zeridame® SR (Actavis) PoM
Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg, 60-tab pack = £27.39; 200 mg, 60-tab pack = £36.52. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100 mg twice daily increased if necessary to 150–200 mg twice daily; usual max. 400 mg daily

Zydol SR® (Grünenthal) PoM
Tablets, m/r, f/c, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg (beige), 60-tab pack = £27.39; 200 mg (orange), 60-tab pack = £36.52. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required

Modified-release 24-hourly preparations

Tradorec XL® (Labopharm) PoM
Tablets, m/r, tramadol hydrochloride 100 mg, net price 30-tab pack = £14.10; 200 mg, 30-tab pack = £14.98; 300 mg, 30-tab pack = £22.47. Label: 2, 25
Dose ADULT and CHILD over 12 years, initially 100 mg once daily, increased if necessary; usual max. 400 mg once daily

Zamadol® 24hr (Meda) PoM
Tablets, all f/c, all m/r, tramadol hydrochloride 150 mg, net price 28-tab pack = £10.70; 200 mg, 28-tab pack = £14.26; 300 mg, 28-tab pack = £21.39; 400 mg, 28-tab pack = £28.51. Label: 2, 25
Dose ADULT and CHILD over 12 years, 150 mg once daily increased if necessary; max. 400 mg once daily

Zydol XL® (Grünenthal) PoM
Tablets, m/r, f/c, tramadol hydrochloride 150 mg, net price 30-tab pack = £12.18; 200 mg, 30-tab pack = £17.98; 300 mg, 30-tab pack = £24.94; 400 mg, 30-tab pack = £32.47. Label: 2, 25
Dose ADULT and CHILD over 12 years, 150 mg once daily increased if necessary; usual max. 400 mg once daily

With paracetamol

Tramacet® (Janssen-Cilag) PoM
Tablets, f/c, yellow, tramadol hydrochloride 37.5 mg, paracetamol 325 mg, net price 60-tab pack = £9.68. Label: 2, 25, 29, 30
Dose 2 tablets not more than every 6 hours; max. 8 tablets daily; CHILD under 12 years not recommended

4.7.3 Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes *postherpetic neuralgia* (see below), *phantom limb pain, complex regional pain syndrome* (reflex sympathetic dystrophy, causalgia) *compression neuropathies, peripheral neuropathies* (e.g. due to diabetes, haematological malignancies, rheumatoid arthritis, alcoholism, drug misuse), *trauma, central pain* (e.g. pain following stroke, spinal cord injury and syringomyelia) and *idiopathic neuropathy*. The pain occurs in an area of sensory deficit and may be described as burning, shooting or scalding and is often accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management (see below) is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant and certain antiepileptic drugs. Neuropathic pain may respond only partially to opioid analgesics. Of the opioids, methadone, tramadol, and oxycodone are probably the most effective for neuropathic pain and they may be considered when other measures fail. Nerve blocks, transcutaneous electrical nerve stimulation (TENS) and, in selected cases, central electrical stimulation may help. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Gabapentin (p. 256) and **pregabalin** (p. 257) are effective for the treatment of neuropathic pain. **Amitriptyline** (p. 211) is also prescribed frequently [unlicensed indication]; **nortriptyline** [unlicensed indication] (p. 212) may be better tolerated than amitriptyline.

Capsaicin (section 10.3.2) is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). **Ketamine** (section 15.1.1), an NMDA antagonist, or **lidocaine (lignocaine)** by intravenous infusion may also be useful in some forms of neuropathic pain [both unlicensed indication; specialist use only].

A **corticosteroid** may help to relieve pressure in compression neuropathy and thereby reduce pain. The

management of trigeminal neuralgia and postherpetic neuralgia are outlined below; for the management of neuropathic pain in *palliative care* see p. 16; for the management of diabetic neuropathy, see section 6.1.5.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. **Carbamazepine** (section 4.8.1) taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. **Oxcarbazepine** [unlicensed indication] is an alternative to carbamazepine. **Lamotrigine** [unlicensed indication] and **gabapentin** are also used in trigeminal neuralgia. Some cases respond to **phenytoin** (section 4.8.1); the drug may be given by intravenous infusion (possibly as fosphenytoin) in a crisis (specialist use only).

Postherpetic neuralgia

Postherpetic neuralgia can follow acute herpes zoster infection (shingles), particularly in the elderly. If **amitriptyline** [unlicensed indication] fails to manage the pain adequately, **gabapentin** may improve control. A topical analgesic preparation containing **capsaicin** 0.075% (section 10.3.2) is licensed for use in postherpetic neuralgia. Application of topical local anaesthetic preparations such as lidocaine medicated plasters (section 15.2) may be helpful in some patients.

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed 'atypical facial pain') and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants (section 4.3.1) may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

4.7.4 Antimigraine drugs

4.7.4.1 Treatment of acute migraine
4.7.4.2 Prophylaxis of migraine
4.7.4.3 Cluster headache

4.7.4.1 Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A **simple analgesic** such as aspirin, paracetamol (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant **antiemetic** treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a **5HT$_1$ agonist** ('triptan'). **Ergot alkaloids** are rarely required now; oral and rectal preparations are associated with many side-effects and they should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT$_1$ agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as **aspirin** or **paracetamol** (section 4.7.1) but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred.

The NSAID **tolfenamic acid** is licensed specifically for the treatment of an acute attack of migraine; **diclofenac potassium**, **flurbiprofen**, **ibuprofen**, and **naproxen sodium** (section 10.1.1) are also licensed for use in migraine.

ANALGESICS

Aspirin

Section 4.7.1

Paracetamol

Section 4.7.1

Non-steroidal anti-inflammatory drugs (NSAIDs)

Section 10.1.1

With antiemetics

Migraleve® (McNeil)

Tablets, all f/c, *pink tablets*, buclizine hydrochloride 6.25 mg, paracetamol 500 mg, codeine phosphate 8 mg; *yellow tablets*, paracetamol 500 mg, codeine phosphate 8 mg. Net price 48-tab *Migraleve* PoM (32 pink + 16 yellow) = £5.10; 48 pink (*Migraleve Pink*) = £5.56; 48 yellow (*Migraleve Yellow*) = £4.70. Label: 2, (*Migraleve Pink*), 17, 30

Dose 2 pink tablets at onset of attack, or if it is imminent, then 2 yellow tablets every 4 hours if necessary; max. in 24 hours 2 pink and 6 yellow; CHILD under 10 years, only under close medical supervision; 10–14 years, half adult dose

MigraMax® (Zeneus) PoM

Oral powder, aspirin (as lysine acetylsalicylate) 900 mg, metoclopramide hydrochloride 10 mg/sachet, net price 6-sachet pack = £6.73, 20-sachet pack = £22.42. Label: 13, 21, 32

Dose ADULT over 20 years 1 sachet in water at onset of attack, repeated after 2 hours if necessary (max. 3 sachets in 24 hours); YOUNG ADULT (under 20 years) and CHILD not recommended

Important Metoclopramide can cause **severe extrapyramidal effects**, particularly in children and young adults (for further details, see p. 225)

Excipients include aspartame (section 9.4.1)

Paramax® (Sanofi-Synthelabo) PoM

Tablets, scored, paracetamol 500 mg, metoclopramide hydrochloride 5 mg. Net price 42-tab pack = £9.64. Label: 17, 30

Sachets, effervescent powder, sugar-free, the contents of 1 sachet = 1 tablet; to be dissolved in ¼ tumblerful of liquid before administration. Net price 42-sachet pack = £12.52. Label: 13, 17, 30

Dose (tablets or sachets): 2 at onset of attack then every 4 hours when necessary to max. of 6 in 24 hours; YOUNG ADULT 12–19 years, 1 at onset of attack then 1 every 4 hours when necessary to max. of 3 in 24 hours (max. dose of metoclopramide 500 micrograms/kg daily)

Important Metoclopramide can cause **severe extrapyramidal effects**, particularly in children and young adults (for further details, see p. 225)

TOLFENAMIC ACID

Indications treatment of acute migraine

Cautions see NSAIDs, section 10.1.1

Contra-indications see NSAIDs, section 10.1.1

Side-effects see NSAIDs, section 10.1.1; also dysuria (most commonly in men), confusion, malaise, hallucination, paraesthesia, tremor, euphoria, fatigue, and visual disturbances reported

Dose

- ADULT over 18 years, 200 mg at onset repeated once after 1–2 hours if necessary

Clotam Rapid® (Galen) PoM

Tablets, tolfenamic acid 200 mg. Net price 10-tab pack = £15.00. Label: 21

$5HT_1$ agonists

A $5HT_1$ agonist is of considerable value in the treatment of an acute migraine attack. The $5HT_1$ agonists ('triptans') act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as $5HT_{1B/1D}$-receptor agonists. A $5HT_1$ agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics.

The $5HT_1$ agonists available for treating migraine are **almotriptan**, **eletriptan**, **frovatriptan**, **naratriptan**, **rizatriptan**, **sumatriptan**, and **zolmitriptan**. Sumatriptan is also of value in cluster headache (section 4.7.4.3).

Cautions $5HT_1$ agonists should be used with caution in conditions which predispose to coronary artery disease (pre-existing cardiac disease, see Contra-indications below); hepatic impairment (see Appendix 2); pregnancy (see Appendix 4) and breast-feeding (see Appendix 5). $5HT_1$ agonists are recommended as monotherapy and should not be taken concurrently with other therapies for acute migraine; see also **interactions**: Appendix 1 ($5HT_1$ agonists). Little information is available on the use of these drugs in the elderly (over 65 years).

Contra-indications $5HT_1$ agonists are contra-indicated in ischaemic heart disease, previous myocardial infarction, coronary vasospasm (including Prinzmetal's angina), and uncontrolled or severe hypertension.

Side-effects Side-effects of the $5HT_1$ agonists include sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis; see also CSM advice under Sumatriptan); flushing, dizziness, feeling of weakness; fatigue; nausea and vomiting also reported.

ALMOTRIPTAN

Indications treatment of acute migraine

Cautions see under $5HT_1$ agonists above; sensitivity to sulphonamides; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 ($5HT_1$ agonists)

Contra-indications see under $5HT_1$ agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

Side-effects see under $5HT_1$ agonists above; also transient increase in blood pressure, drowsiness; *less commonly* diarrhoea, dyspepsia, dry mouth, chest pain, palpitation, paraesthesia, headache, myalgia, bone pain, tinnitus; *very rarely* myocardial infarction, and tachycardia

Dose

- 12.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 25 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Almogran® (Organon) PoM

Tablets, f/c, almotriptan (as hydrogen malate) 12.5 mg, net price 3-tab pack = £9.07; 6-tab pack = £18.14; 9-tab pack = £27.20. Label: 3

ELETRIPTAN

Indications treatment of acute migraine

Cautions see under $5HT_1$ agonists above; renal impairment (avoid if severe—Appendix 3); **interactions**: Appendix 1 ($5HT_1$ agonists)

Contra-indications see under $5HT_1$ agonists above; previous cerebrovascular accident or transient ischaemic attack; arrhythmias; heart failure; peripheral vascular disease; severe hepatic impairment

Side-effects see under $5HT_1$ agonists above; also abdominal pain, dry mouth, dyspepsia; tachycardia, palpitation; drowsiness, headache; pharyngitis, rhinitis, chills; myasthenia, myalgia; sweating; *less commonly* diarrhoea, glossitis, thirst, anorexia, taste disturbance; dyspnoea, yawning, oedema, agitation, confusion, euphoria, depression, insomnia, depersonalisation, tremor, dysarthria, stupor, movement disorders, hypertonia, urinary frequency, arthralgia, photophobia, visual disturbances, tinnitus, rash, and pruritus; *rarely* constipation, oesophagitis, bradycardia, asthma, syncope, lymphadenopathy, and menorrhagia; ischaemic colitis and hypertension also reported

Dose

- ADULT over 18 years, 40 mg repeated after 2 hours if migraine recurs (patient not responding to initial dose should not take second dose for same attack); increase to 80 mg for subsequent attacks if 40-mg dose inadequate; max. 80 mg in 24 hours

Relpax® (Pfizer) ▼ PoM

Tablets, f/c, orange, eletriptan (as hydrobromide) 20 mg, net price 6-tab pack = £22.50; 40 mg, 6-tab pack = £22.50. Label: 3

FROVATRIPTAN

Indications treatment of acute migraine

Cautions see under $5HT_1$ agonists above; **interactions:** Appendix 1 ($5HT_1$ agonists)

Contra-indications see under $5HT_1$ agonists above; severe hepatic impairment; previous cerebrovascular attack or transient ischaemic attack; peripheral vascular disease

Side-effects see under $5HT_1$ agonists above; also dry mouth, dyspepsia, abdominal pain, paraesthesia, drowsiness, headache, visual disturbances, sweating; *less commonly* diarrhoea, dysphagia, flatulence, tachycardia, palpitation, hypertension, rhinitis, pharyngitis, sinusitis, laryngitis, tremor, anxiety, asthenia, insomnia, confusion, nervousness, impaired concentration, agitation, depression, depersonalisation, taste disturbances, micturition disorders, thirst, dehydration, arthralgia, muscle stiffness, tinnitus, vertigo, pruritus; *rarely* constipation, gastro-oesophageal reflux, irritable bowel syndrome, hiccup, peptic ulcer, stomatitis, bradycardia, hyperventilation, amnesia, abnormal dreams, hypertonia, hypotonia, breast tenderness, hypocalcaemia, hypoglycaemia, bilirubinaemia, epistaxis, urticaria, pyrexia, and purpura

Dose

- 2.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 5 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Migard® (Menarini) PoM

Tablets, f/c, frovatriptan (as succinate) 2.5 mg, net price 6-tab pack = £16.67. Label: 3

NARATRIPTAN

Indications treatment of acute migraine

Cautions see under $5HT_1$ agonists above; sensitivity to sulphonamides; renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3); **interactions:** Appendix 1 ($5HT_1$ agonists)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications see under $5HT_1$ agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

Side-effects see under $5HT_1$ agonists above; also *less commonly* bradycardia, tachycardia, palpitation, and visual disturbance; *rarely* ischaemic colitis

Dose

- 2.5 mg, repeated after at least 4 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 5 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Naramig® (GSK) PoM

Tablets, f/c, green, naratriptan (as hydrochloride) 2.5 mg, net price 6-tab pack = £24.55, 12-tab pack = £49.10. Label: 3

RIZATRIPTAN

Indications treatment of acute migraine

Cautions see under $5HT_1$ agonists above; renal impairment (avoid in severe impairment; Appendix 3); **interactions:** Appendix 1 ($5HT_1$ agonists)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications see under $5HT_1$ agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

Side-effects see under $5HT_1$ agonists above; drowsiness, palpitation, tachycardia, dry mouth, diarrhoea, dyspepsia, thirst, pharyngeal discomfort, dyspnoea, headache, paraesthesia, decreased alertness, insomnia, tremor, ataxia, nervousness, vertigo, confusion, myalgia and muscle weakness, sweating, urticaria, pruritus, blurred vision; rarely syncope, hypertension; hypersensitivity reactions (including rash, angioedema, and toxic epidermal necrolysis) and taste disturbance reported

Dose

- 10 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 20 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Maxalt® (MSD) PoM

Tablets, pink, rizatriptan (as benzoate) 5 mg, net price 6-tab pack = £26.74; 10 mg, 3-tab pack = £13.37, 6-tab pack = £26.74. Label: 3

Oral lyophilisate (*Maxalt® Melt Wafers*), rizatriptan (as benzoate) 10 mg, net price 3-wafer pack = £13.37, 6-wafer pack = £26.74. Label: 3, counselling, administration

Counselling *Maxalt® Melt* wafers should be placed on the tongue and allowed to dissolve

Excipients include aspartame equivalent to phenylalanine 2.1 mg (section 9.4.1)

SUMATRIPTAN

Indications treatment of acute migraine; cluster headache (subcutaneous injection only)

Cautions see under $5HT_1$ agonists above; history of seizures; renal impairment; sensitivity to sulphonamides; **interactions:** Appendix 1 ($5HT_1$ agonists)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications see under $5HT_1$ agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease; moderate and severe hypertension

Side-effects see under $5HT_1$ agonists above; also drowsiness, transient increase in blood pressure; *very rarely* ischaemic colitis, hypotension, bradycardia or tachycardia, palpitation, arrhythmias, myocardial infarction, Raynaud's syndrome, seizures, tremor, dystonia, nystagmus, and visual disturbances; erythema at injection site; nasal irritation and epistaxis with nasal spray

CSM advice Following reports of chest pain and tightness (coronary vasoconstriction) CSM has emphasised that sumatriptan should **not** be used in ischaemic heart disease or Prinzmetal's angina, and that use with ergotamine should be **avoided** (see also Cautions).

Dose

- By mouth, 50 mg (some patients may require 100 mg); dose may be repeated after at least 2 hours if migraine recurs; max. 300 mg in 24 hours; CHILD and ADOLESCENT under 18 years, see *BNF for Children*
- By subcutaneous injection using auto-injector, 6 mg; dose may be repeated once after at least 1 hour if migraine recurs; max. 12 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended
  Important **Not** for intravenous injection which may cause coronary vasospasm and angina
- Intranasally, 10–20 mg (ADOLESCENT 12–17 years 10 mg) into one nostril; dose may be repeated once after at least 2 hours if migraine recurs; max. 40 mg (ADOLESCENT 12–17 years 20 mg) in 24 hours

Note Patient not responding to initial dose should not take second dose for same attack

[1] **Sumatriptan** (Non-proprietary) PoM

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £8.99; 100 mg, 6-tab pack = £13.60. Label: 3, 10, patient information leaflet

1. Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg

Imigran® (GSK) PoM

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £26.54, 12-tab pack = £50.43; 100 mg, 6-tab pack = £42.90, 12-tab pack = £85.80. Label: 3, 10, patient information leaflet

Injection, sumatriptan (as succinate) 12 mg/mL (= 6 mg/0.5-mL syringe), net price, treatment pack (2 × 0.5-mL prefilled syringes and auto-injector) = £42.47; refill pack 2 × 0.5-mL prefilled cartridges = £40.41. Label: 3, 10, patient information leaflet

Nasal spray, sumatriptan 10 mg/0.1-mL actuation, net price 2 unit-dose spray device = £11.80; 20 mg/0.1-mL actuation, 2 unit-dose spray device = £11.80, 6 unit-dose spray device = £35.39. Label: 3, 10, patient information leaflet

Imigran® Radis (GSK) PoM

Tablets, f/c, sumatriptan (as succinate) 50 mg (pink), net price 6-tab pack = £23.90, 12-tab pack = £47.83; 100 mg (white), 6-tab pack = £42.90, 12-tab pack = £85.80. Label: 3, 10, patient information leaflet

ZOLMITRIPTAN

Indications treatment of acute migraine

Cautions see under $5HT_1$ agonists above; should not be taken within 12 hours of any other $5HT_1$ agonist; **interactions:** Appendix 1 ($5HT_1$ agonists)

Contra-indications see under $5HT_1$ agonists above; Wolff-Parkinson-White syndrome or arrhythmias associated with accessory cardiac conduction pathways; previous cerebrovascular accident or transient ischaemic attack

Side-effects see under $5HT_1$ agonists above; also dry mouth, drowsiness, paraesthesia, myalgia, muscle weakness; *rarely* palpitation, tachycardia, angioedema, headache, urticaria; *very rarely* abdominal pain, gastro-intestinal and splenic infarction, ischaemic colitis, angina, myocardial infarction, polyuria, transient increase in blood pressure; *with nasal spray*, taste disturbance and nasal discomfort

Dose

- By mouth, ADULT over 18 years, 2.5 mg repeated after not less than 2 hours if migraine persists or recurs (increase to 5 mg for subsequent attacks in patients not achieving satisfactory relief with 2.5-mg dose); max. 10 mg in 24 hours
- Intranasally, ADULT over 18 years, 5 mg (1 spray) into one nostril as soon as possible after onset repeated after not less than 2 hours if migraine persists or recurs; max. 10 mg in 24 hours

Zomig® (AstraZeneca) PoM

Tablets, f/c, yellow, zolmitriptan 2.5 mg, net price 6-tab pack = £18.00, 12-tab pack = £36.00

Orodispersible tablets (*Zomig Rapimelt®*), zolmitriptan 2.5 mg, net price 6-tab pack = £17.90; 5 mg, 6-tab pack = £22.80 Counselling, administration

Counselling *Zomig Rapimelt®* should be placed on the tongue, allowed to disperse and swallowed

Excipients include aspartame equivalent to phenylalanine 2.81 mg/tablet (section 9.4.1)

Nasal spray, zolmitriptan 5 mg/0.1-mL unit-dose spray device, net price 6 unit-dose sprays = £36.50

Ergot alkaloids

The value of **ergotamine** for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and *muscular cramps*; it is best avoided. The recommended doses of ergotamine preparations should **not** be exceeded and treatment should **not** be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine should be limited to **no more than** twice a month. It should **never** be prescribed prophylactically but in the management of cluster headache a low dose (e.g. ergotamine 1 mg at night for 6 nights in 7) is occasionally given for 1 to 2 weeks [unlicensed indication].

ERGOTAMINE TARTRATE

Indications treatment of acute migraine and migraine variants unresponsive to analgesics

Cautions risk of peripheral vasospasm (see below); elderly; dependence (see Ergot Alkaloids above); cardiac disease; anaemia; **interactions:** Appendix 1 (ergot alkaloids)

Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.

Contra-indications peripheral vascular disease, coronary heart disease, obliterative vascular disease and Raynaud's syndrome, temporal arteritis, hepatic impairment (Appendix 2), renal impairment (Appendix 3), sepsis, severe or inadequately controlled hypertension, hyperthyroidism, pregnancy (Appendix 4), breast-feeding (Appendix 5), acute porphyria (section 9.8.2)

Side-effects abdominal pain, nausea, vomiting; dizziness; *less commonly* diarrhoea, pain and weakness in extremities, cyanosis, peripheral vasoconstriction, paraesthesia, and hypoesthesia; *rarely* intestinal ischaemia, arrhythmias, increased blood pressure, bradycardia, tachycardia, dyspnoea, ergotism (including absence of pulse and numbness in extremities), myalgia, rash, and urticaria; *very rarely* myocardial ischaemia, myocardial infarction, heart-valve fibrosis, and gangrene; constipation, dry mouth, cerebral ischaemia, thrombosis, drowsiness, sleep

disturbances, tremor, seizures, extrapyramidal effects, anxiety, depression, confusion, hallucinations, renal artery spasm, urinary retention, blood disorders, blurred vision, and arthralgia also reported; *with suppositories* rectal and anal ulcers on prolonged use

Dose

- See under preparations below

Cafergot® (Alliance) PoM

Tablets, s/c, ergotamine tartrate 1 mg, caffeine 100 mg, net price 30-tab pack = £4.02. Label: 18, counselling, dosage

Dose ADULT and CHILD over 12 years, 1–2 tablets at onset; max. 4 tablets in 24 hours; not to be repeated at intervals of less than 4 days; max. 8 tablets in one week (but see also notes above)

Suppositories, ergotamine tartrate 2 mg, caffeine 100 mg, net price 30 = £8.10. Label: 18, counselling, dosage

Dose ADULT and CHILD over 12 years, 1 suppository at onset; max. 2 in 24 hours; max. 4 suppositories in one week (but see also notes above)

Migril® (CP) PoM

Tablets, scored, ergotamine tartrate 2 mg, cyclizine hydrochloride 50 mg, caffeine hydrate 100 mg, net price 100 = £51.00. Label: 2, 18, counselling, dosage

Dose 1 tablet at onset, followed after 30 minutes by ½–1 tablet, repeated every 30 minutes if necessary; max. 3 tablets in 24 hours, 4 tablets per attack, 6 tablets in one week (but see also notes above); CHILD not recommended

Antiemetics

Antiemetics (section 4.6), such as **metoclopramide** or **domperidone**, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide are a convenient alternative (**important:** for warnings relating to extrapyramidal effects of metoclopramide particularly in children and young adults, see p. 225).

4.7.4.2 Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine, see section 7.3.1 for advice.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The **beta-blockers** propranolol, metoprolol, nadolol, and timolol (section 2.4) are all effective. Propranolol is the most commonly used.

Pizotifen is an antihistamine and serotonin antagonist structurally related to the tricyclic antidepressants. It affords good prophylaxis but may cause weight gain. To avoid undue drowsiness treatment may be started at a low dose and gradually increased.

Sodium valproate (section 4.8.1) may be effective for migraine prophylaxis [unlicensed indication] in a starting dose of 300 mg twice daily, increased if necessary to 1.2 g daily in divided doses. **Valproic acid** (as semisodium valproate) (section 4.2.3) is similarly effective [unlicensed indication] in a starting dose of 250 mg twice daily, increased if necessary to 1 g daily in divided doses.

Topiramate (section 4.8.1) is effective for migraine prophylaxis. Treatment should be supervised by a specialist.

Tricyclic antidepressants (section 4.3.1) (e.g. **amitriptyline**) are also used for preventing migraine [unlicensed indication].

Cyproheptadine (section 3.4.1), an antihistamine with serotonin-antagonist and calcium channel-blocking properties, may also be tried in refractory cases.

Clonidine (*Dixarit®*) is **not** recommended and may aggravate depression or produce insomnia. **Methysergide**, a semi-synthetic ergot alkaloid, has dangerous side-effects (retroperitoneal fibrosis and fibrosis of the heart valves and pleura); **important:** it should only be administered under hospital supervision.

PIZOTIFEN

Indications prevention of vascular headache including classical migraine, common migraine, and cluster headache

Cautions urinary retention; susceptibility to angle-closure glaucoma; renal impairment; pregnancy; breast-feeding (Appendix 5); **interactions:** Appendix 1 (pizotifen)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Side-effects antimuscarinic effects (*very rarely* angle-closure glaucoma), drowsiness, increased appetite and weight gain; occasionally nausea, dizziness; *rarely* anxiety, aggression, and depression; CNS stimulation may occur in children

Dose

- Initially 500 micrograms at night increased gradually to usual dose of 1.5 mg at night *or* in 3 divided doses; may be further increased up to max. daily dose 4.5 mg (but rarely necessary), max. single dose 3 mg; CHILD over 5 years, up to 1.5 mg daily in divided doses; max. single dose at night 1 mg

Pizotifen (Non-proprietary) PoM

Tablets, pizotifen (as hydrogen malate), 500 micrograms, net price 28-tab pack = £1.34; 1.5 mg, 28-tab pack = £2.47. Label: 2

Sanomigran® (Novartis) PoM

Tablets, both ivory-yellow, s/c, pizotifen (as hydrogen malate), 500 micrograms, net price 60-tab pack = £2.57; 1.5 mg, 28-tab pack = £4.28. Label: 2

Elixir, pizotifen (as hydrogen malate) 250 micrograms/5 mL, net price 300 mL = £4.51. Label: 2

CLONIDINE HYDROCHLORIDE

Indications prevention of recurrent migraine (but see notes above), vascular headache, menopausal flushing; hypertension (section 2.5.2)

Cautions depressive illness, concurrent antihypertensive therapy; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clonidine)

Side-effects dry mouth, sedation, dizziness, nausea, nocturnal restlessness; occasionally rashes

Dose

- 50 micrograms twice daily, increased after 2 weeks to 75 micrograms twice daily if necessary; CHILD not recommended

Clonidine (Non-proprietary) PoM

Tablets, clonidine hydrochloride 25 micrograms. Net price 112-tab pack = £10.29

Dixarit® (Boehringer Ingelheim) PoM

Tablets, blue, s/c, clonidine hydrochloride 25 micrograms. Net price 112-tab pack = £6.75

Catapres® PoM

Section 2.5.2 (hypertension)

METHYSERGIDE

Indications prevention of severe recurrent migraine, cluster headache and other vascular headaches in patients who are refractory to other treatment and whose lives are seriously disrupted (**important:** hospital supervision only, see notes above); diarrhoea associated with carcinoid syndrome

Cautions history of peptic ulceration; avoid abrupt withdrawal of treatment; after 6 months withdraw (gradually over 2 to 3 weeks) for reassessment for at least 1 month (see also notes above); **interactions:** Appendix 1 (ergot alkaloids)

Contra-indications renal, hepatic, pulmonary, and cardiovascular disease, severe hypertension, collagen disease, cellulitis, urinary-tract disorders, cachectic or septic conditions, pregnancy, breast-feeding

Side-effects nausea, vomiting, heartburn, abdominal discomfort, drowsiness, and dizziness occur frequently in initial treatment; mental and behavioural disturbances, insomnia, oedema, weight gain, rashes, loss of scalp hair, cramps, arterial spasm (including coronary artery spasm with angina and possible myocardial infarction), paraesthesias of extremities, postural hypotension, and tachycardia also occur; retroperitoneal and other abnormal fibrotic reactions may occur on prolonged administration, requiring immediate withdrawal of treatment

Dose

- Initially 1 mg at bedtime, increased gradually over about 2 weeks to 1–2 mg 3 times daily with food (see notes above); CHILD not recommended
- Diarrhoea associated with carcinoid syndrome, usual range, 12–20 mg daily (hospital supervision); CHILD not recommended

Deseril® (Alliance) PoM

Tablets, s/c, methysergide (as maleate) 1 mg, net price 60-tab pack = £12.45. Label: 2, 21

4.7.4.3 Cluster headache

Cluster headache rarely responds to standard analgesics. **Sumatriptan** given by subcutaneous injection is the drug of choice for the *treatment* of cluster headache. Alternatively, 100% **oxygen** at a rate of 7–12 litres/minute is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, or last over 3 weeks, or if the attacks cannot be treated effectively. **Verapamil** or **lithium** [both unlicensed use] are used for prophylaxis. **Ergotamine**, used on an intermittent basis is an alternative for patients with short bouts, but it should **not** be used for prolonged periods. **Methysergide** is effective but must be used with extreme caution (section 4.7.4.2) and only if other drugs cannot be used or if they are not effective.

4.8 Antiepileptic drugs

4.8.1 Control of epilepsy
4.8.2 Drugs used in status epilepticus
4.8.3 Febrile convulsions

4.8.1 Control of epilepsy

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the seizure type, concomitant medication, co-morbidity, age, and sex should be taken into account. For women of childbearing age, see Pregnancy and Breast-feeding, p. 253.

The dose frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, may be given twice daily. Lamotrigine, phenobarbital, and phenytoin, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration. Young children metabolise antiepileptics more rapidly than adults and therefore require more frequent doses and a higher dose in proportion to their body-weight.

Management When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The changeover from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with 2 or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions (see below). If combination therapy does not bring about worthwhile

benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy.

Interactions Interactions between antiepileptic drugs are complex and may enhance toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by *hepatic enzyme induction* or *hepatic enzyme inhibition*; *displacement from protein binding sites* is not usually a problem. These interactions are highly variable and unpredictable.

Significant interactions that occur **between antiepileptics** themselves are as follows:

Note Check under each drug for possible interactions when two or more antiepileptic drugs are used

Carbamazepine
often lowers plasma concentration of clobazam, clonazepam, lamotrigine, an active metabolite of oxcarbazepine, and of phenytoin (but may also raise phenytoin concentration), tiagabine, topiramate, valproate, and zonisamide

sometimes lowers plasma concentration of ethosuximide, and primidone (but tendency for corresponding increase in phenobarbital level)

Ethosuximide
sometimes raises plasma concentration of phenytoin

Gabapentin
no interactions with gabapentin reported

Lamotrigine
sometimes raises plasma concentration of an active metabolite of carbamazepine (but evidence is conflicting)

Levetiracetam
no interactions with levetiracetam reported

Oxcarbazepine
sometimes lowers plasma concentration of carbamazepine (but may raise concentration of an active metabolite of carbamazepine)

sometimes raises plasma concentration of phenytoin

often raises plasma concentration of phenobarbital

Phenobarbital *or* **Primidone**
often lowers plasma concentration of carbamazepine, clonazepam, lamotrigine, and of phenytoin (but may also raise phenytoin concentration), tiagabine, valproate, and zonisamide

sometimes lowers plasma concentration of ethosuximide

Phenytoin
often lowers plasma concentration of clonazepam, carbamazepine, lamotrigine, an active metabolite of oxcarbazepine, and of tiagabine, topiramate, valproate, and zonisamide

often raises plasma concentration of phenobarbital

sometimes lowers plasma concentration of ethosuximide, and primidone (by increasing conversion to phenobarbital)

Pregabalin
no interactions with pregabalin reported

Rufinamide
sometimes raises plasma concentration of phenytoin

Topiramate
sometimes raises plasma concentration of phenytoin

Valproate
sometimes lowers plasma concentration of an active metabolite of oxcarbazepine

often raises plasma concentration of an active metabolite of carbamazepine, and of lamotrigine, primidone, phenobarbital, and phenytoin (but may also lower)

sometimes raises plasma concentration of ethosuximide, primidone, (and tendency for significant increase in phenobarbital level), and rufinamide

Vigabatrin
often lowers plasma concentration of phenytoin

sometimes lowers plasma concentration of phenobarbital, and primidone

For other important interactions see **Appendix 1**; for advice on hormonal contraception and enzyme-inducing drugs (including antiepileptics), see section 7.3.1 and section 7.3.2.

Withdrawal Antiepileptic drugs should be withdrawn under specialist supervision. Abrupt withdrawal, particularly of the barbiturates and benzodiazepines, should be avoided because this may precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Driving Patients suffering from epilepsy may drive a motor vehicle (but not a heavy goods or public service vehicle) provided that they have had a seizure-free period of one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Patients affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during withdrawal of antiepileptic drugs, or for 6 months afterwards (see also Drugs and Driving under General Guidance, p. 3).

Pregnancy and breast-feeding There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (reduced if treatment is limited to a single drug). In view of the increased risk of neural tube and other defects associated, in particular, with **carbamazepine**, **lamotrigine**, **oxcarbazepine**, **phenytoin**, and **valproate**, women taking antiepileptic drugs who *may become pregnant* should be **informed of the possible consequences**. Those who *wish to become pregnant* should be referred to an appropriate specialist for advice. Women who become pregnant should be **counselled** and offered **antenatal screening** (alpha-fetoprotein measurement and a second trimester ultrasound scan).

To counteract the risk of neural tube defects, adequate folate supplements are advised for women before and during pregnancy (section 9.1.2).

The concentration of antiepileptic drugs in the blood can change during pregnancy, particularly in the later stages. The dose of antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

Routine injection of vitamin K (section 9.6.6) at birth effectively counteracts any antiepileptic-associated risk of neonatal haemorrhage.

Breast-feeding is acceptable with all antiepileptic drugs, taken in normal doses, with the possible exception of the barbiturates, and also some of the more recently introduced ones, see Appendix 5.

Partial seizures with or without secondary generalisation

Carbamazepine, **lamotrigine**, **oxcarbazepine**, and **sodium valproate** are the drugs of choice for partial (focal) seizures; second-line drugs include clobazam, gabapentin, levetiracetam, pregabalin, tiagabine, topiramate, and zonisamide.

Generalised seizures

Tonic-clonic seizures The drugs of choice for tonic-clonic seizures are **carbamazepine**, **lamotrigine**, and **sodium valproate**. Clobazam, levetiracetam, oxcarbazepine, and topiramate are second-line drugs.

Absence seizures **Ethosuximide** and **sodium valproate** are the drugs of choice in typical absence seizures; alternatives include clonazepam and lamotrigine. Sodium valproate is also highly effective in treating the generalised tonic-clonic seizures which can co-exist with absence seizures in idiopathic primary generalised epilepsy.

Myoclonic seizures Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. **Sodium valproate** is the drug of choice; **clonazepam** and **levetiracetam** can also be used. Alternatives include lamotrigine and topiramate, but lamotrigine may occasionally exacerbate myoclonic seizures. For reference to the adjunctive use of piracetam, see section 4.9.3.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that co-exist with myoclonic seizures in idiopathic generalised epilepsy.

Atypical absence, atonic, and tonic seizures Atypical absence, atonic, and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. **Sodium valproate**, **lamotrigine**, and **clonazepam** can be tried. Second-line drugs that are occasionally helpful include clobazam, ethosuximide, levetiracetam, and topiramate.

Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

For more information on epilepsy syndromes in children, see *BNF for Children*, section 4.8.1. Prescribing information for stiripentol (*Diacomit*®) in severe myoclonic epilepsy of infancy (Dravet syndrome) can also be found in *BNF for Children*.

Carbamazepine and oxcarbazepine

Carbamazepine is a drug of choice for simple and complex partial seizures and for tonic-clonic seizures secondary to a focal discharge. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly with increments of 100–200 mg every two weeks. Reversible blurring of vision, dizziness, and unsteadiness are dose-related, and may be dose-limiting. These side-effects may be reduced by altering the timing of medication; use of modified-release tablets also significantly lessens the incidence of dose-related side-effects.

Oxcarbazepine is licensed for the treatment of partial seizures with or without secondarily generalised tonic-clonic seizures. Oxcarbazepine induces hepatic enzymes to a lesser extent than carbamazepine.

CARBAMAZEPINE

Indications partial and secondary generalised tonic-clonic seizures, primary generalised tonic-clonic seizures; trigeminal neuralgia; prophylaxis of bipolar disorder unresponsive to lithium

Cautions hepatic impairment (Appendix 2) or renal impairment; cardiac disease (see also Contra-indications); skin reactions (see also Blood, Hepatic or Skin disorders, below and under Side-effects); test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele; history of haematological reactions to other drugs; manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value unsatisfactory); may exacerbate absence and myoclonic seizures; consider vitamin D supplementation in patients that are immobilized for long periods or who have inadequate sun exposure or dietary intake of calcium; susceptibility to angle-closure glaucoma; pregnancy (**important:** see p. 253 and Appendix 4 (neural tube screening)), breast-feeding (see p. 253 and Appendix 5); avoid abrupt withdrawal; **interactions:** see p. 253 and Appendix 1 (carbamazepine)

Blood, hepatic or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia which is severe, progressive or associated with clinical symptoms requires withdrawal (if necessary under cover of suitable alternative).

Contra-indications AV conduction abnormalities (unless paced); history of bone marrow depression, acute porphyria (section 9.8.2)

Side-effects nausea and vomiting, dizziness, drowsiness, headache, ataxia, confusion and agitation (elderly), visual disturbances (especially diplopia and often associated with peak plasma concentrations); constipation or diarrhoea, anorexia; mild transient generalised erythematous rash may occur in a large number of patients (withdraw if worsens or is accompanied by other symptoms); leucopenia and other blood disorders (including thrombocytopenia, agranulocytosis and aplastic anaemia); other side-effects include cholestatic jaundice, hepatitis and acute renal failure, Stevens-Johnson syndrome, toxic

epidermal necrolysis, alopecia, thromboembolism, arthralgia, fever, proteinuria, lymph node enlargement, cardiac conduction disturbances (sometimes arrhythmias), dyskinesias, paraesthesia, depression, impotence (and impaired fertility), gynaecomastia, galactorrhoea, aggression, activation of psychosis; *very rarely* angle-closure glaucoma; photosensitivity, pulmonary hypersensitivity (with dyspnoea and pneumonitis), hyponatraemia, oedema, and disturbances of bone metabolism (with osteomalacia) also reported (see Cautions); suicidal ideation

Dose

Note Different preparations may vary in bioavailability; to avoid reduced effect or excessive side-effects, it may be prudent to avoid changing the formulation (see also notes above on how side-effects may be reduced)

- By mouth, epilepsy, initially, 100–200 mg 1–2 times daily, increased slowly (see notes above) to usual dose of 0.4–1.2 g daily in divided doses; in some cases 1.6–2 g daily in divided doses, may be needed; ELDERLY reduce initial dose; CHILD daily in divided doses, up to 1 year 100–200 mg, 1–5 years 200–400 mg, 5–10 years 400–600 mg, 10–15 years 0.4–1 g

  Trigeminal neuralgia, initially 100 mg 1–2 times daily (but some patients may require higher initial dose), increased gradually according to response; usual dose 200 mg 3–4 times daily, up to 1.6 g daily in some patients

  Prophylaxis of bipolar disorder unresponsive to lithium (see also section 4.2.3), initially 400 mg daily in divided doses increased until symptoms controlled; usual range 400–600 mg daily; max. 1.6 g daily
- By rectum, epilepsy, for short-term use (max. 7 days) when oral therapy temporarily not possible; 125-mg suppository approx. equivalent to 100-mg tablet, but final adjustment should always depend on clinical response (plasma concentration monitoring recommended); max. 1 g daily in 4 divided doses

  Note Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre)

Carbamazepine (Non-proprietary) PoM

Tablets, carbamazepine 100 mg, net price 28 = £5.64; 200 mg, 28 = £4.90; 400 mg, 28 = £6.59. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Brands include *Epimaz*®

Dental prescribing on NHS Carbamazepine Tablets may be prescribed

Tegretol® (Novartis) PoM

Tablets, all scored, carbamazepine 100 mg, net price 84-tab pack = £2.43; 200 mg, 84-tab pack = £4.50; 400 mg, 56-tab pack = £5.90. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Chewtabs, orange, carbamazepine 100 mg, net price 56-tab pack = £3.72; 200 mg, 56-tab pack = £6.92. Label: 3, 8, 21, 24, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Liquid, sugar-free, carbamazepine 100 mg/5 mL. Net price 300-mL pack = £7.20. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Suppositories, carbamazepine 125 mg, net price 5 = £9.45; 250 mg, 5 = £12.60. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Modified release

Carbagen® SR (Generics) PoM

Tablets, m/r, f/c, both scored, carbamazepine 200 mg, net price 56-tab pack = £4.88; 400 mg, 56-tab pack = £9.63. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy (ADULT and CHILD over 5 years), as above; trigeminal neuralgia, as above; total daily dose given in 1–2 divided doses; bipolar disorder, as above

Tegretol® Retard (Novartis) PoM

Tablets, m/r, both scored, carbamazepine 200 mg (beige-orange), net price 56-tab pack = £5.30; 400 mg (brown-orange), 56-tab pack = £10.44. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy (ADULT and CHILD over 5 years), as above; trigeminal neuralgia, as above; total daily dose given in 2 divided doses

OXCARBAZEPINE

Indications monotherapy and adjunctive treatment of partial seizures with or without secondarily generalised tonic-clonic seizures; trigeminal neuralgia [unlicensed indication] (section 4.7.3)

Cautions hypersensitivity to carbamazepine; avoid abrupt withdrawal; hyponatraemia (monitor plasma-sodium concentration in patients at risk), heart failure (monitor body-weight), cardiac conduction disorders; avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 253 and Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (oxcarbazepine)

Blood, hepatic or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, sore throat, rash, blistering, mouth ulcers, bruising, or bleeding develop

Side-effects nausea, vomiting, constipation, diarrhoea, abdominal pain; dizziness, headache, drowsiness, agitation, amnesia, asthenia, ataxia, confusion, impaired concentration, depression, tremor; hyponatraemia; acne, alopecia, rash, nystagmus, visual disorders including diplopia; *less commonly* urticaria, leucopenia; *very rarely* hepatitis, pancreatitis, arrhythmias, hypersensitivity reactions, blood disorders, systemic lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; suicidal ideation

Dose

- Initially 300 mg twice daily increased according to response in steps of up to 600 mg daily at weekly intervals; usual dose range 0.6–2.4 g daily in divided doses; CHILD 6–18 years, 8–10 mg/kg daily in 2 divided doses increased according to response in steps of up to 10 mg/kg daily at weekly intervals (in adjunctive therapy, maintenance dose approx. 30 mg/kg daily); max. 46 mg/kg daily in divided doses

  Note In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine

Oxcarbazepine (Non-proprietary) PoM

Tablets, oxcarbazepine 150 mg, net price 50-tab pack = £10.00; 300 mg, 50-tab pack = £19.96; 600 mg, 50-

tab pack = £39.81. Label: 3, 8, counselling, blood, hepatic, or skin disorders (see above), driving (see notes above)

Trileptal® (Novartis) PoM

Tablets, f/c, scored, oxcarbazepine 150 mg (green), net price 50-tab pack = £10.00; 300 mg (yellow), 50-tab pack = £20.00; 600 mg (pink), 50-tab pack = £40.00. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

Oral suspension, sugar-free, oxcarbazepine 300 mg/5 mL, net price 250 mL (with oral syringe) = £40.00. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

Excipients include propylene glycol (see Excipients, p. 2)

Ethosuximide

Ethosuximide is used in typical absence seizures; it may also be used in atypical absence seizures. Ethosuximide is rarely used for myoclonic or tonic seizures.

ETHOSUXIMIDE

Indications see notes above

Cautions avoid abrupt withdrawal; hepatic impairment; renal impairment; pregnancy (see p. 253 and Appendix 4); breast-feeding (Appendix 5); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (ethosuximide)

Blood disorders Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, mouth ulcers, bruising, or bleeding develop

Side-effects gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, abdominal pain, anorexia, weight loss); *less frequently* headache, fatigue, drowsiness, dizziness, hiccup, ataxia, mild euphoria, irritability, aggression, impaired concentration; *rarely* tongue swelling, sleep disturbances, night terrors, depression, psychosis, photophobia, dyskinesia, increased libido, vaginal bleeding, myopia, gingival hypertrophy, and rash; also reported, hyperactivity, increase in seizure frequency, blood disorders such as leucopenia, agranulocytosis, pancytopenia, and aplastic anaemia (blood counts required if features of infection), systemic lupus erythematosus, and Stevens-Johnson syndrome; suicidal ideation

Dose

- ADULT and CHILD over 6 years, initially 500 mg daily, increased by 250 mg at intervals of 4–7 days to usual dose of 1–1.5 g daily; occasionally up to 2 g daily may be needed; CHILD up to 6 years initially 250 mg daily, increased gradually to usual dose of 20 mg/kg daily; max. 1 g daily

Ethosuximide (Non-proprietary) PoM

Capsules, ethosuximide 250 mg, net price 56-cap pack = £38.23. Label: 8, counselling, blood disorders (see above), driving (see notes above)

Emeside® (Chemidex) PoM

Syrup, black currant, ethosuximide 250 mg/5 mL, net price 200-mL pack = £6.60. Label: 8, counselling, blood disorders (see above), driving (see notes above)

Zarontin® (Pfizer) PoM

Syrup, yellow, ethosuximide 250 mg/5 mL, net price 200-mL pack = £4.31. Label: 8, counselling, blood disorders (see above), driving (see notes above)

Gabapentin and pregabalin

Gabapentin and **pregabalin** are used for the treatment of partial seizures with or without secondary generalisation. They are also licensed for the treatment of neuropathic pain (p. 246). Pregabalin is licensed for the treatment of generalised anxiety disorder (p. 209).

The *Scottish Medicines Consortium* (p. 3) has advised (July 2007) that pregabalin (*Lyrica®*) is not recommended for the treatment of central neuropathic pain.

The *Scottish Medicines Consortium* (p. 3) has advised (April 2009) that pregabalin (*Lyrica®*) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

GABAPENTIN

Indications monotherapy and adjunctive treatment of partial seizures with or without secondary generalisation; peripheral neuropathic pain (section 4.7.3)

Cautions avoid abrupt withdrawal (may cause anxiety, insomnia, nausea, pain, and sweating—taper off over at least 1 week); elderly; renal impairment (Appendix 3); diabetes mellitus; false positive readings with some urinary protein tests; pregnancy (see p. 253 and Appendix 4); breast-feeding (see p. 253 and Appendix 5); **interactions:** Appendix 1 (gabapentin)

Side-effects diarrhoea, dry mouth, dyspepsia, nausea, vomiting, constipation, abdominal pain, flatulence, appetite changes, gingivitis, weight gain; hypertension, vasodilation, oedema; dyspnoea, cough, rhinitis; confusion, depression, hostility, sleep disturbances, headache, dizziness, anxiety, amnesia, ataxia, dysarthria, nystagmus, tremor, asthenia, paraesthesia, hyperkinesia; influenza-like symptoms; impotence, urinary incontinence; leucopenia; myalgia, arthralgia; diplopia, amblyopia; rash, purpura, pruritus, acne; *rarely* pancreatitis, hepatitis, jaundice, palpitation, hallucinations, movement disorders, thrombocytopenia, blood-glucose fluctuations in patients with diabetes, tinnitus, acute renal failure, Stevens-Johnson syndrome, and alopecia; suicidal ideation

Dose

- Epilepsy, 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily on day 3 *or* initially 300 mg 3 times daily on day 1; then increased according to response in steps of 300 mg daily (in 3 divided doses) every 2–3 days; usual dose 0.9–3.6 g daily in 3 divided doses; CHILD 6–12 years (adjunctive therapy only) 10–15 mg/kg once daily initially, then increased according to response over 3 days to usual maintenance dose 25–35 mg/kg daily in 3 divided doses; max. 50 mg/kg daily in 3 divided doses; CHILD 2–6 years see *BNF for Children*
- Neuropathic pain, ADULT over 18 years, 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily (approx. every 8 hours) on day 3 *or* initially 300 mg 3 times daily on day 1, then increased according to response in steps of 300 mg daily (in 3 divided doses) every 2–3 days to max. 3.6 g daily

Gabapentin (Non-proprietary) PoM

Capsules, gabapentin 100 mg, net price 100-cap pack = £5.35; 300 mg, 100-cap pack = £7.39; 400 mg, 100-cap pack = £7.74. Label: 3, 5, 8, counselling, driving (see notes above)

Tablets, gabapentin 600 mg, net price 100-tab pack = £99.26; 800 mg, 100-tab pack = £65.05. Label: 3, 5, 8, counselling, driving (see notes above)

Neurontin® (Pfizer) PoM

Capsules, gabapentin 100 mg (white), net price 100-cap pack = £18.29; 300 mg (yellow), 100-cap pack = £42.40; 400 mg (orange), 100-cap pack = £49.06. Label: 3, 5, 8, counselling, driving (see notes above)

Tablets, f/c, gabapentin 600 mg, net price 100-tab pack = £84.80; 800 mg, 100-tab pack = £98.13. Label: 3, 5, 8, counselling, driving (see notes above)

PREGABALIN

Indications peripheral and central neuropathic pain; adjunctive therapy for partial seizures with or without secondary generalisation; generalised anxiety disorder

Cautions avoid abrupt withdrawal (taper over at least 1 week); severe congestive heart failure; renal impairment (Appendix 3); pregnancy (Appendix 4)

Contra-indications breast-feeding (Appendix 5)

Side-effects dry mouth, constipation, nausea, vomiting, flatulence; oedema; dizziness, drowsiness, irritability, attention disturbance, disturbances in muscle control and movement, memory impairment, paraesthesia, euphoria, confusion, fatigue, appetite changes, weight gain; changes in sexual function; visual disturbances and ocular disorders (including blurred vision, diplopia, eye strain and eye irritation); *less commonly* abdominal distension, increased salivation, gastro-oesophageal reflux disease, taste disturbance, thirst, hot flushes, tachycardia, syncope, dyspnoea, chest tightness, nasal dryness, stupor, depersonalisation, depression, insomnia, abnormal dreams, hallucinations, agitation, mood swings, panic attacks, asthenia, speech disorder, dysuria, urinary incontinence, thrombocytopenia, joint swelling, muscle cramp, myalgia, arthralgia, sweating, and rash; *rarely* ascites, dysphagia, pancreatitis, hypotension, hypertension, cold extremities, first-degree AV block, arrhythmia, bradycardia, nasopharyngitis, cough, epistaxis, rhinitis, parosmia, pyrexia, rigors, disinhibition, weight loss, hypoglycaemia or hyperglycaemia, renal failure, menstrual disturbances, breast pain, breast discharge, breast hypertrophy, neutropenia, rhabdomyolysis, hyperacusis, hypokalaemia, and leucocytosis; diarrhoea, congestive heart failure, angioedema, loss of consciousness, headache, Stevens-Johnson syndrome, and pruritus also reported; suicidal ideation

Dose

- Neuropathic pain, ADULT over 18 years, initially 150 mg daily in 2–3 divided doses, increased if necessary after 3–7 days to 300 mg daily in 2–3 divided doses, increased further if necessary after 7 days to max. 600 mg daily in 2–3 divided doses
- Epilepsy, ADULT over 18 years, initially 25 mg twice daily, increased at 7-day intervals in steps of 50 mg daily to 300 mg daily in 2–3 divided doses, increased further if necessary after 7 days to max. 600 mg daily in 2–3 divided doses
- Generalised anxiety disorder, ADULT over 18 years, initially 150 mg daily in 2–3 divided doses, increased if necessary at 7-day intervals in steps of 150 mg daily; max. 600 mg daily in 2–3 divided doses

Note Pregabalin doses in BNF may differ from those in product literature

Lyrica® (Pfizer) ▼ PoM

Capsules, pregabalin 25 mg (white), net price 56-cap pack = £64.40, 84-cap pack = £96.60; 50 mg (white), 84-cap pack = £96.60; 75 mg (white/orange), 56-cap pack = £64.40; 100 mg (orange), 84-cap pack = £96.60; 150 mg (white), 56-cap pack = £64.40; 200 mg (orange), 84-cap pack = £96.60; 225 mg (white/orange), 56-cap pack = £64.40; 300 mg (white/orange), 56-cap pack = £64.40. Label: 3, 8, counselling, driving (see notes above)

Lacosamide

Lacosamide is licensed for adjunctive treatment of partial seizures with or without secondary generalisation.

The *Scottish Medicines Consortium* (p. 3) has advised (January 2009) that lacosamide (*Vimpat®*) is accepted for restricted use within NHS Scotland as adjunctive treatment for partial seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

LACOSAMIDE

Indications see notes above

Cautions conduction problems or severe cardiac disease (increased risk of PR-interval prolongation), elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 253 and Appendix 4); breast-feeding (see p. 253 and Appendix 5); **interactions:** Appendix 1 (lacosamide)

Contra-indications second- or third-degree AV block

Side-effects nausea, vomiting, flatulence, constipation; dizziness, headache, depression, diplopia, nystagmus, impaired coordination, impaired memory, cognitive disorder, drowsiness, tremor, asthenia, fatigue; pruritus; *less commonly* PR-interval prolongation; suicidal ideation

Dose

- By intravenous infusion over 15–60 minutes (for up to 5 days) or by mouth, ADULT and CHILD over 16 years, initially 50 mg twice daily, increased weekly by 50 mg twice daily to max. 200 mg twice daily

Vimpat® (UCB Pharma) ▼ PoM

Tablets, f/c, lacosamide 50 mg (pink), net price 14-tab pack = £9.01; 100 mg (yellow), 14-tab pack = £18.02, 56-tab pack = £72.08; 150 mg (pink), 14-tab pack = £27.03, 56-tab pack £108.12; 200 mg (blue), 56-tab pack = £144.16. Label: 8, counselling, driving (see notes above)

Syrup, lacosamide 15 mg/mL, net price 200 mL = £38.61. Label: 8, counselling, driving (see notes above)
Electrolytes Na^+ 0.4 mmol/5 mL
Excipients include aspartame (section 9.4.1)

Intravenous infusion, lacosamide 10 mg/mL, net price 200-mg vial = £29.70
Electrolytes Na^+ 2.6 mmol/vial

Lamotrigine

Lamotrigine is an antiepileptic for partial seizures and primary and secondarily generalised tonic-clonic seizures. Lamotrigine may cause serious skin rash especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration whereas the enzyme inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. Where the potential for interaction is not known, treatment should be initiated with lower doses such as those used with valproate.

LAMOTRIGINE

Indications monotherapy and adjunctive treatment of partial seizures and primary and secondarily generalised tonic-clonic seizures; seizures associated with Lennox-Gastaut syndrome; trigeminal neuralgia [unlicensed indication] (section 4.7.3)

Cautions closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop; avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 253 and Appendix 4); breast-feeding (Appendix 5); **interactions:** see p. 253 and Appendix 1 (lamotrigine)

Blood disorders The CSM has advised prescribers to be alert for symptoms and signs suggestive of bone-marrow failure such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression and pancytopenia have been associated rarely with lamotrigine.

Side-effects rash (see Skin Reactions, below); hypersensitivity syndrome (possibly including rash, fever, lymphadenopathy, hepatic dysfunction, blood disorders, disseminated intravascular coagulation and multi-organ dysfunction); nausea, vomiting, diarrhoea, hepatic dysfunction; headache, fatigue, dizziness, sleep disturbances, tremor, movement disorders, agitation, confusion, hallucinations, occasional increase in seizure frequency; blood disorders (including leucopenia, thrombocytopenia, pancytopenia—see Blood Disorders, above); arthralgia; lupus erythematosus-like effect; photosensitivity; nystagmus, diplopia, blurred vision, conjunctivitis; suicidal ideation

Skin reactions Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (rarely with fatalities) have developed especially in children; most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome (see Side-effects, above) and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. The CSM has advised that factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

Counselling Warn patients to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop

Dose

Important Do not confuse the different combinations; see also notes above

Note Dose titration should be repeated if restarting after an interval of more than 5 days

- Monotherapy, ADULT and CHILD over 12 years, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 50–100 mg daily every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses (up to 500 mg daily has been required)
- Adjunctive therapy *with valproate*, initially 25 mg on alternate days for 14 days then 25 mg once daily for further 14 days, thereafter increased by max. 25–50 mg daily every 7–14 days; usual maintenance, 100–200 mg daily in 1–2 divided doses; CHILD 2–12 years initially 150 micrograms/kg once daily for 14 days (those weighing under 13 kg may receive 2 mg on alternate days for first 14 days) then 300 micrograms/kg once daily for further 14 days, thereafter increased by max. 300 micrograms/kg daily every 7–14 days; usual maintenance 1–5 mg/kg daily in 1–2 divided doses (max. single dose 100 mg)
- Adjunctive therapy (with enzyme inducing drugs) *without valproate*, initially 50 mg once daily for 14 days then 50 mg twice daily for further 14 days, thereafter increased by max. 100 mg daily every 7–14 days; usual maintenance 200–400 mg daily in 2 divided doses (up to 700 mg daily has been required); CHILD 2–12 years initially 600 micrograms/kg daily in 2 divided doses for 14 days then 1.2 mg/kg daily in 2 divided doses for further 14 days, thereafter increased by max. 1.2 mg/kg daily every 7–14 days; usual maintenance 5–15 mg/kg daily in 2 divided doses (max. single dose 200 mg)
- Adjunctive therapy *with oxcarbazepine*, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 50–100 mg daily every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses; CHILD 2–12 years initially 300 micrograms/kg daily in 1–2 divided doses for 14 days then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, thereafter increased by max. 600 micrograms/kg daily every 7–14 days; usual maintenance 1–10 mg/kg daily in 1–2 divided doses; max. 200 mg daily

Lamotrigine (Non-proprietary) PoM

Tablets, lamotrigine 25 mg, net price 56-tab pack = £3.06; 50 mg, 56-tab pack = £3.82; 100 mg, 56-tab pack = £5.26; 200 mg, 30-tab pack = £27.53, 56-tab pack = £9.43. Label: 8, counselling, driving (see notes above), skin reactions (see above)

Dispersible tablets, lamotrigine 5 mg, net price 28-tab pack = £2.83; 25 mg, 56-tab pack = £3.80; 100 mg, 56-tab pack = £6.96. Label: 8, 13, counselling, driving (see notes above), skin reactions (see above)

Lamictal® (GSK) PoM

Tablets, yellow, lamotrigine 25 mg, net price 21-tab pack (*'Valproate Add-on therapy' Starter Pack*) = £7.35, 42-tab pack (*'Monotherapy' Starter Pack*) = £14.70, 56-tab pack = £19.61; 50 mg, 42-tab pack (*'Non-valproate Add-on therapy' Starter Pack*) = £25.01, 56-tab pack = £33.35; 100 mg, 56-tab pack = £57.53; 200 mg, 56-tab pack = £97.79. Label: 8, counselling, driving (see notes above), skin reactions (above)

Dispersible tablets, chewable, lamotrigine 2 mg, net price 30-tab pack = £10.45; 5 mg, 28-tab pack = £7.82; 25 mg, 56-tab pack = £19.61; 100 mg, 56-tab pack = £57.53. Label: 8, 13, counselling, , driving (see notes above), skin reactions (above)

Levetiracetam

Levetiracetam is licensed for monotherapy and adjunctive treatment of partial seizures with or without secondary generalisation, and for adjunctive therapy of myoclonic seizures and primarily generalised tonic-clonic seizures.

LEVETIRACETAM

Indications see notes above

Cautions avoid abrupt withdrawal; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 253 and Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (levetiracetam)

Side-effects nausea, vomiting, dyspepsia, diarrhoea, abdominal pain, anorexia, weight changes; cough; drowsiness, asthenia, amnesia, ataxia, seizures, dizziness, headache, tremor, hyperkinesia, depression, emotional lability, insomnia, anxiety, impaired attention, aggression, irritability; thrombocytopenia; myalgia; visual disturbances; pruritus, rash; *also reported* pancreatitis, hepatic dysfunction, confusion, psychosis, hallucinations, suicidal ideation, paraesthesia, leucopenia, pancytopenia, and alopecia

Dose

- Monotherapy of partial seizures with or without secondary generalisation, by mouth *or* by intravenous infusion, ADULT and CHILD over 16 years, initially 250 mg once daily increased according to response in steps of 250 mg twice daily every 2 weeks; max. 1.5 g twice daily
- Adjunctive therapy of partial seizures with or without secondary generalisation, by mouth *or* by intravenous infusion, ADULT and CHILD over 12 years, body-weight over 50 kg, initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD 4–18 years body-weight under 50 kg, initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily
- Adjunctive therapy of myoclonic seizures and tonic-clonic seizures, by mouth *or* by intravenous infusion, ADULT and CHILD over 12 years, body-weight over 50 kg, initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD 12–18 years, body-weight under 50 kg, initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily

Keppra® (UCB Pharma) PoM

Tablets, f/c, levetiracetam 250 mg (blue), net price 60-tab pack = £29.70; 500 mg (yellow), 60-tab pack = £52.30; 750 mg (orange) 60-tab pack = £89.10; 1 g (white), 60-tab pack = £101.10. Label: 8

Oral solution, sugar-free, levetiracetam 100 mg/mL, net price 300 mL = £71.00. Label: 8

Concentrate for intravenous infusion, levetiracetam 100 mg/mL. For dilution before use. Net price 5-mL vial = £13.50

Electrolytes Na^+ <0.5 mmol/vial

Phenobarbital and other barbiturates

Phenobarbital (phenobarbitone) is effective for tonic-clonic and partial seizures but may be sedative in adults and cause behavioural disturbances and hyperkinesia in children. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal. Monitoring plasma concentrations is less useful than with other drugs because tolerance occurs.

Primidone is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A small starting dose of primidone (125 mg) is essential, and the drug should be introduced over several weeks.

PHENOBARBITAL
(Phenobarbitone)

Indications all forms of epilepsy except absence seizures; status epilepticus (section 4.8.2)

Cautions see notes above; elderly; debilitated; children; respiratory depression (avoid if severe); avoid abrupt withdrawal (dependence with prolonged use); history of drug or alcohol abuse; consider vitamin D supplementation in patients that are immobilized for long periods or who have inadequate sun exposure or dietary intake of calcium; avoid in acute porphyria (section 9.8.2); hepatic impairment (avoid if severe—Appendix 2); renal impairment; pregnancy (see p. 253 and Appendix 4); breast-feeding (see p. 253 and Appendix 5); **interactions:** see p. 253 and Appendix 1 (barbiturates)

Side-effects hepatitis, cholestasis; hypotension; respiratory depression; behavioural disturbances, nystagmus, irritability, drowsiness, lethargy, depression, ataxia, paradoxical excitement, hallucinations, impaired memory and cognition, hyperactivity particularly in the elderly and in children; osteomalacia (see Cautions); megaloblastic anaemia (may be treated with folic acid), agranulocytosis, thrombocytopenia; allergic skin reactions; *very rarely* Stevens-Johnson syndrome and toxic epidermal necrolysis; suicidal ideation; **overdosage:** see Emergency Treatment of Poisoning, p. 28

Dose

- By mouth, 60–180 mg at night; CHILD 5–8 mg/kg daily

  Note For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect. Plasma-phenobarbital concentration for optimum response 15–40 mg/litre (60–180 micromol/litre)

Phenobarbital (Non-proprietary) CD

Tablets, phenobarbital 15 mg, net price 28-tab pack = 86p; 30 mg, 28-tab pack = 59p; 60 mg, 28-tab pack = 69p. Label: 2, 8, counselling, driving (see notes above)

Elixir, phenobarbital 15 mg/5 mL in a suitable flavoured vehicle, containing alcohol 38%, net price 100 mL = 77p. Label: 2, 8, counselling, driving (see notes above)

Note Some hospitals supply **alcohol-free** formulations of varying phenobarbital strengths

Injection

Section 4.8.2

PRIMIDONE

Indications all forms of epilepsy except absence seizures; essential tremor (also section 4.9.3)

Cautions see under Phenobarbital; **interactions:** see p. 253 and Appendix 1 (primidone)

Side-effects see under Phenobarbital; also nausea and visual disturbances; *less commonly* vomiting, headache, and dizziness; *rarely* arthralgia

Dose

- Epilepsy, ADULT and CHILD over 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days to 500 mg daily in 2 divided doses, then increased according to response by 250 mg every 3 days to usual maintenance 0.75–1.5 g daily in 2 divided doses; CHILD under 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to response; usual maintenance, CHILD under 2 years, 250–500 mg daily in 2 divided doses; 2–5 years, 500–750 mg daily in 2 divided doses; 5–9 years 0.75–1 g daily in 2 divided doses
- Essential tremor, initially 62.5 mg daily increased gradually over 2–3 weeks according to response; max. 750 mg daily

Note Monitor plasma concentrations of derived phenobarbital; optimum range as for phenobarbital. Primidone doses in BNF may differ from those in product literature

Mysoline® (Acorus) PoM

Tablets, scored, primidone 250 mg, net price 100-tab pack = £12.60. Label: 2, 8, counselling, driving (see notes above)

Phenytoin

Phenytoin is effective for tonic-clonic and partial seizures. It has a narrow therapeutic index and the relationship between dose and plasma concentration is non-linear; small dosage increases in some patients may produce large rises in plasma concentrations with acute toxic side-effects. Monitoring of plasma concentration greatly assists dosage adjustment. A few missed doses or a small change in drug absorption may result in a marked change in plasma concentration.

Phenytoin may cause coarse facies, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.

When only parenteral administration is possible, **fosphenytoin** (section 4.8.2), a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin can be given intravenously only, fosphenytoin may also be given by intramuscular injection.

PHENYTOIN

Indications all forms of epilepsy except absence seizures; status epilepticus (section 4.8.2); trigeminal neuralgia if carbamazepine inappropriate (see also section 4.7.3)

Cautions avoid abrupt withdrawal; manufacturer recommends blood counts (but evidence of practical value unsatisfactory); consider vitamin D supplementation in patients that are immobilized for long periods or who have inadequate sun exposure or dietary intake of calcium; avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); pregnancy (**important:** see notes above and Appendix 4); breast-feeding (see notes above and Appendix 5); **interactions:** see p. 253 and Appendix 1 (phenytoin)

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia which is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of suitable alternative)

Side-effects nausea, vomiting, constipation, insomnia, transient nervousness, tremor, paraesthesia, dizziness, headache, anorexia; gingival hypertrophy and tenderness (maintain good oral hygiene); rash (discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence), acne, hirsutism, coarse facies; *rarely* hepatotoxicity, peripheral neuropathy, dyskinesia, lymphadenopathy, osteomalacia (see Cautions); blood disorders (including megaloblastic anaemia (may be treated with folic acid), leucopenia, thrombocytopenia, and aplastic anaemia), polyarteritis nodosa, lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; also reported pneumonitis and interstitial nephritis; suicidal ideation; *with excessive dosage* nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia

Dose

- By mouth, initially 3–4 mg/kg daily *or* 150–300 mg daily (as a single dose *or* in 2 divided doses) increased gradually as necessary (with plasma-phenytoin concentration monitoring); usual dose 200–500 mg daily (exceptionally, higher doses may be used); CHILD initially 5 mg/kg daily in 2 divided doses, usual dose range 4–8 mg/kg daily (max. 300 mg daily)

Note Plasma concentration for optimum response 10–20 mg/litre (40–80 micromol/litre)

Counselling Take preferably with or after food

Phenytoin (Non-proprietary) PoM

Tablets, coated, phenytoin sodium 100 mg, net price 28-tab pack = £30.00. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note On the basis of single dose tests there are no clinically relevant differences in bioavailability between available phenytoin sodium tablets and capsules but there may be a pharmacokinetic basis for maintaining the same brand of phenytoin in some patients

Epanutin® (Pfizer) PoM

Capsules, phenytoin sodium 25 mg (white/purple), net price 28-cap pack = 66p; 50 mg (white/pink), 28-cap pack = 67p; 100 mg (white/orange), 84-cap pack = £2.83; 300 mg (white/green), 28-cap pack = £2.83. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Infatabs® (= chewable tablets), yellow, scored, phenytoin 50 mg, net price 112 = £7.38. Label: 8, 24, counselling, blood or skin disorder symptoms (see above), driving (see notes above)

Note Contain phenytoin 50 mg (as against phenytoin sodium) therefore care is needed on changing to capsules or tablets containing phenytoin sodium

Suspension, red, phenytoin 30 mg/5 mL, net price 500 mL = £4.27. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note Suspension of phenytoin 90 mg in 15 mL may be considered to be approximately equivalent in therapeutic effect to capsules or tablets containing phenytoin sodium 100 mg, but nevertheless care is needed in making changes

Rufinamide

Rufinamide is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome.

The *Scottish Medicines Consortium* (p. 3) has advised (October 2008) that rufinamide (*Inovelon®*) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

RUFINAMIDE

Indications adjunctive treatment of seizures in Lennox-Gastaut syndrome

Cautions closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop; avoid abrupt withdrawal; hepatic impairment (avoid if severe; Appendix 2); pregnancy (see p. 253 and Appendix 4); **interactions:** see p. 253 and Appendix 1 (rufinamide)

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain, weight loss, anorexia; rhinitis, epistaxis; dizziness, headache, drowsiness, insomnia, anxiety, fatigue, increase in seizure frequency, impaired coordination, hyperactivity, tremor, gait disturbances; influenza-like symptoms; oligomenorrhoea; back pain; nystagmus, diplopia, blurred vision; rash and acne; hypersensitivity syndrome (possibly including rash, fever, lymphadenopathy, hepatic dysfunction, haematuria, and multiorgan dysfunction) also reported

Hypersensitivity syndrome Serious hypersensitivity syndrome (see Side-effects) has developed, especially in children and upon initiation of therapy; consider withdrawal if rash or signs or symptoms of hypersensitivity syndrome develop

Counselling Warn patients to seek immediate medical attention if signs or symptoms of hypersensitivity develop

Dose

- ADULT and CHILD over 4 years body-weight over 30 kg, initially 200 mg twice daily increased according to response in steps of 200 mg twice daily at intervals of not less than 2 days; body-weight 30–50 kg max. 900 mg twice daily; body-weight 50–70 kg max. 1.2 g twice daily; body-weight over 70 kg max. 1.6 g twice daily; CHILD over 4 years body-weight less than 30 kg, initially 100 mg twice daily increased according to response in steps of 100 mg twice daily at intervals of not less than 2 days; max. 500 mg twice daily (max. 300 mg twice daily if adjunctive therapy *with valproate*)

Inovelon® (Eisai) ▼ PoM

Tablets, pink, f/c, scored, rufinamide 100 mg, net price10-tab pack = £8.58; 200 mg, 60-tab pack = £51.48; 400 mg, 60-tab pack = £85.80. Label: 21, counselling, driving (see notes above), hypersensitivity syndrome (see above)

Tiagabine

Tiagabine is used as adjunctive treatment for partial seizures, with or without secondary generalisation.

TIAGABINE

Indications adjunctive treatment for partial seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics

Cautions avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); avoid abrupt withdrawal; **interactions:** Appendix 1 (tiagabine)

Driving May impair performance of skilled tasks (e.g. driving)

Side-effects diarrhoea; dizziness, tiredness, nervousness, tremor, impaired concentration, emotional lability, speech impairment; *rarely* confusion, depression, drowsiness, psychosis, non-convulsive status epilepticus, bruising, and visual disturbances; suicidal ideation; leucopenia also reported

Dose

- Adjunctive therapy, ADULT and CHILD over 12 years, with *enzyme-inducing* drugs, 5 mg twice daily for 1 week, then increased at weekly intervals in steps of 5–10 mg daily; usual maintenance dose 30–45 mg daily (doses above 30 mg given in 3 divided doses); in patients receiving *non-enzyme-inducing* drugs, initial maintenance dose 15–30 mg daily

Gabitril® (Cephalon) PoM

Tablets, f/c, tiagabine (as hydrochloride) 5 mg, net price 100-tab pack = £41.68; 10 mg, 100-tab pack = £83.36; 15 mg, 100-tab pack = £125.04. Label: 21

Topiramate

Topiramate can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or partial seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome. Topiramate is also licensed for prophylaxis of migraine (section 4.7.4.2).

TOPIRAMATE

Indications monotherapy and adjunctive treatment of generalised tonic-clonic seizures or partial seizures with or without secondary generalisation; adjunctive treatment of seizures in Lennox-Gastaut syndrome; migraine prophylaxis (under specialist supervision)

Cautions avoid abrupt withdrawal; ensure adequate hydration (especially if predisposition to nephrolithiasis or in strenuous activity or warm environment); avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see notes above and

Appendix 4); **interactions:** see p. 253 and Appendix 1 (topiramate)

CSM advice Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. The CSM advises that if raised intra-ocular pressure occurs:

- seek specialist ophthalmological advice;
- use appropriate measures to reduce intra-ocular pressure;
- stop topiramate as rapidly as feasible

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, abdominal pain, dyspepsia, diarrhoea, dry mouth, taste disturbance, weight loss, anorexia; paraesthesia, hypoaesthesia, headache, fatigue, dizziness, speech disorder, drowsiness, insomnia, impaired memory and concentration, anxiety, depression; visual disturbances; *less commonly* suicidal ideation; *rarely* reduced sweating mainly in children, metabolic acidosis, and alopecia; *very rarely* leucopenia, thrombocytopenia, and serious skin reactions

Dose

- Monotherapy, initially 25 mg at night for 1 week *then* increased in steps of 25–50 mg daily at intervals of 1–2 weeks taken in 2 divided doses; usual dose 100 mg daily in 2 divided doses; max. 400 mg daily; CHILD 6–16 years, initially 0.5–1 mg/kg at night for 1 week *then* increased in steps of 0.5–1 mg/kg daily at intervals of 1–2 weeks taken in 2 divided doses; usual dose 3–6 mg/kg daily in 2 divided doses; max. 15 mg/kg daily
- Adjunctive therapy, initially 25 mg at night for 1 week *then* increased in steps of 25–50 mg daily at intervals of 1–2 weeks taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; max. 800 mg daily; CHILD 2–16 years, initially 25 mg at night for 1 week *then* increased in steps of 1–3 mg/kg daily at intervals of 1–2 weeks taken in 2 divided doses; recommended dose range 5–9 mg/kg daily in 2 divided doses; max. 15 mg/kg daily
- Migraine prophylaxis ADULT and CHILD over 16 years, initially 25 mg daily at night for 1 week *then* increased in steps of 25 mg daily at intervals of 1 week; usual dose 50–100 mg daily in 2 divided doses

Note If patient cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used

Topamax® (Janssen-Cilag) ▼ PoM

Tablets, f/c, topiramate 25 mg, net price 60-tab pack = £19.68; 50 mg (light yellow), 60-tab pack = £32.33; 100 mg (yellow), 60-tab pack = £57.91; 200 mg (salmon), 60-tab pack = £112.46. Label: 3, 8, counselling, driving (see notes above)

Sprinkle capsules, topiramate 15 mg, net price 60-cap pack = £15.09; 25 mg, 60-cap pack = £22.63; 50 mg, 60-cap pack = £37.18. Label: 3, 8, counselling, administration, driving (see notes above)

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Valproate

Sodium valproate is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised epilepsy, generalised absences and myoclonic seizures, and can be tried in atypical absence, atonic, and tonic seizures. Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful. The drug has widespread metabolic effects, and may have dose-related side-effects.

Valproic acid (as semisodium valproate) (section 4.2.3) is licensed for acute mania associated with bipolar disorder.

SODIUM VALPROATE

Indications all forms of epilepsy

Cautions monitor liver function before therapy and during first 6 months especially in patients most at risk (see also below); measure full blood count and ensure no undue potential for bleeding before starting and before surgery; systemic lupus erythematosus; false-positive urine tests for ketones; avoid abrupt withdrawal; consider vitamin D supplementation in patients that are immobilized for long periods or who have inadequate sun exposure or dietary intake of calcium; renal impairment (Appendix 3); pregnancy (**important** see notes above and Appendix 4); breast-feeding (Appendix 5); **interactions:** see p. 253 and Appendix 1 (valproate)

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea and vomiting develop; discontinue if pancreatitis is diagnosed

Contra-indications active liver disease, family history of severe hepatic dysfunction; acute porphyria (section 9.8.2)

Side-effects nausea, gastric irritation, diarrhoea; weight gain; hyperammonaemia, thrombocytopenia; transient hair loss (regrowth may be curly); *less frequently* increased alertness, aggression, hyperactivity, behavioural disturbances, ataxia, tremor, and vasculitis; *rarely* hepatic dysfunction (see under Cautions; withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control), lethargy, drowsiness, confusion, stupor, hallucinations, menstrual disturbances, anaemia, leucopenia, pancytopenia, hearing loss, and rash; *very rarely* pancreatitis (see under Cautions), peripheral oedema, increase in bleeding time, extrapyramidal symptoms, dementia, encephalopathy, coma, gynaecomastia, Fanconi's syndrome, hirsutism, acne, enuresis, hyponatraemia, toxic epidermal necrolysis, and Stevens-Johnson syndrome; suicidal ideation; reduced bone mineral density (see Cautions)

Dose

- By mouth, initially 600 mg daily in 2 divided doses, preferably after food, increased by 200 mg daily every 3 days to max. 2.5 g daily, usual maintenance

dose 1–2 g daily (20–30 mg/kg daily); CHILD bodyweight up to 20 kg, initially 20 mg/kg daily in divided doses, may be increased provided plasma concentration monitored (dose above 40 mg/kg daily also monitor clinical chemistry and haematological parameters); CHILD under 12 years bodyweight over 20 kg, initially 400 mg daily in divided doses increased according to response (usual range 20–30 mg/kg daily); max. 35 mg/kg daily

- By intravenous injection (over 3–5 minutes) *or* by intravenous infusion, continuation of valproate treatment, same as current dose by oral route

Initiation of valproate therapy, by intravenous injection (over 3–5 minutes), 400–800 mg (up to 10 mg/kg) followed by intravenous infusion up to max. 2.5 g daily; CHILD under 12 years, usually 20–30 mg/kg daily, may be increased provided plasma concentration monitored (dose above 40 mg/kg daily also monitor clinical chemistry and haematological parameters)

Oral

Sodium Valproate (Non-proprietary) PoM

Tablets (crushable), scored, sodium valproate 100 mg, net price 100-tab pack = £5.60. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Tablets, e/c, sodium valproate 200 mg, net price 100-tab pack = £5.78; 500 mg, 100-tab pack = £11.56. Label: 5, 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Brands include *Orlept®*

Oral solution, sodium valproate 200 mg/5 mL, net price 300 mL = £6.57. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Brands include *Orlept®* sugar-free

Epilim® (Sanofi-Synthelabo) PoM

Tablets (crushable), scored, sodium valproate 100 mg, net price 100 = £5.60. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Tablets, both e/c, lilac, sodium valproate 200 mg, net price 100 = £7.70; 500 mg, 100 = £19.25. Label: 5, 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Liquid, red, sugar-free, sodium valproate 200 mg/5 mL, net price 300-mL pack = £9.33. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Syrup, red, sodium valproate 200 mg/5 mL, net price 300-mL pack = £7.78. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Modified release

Epilim Chrono® (Sanofi-Synthelabo) PoM

Tablets, m/r, lilac, sodium valproate 200 mg (as sodium valproate and valproic acid), net price 100-tab pack = £11.65; 300 mg, 100-tab pack = £17.47; 500 mg, 100-tab pack = £29.10. Label: 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose ADULT and CHILD over 20 kg, as above, total daily dose given in 1–2 divided doses

Epilim Chronosphere® (Sanofi-Aventis) PoM

Granules, m/r, sodium valproate 50 mg (as sodium valproate and valproic acid), net price 30-sachet pack = £30.00; 100 mg, 30-sachet pack = £30.00; 250 mg, 30-sachet pack = £30.00; 500 mg, 30-sachet pack = £30.00; 750 mg, 30-sachet pack = £30.00; 1000 mg, 30-sachet pack = £30.00. Label: 8, 25, counselling, administration, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose ADULT and CHILD, as above, total daily dose given in 1–2 divided doses

Counselling Granules may be mixed with cold food or drink and swallowed immediately without chewing

Episenta® (Beacon) PoM

Capsules, enclosing m/r granules, sodium valproate 150 mg, net price 100-cap pack = £5.70; 300 mg, 100-cap pack = £10.90. Label: 8, 25, counselling, administration, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose ADULT and CHILD, as above, total daily dose given in 1–2 divided doses

Counselling Contents of capsule may be mixed with cold food or drink and swallowed immediately without chewing

Granules, m/r, sodium valproate 500 mg, net price 100-sachet pack = £18.00; 1 g, 100-sachet pack = £35.50. Label: 8, 25, counselling, administration, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose ADULT and CHILD, as above, total daily dose given in 1–2 divided doses

Counselling Granules may be mixed with cold food or drink and swallowed immediately without chewing

Parenteral

Epilim® Intravenous (Sanofi-Synthelabo) PoM

Injection, powder for reconstitution, sodium valproate, net price 400-mg vial (with 4-mL amp water for injections) = £11.58

Episenta® (Beacon) PoM

Injection, sodium valproate 100 mg/mL, net price 3-mL amp = £7.00, 10-mL amp = £23.33

Valproic acid

Convulex® (Pharmacia) PoM

Capsules, e/c, valproic acid 150 mg, net price 100-cap pack = £3.68; 300 mg, 100-cap pack = £7.35; 500 mg, 100-cap pack = £12.25. Label: 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose epilepsy, ADULT and CHILD as for sodium valproate, total daily dose given in 2–4 divided doses

Equivalence to sodium valproate Manufacturer advises that *Convulex®* has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed in making changes

Depakote® (Sanofi-Synthelabo) PoM

Section 4.2.3 (bipolar disorder)

Vigabatrin

For partial epilepsy with or without secondary generalisation, **vigabatrin** is given in combination with other antiepileptic treatment; its use is restricted to patients in whom all other combinations are inadequate or are not tolerated. It can be used as sole therapy in the management of infantile spasms in West's syndrome.

About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and **careful monitoring** for this side-effect are required (see also Visual Field Defects under Cautions below). Vigabatrin has prominent behavioural side-effects in some patients.

VIGABATRIN

Indications initiated and supervised by appropriate specialist, adjunctive treatment of partial seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics; monotherapy for management of infantile spasms (West's syndrome)

Cautions renal impairment (Appendix 3); elderly; closely monitor neurological function; avoid sudden withdrawal (taper off over 2–4 weeks); history of psychosis, depression or behavioural problems; pregnancy (see p. 253 and Appendix 4) and breast-feeding (Appendix 5); absence seizures (may be exacerbated); **interactions:** see p. 253 and Appendix 1 (vigabatrin)

Visual field defects Vigabatrin is associated with visual field defects. The CSM has advised that onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation. Product literature advises visual field testing before treatment and at 6-month intervals; a procedure for testing visual fields in those with a developmental age of less than 9 years is available from the manufacturers. Patients should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

Contra-indications visual field defects

Side-effects nausea, abdominal pain; oedema; drowsiness (rarely encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG—reduce dose or withdraw), fatigue, excitation, and agitation (especially in children), dizziness, headache, nervousness, depression, aggression, paranoia, impaired concentration, memory disturbances, tremor, paraesthesia, weight gain; visual field defects (see also under Cautions), blurred vision, nystagmus, diplopia; *less commonly* ataxia, psychosis, mania, and rash; occasional increase in seizure frequency (especially if myoclonic); *rarely* suicidal ideation and retinal disorders (including peripheral retinal neuropathy); *very rarely* hepatitis, optic neuritis and optic atrophy; also reported, decrease in liver enzymes and speech disorder

Dose

- With current antiepileptic therapy, initially 1 g daily in single or 2 divided doses then increased according to response in steps of 500 mg at weekly intervals; usual range 2–3 g daily (max. 3 g daily); CHILD initially 40 mg/kg daily in single or 2 divided doses then adjusted according to body-weight 10–15 kg, 0.5–1 g daily; body-weight 15–30 kg, 1–1.5 g daily; body-weight 30–50 kg, 1.5–3 g daily; body-weight over 50 kg, 2–3 g daily
- Infantile spasms (West's syndrome), *monotherapy*, 50 mg/kg daily, adjusted according to response over 7 days; up to 150 mg/kg daily used with good tolerability

Sabril® (Aventis Pharma) PoM

Tablets, f/c, scored, vigabatrin 500 mg, net price 100-tab pack = £30.84. Label: 3, 8, counselling, driving (see notes above)

Powder, sugar-free, vigabatrin 500 mg/sachet. Net price 50-sachet pack = £17.08. Label: 3, 8, 13, counselling, driving (see notes above)

Note The contents of a sachet should be dissolved in water or a soft drink immediately before taking

Zonisamide

Zonisamide can be used as adjunctive treatment for refractory partial seizures with or without secondary generalisation.

ZONISAMIDE

Indications adjunctive therapy for refractory partial seizures with or without secondary generalisation

Cautions elderly; ensure adequate hydration (especially if predisposition to nephrolithiasis or in strenuous activity or warm environment); concomitant use of drugs that increase risk of hyperthermia or nephrolithiasis; avoid abrupt withdrawal; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** see p. 253 and Appendix 1 (zonisamide)

Contra-indications hypersensitivity to sulphonamides; breast-feeding (Appendix 5)

Side-effects nausea, diarrhoea, abdominal pain, anorexia, weight loss; drowsiness, dizziness, confusion, agitation, irritability, depression, ataxia, speech disorder, impaired memory and attention, pyrexia; diplopia; rash (consider withdrawal); *less commonly* vomiting, cholelithiasis, cholecystitis, aggression, suicidal ideation, convulsions, psychosis, urinary calculus, hypokalaemia; *very rarely* hepatitis, pancreatitis, dyspnoea, hallucinations, insomnia, amnesia, coma, myasthenic syndrome, neuroleptic malignant syndrome, heat stroke, hydronephrosis, renal impairment, metabolic acidosis, blood disorders, rhabdomyolysis, impaired sweating, pruritus, and Stevens-Johnson syndrome; suicidal ideation

Dose

- ADULT over 18 years, initially 50 mg daily in 2 divided doses, increased after 7 days to 100 mg daily in 2 divided doses; then increase if necessary by 100 mg every 7 days; usual maintenance 300–500 mg daily in 1–2 divided doses

Zonegran® (Eisai) ▼ PoM

Capsules, zonisamide 25 mg (white), net price 14-cap pack = £8.82; 50 mg (white/grey), 56-cap pack = £47.04; 100 mg (white/red), 56-cap pack = £62.72. Label: 3

Benzodiazepines

Clonazepam is occasionally used in tonic-clonic or partial seizures, but its sedative side-effects may be prominent. **Clobazam** may be used as adjunctive therapy in the treatment of epilepsy (section 4.1.2), but the effectiveness of these and other **benzodiazepines** may wane considerably after weeks or months of continuous therapy.

CLOBAZAM

Indications adjunct in epilepsy; anxiety (short-term use)

Cautions see under Diazepam (section 4.1.2)

Contra-indications see under Diazepam (section 4.1.2)

Side-effects see under Diazepam (section 4.1.2)

Dose

- Epilepsy, 20–30 mg daily; max. 60 mg daily; CHILD over 3 years, not more than half adult dose
- Anxiety, 20–30 mg daily in divided doses or as a single dose at bedtime, increased in severe anxiety (in hospital patients) to a max. of 60 mg daily in divided doses; ELDERLY (or debilitated) 10–20 mg daily

[1] **Clobazam** (Non-proprietary) PoM NHS
Tablets, clobazam 10 mg. Net price 30-tab pack = £4.68. Label: 2 or 19, 8, counselling, driving (see notes above)
Brands include *Frisium*® NHS

1. NHS except for epilepsy and endorsed 'SLS'

CLONAZEPAM

Indications all forms of epilepsy; myoclonus; status epilepticus (section 4.8.2)

Cautions see notes above; elderly and debilitated, respiratory disease, spinal or cerebellar ataxia; history of alcohol or drug abuse, depression or suicidal ideation; avoid sudden withdrawal; myasthenia gravis (avoid if unstable); acute porphyria (section 9.8.2); hepatic impairment (avoid if severe; Appendix 2); renal impairment; pregnancy (see notes above and Appendix 4); breast-feeding (see notes above and Appendix 5); **interactions:** Appendix 1 (anxiolytics and hypnotics)
Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome; marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects drowsiness, fatigue, dizziness, muscle hypotonia, co-ordination disturbances; also poor concentration, restlessness, confusion, amnesia, dependence, and withdrawal; salivary or bronchial hypersecretion in infants and small children; *rarely* gastro-intestinal symptoms, respiratory depression, headache, paradoxical effects including aggression and anxiety, sexual dysfunction, urinary incontinence, urticaria, pruritus, reversible hair loss, skin pigmentation changes; dysarthria, and visual disturbances on long-term treatment; blood disorders reported; **overdosage:** see Emergency Treatment of Poisoning, p. 32

Dose

- 1 mg (ELDERLY 500 micrograms) initially at night for 4 nights, increased according to response over 2–4 weeks to usual maintenance dose of 4–8 mg usually at night (may be given in 3–4 divided doses if necessary); CHILD up to 1 year, initially 250 micrograms increased as above to usual maintenance dose of 0.5–1 mg, 1–5 years, initially 250 micrograms increased as above to 1–3 mg, 5–12 years, initially 500 micrograms increased as above to 3–6 mg

Note Clonazepam doses in BNF may differ from those in product literature

Rivotril® (Roche) PoM
Tablets, both scored, clonazepam 500 micrograms (beige), net price 100 = £3.77; 2 mg (white), 100 = £5.03. Label: 2, 8, counselling, driving (see notes above)
Injection, section 4.8.2

Other drugs

Acetazolamide (section 11.6), a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. It can also be used with other antiepileptics for tonic-clonic and partial seizures. It is occasionally helpful in atypical absence, atonic, and tonic seizures.

Piracetam (section 4.9.3) is used as adjunctive treatment for cortical myoclonus.

4.8.2 Drugs used in status epilepticus

Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral **thiamine** should be considered if alcohol abuse is suspected; **pyridoxine** (section 9.6.2) should be given if the status epilepticus is caused by pyridoxine deficiency.

Convulsive status epilepticus should be treated urgently with intravenous **lorazepam**, repeated once after 10 minutes if seizures recur. Intravenous diazepam is effective but it is associated with a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. **Clonazepam** can also be used as an alternative.

Where facilities for resuscitation are not immediately available, **diazepam** can be administered as a rectal solution or **midazolam** [unlicensed use] can be given into the buccal cavity.

> **Important**
> If seizures recur or fail to respond within 30 minutes, phenytoin sodium, fosphenytoin, or phenobarbital sodium should be used.
> If these measures fail to control seizure within 60 minutes, anaesthesia with thiopental (section 15.1.1), midazolam (section 15.1.4), or in adults, a non-barbiturate anaesthetic such as propofol [unlicensed indication] (section 15.1.1), should be instituted with full intensive care support.

Phenytoin sodium may be given by slow intravenous injection, with ECG monitoring, followed by the maintenance dosage. Intramuscular use of phenytoin is not recommended (absorption is slow and erratic).

Alternatively, **fosphenytoin**, a pro-drug of phenytoin, can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin. Intravenous administration requires ECG monitoring. Although it can also be given intramuscularly, absorp-

tion is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin should be expressed in terms of phenytoin sodium.

Paraldehyde also remains a valuable drug. Given rectally it causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

For advice on the management of epileptic seizures in dental practice, see p. 22.

Non-convulsive status epilepticus The urgency to treat non-convulsive status epilepticus depends upon the severity of the patient's condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

CLONAZEPAM

Indications status epilepticus; other forms of epilepsy, and myoclonus (section 4.8.1)

Cautions see section 4.8.1; facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)
Intravenous infusion Intravenous infusion of clonazepam is potentially hazardous (especially if prolonged), calling for close and constant observation and best carried out in specialist centres with intensive care facilities. Prolonged infusion may lead to accumulation and delay recovery

Contra-indications see section 4.8.1; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Side-effects see section 4.8.1; hypotension and apnoea

Dose

- By intravenous injection into a large vein (over at least 2 minutes) *or* by intravenous infusion, 1 mg, repeated if necessary; CHILD all ages, 500 micrograms

Rivotril® (Roche) PoM
Injection, clonazepam 1 mg/mL in solvent, for dilution with 1 mL water for injections immediately before injection or as described in Appendix 6. Net price 1-mL amp (with 1 mL water for injections) = 61p
Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available, see Excipients, p. 2), ethanol, propylene glycol

Oral preparations

Section 4.8.1

DIAZEPAM

Indications status epilepticus; febrile convulsions; convulsions due to poisoning (see p. 28); other indications (section 4.1.2, section 10.2.2, and section 15.1.4.1)

Cautions see section 4.1.2; when given intravenously facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

Contra-indications see section 4.1.2

Side-effects see section 4.1.2; hypotension and apnoea

Dose

- Status epilepticus (but see notes above), febrile convulsions, and convulsions due to poisoning, by intravenous injection, 10 mg at a rate of 1 mL (5 mg) per minute, repeated once after 10 minutes if necessary; CHILD under 12 years, 300–400 micrograms/kg [unlicensed dose], repeated once after 10 minutes if necessary

  By rectum as rectal solution, ADULT over 18 years, 10–20 mg (max. 30 mg), repeated once after 10–15 minutes if necessary; ELDERLY 10 mg (max. 15 mg); NEONATE 1.25–2.5 mg; CHILD 1 month–2 years, 5 mg; 2–12 years, 5–10 mg; 12–18 years, 10 mg

Diazepam (Non-proprietary) PoM
Injection (solution), diazepam 5 mg/mL. See Appendix 6. Net price 2-mL amp = 45p
Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2), ethanol, propylene glycol

Injection (emulsion), diazepam 5 mg/mL (0.5%). See Appendix 6. Net price 2-mL amp = 92p
Brands include *Diazemuls®*

Rectal tubes (= rectal solution), diazepam 2 mg/mL, net price 1.25-mL (2.5-mg) tube = 90p, 2.5-mL (5-mg) tube = £1.27; 4 mg/mL, 2.5-mL (10-mg) tube = £1.65
Brands include *Diazepam Rectubes®*, *Stesolid®*

Oral preparations

Section 4.1.2

FOSPHENYTOIN SODIUM

Note Fosphenytoin is a pro-drug of phenytoin

Indications status epilepticus; seizures associated with neurosurgery or head injury; when phenytoin by mouth not possible

Cautions see Phenytoin Sodium; liver impairment (Appendix 2); renal impairment (Appendix 3); resuscitation facilities must be available; **interactions:** see p. 253 and Appendix 1 (phenytoin)

Contra-indications see Phenytoin Sodium

Side-effects see Phenytoin Sodium
CSM advice Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The CSM advises:

- monitor heart rate, blood pressure, and respiratory function for duration of infusion
- observe patient for at least 30 minutes after infusion
- if hypotension occurs, reduce infusion rate or discontinue
- reduce dose or infusion rate in elderly, and in renal or hepatic impairment.

Dose

Note Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg

- Status epilepticus, by intravenous infusion (at a rate of 100–150 mg(PE)/minute), initially 20 mg(PE)/kg then by intravenous infusion (at a rate of 50–100 mg(PE)/minute), 4–5 mg(PE)/kg daily in 1–2 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration

  CHILD 5 years and over, by intravenous infusion (at a rate of 2–3 mg(PE)/kg/minute), initially 20 mg(PE)/kg then by intravenous infusion (at a rate of 1–2 mg(PE)/kg/minute), 4–5 mg(PE)/kg daily in 1–4

divided doses, dose adjusted according to response and trough plasma-phenytoin concentration

- Prophylaxis or treatment of seizures associated with neurosurgery or head injury, by intramuscular injection *or* by intravenous infusion (at a rate of 50–100 mg(PE)/minute), initially 10–15 mg(PE)/kg then by intramuscular injection *or* by intravenous infusion (at a rate of 50–100 mg(PE)/minute), 4–5 mg(PE)/kg daily (in 1–2 divided doses), dose adjusted according to response and trough plasma-phenytoin concentration
  CHILD 5 years and over, by intravenous infusion (at a rate of 1–2 mg(PE)/kg/minute), initially 10–15 mg(PE)/kg then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration
- Temporary substitution for oral phenytoin, by intramuscular injection *or* by intravenous infusion (at a rate of 50–100 mg(PE)/minute), same dose and dosing frequency as oral phenytoin therapy; CHILD 5 years and over, by intravenous infusion (at a rate of 1–2 mg(PE)/kg/minute), same dose and dosing frequency as oral phenytoin therapy

Note ELDERLY consider 10–25% reduction in dose or infusion rate

Note Fosphenytoin sodium doses in BNF may differ from those in product literature

Pro-Epanutin® (Pfizer) PoM
Injection, fosphenytoin sodium 75 mg/mL (equivalent to phenytoin sodium 50 mg/mL), net price 10-mL vial = £40.00
Electrolytes phosphate 3.7 micromol/mg fosphenytoin sodium (phosphate 5.6 micromol/mg phenytoin sodium)

LORAZEPAM

Indications status epilepticus; other indications (section 4.1.2)

Cautions see section 4.1.2

Contra-indications see under Diazepam (section 4.1.2)

Side-effects see under Diazepam (section 4.1.2)

Dose

- By slow intravenous injection (into large vein), 4 mg repeated once after 10 minutes if necessary; CHILD under 12 years 100 micrograms/kg (max. 4 mg) repeated once after 10 minutes if necessary

Preparations

Section 4.1.2

MIDAZOLAM

Indications status epilepticus [unlicensed indication]; other indications (section 15.1.4)

Cautions section 15.1.4

Contra-indications section 15.1.4

Side-effects section 15.1.4

Dose

- By buccal administration [unlicensed], ADULT and CHILD over 10 years, 10 mg repeated once after 10 minutes if necessary; CHILD up to 6 months, 300 micrograms/kg (max. 2.5 mg); 6 months–1 year, 2.5 mg; 1–5 years, 5 mg; 5–10 years, 7.5 mg

Note Midazolam injection solution may be given by buccal administration

Midazolam (Non-proprietary) CD
Buccal liquid, midazolam 10 mg/mL
Available from 'special-order' manufacturers or specialist importing companies, see p. 969

Injection

Section 15.1.4

PARALDEHYDE

Indications status epilepticus

Cautions bronchopulmonary disease, hepatic impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5); **interactions:** Appendix 1 (paraldehyde)

Contra-indications gastric disorders; rectal administration in colitis

Side-effects rashes; rectal irritation after enema

Dose

- By rectum (doses expressed as undiluted paraldehyde), ADULT and CHILD over 12 years, 20 mL; CHILD up to 3 months 0.5 mL, 3–6 months 1 mL, 6–12 months 1.5 mL, 1–2 years 2 mL, 2–5 years 3–4 mL, 5–12 years 5–10 mL

Administration for *rectal administration*, do not administer paraldehyde undiluted

Paraldehyde (Non-proprietary) PoM
Enema, 8–50%, available from 'special-order' manufacturers or specialist importing companies, see p. 969

PHENOBARBITAL SODIUM
(Phenobarbitone sodium)

Indications status epilepticus; other forms of epilepsy except absence seizures (section 4.8.1)

Cautions see under Phenobarbital (section 4.8.1)

Side-effects see under Phenobarbital (section 4.8.1)

Dose

- Status epilepticus, by intravenous injection (dilute injection 1 in 10 with water for injections), 10 mg/kg at a rate of not more than 100 mg/minute; max. 1 g

Note For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect

Phenobarbital (Non-proprietary) CD
Injection, phenobarbital sodium 200 mg/mL, net price 1-mL amp = £2.00
Excipients include propylene glycol 90% (see Excipients, p. 2)
Note Must be diluted before intravenous administration (see under Dose)

Oral preparations

Section 4.8.1

PHENYTOIN SODIUM

Indications status epilepticus; seizures in neurosurgery; arrhythmias, but now obsolete (section 2.3.2)

Cautions hypotension and heart failure; resuscitation facilities must be available; injection solutions alkaline (irritant to tissues); see also p. 260; **interactions:** see p. 253 and Appendix 1 (phenytoin)

Contra-indications sinus bradycardia, sino-atrial block, and second- and third-degree heart block; Stokes-Adams syndrome; acute porphyria (section 9.8.2)

Side-effects intravenous injection may cause cardiovascular and CNS depression (particularly if injection too rapid) with arrhythmias, hypotension, and cardiovascular collapse; alterations in respiratory function (including respiratory arrest); injection site reactions; see also p. 260

Dose

- By slow intravenous injection *or* infusion (with blood pressure and ECG monitoring), status epilepticus, 18 mg/kg at a rate not exceeding 50 mg per minute, as a loading dose (see also notes above); maintenance doses of about 100 mg should be given thereafter at intervals of every 6–8 hours, monitored by measurement of plasma concentrations; rate and dose reduced according to weight; CHILD 18 mg/kg as a loading dose (NEONATE 15–20 mg/kg at rate of 1–3 mg/kg/minute)

  Ventricular arrhythmias (but use now obsolete), by intravenous injection via caval catheter, 3.5–5 mg/kg at a rate not exceeding 50 mg/minute, with blood pressure and ECG monitoring; repeated once if necessary

  Note To avoid local venous irritation each injection or infusion should be preceded and followed by an injection of sterile physiological saline through the same needle or catheter
- By intramuscular injection, not recommended (see notes above)

Note Phenytoin sodium doses in BNF may differ from those in product literature

Phenytoin (Non-proprietary) PoM

Injection, phenytoin sodium 50 mg/mL with propylene glycol 40% and alcohol 10% in water for injections, net price 5-mL amp = £3.40

Epanutin® Ready-Mixed Parenteral (Pfizer) PoM

Injection, phenytoin sodium 50 mg/mL with propylene glycol 40% and alcohol 10% in water for injections, net price 5-mL amp = £4.88

Electrolytes 1.1 mmol Na^+ per 5 mL ampoule

Oral preparations

Section 4.8.1

4.8.3 Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication, e.g. **paracetamol** (section 4.7.1) is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 15 minutes or longer), *recurrent convulsions*, or those occurring in a child at known risk must be treated more actively, as there is the possibility of resulting brain damage. **Diazepam** is the drug of choice given either by slow intravenous injection or preferably rectally in solution (section 4.8.2). The rectal route is preferred as satisfactory absorption is achieved within minutes and administration is much easier. Suppositories are not suitable because absorption is too slow.

Intermittent prophylaxis (i.e. the anticonvulsant administered at the onset of fever) is possible in only a small proportion of children. Again **diazepam** is the treatment of choice, orally or rectally.

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated. Anticonvulsant treatment needs to be considered only for children at risk from prolonged or complex febrile convulsions, including those whose first seizure occurred at under 14 months or who have neurological abnormalities or who have had previous prolonged or focal convulsions.

4.9 Drugs used in parkinsonism and related disorders

4.9.1 Dopaminergic drugs used in parkinsonism
4.9.2 Antimuscarinic drugs used in parkinsonism
4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

In idiopathic Parkinson's disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients' quality of life.

Patients with suspected Parkinson's disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson's disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson's disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson's disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require **levodopa** and subsequently develop motor complications.

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

Elderly Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

4.9.1 Dopaminergic drugs used in parkinsonism

Dopamine receptor agonists

The dopamine receptor agonists, **bromocriptine**, **cabergoline**, **pergolide**, **pramipexole**, **ropinirole**, and **rotigotine** have a direct action on dopamine receptors. The treatment of new patients is often started with dopamine receptor agonists. They are also used with levodopa in more advanced disease. Rotigotine is

licensed for use as monotherapy in early-stage Parkinson's disease.

When used alone, dopamine receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine receptor agonists are associated with more neuropsychiatric side-effects than levodopa. The ergot-derived dopamine receptor agonists, bromocriptine, cabergoline, and pergolide, have been associated with fibrotic reactions (see notes below). Patients should be monitored for signs of cardiac fibrosis, before and at regular intervals during treatment with cabergoline or pergolide. In most cases, non-ergot-derived dopamine agonists are preferred over ergot-derived dopamine agonists.

Dopamine receptor agonists can cause excessive daytime sleepiness and sudden onset of sleep, see Sudden Onset of Sleep, p. 272.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Doses of dopamine receptor agonists should be increased slowly according to response and tolerability. Treatment with dopamine receptor agonists should not be withdrawn abruptly.

Fibrotic reactions

Ergot-derived dopamine receptor agonists, bromocriptine, cabergoline, and pergolide, have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

Apomorphine is a potent dopamine agonist that is sometimes helpful in advanced disease for patients experiencing unpredictable 'off' periods with levodopa treatment. Apomorphine is highly emetogenic; patients must receive domperidone for at least 2 days before starting treatment. Specialist supervision is advisable throughout apomorphine treatment.

APOMORPHINE HYDROCHLORIDE

Indications refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by levodopa with dopa-decarboxylase inhibitor or other dopaminergics (for capable and motivated patients under specialist supervision)

Cautions see notes above; pulmonary or cardiovascular disease, history of postural hypotension (special care on initiation); neuropsychiatric problems or dementia; hepatic, haemopoietic, renal, and cardiovascular monitoring; *on administration with levodopa* test initially and every 6 months for haemolytic anaemia (development calls for specialist haematological care with dose reduction and possible discontinuation); renal impairment; pregnancy; **interactions:** Appendix 1 (apomorphine)

Contra-indications respiratory depression, hypersensitivity to opioids; not suitable if 'on' response to levodopa marred by severe dyskinesia, hypotonia or psychiatric effects; hepatic impairment; breast-feeding; not for intravenous administration

Side-effects nausea, vomiting (see below under Dose); drowsiness (including sudden onset of sleep), confusion, hallucinations, injection-site reactions (including nodule formation and ulceration)—change injection sites in rotation; *less commonly* postural hypotension, breathing difficulties, dykinesias during 'on' periods (may require discontinuation), haemolytic anaemia with levodopa (see Cautions), and rash; *rarely* eosinophilia; pathological gambling, increased libido, and hypersexuality also reported

Dose

- By subcutaneous injection, usual range (after initiation as below) 3–30 mg daily in divided doses; subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses daily; max. single dose 10 mg; CHILD and ADOLESCENT under 18 years not recommended
- By continuous subcutaneous infusion (those requiring division into more than 10 injections daily) initially 1 mg/hour daily increased according to response (not more often than every 4 hours) in max. steps of 500 micrograms/hour, to usual rate of 1–4 mg/hour (14–60 micrograms/kg/hour); change infusion site every 12 hours and give during waking hours only (24-hour infusions not advised unless severe night-time symptoms)—intermittent bolus boosts also usually needed; CHILD and ADOLESCENT under 18 years not recommended

Note Total daily dose by either route (or combined routes) max. 100 mg

Requirements for initiation *Hospital admission* and at least 2 days of pretreatment with domperidone for nausea and vomiting, *after at least 3 days* withhold existing antiparkinsonian medication overnight to provoke 'off' episode, *determine* threshold dose, *re-establish* other antiparkinsonian drugs, *determine* effective apomorphine regimen, *teach* to administer by subcutaneous injection into lower abdomen or outer thigh at first sign of 'off' episode, *discharge* from hospital, *monitor* frequently and *adjust* dosage regimen as appropriate (domperidone may normally be withdrawn over several weeks or longer)—for full details of initiation requirements, consult product literature

APO-go® (Forum) PoM

Injection, apomorphine hydrochloride 10 mg/mL, net price 2-mL amp = £7.59, 5-mL amp = £14.62
Excipients include sulphites

Injection (APO-go® Pen), apomorphine hydrochloride 10 mg/mL, net price 3-mL pen injector = £24.78
Excipients include sulphites

Injection (APO-go® PFS), apomorphine hydrochloride 5 mg/mL, net price 10-mL prefilled syringe = £14.62
Excipients include sulphites

BROMOCRIPTINE

Indications parkinsonism (but not drug-induced extrapyramidal symptoms); endocrine disorders (section 6.7.1)

Cautions see section 6.7.1 and notes above

Contra-indications section 6.7.1

Side-effects section 6.7.1

Dose

- First week 1–1.25 mg at night, second week 2–2.5 mg at night, third week 2.5 mg twice daily, fourth week 2.5 mg 3 times daily then increasing by 2.5 mg every 3–14 days according to response to a usual range of 10–30 mg daily; taken with food

Preparations

Section 6.7.1

CABERGOLINE

Indications alone or as adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson's disease where dopamine receptor agonists other than ergot derivative not appropriate; endocrine disorders (section 6.7.1)

Cautions see section 6.7.1 and notes above

Contra-indications section 6.7.1

Side-effects section 6.7.1

Dose

- Initially 1 mg daily, increased by increments of 0.5–1 mg at 7 or 14 day intervals; usual range 2–3 mg daily
  Note Concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased

Cabergoline (Non-proprietary) PoM

Tablets, scored, cabergoline 1 mg, net price 20-tab pack = £52.97; 2 mg, 20-tab pack = £63.79. Label: 21, counselling, hypotensive reactions, driving, see notes above

Note Dispense in original container (contains desiccant)

PERGOLIDE

Indications alone or as adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson's disease where dopamine receptor agonists other than ergot derivative not appropriate

Cautions see notes above; arrhythmias or underlying cardiac disease; history of confusion, psychosis, or hallucinations, dyskinesia (may exacerbate); acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (pergolide)

Contra-indications history of fibrotic disorders; cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, p. 269)

Side-effects see notes above; also nausea, vomiting, dyspepsia, abdominal pain; dyspnoea, rhinitis; hallucinations, dyskinesia, drowsiness (including sudden onset of sleep); diplopia; also reported constipation, diarrhoea, tachycardia, atrial premature contractions, palpitation, hypotension, syncope, Raynaud's phenomenon, cardiac valvulopathy, pericarditis, pericardial effusion, pleuritis, pleural effusion, pleural fibrosis, insomnia, confusion, dizziness, pathological gambling, neuroleptic malignant syndrome, fever, increased libido, hypersexuality, and rash

Dose

- Monotherapy, 50 micrograms at night on day 1, then 50 micrograms twice daily on days 2–4, then increased by 100–250 micrograms daily every 3–4 days to 1.5 mg daily in 3 divided doses at day 28; after day 30, further increases every 3–4 days of up to 250 micrograms daily; usual maintenance dose 2.1–2.5 mg daily; max. 3 mg daily
- Adjunctive therapy with levodopa, 50 micrograms daily for 2 days, increased gradually by 100–150 micrograms every 3 days over next 12 days, usually given in 3 divided doses; further increases of 250 micrograms every 3 days; max. 3 mg daily; during pergolide titration levodopa dose may be reduced cautiously

Pergolide (Non-proprietary) PoM

Tablets, pergolide (as mesilate) 50 micrograms, net price 100-tab pack = £14.41; 250 micrograms, 100-tab pack = £10.52; 1 mg, 100-tab pack = £21.58. Counselling, hypotensive reactions, driving, see notes above

Celance® (Lilly) PoM

Tablets, all scored, pergolide (as mesilate) 50 micrograms (ivory), net price 100-tab pack = £20.70; 250 micrograms (green), 100-tab pack = £16.91; 1 mg (pink), 100-tab pack = £43.44. Counselling, hypotensive reactions, driving, see notes above

PRAMIPEXOLE

Indications Parkinson's disease, used alone or as an adjunct to levodopa with dopa-decarboxylase inhibitor; moderate to severe restless legs syndrome

Cautions see notes above; psychotic disorders; ophthalmological testing recommended (risk of visual disorders); severe cardiovascular disease; renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (pramipexole)

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also nausea, constipation; postural hypotension, hypotension, headache, confusion, drowsiness (including sudden onset of sleep), fatigue, insomnia, dizziness, hallucinations (mostly visual), dyskinesia, peripheral oedema; hyperkinesia, delusions, abnormal dreams, paradoxical worsening of restless legs syndrome, and behavioural changes including pathological gambling, binge eating, hypersexuality, and changes in libido also reported

Dose

Important Doses and strengths are stated in terms of pramipexole (base); equivalent strengths in terms of pramipexole dihydrochloride monohydrate (salt) are as follows:
88 micrograms base ≡ 125 micrograms salt;
180 micrograms base ≡ 250 micrograms salt;
350 micrograms base ≡ 500 micrograms salt;
700 micrograms base ≡ 1 mg salt

- Parkinson's disease, initially 88 micrograms 3 times daily, dose doubled every 5–7 days if tolerated to 350 micrograms 3 times daily; further increased if necessary by 180 micrograms 3 times daily at weekly intervals; max. 3.3 mg daily in 3 divided doses
  Note During pramipexole dose titration and maintenance, levodopa dose may be reduced
- Restless legs syndrome, initially 88 micrograms once daily 2–3 hours before bedtime, dose doubled every 4–7 days if necessary to 350 micrograms daily; max. 540 micrograms daily; CHILD under 18 years not recommended

Mirapexin® (Boehringer Ingelheim) ▼ PoM

Tablets, pramipexole 88 micrograms, net price 30-tab pack = £9.55; 180 micrograms (scored), 30-tab pack = £19.10, 100-tab pack = £63.67; 350 micrograms (scored), 30-tab pack = £38.20, 100-tab pack = £127.34; 700 micrograms (scored), 30-tab pack = £76.40, 100-tab pack = £254.69. Counselling, hypotensive reactions, driving, see notes above

ROPINIROLE

Indications Parkinson's disease, either used alone or as an adjunct to levodopa with a dopa-decarboxylase inhibitor; moderate to severe restless legs syndrome

Cautions see notes above; severe cardiovascular disease, major psychotic disorders; hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 (ropinirole)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; also nausea, vomiting, abdominal pain, dyspepsia, constipation; hypotension; syncope, peripheral oedema; drowsiness (including sudden onset of sleep, see p. 272), dizziness, nervousness, fatigue, dyskinesia, hallucinations, confusion; *less commonly* psychosis, pathological gambling, hypersexuality, and increased libido; *very rarely* hepatic disorders; *also reported* paradoxical worsening of restless legs syndrome

Dose

- Parkinson's disease, initially 750 micrograms daily in 3 divided doses, increased by increments of 750 micrograms at weekly intervals to 3 mg daily; further increased by increments of up to 3 mg at weekly intervals according to response; usual range 9–16 mg daily (but higher doses may be required if used with levodopa); max. 24 mg daily
  Note When administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%; ropinirole doses in the BNF may differ from those in product literature
- Restless legs syndrome, ADULT over 18 years initially 250 micrograms at night for 2 days, increased if tolerated to 500 micrograms at night for 5 days and then to 1 mg at night for 7 days; further increased at weekly intervals in steps of 500 micrograms daily according to response; usual dose 2 mg at night; max. 4 mg daily
  Note Repeat dose titration if restarting after interval of more than a few days

Ropinirole (Non-proprietary) PoM

Tablets, ropinirole (as hydrochloride) 250 microgram, net price 12-tab pack = £3.94; 500 microgram, 28-tab pack = £15.75; 1 mg, 84-tab pack = £47.26; 2 mg, 84-tab pack = £94.53; 5 mg, 84-tab pack = £163.27. Label: 21, counselling, driving, see notes above

Adartrel® (GSK) PoM

Tablets, f/c, ropinirole (as hydrochloride) 250 micrograms (white), net price 12-tab pack = £3.94; 500 micrograms (yellow), 28-tab pack = £15.75, 84-tab pack = £47.26; 2 mg (pink), 28-tab pack = £31.51, 84-tab pack = £94.53. Label: 21, counselling, driving, see notes above

Note Licensed for use in restless legs syndrome only

The *Scottish Medicines Consortium* has advised (June 2006) that *Adartrel®* should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale

Requip® (GSK) PoM

Tablets, f/c, ropinirole (as hydrochloride) 1 mg (green), net price 84-tab pack = £47.26; 2 mg (pink), 84-tab pack = £94.53; 5 mg (blue), 84-tab pack = £163.27; 28-day starter pack of 42 × 250-microgram (white) tablets, 42 × 500-microgram (yellow) tablets, and 21 × 1-mg (green) tablets = £40.10; 28-day follow-on pack of 42 × 500-microgram (yellow) tablets, 42 × 1-mg (green) tablets, and 63 × 2-mg (pink) tablets = £74.40. Label: 21, counselling, driving, see notes above

Note Licensed for use in Parkinson's disease only

Modified release

Requip® XL (GSK) ▼ PoM

Tablets, m/r, f/c, ropinirole (as hydrochloride) 2 mg (pink), net price 28-tab pack = £31.36; 4 mg (brown), 28-tab pack = £62.72; 8 mg (red), 28-tab pack = £105.28. Label: 25, counselling, driving, see notes above

Dose stable Parkinson's disease in patients transferring from ropinirole immediate-release tablets, initially *Requip® XL* once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, *in patients receiving less than 8 mg once daily*, increase in steps of 2 mg at intervals of at least 1 week to 8 mg once daily according to response; *in patients receiving 8 mg once daily or more*, increase in steps of 2 mg at intervals of at least 2 weeks according to response; max. 24 mg once daily

Note When administered as adjunct to levodopa, concurrent dose of levodopa may be reduced

ROTIGOTINE

Indications Parkinson's disease, either used alone or as an adjunct to levodopa with dopa-decarboxylase inhibitor

Cautions see notes above; ophthalmic testing recommended; avoid exposure of patch to heat; hepatic impairment (Appendix 2); **interactions:** Appendix 1 (rotigotine)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5); remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

Side-effects nausea, vomiting, constipation, dry mouth, diarrhoea, dyspepsia, weight changes; postural hypotension, peripheral oedema; confusion, drowsiness (including sudden onset of sleep), sleep disorders, dizziness, headache, dyskinesia, asthenia, hallucinations; hyperhidrosis, rash (including local reactions to patch), and pruritus; *less commonly* abdominal pain, anorexia, taste disturbance, palpitation, tachycardia, hypotension, hypertension, atrial fibrillation, syncope, dyspnoea, cough, hiccup, tremor, psychosis, pathological gambling, anxiety, impaired attention, dystonia, paraesthesia, impaired memory, erectile dysfunction, increased libido, arthralgia, and visual disturbances; *rarely* convulsions and loss of consciousness

Dose

- Monotherapy, apply '2 mg/24 hours' patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days); increased in steps of 2 mg/24 hours at weekly intervals if required; max. 8 mg/24 hours
- Adjunctive therapy with levodopa, apply '4 mg/24 hours' patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same site for 14 days); increased in steps of 2 mg/24 hours at weekly intervals if required; max. 16 mg/24 hours

Neupro® (UCB Pharma) ▼ PoM

Patches, self-adhesive, beige, rotigotine 2 mg/24 hours, net price 28 = £77.24; 4 mg/24 hours, 28 = £117.71; 6 mg/24 hours, 28 = £142.79; 8 mg/24 hours, 28 = £142.79; 28-day starter pack of 7 × 2 mg/24 hours, 7 × 4 mg/24 hours, 7 × 6 mg/24 hours, and 7 × 8 mg/24 hours patches = £142.79. Counselling, hypotensive reactions, driving, see notes above

Note The *Scottish Medicines Consortium* has advised that *Neupro®* is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson's disease (June 2007) and for restricted use for the treatment of advanced Parkinson's disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007)

Levodopa

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine; it is given with an extracerebral **dopa-decarboxylase inhibitor** that reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting and cardiovascular effects. Additionally, effective brain-dopamine concentrations can be achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in **co-beneldopa**) and carbidopa (in **co-careldopa**).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Note When co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting but domperidone (section 4.6) may be useful in controlling these effects.

Levodopa treatment is associated with the development of potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period. 'End-of-dose' deterioration also occurs, where the duration of benefit after each dose becomes progressively shorter. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

Cautions Levodopa should be used with caution in severe cardiovascular or pulmonary disease, psychiatric illness (avoid if severe), endocrine disorders (including hyperthyroidism, Cushing's syndrome, diabetes mellitus, osteomalacia, and phaeochromocytoma), and in those with a history of convulsions, malignant melanoma, or peptic ulcer. Levodopa should be used with caution in open-angle glaucoma and patients susceptible to angle-closure glaucoma, and in hepatic or renal impairment. Patients should be advised to avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis), and to be aware of the potential for excessive drowsiness and sudden onset of sleep (see Sudden Onset of Sleep, below). Levodopa should be used with caution in pregnancy (Appendix 4); **interactions:** Appendix 1 (levodopa).

Contra-indications Levodopa should be avoided in breast-feeding (Appendix 5).

Side-effects Side-effects of levodopa include nausea, vomiting, taste disturbances, dry mouth, anorexia, arrhythmias, postural hypotension, syncope, drowsiness (including sudden onset of sleep), fatigue, dementia, psychoses, hallucinations, confusion, euphoria, abnormal dreams, insomnia, depression (*very rarely* with suicidal ideation), anxiety, dizziness, dystonia, dyskinesia, and chorea.

Less commonly weight loss or gain, constipation, diarrhoea, hypersalivation, dysphagia, flatulence, hypertension, chest pain, oedema, hoarseness, ataxia, increased hand tremor, malaise, muscle cramps, and reddish discoloration of the urine and other body fluids may occur. *Rare* side-effects include abdominal pain, gastro-intestinal bleeding, dyspepsia, phlebitis, dyspnoea, agitation, paraesthesia, bruxism, trismus, hiccups, neuroleptic malignant syndrome (associated with abrupt withdrawal), convulsions, reduced mental acuity, disorientation, headache, urinary retention, urinary incontinence, priapism, activation of malignant melanoma, leucopenia, haemolytic and non-haemolytic anaemia, thrombocytopenia, agranulocytosis, blurred vision, blepharospasm, diplopia, activation of Horner's syndrome, pupil dilatation, oculogyric crisis, angioedema, rash, urticaria, pruritus, flushing, alopecia, exanthema, Henoch-Schönlein purpura, and increased sweating. *Very rarely* angle-closure glaucoma may occur; pathological gambling, increased libido, hypersexuality, and false positive tests for urinary ketones have also been reported.

Sudden onset of sleep

Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa, co-beneldopa, and dopamine receptor agonists.

Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery.

Patients who have suffered excessive sedation or sudden onset of sleep, should refrain from driving or operating machines until those effects have stopped recurring.

CO-BENELDOPA

A mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa

Indications parkinsonism (but not drug-induced extrapyramidal symptoms), see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- See preparations

Madopar® (Roche) PoM

Capsules 62.5, blue/grey, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa

50 mg). Net price 100-cap pack = £5.96. Label: 14, counselling, driving, see notes above

Capsules 125, blue/pink, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg). Net price 100-cap pack = £8.30. Label: 14, counselling, driving, see notes above

Capsules 250, blue/caramel, co-beneldopa 50/200 (benserazide 50 mg (as hydrochloride), levodopa 200 mg). Net price 100-cap pack = £14.16. Label: 14, counselling, driving, see notes above

Dispersible tablets 62.5, scored, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg). Net price 100-tab pack = £7.08. Label: 14, counselling, administration, see below, driving, see notes above

Dispersible tablets 125, scored, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride) levodopa 100 mg). Net price 100-tab pack = £12.55. Label: 14, counselling, administration, see below, driving, see notes above

Note The tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole

Dose expressed as levodopa, initially 50 mg 3–4 times daily (100 mg 3 times daily in advanced disease), increased by 100 mg daily once or twice weekly according to response; usual maintenance dose 400–800 mg daily in divided doses; ELDERLY initially 50 mg once or twice daily, increased by 50 mg daily every 3–4 days according to response

Note When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter)

Modified release

Madopar® CR (Roche) PoM

Capsules 125, m/r, dark green/light blue, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg). Net price 100-cap pack = £15.34. Label: 5, 14, 25, counselling, driving, see notes above

Dose Patients not taking levodopa/dopa-decarboxylase inhibitor therapy, initially 1 capsule 3 times daily (max. initial dose 6 capsules daily)

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks

Supplementary dose of immediate-release *Madopar®* may be needed with first morning dose; if response still poor to total daily dose of *Madopar® CR* plus *Madopar®* corresponding to 1.2 g levodopa, consider alternative therapy

CO-CAREL DOPA

A mixture of carbidopa and levodopa; the proportions are expressed in the form *x*/*y* where *x* and *y* are the strengths in milligrams of carbidopa and levodopa respectively

Indications parkinsonism (but not drug-induced extrapyramidal symptoms), see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Expressed as levodopa, initially 100 mg (with carbidopa 25 mg) 3 times daily, increased by 50–100 mg (with carbidopa 12.5–25 mg) daily or on alternate days according to response, up to 800 mg (with carbidopa 200 mg) daily in divided doses
- Alternatively, initially 50–100 mg (with carbidopa 10–12.5 mg) 3–4 times daily, increased by 50–100 mg daily or on alternate days according to response, up to 800 mg (with carbidopa 80–100 mg) daily in divided doses
- Alternatively, initially 125 mg (with carbidopa 12.5 mg, as ½ tablet of co-careldopa 25/250) 1–2 times daily, increased by 125 mg (with carbidopa 12.5 mg) daily or on alternate days according to response

Note At least 70 mg carbidopa daily is necessary to achieve full inhibition of peripheral dopa-decarboxylase. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before

Co-careldopa (Non-proprietary) PoM

Tablets, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £17.38. Label: 14, counselling, driving, see notes above

Tablets, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £21.86. Label: 14, counselling, driving, see notes above

Tablets, co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 100-tab pack = £29.27. Label: 14, counselling, driving, see notes above

Sinemet® (Bristol-Myers Squibb) PoM

Sinemet-62.5 tablets, yellow, scored, co-careldopa 12.5/50 (carbidopa 12.5 mg (anhydrous), levodopa 50 mg), net price 90-tab pack = £6.28. Label: 14, counselling, driving, see notes above

Note 2 tablets *Sinemet-62.5®* ≡ 1 tablet *Sinemet Plus®*

Sinemet-110 tablets, blue, scored, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 90-tab pack = £6.57. Label: 14, counselling, driving, see notes above

Sinemet-Plus tablets, yellow, scored, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 90-tab pack = £9.66. Label: 14, counselling, driving, see notes above

Note Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed

Sinemet-275 tablets, blue, scored, co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 90-tab pack = £13.72. Label: 14, counselling, driving, see notes above

For use with enteral tube

Duodopa® (Solvay) ▼ PoM

Intestinal gel, co-careldopa 5/20 (carbidopa 5 mg as monohydrate, levodopa 20 mg)/mL, net price 100 mL cassette (for use with *Duodopa®* portable pump) = £77.00. Label: 14, counselling, driving, see notes above

Dose Severe Parkinson's disease inadequately controlled by other preparations, consult product literature

Modified release

Caramet® CR (TEVA UK) PoM

Tablets, m/r, orange-brown, co-careldopa 25/100 (carbidopa 25 mg (as monohydrate), levodopa 100 mg), net price 60-tab pack = £11.47; co-careldopa 50/200 (carbidopa 50 mg (as monohydrate), levodopa

200 mg), 60-tab pack = £11.47. Label: 14, 25, counselling, driving, see notes above

Dose patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa, initially 100–200 mg twice daily (at least 6 hours between doses); dose adjusted according to response at intervals of at least 2 days

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, discontinue previous preparation at least 12 hours before first dose of *Caramet® CR*; substitute *Caramet® CR* to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days

Half Sinemet® CR (Bristol-Myers Squibb) PoM

Tablets, m/r, pink, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 60-tab pack = £11.60. Label: 14, 25, counselling, driving, see notes above

Dose For fine adjustment of *Sinemet® CR* dose (see below)

Sinemet® CR (Bristol-Myers Squibb) PoM

Tablets, m/r, peach, scored, co-careldopa 50/200 (carbidopa 50 mg (anhydrous), levodopa 200 mg), net price 60-tab pack = £11.60. Label: 14, 25, counselling, driving, see notes above

Dose Patients not receiving levodopa/dopa-decarboxylase inhibitor therapy, initially, 1 *Sinemet® CR* tablet twice daily; both dose and interval then adjusted according to response at intervals of not less than 3 days

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, 1 *Sinemet® CR* tablet twice daily can be substituted for a daily dose of levodopa 300–400 mg in immediate-release *Sinemet®* tablets (substitute *Sinemet® CR* to provide approx. 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days

With entacapone

Note For Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

Stalevo® (Orion) PoM

Stalevo 50 mg/12.5 mg/200 mg tablets, f/c, brown, levodopa 50 mg, carbidopa 12.5 mg, entacapone 200 mg, net price 30-tab pack = £21.11, 100-tab pack = £70.37. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron-containing preparations at the same time of day

Dose only 1 tablet to be taken for each dose; max. 10 tablets daily

Stalevo 75 mg/18.75 mg/200 mg tablets, f/c, brown, levodopa 75 mg, carbidopa 18.75 mg, entacapone 200 mg, net price 30-tab pack = £21.11, 100-tab pack = £70.37. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron containing preparations at the same time of day

Dose only 1 tablet to be taken for each dose; max. 10 tablets daily

Stalevo 100 mg/25 mg/200 mg tablets, f/c, brown, levodopa 100 mg, carbidopa 25 mg, entacapone 200 mg, net price 30-tab pack = £21.11, 100-tab pack = £70.37. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron-containing preparations at the same time of day

Dose only 1 tablet to be taken for each dose; max. 10 tablets daily

Stalevo 125 mg/31.25 mg/200 mg tablets, f/c, brown, levodopa 125 mg, carbidopa 31.25 mg, entacapone 200 mg, net price 30-tab pack = £21.11, 100-tab pack = £70.37. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron-containing preparations at the same time of day

Dose only 1 tablet to be taken for each dose; max. 10 tablets daily

Stalevo 150 mg/37.5 mg/200 mg tablets, f/c, brown, levodopa 150 mg, carbidopa 37.5 mg, entacapone 200 mg, net price 30-tab pack = £21.11, 100-tab pack = £70.37. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron-containing preparations at the same time of day

Dose only 1 tablet to be taken for each dose; max. 10 tablets daily

Stalevo 200 mg/50 mg/200 mg tablets, f/c, brown, levodopa 200 mg, carbidopa 50 mg, entacapone 200 mg, net price 30-tab pack = £21.11, 100-tab pack = £70.37. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron containing preparations at the same time of day

Dose only 1 tablet to be taken for each dose; max. 7 tablets daily

Note Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate *Stalevo®* at a dose that provides similar (or slightly lower) amount of levodopa

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to *Stalevo®* (levodopa dose may need to be reduced by 10–30% initially)

Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate *Stalevo®* at a dose that provides similar (or slightly higher) amount of levodopa

Monoamine-oxidase-B inhibitors

Rasagiline, a monoamine-oxidase-B inhibitor, is licensed for the management of Parkinson's disease used alone or as an adjunct to levodopa for 'end-of-dose' fluctuations.

Selegiline is a monoamine-oxidase-B inhibitor used in conjunction with levodopa to reduce 'end-of-dose' deterioration in advanced Parkinson's disease. Early treatment with selegiline alone can delay the need for levodopa therapy. When combined with levodopa, selegiline should be avoided or used with great caution in postural hypotension.

RASAGILINE

Indications Parkinson's disease, used alone or as adjunct to levodopa with dopa-decarboxylase inhibitor

Cautions avoid abrupt withdrawal; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (rasagiline)

Side-effects dry mouth, dyspepsia, constipation; angina; headache, depression, anorexia, weight loss, abnormal dreams, vertigo, hallucinations; influenza-like symptoms; urinary urgency; leucopenia; arthralgia; conjunctivitis; rash; *less commonly* myocardial infarction, and cerebrovascular accident

Dose

- 1 mg daily

Azilect® (Teva) PoM

Tablets, rasagiline (as mesilate) 1 mg, net price 28-tab pack = £70.72

SELEGILINE HYDROCHLORIDE

Indications Parkinson's disease, used alone or as adjunct to levodopa with dopa-decarboxylase inhibitor

Cautions avoid abrupt withdrawal; gastric and duodenal ulceration (avoid in active ulceration), uncontrolled hypertension, arrhythmias, angina, psychosis, side-effects of levodopa may be increased, concurrent

levodopa dosage can be reduced by 10–20%; **interactions:** Appendix 1 (selegiline)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea, constipation, diarrhoea, dry mouth; postural hypotension; dyskinesia, vertigo, sleeping disorders, confusion, hallucinations; arthralgia, myalgia; mouth ulcers with oral lyophilisate; *rarely* arrhythmias, agitation, headache, micturition difficulties, skin reactions; also reported chest pain

Dose

- 10 mg in the morning, or 5 mg at breakfast and midday; ELDERLY see below

  Elderly To avoid initial confusion and agitation, it may be appropriate to start treatment with a dose of 2.5 mg daily, particularly in the elderly

Selegiline Hydrochloride (Non-proprietary) PoM

Tablets, selegiline hydrochloride 5 mg, net price 56-tab pack = £4.99; 10 mg, 30-tab pack = £7.91

Eldepryl® (Orion) PoM

Tablets, both scored, selegiline hydrochloride 5 mg, net price 60-tab pack = £10.06; 10 mg, 30-tab pack = £9.82

Oral liquid, selegiline hydrochloride 10 mg/5 mL, net price 200 mL = £18.20

Oral lyophilisate

Zelapar® (Cephalon) PoM

Oral lyophilisates (= freeze-dried tablets), yellow, selegiline hydrochloride 1.25 mg, net price 30-tab pack = £47.96. Counselling, administration

Excipients include aspartame (section 9.4.1)

Dose 1.25 mg daily before breakfast

Counselling Tablets should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet

Note Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to *Zelapar®* 1.25 mg

Catechol-*O*-methyltransferase inhibitors

Entacapone and **tolcapone** prevent the peripheral breakdown of levodopa, by inhibiting catechol-*O*-methyltransferase, allowing more levodopa to reach the brain. They are licensed for use as an adjunct to co-beneldopa or co-careldopa for patients with Parkinson's disease who experience 'end-of-dose' deterioration and cannot be stabilised on these combinations. Due to the risk of hepatotoxicity, tolcapone should be prescribed under specialist supervision only, when other catechol-*O*-methyltransferase inhibitors combined with co-beneldopa or co-careldopa are ineffective.

ENTACAPONE

Indications adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson's disease and 'end-of-dose' motor fluctuations

Cautions avoid abrupt withdrawal; concurrent levodopa dose may need to be reduced by about 10–30%; **interactions:** Appendix 1 (entacapone)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5); hepatic impairment; phaeochromocytoma; history of neuroleptic malignant syndrome or non-traumatic rhabdomyolysis

Side-effects nausea, vomiting, abdominal pain, constipation, diarrhoea, urine may be coloured reddish-brown, dry mouth; confusion, dizziness, abnormal dreams, fatigue, insomnia, dystonia, dyskinesia, hallucinations; increased sweating; *rarely* hepatic dysfunction and rash; *very rarely* anorexia, weight loss, agitation, and urticaria; also reported colitis, neuroleptic malignant syndrome, rhabdomyolysis, and skin, hair, and nail discoloration

Dose

- 200 mg with each dose of levodopa with dopa-decarboxylase inhibitor; max. 2 g daily

Comtess® (Orion) PoM

Tablets, f/c, brown/orange, entacapone 200 mg, net price 30-tab pack = £17.50, 100-tab pack = £58.32. Label: 14, (urine reddish-brown), counselling, driving, see notes above, avoid iron-containing products at the same time of day

TOLCAPONE

Indications adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson's disease and 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-*O*-methyltransferase inappropriate (under specialist supervision)

Cautions avoid abrupt withdrawal; most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%; renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (tolcapone)

Hepatotoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in females and during the first 6 months, but late-onset liver injury has also been reported; test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and every 8 weeks thereafter (restart monitoring schedule if dose increased); discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); do not re-introduce tolcapone once discontinued

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

Contra-indications hepatic impairment or raised liver enzymes (see Hepatotoxicity above), severe dyskinesia, phaeochromocytoma, previous history of neuroleptic malignant syndrome, rhabdomyolysis, or hyperthermia; breast-feeding (Appendix 5)

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dystonia, dyskinesia, drowsiness, headache, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urine discoloration; sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal

Dose

- 100 mg 3 times daily, leave 6 hours between each dose; max. 200 mg 3 times daily in exceptional circumstances; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor

  Note Continue beyond 3 weeks **only** if substantial improvement

Tasmar® (Meda) ▼ PoM

Tablets, f/c, yellow, tolcapone 100 mg, net price 100-tab pack = £95.20. Label: 14, 25

Amantadine

Amantadine is a weak dopamine agonist with modest antiparkinsonian effects. It improves mild bradykinetic disabilities as well as tremor and rigidity. It may also be useful for dyskinesias in more advanced disease. Tolerance to its effects may develop and confusion and hallucinations may occasionally occur. Withdrawal of amantadine should be gradual irrespective of the patient's response to treatment.

AMANTADINE HYDROCHLORIDE

Indications Parkinson's disease (but not drug-induced extrapyramidal symptoms); antiviral (section 5.3.4)

Cautions hepatic impairment; renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3), congestive heart disease (may exacerbate oedema), confused or hallucinatory states, elderly; avoid abrupt withdrawal in Parkinson's disease; **interactions:** Appendix 1 (amantadine)
Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications epilepsy; history of gastric ulceration; pregnancy (Appendix 4), breast-feeding (Appendix 5)

Side-effects anorexia, nausea, nervousness, inability to concentrate, insomnia, dizziness, convulsions, hallucinations or feelings of detachment, blurred vision, gastro-intestinal disturbances, livedo reticularis and peripheral oedema; rarely leucopenia, rashes

Dose

- Parkinson's disease, 100 mg daily increased after one week to 100 mg twice daily, usually in conjunction with other treatment; some patients may require higher doses, max. 400 mg daily; ELDERLY 65 years and over, 100 mg daily adjusted according to response
- Post-herpetic neuralgia, 100 mg twice daily for 14 days, continued for a further 14 days if necessary

Symmetrel® (Alliance) PoM

Capsules, red-brown, amantadine hydrochloride 100 mg. Net price 56-cap pack = £16.22. Counselling, driving, see Cautions

Syrup, amantadine hydrochloride 50 mg/5 mL. Net price 150-mL pack = £5.33. Counselling, driving, see Cautions

Lysovir® (Alliance) PoM

See p. 355

4.9.2 Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs exert their antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency. Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson's disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs **orphenadrine**, **procyclidine**, and **trihexyphenidyl** (benzhexol), reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson's disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.

No important differences exist between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine may be given parenterally and it is effective emergency treatment for acute drug-induced dystonic reactions.

Cautions Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, prostatic hypertrophy, pyrexia, in those susceptible to angle-closure glaucoma, and in the elderly. Antimuscarinics should not be withdrawn abruptly in patients receiving long-term treatment. Antimuscarinics are liable to abuse. They should also be used with caution in hepatic impairment, renal impairment, pregnancy (Appendix 4), and breast-feeding (Appendix 5). **Interactions:** Appendix 1 (Antimuscarinics)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

Side-effects Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma may occur very rarely

ORPHENADRINE HYDROCHLORIDE

Indications parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

Cautions see notes above

Contra-indications see notes above; also acute porphyria (section 9.8.2)

Side-effects see notes above; *less commonly* insomnia and impaired coordination

Dose

- Initially 150 mg daily in divided doses, increased gradually in steps of 50 mg every 2–3 days according to response; usual dose range 150–300 mg daily in divided doses; max. 400 mg daily; ELDERLY preferably lower end of range

Orphenadrine Hydrochloride (Non-proprietary) PoM

Tablets, orphenadrine hydrochloride 50 mg, net price 20 = £11.13. Counselling, driving, see notes above

Oral solution, orphenadrine hydrochloride 50 mg/5 mL, net price 200 mL = £9.47. Counselling, driving, see notes above

Biorphen® (Alliance) PoM

Liquid, sugar-free, orphenadrine hydrochloride 25 mg/5 mL, net price 200 mL = £8.48. Counselling, driving, see notes above

Disipal® (Astellas) PoM

Tablets, yellow, s/c, orphenadrine hydrochloride 50 mg, net price 20 = 69p. Counselling, driving, see notes above
Excipients include tartrazine

PROCYCLIDINE HYDROCHLORIDE

Indications parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above, but causes sedation rather than stimulation; also gingivitis

Dose

- By mouth, 2.5 mg 3 times daily, increased gradually in steps of 2.5–5 mg daily every 2–3 days if necessary; usual max. 30 mg daily in 2–4 divided doses (60 mg daily in exceptional circumstances); ELDERLY preferably lower end of range
- By intramuscular *or* intravenous injection, acute dystonia, 5–10 mg (occasionally more than 10 mg), usually effective in 5–10 minutes but may need 30 minutes for relief; ELDERLY preferably lower end of range

Procyclidine (Non-proprietary) PoM
Tablets, procyclidine hydrochloride 5 mg, net price 28-tab pack = £6.10. Counselling, driving, see notes above

Arpicolin® (Rosemont) PoM
Syrup, sugar-free, procyclidine hydrochloride 2.5 mg/5 mL, net price 150 mL = £4.22; 5 mg/5 mL, 150 mL pack = £7.54. Counselling, driving, see notes above

Kemadrin® (GSK) PoM
Tablets, scored, procyclidine hydrochloride 5 mg, net price 20 = 94p. Counselling, driving, see notes above

Kemadrin® (Auden Mckenzie) PoM
Injection, procyclidine hydrochloride 5 mg/mL, net price 2-mL amp = £1.49

TRIHEXYPHENIDYL HYDROCHLORIDE
(Benzhexol hydrochloride)

Indications parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- 1 mg daily, increased gradually; usual maintenance dose 5–15 mg daily in 3–4 divided doses (max. 20 mg daily); ELDERLY preferably lower end of range

Trihexyphenidyl (Non-proprietary) PoM
Tablets, trihexyphenidyl hydrochloride 2 mg, net price 84-tab pack = £25.53; 5 mg, 100-tab pack = £15.60. Counselling, with or after food, driving, see notes above

Broflex® (Alliance) PoM
Syrup, pink, black currant, trihexyphenidyl hydrochloride 5 mg/5 mL, net price 200 mL = £7.44. Counselling, driving, see notes above

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

Tetrabenazine is mainly used to control movement disorders in Huntington's chorea and related disorders. It may act by depleting nerve endings of dopamine. It has useful action in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol may be useful in improving motor tics and symptoms of Tourette syndrome and related choreas. **Pimozide** [unlicensed indication] (see section 4.2.1 for CSM warning), **clonidine** [unlicensed indication] (section 4.7.4.2), and **sulpiride** [unlicensed indication] (section 4.2.1) are also used in Tourette syndrome. **Trihexyphenidyl (benzhexol)** (section 4.9.2) in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks, to 20 to 30 mg daily or higher. **Chlorpromazine** and **haloperidol** are used to relieve intractable hiccup (section 4.2.1).

Propranolol or another beta-adrenoceptor blocking drug (section 2.4) may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis. Propranolol is given in a dosage of 40 mg 2 or 3 times daily, increased if necessary; 80 to 160 mg daily is usually required for maintenance.

Primidone (section 4.8.1) in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam is used as an adjunctive treatment for myoclonus of cortical origin.

Riluzole is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

NICE guidance
Riluzole for motor neurone disease (January 2001)
Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.

HALOPERIDOL

Indications motor tics, adjunctive treatment in choreas and Tourette syndrome; other indications, section 4.2.1

Cautions section 4.2.1

Contra-indications section 4.2.1

Side-effects section 4.2.1

Dose

- By mouth, 0.5–1.5 mg 3 times daily adjusted according to the response; 10 mg daily or more may occasionally be necessary in Tourette syndrome; CHILD 5–12 years, Tourette syndrome, 12.5–

25 microgram/kg twice daily, adjusted according to response up to max. 10 mg daily

Preparations
Section 4.2.1

PIRACETAM

Indications adjunctive treatment of cortical myoclonus

Cautions avoid abrupt withdrawal; elderly; haemostasis, major surgery, or severe haemorrhage; renal impairment (avoid if eGFR less than 20 mL/minute; Appendix 3)

Contra-indications cerebral haemorrhage; hepatic impairment; pregnancy; breast-feeding

Side-effects weight gain, nervousness, hyperkinesia; *less commonly* drowsiness, depression, asthenia,; *also reported* abdominal pain, nausea, vomiting, diarrhoea, headache, anxiety, confusion, hallucination, vertigo, ataxia, insomnia, and rash

Dose

- Initially 7.2 g daily in 2–3 divided doses, increased according to response by 4.8 g daily every 3–4 days to max. 20 g daily (subsequently, attempts should be made to reduce dose of concurrent therapy); CHILD under 16 years not recommended

Oral solution Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

Nootropil® (UCB Pharma) PoM

Tablets, f/c, scored, piracetam 800 mg, net price 90-tab pack = £11.75; 1.2 g, 60-tab pack = £10.97. Label: 3

Oral solution, piracetam, 333.3 mg/mL, net price 300-mL pack = £16.31. Label: 3

RILUZOLE

Indications to extend life in patients with amyotrophic lateral sclerosis, initiated by specialists experienced in the management of motor neurone disease

Cautions history of abnormal hepatic function (consult product literature for details)

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur; white blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole

Driving Dizziness or vertigo may affect performance of skilled tasks (e.g. driving)

Contra-indications hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea, abdominal pain; tachycardia; asthenia, headache, dizziness, drowsiness, oral paraesthesia; *less commonly* pancreatitis and anaemia; *rarely* neutropenia; *very rarely* hepatitis

Dose

- 50 mg twice daily; CHILD not recommended

Rilutek® (Aventis Pharma) PoM

Tablets, f/c, riluzole 50 mg. Net price 56-tab pack = £242.39. Counselling, blood disorders, driving, see Cautions

TETRABENAZINE

Indications see under Dose

Cautions pregnancy (Appendix 4); avoid in breast-feeding; **interactions:** Appendix 1 (tetrabenazine)

Driving May affect performance of skilled tasks (e.g. driving)

Side-effects drowsiness, gastro-intestinal disturbances, depression, extrapyramidal dysfunction, hypotension; rarely parkinsonism; neuroleptic malignant syndrome reported

Dose

- Movement disorders due to Huntington's chorea, hemiballismus, senile chorea, and related neurological conditions, initially 12.5 mg twice daily (elderly 12.5 mg daily) gradually increased to 12.5–25 mg 3 times daily; max. 200 mg daily
- Moderate to severe tardive dyskinesia, initially 12.5 mg daily, gradually increased according to response

Xenazine® 25 (Cambridge) PoM

Tablets, yellow, scored, tetrabenazine 25 mg. Net price 112-tab pack = £100.00. Label: 2

Torsion dystonias and other involuntary movements

Botulinum toxin type A should be used under specialist supervision. *Botox®* and *Dysport®* are licensed for the treatment of focal spasticity (including arm symptoms in conjunction with physiotherapy, dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy patients over 2 years of age, hand and wrist disability associated with stroke), blepharospasm, hemifacial spasm, and spasmodic torticollis. *Botox®* is also licensed for severe hyperhidrosis of the axillae.

Vistabel® is licensed for the temporary improvement of moderate to severe wrinkles between the eyebrows.

Xeomin® is licensed for the treatment of blepharospasm and spasmodic torticollis.

BOTULINUM TOXIN TYPE A

Indications see notes above; preparations are **not** interchangeable and should be used under specialist supervision

Cautions history of dysphagia or aspiration; neurological disorders (can lead to increased sensitivity and exaggerated muscle weakness); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Specific cautions for blepharospasm or hemifacial spasm Caution if risk of angle-closure glaucoma; reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed

Contra-indications generalised disorders of muscle activity (e.g. myasthenia gravis)

Side-effects increased electrophysiologic jitter in some distant muscles; misplaced injections may paralyse nearby muscle groups and excessive doses may paralyse distant muscles; influenza-like symptoms; *rarely* arrhythmias, myocardial infarction, seizures, hypersensitivity reactions including rash, pruritus and anaphylaxis, antibody formation (substantial

deterioration in response), and injection-site reactions; *very rarely* exaggerated muscle weakness, dysphagia, and aspiration (seek medical attention if swallowing, speech, or respiratory disorders)

Specific side-effects for blepharospasm or hemifacial spasm Ptosis; keratitis, lagophthalmos, dry eye, irritation, photophobia, lacrimation; facial oedema; *less commonly* dry mouth, facial weakness (including drooping), dizziness, tiredness, ectropion, entropion, diplopia, visual disturbances, conjunctivitis; *rarely* eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection); *very rarely* angle-closure glaucoma, corneal ulceration

Specific side-effects in paediatric cerebral palsy Drowsiness, paraesthesia, urinary incontinence, myalgia

Specific side-effects for temporary improvement of moderate to severe wrinkles between the eyebrows Headache; ptosis; *less commonly* nausea, dry mouth, facial oedema, dizziness, asthenia, anxiety, paraesthesia, visual disturbances, blepharitis, photosensitivity reactions, and dry skin

Specific side-effects in spasmodic torticollis Dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle), nausea, dry mouth, rhinitis, drowsiness, headache, dizziness, hypertonia, stiffness; *less commonly* dyspnoea, voice alteration, diplopia, and ptosis

Specific side-effects in axillary hyperhidrosis Non-axillary sweating, hot flushes; *less commonly* myalgia and joint pain

Specific side-effects in focal upper-limb spasticity associated with stroke Dysphagia; hypertonia; *less commonly* arthralgia and bursitis

Dose

- Consult product literature (**important:** specific to **each individual preparation** and **not interchangeable**)

Botox® (Allergan) PoM

Injection, powder for reconstitution, botulinum toxin type A complex, net price 50-unit vial = £77.50, 100-unit vial = £138.20

Dysport® (Ipsen) PoM

Injection, powder for reconstitution, botulinum toxin-haemagglutinin complex type A , net price 500-unit vial = £157.00

Vistabel® (Allergan) PoM

Injection, powder for reconstitution, botulinum toxin type A, net price 50-unit vial = £85.00

Xeomin® (Merz) ▼ PoM

Injection, powder for reconstitution, botulinum toxin type A, net price 100-unit vial = £119.90

BOTULINUM TOXIN TYPE B

Indications spasmodic torticollis (cervical dystonia)—specialist use only

Cautions history of dysphagia or aspiration; inadvertent injection into a blood vessel; tolerance may occur

Contra-indications neuromuscular or neuromuscular junctional disorders; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Side-effects increased electrophysiologic jitter in some distant muscles; dry mouth, dyspepsia, worsening torticollis, neck pain, myasthenia, voice changes, taste disturbances; *very rarely* exaggerated muscle weakness, dysphagia, and aspiration (seek medical attention if swallowing, speech, or respiratory disorders)

Dose

- By intramuscular injection, initially 5000–10 000 units divided between 2–4 most affected muscles; adjust dose and frequency according to response; **important: not** interchangeable with other botulinum toxin preparations

NeuroBloc® (Eisai) PoM

Injection, botulinum toxin type B 5000 units/mL, net price 0.5-mL vial = £111.20; 1-mL vial = £148.27; 2-mL vial = £197.69

Note May be diluted with sodium chloride 0.9%

4.10 Drugs used in substance dependence

This section includes drugs used in alcohol dependence, cigarette smoking, and opioid dependence.

The health departments of the UK have produced a report, *Drug Misuse and Dependence* which contains guidelines on clinical management.

Drug Misuse and Dependence, London, The Stationery Office, 1999 can be obtained from:

The Publications Centre
PO Box 276
London, SW8 5DT
Tel: (087) 0600 5522
Fax: (087) 0600 5533

or from The Stationery Office bookshops and through all good booksellers.

It is **important** to be aware that *people who misuse drugs* may be at risk not only from the intrinsic toxicity of the drug itself but also from the practice of injecting preparations intended for administration by mouth. Excipients used in the production of oral dose forms are usually insoluble and may lead to *abscess formation at the site of injection*, or even to *necrosis and gangrene*; moreover, deposits in the heart or lungs may lead to *severe cardiac or pulmonary toxicity*. Additional hazards include *infection* following the use of a dirty needle or an unsterilised diluent.

Alcohol dependence

Disulfiram is used as an adjunct to the treatment of alcohol dependence. It gives rise to extremely unpleasant systemic reactions after the ingestion of even a small amount of alcohol because it leads to accumulation of acetaldehyde in the body. Reactions include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse. Small amounts of alcohol included in many oral medicines may be sufficient to precipitate a reaction (even toiletries and mouthwashes that contain alcohol should be avoided). It may be advisable for patients to carry a card warning of the danger of administration of alcohol.

Long-acting **benzodiazepines** (section 4.1) are used to attenuate withdrawal symptoms but they also have a dependence potential. To minimise the risk of dependence, administration should be for a limited period only (e.g. **chlordiazepoxide** 10–50 mg 4 times daily, gradually reducing over 7–14 days). Benzodiazepines should

not be prescribed if the patient is likely to continue drinking alcohol.

Clomethiazole (chlormethiazole) (section 4.1.1) should be used for the management of withdrawal in an **in-patient setting only**. It is associated with a risk of dependence and should not be prescribed if the patient is likely to continue drinking alcohol.

Acamprosate, in combination with counselling, may be helpful in maintaining abstinence in alcohol-dependent patients. It should be initiated as soon as possible *after* abstinence has been achieved and should be maintained if the patient relapses. Continued alcohol abuse, however, negates the therapeutic benefit of acamprosate.

ACAMPROSATE CALCIUM

Indications maintenance of abstinence in alcohol dependence

Cautions continued alcohol abuse (risk of treatment failure)

Contra-indications severe hepatic impairment; renal impairment (avoid if serum creatinine over 120 micromol/litre; Appendix 3); pregnancy; breast-feeding

Side-effects diarrhoea, nausea, vomiting, abdominal pain; fluctuation in libido; pruritus, maculopapular rash; *rarely* bullous skin reactions

Dose

- ADULT 18–65 years, body-weight 60 kg and over, 666 mg 3 times daily; body-weight less than 60 kg, 666 mg at breakfast, 333 mg at midday and 333 mg at night

  Treatment course Treatment should be initiated as soon as possible after alcohol withdrawal period and maintained if patient relapses; recommended treatment period 1 year

Campral EC® (Merck) PoM

Tablet, e/c, acamprosate calcium 333 mg, net price 168-tab pack = £24.00. Label: 21, 25

Electrolytes Ca^{2+} 0.8 mmol/tablet

DISULFIRAM

Indications adjunct in the treatment of chronic alcohol dependence (under specialist supervision)

Cautions ensure that alcohol not consumed for at least 24 hours before initiating treatment; see also notes above; alcohol challenge **not** recommended on routine basis (if considered essential—specialist units only with resuscitation facilities); hepatic or renal impairment, respiratory disease, diabetes mellitus, epilepsy; **interactions:** Appendix 1 (disulfiram)

Alcohol reaction Patients should be warned of unpredictable and occasionally severe nature of disulfiram-alcohol interactions. Reactions can occur within 10 minutes and last several hours (may require intensive supportive therapy—oxygen should be available). Patients should not ingest alcohol at all and should be warned of possible presence of alcohol in liquid medicines, remedies, tonics, foods and even in toiletries (alcohol should also be avoided for at least 1 week after stopping)

Contra-indications cardiac failure, coronary artery disease, history of cerebrovascular accident, hypertension, psychosis, severe personality disorder, suicide risk, pregnancy (Appendix 4), breast-feeding (Appendix 5)

Side-effects initially drowsiness and fatigue; nausea, vomiting, halitosis, reduced libido; rarely psychotic reactions (depression, paranoia, schizophrenia, mania), allergic dermatitis, peripheral neuritis, hepatic cell damage

Dose

- 800 mg as a single dose on first day, reducing over 5 days to 100–200 mg daily; should not be continued for longer than 6 months without review; CHILD not recommended

Antabuse® (Actavis) PoM

Tablets, scored, disulfiram 200 mg. Net price 50-tab pack = £25.26. Label: 2, counselling, alcohol reaction

Cigarette smoking

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help if interested in doing so, with follow-up when appropriate.

When possible, smokers should have access to a smoking cessation clinic for behavioural support. **Nicotine replacement therapy** and **bupropion** are effective aids to smoking cessation for those smoking more than 10 cigarettes a day. **Bupropion** has been used as an antidepressant but its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission. **Varenicline** is a selective nicotine receptor partial agonist used as an aid for smoking cessation. Nicotine replacement therapy is regarded as the pharmacological treatment of choice in the management of smoking cessation.

Cigarette smoking should stop completely before starting nicotine replacement therapy. If complete smoking cessation is not possible some nicotine preparations are licensed for use as part of a programme to reduce smoking before stopping completely; the smoking cessation regimen can be followed during a quit attempt.

NICE guidance

Nicotine replacement therapy and bupropion for smoking cessation (March 2002)

Nicotine replacement therapy or bupropion should be prescribed only for a smoker who commits to a target stop date. The smoker should be offered advice and encouragement to aid smoking cessation.

Therapy to aid smoking cessation is chosen according to the smoker's likely compliance, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the products, and the smoker's preferences.

Initial supply of the prescribed smoking-cessation therapy should be sufficient to last only 2 weeks after the target stop date; normally this will be 2 weeks of nicotine replacement therapy or 3–4 weeks of bupropion. A second prescription should be issued only if the smoker demonstrates a continuing attempt to stop smoking.

If an attempt to stop smoking is unsuccessful, the NHS should not normally fund a further attempt within 6 months.

There is currently insufficient evidence to recommend the combined use of nicotine replacement therapy and bupropion.

NICE guidance

Varenicline for smoking cessation (July 2007)

Varenicline is recommended as an adjunct to smoking cessation for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as a part of a programme of behavioural support.

CSM advice (bupropion)

The CSM has issued a reminder that bupropion is contra-indicated in patients with a history of seizures or of eating disorders, a CNS tumour, or who are experiencing acute symptoms of alcohol or benzodiazepine withdrawal. Bupropion should not be prescribed to patients with other risk factors for seizures unless the potential benefit of smoking cessation clearly outweighs the risk. Factors that increase the risk of seizures include concomitant administration of drugs that can lower the seizure threshold (e.g. antidepressants, antimalarials [such as mefloquine and chloroquine], antipsychotics, quinolones, sedating antihistamines, systemic corticosteroids, theophylline, tramadol), alcohol abuse, history of head trauma, diabetes, and use of stimulants and anorectics.

BUPROPION HYDROCHLORIDE

(Amfebutamone hydrochloride)

Indications see notes above

Cautions elderly; predisposition to seizures (see CSM advice above); measure blood pressure before and during treatment (monitor weekly if used with nicotine products); hepatic impairment (Appendix 2), renal impairment (Appendix 3); **interactions**: Appendix 1 (bupropion)

Driving May impair performance of skilled tasks (e.g. driving)

Contra-indications see CSM advice above; history of bipolar disorder; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects dry mouth, gastro-intestinal disturbances, taste disturbance; insomnia (reduced by avoiding dose at bedtime), tremor, impaired concentration, headache, dizziness, depression, agitation, anxiety; fever; rash, pruritus, sweating; *less commonly* chest pain, tachycardia, hypertension, flushing, confusion, tinnitus, asthenia, and visual disturbances; *rarely* jaundice, hepatitis, palpitation, postural hypotension, hallucinations, depersonalisation, seizures, dystonia, ataxia, abnormal dreams, memory impairment, paraesthesia, blood-glucose disturbances, urinary retention, urinary frequency, Stevens-Johnson syndrome, and exacerbation of psoriasis; *very rarely* delusions, and aggression

Dose

- ADULT over 18 years, start 1–2 weeks before target stop date, initially 150 mg daily for 6 days then 150 mg twice daily (max. single dose 150 mg, max. daily dose 300 mg; minimum 8 hours between doses); period of treatment 7–9 weeks; discontinue if abstinence not achieved at 7 weeks; consider max. 150 mg daily in patients with risk factors for seizures (see CSM advice above); ELDERLY max. 150 mg daily

Zyban® (GSK) PoM

Tablets, m/r, f/c, bupropion hydrochloride 150 mg, net price 60-tab pack = £47.82. Label: 25, counselling, driving, see Cautions

NICOTINE

Indications see notes above

Cautions severe or unstable cardiovascular disease (including hospitalisation for severe arrhythmias, recent myocardial infarction, or recent cerebrovascular accident)—initiate under medical supervision; uncontrolled hyperthyroidism; diabetes mellitus (monitor blood-glucose concentration closely when initiating treatment); phaeochromocytoma; *oral preparations*, oesophagitis, gastritis, peptic ulcers; *patches*, skin disorders (patches should not be placed on broken skin); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Note Most warnings under Cautions also apply to continuation of cigarette smoking

Side-effects gastro-intestinal disturbances (including nausea, vomiting, dyspepsia); headache, dizziness; influenza-like symptoms; dry mouth; rash; *less frequently* palpitation; *rarely* atrial fibrillation; *with nasal spray*, sneezing, epistaxis, watering eyes, ear sensations; *with lozenges*, thirst, paraesthesia of mouth, taste disturbances; *with patches*, skin reactions (discontinue if severe)—vasculitis also reported, blood pressure changes; *with patches* or *lozenges*, sleep disturbances, nightmares, chest pain; *with gum* or *lozenges*, mouth ulceration, increased salivation; *with gum, lozenge, sublingual tablets,* or *inhalator*, hiccups, throat irritation

Dose

- See under preparations, below

Nicopass® (Fabre)

Lozenges, sugar-free, fresh mint- or liquorice mint-flavoured, nicotine (as resinate complex) 1.5 mg, net price pack of 12 = £1.68, pack of 36 = £4.18, pack of 96 = £8.94. Label: 24

Excipients include aspartame (section 9.4.1)

Dose smoking cessation, ADULT over 18 years (not heavily dependent on nicotine), initially suck 1 lozenge when urge to smoke occurs (max. 20 lozenges daily); withdraw gradually after 3 months; max. period of treatment 6 months

Nicopatch® (Fabre)

Patches, self-adhesive, nicotine *'7 mg' patch* (releasing approx. 7 mg/24 hours), net price 7 = £8.95; *'14 mg' patch* (releasing approx. 14 mg/24 hours), 7 = £8.95; *'21 mg' patch* (releasing approx. 21 mg/24 hours), 7 = £8.95

Dose smoking cessation, ADULT over 18 years, apply to dry, non-hairy skin site, removing after 24 hours and siting replacement patch on a different area (avoid using same area for 24 hours); individuals smoking *less than 20 cigarettes daily*, initially '14-mg' or '21-mg' patch daily (depending on severity of withdrawal symptoms); individuals smoking *20 or more cigarettes daily*, initially '21-mg' patch daily; withdraw gradually, reducing dose every 3–4 weeks; review treatment if abstinence not achieved within 3 months; max. period of treatment should not exceed 6 months

Nicorette® (McNeil)

Microtab (sublingual), nicotine (as a cyclodextrin complex) 2 mg, net price starter pack of 2 × 15-tablet discs with dispenser = £4.46; refill pack of 7 × 15-tablet discs = £12.04. Label: 26

Dose smoking cessation, individuals smoking *20 cigarettes or less daily*, sublingually, 2 mg each hour; for patients who fail to stop smoking or have significant withdrawal symptoms, consider

increasing to 4 mg each hour; individuals smoking *more than 20 cigarettes daily*, sublingually, 4 mg each hour; max. 80 mg daily; treatment continued for at least 3 months followed by a gradual reduction in dose; review treatment if abstinence not achieved within 9 months; CHILD 12–18 years, treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

Chewing gum, sugar-free, nicotine (as resin) 2 mg, net price pack of 15 = £1.71, pack of 30 = £3.25, pack of 105 = £8.89; 4 mg, net price pack of 15 = £2.11, pack of 30 = £3.99, pack of 105 = £10.83

Note Also available in mint, freshfruit, freshmint, and icy white flavours

Dose smoking cessation, individuals smoking *20 cigarettes or less daily*, initially chew one 2-mg piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes when urge to smoke occurs; individuals smoking *more than 20 cigarettes daily* or needing more than 15 pieces of 2-mg gum daily should use the 4-mg strength; max. 15 pieces of 4-mg strength daily; withdraw gradually after 3 months; review treatment if abstinence not achieved within 9 months; CHILD 12–18 years, treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

Smoking reduction, chew 1 piece when urge to smoke occurs between smoking episodes; reduce smoking within 6 weeks and attempt smoking cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

Patches, self-adhesive, beige, nicotine, *'5 mg' patch* (releasing approx. 5 mg/16 hours), net price 7 = £9.07; *'10 mg' patch* (releasing approx. 10 mg/16 hours), 7 = £9.07; *'15 mg' patch* (releasing approx. 15 mg/16 hours), 2 = £2.85, 7 = £9.07

Dose smoking cessation, ADULT and CHILD over 12 years, apply on waking to dry, non-hairy skin on hip, chest or upper arm, removing after approx. 16 hours, usually when retiring to bed; site next patch on different area (avoid using same area on consecutive days); initially '15-mg' patch for 16 hours daily for 8 weeks then if abstinence achieved '10-mg' patch for 16 hours daily for 2 weeks then '5-mg' patch for 16 hours daily for 2 weeks; review treatment if abstinence not achieved within 3 months—further courses may be given if considered beneficial

Nicorette Invisi patches, self-adhesive, beige, nicotine, *'10 mg' patch* (releasing approx. 10 mg/16 hours), net price 7 = £14.83; *'15 mg' patch* (releasing approx. 15 mg/16 hours), 7 = £14.83; *'25 mg' patch* (releasing approx. 25 mg/16 hours), 7 = £14.83

Dose smoking cessation, ADULT and CHILD over 12 years, apply on waking to dry, non-hairy skin on hip, chest or upper arm, removing after approx. 16 hours, usually when retiring to bed; site next patch on different area (avoid using same area on consecutive days); individuals smoking 10 or more cigarettes daily, initially '25-mg' patch for 16 hours daily for 8 weeks then if abstinence achieved '15-mg' patch for 16 hours daily for 2 weeks then '10-mg' patch for 16 hours daily for 2 weeks; individuals smoking less than 10 cigarettes daily, initially '15-mg' patch for 16 hours daily for 8 weeks then '10-mg' patch for 16 hours daily for 4 weeks; review treatment if abstinence not achieved within 3 months—further courses may be given if considered beneficial

Note Patients using the '25-mg' patch who experience excessive side-effects that do not resolve within a few days should change to '15-mg' patch for the remainder of the initial 8-week course before switching to the '10-mg' patch for the final 4 weeks

Nasal spray, nicotine 500 micrograms/metered spray, net price 200-spray unit = £13.30

Dose smoking cessation, ADULT and CHILD over 12 years, apply 1 spray into each nostril as required to max. twice an hour for 16 hours daily (max. 64 sprays daily) for 8 weeks, then reduce gradually over next 4 weeks (reduce by half at end of first 2 weeks, stop altogether at end of next 2 weeks); review treatment if abstinence not achieved within 3 months

Inhalator (nicotine-impregnated plug for use in inhalator mouthpiece), nicotine 10 mg/cartridge, net price 6-cartridge (starter) pack = £4.46, 42-cartridge (refill) pack = £14.02

Dose smoking cessation, ADULT and CHILD over 12 years, inhale when urge to smoke occurs; initially use between 6 and 12 cartridges daily for up to 8 weeks, then reduce number of cartridges used by half over next 2 weeks and then stop altogether at end of further 2 weeks; review treatment if abstinence not achieved within 3 months

Smoking reduction, ADULT and CHILD over 12 years, inhale when urge to smoke occurs between smoking episodes; reduce smoking within 6 weeks and attempt smoking cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting a smoking-reduction regimen

Nicotinell® (Novartis Consumer Health)

Chewing gum, sugar-free, nicotine (as polacrilin complex) 2 mg, net price pack of 12 = £1.71, pack of 24 = £3.01, pack of 96 = £8.26, pack of 204 = £14.23; 4 mg, pack of 12 = £1.70, pack of 24 = £3.30, pack of 96 = £10.26

Note Also available in fruit, liquorice and mint flavours

Dose smoking cessation, individuals smoking *20 cigarettes or less daily*, initially chew one 2-mg piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes, when urge to smoke occurs; individuals smoking *more than 20 cigarettes daily* should use the 4-mg strength; max. 60 mg daily; withdraw gradually after 3 months; max. period of treatment should not usually exceed 6 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

Mint lozenge, sugar-free, nicotine (as bitartrate) 1 mg, net price pack of 12 = £1.71, pack of 36 = £4.27, pack of 96 = £9.12; 2 mg, net price pack of 12 = £1.99, pack of 36 = £4.95, pack of 96 = £10.60. Label: 24

Excipients include aspartame (section 9.4.1)

Dose smoking cessation, individuals smoking *30 cigarettes or less daily*, initially suck one 1-mg lozenge every 1–2 hours, when urge to smoke occurs; individuals smoking *more than 30 cigarettes daily* should use the 2-mg strength; max. 30 mg daily; withdraw gradually after 3 months; max. period of treatment should not usually exceed 6 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

TTS Patches, self-adhesive, all yellowish-ochre, nicotine, *'10' patch* (releasing approx. 7 mg/24 hours), net price 7 = £9.12; *'20' patch* (releasing approx. 14 mg/24 hours), net price 2 = £2.57, 7 = £9.40; *'30' patch* (releasing approx. 21 mg/24 hours), net price 2 = £2.85, 7 = £9.97, 21 = £24.51

Dose smoking cessation, ADULT and CHILD over 12 years, apply to dry, non-hairy skin on trunk or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for several days); individuals smoking *less than 20 cigarettes daily*, initially '20' patch daily; individuals smoking *20 or more cigarettes daily*, initially '30' patch daily; withdraw gradually, reducing dose every 3–4 weeks; review treatment if abstinence not achieved within 3 months

NiQuitin® (GSK Consumer Healthcare)

Chewing gum, sugar-free, mint-flavour, nicotine 2 mg (white), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55; 4 mg (yellow), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55

Dose smoking cessation, initially chew 1 piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes, when urge to smoke occurs; max. 15 pieces daily; withdraw gradually after 3 months; review treatment if abstinence not achieved within 9 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

Smoking reduction, chew 1 piece when urge to smoke occurs between smoking episodes (max. 15 pieces daily); reduce smoking within 6 weeks and attempt cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

Temporary abstinence, chew 1 piece when urge to smoke occurs between smoking episodes (max. 15 pieces daily); review treatment if unable to undertake permanent quit attempt within 6 months

Lozenges, sugar-free, nicotine (as polacrilex) 2 mg, net price pack of 36 = £5.12, pack of 72 = £9.97; 4 mg, pack of 36 = £5.12, pack of 72 = £9.97. Contains 0.65 mmol Na^+/lozenge. Label: 24

Excipients include aspartame (section 9.4.1)

Note Also available as *Pre-Quit 4 mg Lozenges*

Dose smoking cessation, initially suck 1 lozenge every 1–2 hours when urge to smoke occurs (max. 15 lozenges daily) for 6 weeks, then 1 lozenge every 2–4 hours for 3 weeks, then 1 lozenge every 4–8 hours for 3 weeks; withdraw gradually after 3 months; review treatment if abstinence not achieved within 9 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

Smoking reduction, suck 1 lozenge when urge to smoke occurs between smoking episodes (max. 15 lozenges daily); reduce smoking within 6 weeks and attempt cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

Temporary abstinence, suck 1 lozenge every 1–2 hours when urge to smoke occurs between smoking episodes (max. 15 lozenges daily); review treatment if unable to undertake permanent quit attempt within 6 months

Patches, self-adhesive, pink/beige, nicotine *'7 mg' patch* (releasing approx. 7 mg/24 hours), net price 7 = £9.97; *'14 mg' patch* (releasing approx. 14 mg/24 hours), 7 = £9.97; *'21 mg' patch* (releasing approx. 21 mg/24 hours), 7 = £9.97, 14 = £18.79

Note Also available as a clear patch

Dose smoking cessation, apply on waking to dry, non-hairy skin site, removing after 24 hours and siting replacement patch on different area (avoid using same area for 7 days); individuals smoking *10 or more cigarettes daily*, initially '21-mg' patch daily for 6 weeks then '14-mg' patch daily for 2 weeks then '7-mg' patch daily for 2 weeks; individuals smoking *less than 10 cigarettes daily*, initially '14-mg' patch daily for 6 weeks then '7-mg' patch daily for 2 weeks; review treatment if abstinence not achieved within 9 months; CHILD 12–18 years, withdraw gradually and review if abstinence not achieved within 3 months

Note Patients using the '21-mg' patch who experience excessive side-effects, which do not resolve within a few days, should change to '14-mg' patch for the remainder of the initial 6 weeks before switching to the '7-mg' patch for the final 2 weeks

VARENICLINE

Indications see notes above

Cautions risk of relapse, irritability, depression, and insomnia on discontinuation (consider dose tapering on completion of 12-week course); history of psychiatric illness (may exacerbate underlying illness including depression); renal impairment (Appendix 3); breast-feeding (Appendix 5)

MHRA/CHM advice

Suicidal behaviour and varenicline

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline

Contra-indications pregnancy (Appendix 4)

Side-effects gastro-intestinal disturbances, appetite changes, dry mouth, taste disturbance; headache, drowsiness, dizziness, sleep disorders, abnormal dreams; *less commonly* thirst, weight gain, aphthous stomatitis, gingival pain, chest pain, hypertension, tachycardia, atrial fibrillation, palpitation, panic attack, abnormal thinking, mood swings, dysarthria, asthenia, tremor, incoordination, hypertonia, restlessness, hypoaesthesia, impaired temperature regulation, menorrhagia, vaginal discharge, sexual dysfunction, dysuria, arthralgia, muscle spasm, visual disturbances, eye pain, lacrimation, tinnitus, acne, sweating, rash, and pruritus; myocardial infarction, depression, suicidal ideation (see MHRA/CHM advice above), and hypersensitivity reactions (angioedema and facial swelling) also reported

Dose

- ADULT over 18 years, start 1–2 weeks before target stop date, initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks (reduce to 500 micrograms twice daily if not tolerated); 12-week course can be repeated in abstinent individuals to reduce risk of relapse

Champix® (Pfizer) ▼ PoM

Tablets, f/c, varenicline (as tartrate) 500 micrograms (white), net price 56-tab pack = £54.60; 1 mg (blue) 28-tab pack = £27.30, 56-tab pack = £54.60; starter pack of 11 × 500-microgram tabs with 14 × 1-mg tabs = £27.30. Label: 3

Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is valuable. Treatment with opioid substitutes or with naltrexone is best initiated under the supervision of an appropriately qualified physician.

Methadone, an opioid *agonist*, can be substituted for opioids such as diamorphine, preventing the onset of withdrawal symptoms; it is itself addictive and should only be prescribed for those who are physically dependent on opioids. It is administered in a single daily dose usually as methadone oral solution 1 mg/mL. The dose is adjusted according to the degree of dependence.

Buprenorphine is an opioid partial agonist. Because of its abuse and dependence potential it should be prescribed only for those who are already physically dependent on opioids. It can be used as substitution therapy for patients with moderate opioid dependence. In patients dependent on high doses of opioids, buprenorphine may precipitate withdrawal due to its partial antagonist properties; in these patients, the daily opioid dose should be reduced gradually before initiating therapy with buprenorphine.

Naltrexone, an opioid *antagonist*, blocks the action of opioids and precipitates withdrawal symptoms in opioid-dependent subjects. Because the euphoric action of opioid agonists is blocked by naltrexone it is given to former addicts as an aid to prevent relapse.

Lofexidine is used for the alleviation of symptoms in individuals whose opioid use is well controlled and are undergoing opioid withdrawal. Like clonidine it is an alpha-adrenergic agonist and appears to act centrally to produce a reduction in sympathetic tone, but reduction in blood pressure is less marked.

NICE guidance

Methadone and buprenorphine for the management of opioid dependence (January 2007)

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

NICE guidance

Naltrexone for the management of opioid dependence (January 2007)

Naltrexone is recommended for the prevention of relapse in detoxified formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

BUPRENORPHINE

Indications adjunct in the treatment of opioid dependence; premedication, peri-operative analgesia, analgesia in other situations (section 4.7.2)

Cautions see section 4.7.2 and notes above; effects only partially reversed by naloxone

Contra-indications see section 4.7.2; breast-feeding (Appendix 5)

Side-effects see section 4.7.2

Dose

- By sublingual administration, initially, 0.8–4 mg as a single daily dose, adjusted according to response; max. 32 mg daily; withdraw gradually; CHILD under 16 years not recommended

  Note In patients who have not undergone opioid withdrawal, buprenorphine should be given at least 6 hours after last use of opioid or when signs of withdrawal appear
  In patients receiving methadone, dose of methadone should be reduced to max. 30 mg daily before starting buprenorphine

Buprenorphine (Non-proprietary) CD

Tablets (sublingual), buprenorphine (as hydrochloride) 400 micrograms, net price 7-tab pack = £1.57; 2 mg, 7-tab pack = £6.71; 8 mg, 7-tab pack = £19.76. Label: 2, 26

Subutex® (Schering-Plough) CD

Tablets (sublingual), buprenorphine (as hydrochloride) 400 micrograms, net price 7-tab pack = £1.57; 2 mg, 7-tab pack = £6.59; 8 mg, 7-tab pack = £19.78. Label: 2, 26

With naloxone

Suboxone® (Schering-Plough) ▼ CD

Suboxone 2 mg/500 micrograms tablets (sublingual), buprenorphine (as hydrochloride) 2 mg, naloxone (as hydrochloride) 500 micrograms, net price 28-tab pack = £26.37. Label: 2, 26

Suboxone 8 mg/2 mg tablets (sublingual), buprenorphine (as hydrochloride) 8 mg, naloxone (as hydrochloride) 2 mg, net price 28-tab pack = £79.11. Label: 2, 26

Dose expressed as buprenorphine, ADULT and CHILD over 15 years, initially 2-8 mg once daily, increased in steps of 2–8 mg according to response; max. 24 mg daily; total weekly dose may be divided and given on alternate days or 3 times weekly (but max. daily dose 24 mg)

Note In patients who have not undergone opioid withdrawal, *Suboxone®* should be given when signs of withdrawal appear, at least 6 hours after last use of opioid

In patients receiving methadone, dose of methadone should be reduced to max. 30 mg daily before starting *Suboxone®*; first dose of *Suboxone®* should be given when signs of withdrawal appear, at least 24 hours after last dose of methadone

Note The *Scottish Medicines Consortium* has advised (February 2007) that *Suboxone®* should be restricted for use in patients in whom methadone is not suitable

LOFEXIDINE HYDROCHLORIDE

Indications management of symptoms of opioid withdrawal

Cautions severe coronary insufficiency, recent myocardial infarction, cerebrovascular disease, marked bradycardia (monitor pulse rate); history of QT prolongation, concomitant administration of drugs that prolong QT interval; withdraw gradually over 2–4 days (or longer) to minimise risk of rebound hypertension and associated symptoms; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (lofexidine)

Side-effects dry mucous membranes, hypotension, bradycardia, rebound hypertension on withdrawal, drowsiness

Dose

- Initially, 800 micrograms daily in divided doses, increased as necessary in steps of 400–800 micrograms daily to max. 2.4 mg daily in divided doses; max. single dose 800 micrograms; recommended duration of treatment 7–10 days if no opioid use (but longer may be required); CHILD under 18 years not recommended

BritLofex® (Forum) PoM

Tablets, peach, f/c, lofexidine hydrochloride 200 micrograms, net price 60-tab pack = £61.79. Label: 2

METHADONE HYDROCHLORIDE

Indications adjunct in treatment of opioid dependence, see notes above; analgesia (section 4.7.2); cough in terminal disease (section 3.9.1)

Cautions section 4.7.2

Contra-indications section 4.7.2

Side-effects section 4.7.2; **overdosage:** see Emergency Treatment of Poisoning, p. 31

Important Methadone, even in low doses is a **special hazard** for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction

Incompatibility Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

Dose

- Initially 10–40 mg daily, increased by up to 10 mg daily (max. weekly increase 30 mg) until no signs of withdrawal or intoxication; usual dose range 60–120 mg daily; CHILD not recommended (see also important note above)

Note Methadone hydrochloride doses in the BNF may differ from those in the product literature

Methadone (Non-proprietary) CD

Oral solution 1 mg/mL, methadone hydrochloride 1 mg/mL, net price 20 mL = 29p, 30 mL = 62p, 40 mL = 58p, 50 mL = £1.04, 60 mL = 87p, 100 mL = £1.31, 500 mL = £9.18. Label: 2

Brands include *Eptadone®*, *Metharose®* (sugar-free), *Physeptone* (sugar-free)

Important Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (section 3.9.1). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain

Oral solution 5 mg/mL, methadone hydrochloride 5 mg/mL, net price 20 mL = £1.47, 1 litre = £73.33. Label: 2

Brands include *Eptadone®*

Note Care is required in prescribing and dispensing the *correct strength* since any confusion could lead to an overdose

Injection, methadone hydrochloride 25 mg/mL, net price 2-mL amp = £2.05; 50 mg/mL, 1-mL amp = £2.05

Brands include *Synastone®*

Methadose® (Rosemont) CD

Oral concentrate, methadone hydrochloride 10 mg/mL (blue), net price 150 mL = £12.01; 20 mg/mL (brown), 150 mL = £24.02. Label: 2

Note The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription

Important Care is required in prescribing and dispensing the **correct strength** since any confusion could lead to an overdose; this preparation should be dispensed only **after dilution** as appropriate with *Methadose® Diluent* (life of diluted solution 3 months) and is for drug dependent persons (see also p. 7)

NALTREXONE HYDROCHLORIDE

Indications adjunct to prevent relapse in detoxified formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days)

Cautions liver function tests needed before and during treatment; test for opioid dependence with naloxone before treatment; avoid concomitant use of opioids but increased dose of opioid analgesic may be required for pain (monitor for opioid intoxication); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Note Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication

Contra-indications patients currently dependent on opioids

Side-effects nausea, vomiting, abdominal pain, diarrhoea, constipation, reduced appetite, increased thirst; chest pain; anxiety, sleep disorders, headache, reduced energy, increased energy, irritability, emotional lability, dizziness; chills; urinary retention; delayed ejaculation, decreased potency; arthralgia, myalgia; increased lacrimation; rash, and increased sweating; *rarely* hepatic dysfunction, suicidal ideation, and speech disorders; *very rarely* hallucinations, tremor, and idiopathic thrombocytopenia

Dose

- ADULT over 18 years (initiate in specialist clinics only), 25 mg initially then 50 mg daily; total weekly dose (350 mg) may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday)

Nalorex® (Bristol-Myers Squibb) PoM

Tablets, yellow, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £22.79

Opizone® (Genus) PoM

Tablets, beige, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £23.00

4.11 Drugs for dementia

Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer's disease, specifically for mild to moderate disease. Rivastigmine is also licensed for mild to moderate dementia associated with Parkinson's disease. The evidence to support the use of these drugs relates to their cognitive enhancement.

Treatment with drugs for dementia should be initiated and supervised only by a specialist experienced in the management of dementia.

Benefit is assessed by repeating the cognitive assessment at around 3 months. Such assessment cannot demonstrate how the disease may have progressed in the absence of treatment but it can give a good guide to response. Up to half the patients given these drugs will show a slower rate of cognitive decline. Drugs for dementia should be discontinued in those thought not to be responding. Many specialists repeat the cognitive assessment 4 to 6 weeks after discontinuation to assess deterioration; if significant deterioration occurs during this short period, consideration should be given to restarting therapy.

Donepezil is a reversible inhibitor of acetylcholinesterase. **Galantamine** is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties. **Rivastigmine** is a reversible non-competitive inhibitor of acetylcholinesterases; it is also licensed for treating mild to moderate dementia in Parkinson's disease.

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

Memantine is a NMDA-receptor antagonist that affects glutamate transmission; it is licensed for treating moderate to severe Alzheimer's disease.

NICE guidance

Donepezil, galantamine, rivastigmine, and memantine for Alzheimer's disease (September 2007)

Donepezil, galantamine, and rivastigmine are recommended for the adjunctive treatment of moderate Alzheimer's disease in those whose mini mental-state examination (MMSE) score is 10–20 points under the following conditions:

- Alzheimer's disease must be diagnosed in a specialist clinic; the clinic should also assess cognitive, global, and behavioural functioning, activities of daily living, and the likelihood of compliance with treatment;
- treatment should be initiated by specialists but can be continued by general practitioners under a shared-care protocol;
- the carers' views of the condition should be sought before and during drug treatment;
- the patient should be assessed every 6 months and drug treatment should normally continue only if the MMSE score remains at or above 10 points and if treatment is considered to have a worthwhile effect on the global, functional, and behavioural condition.
- Patients receiving acetylcholinesterase inhibitors for mild Alzheimer's disease can continue treatment until they, their carers, or their specialist consider it appropriate to stop.

Healthcare professionals should not rely solely on the MMSE score to assess the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

NICE does not recommend memantine for moderately severe to severe Alzheimer's disease except as part of well designed clinical studies; patients already receiving memantine can continue treatment until they, their carers, or their specialist consider it appropriate to stop.

DONEPEZIL HYDROCHLORIDE

Indications mild to moderate dementia in Alzheimer's disease

Cautions sick sinus syndrome or other supraventricular conduction abnormalities; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease; hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (parasympathomimetics)

Contra-indications breast-feeding

Side-effects nausea, vomiting, anorexia, diarrhoea; fatigue, insomnia, headache, dizziness, syncope, hallucinations, agitation, aggression; muscle cramps; urinary incontinence; rash, pruritus; *less commonly* gastric and duodenal ulcers, gastro-intestinal haemorrhage, bradycardia, seizures; *rarely* sino-atrial block, AV block, hepatitis, extrapyramidal symptoms; potential for bladder outflow obstruction

Dose

- Initially 5 mg once daily at bedtime, increased if necessary after one month to max. 10 mg daily

Aricept® (Pfizer, Eisai) PoM

Tablets, f/c, donepezil hydrochloride 5 mg (white), net price 28-tab pack = £63.54; 10 mg (yellow), 28-tab pack = £89.06.

Aricept Evess® (Pfizer, Eisai) PoM

Orodispersible tablets, donepezil hydrochloride 5 mg (white), net price 28-tab pack = £63.54; 10 mg (yellow), 28-tab pack = £89.06. Counselling, administration

Counselling *Aricept Evess®* should be placed on the tongue, allowed to disperse, and swallowed

GALANTAMINE

Indications mild to moderate dementia in Alzheimer's disease

Cautions cardiac disease (including sick sinus syndrome or other supraventricular conduction abnormalities, unstable angina, congestive heart failure); electrolyte disturbances; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease, pulmonary infection; avoid in urinary retention and gastro-intestinal obstruction; hepatic impairment (Appendix 2—avoid if severe); pregnancy (Appendix 4); **interactions:** Appendix 1 (parasympathomimetics)

Contra-indications renal impairment (Appendix 3); breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea, abdominal pain, dyspepsia; syncope; rhinitis; sleep disturbances, dizziness, confusion, depression, headache, fatigue, anorexia, tremor; fever; weight loss; *less commonly* arrythmias, palpitation, myocardial infarction, cerebrovascular disease, paraesthesia, tinnitus, and leg cramps; *rarely* bradycardia, seizures, hallucinations, agitation, aggression, dehydration, hypokalaemia, and rash; *very rarely* gastrointestinal bleeding, dysphagia, hypotension, exacerbation of Parkinson's disease, and sweating

Dose

- Initially 4 mg twice daily for 4 weeks increased to 8 mg twice daily for 4 weeks; maintenance 8–12 mg twice daily

Reminyl® (Shire) PoM

Tablets, all f/c, galantamine (as hydrobromide) 8 mg (pink), net price 56-tab pack = £68.32; 12 mg (orange-brown), 56-tab pack = £84.00 Label: 3, 21

Oral solution, galantamine (as hydrobromide) 4 mg/mL, net price 100 mL with pipette = £120.00. Label: 3, 21

Modified release

Reminyl® XL (Shire) PoM

Capsules, m/r, galantamine (as hydrobromide) 8 mg (white), net price 28-cap pack = £51.88; 16 mg (pink), 28-cap pack = £64.90; 24 mg (beige), 28-cap pack = £79.80. Label: 3, 21, 25

Dose initially 8 mg once daily for 4 weeks increased to 16 mg once daily for 4 weeks; maintenance 16–24 mg daily

MEMANTINE HYDROCHLORIDE

Indications moderate to severe dementia in Alzheimer's disease

Cautions history of convulsions; renal impairment (avoid if eGFR less than 5 mL/minute; Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (memantine)

Contra-indications breast-feeding

Side-effects constipation; hypertension; headache, dizziness, drowsiness; *less commonly* vomiting, thrombosis, heart failure, confusion, fatigue, halluci-

nations, and abnormal gait; *very rarely* seizures; pancreatitis, psychosis, depression, and suicidal ideation also reported

Dose

- Initially 5 mg once daily, increased in steps of 5 mg at weekly intervals; max. 20 mg daily

Ebixa® (Lundbeck) PoM

Tablets, f/c, scored, memantine hydrochloride 10 mg, net price 28-tab pack = £34.50, 56-tab pack = £69.01, 112-tab pack = £138.01; 20 mg, 28-tab pack = £69.01; treatment initiation pack, 7 × 5 mg, 7 × 10 mg, 7 × 15 mg, and 7 × 20 mg = £43.13

Oral drops, memantine hydrochloride 10 mg/g, net price 50 g = £61.61, 100 g = £123.23

Note 5 mg ≡ 10 drops of memantine hydrochloride oral drops

RIVASTIGMINE

Indications mild to moderate dementia in Alzheimer's disease or in Parkinson's disease

Cautions gastric or duodenal ulcers (or susceptibility to ulcers); monitor body-weight; sick sinus syndrome, conduction abnormalities; history of asthma or chronic obstructive pulmonary disease; history of seizures; bladder outflow obstruction; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (parasympathomimetics)

Note If treatment interrupted for more than several days, re-introduce with initial dose and increase gradually (see Dose)

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea, dyspepsia, anorexia, abdominal pain; dizziness, headache, drowsiness, tremor, asthenia, malaise, agitation, confusion; sweating; weight loss; *less commonly* gastric or duodenal ulceration, bradycardia, syncope, depression, insomnia; *rarely* angina pectoris, seizures; *very rarely* gastro-intestinal haemorrhage, pancreatitis, cardiac arrhythmias, hypertension, hallucinations, extrapyramidal symptoms (including worsening of Parkinson's disease), and rash; *with patches* application-site reactions

Note Gastro-intestinal side-effects more common in women

Dose

- See under preparations below

Exelon® (Novartis) ▼ PoM

Capsules, rivastigmine (as hydrogen tartrate) 1.5 mg (yellow), net price 28-cap pack = £33.25, 56-cap pack = £66.51; 3 mg (orange), 28-cap pack = £33.25, 56-cap pack = £66.51; 4.5 mg (red), 28-cap pack = £33.25, 56-cap pack = £66.51; 6 mg (red/orange), 28-cap pack = £33.25, 56-cap pack = £66.51. Label: 21, 25

Oral solution, rivastigmine (as hydrogen tartrate) 2 mg/mL, net price 120 mL (with oral syringe) = £99.14. Label: 21

Dose initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily at intervals of at least 2 weeks according to response and tolerance; usual range 3–6 mg twice daily; max. 6 mg twice daily

Patches, self-adhesive, beige, rivastigmine 4.6 mg/24 hours, net price 30 = £77.97; 9.5 mg/24 hours, 30 = £77.97

Dose initially apply 4.6 mg/24 hours patch to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days); if well tolerated increase to 9.5 mg/24 hours patch daily after no less than 4 weeks; if patch not applied for more than several days, treatment should be restarted with 4.6 mg/24 hours patch

Note When switching a patient from oral to transdermal therapy, patients taking 3–6 mg daily should be prescribed the 4.6 mg/24 hours patch; patients taking 9 mg daily who do not tolerate the dose well should be prescribed the 4.6 mg/24 hours patch, while those taking 9 mg daily who tolerate the dose well should be prescribed the 9.5 mg/24 hours patch; patients taking 12 mg daily should be prescribed the 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

Note The *Scottish Medicines Consortium* has advised (October 2007) that *Exelon®* patches should be restricted for use in patients with moderately severe Alzheimer's disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

- Anthrax
- Cholera
- Diphtheria
- Dysentery (amoebic or bacillary)
- Encephalitis, acute
- Food poisoning
- Haemorrhagic fever (viral)
- Hepatitis, viral
- Leprosy
- Leptospirosis
- Malaria
- Measles
- Meningitis
- Meningococcal septicaemia (without meningitis)
- Mumps
- Ophthalmia neonatorum
- Paratyphoid fever
- Plague
- Poliomyelitis, acute
- Rabies
- Relapsing fever
- Rubella
- Scarlet fever
- Smallpox
- Tetanus
- Tuberculosis
- Typhoid fever
- Typhus
- Whooping cough
- Yellow fever

Note It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

5.1 Antibacterial drugs

Choice of a suitable drug Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin but sensitive to nitrofurantoin (can cause nausea), gentamicin (can be given only by injection and best avoided in pregnancy), tetracycline (causes dental discoloration) and trimethoprim (folate antagonist therefore theoretical teratogenic risk), and cefalexin. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and new information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Before starting therapy The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials are occasionally helpful in controlling secondary bacterial infection (e.g. acute necrotising ulcerative gingivitis secondary to herpes simplex infection);
- Samples should be taken for culture and sensitivity testing; **'blind'** antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of **prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The **dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The **route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections.

Oral bacterial infections Antibacterial drugs should only be prescribed for the *treatment* of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be indicated if treatment has to be delayed and they are essential in immunocompromised patients or in those with conditions such as diabetes or Paget's disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be

changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or erythromycin) with metronidazole may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

See also **Penicillins** (section 5.1.1), **Cephalosporins** (section 5.1.2), **Tetracyclines** (section 5.1.3), **Macrolides** (section 5.1.5), **Clindamycin** (section 5.1.6), **Metronidazole** (section 5.1.11), **Fusidic acid** (section 13.10.1.2) .

Superinfection In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or *antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Therapy Suggested treatment is shown in table 1. When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds. Infections for which prophylaxis is useful are listed in table 2.

Table 1. Summary of antibacterial therapy

If treating a patient suspected of suffering from a notifiable disease, the consultant in communicable disease control should be informed (see p. 288)

Gastro-intestinal system

Gastro-enteritis

Antibacterial not usually indicated

Frequently self-limiting and may not be bacterial

Campylobacter enteritis

Ciprofloxacin *or* erythromycin

Frequently self-limiting; treat severe infection

Invasive salmonellosis

Ciprofloxacin *or* cefotaxime

Includes severe infections which may be invasive

Shigellosis

Ciprofloxacin *or* azithromycin [unlicensed indication]

Amoxicillin or trimethoprim can be used if organism sensitive. Antibacterial not indicated for mild cases

Typhoid fever

Ciprofloxacin *or* cefotaxime

Infections from Indian subcontinent, Middle-East, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested; azithromycin [unlicensed indication] may be an option in mild or moderate disease caused by multiple antibacterial-resistant organisms

***Clostridium difficile* infection**

Oral metronidazole *or* oral vancomycin

Treat for 10–14 days. Use vancomycin for third or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole. For infection not responding to vancomycin or for life-threatening infection, use oral vancomycin + intravenous metronidazole

Biliary-tract infection

Ciprofloxacin *or* gentamicin *or* a cephalosporin

Peritonitis

A cephalosporin + metronidazole *or* gentamicin + metronidazole *or* gentamicin + clindamycin *or* piperacillin with tazobactam

Peritoneal dialysis-associated peritonitis

Either vancomycin[1] + ceftazidime added to dialysis fluid *or* vancomycin added to dialysis fluid + ciprofloxacin by mouth

Treat for 14 days or longer

Cardiovascular system

Endocarditis: initial 'blind' therapy

Flucloxacillin (*or* benzylpenicillin if symptoms less severe) + gentamicin

Substitute flucloxacillin (or benzylpenicillin) with vancomycin + rifampicin if cardiac prostheses present, or if penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected

Endocarditis caused by staphylococci

Flucloxacillin (*or* vancomycin + rifampicin if penicillin-allergic or if meticillin-resistant *Staphylococcus aureus*)

Treat for at least 4 weeks; treat prosthetic valve endocarditis for at least 6 weeks and if using flucloxacillin add rifampicin for at least 2 weeks

Endocarditis caused by streptococci (e.g. viridans streptococci)

Benzylpenicillin (*or* vancomycin[1] if penicillin- allergic or highly penicillin-resistant) + gentamicin

Treat endocarditis caused by fully sensitive streptococci with benzylpenicillin or vancomycin alone for 4 weeks *or* (if no intracardiac abscess or infected emboli) with benzylpenicillin + gentamicin for 2 weeks. Treat more resistant organisms for 4–6 weeks (stopping gentamicin after 2 weeks for organisms moderately sensitive to penicillin); if aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, treat with benzylpenicillin alone for 4 weeks. Treat prosthetic valve endocarditis for at least 6 weeks (stopping gentamicin after 2 weeks if organisms fully sensitive to penicillin)

Endocarditis caused by enterococci (e.g. *Enterococcus faecalis*)

Amoxicillin[2] (*or* vancomycin[1] if penicillin-allergic or penicillin-resistant) + gentamicin

Treat for at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis); if gentamicin-resistant, substitute gentamicin with streptomycin

Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK' organisms)

Amoxicillin[2] (*or* ceftriaxone if amoxicillin-resistant) + low-dose gentamicin

Treat for 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Respiratory system

***Haemophilus influenzae* epiglottitis**

Cefotaxime *or* chloramphenicol

Give intravenously

Exacerbations of chronic bronchitis

Amoxicillin[2] *or* tetracycline (*or* erythromycin[3])

Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant

Uncomplicated community-acquired pneumonia

Amoxicillin[2] (*or* benzylpenicillin if previously healthy chest *or* erythromycin[3] if penicillin-allergic)

Add flucloxacillin if staphylococci suspected, e.g. in influenza or measles (or vancomycin[1] if meticillin-resistant *Staphylococcus aureus* suspected); treat for 7 days (14–21 days

1. Where vancomycin is suggested teicoplanin may be used.
2. Where amoxicillin is suggested ampicillin may be used.
3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

for infections caused by staphylococci); pneumococci with decreased penicillin sensitivity being isolated but not yet common in UK; add erythromycin[1] if hospitalised for clinical reasons or if atypical pathogens suspected

Severe community-acquired pneumonia of unknown aetiology

Cefuroxime + erythromycin[1] *or* cefotaxime + erythromycin[1] *or* co-amoxiclav + erythromycin[1]

Add vancomycin[2] if meticillin-resistant *Staphylococcus aureus* suspected; treat for 10 days (14–21 days if staphylococci, legionella, or Gram-negative enteric bacilli suspected)

Pneumonia possibly caused by atypical pathogens

Erythromycin[1]

Severe Legionella infections may require addition of rifampicin; tetracycline is an alternative for chlamydial and mycoplasma infections; treat for at least 14 days (14–21 days for legionella)

Hospital-acquired pneumonia

Early-onset infection (less than 5 days after admission to hospital), co-amoxiclav *or* cefuroxime

Treat for 7 days. If life threatening infection, or if recent history of antibacterial treatment, or if resistant organisms suspected, treat as for late-onset hospital-acquired pneumonia

Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam) *or* a broad-spectrum cephalosporin (e.g. ceftazidime) *or* another antipseudomonal beta-lactam *or* a quinolone (e.g. ciprofloxacin)

Treat for 7 days (longer if *Pseudomonas aeruginosa* confirmed). Add vancomycin if MRSA suspected. Consider adding an aminoglycoside for severe illness caused by *Pseudomonas aeruginosa*

Central nervous system

Meningitis: initial empirical therapy

- Transfer patient urgently to hospital
- If bacterial meningitis and especially if *meningococcal disease* suspected, general practitioners should give benzylpenicillin (see p. 296 for dose) before urgent transfer to hospital; cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol (section 5.1.7) may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins
- Consider adjunctive treatment with dexamethasone (particularly if pneumococcal meningitis suspected in adults; section 6.3.2) starting before or with first dose of antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery

Meningitis caused by meningococci

Benzylpenicillin *or* cefotaxime

Treat for at least 5 days; substitute chloramphenicol if history of immediate hypersensitivity reaction to penicillin or to cephalosporins. To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

Meningitis caused by pneumococci

Cefotaxime

Treat for 10–14 days; substitute benzylpenicillin if organism penicillin-sensitive; if organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin. Consider adjunctive treatment with dexamethasone (section 6.3.2) starting before or with first dose of antibacterial (but may reduce penetration of vancomycin into cerebrospinal fluid)

Meningitis caused by *Haemophilus influenzae*

Cefotaxime

Treat for at least 10 days; substitute chloramphenicol if history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if organism resistant to cefotaxime. Consider adjunctive treatment with dexamethasone (section 6.3.2) starting before or with first dose of antibacterial. For *H. influenzae* type b give rifampicin for 4 days before hospital discharge (see Table 2, section 5.1)

Meningitis caused by Listeria

Amoxicillin[3] + gentamicin

Treat for 10–14 days

Urinary tract

Acute pyelonephritis

A broad-spectrum cephalosporin *or* a quinolone

Treat for 10–14 days; longer treatment may be necessary in complicated pyelonephritis

Acute prostatitis

A quinolone *or* trimethoprim

Treat for 28 days

'Lower' urinary-tract infection

Trimethoprim *or* nitrofurantoin *or* amoxicillin[3] *or* oral cephalosporin

Treat for 7 days but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women. See also section 5.1.13

Genital system

Syphilis

Benzathine benzylpenicillin [unlicensed] *or* doxycycline *or* erythromycin

Treat early syphilis (infection of less than 2 years) with benzathine benzylpenicillin as a single dose (repeat dose after 7 days for women in the third trimester of pregnancy) or with doxycycline or erythromycin for 14 days. Treat late latent syphilis (asymptomatic infection of more than 2 years) with doxycycline for 28 days or with benzathine benzylpenicillin once weekly for 2 weeks. Treat asymptomatic contacts of patients with infectious syphilis with doxycycline for 14 days. Contact tracing recommended.

Uncomplicated gonorrhoea

Cefixime [unlicensed indication] *or* ciprofloxacin

Single-dose treatment in uncomplicated infection. Choice depends on locality where infection acquired. Pharyngeal infection requires treatment with ceftriaxone. Use ciprofloxacin only if organism sensitive. Contact tracing recommended; remember chlamydia

Uncomplicated genital chlamydial infection, non-gonococcal urethritis and non-specific genital infection

Doxycycline *or* azithromycin

Treat with doxycycline for 7 days or with azithromycin as a single dose; alternatively, treat with erythromycin for 14 days. Contact tracing recommended

Pelvic inflammatory disease

Doxycycline + metronidazole + i/m ceftriaxone *or* ofloxacin + metronidazole

Treat for at least 14 days (use i/m ceftriaxone as a single dose). In severely ill patients initial treatment with doxycycline + i/v ceftriaxone (as a single dose) + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days' treatment. Contact tracing recommended

Bacterial vaginosis

Oral or topical metronidazole *or* topical clindamycin

Oral treatment for 5–7 days (or with high-dose metronidazole as a single dose); topical treatment for 5 days (7 days with clindamycin)

1. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
2. Where vancomycin is suggested teicoplanin may be used.
3. Where amoxicillin is suggested ampicillin may be used.

Blood

Community-acquired septicaemia

A broad-spectrum antipseudomonal penicillin (e.g. *Tazocin®*, *Timentin®*) *or* a broad-spectrum cephalosporin (e.g. cefuroxime)

Add aminoglycoside if pseudomonas suspected, or if severe sepsis, or if patient recently discharged from hospital. Add vancomycin[1] if meticillin-resistant *Staphylococcus aureus* suspected. Add metronidazole to broad-spectrum cephalosporin if anaerobic infection suspected

Hospital-acquired septicaemia

A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. *Tazocin®*, *Timentin®*, ceftazidime, imipenem (with cilastatin as *Primaxin®*) *or* meropenem)

Add aminoglycoside if pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis. Add vancomycin[1] if meticillin-resistant *Staphylococcus aureus* suspected. Add metronidazole to broad-spectrum cephalosporin if anaerobic infection suspected

Septicaemia related to vascular catheter

Vancomycin[1]

Add a broad-spectrum antipseudomonal beta-lactam if Gram-negative sepsis suspected, especially in the immunocompromised. Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or candida

Meningococcal septicaemia

Benzylpenicillin *or* cefotaxime

If meningococcal disease suspected, general practitioners advised to give a single dose of benzylpenicillin (see p. 296 for dose) before urgent transfer to hospital; cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins. To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

Musculoskeletal system

Osteomyelitis

Flucloxacillin *or* clindamycin if penicillin-allergic (*or* vancomycin[1] if resistant *Staphylococcus epidermidis* or meticillin-resistant *Staph. aureus*)

Treat acute infection for 4–6 weeks and chronic infection for at least 12 weeks. Combine vancomycin[1] with either fusidic acid or rifampicin if prostheses present or if life-threatening condition

Septic arthritis

Flucloxacillin *or* clindamycin if penicillin-allergic (*or* vancomycin[1] if resistant *Staphylococcus epidermidis* or meticillin-resistant *Staph. aureus*) (*or* cefotaxime if gonococcal arthritis or Gram-negative infection)

Treat usually for 6 weeks (longer if infection complicated or if prosthesis present; treat for 2 weeks if gonococcal infection). Combine vancomycin[1] with either fusidic acid or rifampicin if prostheses present or if life-threatening condition

Eye

Purulent conjunctivitis

Chloramphenicol *or* gentamicin eye-drops

Ear, nose, and oropharynx

Pericoronitis

Metronidazole *or* amoxicillin

Antibacterial required only in presence of systemic features of infection or of trismus or persistent swelling despite local treatment; treat for 3 days or until symptoms resolve

Acute necrotising ulcerative gingivitis

Metronidazole *or* amoxicillin

Antibacterial required only if systemic features of infection; treat for 3 days or until symptoms resolve

Periapical or periodontal abscess

Amoxicillin *or* metronidazole

Antibacterial required only in severe disease with cellulitis or if systemic features of infection; treat for 5 days

Periodontitis

Metronidazole *or* doxycycline

Antibacterial required for severe disease or disease unresponsive to local treatment

Throat infections

Phenoxymethylpenicillin (*or* erythromycin[2] if penicillin-allergic)

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis; treat for 10 days. **Avoid** amoxicillin if possibility of glandular fever, see section 5.1.1.3. Initial parenteral therapy (in severe infection) with benzylpenicillin, then oral therapy with phenoxymethylpenicillin *or* amoxicillin[3]

Sinusitis

Amoxicillin[3] *or* doxycycline *or* erythromycin[2]

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis). Treat for 7 days

Otitis externa

Flucloxacillin (*or* erythromycin[2] if penicillin-allergic)

Consider systemic antibacterial if spreading cellulitis or patient systemically unwell. Use ciprofloxacin (or an aminoglycoside) if pseudomonas suspected. For topical preparations see section 12.1.1

Otitis media

Amoxicillin[3] (*or* erythromycin[2] if penicillin-allergic)

Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media. Treat for 5 days (longer if severely ill); initial parenteral therapy in severe infections; consider co-amoxiclav or ceftriaxone if no improvement after 24–48 hours

Skin

Impetigo

Topical fusidic acid (*or* mupirocin if meticillin-resistant *Staphylococcus aureus*); oral flucloxacillin *or* erythromycin[2] if widespread

Topical treatment for 7 days usually adequate; max. duration of topical treatment 10 days; seek local microbiology advice before using topical treatment in hospital; oral treatment for 7 days; add phenoxymethylpenicillin to flucloxacillin if streptococcal infection suspected

Erysipelas

Phenoxymethylpenicillin (*or* erythromycin[2] if penicillin-allergic)

Treat for at least 7 days; add flucloxacillin to phenoxymethylpenicillin if staphylococcus suspected; substitute benzylpenicillin for phenoxymethylpenicillin if parenteral treatment required

Cellulitis

Benzylpenicillin + flucloxacillin (*or* erythromycin[2] alone if penicillin-allergic)

Substitute phenoxymethylpenicillin for benzylpenicillin if oral treatment appropriate. Discontinue flucloxacillin if streptococcal infection confirmed. Substitute treatment with

1. Where vancomycin is suggested teicoplanin may be used.
2. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
3. Where amoxicillin is suggested ampicillin may be used.

broad-spectrum antibacterials if Gram-negative bacteria or anaerobes suspected

Animal and human bites

Co-amoxiclav alone (*or* doxycycline + metronidazole if penicillin-allergic)

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection), see under Tetanus Vaccines, section 14.4. Consider rabies prophylaxis (section 14.4) for bites from animals in endemic countries; assess risk of blood-borne viruses

Acne

See section 13.6

Table 2. Summary of antibacterial prophylaxis

Prevention of recurrence of rheumatic fever

Phenoxymethylpenicillin 250 mg twice daily *or* sulfadiazine 1 g daily (500 mg daily for patients under 30 kg)

Prevention of secondary case of invasive group A *streptococcal infection*[1]

Phenoxymethylpenicillin 250–500 mg every 6 hours for 10 days; CHILD under 1 year 62.5 mg every 6 hours, 1–5 years 125 mg every 6 hours, 6–12 years 250 mg every 6 hours

Patients who are penicillin allergic,

either erythromycin ADULT and CHILD over 8 years, 250–500 mg every 6 hours for 10 days; CHILD under 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours

or azithromycin [unlicensed indication] 500 mg once daily for 5 days; CHILD over 6 months, 12 mg/kg (max. 500 mg) once daily

Prevention of secondary case of meningococcal meningitis[2]

Rifampicin 600 mg every 12 hours for 2 days; CHILD 10 mg/kg (under 1 year, 5 mg/kg) every 12 hours for 2 days

or ciprofloxacin 500 mg as a single dose; CHILD [unlicensed] 2–5 years 125 mg; 5–12 years 250 mg

or i/m ceftriaxone [unlicensed indication] 250 mg as a single dose; CHILD under 12 years 125 mg

Prevention of secondary case of Haemophilus influenzae type b disease[2]

Rifampicin 600 mg once daily for 4 days (regimen of choice for adults); CHILD 1–3 months 10 mg/kg once daily for 4 days, over 3 months 20 mg/kg once daily for 4 days (max. 600 mg daily)

Prevention of secondary case of diphtheria in non-immune patient

Erythromycin 500 mg every 6 hours for 7 days; CHILD up to 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

Prevention of secondary case of pertussis in non-immune patient or partially immune patient

Erythromycin[3] ADULT and CHILD over 8 years, 250–500 mg every 6 hours for 7 days; CHILD under 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

Phenoxymethylpenicillin 500 mg every 12 hours; CHILD under 5 years 125 mg every 12 hours, 6–12 years 250 mg every 12 hours—if cover also needed for *H. influenzae* in CHILD give amoxicillin instead (under 5 years 125 mg every 12 hours, over 5 years 250 mg every 12 hours)

Note Antibiotic prophylaxis is not fully reliable; for vaccines in asplenia see p. 670

Prevention of gas-gangrene in high lower-limb amputations or following major trauma

Benzylpenicillin 300–600 mg every 6 hours for 5 days *or* if penicillin-allergic metronidazole 400–500 mg every 8 hours

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive[4]

Isoniazid 300 mg daily for 6 months; CHILD 5 mg/kg daily (max. 300 mg daily)

or isoniazid 300 mg daily + rifampicin 600 mg daily (450 mg if less than 50 kg) for 3 months; CHILD isoniazid 5 mg/kg daily (max. 300 mg daily) + rifampicin 10 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)

or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin 600 mg daily (450 mg if less than 50 kg) for 6 months; CHILD 10 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)

Prevention of infection in gastro-intestinal procedures

Operations on stomach or oesophagus

Single dose[5] of i/v gentamicin *or* i/v cefuroxime

Add teicoplanin[6] if high risk of meticillin-resistant *Staphylococcus aureus*

1. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory).
2. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.
3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
4. For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control). See also section 5.1.9, for advice on immunocompromised patients and on prevention of tuberculosis.
5. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss.
6. Where teicoplanin is suggested vancomycin may be used

Open biliary surgery

Single dose[1] of i/v cefuroxime + i/v metronidazole[2] *or* i/v gentamicin + i/v metronidazole[2]
Add teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

Single dose[1] of i/v gentamicin + i/v metronidazole[2] *or* i/v cefuroxime + i/v metronidazole[2] *or* i/v co-amoxiclav alone
Add teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Endoscopic retrograde cholangiopancreatography

Single dose of i/v gentamicin *or* oral or i/v ciprofloxacin
Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage

Percutaneous endoscopic gastrostomy or jejunostomy

Single dose of i/v co-amoxiclav *or* i/v cefuroxime
Use i/v teicoplanin[3] if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee and management of fractures

Single dose[1] of i/v cefuroxime or i/v flucloxacillin
Substitute i/v teicoplanin[3] if history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*; use cefuroxime + metronidazole for complex open fractures with extensive soft-tissue damage; prophylaxis continued for 24 hours in open fractures (longer if complex open fractures)

Prevention of infection in urological procedures

Transrectal prostate biopsy

Single dose[1] of oral ciprofloxacin + oral metronidazole *or* i/v gentamicin + i/v metronidazole[2]

Transurethral resection of prostate

Single dose[1] of oral ciprofloxacin *or* i/v gentamicin *or* i/v cefuroxime

Prevention of infection in obstetric and gynaecological surgery

Caesarean section

Single dose[1] of i/v cefuroxime
Administer immediately after umbilical cord is clamped; substitute i/v clindamycin if history of allergy to penicillins or cephalosporins

Hysterectomy

Single dose[1] of i/v cefuroxime + i/v metronidazole[2] *or* i/v gentamicin + i/v metronidazole[2] *or* i/v co-amoxiclav alone

Termination of pregnancy

Single dose[1] of oral metronidazole
If genital chlamydial infection cannot be ruled out, give doxycycline (section 5.1.3) postoperatively

1. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss.
2. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
3. Where teicoplanin is suggested vancomycin may be used

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs

Single dose[1] of i/v cefuroxime *or* i/v ciprofloxacin
Add i/v metronidazole for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation; add i/v teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Prevention of endocarditis

NICE guidance

Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is **not** recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis[4] should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis[4] are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis[4] should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures[5] do not require antibacterial prophylaxis against endocarditis.

4. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.
5. The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

Joint prostheses and dental treatment

Joint prostheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

5.1.1 Penicillins

5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin
5.1.1.2 Penicillinase-resistant penicillins
5.1.1.3 Broad-spectrum penicillins
5.1.1.4 Antipseudomonal penicillins
5.1.1.5 Mecillinams

The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

Hypersensitivity reactions The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. As patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics; aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients and can be used with caution. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity (see also p. 302).

Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Another problem relating to high doses of penicillin, or normal doses given to patients with renal failure, is the accumulation of electrolyte since most injectable penicillins contain either sodium or potassium.

Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax (section 5.1.12), diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease (section 5.1.1.3). Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin is effective in the treatment of tetanus, metronidazole (section 5.1.11) is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gut is low; therefore it is best given by injection.

Benzathine benzylpenicillin (available from 'special-order' manufacturers or specialist importing companies, see p. 969) is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated princi-

pally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

Oral infections Phenoxymethylpenicillin is effective for dentoalveolar abscess.

BENZYLPENICILLIN SODIUM
(Penicillin G)

Indications throat infections, otitis media, endocarditis, meningococcal disease, pneumonia, cellulitis (Table 1, section 5.1); anthrax; prophylaxis in limb amputation (Table 2, section 5.1); see also notes above

Cautions history of allergy; false-positive urinary glucose (if tested for reducing substances); renal impairment (Appendix 3); **interactions:** Appendix 1 (penicillins)

Contra-indications penicillin hypersensitivity

Side-effects hypersensitivity reactions including urticaria, fever, joint pains, rashes, angioedema, anaphylaxis, serum sickness-like reaction; *rarely* CNS toxicity including convulsions (especially with high doses or in severe renal impairment), interstitial nephritis, haemolytic anaemia, leucopenia, thrombocytopenia, and coagulation disorders; also reported diarrhoea (including antibiotic-associated colitis)

Dose

- By intramuscular *or* by slow intravenous injection *or* by infusion, 2.4–4.8 g daily in 4 divided doses, increased if necessary in more serious infections (single doses over 1.2 g intravenous route only; see also below); PRETERM NEONATE and NEONATE under 1 week, 50 mg/kg daily in 2 divided doses; NEONATE 1–4 weeks, 75 mg/kg daily in 3 divided doses; CHILD 1 month–12 years, 100 mg/kg daily in 4 divided doses (higher doses may be required, see also below); intravenous route recommended in neonates and infants
- Endocarditis (in combination with another antibacterial if necessary, see Table 1, section 5.1), by slow intravenous injection *or* by infusion, 7.2 g daily in 6 divided doses, increased if necessary (e.g. in enterococcal endocarditis or if benzylpenicillin used alone) to 14.4 g daily in 6 divided doses
- Anthrax (in combination with other antibacterials, see also section 5.1.12), by slow intravenous injection *or* by infusion, 2.4 g every 4 hours; CHILD 150 mg/kg daily in 4 divided doses
- Intrapartum prophylaxis against group B streptococcal infection, by slow intravenous injection *or* by infusion, initially 3 g then 1.5 g every 4 hours until delivery
- Meningitis, meningococcal disease, by slow intravenous injection *or* by infusion, 2.4 g every 4 hours; PRETERM NEONATE and NEONATE, 225 mg/kg daily in 3 divided doses; CHILD 1 month–12 years, 180–300 mg/kg daily in 4–6 divided doses

  Important. If bacterial meningitis and especially if meningococcal disease is suspected general practitioners are advised to give a single injection of benzylpenicillin by intravenous injection (or by intramuscular injection) before transferring the patient urgently to hospital. Suitable doses are: ADULT 1.2 g; INFANT under 1 year 300 mg; CHILD 1–9 years 600 mg, 10 years and over as for adult. In **penicillin allergy**, cefotaxime (section 5.1.2) may be an alternative; chloramphenicol may be used if there is a history of anaphylaxis to penicillins
- By intrathecal injection, **not** recommended

Note Benzylpenicillin doses in BNF may differ from those in product literature

Crystapen® (Genus) PoM

Injection, powder for reconstitution, benzylpenicillin sodium (unbuffered), net price 600-mg vial = 95p, 2-vial 'GP pack' = £2.64; 1.2-g vial = £1.89

Electrolytes Na^+ 1.68 mmol/600-mg vial; 3.36 mmol/1.2-g vial

PHENOXYMETHYLPENICILLIN
(Penicillin V)

Indications oral infections (see notes above); tonsillitis, otitis media, erysipelas, cellulitis; group A streptococcal infection, rheumatic fever and pneumococcal infection prophylaxis (Table 2, section 5.1)

Cautions see under Benzylpenicillin; **interactions:** Appendix 1 (penicillins)

Contra-indications see under Benzylpenicillin

Side-effects see under Benzylpenicillin

Dose

- 500 mg every 6 hours increased up to 1 g every 6 hours in severe infections; CHILD up to 1 year 62.5 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections; 1–6 years, 125 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections; 6–12 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections

Note Phenoxymethylpenicillin doses in the BNF may differ from those in product literature

Phenoxymethylpenicillin (Non-proprietary) PoM

Tablets, phenoxymethylpenicillin (as potassium salt) 250 mg, net price 28-tab pack = £1.25. Label: 9, 23

Oral solution, phenoxymethylpenicillin (as potassium salt) for reconstitution with water, net price 125 mg/5 mL, 100 mL = £1.90; 250 mg/5 mL, 100 mL = £2.59. Label: 9, 23

Dental prescribing on NHS Phenoxymethylpenicillin Tablets and Oral Solution may be prescribed

5.1.1.2 Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. **Flucloxacillin**, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection.

Flucloxacillin is well absorbed from the gut. For CSM warning on hepatic disorders see under Flucloxacillin.

Temocillin is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

MRSA Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin (section 5.1.9) or **sodium fusidate** (section 5.1.7) should **not** be used alone because resistance may develop rapidly. A **tetracycline** alone or a combination of rifampicin and sodium fusidate can be used for *skin* and *soft-tissue infections* caused by MRSA; **clindamycin** alone is an alternative. A **glycopeptide** (e.g. vancomycin, section 5.1.7) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, **linezolid** (section 5.1.7) can be used on expert advice. As linezolid is **not** active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and sodium fusidate *or* a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

The combination of the streptogramin antibiotics **quinupristin** and **dalfopristin** (section 5.1.7) should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for patients who cannot tolerate other antibacterials. **Tigecycline** (section 5.1.3) and **daptomycin** (section 5.1.7) are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or **clindamycin** can be used for *bronchiectasis* caused by MRSA. A **glycopeptide** can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, **linezolid** can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. **Quinupristin** and **dalfopristin** should be reserved for hospital acquired pneumonia that has not responded to other antibacterials or for patients who cannot tolerate other antibacterials.

A **tetracycline** can be used for *urinary-tract infections* caused by MRSA; **trimethoprim** or **nitrofurantoin** are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

For the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA, see Table 1, section 5.1.

Prophylaxis with vancomycin or teicoplanin (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

For eradication of nasal carriage of MRSA, see section 12.2.3.

FLUCLOXACILLIN

Indications infections due to beta-lactamase-producing staphylococci including otitis externa; adjunct in pneumonia, impetigo, cellulitis, osteomyelitis and in staphylococcal endocarditis (Table 1, section 5.1)

Cautions see under Benzylpenicillin (section 5.1.1.1); also hepatic impairment (see CSM advice below); risk of kernicterus in jaundiced neonates when high doses given parenterally

CSM advice (hepatic disorders)

CSM has advised that very rarely cholestatic jaundice and hepatitis may occur up to several weeks after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. CSM has reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1); also gastro-intestinal disturbances; *very rarely* hepatitis and cholestatic jaundice (see also CSM advice above)

Dose

- By mouth, 250–500 mg every 6 hours, at least 30 minutes before food; CHILD under 2 years quarter adult dose; 2–10 years half adult dose
- By intramuscular injection, 250–500 mg every 6 hours; CHILD under 2 years quarter adult dose; 2–10 years half adult dose
- By slow intravenous injection *or* by intravenous infusion, 0.25–2 g every 6 hours; CHILD under 2 years quarter adult dose; 2–10 years half adult dose

  Endocarditis (in combination with another antibacterial, see Table 1, section 5.1), body-weight under 85 kg, 8 g daily in 4 divided doses; body-weight over 85 kg, 12 g daily in 6 divided doses

  Osteomyelitis (see Table 1, section 5.1), up to 8 g daily in 3–4 divided doses
- Surgical prophylaxis, by slow intravenous injection *or* by intravenous infusion, 1–2 g at induction; up to 4 further doses of 500 mg may be given every 6 hours by mouth, *or* by intramuscular injection, *or* by slow intravenous injection *or* by intravenous infusion for high risk procedures

Note Flucloxacillin doses in BNF may differ from those in product literature

Flucloxacillin (Non-proprietary) PoM

Capsules, flucloxacillin (as sodium salt) 250 mg, net price 28 = £1.93; 500 mg, 28 = £3.90. Label: 9, 23
Brands include *Floxapen®*, *Fluclomix®*, *Ladropen®*

Oral solution (= elixir or syrup), flucloxacillin (as sodium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £3.07; 250 mg/5 mL, 100 mL = £8.51. Label: 9, 23
Brands include *Ladropen®*

Injection, powder for reconstitution, flucloxacillin (as sodium salt). Net price 250-mg vial = £1.23; 500-mg vial = £2.45; 1-g vial = £4.90

Floxapen® (GSK) PoM

Suspension (= syrup), flucloxacillin (as magnesium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £4.03; 250 mg/5 mL, 100 mL = £8.02. Label: 9, 23

TEMOCILLIN

Indications septicaemia, urinary-tract infections, lower respiratory-tract infections caused by susceptible Gram-negative bacteria

Cautions see under Benzylpenicillin (section 5.1.1.1); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1)

Dose

- By intramuscular injection *or* by intravenous injection over 3–4 minutes, *or* by intravenous infusion, ADULT and CHILD over 12 years (body-weight over 45 kg), 1–2 g every 12 hours

  Uncomplicated urinary-tract infections, ADULT and CHILD over 12 years (body-weight over 45 kg), 1 g daily as a single daily dose or in divided doses

Negaban® (Eumedica) PoM

Injection, powder for reconstitution, temocillin (as sodium salt), net price 1-g vial = £25.45

Electrolytes Na^+ 4.35 mmol/g

5 Infections

5.1.1.3 Broad-spectrum penicillins

Ampicillin is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections (section 5.1.13).

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. Rashes are also common in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin (amoxycillin) is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed], see below.

Co-amoxiclav consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains; for CSM warning on cholestatic jaundice see under Co-amoxiclav.

A combination of ampicillin with flucloxacillin (as co-fluampicil) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Lyme disease Lyme disease should generally be treated by those experienced in its management. **Doxycycline** (p. 309), **amoxicillin** [unlicensed indication] or **cefuroxime axetil** are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis*. If these antibacterials are contra-indicated, a **macrolide** (e.g. erythromycin) can be used for early Lyme disease. Intravenous administration of **ceftriaxone**, **cefotaxime** (p. 302), or **benzylpenicillin** (p. 296) is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

Oral infections Amoxicillin or ampicillin are as effective as phenoxymethylpenicillin (section 5.1.1.1) but they are better absorbed; however, they may encourage emergence of resistant organisms. Like phenoxymethylpenicillin, amoxicillin and ampicillin are ineffective against bacteria that produce beta-lactamases. Amoxicillin may be useful for short-course oral regimens. Co-amoxiclav is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

AMOXICILLIN

(Amoxycillin)

Indications see under Ampicillin; oral infections (see notes above); also endocarditis treatment (Table 1, section 5.1); anthrax (section 5.1.12); adjunct in listerial meningitis (Table 1, section 5.1); *Helicobacter pylori* eradication (section 1.3)

Cautions see under Ampicillin; maintain adequate hydration with high doses (particularly during parenteral therapy)

Contra-indications see under Ampicillin

Side-effects see under Ampicillin

Dose

- By mouth, 250 mg every 8 hours, doubled in severe infections; CHILD up to 10 years, 125 mg every 8 hours, doubled in severe infections

  Otitis media, 1 g every 8 hours; CHILD 40 mg/kg daily in 3 divided doses (max. 3 g daily)

  Pneumonia, 0.5–1 g every 8 hours

  Anthrax (treatment and post-exposure prophylaxis—see also section 5.1.12), 500 mg every

8 hours; CHILD body-weight under 20 kg, 80 mg/kg daily in 3 divided doses, body-weight over 20 kg, adult dose

- *Short-course oral therapy*

  Dental abscess, 3 g repeated after 8 hours

  Urinary-tract infections, 3 g repeated after 10–12 hours
- By intramuscular injection, 500 mg every 8 hours; CHILD, 50–100 mg/kg daily in divided doses
- By intravenous injection *or* infusion, 500 mg every 8 hours increased to 1 g every 6 hours in severe infections; CHILD, 50–100 mg/kg daily in divided doses
- Listerial meningitis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous infusion, 2 g every 4 hours for 10–14 days
- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), by intravenous infusion, 2 g every 6 hours, increased to 2 g every 4 hours e.g. in enterococcal endocarditis or if amoxicillin used alone

Note Amoxicillin doses in BNF may differ from those in product literature

Amoxicillin (Non-proprietary) PoM

Capsules, amoxicillin (as trihydrate) 250 mg, net price 21 = £1.16; 500 mg, 21 = £1.53. Label: 9

Brands include *Amix®*, *Amoram®*, *Amoxident®*, *Galenamox®*, *Rimoxallin®*

Oral suspension, amoxicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.34; 250 mg/5 mL, 100 mL = £1.48. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Amoram®*, *Galenamox®*, *Rimoxallin®*

Sachets, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack = £5.43, 14-sachet pack = £31.94. Label: 9, 13

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 250-mg vial = 32p; 500-mg vial = 66p; 1-g vial = £1.16

Dental prescribing on NHS Amoxicillin Capsules and Oral Suspension may be prescribed. Amoxicillin Sachets may be prescribed as Amoxicillin Oral Powder

Amoxil® (GSK) PoM

Capsules, both maroon/gold, amoxicillin (as trihydrate), 250 mg, net price 21-cap pack = £3.45; 500 mg, 21-cap pack = £6.91. Label: 9

Paediatric suspension, amoxicillin 125 mg (as trihydrate)/1.25 mL when reconstituted with water, net price 20 mL (peach- strawberry- and lemon-flavoured) = £3.25. Label: 9, counselling , use of pipette

Excipients include sucrose 600 mg/1.25 mL

Sachets SF, powder, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, 2-sachet pack (peach- strawberry- and lemon-flavoured) = £2.99. Label: 9, 13

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = 56p; 1-g vial = £1.12

Electrolytes Na^+ 3.3 mmol/g

AMPICILLIN

Indications urinary-tract infections, otitis media, sinusitis, oral infections (see notes above), bronchitis, uncomplicated community-acquired pneumonia (Table 1, section 5.1), *Haemophilus influenzae* infections, invasive salmonellosis; listerial meningitis (Table 1, section 5.1)

Cautions history of allergy; renal impairment (Appendix 3); erythematous rashes common in glandular fever, cytomegalovirus infection, and acute or chronic lymphocytic leukaemia (see notes above); **interactions**: Appendix 1 (penicillins)

Contra-indications penicillin hypersensitivity

Side-effects nausea, vomiting, diarrhoea; rashes (discontinue treatment); rarely, antibiotic-associated colitis; see also under Benzylpenicillin (section 5.1.1.1)

Dose

- By mouth, 0.25–1 g every 6 hours, at least 30 minutes before food; CHILD under 10 years, half adult dose

  Urinary-tract infections, 500 mg every 8 hours; CHILD under 10 years, half adult dose
- By intramuscular injection *or* intravenous injection *or* infusion, 500 mg every 4–6 hours; CHILD under 10 years, half adult dose
- Endocarditis (in combination with another antibiotic if necessary), by intravenous infusion, 2 g every 6 hours, increased to 2 g every 4 hours e.g. in enterococcal endocarditis or if ampicillin used alone
- Listerial meningitis (in combination with another antibiotic), by intravenous infusion, 2 g every 4 hours for 10–14 days; NEONATE 50 mg/kg every 6 hours; INFANT 1–3 months, 50–100 mg/kg every 6 hours; CHILD 3 months–12 years, 100 mg/kg every 6 hours (max. 12 g daily)

Note Ampicillin doses in BNF may differ from those in product literature

Ampicillin (Non-proprietary) PoM

Capsules, ampicillin 250 mg, net price 28 = £3.88; 500 mg, 28 = £19.68. Label: 9, 23

Brands include *Rimacillin®*

Oral suspension, ampicillin 125 mg/5 mL when reconstituted with water, net price 100 mL = £3.38; 250 mg/5 mL, 100 mL = £6.61. Label: 9, 23

Brands include *Rimacillin®*

Injection, powder for reconstitution, ampicillin (as sodium salt), net price 500-mg vial = £7.83

Dental prescribing on NHS Ampicillin Capsules and Oral Suspension may be prescribed

Penbritin® (Chemidex) PoM

Capsules, grey/red, ampicillin (as trihydrate) 250 mg, net price 28-cap pack = £2.10; 500 mg, 28-cap pack = £5.28. Label: 9, 23

Syrup, apricot- caramel- and peppermint-flavoured, ampicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £3.78; 250 mg/5 mL, 100 mL = £7.39. Label: 9, 23

Excipients include sucrose 3.6 g/5 mL

With flucloxacillin

See Co-fluampicil

CO-AMOXICLAV

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form *x*/*y* where *x* and *y* are the strengths in milligrams of amoxicillin and clavulanic acid respectively

Indications infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, genito-urinary

and abdominal infections, cellulitis, animal bites, severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial

Cautions see under Ampicillin and notes above; also caution in hepatic impairment (monitor hepatic function), pregnancy; maintain adequate hydration with high doses (particularly during parenteral therapy)

Cholestatic jaundice CSM has advised that cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days

Contra-indications penicillin hypersensitivity, history of co-amoxiclav-associated or penicillin-associated jaundice or hepatic dysfunction

Side-effects see under Ampicillin; hepatitis, cholestatic jaundice (see above); Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, vasculitis reported; rarely prolongation of bleeding time, dizziness, headache, convulsions (particularly with high doses or in renal impairment); superficial staining of teeth with suspension, phlebitis at injection site

Dose

- By mouth, expressed as co-amoxiclav, one *250/125* strength tablet every 8 hours, increased in severe infections to one *500/125* strength tablet every 8 hours; CHILD see under preparations below (under 6 years *Augmentin® '125/31 SF'* suspension; 6–12 years *Augmentin® '250/62 SF'* suspension *or* for short-term treatment with twice daily dosage in CHILD 2 months–12 years *Augmentin-Duo® 400/57* suspension)

  Severe dental infections (but not generally first-line, see notes above), expressed as co-amoxiclav, one *250/125* strength tablet every 8 hours for 5 days
- By intravenous injection over 3–4 minutes or by intravenous infusion, expressed as co-amoxiclav, 1.2 g every 8 hours increased in more serious infections to 1.2 g every 6 hours; INFANTS up to 3 months 30 mg/kg every 8 hours (every 12 hours in the perinatal period and in premature infants); CHILD 3 months–12 years, 30 mg/kg every 8 hours increased in more serious infections to 30 mg/kg every 6 hours

  Surgical prophylaxis, expressed as co-amoxiclav, 1.2 g at induction; for high risk procedures (e.g. colorectal surgery) up to 2–3 further doses of 1.2 g may be given every 8 hours

Co-amoxiclav (Non-proprietary) PoM

Tablets, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £2.59. Label: 9

Dental prescribing on NHS Co-amoxiclav 250/125 Tablets may be prescribed

Tablets, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £6.17. Label: 9

Oral suspension, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £3.26. Label: 9

Dental prescribing on NHS Co-amoxiclav 125/31 Suspension may be prescribed

Oral suspension, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £4.04. Label: 9

Dental prescribing on NHS Co-amoxiclav 250/62 Suspension may be prescribed

Injection 500/100, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.21

Injection 1000/200, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £2.42

Augmentin® (GSK) PoM

Tablets 375 mg, f/c, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.28. Label: 9

Tablets 625 mg, f/c, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt). Net price 21-tab pack = £8.16. Label: 9

Dispersible tablets, sugar-free, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt). Net price 21-tab pack = £9.82. Label: 9, 13

Suspension '125/31 SF', sugar-free, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water. Net price 100 mL (raspberry-and orange-flavoured) = £4.08. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Dose CHILD 1–6 years (10–18 kg) 5 mL every 8 hours *or* INFANT and CHILD up to 6 years 0.8 mL/kg daily in 3 divided doses; in severe infections dose increased to 1.6 mL/kg daily in 3 divided doses

Suspension '250/62 SF', sugar-free, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water. Net price 100 mL (raspberry-and orange-flavoured) = £5.74. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Dose CHILD 6–12 years (18–40 kg) 5 mL every 8 hours *or* 0.4 mL/kg daily in 3 divided doses; in severe infections dose increased to 0.8 mL/kg daily in 3 divided doses

Injection 600 mg, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt). Net price per vial = £1.33

Electrolytes Na^+ 1.35 mmol, K^+ 0.5 mmol/600-mg vial

Injection 1.2 g, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt). Net price per vial = £2.65

Electrolytes Na^+ 2.7 mmol, K^+ 1 mmol/1.2-g vial

Augmentin-Duo® (GSK) PoM

Suspension '400/57', sugar-free, strawberry-flavoured, co-amoxiclav 400/57 (amoxicillin 400 mg as trihydrate, clavulanic acid 57 mg as potassium salt)/5 mL when reconstituted with water. Net price 35 mL = £4.21, 70 mL = £5.91. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Dose CHILD 2 months–2 years 0.15 mL/kg twice daily, 2–6 years (13–21 kg) 2.5 mL twice daily, 7–12 years (22–40 kg) 5 mL twice daily, doubled in severe infections

CO-FLUAMPICIL

A mixture of equal parts by mass of flucloxacillin and ampicillin

Indications mixed infections involving beta-lactamase-producing staphylococci

Cautions see under Ampicillin and Flucloxacillin

Contra-indications see under Ampicillin and Flucloxacillin

Side-effects see under Ampicillin and Flucloxacillin

Dose

- By mouth, co-fluampicil, 250/250 every 6 hours, dose doubled in severe infections; CHILD under 10 years half adult dose, dose doubled in severe infections
- By intramuscular *or* slow intravenous injection *or* by intravenous infusion, co-fluampicil 250/250 every 6 hours, dose doubled in severe infections; CHILD under 2 years quarter adult dose, 2–10 years half adult dose, dose doubled in severe infections

Co-fluampicil (Non-proprietary) PoM

Capsules, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 28-cap pack = £15.85. Label: 9, 22

Brands include *Flu-Amp®*

Magnapen® (Wockhardt) PoM

Capsules, black/turquoise, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 20-cap pack = £4.00. Label: 9, 22

Syrup, co-fluampicil 125/125 (flucloxacillin 125 mg as magnesium salt, ampicillin 125 mg as trihydrate)/5 mL when reconstituted with water, net price 100 mL = £4.99. Label: 9, 22

Excipients include sucrose 3.14 g/5 mL

Injection 500 mg, powder for reconstitution, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as sodium salt), net price per vial = £1.33

Electrolytes Na^+ 1.3 mmol/vial

5.1.1.4 Antipseudomonal penicillins

The carboxypenicillin, **ticarcillin**, is principally indicated for serious infections caused by *Pseudomonas aeruginosa* although it also has activity against certain other Gram-negative bacilli including *Proteus* spp. and *Bacteroides fragilis*.

Ticarcillin is now available only in combination with clavulanic acid (section 5.1.1.3); the combination (*Timentin®*) is active against beta-lactamase-producing bacteria resistant to ticarcillin.

The ureidopenicillin, **piperacillin**, is more active than ticarcillin against *Ps. aeruginosa*. Piperacillin is now available only in combination with the beta-lactamase inhibitor tazobactam. The spectrum of activity of piperacillin with tazobactam is comparable to that of the carbapenems, imipenem and meropenem (section 5.1.2).

For pseudomonas septicaemias (especially in neutropenia or endocarditis) these antipseudomonal penicillins should be given with an aminoglycoside (e.g. gentamicin section 5.1.4) since they have a synergistic effect.

Owing to the sodium content of many of these antibiotics, high doses may lead to hypernatraemia.

PIPERACILLIN WITH TAZOBACTAM

Indications see under Dose

Cautions see under Benzylpenicillin (section 5.1.1.1); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, diarrhoea; *less commonly* stomatitis, dyspepsia, constipation, jaundice, hypotension, headache, insomnia, and injection-site reactions; *rarely* abdominal pain, hepatitis, oedema, fatigue, and eosinophilia; *very rarely* hypoglycaemia, hypokalaemia, pancytopenia, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

Note Expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1

- Lower respiratory-tract, urinary-tract, intra-abdominal and skin infections, and septicaemia, ADULT and CHILD over 12 years, by intravenous injection over 3–5 minutes *or* by intravenous infusion, 2.25–4.5 g every 6–8 hours, usually 4.5 g every 8 hours
- Complicated appendicitis, by intravenous injection over 3–5 minutes *or* by intravenous infusion, CHILD 2–12 years, 112.5 mg/kg (max. 4.5 g) every 8 hours for 5–14 days; CHILD under 2 years, not recommended
- Infections in neutropenic patients (in combination with an aminoglycoside), by intravenous injection over 3–5 minutes *or* by intravenous infusion, ADULT and CHILD over 50 kg, 4.5 g every 6 hours; CHILD less than 50 kg, 90 mg/kg every 6 hours

Piperacillin with tazobactam (Non-proprietary) PoM

Injection 2.25 g, powder for reconstitution, piperacillin 2 g (as sodium salt), tazobactam 250 mg (as sodium salt), net price 2.25-g vial = £7.16

Injection 4.5 g, powder for reconstitution, piperacillin 4 g (as sodium salt), tazobactam 500 mg (as sodium salt), net price 4.5-g vial = £14.21

Tazocin® (Wyeth) PoM

Injection 2.25 g, powder for reconstitution, piperacillin 2 g (as sodium salt), tazobactam 250 mg (as sodium salt), net price 2.25-g vial = £7.65

Electrolytes Na^+ 5.58 mmol/2.25-g vial

Injection 4.5 g, powder for reconstitution, piperacillin 4 g (as sodium salt), tazobactam 500 mg (as sodium salt), net price 4.5-g vial = £15.17

Electrolytes Na^+ 11.16 mmol/4.5-g vial

TICARCILLIN

Indications infections due to *Pseudomonas* and *Proteus* spp, see notes above

Cautions see under Benzylpenicillin (section 5.1.1.1)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, coagulation disorders, haemorrhagic cystitis (more frequent in children), injection-site reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, hypokalaemia, eosinophilia

Dose

- See under preparation

With clavulanic acid

Note For a CSM warning on cholestatic jaundice possibly associated with clavulanic acid, see under Co-amoxiclav p. 300.

Timentin (GSK) PoM

Injection 3.2 g, powder for reconstitution, ticarcillin 3 g (as sodium salt), clavulanic acid 200 mg (as potassium salt). Net price per vial = £5.44

Electrolytes Na^+ 16 mmol, K^+ 1 mmol /3.2-g vial

Dose by intravenous infusion, 3.2 g every 6–8 hours increased to every 4 hours in more severe infections; CHILD 1 month–18 years, body-weight under 40 kg, 80 mg/kg every 8 hours, increased to every 6 hours in more severe infections; body weight over 40 kg, adult dose

5.1.1.5 Mecillinams

Pivmecillinam has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam is hydrolysed to mecillinam, which is the active drug.

PIVMECILLINAM HYDROCHLORIDE

Indications see under Dose below

Cautions see under Benzylpenicillin (section 5.1.1.1); also liver and renal function tests required in long-term use; avoid in acute porphyria (section 9.8.2); pregnancy; **interactions:** Appendix 1 (penicillins)

Contra-indications see under Benzylpenicillin (section 5.1.1.1); also carnitine deficiency, oesophageal strictures, gastro-intestinal obstruction, infants under 3 months

Side-effects see under Benzylpenicillin (section 5.1.1.1); nausea, vomiting, dyspepsia; also reduced serum and total body carnitine (especially with long-term or repeated use)

Dose

- Acute uncomplicated cystitis, ADULT and CHILD over 40 kg, initially 400 mg then 200 mg every 8 hours for 3 days
- Chronic or recurrent bacteriuria, ADULT and CHILD over 40 kg, 400 mg every 6–8 hours
- Urinary-tract infections, CHILD under 40 kg, 20–40 mg/kg daily in 3–4 divided doses
- Salmonellosis, not recommended therefore no dose stated

Counselling Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

Selexid® (LEO) PoM

Tablets, f/c, pivmecillinam hydrochloride 200 mg, net price 10-tab pack = £4.50. Label 9, 21, 27, counselling, posture (see Dose above)

5.1.2 Cephalosporins, carbapenems, and other beta-lactams

Antibiotics in this section include the **cephalosporins**, such as cefotaxime, ceftazidime, cefuroxime, cefalexin and cefradine, the **monobactam**, aztreonam, and the **carbapenems**, imipenem (a thienamycin derivative), meropenem, doripenem, and ertapenem.

5.1.2.1 Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime is a suitable cephalosporin for infections of the CNS (e.g meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin should not receive a cephalosporin. If a cephalosporin is essential in these patients because a suitable alternative antibacterial is not available, then cefixime, cefotaxime, ceftazidime, ceftriaxone, or cefuroxime can be used with caution; cefaclor, cefadroxil, cefalexin, and cefradine should be avoided.

Antibiotic-associated colitis may occur with the use of broad-spectrum cephalosporins.

Cefradine (cephradine) has generally been replaced by the newer cephalosporins.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae* and *Neisseria gonorrhoeae*.

Cefotaxime, **ceftazidime** and **ceftriaxone** are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Orally active cephalosporins The orally active 'first generation' cephalosporins, **cefalexin** (cephalexin), **cefradine**, and **cefadroxil** and the 'second generation' cephalosporin, **cefaclor**, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*, but it is associated with protracted skin reactions especially in children. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed.

Cefixime has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefpodoxime proxetil is more active than the other oral cephalosporins against respiratory bacterial pathogens and it is licensed for upper and lower respiratory-tract infections.

For treatment of Lyme disease, see section 5.1.1.3.

Oral infections The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin and cefradine have been used in the treatment of oral infections.

CEFACLOR

Indications infections due to sensitive Gram-positive and Gram-negative bacteria, but see notes above

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also notes above and p. 295); renal impairment (Appendix 3); pregnancy and breast-feeding (but appropriate to use); false positive urinary glucose (if tested for reducing substances) and false positive Coombs' test; **interactions:** Appendix 1 (cephalosporins)

Contra-indications cephalosporin hypersensitivity

Side-effects diarrhoea and rarely antibiotic-associated colitis (CSM has warned both more likely with higher doses), nausea and vomiting, abdominal discomfort, headache; allergic reactions including rashes, pruritus, urticaria, serum sickness-like reactions with rashes, fever and arthralgia, and anaphylaxis; Stevens-Johnson syndrome, toxic epidermal necrolysis reported; disturbances in liver enzymes, transient hepatitis and cholestatic jaundice; other side-effects reported include eosinophilia and blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia and haemolytic anaemia); reversible interstitial nephritis, hyperactivity, nervousness, sleep disturbances, hallucinations, confusion, hypertonia, and dizziness

Dose

- 250 mg every 8 hours, doubled for severe infections; max. 4 g daily; CHILD over 1 month, 20 mg/kg daily in 3 divided doses, doubled for severe infections, max. 1 g daily; *or* 1 month–1 year, 62.5 mg every 8 hours; 1–5 years, 125 mg; over 5 years, 250 mg; doses doubled for severe infections

Cefaclor (Non-proprietary) PoM

Capsules, cefaclor (as monohydrate) 250 mg, net price 21-cap pack = £4.52; 500 mg, 50-cap pack = £22.76. Label: 9

Brands include *Keflid®*

Suspension, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £5.45; 250 mg/5 mL, 100 mL = £6.58. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Keflid®*

Distaclor® (Flynn) PoM

Capsules, cefaclor (as monohydrate) 500 mg (violet/grey), net price 20 = £17.33. Label: 9

Suspension, both pink, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £4.13; 250 mg/5 mL, 100 mL = £8.26. Label: 9

Distaclor MR® (Flynn) PoM

Tablets, m/r, both blue, cefaclor (as monohydrate) 375 mg. Net price 14-tab pack = £8.31. Label: 9, 21, 25

Dose 375 mg every 12 hours with food, dose doubled for pneumonia

Lower urinary-tract infections, 375 mg every 12 hours with food

CEFADROXIL

Indications see under Cefaclor; see also notes above

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- Patients over 40 kg, 0.5–1 g twice daily; skin, soft tissue, and simple urinary-tract infections, 1 g daily; CHILD under 1 year, 25 mg/kg daily in divided doses; 1–6 years, 250 mg twice daily; over 6 years, 500 mg twice daily

Cefadroxil (Non-proprietary) PoM

Capsules, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £5.25. Label: 9

Baxan® (Bristol-Myers Squibb) PoM

Capsules, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £5.05. Label: 9

Suspension, cefadroxil (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 60 mL = £1.57; 250 mg/5 mL, 60 mL = £3.11; 500 mg/5 mL, 60 mL = £4.66. Label: 9

CEFALEXIN

(Cephalexin)

Indications see under Cefaclor

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- 250 mg every 6 hours *or* 500 mg every 8–12 hours increased to 1–1.5 g every 6–8 hours for severe infections; CHILD 25 mg/kg daily in divided doses, doubled for severe infections, max. 100 mg/kg daily; *or* under 1 year 125 mg every 12 hours, 1–5 years 125 mg every 8 hours, 5–12 years 250 mg every 8 hours
- Prophylaxis of recurrent urinary-tract infection, ADULT 125 mg at night

Cefalexin (Non-proprietary) PoM

Capsules, cefalexin 250 mg, net price 28-cap pack = £1.86; 500 mg, 21-cap pack = £2.49. Label: 9

Tablets, cefalexin 250 mg, net price 28-tab pack = £2.17; 500 mg, 21-tab pack = £2.70. Label: 9

Oral suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.76; 250 mg/5 mL, 100 mL = £2.08. Label: 9

Dental prescribing on NHS Cefalexin Capsules, Tablets, and Oral Suspension may be prescribed

Ceporex® (Galen) PoM

Capsules, both caramel/grey, cefalexin 250 mg, net price 28-cap pack = £4.02; 500 mg, 28-cap pack = £7.85. Label: 9

Tablets, all pink, f/c, cefalexin 250 mg, net price 28-tab pack = £4.02; 500 mg, 28-tab pack = £7.85. Label: 9

Syrup, all orange, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.43; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. Label: 9

Keflex® (Flynn) PoM

Capsules, cefalexin 250 mg (green/white), net price 28-cap pack = £1.46; 500 mg (pale green/dark green), 21-cap pack = £1.98. Label: 9

Tablets, both peach, cefalexin 250 mg, net price 28-tab pack = £1.60; 500 mg (scored), 21-tab pack = £2.08. Label: 9

Suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = 84p; 250 mg/5 mL, 100 mL = £1.40. Label: 9

CEFIXIME

Indications see under Cefaclor (acute infections only); gonorrhoea [unlicensed indication] (Table 1, section 5.1)

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- ADULT and CHILD over 10 years, 200–400 mg daily in 1–2 divided doses; CHILD over 6 months 8 mg/kg daily in 1–2 divided doses *or* 6 months–1 year 75 mg daily; 1–4 years 100 mg daily; 5–10 years 200 mg daily
- Gonorrhoea [unlicensed indication], 400 mg as a single dose

Suprax® (Rhône-Poulenc Rorer) PoM

Tablets, f/c, scored, cefixime 200 mg. Net price 7-tab pack = £13.23. Label: 9

Paediatric oral suspension, cefixime 100 mg/5 mL when reconstituted with water, net price 50 mL (with double-ended spoon for measuring 3.75 mL or 5 mL since dilution not recommended) = £10.53, 100 mL = £18.91. Label: 9

CEFOTAXIME

Indications see under Cefaclor; gonorrhoea; surgical prophylaxis; Haemophilus epiglottitis and meningitis (Table 1, section 5.1); see also notes above

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor; rarely arrhythmias following rapid injection reported

Dose

- By intramuscular *or* intravenous injection *or* by intravenous infusion, 1 g every 12 hours increased in severe infections (e.g. meningitis) to 8 g daily in 4 divided doses; higher doses (up to 12 g daily in 3–4 divided doses) may be required; NEONATE 50 mg/kg daily in 2–4 divided doses increased to 150–200 mg/kg daily in severe infections; CHILD 100–150 mg/kg daily in 2–4 divided doses increased up to 200 mg/kg daily in very severe infections

  Gonorrhoea, 500 mg as a single dose

  Important. If bacterial meningitis and especially if meningococcal disease is suspected the patient should be transferred urgently to hospital. If benzylpenicillin cannot be given (e.g. because of an allergy), a single dose of cefotaxime may be given (if available) before urgent transfer to hospital. Suitable doses of cefotaxime by intravenous injection (or by intramuscular injection) are ADULT and CHILD over 12 years 1 g; CHILD under 12 years 50 mg/kg; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins or cephalosporins

Cefotaxime (Non-proprietary) PoM

Injection, powder for reconstitution, cefotaxime (as sodium salt), net price 500-mg vial = £2.14; 1-g vial = £4.31; 2-g vial = £8.57

CEFPODOXIME

Indications see under Dose

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- Upper respiratory-tract infections (but in pharyngitis and tonsillitis reserved for infections which are recurrent, chronic, or resistant to other antibacterials), 100 mg twice daily (200 mg twice daily in sinusitis); CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Lower respiratory-tract infections (including bronchitis and pneumonia), 100–200 mg twice daily; CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Skin and soft-tissue infections, 200 mg twice daily; CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Uncomplicated urinary-tract infections, 100 mg twice daily (200 mg twice daily in uncomplicated upper urinary-tract infections); CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Uncomplicated gonorrhoea, 200 mg as a single dose

Orelox® (Hoechst Marion Roussel) PoM

Tablets, f/c, cefpodoxime 100 mg (as proxetil), net price 10-tab pack = £9.78. Label: 5, 9, 21

Oral suspension, cefpodoxime (as proxetil) for reconstitution with water, 40 mg/5 mL, net price 100 mL = £11.50. Label: 5, 9, 21

Excipients include aspartame (section 9.4.1)

CEFRADINE

(Cephradine)

Indications see under Cefaclor; surgical prophylaxis

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- By mouth, 250–500 mg every 6 hours *or* 0.5–1 g every 12 hours; up to 1 g every 6 hours in severe infections; CHILD, 25–50 mg/kg daily in 2–4 divided doses

- By deep intramuscular injection *or* by intravenous injection over 3–5 minutes *or* by intravenous infusion, 0.5–1 g every 6 hours, increased to 8 g daily in severe infections; CHILD 50–100 mg/kg daily in 4 divided doses
- Surgical prophylaxis, by deep intramuscular injection *or* by intravenous injection over 3–5 minutes, 1–2 g at induction

Cefradine (Non-proprietary) PoM

Capsules, cefradine 250 mg, net price 20-cap pack = £3.71; 500 mg, 20-cap pack = £5.78. Label: 9

Brands include *Nicef*®

Dental prescribing on NHS Cefradine Capsules may be prescribed

Velosef® (Squibb) PoM

Capsules, cefradine 250 mg (orange/blue), net price 20-cap pack = £3.17; 500 mg (blue), 20-cap pack = £6.26. Label: 9

Syrup, cefradine 250 mg/5 mL when reconstituted with water. Net price 100 mL = £3.77. Label: 9

Dental prescribing on NHS *Velosef*® syrup may be prescribed as Cefradine Oral Solution

Injection, powder for reconstitution, cefradine. Net price 500-mg vial = 89p; 1-g vial = £1.74

CEFTAZIDIME

Indications see under Cefaclor; see also notes above

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- By deep intramuscular injection *or* intravenous injection *or* infusion, 1 g every 8 hours *or* 2 g every 12 hours; 2 g every 8–12 hours *or* 3 g every 12 hours in severe infections; single doses over 1 g intravenous route only; ELDERLY usual max. 3 g daily; CHILD, up to 2 months 25–60 mg/kg daily in 2 divided doses, over 2 months 30–100 mg/kg daily in 2–3 divided doses; up to 150 mg/kg daily (max. 6 g daily) in 3 divided doses if immunocompromised or meningitis; intravenous route recommended for children

  Urinary-tract and less serious infections, 0.5–1 g every 12 hours

  Pseudomonal lung infection in cystic fibrosis, ADULT 100–150 mg/kg daily in 3 divided doses; CHILD up to 150 mg/kg daily (max. 6 g daily) in 3 divided doses; intravenous route recommended for children

  Surgical prophylaxis, prostatic surgery, 1 g at induction of anaesthesia repeated if necessary when catheter removed

Ceftazidime (Non-proprietary) PoM

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £8.50; 2-g vial = £17.90

Fortum® (GSK) PoM

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 250-mg vial = £2.20, 500-mg vial = £4.40, 1-g vial = £8.79, 2-g vial = £17.59, 3-g vial = £25.76; *Monovial*, 2 g vial (with transfer needle) = £17.59

Electrolytes Na^+ 2.3 mmol/g

Kefadim® (Flynn) PoM

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £7.92; 2-g vial = £15.84

Electrolytes Na^+ 2.3 mmol/g

CEFTRIAXONE

Indications see under Cefaclor and notes above; surgical prophylaxis; prophylaxis of meningococcal meningitis [unlicensed indication] (Table 2, section 5.1)

Cautions see under Cefaclor; severe renal impairment (Appendix 3); hepatic impairment if accompanied by renal impairment (Appendix 2); premature neonates; may displace bilirubin from serum albumin, administer over 60 minutes in neonates (see also Contra-indications); treatment longer than 14 days, renal failure, dehydration—risk of ceftriaxone precipitation in gall bladder

Contra-indications see under Cefaclor; neonates with jaundice, hypoalbuminaemia, acidosis or impaired bilirubin binding; concomitant treatment with calcium in children—risk of precipitation in urine and lungs of neonates (and possibly infants and older children)

Side-effects see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis

Dose

- By deep intramuscular injection, *or* by intravenous injection over at least 2–4 minutes, *or* by intravenous infusion, 1 g daily; 2–4 g daily in severe infections; intramuscular doses over 1 g divided between more than one site; single intravenous doses above 1 g by intravenous infusion only

  NEONATE by intravenous infusion over 60 minutes, 20–50 mg/kg daily (max. 50 mg/kg daily) INFANT and CHILD under 50 kg, by deep intramuscular injection, *or* by intravenous injection over 2–4 minutes, *or* by intravenous infusion, 20–50 mg/kg daily; up to 80 mg/kg daily in severe infections; doses of 50 mg/kg and over by intravenous infusion only; 50 kg and over, adult dose
- Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK organisms') (in combination with another antibacterial, see Table 1, section 5.1; [unlicensed indication]), by intravenous infusion, 2–4 g daily
- Early syphilis [unlicensed indication], by deep intramuscular injection, 500 mg daily for 10 days
- Uncomplicated gonorrhoea, by deep intramuscular injection, 250 mg as a single dose
- Surgical prophylaxis, by deep intramuscular injection *or* by intravenous injection over at least 2–4 minutes, 1 g at induction; colorectal surgery, by deep intramuscular injection *or* by intravenous infusion, 2 g at induction; intramuscular doses over 1 g divided between more than one site

Ceftriaxone (Non-proprietary) PoM

Injection, powder for reconstitution, ceftriaxone (as sodium salt), net price 1-g vial = £10.17; 2-g vial = £20.36

Rocephin® (Roche) PoM
Injection, powder for reconstitution, ceftriaxone (as sodium salt), net price 250-mg vial = £2.45; 1-g vial = £9.77; 2-g vial = £19.57
Electrolytes Na^+ 3.6 mmol/g

CEFUROXIME

Indications see under Cefaclor; surgical prophylaxis; more active against *Haemophilus influenzae* and *Neisseria gonorrhoeae*; Lyme disease

Cautions see under Cefaclor

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Dose

- By mouth (as cefuroxime axetil), 250 mg twice daily in most infections including mild to moderate lower respiratory-tract infections (e.g. bronchitis); doubled for more severe lower respiratory-tract infections or if pneumonia suspected
  Urinary-tract infection, 125 mg twice daily, doubled in pyelonephritis
  Gonorrhoea, 1 g as a single dose
  CHILD over 3 months, 125 mg twice daily, if necessary doubled in child over 2 years with otitis media
  Lyme disease, ADULT and CHILD over 12 years, 500 mg twice daily for 20 days
- By intramuscular injection *or* intravenous injection *or* infusion, 750 mg every 6–8 hours; 1.5 g every 6–8 hours in severe infections; single doses over 750 mg intravenous route only
  CHILD usual dose 60 mg/kg daily (range 30–100 mg/kg daily) in 3–4 divided doses (2–3 divided doses in neonates)
- Gonorrhoea, 1.5 g as a single dose by intramuscular injection (divided between 2 sites)
- Surgical prophylaxis, 1.5 g by intravenous injection at induction; up to 3 further doses of 750 mg may be given by intramuscular *or* intravenous injection every 8 hours for high-risk procedures
- Meningitis, 3 g intravenously every 8 hours; CHILD, 200–240 mg/kg daily (in 3–4 divided doses) reduced to 100 mg/kg daily after 3 days or on clinical improvement; NEONATE, 100 mg/kg daily reduced to 50 mg/kg daily

Cefuroxime (Non-proprietary) PoM
Tablets, cefuroxime (as axetil) 250 mg, net price 14-tab pack = £9.01. Label: 9, 21, 25

Zinacef® (GSK) PoM
Injection, powder for reconstitution, cefuroxime (as sodium salt). Net price 250-mg vial = 94p; 750-mg vial = £2.34; 1.5-g vial = £4.70
Electrolytes Na^+ 1.8 mmol/750-mg vial

Zinnat® (GSK) PoM
Tablets, both f/c, cefuroxime (as axetil) 125 mg, net price 14-tab pack = £4.65; 250 mg, 14-tab pack = £9.29. Label: 9, 21, 25
Suspension, cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.30. Label: 9, 21
Excipients include aspartame (section 9.4.1), sucrose 3.1 g/5 mL

5.1.2.2 Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem**, **meropenem**, and **doripenem** have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections. Doripenem is an alternative for hospital-acquired pneumonia, complicated intra-abdominal infections, and complicated urinary-tract infections.

Ertapenem is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin**, a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem, doripenem, and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics; neurotoxicity has been observed at very high dosage, in renal failure, or in patients with CNS disease. Ertapenem has been associated with seizures uncommonly. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

DORIPENEM

Indications hospital-acquired pneumonia; complicated intra-abdominal infections; complicated urinary-tract infections

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 295); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (doripenem)

Side-effects nausea, diarrhoea; headache; phlebitis, pruritus, rash; *less commonly* antibiotic-associated colitis; also reported, neutropenia

Dose

- By intravenous infusion, ADULT over 18 years, 500 mg every 8 hours; max. duration of treatment 14 days

Doribax® (Janssen-Cilag) ▼ PoM
Intravenous infusion, powder for reconstitution, doripenem (as monohydrate), net price 500-mg vial = £14.52

ERTAPENEM

Indications abdominal infections; acute gynaecological infections; community-acquired pneumonia; diabetic foot infections of the skin and soft-tissue; prophylaxis for colorectal surgery

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 295); elderly, renal impairment (Appendix 3), CNS disorders—risk of seizures; pregnancy (Appendix 4); **interactions:** Appendix 1 (ertapenem)

Contra-indications breast-feeding (Appendix 5)

Side-effects diarrhoea, nausea, vomiting, headache, injection-site reactions, rash, pruritus, raised platelet count; *less commonly* dry mouth, taste disturbances, dyspepsia, abdominal pain, anorexia, constipation, melaena, antibiotic-associated colitis, bradycardia, hypotension, chest pain, oedema, pharyngeal discomfort, dyspnoea, dizziness, sleep disturbances, confusion, asthenia, seizures, vaginitis, raised glucose, petechiae; *rarely* dysphagia, cholecystitis, liver disorder (including jaundice), arrhythmia, increase in blood pressure, syncope, nasal congestion, cough, wheezing, anxiety, depression, agitation, tremor, pelvic peritonitis, renal impairment, muscle cramp, scleral disorder, blood disorders (including neutropenia, thrombocytopenia, haemorrhage), hypoglycaemia, electrolyte disturbances; *very rarely* hallucinations

Dose

- By intravenous infusion, ADULT and ADOLESCENT over 13 years, 1 g once daily; CHILD 3 months–13 years, 15 mg/kg every 12 hours (max. 1 g daily)

  Surgical prophylaxis, colorectal surgery, ADULT over 18 years, 1 g completed within 1 hour before surgery

Invanz® (MSD) PoM

Intravenous infusion, powder for reconstitution, ertapenem (as sodium salt), net price 1-g vial = £31.65
Electrolytes Na^+ 6 mmol/1-g vial

IMIPENEM WITH CILASTATIN

Indications aerobic and anaerobic Gram-positive and Gram-negative infections; surgical prophylaxis; hospital-acquired septicaemia (Table 1, section 5.1); not indicated for CNS infections

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 295); renal impairment (Appendix 3); CNS disorders (e.g. epilepsy); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (imipenem with cilastatin)

Side-effects nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), taste disturbances, tooth or tongue discoloration, hearing loss; blood disorders, positive Coombs' test; allergic reactions (with rash, pruritus, urticaria, Stevens-Johnson syndrome, fever, anaphylactic reactions, rarely toxic epidermal necrolysis, exfoliative dermatitis); myoclonic activity, convulsions, confusion and mental disturbances reported; slight increases in liver enzymes and bilirubin reported, rarely hepatitis; increases in serum creatinine and blood urea; red coloration of urine in children reported; local reactions: erythema, pain and induration, and thrombophlebitis

Dose

- By intravenous infusion, in terms of imipenem, 1–2 g daily (in 3–4 divided doses); less sensitive organisms, up to 50 mg/kg daily (max. 4 g daily) in 3–4 divided doses; CHILD 3 months and older, 60 mg/kg (up to max. of 2 g) daily in 4 divided doses; over 40 kg, adult dose

  Surgical prophylaxis, 1 g at induction repeated after 3 hours, supplemented in high risk (e.g. colorectal) surgery by doses of 500 mg 8 and 16 hours after induction

Primaxin® (MSD) PoM

Intravenous infusion, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00
Electrolytes Na^+ 1.72 mmol/vial

MEROPENEM

Indications aerobic and anaerobic Gram-positive and Gram-negative infections

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 295); hepatic impairment (monitor liver function; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (meropenem)

Side-effects nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests; headache; thrombocythaemia, positive Coombs' test; rash, pruritus, injection-site reactions; *less commonly* eosinophilia, thrombocytopenia; *rarely* convulsions; also reported paraesthesia, leucopenia, haemolytic anaemia, reduction in partial thromboplastin time, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- By intravenous injection over 5 minutes *or* by intravenous infusion, 500 mg every 8 hours, dose doubled in hospital-acquired pneumonia, peritonitis, septicaemia and infections in neutropenic patients; CHILD 3 months–12 years [not licensed for infection in neutropenia] 10–20 mg/kg every 8 hours, over 50 kg body weight adult dose

  Meningitis, 2 g every 8 hours; CHILD 3 months–12 years 40 mg/kg every 8 hours, over 50 kg body weight adult dose

  Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis, up to 2 g every 8 hours; CHILD 4–18 years 25–40 mg/kg every 8 hours

Meronem® (AstraZeneca) PoM

Injection, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.60; 1-g vial = £17.19
Electrolytes Na^+ 3.9 mmol/g

5.1.2.3 Other beta-lactam antibiotics

Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection). Side-effects are similar to those of the other beta-lactams although aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients.

AZTREONAM

Indications Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

Cautions hypersensitivity to beta-lactam antibiotics; hepatic impairment; renal impairment (Appendix 3); breast-feeding (Appendix 5); **interactions:** Appendix 1 (aztreonam)

Contra-indications aztreonam hypersensitivity; pregnancy (Appendix 4)

Side-effects nausea, vomiting, diarrhoea, abdominal cramps; mouth ulcers, altered taste; jaundice and hepatitis; flushing; hypersensitivity reactions; blood disorders (including thrombocytopenia and neutropenia); rashes, injection-site reactions; rarely hypotension, seizures, asthenia, confusion, dizziness, headache, halitosis, and breast tenderness; very rarely antibiotic-associated colitis, gastro-intestinal bleeding, and toxic epidermal necrolysis

Dose

- By deep intramuscular injection *or* by intravenous injection over 3–5 minutes *or* by intravenous infusion, 1 g every 8 hours *or* 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic *Pseudomonas aeruginosa* and lung infections in cystic fibrosis); single doses over 1 g intravenous route only

  Urinary-tract infections, 0.5–1 g every 8–12 hours
- CHILD over 1 week, by intravenous injection *or* infusion, 30 mg/kg every 6–8 hours increased in severe infections for child of 2 years or older to 50 mg/kg every 6–8 hours; max. 8 g daily
- Gonorrhoea, cystitis, by intramuscular injection, 1 g as a single dose

Azactam® (Squibb) PoM

Injection, powder for reconstitution, aztreonam. Net price 500-mg vial = £4.81; 1-g vial = £9.59; 2-g vial = £19.20

5.1.3 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline with either streptomycin or rifampicin), and the spirochaete, *Borrelia burgdorferi* (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

For the role of tetracyclines in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infection, see p. 297.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being **minocycline** which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see section 5.1, table 2 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Oral infections In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, oral herpes, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1 and section 12.3.2.

Cautions Tetracyclines should be used with caution in patients with hepatic impairment (Appendix 2) or those receiving potentially hepatotoxic drugs. Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other **interactions:** Appendix 1 (tetracyclines).

Contra-indications Deposition of tetracyclines in growing bone and teeth (by binding to calcium) causes staining and occasionally dental hypoplasia, and they should **not** be given to children under 12 years, or to pregnant (Appendix 4) or breast-feeding women (Appendix 5). However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication]. With the exception of **doxycycline** and **minocycline**, the tetracyclines may exacerbate renal failure and should **not** be given to patients with kidney disease (Appendix 3). Tetracyclines should not be given to patients with acute porphyria (section 9.8.2)

Side-effects Side-effects of the tetracyclines include nausea, vomiting, diarrhoea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angioedema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

TETRACYCLINE

Indications see notes above; acne vulgaris, rosacea (section 13.6)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also acute renal failure, skin discoloration

Dose

- 250 mg every 6 hours, increased in severe infections to 500 mg every 6–8 hours
- Acne, see section 13.6.2
- Non-gonococcal urethritis, 500 mg every 6 hours for 7–14 days (21 days if failure or relapse after first course)

  Counselling Tablets should be swallowed whole with plenty of fluid while sitting or standing

Tetracycline (Non-proprietary) PoM

Tablets, coated, tetracycline hydrochloride 250 mg, net price 28-tab pack = £9.09. Label: 7, 9, 23, counselling, posture

Dental prescribing on NHS Tetracycline Tablets may be prescribed

DEMECLOCYCLINE HYDROCHLORIDE

Indications see notes above; also inappropriate secretion of antidiuretic hormone, section 6.5.2

Cautions see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Side-effects see notes above; also reversible nephrogenic diabetes insipidus, acute renal failure

Dose

- 150 mg every 6 hours *or* 300 mg every 12 hours

Ledermycin® (Goldshield) PoM

Capsules, red, demeclocycline hydrochloride 150 mg, net price 28-cap pack = £15.10. Label: 7, 9, 11, 23

DOXYCYCLINE

Indications see notes above; chronic prostatitis; sinusitis, syphilis, pelvic inflammatory disease (Table 1, section 5.1); treatment and prophylaxis of anthrax [unlicensed indication]; malaria treatment and prophylaxis (section 5.4.1); recurrent aphthous ulceration, adjunct to gingival scaling and root planing for periodontitis (section 12.3.1); oral herpes simplex (section 12.3.2); rosacea [unlicensed indication], acne vulgaris (section 13.6)

Cautions see notes above, but may be used in renal impairment; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Side-effects see notes above; also anorexia, flushing, and tinnitus

Dose

- 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections), 200 mg daily
- Early syphilis, 100 mg twice daily for 14 days; late latent syphilis, 100 mg twice daily for 28 days; neurosyphilis, 200 mg twice daily for 28 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease, see also Table 1, section 5.1)
- Anthrax (treatment or post-exposure prophylaxis; see also section 5.1.12), 100 mg twice daily; CHILD (only if alternative antibacterial cannot be given) [unlicensed dose] 5 mg/kg daily in 2 divided doses (max. 200 mg daily)

  Counselling Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

Note Doxycycline doses in BNF may differ from those in product literature

Doxycycline (Non-proprietary) PoM

Capsules, doxycycline (as hyclate) 50 mg, net price 28-cap pack = £1.76; 100 mg, 8-cap pack = £1.14. Label: 6, 9, 11, 27, counselling, posture

Brands include *Doxylar®*

Dental prescribing on NHS Doxycycline Capsules 100 mg may be prescribed

Vibramycin-D® (Pfizer) PoM

Dispersible tablets, yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

LYMECYCLINE

Indications see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- 408 mg every 12 hours, increased to 1.224–1.632 g daily in severe infections
- Acne, 408 mg daily for at least 8 weeks

Tetralysal 300® (Galderma) PoM

Capsules, red/yellow, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £7.77, 56-cap pack = £14.97. Label: 6, 9

MINOCYCLINE

Indications see notes above; meningococcal carrier state; acne vulgaris (section 13.6.2)

Cautions see notes above, but may be used in renal impairment; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens

Contra-indications see notes above

Side-effects see notes above; also dizziness and vertigo (more common in women); *rarely* anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; *very rarely* systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat

Dose

- 100 mg twice daily
- Acne, see section 13.6.2 and under preparations, below
- Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended, see notes above), 100 mg twice daily for 5 days usually followed by rifampicin

  Counselling Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

Minocycline (Non-proprietary) PoM

Capsules, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27; 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture

Brands include *Aknemin®*

Tablets, minocycline (as hydrochloride) 50 mg, net price 28-tab pack = £3.76, 100 mg, 28-tab pack = £7.27. Label: 6, 9, counselling, posture

Modified release

Acnamino® MR (Dexcel) PoM
Capsules, m/r, buff/brown (enclosing pink and peach tablets), minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £21.14. Label: 6, 25
Dose acne, 1 capsule daily

Minocin MR® (Meda) PoM
Capsules, m/r, orange/brown (enclosing yellow and white pellets), minocycline (as hydrochloride) 100 mg. Net price 56-cap pack = £20.08. Label: 6, 25
Dose acne, 1 capsule daily

Sebomin MR® (Actavis) PoM
Capsules, m/r, orange, minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £20.32. Label: 6, 25
Dose acne, 1 capsule daily

OXYTETRACYCLINE

Indications see notes above; acne vulgaris, rosacea (section 13.6)
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose
- 250–500 mg every 6 hours
- Acne, see section 13.6.2

Oxytetracycline (Non-proprietary) PoM
Tablets, coated, oxytetracycline dihydrate 250 mg, net price 28-tab pack = £1.08. Label: 7, 9, 23
Brands include *Oxymycin®*
Dental prescribing on NHS Oxtetracycline Tablets may be prescribed

Tigecycline

Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines; side-effects similar to those of the tetracyclines can potentially occur. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline. Tigecycline should be reserved for the treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms.

TIGECYCLINE

Indications complicated intra-abdominal infections; complicated skin and soft-tissue infections
Cautions cholestasis, hepatic impairment (Appendix 2); breast-feeding (Appendix 5); **interactions:** Appendix 1 (tigecycline)
Contra-indications hypersensitivity to tetracyclines; pregnancy (Appendix 4)
Side-effects see notes above; also nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, anorexia, bilirubinaemia, dizziness, headache, prolonged prothrombin time, prolonged activated partial thromboplastin time, rash, pruritus, and injection-site reactions; *less commonly* pancreatitis and hypoproteinaemia; also reported, antibiotic-associated colitis and thrombocytopenia
Dose
- By intravenous infusion, ADULT over 18 years, initially 100 mg, then 50 mg every 12 hours for 5–14 days

Tygacil® (Wyeth) ▼ PoM
Intravenous infusion, powder for reconstitution, tigecycline, net price 50-mg vial = £32.31

5.1.4 Aminoglycosides

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Excretion is principally via the kidney and accumulation occurs in renal impairment.

Most side-effects of this group of antibiotics are dose-related therefore care must be taken with dosage and whenever possible treatment should not exceed 7 days. The important side-effects are ototoxicity, and nephrotoxicity; they occur most commonly in the elderly and in patients with renal failure.

If there is impairment of renal function (or high pre-dose serum concentrations) the interval between doses must be increased; if the renal impairment is severe the dose itself should be reduced as well.

Aminoglycosides may impair neuromuscular transmission and should not be given to patients with myasthenia gravis; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

Aminoglycosides should preferably not be given with potentially ototoxic diuretics (e.g. furosemide (frusemide)); if concurrent use is unavoidable administration of the aminoglycoside and of the diuretic should be separated by as long a period as practicable.

Once daily dosage *Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis, extensive burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute.

Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen; patients with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). For once daily dose regimens, consult local guidelines on serum concentration monitoring.

Serum-aminoglycoside concentrations should be measured in all patients and **must** be determined in infants, in the elderly, in obesity, and in cystic fibrosis, *or* if high doses are being given, *or* if there is renal impairment.

Endocarditis **Gentamicin** is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be determined twice each week (more often in renal impairment). **Streptomycin** may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see above and Table 1, section 5.1).

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin may be administered by nebuliser on a cyclical basis (28 days of tobramycin followed by a 28–day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

GENTAMICIN

Indications septicaemia and neonatal sepsis; meningitis and other CNS infections; biliary-tract infection, acute pyelonephritis or prostatitis, endocarditis (see notes above); pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1); eye (section 11.3.1); ear (section 12.1.1)

Cautions pregnancy (Appendix 4), renal impairment, neonates, infants and elderly (adjust dose and monitor renal, auditory and vestibular function together with serum gentamicin concentrations); avoid prolonged use; conditions characterised by muscular weakness; obesity (use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely); see also notes above; **interactions:** Appendix 1 (aminoglycosides)

Contra-indications myasthenia gravis

Side-effects vestibular and auditory damage, nephrotoxicity; rarely, hypomagnesaemia on prolonged therapy, antibiotic-associated colitis, stomatitis; also reported, nausea, vomiting, rash, blood disorders; see also notes above

Dose

- Multiple daily dose regimen, by intramuscular *or* by slow intravenous injection over at least 3 minutes *or* by intravenous infusion, 3–5 mg/kg daily (in divided doses every 8 hours), see also notes above; CHILD under 18 years see *BNF for Children*
  Endocarditis (in combination with other antibacterials, see Table 1, section 5.1), ADULT 1 mg/kg every 8 hours
- Once daily dose regimen (see notes above and also consult local guidelines), by intravenous infusion, initially 5–7 mg/kg, then adjust according to serum-gentamicin concentration
- By intrathecal injection, seek specialist advice, 1 mg daily (increased if necessary to 5 mg daily)

Note For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis); pre-dose ('trough') concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration

Gentamicin (Non-proprietary) PoM

Injection, gentamicin (as sulphate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.54, 2-mL vial = £1.48

Paediatric injection, gentamicin (as sulphate) 10 mg/mL, net price 2-mL vial = £1.80

Intrathecal injection, gentamicin (as sulphate) 5 mg/mL, net price 1-mL amp = 74p

Cidomycin® (Sanofi-Aventis) PoM

Injection, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp or vial = £1.48

Genticin® (Amdipharm) PoM

Injection, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp = £1.40

Isotonic Gentamicin Injection (Baxter) PoM

Intravenous infusion, gentamicin (as sulphate) 800 micrograms/mL in sodium chloride intravenous infusion 0.9%. Net price 100-mL (80-mg) *Viaflex®* bag = £1.61

Electrolytes Na^+ 15.4 mmol/100-mL bag

AMIKACIN

Indications serious Gram-negative infections resistant to gentamicin

Cautions see under Gentamicin

Contra-indications see under Gentamicin

Side-effects see under Gentamicin

Dose

- By intramuscular *or* by slow intravenous injection *or* by infusion, 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses in severe infections; max. 1.5 g daily for up to 10 days (max. cumulative dose 15 g); CHILD under 18 years see *BNF for Children*

  Note One-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre

Amikacin (Non-proprietary) PoM

Injection, amikacin (as sulphate) 250 mg/mL. Net price 2-mL vial = £10.14

Electrolytes Na^+ 0.56 mmol/500-mg vial

Amikin® (Bristol-Myers Squibb) PoM

Paediatric injection, amikacin (as sulphate) 50 mg/mL. Net price 2-mL vial = £2.11

Electrolytes $Na^+ < 0.5$ mmol/vial

NEOMYCIN SULPHATE

Indications bowel sterilisation before surgery, see also notes above

Cautions see under Gentamicin but too toxic for systemic use, see notes above

Contra-indications see under Gentamicin; intestinal obstruction; renal impairment (Appendix 3)

Side-effects see under Gentamicin but poorly absorbed on oral administration; increased salivation, stomatitis, impaired intestinal absorption with steatorrhoea and diarrhoea

Dose

- By mouth, pre-operative bowel sterilisation, 1 g every hour for 4 hours, then 1 g every 4 hours for 2–3 days

  Hepatic coma, up to 4 g daily in divided doses usually for 5–7 days

Neomycin (Non-proprietary) PoM

Tablets, neomycin sulphate 500 mg. Net price 20 = £4.13

Brands include *Nivemycin®*

TOBRAMYCIN

Indications see under Gentamicin and notes above

Cautions see under Gentamicin

Specific cautions for inhaled treatment Other inhaled drugs should be administered before tobramycin; monitor for bronchospasm with initial dose, measure peak flow before and after nebulisation—if bronchospasm occurs, repeat test using bronchodilator; monitor renal function before treatment and then annually; severe haemoptysis

Contra-indications see under Gentamicin

Side-effects see under Gentamicin; *on inhalation*, mouth ulcers, taste disturbances, voice alteration, cough, bronchospasm (see Cautions)

Dose

- By intramuscular injection *or* by slow intravenous injection *or* by intravenous infusion, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); CHILD under 18 years see *BNF for Children*
- Urinary-tract infection, by intramuscular injection, 2–3 mg/kg daily as a single dose

Note One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre

- Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis, by inhalation of nebulised solution, ADULT and CHILD over 6 years, 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

Parenteral

Tobramycin (Non-proprietary) PoM

Injection, tobramycin (as sulphate) 40 mg/mL, net price 1-mL (40-mg) vial = £4.00, 2-mL (80-mg) vial = £4.16, 6-mL (240-mg) vial = £19.20

Inhalation

Bramitob® (Chiesi) PoM

Nebuliser solution, tobramycin 75 mg/mL, net price 56 × 4-mL (300-mg) unit = £1187.00

Tobi® (Chiron) PoM

Nebuliser solution, tobramycin 60 mg/mL, net price 56 × 5-mL (300-mg) unit = £1187.20

5.1.5 Macrolides

Erythromycin has an antibacterial spectrum that is similar but not identical to that of penicillin; it is thus an alternative in penicillin-allergic patients.

Indications for erythromycin include respiratory infections, whooping cough, legionnaires' disease, and campylobacter enteritis. It is active against many penicillin-resistant staphylococci but some are now also resistant to erythromycin; it has poor activity against *Haemophilus influenzae*. Erythromycin is also active against chlamydia and mycoplasmas.

Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose (250 mg 4 times daily) but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. For treatment of Lyme disease, see section 5.1.1.3. Azithromycin is also used in the treatment of trachoma [unlicensed indication] (section 11.3.1).

Clarithromycin is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily.

Azithromycin and clarithromycin cause fewer gastrointestinal side-effects than erythromycin.

Spiramycin is also a macrolide (section 5.4.7).

The ketolide **telithromycin** is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*. Telithromycin should only be used to treat beta-haemolytic streptococcal pharyngitis and tonsillitis, sinusitis, community-acquired pneumonia, and exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated.

Oral infections Erythromycin is an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to erythromycin or rapidly develop resistance; its use should therefore be limited to short courses. Metronidazole (section 5.1.11) may be preferred as an alternative to a penicillin.

ERYTHROMYCIN

Indications susceptible infections in patients with penicillin hypersensitivity; oral infections (see notes above); campylobacter enteritis, syphilis, non-gonococcal urethritis, respiratory-tract infections (including Legionnaires' disease), skin infections (Table 1, section 5.1); chronic prostatitis; prophylaxis of diphtheria, group A streptococcal infection, and whooping cough (Table 2, section 5.1); acne vulgaris and rosacea (section 13.6)

Cautions neonate under 2 weeks (risk of hypertrophic pyloric stenosis); predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (not known to be harmful) and breast-feeding (only small amounts in milk); **interactions:** Appendix 1 (macrolides)

Side-effects nausea, vomiting, abdominal discomfort, diarrhoea (antibiotic-associated colitis reported); less frequently urticaria, rashes and other allergic reactions; reversible hearing loss reported after large doses; cholestatic jaundice, pancreatitis, cardiac effects (including chest pain and arrhythmias), myasthenia-like syndrome, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

Dose

- By mouth, ADULT and CHILD over 8 years, 250–500 mg every 6 hours *or* 0.5–1 g every 12 hours (see notes above); up to 4 g daily in divided doses in severe infections; NEONATE 12.5 mg/kg every 6 hours; CHILD 1 month–2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours, doses doubled for severe infections

  Early syphilis, 500 mg 4 times daily for 14 days

  Uncomplicated genital chlamydia, non-gonococcal urethritis, 500 mg twice daily for 14 days
- By intravenous infusion, ADULT and CHILD severe infections, 50 mg/kg daily by continuous infusion *or* in divided doses every 6 hours; mild infections (oral treatment not possible), 25 mg/kg daily; NEONATE see *BNF for Children*

Erythromycin (Non-proprietary) PoM

Capsules, enclosing e/c microgranules, erythromycin 250 mg, net price 28-cap pack = £5.95. Label: 5, 9, 25

Brands include *Tiloryth®*

Tablets, e/c, erythromycin 250 mg, net price 28 = £1.78. Label: 5, 9, 25

Dental prescribing on NHS Erythromycin Tablets e/c may be prescribed

Erythromycin Ethyl Succinate (Non-proprietary) PoM

Oral suspension, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £1.83; 250 mg/5 mL, 100 mL = £2.49; 500 mg/5 mL, 100 mL = £3.96. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Primacine®*

Dental prescribing on NHS Erythromycin Ethyl Succinate Oral Suspension may be prescribed

Erythromycin Lactobionate (Non-proprietary) PoM

Intravenous infusion, powder for reconstitution, erythromycin (as lactobionate), net price 1-g vial = £9.98

Erymax® (Zeneus) PoM

Capsules, opaque orange/clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28-cap pack = £5.72, 112-cap pack = £22.87. Label: 5, 9, 25

Dose 1 capsule every 6 hours *or* 2 capsules every 12 hours; acne, 1 capsule twice daily for 1 month then 1 capsule daily

Erythrocin® (Abbott) PoM

Tablets, both f/c, erythromycin (as stearate), 250 mg, net price 20 = £3.64; 500 mg, 20 = £7.28. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Stearate Tablets

Erythroped® (Abbott) PoM

Suspension SF, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (*Suspension PI SF*), net price 140 mL = £3.06; 250 mg/5 mL, 140 mL = £5.95; 500 mg/5 mL (*Suspension SF Forte*), 140 mL = £10.56. Label: 9

Erythroped A® (Abbott) PoM

Tablets, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Ethyl Succinate Tablets

AZITHROMYCIN

Indications respiratory-tract infections; otitis media; skin and soft-tissue infections; uncomplicated genital chlamydial infections and non-gonococcal urethritis (Table 1, section 5.1); mild or moderate typhoid due to multiple-antibacterial-resistant organisms [unlicensed indication]; prophylaxis of group A streptococcal infection (Table 2, section 5.1)

Cautions see under Erythromycin; pregnancy (Appendix 4) and breast-feeding (Appendix 5); **interactions:** Appendix 1 (macrolides)

Contra-indications severe hepatic impairment (Appendix 2)

Side-effects see under Erythromycin; also anorexia, dyspepsia, flatulence, dizziness, headache, drowsiness, convulsions, arthralgia, and disturbances in taste and smell; *rarely* constipation, hepatitis, hepatic failure, syncope, insomnia, agitation, anxiety, asthenia, paraesthesia, hyperactivity, thrombocytopenia, haemolytic anaemia, interstitial nephritis, acute renal failure, photosensitivity, tooth and tongue discoloration

Dose

- 500 mg once daily for 3 days *or* 500 mg on first day then 250 mg once daily for 4 days; CHILD over 6 months 10 mg/kg once daily for 3 days; *or* body-weight 15–25 kg, 200 mg once daily for 3 days; body-weight 26–35 kg, 300 mg once daily for 3 days; body-weight 36–45 kg, 400 mg once daily for 3 days
- Uncomplicated genital chlamydial infections and non-gonococcal urethritis, 1 g as a single dose
- Typhoid [unlicensed indication], 500 mg once daily for 7 days

Azithromycin (Non-proprietary) PoM

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £8.96, 6-cap pack = £13.45. Label: 5, 9, 23

[1]Tablets, azithromycin (as monohydrate hemi-ethanolate) 250 mg, net price 4-tab pack = £8.82; 500 mg, 3-tab pack = £9.16. Label: 5, 9

1. Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to max. single dose of 1 g, max. daily dose 1 g, and a pack size of 1 g

Zithromax® (Pfizer) PoM

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £8.95, 6-cap pack = £13.43. Label: 5, 9, 23

Oral suspension, cherry/banana-flavoured, azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water. Net price 15-mL pack = £5.08, 22.5-mL pack = £7.62, 30-mL pack = £13.80. Label: 5, 9

Dental prescribing on NHS May be prescribed as Azithromycin Oral Suspension 200 mg/5 mL

CLARITHROMYCIN

Indications respiratory-tract infections, mild to moderate skin and soft tissue infections, otitis media; *Helicobacter pylori* eradication (section 1.3)

Cautions see under Erythromycin; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (macrolides)

Side-effects see under Erythromycin; also dyspepsia, tooth and tongue discoloration, smell and taste disturbances, stomatitis, glossitis, and headache; *less commonly* hepatitis, arthralgia, and myalgia; *rarely* tinnitus; *very rarely* pancreatitis, dizziness, insomnia, nightmares, anxiety, confusion, psychosis, paraesthesia, convulsions, hypoglycaemia, renal failure, leucopenia, and thrombocytopenia; on intravenous infusion, local tenderness, phlebitis

Dose

- By mouth, 250 mg every 12 hours for 7 days, increased in severe infections to 500 mg every 12 hours for up to 14 days; CHILD body-weight under 8 kg, 7.5 mg/kg twice daily; 8–11 kg (1–2 years), 62.5 mg twice daily; 12–19 kg (3–6 years), 125 mg twice daily; 20–29 kg (7–9 years), 187.5 mg twice daily; 30–40 kg (10–12 years), 250 mg twice daily
- By intravenous infusion into larger proximal vein, 500 mg twice daily; CHILD under 12 years see *BNF for Children*

Clarithromycin (Non-proprietary) PoM

Tablets, clarithromycin 250 mg, net price 14-tab pack = £3.28; 500 mg, 14-tab pack = £6.60. Label: 9

Klaricid® (Abbott) PoM

Tablets, both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £7.14; 500 mg, 14-tab pack = £11.53, 20-tab pack = £16.47. Label: 9

Paediatric suspension, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £5.36, 100 mL = £9.23; 250 mg/5 mL, 70 mL = £10.72. Label: 9

Granules, clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

Intravenous infusion, powder for reconstitution, clarithromycin. Net price 500-mg vial = £9.45

Electrolytes $Na^+ < 0.5$ mmol/500-mg vial

Klaricid XL® (Abbott) PoM

Tablets, m/r, yellow, clarithromycin 500 mg, net price 7-tab pack = £6.46, 14-tab pack = £12.71. Label: 9, 21, 25

Dose 500 mg once daily (doubled in severe infections) for 7–14 days

TELITHROMYCIN

Indications see notes above

Cautions hepatic impairment (Appendix 2; see also Hepatic Disorders below); renal impairment (Appendix 3); pregnancy (Appendix 4); coronary heart disease, ventricular arrhythmias, bradycardia, hypokalaemia, hypomagnesaemia—risk of QT interval prolongation; concomitant administration of drugs that prolong QT-interval; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (telithromycin)

Hepatic disorders Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop

Driving Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected

Contra-indications myasthenia gravis; history of telithromycin-associated hepatitis or jaundice; prolongation of QT interval; congenital or family history of QT interval prolongation (if not excluded by ECG); breast-feeding (Appendix 5)

Side-effects diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; *less commonly* constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; *rarely* cholestatic jaundice, arrhythmias, hypotension, transient loss of consciousness, paraesthesia, and diplopia; *very rarely* antibiotic-associated colitis, altered sense of smell, muscle cramp, erythema multiforme; also reported pancreatitis, confusion, hallucinations and arthralgia

Dose

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis *or* for 7–10 days in community-acquired pneumonia; CHILD under 18 years safety and efficacy not established
- Tonsillitis or pharyngitis caused by *Streptococcus pyogenes*, ADULT and CHILD over 12 years, 800 mg once daily for 5 days

Ketek® (Sanofi-Aventis) ▼ PoM
Tablets, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling , driving, hepatic disorders

5.1.6 Clindamycin

Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis; it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. Clindamycin can also be used for infections associated with meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis (section 1.5), which may be fatal; it is most common in middle-aged and elderly women, especially following an operation. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

Oral infections Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

CLINDAMYCIN

Indications see notes above; staphylococcal bone and joint infections, peritonitis; falciparum malaria (section 5.4.1)

Cautions discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function on prolonged therapy and in neonates and infants; pregnancy (Appendix 4); breast-feeding (Appendix 5); avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clindamycin)

Contra-indications diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Side-effects diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice; leucopenia, eosinophilia, and thrombocytopenia reported; polyarthritis reported; rash, pruritus, urticaria, anaphylactoid reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

Dose

- By mouth, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; CHILD, 3–6 mg/kg every 6 hours
  Counselling Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water.
- By deep intramuscular injection *or* by intravenous infusion, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g; CHILD over 1 month, 15–40 mg/kg daily in 3–4 divided doses; severe infections, at least 300 mg daily regardless of weight

Clindamycin (Non-proprietary) PoM
Capsules, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £21.51. Label: 9, 27, counselling, see above (diarrhoea)
Dental prescribing on NHS Clindamycin Capsules may be prescribed

Dalacin C® (Pharmacia) PoM
Capsules, clindamycin (as hydrochloride) 75 mg (lavender), net price 24-cap pack = £7.45; 150 mg, (lavender/maroon), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)
Dental prescribing on NHS May be prescribed as Clindamycin Capsules

Injection, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £6.20; 4-mL amp = £12.35
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), linezolid, the streptogramins (quinupristin and dalfopristin) and the polymyxin, colistin.

Chloramphenicol

Chloramphenicol is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

CHLORAMPHENICOL

Indications see notes above

Cautions avoid repeated courses and prolonged treatment; reduce doses in hepatic impairment (Appendix 2); renal impairment (Appendix 3); blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); **interactions:** Appendix 1 (chloramphenicol)

Contra-indications pregnancy (Appendix 4), breast-feeding (Appendix 5), acute porphyria (section 9.8.2)

Side-effects blood disorders including reversible and irreversible aplastic anaemia (with reports of resulting leukaemia), peripheral neuritis, optic neuritis, headache, depression, urticaria, erythema multiforme, nausea, vomiting, diarrhoea, stomatitis, glossitis, dry mouth; nocturnal haemoglobinuria reported; grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism

Dose

- By mouth *or* by intravenous injection *or* infusion, 50 mg/kg daily in 4 divided doses (exceptionally, can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated); CHILD, haemophilus epiglottitis and pyogenic meningitis, 50–100 mg/kg daily in divided doses (high dosages decreased as soon as clinically indicated); NEONATE under 2 weeks 25 mg/kg daily (in 4 divided doses); INFANT 2 weeks–1 year 50 mg/kg daily (in 4 divided doses)

  Note Plasma concentration monitoring required in neonates and preferred in those under 4 years of age, in the elderly, and in hepatic impairment; recommended peak plasma concentration (approx. 1 hour after intravenous injection or infusion) 15–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre

Chloramphenicol (Non-proprietary) PoM

Capsules, chloramphenicol 250 mg. Net price 60 = £377.00

Kemicetine® (Pharmacia) PoM

Injection, powder for reconstitution, chloramphenicol (as sodium succinate). Net price 1-g vial = £1.39

Electrolytes Na^+ 3.14 mmol/g

Fusidic acid

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance.

SODIUM FUSIDATE

Indications penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibacterials (Table 1, section 5.1)

Cautions monitor liver function with high doses, on prolonged therapy or in hepatic impairment (Appendix 2); elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (fusidic acid)

Side-effects nausea, vomiting, reversible jaundice, especially after high dosage or rapid infusion (withdraw therapy if persistent); rarely hypersensitivity reactions, acute renal failure (usually with jaundice), blood disorders

Dose

- See under Preparations, below

Sodium fusidate (LEO) PoM

Intravenous infusion, powder for reconstitution, sodium fusidate 500 mg (= fusidic acid 480 mg), with buffer, net price per vial (with diluent) = £70.04

Electrolytes Na^+ 3.1 mmol/vial when reconstituted with buffer

Dose as sodium fusidate, by intravenous infusion, ADULT over 50 kg, 500 mg 3 times daily; ADULT under 50 kg and CHILD, 6–7 mg/kg 3 times daily

Fucidin® (LEO) PoM

Tablets, f/c, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9

Dose as sodium fusidate, 500 mg every 8 hours, doubled for severe infections

Skin infection, as sodium fusidate, 250 mg every 12 hours for 5–10 days

Suspension, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

Dose as fusidic acid, ADULT 750 mg every 8 hours; CHILD up to 1 year 50 mg/kg daily (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

Note Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

Vancomycin and teicoplanin

The glycopeptide antibiotics vancomycin and teicoplanin have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

Vancomycin is used *by the intravenous route* in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. It has a long duration of action and can therefore be given every 12 hours. Vancomycin (added to dialysis fluid) is also used in the treatment of peritonitis associated with peritoneal dialysis [unlicensed route] (Table 1 section 5.1).

Vancomycin given *by mouth* is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); a dose of 125 mg every 6 hours for 10 to 14 days is considered adequate (up to 500 mg every 6 hours can be considered if the infection fails to respond or if it is life-threatening). Vancomycin should **not** be given by mouth for systemic infections since it is not significantly absorbed.

Teicoplanin is similar to vancomycin but has a significantly longer duration of action allowing once-daily administration. Unlike vancomycin, teicoplanin can be given by intramuscular as well as by intravenous injection; it is not given by mouth.

VANCOMYCIN

Indications see notes above

Cautions avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; renal impairment (Appendix 3); elderly; avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in elderly or if renal impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5); teicoplanin sensitivity; systemic absorption may follow oral

administration especially in inflammatory bowel disorders or following multiple doses; **interactions:** Appendix 1 (vancomycin)

Side-effects after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 25 g), rarely agranulocytosis and thrombocytopenia; nausea; chills, fever; eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body ('red man' syndrome), pain and muscle spasm of back and chest

Dose

- By mouth, *Clostridium difficile* infection, 125 mg every 6 hours for 10–14 days, see notes above; CHILD 5 mg/kg every 6 hours, over 5 years, half adult dose
  Note Oral paediatric dose is lower than that on product literature but is adequate
- By intravenous infusion, 1–1.5 g every 12 hours; ELDERLY over 65 years, 500 mg every 12 hours *or* 1 g once daily; CHILD over 1 month, 15 mg/kg every 8 hours (max. 2 g daily)
  Note Plasma concentration monitoring required (see Cautions above); pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of meticillin-resistant *Staphylococcus aureus*); vancomycin doses in BNF may differ from those in product literature

Vancomycin (Non-proprietary) PoM

Capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £7.25; 1-g vial = £14.50
Note Can be used to prepare solution for oral administration

Vancocin® (Flynn) PoM

Matrigel capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.31. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £8.05; 1-g vial = £16.11
Note Can be used to prepare solution for oral administration

TEICOPLANIN

Indications potentially serious Gram-positive infections including endocarditis, dialysis-associated peritonitis, and serious infections due to *Staphylococcus aureus*; prophylaxis in orthopaedic surgery at risk of infection with Gram-positive organisms

Cautions vancomycin sensitivity; blood counts and liver and kidney function tests required; monitor plasma-teicoplanin concentration if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; monitor renal and auditory function during prolonged treatment in renal impairment (Appendix 3) or if other nephrotoxic or neurotoxic drugs given; pregnancy (Appendix 4) and breast-feeding; **interactions:** Appendix 1 (teicoplanin)

Side-effects nausea, vomiting, diarrhoea; rash, pruritus, fever, bronchospasm, rigors, urticaria, angioedema, anaphylaxis; dizziness, headache; blood disorders including eosinophilia, leucopenia, neutropenia, and thrombocytopenia; disturbances in liver enzymes, transient increase of serum creatinine, renal failure; tinnitus, mild hearing loss, and vestibular disorders also reported; rarely exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis; local reactions include erythema, pain, thrombophlebitis, injection site abscess and rarely flushing with infusion

Dose

- By intramuscular injection *or* by intravenous injection *or* infusion, initially 400 mg (for severe infections, by intravenous injection *or* infusion, initially 400 mg every 12 hours for 3 doses), then 200 mg once daily (400 mg once daily for severe infections); higher doses may be required in patients over 85 kg and in severe burns, or meticillin-resistant *Staphylococcus aureus* infection (consult product literature)
- CHILD over 2 months by intravenous injection *or* infusion, initially 10 mg/kg every 12 hours for 3 doses, subsequently 6 mg/kg once daily (severe infections or in neutropenia, 10 mg/kg once daily); subsequent doses can be given by intramuscular injection (but intravenous administration preferred in children); NEONATE by intravenous infusion, initially a single dose of 16 mg/kg, subsequently 8 mg/kg once daily
- Streptococcal endocarditis (in combination with another antibacterial if necessary, see Table 1, section 5.1), by intravenous injection *or* infusion, ADULT initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily
- Enterococcal endocarditis (in combination with another antibacterial, see Table 1, section 5.1), by intravenous injection *or* infusion, ADULT initially 10 mg/kg every 12 hours for 3 doses, then 10 mg/kg once daily
- Orthopaedic surgery prophylaxis, by intravenous injection, 400 mg at induction of anaesthesia
  Note Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise treatment in some patients (see Cautions). Pre-dose ('trough') concentrations should be greater than 10 mg/litre (greater than 15–20 mg/litre in endocarditis) but less than 60 mg/litre

Targocid® (Sanofi-Aventis) PoM

Injection, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.57; 400-mg vial (with diluent) = £6.10
Electrolytes $Na^+ < 0.5$ mmol/200- and 400-mg vial

Daptomycin

Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft-tissue infections caused by resistant Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA). It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

The *Scottish Medicines Consortium* (p. 3) has advised (February 2008) that daptomycin (*Cubicin®*) is accepted for restricted use within NHS Scotland for the treatment

of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

DAPTOMYCIN

Indications see under Dose

Cautions interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (daptomycin)

Muscle effects Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably avoid concomitant use), or if eGFR less than 30 mL/minute/1.73 m^2). If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea; headache; rash, injection-site reactions; *less commonly* constipation, abdominal pain, dyspepsia, anorexia, taste disturbance, jaundice, hypertension, hypotension, flushing, arrhythmias, anxiety, insomnia, dizziness, fatigue, paraesthesia, hyperglycaemia, vaginitis, renal failure, anaemia, eosinophilia, thrombocythaemia, electrolyte disturbances, muscle effects (see Cautions), arthralgia, glossitis, and pruritus; also reported syncope, wheezing, and peripheral neuropathy

Dose

- By intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, ADULT over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteraemia

  Right-sided endocarditis caused by *Staphylococcus aureus*, ADULT over 18 years, 6 mg/kg once daily

Cubicin® (Novartis) ▼ PoM

Intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £62.00; 500-mg vial = £88.57

Linezolid

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is **not** active against Gram-negative organisms and must be given with other antibacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

LINEZOLID

Indications pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

Cautions monitor full blood count (including platelet count) weekly (see also CSM Advice below); history of seizures; unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (MAOIs)

CSM advice (blood disorders)

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

CHM advice (optic neuropathy)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT$_1$ agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)

Contra-indications breast-feeding (Appendix 5); see also Monoamine oxidase inhibition above

Side-effects diarrhoea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances; headache; *less commonly* thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, anaemia, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diaphoresis, and injection-site reactions; *very rarely* transient ischaemic attacks, renal failure, pancytopenia and Stevens-Johnson syndrome; also reported convulsions, lactic acidosis; peripheral and optic

neuropathy reported on prolonged therapy (see also CHM advice above)

Dose

- By mouth, 600 mg every 12 hours usually for 10–14 days (max. duration of treatment 28 days); CHILD [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose
- By intravenous infusion over 30–120 minutes, 600 mg every 12 hours; CHILD [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

Zyvox® (Pharmacia) ▼ PoM

Tablets, f/c, linezolid 600 mg, net price 10-tab pack = £445.00. Label: 9, 10, patient information leaflet

Suspension, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-flavoured) = £222.50. Label: 9, 10 patient information leaflet

Excipients include aspartame 20 mg/5 mL (section 9.4.1)

Intravenous infusion, linezolid 2 mg/mL, net price 300-mL *Excel*® bag = £44.50

Excipients include Na^+ 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

Quinupristin and dalfopristin

A combination of the streptogramin antibiotics, **quinupristin** and **dalfopristin** (as *Synercid*®) is licensed for infections due to Gram-positive bacteria. The combination should be reserved for treating infections which have failed to respond to other antibacterials (e.g. meticillin-resistant *Staphylococcus aureus*, MRSA) or for patients who cannot be treated with other antibacterials. Quinupristin and dalfopristin are not active against *Enterococcus faecalis* and they need to be given in combination with other antibacterials for mixed infections which also involve Gram-negative organisms.

QUINUPRISTIN WITH DALFOPRISTIN

A mixture of quinupristin and dalfopristin (both as mesilate salts) in the proportions 3 parts to 7 parts

Indications serious Gram-positive infections where no alternative antibacterial is suitable including hospital-acquired pneumonia, skin and soft-tissue infections, infections due to vancomycin-resistant *Enterococcus faecium*

Cautions hepatic impairment (avoid if severe; Appendix 2); pregnancy (Appendix 4); predisposition to cardiac arrhythmias (including congenital QT syndrome, concomitant use of drugs that prolong QT interval, cardiac hypertrophy, dilated cardiomyopathy, hypokalaemia, hypomagnesaemia, bradycardia); **interactions**: Appendix 1 (quinupristin with dalfopristin)

Contra-indications plasma-bilirubin concentration greater than 3 times upper limit of reference range; breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea; headache, asthenia; anaemia, leucopenia, eosinophilia, raised urea and creatinine; arthralgia, myalgia; rash, pruritus; injection-site reactions on peripheral venous administration; *less commonly* stomatitis, constipation, abdominal pain, antibiotic-associated colitis, hepatitis, jaundice, pancreatitis, anorexia, peripheral oedema, hypotension, chest pain, arrhythmias, dyspnoea, insomnia, anxiety, confusion, dizziness, paraesthesia, hypertonia, myasthenia, and gout; *rarely* electrolyte disturbances; *very rarely* thrombocytopenia and pancytopenia

Dose

Note Expressed as a combination of quinupristin and dalfopristin (in a ratio of 3:7)

- ADULT over 18 years, by intravenous infusion into central vein, 7.5 mg/kg every 8 hours for 7 days in skin and soft-tissue infections; for 10 days in hospital-acquired pneumonia; duration of treatment in *E. faecium* infection depends on site of infection

Note In emergency, first dose may be administered *via* peripheral line until central venous catheter in place

Synercid® (Nordic) PoM

Intravenous infusion, powder for reconstitution, quinupristin (as mesilate) 150 mg, dalfopristin (as mesilate) 350 mg, net price 500-mg vial = £37.00

Electrolytes Na^+ approx. 16 mmol/500-mg vial

Polymyxins

The polymyxin antibiotic, **colistin**, is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is **not** absorbed by mouth and thus needs to be given by injection for a systemic effect. Intravenous administration of colistin should be reserved for Gram-negative infections resistant to other antibacterials; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistin is used by mouth in bowel sterilisation regimens in neutropenic patients (usually with nystatin); it is **not** recommended for gastro-intestinal infections. It is also given by inhalation of a nebulised solution as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

Both colistin and polymyxin B are included in some preparations for topical application.

COLISTIN

Indications see notes above

Cautions renal impairment (Appendix 3); acute porphyria (section 9.8.2); risk of bronchospasm on inhalation—may be prevented or treated with a selective $beta_2$ agonist; **interactions:** Appendix 1 (polymyxins)

Contra-indications myasthenia gravis; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects neurotoxicity reported especially with excessive doses (including apnoea, perioral and peripheral paraesthesia, vertigo; rarely vasomotor instability, slurred speech, confusion, psychosis, visual disturbances); nephrotoxicity; hypersensitivity reactions including rash; injection-site reactions; inhalation may cause sore throat, sore mouth, cough, bronchospasm

Dose

- By mouth, bowel sterilisation, 1.5–3 million units every 8 hours
- By slow intravenous injection into a totally implantable venous access device, *or* by

intravenous infusion (but see notes above), ADULT and CHILD body-weight under 60 kg, 50 000–75 000 units/kg daily in 3 divided doses; body-weight over 60 kg, 1–2 million units every 8 hours

Note Plasma concentration monitoring required in neonates, renal impairment, and in cystic fibrosis; recommended 'peak' plasma-colistin concentration (approx. 30 minutes after intravenous injection or infusion) 10–15 mg/litre (125–200 units/mL)

- By inhalation of nebulised solution, ADULT and CHILD over 2 years, 1–2 million units every 12 hours; CHILD under 2 years, 0.5–1 million units every 12 hours

Colomycin® (Forest) (PoM)

Tablets, scored, colistin sulphate 1.5 million units. Net price 50 = £58.28

Syrup, colistin sulphate 250 000 units/5 mL when reconstituted with water. Net price 80 mL = £3.48

Injection, powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium). Net price 1 million-unit vial = £1.68; 2 million-unit vial = £3.09

Electrolytes (before reconstitution) $Na^+ < 0.5$ mmol/500 000-unit, 1 million-unit, and 2 million-unit vial

Note *Colomycin®* Injection (dissolved in physiological saline) may be used for nebulisation

Promixin® (Profile) (PoM)

Powder for nebuliser solution, colistimethate sodium (colistin sulphomethate sodium), net price 1 million-unit vial = £4.60

Injection, powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium), net price 1 million unit-vial = £2.30

Electrolytes (before reconstitution) $Na^+ < 0.5$ mmol/1 million-unit vial

5.1.8 Sulphonamides and trimethoprim

The importance of the sulphonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

Sulfamethoxazole (sulphamethoxazole) and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis) especially in the elderly (see CSM recommendations below).

CSM recommendations.
Co-trimoxazole should be limited to the role of drug of choice in *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for *toxoplasmosis* and *nocardiasis*. It should now only be considered for use in *acute exacerbations of chronic bronchitis* and *infections of the urinary tract* when there is good bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in *acute otitis media in children* when there is good reason to prefer it.

Trimethoprim can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis, and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

For *topical preparations* of sulphonamides used in the treatment of burns see section 13.10.1.1.

CO-TRIMOXAZOLE

A mixture of trimethoprim and sulfamethoxazole in the proportions of 1 part to 5 parts

Indications see CSM recommendations above

Cautions maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency or hyperkalaemia; elderly (see CSM recommendations above); asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); hepatic impairment (avoid if severe); renal impairment (avoid if eGFR less than 15 mL/minute/1.73 m^2; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (trimethoprim, sulfamethoxazole)

Contra-indications acute porphyria (section 9.8.2)

Side-effects nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately; *less commonly* vomiting; *very rarely* glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocarditis, cough and shortness of breath, pulmonary infiltrates, aseptic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus and uveitis; rhabdomyolysis reported in HIV-infected patients

Dose

- By mouth, 960 mg every 12 hours; CHILD, every 12 hours, 6 weeks–5 months, 120 mg; 6 months–5 years, 240 mg; 6–12 years, 480 mg
- By intravenous infusion, 960 mg every 12 hours increased to 1.44 g every 12 hours in severe infections; CHILD 36 mg/kg daily in 2 divided doses increased to 54 mg/kg daily in severe infections
- Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature), by mouth *or* by intravenous infusion, ADULT and CHILD over 4 weeks, 120 mg/kg daily in 2–4 divided doses for 14 days
- Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections, by mouth, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerance) *or* 960 mg on alternate days (3 times a week) *or* 960 mg twice daily on alternate days (3 times a week); CHILD 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week *or* on 7 days per week; 6 months–5 years, 240 mg; 6–12 years, 480 mg

Note 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

Co-trimoxazole (Non-proprietary) PoM

Tablets, co-trimoxazole 480 mg, net price 28-tab pack = £12.22, 960 mg, 20 = £4.69. Label: 9
Brands include *Fectrim®*, *Fectrim® Forte*

Paediatric oral suspension, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9

Oral suspension, co-trimoxazole 480 mg/5 mL. Net price 100 mL = £4.41. Label: 9

Septrin® (GSK) PoM

Tablets, co-trimoxazole 480 mg. Net price 20 = £3.10. Label: 9

Forte tablets, scored, co-trimoxazole 960 mg. Net price 20 = £4.69. Label: 9

Adult suspension, co-trimoxazole 480 mg/5 mL. Net price 100 mL (vanilla-flavoured) = £4.41. Label: 9

Paediatric suspension, sugar-free, co-trimoxazole 240 mg/5 mL. Net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9

Intravenous infusion, co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5-mL amp = £1.78
Excipients include propylene glycol, sulphites

SULFADIAZINE
(Sulphadiazine)

Indications prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7

Cautions see under Co-trimoxazole; renal impairment (avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (sulphonamides)

Contra-indications see under Co-trimoxazole

Side-effects see under Co-trimoxazole

Dose

- Prevention of rheumatic fever, *by mouth*, 1 g daily (500 mg daily for patients less than 30 kg)

Sulfadiazine (Non-proprietary) PoM

Tablets, sulfadiazine 500 mg, net price 56-tab pack = £37.50. Label: 9, 27

TRIMETHOPRIM

Indications urinary-tract infections, acute and chronic bronchitis; pneumocystis pneumonia (section 5.4.8)

Cautions renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); predisposition to folate deficiency; elderly; manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (trimethoprim)

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Contra-indications blood dyscrasias

Side-effects gastro-intestinal disturbances including nausea and vomiting, pruritus, rashes, hyperkalaemia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported

Dose

- Acute infections, 200 mg every 12 hours; CHILD 1 month–12 years, 4 mg/kg (max. 200 mg) every 12 hours; *or* 6 weeks–6 months 25 mg every 12 hours, 6 months–6 years 50 mg every 12 hours, 6–12 years 100 mg every 12 hours
- Prophylaxis, 100 mg at night; CHILD under 12 years, 2 mg/kg (max.100 mg) at night

Trimethoprim (Non-proprietary) PoM

Tablets, trimethoprim 100 mg, net price 28 = 95p; 200 mg, 14-tab pack = 88p. Label: 9
Brands include *Trimopan®*

Suspension, trimethoprim 50 mg/5 mL, net price 100 mL = £1.62. Label: 9

5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should **not** be used concurrently.

Initial phase The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment The following regimen should be used for patients who are likely to take antituberculous drugs reliably **without supervision**. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Recommended dosage for standard unsupervised 6-month treatment

Rifater® [rifampicin, isoniazid, and pyrazinamide] (for 2-month initial phase only)
ADULT under 40 kg 3 tablets daily, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, over 65 kg 6 tablets daily

Ethambutol (for 2-month initial phase only)
ADULT AND CHILD 15 mg/kg daily

Rifinah® [rifampicin and isoniazid] (for 4-month continuation phase following initial treatment with *Rifater®*)
ADULT under 50 kg 3 tablets daily of *Rifinah®-150*, 50 kg and over, 2 tablets daily of *Rifinah®-300*

or (if combination preparations not appropriate):

Isoniazid (for 2-month initial and 4-month continuation phases)
ADULT 300 mg daily; CHILD 5–10 mg/kg (max. 300 mg) daily

Rifampicin (for 2-month initial and 4-month continuation phases)
ADULT under 50 kg 450 mg daily, 50 kg and over 600 mg daily; CHILD 10 mg/kg (max. 600 mg) daily

Pyrazinamide (for 2-month initial phase only)
ADULT under 50 kg 1.5 g daily, 50 kg and over 2 g daily; CHILD 35 mg/kg daily

Ethambutol (for 2-month initial phase only)
ADULT AND CHILD 15 mg/kg daily

Pregnancy and breast-feeding The standard regimen (above) may be used during pregnancy and breast-feeding. Streptomycin should not be given in pregnancy.

Children Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol because of the difficulty in testing eyesight and in obtaining reports of visual symptoms (see below).

Supervised treatment Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid (for 2-month initial and 4-month continuation phases)
ADULT AND CHILD 15 mg/kg (max. 900 mg) 3 times a week

Rifampicin (for 2-month initial and 4-month continuation phases)
ADULT 600–900 mg 3 times a week; CHILD 15 mg/kg (max. 900 mg) 3 times a week

Pyrazinamide (for 2-month initial phase only)
ADULT under 50 kg 2 g 3 times a week, 50 kg and over 2.5 g 3 times a week; CHILD 50 mg/kg 3 times a week

Ethambutol (for 2-month initial phase only)
ADULT AND CHILD 30 mg/kg 3 times a week

Immunocompromised patients Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially hazardous interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

Corticosteroids In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

Prevention of tuberculosis Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1; longer chemoprophylaxis is not recommended.

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4

Monitoring Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity (see Appendix 2), *hepatic function* should be checked before treatment with these drugs. Those with pre-existing liver disease or alcohol dependence should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculous treatment on the one hand and to guard against serious liver damage on the other, patients and their carers should be informed carefully how to recognise signs of liver disorders and advised to discontinue treatment and seek **immediate** medical attention should symptoms of liver disease occur.

Renal function should be checked before treatment with antituberculous drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma-drug concentration monitored.

Visual acuity should be tested before ethambutol is used (see below).

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above).

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulphonylureas, and anticoagulants; **interactions:** Appendix 1 (rifamycins). **Important:** the effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (section 7.3.1).

Rifabutin, a newly introduced rifamycin, is indicated for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the *treatment* of non-tuberculous mycobacterial disease and pulmonary tuberculosis. **Important:** as with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

Pyrazinamide [unlicensed] is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*. Serious liver toxicity may occasionally occur (important: see Monitoring above).

Ethambutol is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Side-effects of ethambutol are largely confined to visual disturbances in the form of loss of acuity, colour blindness, and restriction of visual fields. These toxic effects are more common where excessive dosage is used or if the patient's renal function is impaired. The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Early discontinuation of the drug is almost always followed by recovery of eyesight. Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

Visual acuity should be tested by Snellen chart before treatment with ethambutol.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms. It is given intramuscularly in a dose of 15 mg/kg (max. 1 g) daily; the dose is reduced in those under 50 kg, those over 40 years or those with renal impairment. Plasma-drug concentration should be measured in patients with impaired renal function in whom streptomycin must be used with great care. Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), moxifloxacin and protionamide (prothionamide; no longer on UK market).

CAPREOMYCIN

Indications in combination with other drugs, tuberculosis resistant to first-line drugs

Cautions hepatic impairment; renal impairment (Appendix 3); auditory impairment; monitor renal, hepatic, auditory, and vestibular function and electrolytes; pregnancy (teratogenic in *animals*; Appendix 4) and breast-feeding (Appendix 5); **interactions:** Appendix 1 (capreomycin)

Side-effects hypersensitivity reactions including urticaria and rashes; leucocytosis or leucopenia, rarely thrombocytopenia; changes in liver function tests; nephrotoxicity, electrolyte disturbances; hearing loss with tinnitus and vertigo; neuromuscular block after large doses, pain and induration at injection site

Dose

- By deep intramuscular injection, 1 g daily (not more than 20 mg/kg) for 2–4 months, then 1 g 2–3 times each week

Capastat® (King) PoM

Injection, powder for reconstitution, capreomycin sulphate 1 million units (= capreomycin approx. 1 g). Net price per vial = £22.89

CYCLOSERINE

Indications in combination with other drugs, tuberculosis resistant to first-line drugs

Cautions reduce dose in renal impairment (avoid if severe); monitor haematological, renal, and hepatic function; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (cycloserine)

Contra-indications epilepsy, depression, severe anxiety, psychotic states, alcohol dependence, acute porphyria (section 9.8.2)

Side-effects mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose if symptoms of CNS toxicity); rashes, allergic dermatitis (discontinue or reduce dose);

megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

Dose

- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; CHILD initially 10 mg/kg daily adjusted according to blood concentration and response

  Note Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

Cycloserine (King) PoM

Capsules, red/grey cycloserine 250 mg, net price 100-cap pack = £303.45. Label: 2, 8

ETHAMBUTOL HYDROCHLORIDE

Indications tuberculosis, in combination with other drugs

Cautions reduce dose in renal impairment and if creatinine clearance less than 30 mL/minute, also monitor plasma-ethambutol concentration (Appendix 3); elderly; pregnancy; test visual acuity before treatment and warn patients to report visual changes—see notes above; young children (see notes above)—routine ophthalmological monitoring recommended

Contra-indications optic neuritis, poor vision

Side-effects optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

Dose

- See notes above

  Note 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Cautions above; for advice on laboratory assay of ethambutol contact the Poisons Unit at New Cross Hospital (Tel (020) 7771 5360)

Ethambutol (Non-proprietary) PoM

Tablets, ethambutol hydrochloride 100 mg (yellow), net price 56-tab pack = £11.51; 400 mg (grey), 56-tab pack = £42.74. Label: 8

ISONIAZID

Indications tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

Cautions hepatic impairment (Appendix 2; see also below); renal impairment (Appendix 3); slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); pregnancy (Appendix 4) and breast-feeding (Appendix 5); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (isoniazid)

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications drug-induced liver disease

Side-effects nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above), optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, erythema multiforme, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); systemic lupus erythematosus-like syndrome, pellagra, hyperreflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment)

Dose

- By mouth *or* by intramuscular *or* intravenous injection, see notes above

Isoniazid (Non-proprietary) PoM

Tablets, isoniazid 50 mg, net price 56-tab pack = £8.34; 100 mg, 28-tab pack = £8.29. Label: 8, 22

Elixir (BPC), isoniazid 50 mg, citric acid monohydrate 12.5 mg, sodium citrate 60 mg, concentrated anise water 0.05 mL, compound tartrazine solution 0.05 mL, glycerol 1 mL, double-strength chloroform water 2 mL, water to 5 mL. Label: 8, 22

'Special order' [unlicensed] product; contact Martindale, Rosemont, or regional hospital manufacturing unit

Injection, isoniazid 25 mg/mL, net price 2-mL amp = £11.04

PYRAZINAMIDE

Indications tuberculosis in combination with other drugs [unlicensed]

Cautions pregnancy (Appendix 4); hepatic impairment (monitor hepatic function, see also below and Appendix 2); diabetes; gout (avoid in acute attack); **interactions:** Appendix 1 (pyrazinamide)

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications acute porphyria (section 9.8.2)

Side-effects hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, rash and occasionally photosensitivity

Dose

- See notes above

Pyrazinamide (Non-proprietary) PoM

Tablets, scored, pyrazinamide 500 mg. Label: 8

Available from 'special order' manufacturers or specialist-importing companies, see p. 969

RIFABUTIN

Indications see under Dose

Cautions see under Rifampicin; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); acute porphyria (section 9.8.2)

Side-effects nausea, vomiting; leucopenia, thrombocytopenia, anaemia, rarely haemolysis; raised liver enzymes, jaundice, rarely hepatitis; uveitis following high doses or administration with drugs which raise plasma concentration—see also **interactions:** Appendix 1 (rifamycins); arthralgia, myalgia, influenza-like syndrome, dyspnoea; also hypersensitivity reactions including fever, rash, eosinophilia, bronchospasm, shock; skin, urine, saliva and other body secretions coloured orange-red; asymptomatic corneal opacities reported with long-term use

Dose

- Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose
- Treatment of non-tuberculous mycobacterial disease, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures negative
- Treatment of pulmonary tuberculosis, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months
- CHILD not recommended

Mycobutin® (Pharmacia) PoM

Capsules, red-brown, rifabutin 150 mg. Net price 30-cap pack = £90.38. Label: 8, 14, counselling, lenses, see under Rifampicin

RIFAMPICIN

Indications see under Dose

Cautions hepatic impairment (Appendix 2; liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below); renal impairment (if above 600 mg daily); pregnancy and breast-feeding (see notes above and Appendix 4 and Appendix 5); acute porphyria (section 9.8.2); **important:** advise patients on hormonal contraceptives to use additional means (see also section 7.3.1); discolours soft contact lenses; see also notes above; **interactions:** Appendix 1 (rifamycins)

Note If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications jaundice

Side-effects gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period

Dose

- Brucellosis, legionnaires' disease, endocarditis and serious staphylococcal infections, in combination with other drugs, by mouth *or* by intravenous infusion, 0.6–1.2 g daily (in 2–4 divided doses)
- Tuberculosis, in combination with other drugs, see notes above
- Leprosy, section 5.1.10
- Prophylaxis of meningococcal meningitis and *Haemophilus influenzae* (type b) infection, section 5.1, table 2

Rifampicin (Non-proprietary) PoM

Capsules, rifampicin 150 mg, net price 20 = £3.85; 300 mg, 20 = £8.38. Label: 8, 14, 22, counselling, see lenses above

Rifadin® (Aventis Pharma) PoM

Capsules, rifampicin 150 mg (blue/red), net price 20 = £3.66; 300 mg (red), 20 = £7.33. Label: 8, 14, 22, counselling, see lenses above

Syrup, red, rifampicin 100 mg/5 mL (raspberry-flavoured). Net price 120 mL = £3.56. Label: 8, 14, 22, counselling, see lenses above

Intravenous infusion, powder for reconstitution, rifampicin. Net price 600-mg vial (with solvent) = £7.67

Electrolytes $Na^+ < 0.5$ mmol/vial

Rimactane® (Sandoz) PoM

Capsules, rifampicin 150 mg (red), net price 60-cap pack = £11.35; 300 mg (red/brown), 60-cap pack = £22.69. Label: 8, 14, 22, counselling, see lenses above

Combined preparations

Rifater® (Aventis Pharma) PoM

Tablets, pink, s/c, rifampicin 120 mg, isoniazid 50 mg, pyrazinamide 300 mg. Net price 20 = £4.39. Label: 8, 14, 22, counselling, see lenses above

Dose initial treatment of pulmonary tuberculosis, patients up to 40 kg 3 tablets daily preferably before breakfast, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, 65 kg or more, 6 tablets daily; not suitable for use in children

Rifinah 150® (Aventis Pharma) PoM

Tablets, pink, s/c, rifampicin 150 mg, isoniazid 100 mg, net price 84-tab pack = £15.91. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT under 50 kg, 3 tablets daily, preferably before breakfast

Rifinah 300® (Aventis Pharma) PoM

Tablets, orange, s/c, rifampicin 300 mg, isoniazid 150 mg, net price 56-tab pack = £21.02. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT 50 kg and over, 2 tablets daily, preferably before breakfast

STREPTOMYCIN

Indications tuberculosis, in combination with other drugs; adjunct to doxycycline in brucellosis; enterococcal endocarditis (Table 1, section 5.1)

Cautions see under Aminoglycosides, section 5.1.4; **interactions:** Appendix 1 (aminoglycosides)

Contra-indications see under Aminoglycosides, section 5.1.4

Side-effects see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

Dose

- By deep intramuscular injection, tuberculosis [unlicensed], see notes above; brucellosis, expert advice essential

Note One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years)

Streptomycin Sulphate (Non-proprietary) PoM
Injection, powder for reconstitution, streptomycin (as sulphate), net price 1-g vial = £8.25
Available as an unlicensed preparation from UCB Pharma

5.1.10 Antileprotic drugs

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details of the Panel can be obtained from the Department of Health telephone (020) 7972 4480.

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are **dapsone**, **rifampicin** (section 5.1.9), and **clofazimine**. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate). The following regimens are widely used throughout the world (with minor local variations):

Multibacillary leprosy (3-drug regimen)

Rifampicin	600 mg once-monthly, supervised (450 mg for adults weighing less than 35 kg)
Dapsone	100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)
Clofazimine	300 mg once-monthly, supervised, *and* 50 mg daily (or 100 mg on alternate days), self-administered

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone (initially 40–60 mg daily) should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide [unlicensed] is also useful in men and post-menopausal women who have become corticosteroid dependent, but it should be used under **specialist supervision** and it should **never** be used in women of child-bearing potential (significant teratogenic risk—for CSM guidance on prescribing, see *Current Problems in Pharmacovigilance* 1994; **20**, 8). Increased doses of clofazimine 100 mg 3 times daily for the first month with subsequent reductions, are also useful but may take 4–6 weeks to attain full effect.

Paucibacillary leprosy (2-drug regimen)

Rifampicin	600 mg once-monthly, supervised (450 mg for those weighing less than 35 kg)
Dapsone	100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Paucibacillary leprosy should be treated for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

DAPSONE

Indications leprosy, dermatitis herpetiformis; *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (section 5.4.8)

Cautions cardiac or pulmonary disease; anaemia (treat severe anaemia before starting); susceptibility to haemolysis including G6PD deficiency (section 9.1.5)—susceptible breast-feeding infants also at risk (Appendix 5); pregnancy (Appendix 4); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (dapsone)
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Side-effects (dose-related and uncommon at doses used for leprosy), haemolysis, methaemoglobinaemia, neuropathy, allergic dermatitis (rarely including toxic epidermal necrolysis and Stevens-Johnson syndrome), anorexia, nausea, vomiting, tachycardia, headache, insomnia, psychosis, hepatitis, agranulocytosis; dapsone syndrome (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death)

Dose

- Leprosy, 1–2 mg/kg daily, see notes above
- Dermatitis herpetiformis, see specialist literature

Dapsone (Non-proprietary) PoM
Tablets, dapsone 50 mg, net price 28-tab pack = £24.22; 100 mg, 28-tab pack = £35.11. Label: 8

CLOFAZIMINE

Indications leprosy

Cautions hepatic and renal impairment; pregnancy; breast-feeding (Appendix 5); may discolour soft contact lenses; avoid if persistent abdominal pain and diarrhoea

Side-effects nausea, vomiting (hospitalise if persistent), abdominal pain; headache, tiredness; brownish-black discoloration of lesions and skin including areas exposed to light; reversible hair discoloration; dry skin; red discoloration of faeces, urine and other body fluids; also rash, pruritus, photosensitivity, acne-like eruptions, anorexia, eosinophilic enteropathy, bowel obstruction, dry eyes, dimmed vision, macular and subepithelial corneal pigmentation; elevation of blood sugar, weight loss, splenic infarction, lymphadenopathy

Dose

- Leprosy, see notes above
- Lepromatous lepra reactions, dosage increased to 300 mg daily for max. of 3 months

Clofazimine (Non-proprietary) PoM
Capsules, clofazimine 100 mg. Label: 8, 14, 21
Available on named-patient basis

5.1.11 Metronidazole and tinidazole

Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably *Gardnerella vaginalis* infections), and *Entamoeba histolytica* and *Giardia lamblia* infections (section 5.4.2). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially *Bacteroides fragilis*, is important. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5.2) are also used.

Metronidazole by mouth is effective for the treatment of *Clostridium difficile* infection , see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

Tinidazole is similar to metronidazole but has a longer duration of action.

Oral infections Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; suitable alternatives are amoxicillin (section 5.1.1.3) and erythromycin (section 5.1.5). For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

METRONIDAZOLE

Indications anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3); skin (section 13.10.1.2)

Cautions disulfiram-like reaction with alcohol, hepatic impairment and hepatic encephalopathy (Appendix 2); pregnancy (Appendix 4) and breast-feeding (Appendix 5); avoid in acute porphyria (section 9.8.2); clinical and laboratory monitoring advised if treatment exceeds 10 days; **interactions:** Appendix 1 (metronidazole)

Side-effects gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; *very rarely* hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epileptiform seizures, and leucopenia

Dose

- Anaerobic infections (usually treated for 7 days and for 10–14 days in *Clostridium difficile* infection), by mouth, *either* 800 mg initially then 400 mg every 8 hours *or* 500 mg every 8 hours, CHILD 7.5 mg/kg every 8 hours; by rectum, 1 g every 8 hours for 3 days, then 1 g every 12 hours, CHILD every 8 hours for 3 days, then every 12 hours, age up to 1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; by intravenous infusion over 20 minutes, 500 mg every 8 hours; CHILD 7.5 mg/kg every 8 hours
- Leg ulcers and pressure sores, by mouth, 400 mg every 8 hours for 7 days
- Bacterial vaginosis, by mouth, 400–500 mg twice daily for 5–7 days *or* 2 g as a single dose
- Pelvic inflammatory disease (see also Table 1, section 5.1), by mouth, 400 mg twice daily for 14 days
- Acute ulcerative gingivitis, by mouth, 200–250 mg every 8 hours for 3 days; CHILD 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Acute oral infections, by mouth, 200 mg every 8 hours for 3–7 days (see also notes above); CHILD 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Surgical prophylaxis, by mouth, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; CHILD 7.5 mg/kg 2 hours before surgery; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

  By rectum, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; CHILD 5–10 years 500 mg 2 hours before surgery; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures

  By intravenous infusion (if rectal administration inappropriate), 500 mg at induction; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures; CHILD 7.5 mg/kg at induction; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

Note Metronidazole doses in BNF may differ from those in product literature

Metronidazole (Non-proprietary) PoM

Tablets, metronidazole 200 mg, net price 21-tab pack = £1.08; 400 mg, 21-tab pack = £1.22. Label: 4, 9, 21, 25, 27

Brands include *Vaginyl®*

Tablets, metronidazole 500 mg, net price 21-tab pack = £28.03. Label: 4, 9, 21, 25, 27

Suspension, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £8.15. Label: 4, 9, 23

Brands include *Norzol®*

Intravenous infusion, metronidazole 5 mg/mL. Net price 20-mL amp = £1.56, 100-mL container = £3.41

Dental prescribing on NHS Metronidazole Tablets and Oral Suspension may be prescribed

Flagyl® (Winthrop) PoM

Tablets, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25, 27

Suppositories, metronidazole 500 mg, net price 10 = £15.18; 1 g, 10 = £23.06. Label: 4, 9

Flagyl S® (Winthrop) PoM
Suspension, orange- and lemon-flavoured, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.18. Label: 4, 9, 23

Metrolyl® (Sandoz) PoM
Intravenous infusion, metronidazole 5 mg/mL, net price 100-mL Steriflex® bag = £1.22
Electrolytes Na^+ 14.53 mmol/100-mL bag

Suppositories, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

TINIDAZOLE

Indications anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3)

Cautions see under Metronidazole; pregnancy (manufacturer advises avoid in first trimester); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (tinidazole)

Side-effects see under Metronidazole

Dose

- Anaerobic infections, 2 g initially, followed by 1 g daily *or* 500 mg twice daily, usually for 5–6 days
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose
- Abdominal surgery prophylaxis, a single 2-g dose approximately 12 hours before surgery

Fasigyn® (Pfizer) PoM
Tablets, f/c, tinidazole 500 mg. Net price 20-tab pack = £13.80. Label: 4, 9, 21, 25

5.1.12 Quinolones

Nalidixic acid and **norfloxacin** are effective in uncomplicated urinary-tract infections.

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for community-acquired pneumonia but it is considered to be **second-line treatment** for this indication.

Although ciprofloxacin, levofloxacin and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, or exacerbations of chronic bronchitis which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or meticillin-resistant *Staphylococcus aureus* (MRSA).

Anthrax *Inhalation* or *gastro-intestinal anthrax* should be treated initially with either **ciprofloxacin** or **doxycycline** [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

Cautions Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), in renal impairment (Appendix 3); pregnancy (Appendix 4), during breast-feeding (Appendix 5), and in children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*—see below). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other **interactions:** Appendix 1 (quinolones).

Use in children Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children. For further details see *BNF for Children*.

Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- kidney, heart, or lung transplant recipients are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

Side-effects Side-effects of the quinolones include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea (rarely antibiotic-associated colitis), headache, dizziness, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis). Less frequent side-effects include anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombocytopenia), arthralgia, myalgia, disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dyspnoea (more frequent with moxifloxacin), convulsions, psychoses, paraesthesia, renal failure, interstitial nephritis, tendon inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be **discontinued** if psychiatric, neurological or hypersensitivity reactions (including severe rash) occur.

CIPROFLOXACIN

Indications see notes above and under Dose; eye infections (section 11.3.1)

Cautions see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); **interactions:** Appendix 1 (quinolones)

Driving May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol

Side-effects see notes above; also flatulence, pain and phlebitis at injection site; *rarely* dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, and erythema nodosum; *very rarely* movement disorders, tinnitus, and tenosynovitis

Dose

- By mouth, respiratory-tract infections, 500–750 mg twice daily (750 mg twice daily in pseudomonal lower respiratory-tract infection in cystic fibrosis)

  Urinary-tract infections, 250–750 mg twice daily (250 mg twice daily for 3 days usually adequate for acute uncomplicated cystitis in women)

  Acute or chronic prostatitis, 500 mg twice daily for 28 days

  Gonorrhoea, 500 mg as a single dose

  Most other infections, 500 mg twice daily (increased to 750 mg twice daily in severe or deep-seated infection)

  Surgical prophylaxis [unlicensed], 750 mg 60 minutes before procedure

  Prophylaxis of meningococcal meningitis, Table 2, section 5.1

- By intravenous infusion over 60 minutes, 400 mg every 8–12 hours
- Anthrax (treatment and post-exposure prophylaxis, see notes above), by mouth, 500 mg twice daily

  By intravenous infusion over 60 minutes, 400 mg every 12 hours
- CHILD under 18 years see *BNF for Children*

Ciprofloxacin (Non-proprietary) PoM

Tablets, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.21; 250 mg, 10-tab pack = £1.10, 20-tab pack = £1.18; 500 mg, 10-tab pack = £1.17, 20-tab pack = £1.26; 750 mg, 10-tab pack = £1.90. Label: 7, 9, 25, counselling, driving

Intravenous infusion, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £8.00, 100-mL bottle = £15.00, 200-mL bottle = £22.00

Ciproxin® (Bayer) PoM

Tablets, all f/c, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £2.69; 250 mg (scored), 10-tab pack = £7.21, 20-tab pack = £14.42; 500 mg (scored), 10-tab pack = £13.65, 20-tab pack = £27.29; 750 mg, 10-tab pack = £19.22. Label: 7, 9, 25, counselling, driving

Suspension, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £16.50. Label: 7, 9, 25, counselling, driving

Intravenous infusion, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £8.31, 100-mL bottle = £16.23, 200-mL bottle = £24.70

Electrolytes Na^+ 15.4 mmol/100-mL bottle

LEVOFLOXACIN

Indications see under Dose

Cautions see notes above; predisposition to QT interval prolongation (including cardiac disease, congenital long QT syndrome, electrolyte disturbances, concomitant use with other drugs known to prolong QT interval); **interactions:** Appendix 1 (quinolones)

Driving May impair performance of skilled tasks (e.g. driving)

Side-effects see notes above; also flatulence, constipation; *rarely* tachycardia; *very rarely* pneumonitis, peripheral neuropathy, and hypoglycaemia; also reported, rhabdomyolysis and potentially life-threatening hepatic failure; local reactions and transient hypotension reported with infusion

Dose

- By mouth, acute sinusitis, 500 mg daily for 10–14 days

  Exacerbation of chronic bronchitis, 250–500 mg daily for 7–10 days

  Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days

  Urinary-tract infections, 250 mg daily for 7–10 days (for 3 days in uncomplicated infection)

  Chronic prostatitis, 500 mg once daily for 28 days

  Skin and soft tissue infections, 250 mg daily *or*

500 mg once or twice daily for 7–14 days

- By intravenous infusion (over at least 60 minutes for 500 mg), community-acquired pneumonia, 500 mg once or twice daily

  Complicated urinary-tract infections, 250 mg daily, increased in severe infections

  Skin and soft tissue infections, 500 mg twice daily

Tavanic® (Sanofi-Aventis) PoM

Tablets, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving

Intravenous infusion, levofloxacin 5 mg/mL, net price 100-mL bottle = £26.40

Electrolytes Na^+ 15.4 mmol/100-mL bottle

MOXIFLOXACIN

Indications sinusitis, community-acquired pneumonia, or exacerbations of chronic bronchitis which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials

Cautions see notes above; conditions pre-disposing to arrhythmias, including myocardial ischaemia; **interactions:** Appendix 1 (quinolones)

Driving May impair performance of skilled tasks (e.g. driving)

Contra-indications see notes above; severe hepatic impairment; history of QT-interval prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use with other drugs known to prolong QT-interval

Side-effects see notes above; also gastritis, flatulence, constipation, arrhythmias, palpitation, angina, vasodilatation, hyperlipidaemia, and sweating; *rarely* oedema, hypertension, syncope, dysphagia, abnormal dreams, incoordination, amnesia, hyperglycaemia, hyperuricaemia, and stomatitis; *very rarely* potentially life-threatening hepatic failure

Dose

- 400 mg once daily for 10 days in community-acquired pneumonia, for 5–10 days in exacerbation of chronic bronchitis, for 7 days in sinusitis

Avelox® (Bayer) ▼ PoM

Tablets, red, f/c, moxifloxacin (as hydrochloride) 400 mg, net price 5-tab pack = £11.95. Label: 6, 9, counselling, driving

NALIDIXIC ACID

Indications urinary-tract infections

Cautions see notes above; avoid in acute porphyria (section 9.8.2); liver disease; false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks; **interactions:** Appendix 1 (quinolones)

Side-effects see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, metabolic acidosis

Dose

- 900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; CHILD 3 months–18 years see *BNF for Children*

Uriben® (Rosemont) PoM

Suspension, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £11.42. Label: 9, 11

Excipients include sucrose 450 mg/5 mL

NORFLOXACIN

Indications see under Dose

Cautions see notes above; **interactions:** Appendix 1 (quinolones)

Driving May impair performance of skilled tasks (e.g. driving)

Side-effects see notes above; also tinnitus, epiphora; *rarely* pancreatitis; *very rarely* arrhythmias; also reported, polyneuropathy and exfoliative dermatitis

Dose

- 'Lower' urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)
- Chronic relapsing 'lower' urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks
- Chronic prostatitis, 400 mg twice daily for 28 days

Norfloxacin (Non-proprietary) PoM

Tablets, norfloxacin 400 mg, net price 6-tab pack = £2.30, 14-tab pack = £3.17. Label: 7, 9, 23, counselling, driving

Utinor® (MSD) PoM

Tablets, scored, norfloxacin 400 mg. Net price 7-tab pack = £2.56, 14-tab pack = £5.11. Label: 7, 9, 23, counselling, driving

OFLOXACIN

Indications see under Dose

Cautions see notes above; hepatic impairment (Appendix 2); history of psychiatric illness; **interactions:** Appendix 1 (quinolones)

Driving May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

Side-effects see notes above; also tachycardia; *rarely* abnormal dreams, unsteady gait, neuropathy, and extrapyramidal symptoms; *very rarely* changes in blood sugar; isolated cases of pneumonitis and rhabdomyolysis; on intravenous infusion, hypotension and local reactions (including thrombophlebitis)

Dose

- By mouth, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily

  Acute or chronic prostatitis, 200 mg twice daily for 28 days

  Lower respiratory-tract infections, 400 mg daily preferably in the morning, increased if necessary to 400 mg twice daily

  Skin and soft-tissue infections, 400 mg twice daily

  Uncomplicated gonorrhoea, 400 mg as a single dose

  Uncomplicated genital chlamydial infection, non-gonococcal urethritis, 400 mg daily in single or divided doses for 7 days

  Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days

- By intravenous infusion (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily

  Lower respiratory-tract infection, 200 mg twice daily

  Septicaemia, 200 mg twice daily

  Skin and soft-tissue infections, 400 mg twice daily

  Severe or complicated infections, dose may be increased to 400 mg twice daily

Ofloxacin (Non-proprietary) PoM

Tablets, ofloxacin 200 mg, net price 10-tab pack = £4.96; 400 mg, 5-tab pack = £3.24, 10-tab pack = £5.52. Label: 6, 9, 11, counselling, driving

Tarivid® (Aventis Pharma) PoM

Tablets, f/c, scored, ofloxacin 200 mg, net price 10-tab pack = £7.53, 20-tab pack = £15.05; 400 mg (yellow), 5-tab pack = £7.52, 10-tab pack = £14.99. Label: 6, 9, 11, counselling, driving

Intravenous infusion, ofloxacin (as hydrochloride) 2 mg/mL, net price 100-mL bottle = £16.16 (hosp. only)

5.1.13 Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

Whenever possible a specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Uncomplicated lower urinary-tract infections often respond to trimethoprim, nitrofurantoin, amoxicillin, or nalidixic acid given for 7 days (3 days may be adequate for infections in women); those caused by fully sensitive bacteria respond to two 3-g doses of amoxicillin (section 5.1.1.3). Widespread bacterial resistance, especially to ampicillin, amoxicillin, and trimethoprim has increased the importance of urine culture before therapy. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam, or a quinolone.

Long-term low dose therapy may be required in selected patients to prevent *recurrence of infection*; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin have been recommended for long-term therapy.

Methenamine (hexamine) should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Acute pyelonephritis can lead to septicaemia and is treated initially by injection of a broad-spectrum antibacterial such as cefuroxime or a quinolone if the patient is severely ill; gentamicin can also be used.

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as trimethoprim, or some quinolones.

Where infection is localised and associated with an indwelling *catheter* a bladder instillation is often effective (section 7.4.4).

Urinary-tract infection in *pregnancy* may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulphonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

In *renal failure* antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine, and nitrofurantoin should be avoided altogether.

Children Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in *children over 3 months of age* can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

NITROFURANTOIN

Indications urinary-tract infections

Cautions anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; hepatic impairment; monitor lung and liver function on long-term therapy, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive

urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; **interactions:** Appendix 1 (nitrofurantoin)

Contra-indications renal impairment (Appendix 3); infants less than 3 months old, G6PD deficiency (including pregnancy at term, and breast-feeding of affected infants, see section 9.1.5 and Appendix 4 and Appendix 5), acute porphyria (section 9.8.2)

Side-effects anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

Dose

- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); CHILD over 3 months, 3 mg/kg daily in 4 divided doses
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea)
- Prophylaxis (but see Cautions), 50–100 mg at night; CHILD over 3 months, 1 mg/kg at night

Nitrofurantoin (Non-proprietary) PoM

Tablets, nitrofurantoin 50 mg, net price 28-tab pack = £1.84; 100 mg, 28-tab pack = £4.34. Label: 9, 14, 21

Oral suspension, nitrofurantoin 25 mg/5 mL, net price 300 mL = £65.00. Label: 9, 14, 21

Furadantin® (Goldshield) PoM

Tablets, all yellow, scored, nitrofurantoin 50 mg, net price 20 = £1.96; 100 mg, 20 = £3.62. Label: 9, 14, 21

Macrobid® (Goldshield) PoM

Capsules, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate). Net price 14-cap pack = £4.89. Label: 9, 14, 21, 25

Dose uncomplicated urinary-tract infection, 1 capsule twice daily with food

Genito-urinary surgical prophylaxis, 1 capsule twice daily on day of procedure and for 3 days after

Macrodantin® (Goldshield) PoM

Capsules, nitrofurantoin 50 mg (yellow/white), net price 30-cap pack = £2.49; 100 mg (yellow/white), 20 = £3.21. Label: 9, 14, 21

METHENAMINE HIPPURATE

(Hexamine hippurate)

Indications prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

Cautions pregnancy; avoid concurrent administration with sulphonamides (risk of crystalluria) or urinary alkalinising agents; **interactions:** Appendix 1 (methenamine)

Contra-indications hepatic impairment, renal impairment (avoid if eGFR less than 10 mL/minute/1.73 m^2; Appendix 3), severe dehydration, gout, metabolic acidosis

Side-effects gastro-intestinal disturbances, bladder irritation, rash

Dose

- 1 g every 12 hours (may be increased in patients with catheters to 1 g every 8 hours); CHILD 6–12 years 500 mg every 12 hours

Hiprex® (3M)

Tablets, scored, methenamine hippurate 1 g. Net price 60-tab pack = £6.58. Label: 9

5.2 Antifungal drugs

Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (oropharynx), and section 13.10.2 (skin).

Aspergillosis Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the sinuses, heart, brain, and skin. **Amphotericin** (liposomal formulation preferred if toxicity or renal impairment are concerns) or **voriconazole** can be used for the treatment of aspergillosis. **Caspofungin** or **itraconazole** are alternatives in patients who are refractory to, or intolerant of amphotericin. Itraconazole is also used as an adjunct for the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication]. The *Scottish Medicines Consortium* (March 2003) does not recommend the use of caspofungin because of a lack of robust data on efficacy and safety in the treatment of invasive aspergillosis.

Candidiasis Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with fluconazole given by mouth; for resistant organisms, itraconazole can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for fluconazole-resistant infections. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *deep and disseminated candidiasis*, **amphotericin** can be given by intravenous infusion. **Fluconazole** is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. **Caspofungin** or **voriconazole** can be used for infections caused by fluconazole-resistant *Candida* spp. that have not responded to amphotericin, or in

patients intolerant of amphotericin. In refractory cases, **flucytosine** can be used with intravenous amphotericin.

Cryptococcosis Cryptococcosis is uncommon but infection in the immunocompromised, especially in AIDS patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is **amphotericin** by intravenous infusion and **flucytosine** by intravenous infusion for 2 weeks, followed by **fluconazole** by mouth for 8 weeks or until cultures are negative. In cryptococcosis, **fluconazole** is sometimes given alone as an alternative in AIDS patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. **Itraconazole** can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. **Amphotericin** by intravenous infusion is preferred in patients with fulminant or severe infections. Following successful treatment, itraconazole can be used for prophylaxis against relapse.

Skin and nail infections Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section 13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly **itraconazole**) and **terbinafine** are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. **Griseofulvin** is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. **Terbinafine** is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

Pityriasis versicolor (section 13.10.2) may be treated with **itraconazole** by mouth if topical therapy is ineffective; **fluconazole** by mouth is an alternative. Oral **terbinafine** is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. **Terbinafine** and **itraconazole** have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

Immunocompromised patients Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral imidazole or triazole antifungals are the drugs of choice for prophylaxis. **Fluconazole** is more reliably absorbed than itraconazole and ketoconazole and is considered less toxic than ketoconazole for long-term use.

Amphotericin by intravenous infusion is used for the empirical *treatment* of serious fungal infections. Fluconazole is used for treating *Candida albicans* infection. Caspofungin is licensed for the empirical treatment of systemic fungal infections (such as those involving *Candida* spp. or *Aspergillus* spp.) in patients with neutropenia.

Drugs used in fungal infections

Polyene antifungals The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. They are used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2).

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet®*, *AmBisome®*, and *Amphocil®*) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contraindicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Nystatin is used principally for *Candida albicans* infections of the skin and mucous membranes, including oesophageal and intestinal candidiasis.

Imidazole antifungals The imidazole antifungals include clotrimazole, econazole, ketoconazole, sulconazole, and tioconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

Ketoconazole is better absorbed by mouth than other imidazoles. It has been associated with fatal hepatotoxicity; the CSM has advised that prescribers should weigh the potential benefits of ketoconazole treatment against the risk of liver damage and should carefully monitor patients both clinically and biochemically. It should not be used by mouth for superficial fungal infections.

Miconazole (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Triazole antifungals **Fluconazole** is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption.

Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Echinocandin antifungals **Caspofungin** is active against *Aspergillus* spp. and *Candida* spp. **Anidulafungin** and **micafungin** are licensed for the treatment of invasive candidiasis.

Other antifungals **Flucytosine** is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in AIDS patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment.

Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

AMPHOTERICIN
(Amphotericin B)

Indications See under Dose

Cautions when given parenterally, toxicity common (close supervision necessary and test dose required; see Anaphylaxis below); renal impairment (Appendix 3); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); pregnancy (Appendix 4); breast-feeding (Appendix 5); avoid rapid infusion (risk of arrhythmias); **interactions:** Appendix 1 (amphotericin)

Anaphylaxis The CSM has advised that anaphylaxis occurs rarely with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

Side-effects when given parenterally, anorexia, nausea and vomiting, diarrhoea, epigastric pain; febrile reactions, headache, muscle and joint pain; anaemia; disturbances in renal function (including hypokalaemia and hypomagnesaemia) and renal toxicity; also cardiovascular toxicity (including arrhythmias, blood pressure changes), blood disorders, neurological disorders (including hearing loss, diplopia, convulsions, peripheral neuropathy, encephalopathy), abnormal liver function (discontinue treatment), rash, anaphylactoid reactions (see Anaphylaxis, above); pain and thrombophlebitis at injection site

Dose

- Oral and perioral infections, see section 12.3.2
- By intravenous infusion, see preparations

Note Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

Fungizone® (Squibb) PoM

Intravenous infusion, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £3.96

Electrolytes $Na^+ < 0.5$ mmol/vial

Dose by intravenous infusion, systemic fungal infections, initial test dose of 1 mg over 20–30 minutes then 250 micrograms/kg daily, gradually increased over 2–4 days, if tolerated, to 1 mg/kg daily; max. (severe infection) 1.5 mg/kg daily or on alternate days; CHILD under 18 years see *BNF for Children*

Note Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

Lipid formulations

Abelcet® (Cephalon) PoM

Intravenous infusion, amphotericin 5 mg/mL as lipid complex with L-α-dimyristoylphosphatidylcholine and L-α-dimyristoylphosphatidylglycerol, net price 20-mL vial = £82.13 (hosp. only)

Dose by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients, initial test dose 1 mg over 15 minutes then 5 mg/kg once daily for at least 14 days; CHILD under 18 years see *BNF for Children*

AmBisome® (Gilead) PoM

Intravenous infusion, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

Electrolytes $Na^+ < 0.5$ mmol/vial

Excipients include sucrose 900 mg/vial

Dose by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin, initial test dose 1 mg over 10 minutes then 1 mg/kg once daily increased gradually if necessary to 3 mg/kg once daily; max. 5 mg/kg once daily [unlicensed dose]; CHILD under 18 years see *BNF for Children*

Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily until afebrile for 3 consecutive days; max. period of treatment 42 days; max. 5 mg/kg once daily [unlicensed dose]; CHILD under 18 years see *BNF for Children*

Visceral leishmaniasis, see section 5.4.5 and product literature

Amphocil® (Beacon) PoM

Intravenous infusion, powder for reconstitution, amphotericin as a complex with sodium cholesteryl sulphate, net price 50-mg vial = £104.10, 100-mg vial = £190.05

Electrolytes $Na^+ < 0.5$ mmol/vial

Dose by intravenous infusion, severe systemic or deep mycoses where toxicity or renal failure preclude use of conventional amphotericin, initial test dose 2 mg over 10 minutes then 1 mg/kg once daily increased gradually if necessary to 3–4 mg/kg once daily; max. 6 mg/kg daily; CHILD under 18 years see *BNF for Children*

ANIDULAFUNGIN

Indications invasive candidiasis

Cautions pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects diarrhoea, nausea, vomiting; flushing; convulsion, headache; coagulopathy, hypokalaemia, raised serum creatinine; rash, pruritus; *less commonly* abdominal pain, cholestasis, hypertension, hyperglycaemia, urticaria, and injection-site pain; also reported, hepatitis

Dose

- By intravenous infusion, ADULT over 18 years, 200 mg on first day then 100 mg once daily

Ecalta® (Pfizer) ▼ PoM

Intravenous infusion, powder for reconstitution, anidulafungin, net-price 100-mg vial = £299.99 (with solvent)

Excipients include alcohol 24%

CASPOFUNGIN

Indications invasive aspergillosis either unresponsive to amphotericin or itraconazole or in patients intolerant of amphotericin or itraconazole; invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

Cautions hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (caspofungin)

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, abdominal pain, diarrhoea; tachycardia, flushing; dyspnoea; fever, headache; anaemia, decrease in serum potassium, hypomagnesaemia; rash, pruritus, sweating; injection-site reactions; *less commonly* hypercalcaemia; also reported, hepatic dysfunction, oedema, adult respiratory distress syndrome, hypersensitivity reactions (including anaphylaxis); in children, also hypotension

Dose

- By intravenous infusion, 70 mg on first day then 50 mg once daily (70 mg once daily if body-weight over 80 kg); CHILD 1–18 years see *BNF for Children*

Cancidas® (MSD) ▼ PoM

Intravenous infusion, powder for reconstitution, caspofungin (as acetate), net price 50-mg vial = £327.67; 70-mg vial = £416.78

FLUCONAZOLE

Indications see under Dose

Cautions renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5); concomitant use with hepatotoxic drugs, monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis); susceptibility to QT interval prolongation; **interactions:** Appendix 1 (antifungals, triazole)

Contra-indications acute porphyria (section 9.8.2)

Side-effects nausea, abdominal discomfort, diarrhoea, flatulence, headache, rash (discontinue treatment or monitor closely if infection invasive or systemic); less frequently dyspepsia, vomiting, taste disturbance, hepatic disorders, hypersensitivity reactions, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome (severe cutaneous reactions more likely in AIDS patients), hyperlipidaemia, leucopenia, thrombocytopenia, and hypokalaemia reported

Dose

- Vaginal candidiasis (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) and candidal balanitis, ADULT and CHILD over 16 years, by mouth, a single dose of 150 mg
- Mucosal candidiasis (except genital), by mouth, 50 mg daily (100 mg daily in unusually difficult infections) given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); CHILD by mouth *or* by intravenous infusion, 3–6 mg/kg on first day then 3 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in neonate 2–4 weeks old)
- Tinea pedis, corporis, cruris, pityriasis versicolor, and dermal candidiasis, by mouth, 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks
- Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis), by mouth *or* intravenous infusion, 400 mg on first day then 200–400 mg daily; max. 800 mg daily in severe infections [unlicensed dose]; treatment continued according to response (at least 8 weeks for cryptococcal meningitis); CHILD 6–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 800 mg daily [unlicensed dose]
- Prevention of relapse of cryptococcal meningitis in AIDS patients after completion of primary therapy, by mouth *or* by intravenous infusion, 200 mg daily
- Prevention of fungal infections in immunocompromised patients, by mouth *or* by intravenous infusion, 50–400 mg daily adjusted according to risk; 400 mg daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range; CHILD according to extent and duration of neutropenia, 3–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 400 mg daily

Fluconazole (Non-proprietary) PoM

[1] Capsules, fluconazole 50 mg, net price 7-cap pack = £1.00; 150 mg, single-capsule pack = 94p; 200 mg, 7-cap pack = £1.90. Label: 9, (50 and 200 mg)

Dental prescribing on NHS Fluconazole Capsules 50 mg may be prescribed

Intravenous infusion, fluconazole 2 mg/mL, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28

Diflucan® (Pfizer) PoM

[1] Capsules, fluconazole 50 mg (blue/white), net price 7-cap pack = £16.61; 150 mg (blue), single-capsule pack = £7.12; 200 mg (purple/white), 7-cap pack = £66.42. Label: 9, (50 and 200 mg)

Oral suspension, orange-flavoured, fluconazole for reconstitution with water, 50 mg/5 mL, net price 35 mL = £16.61; 200 mg/5 mL, 35 mL = £66.42. Label: 9

Dental prescribing on NHS May be prescribed as Fluconazole Oral Suspension 50 mg/5 mL

Intravenous infusion, fluconazole 2 mg/mL in sodium chloride intravenous infusion 0.9%, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28

Electrolytes Na^+ 15 mmol/100-mL bottle

FLUCYTOSINE

Indications systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis

1. Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

(see Cryptococcosis, p. 333), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

Cautions renal impairment (Appendix 3); elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in renal impairment or blood disorders); pregnancy (Appendix 4), breast-feeding (Appendix 5); **interactions:** Appendix 1 (flucytosine)

Side-effects nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

Dose

- By intravenous infusion over 20–40 minutes, 200 mg/kg daily in 4 divided doses usually for not more than 7 days; extremely sensitive organisms, 100–150 mg/kg daily may be sufficient; CHILD under 18 years see *BNF for Children*

  Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcosis, p. 333) 100 mg/kg daily in 4 divided doses for 2 weeks [unlicensed duration]; CHILD under 18 years see *BNF for Children*

  Note For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre)

Ancotil® (Valeant) PoM

Intravenous infusion, flucytosine 10 mg/mL, net price 250-mL infusion bottle = £30.33 (hosp. only)

Electrolytes Na^+ 34.5 mmol/250-mL bottle

Note Flucytosine tablets [unlicensed] may be available from 'special-order' manufacturers or specialist-importing companies, see p. 969

GRISEOFULVIN

Indications dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

Cautions **interactions:** Appendix 1 (griseofulvin)

Driving May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2); pregnancy (**avoid** pregnancy **during** and for **1 month after** treatment (Appendix 4); men should not father children within 6 months of treatment); breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea; headache; less frequently hepatotoxicity, dizziness, confusion, fatigue, sleep disturbances, impaired co-ordination, peripheral neuropathy, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity

Dose

- Dermatophyte infections, 500 mg once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs; CHILD under 50 kg, 10 mg/kg once daily or in divided doses
- Tinea capitis caused by *Trichophyton tonsurans*, 1 g once daily or in divided doses; CHILD under 50 kg, 15–20 mg/kg once daily or in divided doses

Note Griseofulvin doses in BNF may differ from those in product literature

Griseofulvin (Non-proprietary) PoM

Tablets, griseofulvin 125 mg, net price 20 = £6.76; 500 mg, 20 = £17.52. Label: 9, 21, counselling, driving

ITRACONAZOLE

Indications see under Dose

Cautions absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary); susceptibility to congestive heart failure (see also CSM advice, below); renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5); **interactions:** Appendix 1 (antifungals, triazole)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of hepatotoxicity with other drugs or in active liver disease (Appendix 2). Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

CSM advice (heart failure)

Following rare reports of heart failure, the CSM has advised caution when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older patients and those with cardiac disease;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Contra-indications acute porphyria (section 9.8.2)

Side-effects *very rarely* nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, constipation, jaundice, hepatitis (see also Hepatotoxicity above), heart failure (see CSM advice above), pulmonary oedema, headache, dizziness, peripheral neuropathy (discontinue treatment), menstrual disorder, hypokalaemia, rash, pruritus, Stevens-Johnson syndrome, and alopecia; *with intravenous injection, very rarely* hypertension and hyperglycaemia

Dose

- By mouth, oropharyngeal candidiasis, 100 mg once daily (200 mg once daily in AIDS or neutropenia) for 15 days; see also under *Sporanox®* oral liquid below

  Vulvovaginal candidiasis, 200 mg twice daily for 1 day

  Pityriasis versicolor, 200 mg once daily for 7 days

  Tinea corporis and tinea cruris, *either* 100 mg once daily for 15 days *or* 200 mg once daily for 7 days

  Tinea pedis and tinea manuum, *either* 100 mg once daily for 30 days *or* 200 mg twice daily for 7 days

  Onychomycosis, *either* 200 mg once daily for 3 months *or* course ('pulse') of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day interval; fingernails 2 courses, toenails 3 courses

  Histoplasmosis, 200 mg 1–2 times daily

  Systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, 200 mg once daily (candidiasis 100–200 mg once daily) increased in invasive or disseminated disease and in cryptococcal meningitis to 200 mg twice daily

  Maintenance in AIDS patients to prevent relapse of underlying fungal infection and prophylaxis in neu-

tropenia when standard therapy inappropriate, 200 mg once daily, increased to 200 mg twice daily if low plasma-itraconazole concentration (see Cautions)

Prophylaxis in patients with haematological malignancy or undergoing bone-marrow transplant, see under *Sporanox®* oral liquid below

- By intravenous infusion, systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, histoplasmosis, 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days
- CHILD under 18 years see *BNF for Children*
- ELDERLY safety and efficacy not established

Itraconazole (Non-proprietary) PoM

Capsules, enclosing coated beads, itraconazole 100 mg, net price 15-cap pack = £10.78. Label: 5, 9, 21, 25, counselling, hepatotoxicity

Sporanox® (Janssen-Cilag) PoM

Capsules, blue/pink, enclosing coated beads, itraconazole 100 mg, net price 4-cap pack = £3.75; 15-cap pack = £14.05; 28-cap pack (*Sporanox®-Pulse*) = £26.24; 60-cap pack = £56.21. Label: 5, 9, 21, 25, counselling, hepatotoxicity

Oral liquid, sugar-free, cherry-flavoured, itraconazole 10 mg/mL, net price 150 mL (with 10-mL measuring cup) = £46.72. Label: 9, 23, counselling, administration, hepatotoxicity

Dose oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no response)

Fluconazole-resistant oral or oesophageal candidiasis, 10–20 mL (1–2 measuring cups) twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic, 5 mg/kg daily in 2 divided doses; starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; CHILD and ELDERLY safety and efficacy not established

Counselling Do not take with food; swish around mouth and swallow, do not rinse afterwards

Concentrate for intravenous infusion, itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £63.84

Excipients include propylene glycol

KETOCONAZOLE

Indications see CSM recommendations, p. 333; dermatophytoses and *Malassezia* folliculitis *either* resistant to fluconazole, terbinafine, or itraconazole *or* in patients intolerant of these antifungals; chronic mucocutaneous, cutaneous, and oropharyngeal candidiasis *either* resistant to fluconazole or itraconazole *or* in patients intolerant of these antifungals

Cautions predisposition to adrenocortical insufficiency; pregnancy (Appendix 4); **interactions:** Appendix 1 (antifungals, imidazole)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely; risk of hepatotoxicity greater if given for longer than 10 days. Monitor liver function before treatment, then on weeks 2 and 4 of treatment, then every month. Avoid or use with caution if abnormal liver function tests (avoid in active liver disease) or if history of hepatotoxicity with other drugs. For CSM advice see p. 333

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, or dark urine develop

Contra-indications acute porphyria (section 9.8.2); hepatic impairment; breast-feeding

Side-effects nausea, vomiting, abdominal pain; pruritus; *less commonly* diarrhoea, headache, dizziness, drowsiness, and rash; also reported fatal liver damage (see Hepatotoxicity above), dyspepsia, raised intracranial pressure, paraesthesia, adrenocortical insufficiency, erectile dysfunction, menstrual disorders, azoospermia (with high doses), gynaecomastia, thrombocytopenia, photophobia, photosensitivity, and alopecia

Dose

- 200 mg once daily, increased if response inadequate to 400 mg once daily; continued until symptoms have cleared and cultures negative, but see Cautions (max. duration of treatment 4 weeks for *Malassezia* infection); CHILD body-weight 15–30 kg, 100 mg once daily; body-weight over 30 kg, adult dose

Nizoral® (Janssen-Cilag) PoM

Tablets, scored, ketoconazole 200 mg. Net price 30-tab pack = £14.02. Label: 5, 9, 21, counselling, hepatotoxicity

MICAFUNGIN

Indications see under Dose

Cautions monitor renal function; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (micafungin)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe; Appendix 2) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age

Side-effects nausea, vomiting, diarrhoea, abdominal pain; headache, fever; hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia; rash, phlebitis; *less commonly* dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hyponatraemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; *rarely* haemolytic anaemia; also reported renal failure (more frequent in children)

Dose

- By intravenous infusion, invasive candidiasis, ADULT body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days; CHILD under 18 years see *BNF for Children*

  Oesophageal candidiasis, ADULT body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily; CHILD 16–18 years see *BNF for Children*

  Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, ADULT body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range; CHILD under 18 years see *BNF for Children*

Mycamine® (Astellas) ▼ PoM
Intravenous infusion, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

NYSTATIN

Indications candidiasis; oral infection (section 12.3.2); skin infection (section 13.10.2)

Side-effects nausea, vomiting, diarrhoea at high doses; oral irritation and sensitisation; rash (including urticaria) and rarely Stevens-Johnson syndrome reported

Dose

- By mouth, intestinal candidiasis 500 000 units every 6 hours, doubled in severe infection; NEONATE 100 000 units 4 times daily; CHILD 1 month–12 years, 100 000 units 4 times daily; immunocompromised children may require higher doses (e.g. 500 000 units 4 times daily)
  Note Unlicensed for treatment of candidiasis in NEONATE. Nystatin doses in BNF may differ from those in product literature

Nystan® (Squibb) PoM
Oral suspension, yellow, nystatin 100 000 units/mL, net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette

POSACONAZOLE

Indications invasive aspergillosis either unresponsive to, or in patients intolerant of, amphotericin or itraconazole; fusariosis either unresponsive to, or in patients intolerant of, amphotericin; chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole; coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole; see also under Dose

Cautions cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function—consider discontinuing if impairment suspected (Appendix 2); pregnancy (ensure effective contraception during treatment; Appendix 4); **interactions:** Appendix 1 (antifungals, triazole)

Contra-indications acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia), electrolyte disturbances; dry mouth; rash; *less commonly* pancreatitis, hepatic disorders, arrhythmias, palpitation, changes in blood pressure, oedema, convulsions, neuropathy, tremor, hyperglycaemia, menstrual disorders, renal failure, musculoskeletal pain, visual disturbances, mouth ulcers, and alopecia; *rarely* ileus, cardiac failure, myocardial infarction, stroke, thrombosis, syncope, pneumonitis, psychosis, depression, encephalopathy, adrenal insufficiency, breast pain, hearing impairment, and Stevens-Johnson syndrome

Dose

- 400 mg twice daily with food *or* if food not tolerated, 200 mg 4 times daily
- Oropharyngeal candidiasis (severe infection or in immunocompromised patients only), 200 mg with food on first day, then 100 mg once daily with food for 13 days
- Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole and itraconazole, 200 mg 3 times daily with food, starting before transplantation or before chemotherapy and continued until neutrophil count recovers
- CHILD under 18 years not recommended

Noxafil® (Schering-Plough) ▼ PoM
Suspension, posaconazole 200 mg/5 mL, net price 105 mL (cherry-flavoured) = £491.20. Label: 9, 21

TERBINAFINE

Indications dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy appropriate (due to site, severity or extent)

Cautions psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (terbinafine)

Side-effects abdominal discomfort, anorexia, nausea, diarrhoea; headache; rash and urticaria occasionally with arthralgia or myalgia; *less commonly* taste disturbance; *rarely* liver toxicity (including jaundice, cholestasis and hepatitis)—discontinue treatment, angioedema, dizziness, malaise, paraesthesia, hypoaesthesia, photosensitivity, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—discontinue treatment if progressive skin rash; *very rarely* psychiatric disturbances, blood disorders (including leucopenia and thrombocytopenia), lupus erythematosus-like effect, and exacerbation of psoriasis

Dose

- By mouth, 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occasionally longer in toenail infections); CHILD [unlicensed] usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily

Terbinafine (Non-proprietary) PoM
Tablets, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £2.74, 28-tab pack = £3.44. Label: 9

Lamisil® (Novartis) PoM
Tablets, off-white, scored, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £23.16, 28-tab pack = £44.66. Label: 9

VORICONAZOLE

Indications invasive aspergillosis; serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

Cautions electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; avoid exposure to sunlight; patients at risk of pancreatitis; monitor liver function before treatment and during treatment; haematological malignancy (increased risk of hepatic reactions); hepatic impairment (Appendix 2); monitor renal function; renal impairment (Appendix 3); pregnancy (ensure effective contraception during treatment—Appendix 4); **interactions**: Appendix 1 (antifungals, triazole)

Contra-indications acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea), jaundice; oedema, hypotension, chest pain; respiratory distress syndrome, sinusitis; headache, dizziness, asthenia, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor; influenza-like symptoms; hypoglycaemia; haematuria; blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia; visual disturbances including altered perception, blurred vision, and photophobia; rash, pruritus, photosensitivity, alopecia, cheilitis; injection-site reactions; *less commonly* cholecystitis, pancreatitis, hepatitis, constipation, arrhythmias (including QT interval prolongation), syncope, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nystagmus, hypoaesthesia, adrenocortical insufficiency, arthritis, blepharitis, optic neuritis, scleritis, glossitis, gingivitis, psoriasis, and Stevens-Johnson syndrome; *rarely* pseudomembranous colitis, convulsions, sleep disturbances, tinnitus, hearing disturbances, extrapyramidal effects, hypertonia, hypothyroidism, hyperthyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, retinal haemorrhage, optic atrophy, and taste disturbances

Dose

- By mouth, ADULT and CHILD over 12 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours; CHILD 2–12 years, (oral suspension recommended) 200 mg every 12 hours
- By intravenous infusion, 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; CHILD 2–18 years see *BNF for Children*

Vfend® (Pfizer) PoM

Tablets, f/c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23

Oral suspension, voriconazole 200 mg/5 mL when reconstituted with water, net price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23

Intravenous infusion, powder for reconstitution, voriconazole, net price 200-mg vial = £77.14

Excipients include sulphobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment)

Electrolytes Na^+ 9.47 mmol/vial

5.3 Antiviral drugs

5.3.1 HIV infection
5.3.2 Herpesvirus infections
5.3.3 Viral hepatitis
5.3.4 Influenza
5.3.5 Respiratory syncytial virus

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.

5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) increase life expectancy considerably but they may be associated with serious side-effects. Treatment should be undertaken only by those experienced in their use.

Principles of treatment Treatment is aimed at reducing the plasma viral load as much as possible and for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count; the plasma viral load and clinical symptoms may also help. The timing and choice of treatment should also take account of the possible effects of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment is initiated with 2 nucleoside reverse transcriptase inhibitors and a non-nucleoside reverse transcriptase inhibitor; the regimens of choice contain *either* tenofovir, emtricitabine, and efavirenz *or* abacavir, lamivudine, and efavirenz. Regimens containing 2 nucleoside reverse transcriptase inhibitors and a boosted protease inhibitor are reserved for

patients with resistance to first-line regimens, women wishing to become pregnant, or patients with psychiatric illness. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3).

Switching therapy Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy and breast-feeding Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although the teratogenic potential of most antiretroviral drugs is unknown), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist**. Zidovudine monotherapy reduces transmission of infection to the neonate. However, combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. Combination antiretroviral therapy may be associated with a greater risk of preterm delivery.

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Children HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

Post-exposure prophylaxis Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS, www.dh.gov.uk) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org

Drugs for HIV infection **Zidovudine**, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include **abacavir**, **didanosine**, **emtricitabine**, **lamivudine**, **stavudine**, and **tenofovir**.

The protease inhibitors include **atazanavir**, **darunavir**, **fosamprenavir** (a pro-drug of amprenavir), **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir**, **saquinavir**, and **tipranavir**. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. A combination of lopinavir with low-dose ritonavir is available. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects (see below).

The non-nucleoside reverse transcriptase inhibitors **efavirenz**, **etravirine**, and **nevirapine** are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV. The *Scottish Medicines Consortium* (p. 3) has advised (March 2008) that maraviroc (*Celsentri*®) is **not** recommended for use within NHS Scotland.

Raltegravir is an inhibitor of HIV integrase. It is licensed for the treatment of HIV infection resistant to multiple antiretrovirals. The *Scottish Medicines Consortium* (p. 3) has advised (April 2008) that raltegravir (*Isentress*®) is accepted for restricted use within NHS Scotland for the treatment of patients with HIV infection resistant to 3 classes of antiretrovirals.

Immune reconstitution syndrome Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms.

Lipodystrophy syndrome Metabolic effects associated with antiretroviral treatment include *fat redistribution*, *insulin resistance*, and *dyslipidaemia*; collectively these have been termed *lipodystrophy syndrome*. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, 'buffalo hump' and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyper-

glycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Nucleoside reverse transcriptase inhibitors

Cautions Nucleoside reverse transcriptase inhibitors should be used with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects), in hepatic impairment (see also Lactic Acidosis below and Appendix 2), in renal impairment (Appendix 3), and in pregnancy (see also p. 340 and Appendix 4).

Lactic acidosis Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients (particularly obese women) with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis (including alcohol abuse). Treatment with the nucleoside reverse transcriptase inhibitor should be **discontinued** in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

Side-effects Side-effects of the nucleoside reverse transcriptase inhibitors include gastro-intestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnoea, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for metabolic effects and lipodystrophy (Lipodystrophy Syndrome), and Osteonecrosis.

ABACAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also test for HLA-B*5701 allele before treatment—risk of hypersensitivity reaction in presence of HLA-B*5701 allele; HIV load greater than 100 000 copies/mL; patients at high risk of cardiovascular disease; **interactions:** Appendix 1 (abacavir)

Hypersensitivity reactions Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure (CSM has identified hypersensitivity reactions presenting as sore throat, influenza-like illness, cough, and breathlessness); rarely myolysis; laboratory abnormalities may include raised liver function tests (see Lactic Acidosis above) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity

Counselling Patients should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; patients should be advised to keep Alert Card with them at all times

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also hypersensitivity reactions (see above); *very rarely* Stevens-Johnson syndrome and toxic epidermal necrolysis; rash and gastro-intestinal disturbances more common in children

Dose

- 600 mg daily in 1–2 divided doses; CHILD 3 months–12 years, 8 mg/kg every 12 hours (max. 600 mg daily) *or* body-weight 14–21 kg, 150 mg every 12 hours; body-weight 21–30 kg, 150 mg in the morning and 300 mg in the evening; body-weight over 30 kg, 300 mg every 12 hours

Ziagen® (GSK) PoM

Tablets, yellow, f/c, scored, abacavir (as sulphate) 300 mg, net price 60-tab pack = £221.81. Counselling, hypersensitivity reactions

Oral solution, sugar-free, banana and strawberry flavoured, abacavir (as sulphate) 20 mg/mL, net price 240-mL = £59.15. Counselling, hypersensitivity reactions

With lamivudine

For **cautions**, **contra-indications** and **side-effects** see under individual drugs

Kivexa® (GSK) PoM

Tablets, orange, f/c, abacavir (as sulphate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £373.94. Counselling, hypersensitivity reactions

Dose ADULT and CHILD over 12 years, body-weight over 40 kg, 1 tablet once daily

With lamivudine and zidovudine

Note For patients stabilised (for 6–8 weeks) on the individual components in the same proportions. For **cautions**, **contra-indications** and **side-effects** see under individual drugs

Trizivir® (GSK) PoM

Tablets, blue-green, f/c, abacavir (as sulphate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £540.40. Counselling, hypersensitivity reactions

Dose ADULT over 18 years, 1 tablet twice daily

DIDANOSINE
(ddI, DDI)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination

(including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; **interactions:** Appendix 1 (didanosine)

Pancreatitis Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also pancreatitis (see also under cautions), liver failure, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypoglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, sialadenitis, alopecia, hyperuricaemia (suspend if raised significantly)

Dose

- ADULT under 60 kg 250 mg daily in 1–2 divided doses, 60 kg and over 400 mg daily in 1–2 divided doses; CHILD over 3 months (under 6 years *Videx*® tablets only), 240 mg/m² daily (180 mg/m² daily in combination with zidovudine) in 1–2 divided doses

Videx® (Bristol-Myers Squibb) PoM

Tablets, with calcium and magnesium antacids, didanosine 25 mg, net price 60-tab pack = £25.56. Label: 23, counselling, administration, see below

Excipients include aspartame equivalent to phenylalanine 36.5 mg per tablet (section 9.4.1)

Note Antacids in formulation may affect absorption of other drugs—see **interactions:** Appendix 1 (antacids)

Counselling To ensure sufficient antacid, each dose to be taken as at least 2 tablets (CHILD under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir

Videx® EC capsules, enclosing e/c granules, didanosine 125 mg, net price 30-cap pack = £49.16; 200 mg, 30-cap pack = £78.65; 250 mg, 30-cap pack = £98.31; 400 mg, 30-cap pack = £157.30. Label: 25, counselling, administration, see below

Counselling Capsules to be taken at least 2 hours before or 2 hours after food

EMTRICITABINE

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions:** Appendix 1 (emtricitabine)

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also abnormal dreams, pruritus, and hyperpigmentation

Dose

- See preparations

Emtriva® (Gilead) PoM

Capsules, white/blue, emtricitabine 200 mg, net price 30-cap pack = £163.50

Dose ADULT and CHILD body-weight over 33 kg, 200 mg once daily

Oral solution, orange, emtricitabine 10 mg/mL, net price 170-mL pack (candy-flavoured) = £46.50

Dose ADULT and CHILD body-weight over 33 kg, 240 mg once daily; CHILD 4 months–18 years, body-weight under 33 kg, 6 mg/kg once daily

Electrolytes Na^+ 460 micromol/mL

Note 240 mg oral solution ≡ 200 mg capsule; where appropriate the capsule may be used instead of the oral solution

With tenofovir

See under Tenofovir

With efavirenz and tenofovir

See under Tenofovir

LAMIVUDINE (3TC)

Indications see preparations below

Cautions see notes above; **interactions:** Appendix 1 (lamivudine)

Chronic Hepatitis B Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral and serological markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue after discontinuation)—consult product literature

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

Dose

- See preparations below

Epivir® (GSK) PoM

Tablets, f/c, lamivudine 150 mg (scored, white), net price 60-tab pack = £152.14; 300 mg (grey), 30-tab pack = £167.21

Oral solution, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £41.41

Excipients include sucrose 1 g/5 mL

Dose HIV infection in combination with other antiretroviral drugs, 150 mg every 12 hours *or* 300 mg once daily; CHILD 3 months–12 years, 4 mg/kg (max. 150 mg) every 12 hours *or* body-weight 14–21 kg, 75 mg twice daily; body-weight 21–30 kg, 75 mg in the morning and 150 mg in the evening; body-weight over 30 kg, 150 mg twice daily

Zeffix® (GSK) PoM

Tablets, brown, f/c, lamivudine 100 mg, net price 28-tab pack = £78.09

Oral solution, banana and strawberry flavoured, lamivudine 25 mg/5 mL, net price 240-mL pack = £22.79

Excipients include sucrose 1 g/5 mL

Dose chronic hepatitis B infection with *either* compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis), *or* decompensated liver disease, 100 mg daily; CHILD [unlicensed indication] 2–11 years, 3 mg/kg once daily (max. 100 mg daily); 12–17 years, adult dose

Note Patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

With abacavir

See under Abacavir

With zidovudine

See under Zidovudine

With abacavir and zidovudine

See under Abacavir

STAVUDINE
(d4T)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also history of peripheral neuropathy (see under Side-effects); history of pancreatitis or concomitant use with other drugs associated with pancreatitis; **interactions:** Appendix 1 (stavudine)

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; *less commonly* anxiety, gynaecomastia

Dose

- ADULT under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; NEONATE under 2 weeks, 500 micrograms/kg every 12 hours; CHILD over 2 weeks, body-weight under 30 kg, 1 mg/kg every 12 hours; body-weight 30 kg and over, adult dose

Zerit® (Bristol-Myers Squibb) PoM

Capsules, stavudine 20 mg (brown), net price 56-cap pack = £142.28; 30 mg (light orange/dark orange), 56-cap pack = £149.20; 40 mg (dark orange), 56-cap pack = £153.70 (all hosp. only)

Oral solution, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £23.40

TENOFOVIR DISOPROXIL

Indications HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis

Cautions see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions:** Appendix 1 (tenofovir)

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; hypophosphataemia; *rarely* renal failure; also reported nephrogenic diabetes insipidus, reduced bone density, hypokalaemia, myopathy, and rhabdomyolysis

Dose

- ADULT over 18 years, 245 mg once daily

Viread® (Gilead) ▼ PoM

Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £255.00. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

With emtricitabine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

Truvada® (Gilead) PoM

Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

Dose ADULT over 18 years, 1 tablet once daily

With efavirenz and emtricitabine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

Atripla® (Gilead) PoM

Tablets, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25

Dose HIV infection stabilised on antiretroviral therapy for more than 3 months, ADULT over 18 years, 1 tablet once daily

ZIDOVUDINE
(Azidothymidine, AZT)

Note The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug

Indications HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission (see notes above under Pregnancy and Breast-feeding)

Cautions see notes above; also haematological toxicity particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B_{12} deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; elderly; **interactions:** Appendix 1 (zidovudine)

Contra-indications abnormally low neutrophil counts or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, gynaecomastia, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa

Dose

- By mouth, ADULT and CHILD body-weight over 30 kg, 250–300 mg twice daily; CHILD body-weight 4–9 kg, 12 mg/kg twice daily; body-weight 9–30 kg, 9 mg/kg twice daily *or* body-weight 8–14 kg, 100 mg twice daily; body-weight 14–21 kg, 100 mg in the morning and 200 mg in the evening; body-weight 21–28 kg, 200 mg twice daily; body-weight 28–30 kg, 200–250 mg twice daily
- Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred)
- Patients temporarily unable to take zidovudine by mouth, by intravenous infusion over 1 hour, 1–2 mg/kg every 4 hours (approximating to 1.5–3 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; CHILD 3 months–12 years, 80–160 mg/m^2 every 6 hours (120 mg/m^2 every 6

hours approximates to 180 mg/m² every 6 hours by mouth)

Retrovir® (GSK) PoM

Capsules, zidovudine 100 mg (white/blue band), net price 100-cap pack = £110.98; 250 mg (blue/white/dark blue band), 40-cap pack = £110.98

Oral solution, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £22.20

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £11.14

With lamivudine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

Combivir® (GSK) PoM

Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £318.60

Dose ADULT and CHILD body-weight over 30 kg, 1 tablet twice daily; CHILD body-weight 14–21 kg, half a tablet twice daily; body-weight 21–30 kg, half a tablet in the morning and one tablet in the evening

Note Tablets may be crushed and mixed with semi-solid food or liquid just before administration

With abacavir and lamivudine

See under Abacavir

Protease inhibitors

Cautions Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 340). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding. Protease inhibitors should be used with caution in hepatic impairment (Appendix 2); the risk of hepatic side-effects is increased in patients with chronic hepatitis B or C. Atazanavir, darunavir, fosamprenavir, and tipranavir may be used at usual doses in patients with renal impairment, but other protease inhibitors should be used with caution in renal impairment (Appendix 3). Protease inhibitors should also be used with caution during pregnancy (Appendix 4).

Contra-indications Protease inhibitors should not be given to patients with acute porphyria (but see section 9.8.2) or to women who are breast-feeding (Appendix 5).

Side-effects Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.

ATAZANAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions:** Appendix 1 (atazanavir)

Contra-indications see notes above

Side-effects see notes above; also mouth ulcers, dry mouth, hypertension, syncope, chest pain, dyspnoea, peripheral neuropathy, abnormal dreams, amnesia, disorientation, depression, anxiety, weight changes, increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; *rarely* hepatosplenomegaly, oedema, palpitation, and abnormal gait; also reported, cholelithiasis, cholecystitis, and torsade de pointes

Dose

- With low-dose ritonavir and food, ADULT over 18 years, 300 mg once daily with ritonavir 100 mg once daily

Reyataz® (Bristol-Myers Squibb) PoM

Capsules, atazanavir (as sulphate) 150 mg (dark blue/light blue), net price 60-cap pack = £303.38; 200 mg (dark blue), 60-cap pack = £303.38; 300 mg (red/blue), 30-cap pack = £303.38. Label: 5, 21

DARUNAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also sulphonamide sensitivity; **interactions:** Appendix 1 (darunavir)

Contra-indications see notes above

Side-effects see notes above; also haematemesis, myocardial infarction, angina, QT interval prolongation, syncope, bradycardia, tachycardia, palpitation, hypertension, flushing, peripheral oedema, dyspnoea, cough, peripheral neuropathy, anxiety, confusion, memory impairment, depression, abnormal dreams, convulsions, increased appetite, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polyuria, nephrolithiasis, renal failure, arthralgia, visual disturbances, dry eyes, conjunctival hyperaemia, rhinorrheoa, throat irritation, dry mouth, stomatisis, nail discoloration, acne, seborrhoeic dermatitis, eczema, increased sweating, and alopecia

Dose

- With low-dose ritonavir, ADULT over 18 years previously treated with antiretroviral therapy, 600 mg twice daily
- With low-dose ritonavir, ADULT over 18 years not previously treated with antiretroviral therapy, 800 mg once daily

Missed dose If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

Prezista® (Janssen-Cilag) ▼ PoM

Tablets, f/c, darunavir (as ethanolate) 300 mg (orange), net price 120-tab pack = £446.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £446.70. Label: 21

FOSAMPRENAVIR

Note Fosamprenavir is a pro-drug of amprenavir

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; **interactions:** Appendix 1 (fosamprenavir)

Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines

Contra-indications see notes above

Side-effects see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

Dose

- With low-dose ritonavir, ADULT and CHILD over 6 years, body-weight over 39 kg, 700 mg twice daily; CHILD over 6 years, body-weight 25–39 kg, 18 mg/kg twice daily

  Note 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir

Telzir® (GSK) PoM

Tablets, f/c, pink, fosamprenavir (as calcium) 700 mg, net price 60-tab pack = £274.92

Oral suspension, fosamprenavir (as calcium) 50 mg/mL, net price 225-mL pack (grape-bubblegum-and peppermint-flavoured) (with 10-mL oral syringe) = £73.31. Counselling, administration

Counselling In adults, oral suspension should be taken on an empty stomach; in children under 18 years, oral suspension should be taken with food

INDINAVIR

Indications HIV infection in combination with nucleoside reverse transcriptase inhibitors

Cautions see notes above; also ensure adequate hydration (risk of nephrolithiasis especially in children); patients at risk of nephrolithiasis (monitor for nephrolithiasis); **interactions:** Appendix 1 (indinavir)

Contra-indications see notes above

Side-effects see notes above; also reported, dry mouth, hypoaesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia), nephrolithiasis (may require interruption or discontinuation; more frequent in children), dysuria, haematuria, crystalluria, proteinuria, pyuria (in children), pyelonephritis; haemolytic anaemia

Dose

- 800 mg every 8 hours; CHILD and ADOLESCENT 4–17 years, 500 mg/m^2 every 8 hours (max. 800 mg every 8 hours); CHILD under 4 years, safety and efficacy not established

Crixivan® (MSD) PoM

Capsules, indinavir (as sulphate), 200 mg, net price 360-cap pack = £226.28; 400 mg, 180-cap pack = £226.28. Label: 27, counselling, administration

Counselling Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food

Note Dispense in original container (contains desiccant)

LOPINAVIR WITH RITONAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (lopinavir, ritonavir)

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

Contra-indications see notes above

Side-effects see notes and Cautions above; also electrolyte disturbances in children; *less commonly* dysphagia, appetite changes, weight changes, cholecystitis, hypertension, myocardial infarction, palpitation, thrombophlebitis, vasculitis, chest pain, oedema, dyspnoea, cough, agitation, anxiety, amnesia, ataxia, hypertonia, confusion, depression, abnormal dreams, extrapyramidal effects, neuropathy, influenza-like syndrome, Cushing's syndrome, hypothyroidism, menorrhagia, amenorrhoea, sexual dysfunction, breast enlargement, dehydration, nephritis, hypercalciuria, lactic acidosis, arthralgia, hyperuricaemia, abnormal vision, otitis media, tinnitus, dry mouth, sialadenitis, mouth ulceration, periodontitis, acne, alopecia, dry skin, sweating, skin discoloration, nail disorders, *rarely* prolonged PR interval

Dose

- See preparations below

Kaletra® (Abbott) PoM

Tablets, pale yellow, f/c, lopinavir 100 mg, ritonavir 25 mg, net price 60-tab pack = £76.85. Label: 25

Dose CHILD over 2 years with body-weight under 40 kg and body surface area 0.5–0.9 m^2, 2 tablets twice daily; body surface area 0.9–1.4 m^2, 3 tablets twice daily

Tablets, yellow, f/c, lopinavir 200 mg, ritonavir 50 mg, net price 120-tab pack = £307.39. Label: 25

Dose ADULT and CHILD with body surface area greater than 1.4 m^2 or body-weight 40 kg and over, 2 tablets twice daily

Oral solution, lopinavir 400 mg, ritonavir 100 mg/5 mL, net price 5×60-mL packs = £307.39. Label: 21

Excipients include propylene glycol 153 mg/mL (see Excipients, p. 2), alcohol 42%

Dose 5 mL twice daily with food; CHILD 2–12 years 2.9 mL/m^2 twice daily with food, max. 5 mL twice daily

NELFINAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; **interactions:** Appendix 1 (nelfinavir)

Contra-indications see notes above

Side-effects see notes above; also reported, fever

Dose

- 1.25 g twice daily *or* 750 mg 3 times daily; CHILD 3–13 years, initially 50–55 mg/kg twice daily (max. 1.25 g twice daily) *or* 25–30 mg/kg 3 times daily (max. 750 mg 3 times daily)

Viracept® (Roche) PoM

Tablets, blue, f/c, nelfinavir (as mesilate) 250 mg, net price 300-tab pack = £262.51. Label: 21

RITONAVIR

Indications HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

Cautions see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (ritonavir)

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

Contra-indications see notes above

Side-effects see notes and Cautions above; also diarrhoea (may impair absorption—close monitoring required), vasodilatation, cough, throat irritation, anxiety, perioral and peripheral paraesthesia, hyperaesthesia, fever, decreased blood thyroxine concentration, electrolyte disturbances, raised uric acid, dry mouth, mouth ulcers, and sweating; *less commonly* increased prothrombin time and dehydration; syncope, postural hypotension, seizures, menorrhagia, and renal failure also reported

Dose

- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; CHILD over 2 years initially 250 mg/m^2 every 12 hours, increased by 50 mg/m^2 at intervals of 2–3 days to 350 mg/m^2 every 12 hours (max. 600 mg every 12 hours)
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily

Norvir® (Abbott) PoM

Capsules, ritonavir 100 mg, net price 84-cap pack = £94.35. Label 21

Excipients include alcohol 12%

Oral solution, sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

Counselling Oral solution contains 43% alcohol; bitter taste can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

With lopinavir

See under Lopinavir with ritonavir

SAQUINAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); **interactions:** Appendix 1 (saquinavir)

Contra-indications see notes above

Side-effects see notes above; also dyspnoea, increased appetite, peripheral neuropathy, convulsions, changes in libido, renal impairment, dry mouth, and alopecia

Dose

- With low-dose ritonavir, ADULT and ADOLESCENT over 16 years, 1 g every 12 hours

Invirase® (Roche) PoM

Capsules, brown/green, saquinavir (as mesilate) 200 mg, net price 270-cap pack = £230.70. Label: 21

Tablets, orange, f/c, saquinavir (as mesilate) 500 mg, net price 120-tab pack = £256.33. Label: 21

TIPRANAVIR

Indications HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

Cautions see notes above; also patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (tipranavir)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported; monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature)

Contra-indications see notes above

Side-effects see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivity; *rarely* dehydration

Dose

- With low-dose ritonavir, ADULT over 18 years, 500 mg twice daily

Aptivus® (Boehringer Ingelheim) ▼ PoM

Capsules, pink, tipranavir 250 mg, net price 120–cap pack = £441.00. Label: 5, 21

Excipients include ethanol 100 mg per capsule

Non-nucleoside reverse transcriptase inhibitors

EFAVIRENZ

Indications HIV infection in combination with other antiretroviral drugs

Cautions chronic hepatitis B or C (greater risk of hepatic side-effects), hepatic impairment (avoid if severe; Appendix 2); severe renal impairment (Appendix 3); pregnancy (Appendix 4); elderly; history of mental illness or seizures; **interactions:** Appendix 1 (efavirenz)

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month

Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur

Contra-indications acute porphyria (but see section 9.8.2); breast-feeding (Appendix 5)

Side-effects rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; *less commonly* pancreatitis, hepatitis, psychosis, mania, suicidal ideation, amnesia, ataxia, convulsions, and blurred vision; also reported hepatic failure, raised serum cholesterol (see Lipodystrophy Syndrome, p. 340), gynaecomastia, photosensitivity; see also Osteonecrosis, p. 341

Dose

- See preparations below

Sustiva® (Bristol-Myers Squibb) PoM

Capsules, efavirenz 50 mg (yellow/white), net price 30-cap pack = £16.73; 200 mg (yellow), 90-cap pack = £200.27. Label: 23

Dose ADULT and CHILD over 3 years, body-weight 13–15 kg, 200 mg once daily; body-weight 15–20 kg, 250 mg once daily; body-weight 20–25 kg, 300 mg once daily; body-weight 25–32.5 kg, 350 mg once daily; body-weight 32.5–40 kg, 400 mg once daily; body-weight 40 kg and over, 600 mg once daily

Tablets, f/c, yellow, efavirenz 600 mg, net price 30-tab pack = £200.27. Label: 23

Dose ADULT and CHILD, body-weight over 40 kg, 600 mg once daily

Oral solution, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180-mL pack = £53.84

Dose ADULT and CHILD over 5 years, body-weight 13–15 kg, 270 mg once daily; body-weight 15–20 kg, 300 mg once daily; body-weight 20–25 kg, 360 mg once daily; body-weight 25–32.5 kg, 450 mg once daily; body-weight 32.5–40 kg, 510 mg once daily; body-weight 40 kg and over, 720 mg once daily; CHILD 3–5 years, body-weight 13–15 kg, 360 mg once daily; body-weight 15–20 kg, 390 mg once daily; body-weight 20–25 kg, 450 mg once daily; body-weight 25–32.5 kg, 510 mg once daily

Note The bioavailability of *Sustiva®* oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis

With emtricitabine and tenofovir

See under Tenofovir

ETRAVIRINE

Indications in combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors

Cautions chronic hepatitis B or C (greater risk of hepatic side-effects); hepatic impairment (avoid if severe; Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (etravirine)

Rash Rash, usually in the second week, is the most common side-effect and appears more frequently in women; discontinue if severe rash; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks

Contra-indications acute porphyria (but seesection 9.8.2); breast-feeding (Appendix 5)

Side-effects rash (rarely including Stevens-Johnson syndrome; see also Rash above); gastro-oesophageal reflux, nausea, abdominal pain, flatulence, gastritis; myocardial infarction, hypertension; peripheral neuropathy; diabetes, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 340); renal failure; anaemia; *less commonly* pancreatitis, haematemesis, hepatitis, angina, bronchospasm, drowsiness, malaise, gynaecomastia, blurred vision, dry mouth, and sweating; also reported, haemorrhagic stroke; see also Osteonecrosis, p. 341

Dose

- ADULT over 18 years, 200 mg twice daily after food

Missed dose If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

Intelence® (Janssen-Cilag) ▼ PoM

Tablets, etravirine 100 mg, net price 120-tab pack = £307.35. Label: 21

Note Dispense in original container (contains desiccant). Patients with swallowing difficulties may disperse tablets in a glass of water just before administration

NEVIRAPINE

Indications HIV infection in combination with other antiretroviral drugs

Cautions hepatic impairment (see below and Appendix 2); chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm^3 or in men with CD4 cell count greater than 400 cells/mm^3 unless potential benefit outweighs risk); pregnancy (Appendix 4); **interactions:** Appendix 1 (nevirapine)

Hepatic disease Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves

Counselling Patients should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop

Contra-indications acute porphyria (but see section 9.8.2); breast-feeding (Appendix 5); severe hepatic impairment; post-exposure prophylaxis

Side-effects rash including Stevens-Johnson syndrome and rarely, toxic epidermal necrolysis (see also Cautions above); nausea, hepatitis (see also Hepatic Disease above), headache; *less commonly* vomiting, abdominal pain, fatigue, fever, and myalgia; *rarely* diarrhoea, angioedema, anaphylaxis, hypersensitivity reactions (may involve hepatic reactions and rash, see Hepatic Disease above), arthralgia, anaemia, and granulocytopenia (more frequent in children); *very rarely* neuropsychiatric reactions; see also Osteonecrosis, p. 341

Dose

- ADULT and CHILD over 16 years, 200 mg once daily for first 14 days then (if no rash present) 200 mg twice daily; NEONATE and CHILD under 8 years, 150 mg/m^2 (max. 200 mg) once daily for first 14 days, then (if no rash present) 150 mg/m^2 (max. 200 mg) twice daily *or* 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 7 mg/kg (max. 200 mg) twice daily; CHILD 8–16 years, 150 mg/m^2 (max. 200 mg) once daily for first 14 days then (if no rash present) 150 mg/m^2 (max. 200 mg) twice daily *or* 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 4 mg/kg (max. 200 mg) twice daily

Note Dose titration should be repeated if treatment interrupted for more than 7 days

Viramune® (Boehringer Ingelheim) PoM

Tablets, nevirapine 200 mg, net price 60-tab pack = £170.00. Counselling, hypersensitivity reactions

Suspension, nevirapine 50 mg/5 mL, net price 240-mL pack = £50.40. Counselling, hypersensitivity reactions

Other antiretrovirals

ENFUVIRTIDE

Indications HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

Cautions chronic hepatitis B or C (possibly greater risk of hepatic side-effects); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

Contra-indications breast-feeding (Appendix 5)

Side-effects injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acne, erythema, skin papilloma; *less commonly* hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 341

Dose

- By subcutaneous injection, ADULT and ADOLESCENT over 16 years, 90 mg twice daily; CHILD 6–15 years, 2 mg/kg twice daily (max. 90 mg twice daily)

Fuzeon® (Roche) PoM

Injection, powder for reconstitution, enfuvirtide 108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1.1 mL Water for Injections), net price 108-mg vial = £18.39 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

MARAVIROC

Indications CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

Cautions cardiovascular disease; chronic hepatitis B or C; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (maraviroc)

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, abdominal pain, dyspepsia, constipation, diarrhoea; cough; dizziness, paraesthesia, asthenia, sleep disturbances, headache, weight loss; muscle spasms, back pain; taste disturbances; rash, pruritus; *less commonly* pancreatitis, hepatic cirrhosis, rectal bleeding, myocardial infarction, myocardial ischaemia, bronchospasm, seizures, hallucinations, loss of consciousness, polyneuropathy, pancytopenia, neutropenia, lymphadenopathy, renal failure, polyuria, and myositis; see also Osteonecrosis, p. 341

Dose

- ADULT over 18 years, 300 mg twice daily

Celsentri® (Pfizer) ▼ PoM

Tablets, blue, f/c, maraviroc, 150 mg, net-price 60-tab pack = £551.10; 300 mg, 60-tab pack = £551.10

RALTEGRAVIR

Indications in combination with other antiretroviral drugs for HIV infection resistant to multiple antiretrovirals

Cautions risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions**: Appendix 1 (raltegravir)

Contra-indications breast-feeding (Appendix 5)

Side-effects diarrhoea, nausea, vomiting, abdominal pain, flatulence, constipation; hypertriglyceridaemia; dizziness, headache, insomnia, asthenia; arthralgia; pruritus, hyperhidrosis, rash (Stevens-Johnson syndrome reported); *less commonly* gastritis, hepatitis, pancreatitis, dry mouth, gastro-oesophageal reflux, glossitis, taste disturbances, pain on swallowing, peptic ulcer, rectal bleeding, lipodystrophy (see Lipodystrophy Syndrome, p. 340), palpitation, ventricular extrasystoles, chest pain, facial oedema, dysphonia, epistaxis, nasal congestion, pharyngeal erythema, drowsiness, abnormal dreams, anxiety, appetite changes, depression, pyrexia, chills, carpal tunnel syndrome, tremor, peripheral neuropathy, erectile dysfunction, gynaecomastia, menopausal symptoms, renal failure, polyuria, anaemia, neutropenia, musculoskeletal pain, visual disturbances, acne, and dry skin; *also reported* suicidal ideation; see also Osteonecrosis, p. 341

Dose

- ADULT and CHILD over 16 years, 400 mg twice daily

Isentress® (MSD) ▼ PoM

Tablets, pink, f/c, raltegravir (as potassium salt) 400 mg, net price 60-tab pack = £647.29. Label: 25

5.3.2 Herpesvirus infections

5.3.2.1 Herpes simplex and varicella–zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

Herpes simplex infections Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins, section 14.5.2).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management (section 4.7.3).

Choice **Aciclovir** is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (section 7.2.2). It is used by mouth for severe herpetic stomatitis (see also p. 620). Aciclovir eye ointment (section 11.3.3) is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes. Penciclovir itself is used as a cream for herpes simplex labialis (section 13.10.3).

Valaciclovir is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following renal transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Idoxuridine (section 13.10.3) has been used topically for treating herpes simplex infections of the skin and external genitalia with variable results. Its value in the treatment of shingles is unclear.

Inosine pranobex has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

ACICLOVIR
(Acyclovir)

Indications herpes simplex and varicella–zoster (see also under Dose)

Cautions maintain adequate hydration (especially with infusion or high doses, or during renal impairment (Appendix 3)); elderly (risk of neurological reactions); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (aciclovir)

Side-effects nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; *very rarely* hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness), acute renal failure, anaemia, thrombocytopenia and leucopenia; on *intravenous infusion*, severe local inflammation (sometimes leading to ulceration), and *very rarely* agitation, tremors, psychosis and fever

Dose

- By mouth, non-genital herpes simplex, treatment, 200 mg (400 mg in the immunocompromised or if absorption impaired) 5 times daily, usually for 5 days (longer if new lesions appear during treatment or if healing incomplete); CHILD 1 month–2 years, half adult dose, over 2 years, adult dose

  Genital herpes simplex, treatment, 200 mg 5 times daily *or* 400 mg 3 times daily usually for 5 days (longer if new lesions appear during treatment or if healing is incomplete); increased in immunocompromised or HIV-positive patients to 400 mg 5 times daily for 7–10 days during *first episode or* 400 mg 3 times daily for 5–10 days during *recurrent infection*

  Herpes simplex, prevention of recurrence, 200 mg 4 times daily *or* 400 mg twice daily, possibly reduced to 200 mg 2 or 3 times daily; increased to 400 mg 3 times daily if recurrences occur on standard suppressive therapy; therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

  Herpes simplex, prophylaxis in the immunocompromised, 200–400 mg 4 times daily; CHILD 1 month–2 years, half adult dose, over 2 years, adult dose

  Varicella and herpes zoster, treatment, 800 mg 5 times daily for 7 days; CHILD, varicella, 1 month–2 years 200 mg 4 times daily for 5 days; 2–6 years 400 mg 4 times daily for 5 days; 6–12 years 800 mg 4 times daily for 5 days

  Attenuation of chickenpox (if varicella–zoster immunoglobulin not indicated) [unlicensed use], ADULT and CHILD 40 mg/kg daily in 4 divided doses for 7 days starting 1 week after exposure
- By intravenous infusion, treatment of herpes simplex in the immunocompromised, severe initial genital herpes, and varicella–zoster, 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours in varicella–zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for

14–21 days); prophylaxis of herpes simplex in the immunocompromised, 5 mg/kg every 8 hours

Note To avoid excessive dosage in obese patients, parenteral dose should be calculated on the basis of ideal weight for height

NEONATE and INFANT up to 3 months, herpes simplex, 20 mg/kg every 8 hours for 14 days (21 days if CNS involvement); varicella–zoster [unlicensed use] 10–20 mg/kg every 8 hours for at least 7 days; CHILD 3 months–12 years, herpes simplex or varicella–zoster, 250 mg/m^2 every 8 hours usually for 5 days, doubled to 500 mg/m^2 every 8 hours for varicella–zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for 14–21 days)

- By topical application, see section 13.10.3 (skin) and section 11.3.3 (eye)

Note Aciclovir doses in BNF may differ from those in product literature

Aciclovir (Non-proprietary) PoM

Tablets, aciclovir 200 mg, net price 25-tab pack = £4.01; 400 mg, 56-tab pack = £9.28; 800 mg, 35-tab pack = £11.42. Label: 9

Brands include *Virovir®*

Dental prescribing on NHS Aciclovir Tablets 200 mg or 800 mg may be prescribed

Dispersible tablets, aciclovir 200 mg, net price 25-tab pack = £2.20; 400 mg, 56-tab pack = £6.80; 800 mg, 35-tab pack = £6.70. Label: 9

Suspension, aciclovir 200 mg/5 mL, net price 125 mL = £31.33; 400 mg/5 mL, 100 mL = £35.25. Label: 9

Dental prescribing on NHS Aciclovir Oral Suspension 200 mg/5 mL may be prescribed

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.13; 500-mg vial = £20.22

Electrolytes Na^+ 1.1 mmol/250-mg vial

Intravenous infusion, aciclovir (as sodium salt), 25 mg/mL, net price 10-mL (250-mg) vial = £10.37; 20-mL (500-mg) vial = £19.21; 40-mL (1-g) vial = £40.44

Electrolytes Na^+ 1.16 mmol/250-mg vial

Zovirax® (GSK) PoM

Tablets, all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £18.07; 800 mg (scored, *Shingles Treatment Pack*), 35-tab pack = £67.13. Label: 9

Suspension, both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.53; 400 mg/5 mL (*Double Strength Suspension*, orange-flavoured) 100 mL = £33.01. Label: 9

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.75; 500-mg vial = £18.07

Electrolytes Na^+ 1.1 mmol/250-mg vial

FAMCICLOVIR

Note Famciclovir is a pro-drug of penciclovir

Indications treatment of herpes zoster, acute genital herpes simplex and suppression of recurrent genital herpes

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5); **interactions**: Appendix 1 (famciclovir)

Side-effects *rarely* nausea, headache, confusion; *very rarely* vomiting, jaundice, dizziness, drowsiness, hallucinations, rash (including Stevens-Johnson syndrome), and pruritus; abdominal pain and fever have been reported in immunocompromised patients

Dose

- Herpes zoster, 250 mg 3 times daily for 7 days *or* 750 mg once daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days)
- Genital herpes, *first episode*, 250 mg 3 times daily for 5 days (longer if new lesions appear during treatment or if healing incomplete); *recurrent infection*, 125 mg twice daily for 5 days (in immunocompromised or HIV-positive patients, all episodes, 500 mg twice daily for 5–10 days)
- Genital herpes, suppression, 250 mg twice daily (in HIV patients, 500 mg twice daily); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
- CHILD not recommended

Famvir® (Novartis) PoM

Tablets, all f/c, famciclovir 125 mg, net price 10-tab pack = £37.12; 250 mg, 15-tab pack = £111.35, 21-tab pack = £155.87; 56-tab pack = £415.67; 500 mg, 14-tab pack = £207.86, 30-tab pack = £445.28, 56-tab pack = £831.46; 750 mg, 7-tab pack = £148.79. Label: 9

INOSINE PRANOBEX

(Inosine acedoben dimepranol)

Indications see under Dose

Cautions renal impairment (Appendix 3); history of gout or hyperuricaemia

Contra-indications pregnancy

Side-effects reversible increase in serum and urinary uric acid; *less commonly* nausea, vomiting, epigastric discomfort, headache, vertigo, fatigue, arthralgia, rashes and itching; *rarely* diarrhoea, constipation, anxiety, sleep disturbances, and polyuria

Dose

- Mucocutaneous herpes simplex, 1 g 4 times daily for 7–14 days
- Adjunctive treatment of genital warts, 1 g 3 times daily for 14–28 days
- Subacute sclerosing panencephalitis, 50–100 mg/kg daily in 6 divided doses

Imunovir® (Ardern) PoM

Tablets, scored, inosine pranobex 500 mg, net price 100-tab pack = £39.50. Label: 9

VALACICLOVIR

Note Valaciclovir is a pro-drug of aciclovir

Indications treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following renal transplantation

Cautions see under Aciclovir; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Side-effects see under Aciclovir but neurological reactions more frequent with high doses

Dose

- Herpes zoster, 1 g 3 times daily for 7 days; CHILD 12–18 years, see *BNF for Children*

- Herpes simplex, *first episode*, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days for genital herpes in immunocompromised or HIV-positive patients); *recurrent infection*, 500 mg twice daily for 5 days (1 g twice daily for 5–10 days for genital herpes in immunocompromised or HIV-positive patients); CHILD 12–18 years, see *BNF for Children*
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences; CHILD 12–18 years, see *BNF for Children*
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following renal transplantation (preferably starting within 72 hours of transplantation), ADULT and CHILD over 12 years, 2 g 4 times daily usually for 90 days

Valtrex® (GSK) PoM

Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £130.87; 500 mg, 10-tab pack = £21.86, 42-tab pack = £91.61. Label: 9

5.3.2.2 Cytomegalovirus infection

Recommendations for the optimum maintenance therapy of cytomegalovirus (CMV) infections and the duration of treatment are subject to rapid change.

Ganciclovir is related to aciclovir but it is more active against cytomegalovirus; it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (see p. 350) is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the *initial treatment* and *maintenance treatment* of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet is also active against cytomegalovirus; it is toxic and can cause renal impairment.

Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

CIDOFOVIR

Indications cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

Cautions monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of ocular hypotony); **interactions:** Appendix 1 (cidofovir)

Nephrotoxicity Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

Ocular disorders Regular ophthalmological examinations recommended; iritis and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recurs after successful treatment

Contra-indications renal impairment (creatinine clearance 55 mL/minute or less); concomitant administration of potentially nephrotoxic drugs (discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir); pregnancy (avoid pregnancy during and for 1 month after treatment, men should not father a child during or within 3 months of treatment; Appendix 4), breast-feeding (Appendix 5)

Side-effects nephrotoxicity (see Cautions above); nausea, vomiting; dyspnoea; headache, fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash; *less commonly* Fanconi syndrome; also reported, hearing impairment and pancreatitis

Dose

- Initial (induction) treatment, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)
- Maintenance treatment, beginning 2 weeks after completion of induction, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

Probenecid co-treatment By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

Prior hydration Sodium chloride 0.9%, by intravenous infusion, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

Vistide® (Gilead) PoM

Intravenous infusion, cidofovir 75 mg/mL, net price 5-mL vial = £653.22

Caution in handling Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water

GANCICLOVIR

Indications life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

Cautions close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopenia; low platelet count; potential carcinogen and teratogen; renal impairment (Appendix 3); radiotherapy; ensure

adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity—not for neonatal or congenital cytomegalovirus disease); **interactions:** Appendix 1 (ganciclovir)

Contra-indications pregnancy (ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment; Appendix 4); breast-feeding; hypersensitivity to ganciclovir or aciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

Side-effects diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, hepatic dysfunction; dyspnoea, chest pain, cough; headache, insomnia, convulsions, dizziness, neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, fever, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain, taste disturbance; dermatitis, pruritus; injection-site reactions; *less commonly* mouth ulcers, pancreatitis, arrhythmias, hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

Dose

- By intravenous infusion, initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on 5 days per week *or* 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated; CHILD under 18 years, see *BNF for Children*

Cymevene® (Roche) PoM

Intravenous infusion, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £30.37

Electrolytes Na^+ 2 mmol/500-mg vial

Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

FOSCARNET SODIUM

Indications cytomegalovirus retinitis in AIDS patients; mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

Cautions renal impairment (reduce dose; consult product literature); monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; **interactions:** Appendix 1 (foscarnet)

Contra-indications pregnancy; breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea (occasionally constipation and dyspepsia), abdominal pain, anorexia; changes in blood pressure and ECG; headache, fatigue, mood disturbances (including psychosis), asthenia, paraesthesia, convulsions, tremor, dizziness, and other neurological disorders; rash; impairment of renal function including acute renal failure; hypocalcaemia (sometimes symptomatic) and other electrolyte disturbances; abnormal liver function tests; decreased haemoglobin concentration, leucopenia, granulocytopenia, thrombocytopenia; thrombophlebitis if given undiluted by peripheral vein; genital irritation and ulceration (due to high concentrations excreted in urine); isolated reports of pancreatitis

Dose

- CMV retinitis, by intravenous infusion, induction 60 mg/kg every 8 hours for 2–3 weeks then maintenance, 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if retinitis progresses on maintenance dose, repeat induction regimen
- Mucocutaneous herpes simplex infection, by intravenous infusion, 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

Foscavir® (AstraZeneca) PoM
