Notes: 1. Epoxy-coated bars of the same size and number may be used except where an "*" is printed. In which case, use: smaller bars (with increased number of bars); hooked or headed bars; increased f'_c, or larger footing.
2. Reinforcing steel quantities do not include footing dowels.

PILE CAPS FOR INDIVIDUAL COLUMNS

General

In this Chapter, a pile cap is considered to be a reinforced concrete structural slab which distributes a column load to a group of individual piles. The tabulated designs are based upon use of a square reinforced concrete column of at least the minimum size indicated or a structural steel column on a square steel base plate such that the section half-way between the column face and the edge of the base plate is equivalent to the size of the column. The tabulated designs are adequate (and conservative) for rectangular columns or steel base plates if the short side or section is equal to the minimum tabulated column size. Columns are located at the centroid of the pile groups.

Pile caps are an important structure, however, somewhat neglected in handbooks on structural steel because they are reinforced concrete or in handbooks on reinforced concrete in the range where steel piles are used. Since pile caps are basic to safety of the structure and usually not open to visual inspection under service, a conservative design is justified. Complete analyses are complex, usually involving strut and tie design models and allowable values for use in design are not available for certain modes of failure. As a result, most pile caps are designed in practice by various short-cut rule-of-thumb procedures using what are hoped to be conservative allowable stresses. Since practical limits on pile capacity and pile spacing exist, a set of tabulated designs can be offered for the usual range of column loads in which the complex analyses are performed by computer.

Basis of Tabulated Designs

(See also Figs. 13-2 and 13-3)

a. *ACI 318 Building Code*. The tabulated designs for pile caps in this Chapter are based on the ACI 318-99 Code. However, headed bars, which first appeared in the ACI 318-08 Code, are recognized as a viable alternative to hooked bars and are referenced in the tabulated designs.

b. *Concrete strengths.* Due to space limitations, tabulated designs are shown for only the two most commonly used concrete compressive strengths, f'_c = 3,000 psi and f'_c = 4,000 psi. Since shear strength controls depth, and $v_c = k\sqrt{f'_c}$, the saving in concrete and formwork for higher values of f'_c would not ordinarily offset the higher concrete cost and added reinforcing steel required for lesser depth. If minimum depth is itself an important cost consideration, then higher strength concrete, or specifying f'_c at periods later than 28 days, or both may be desirable. Such designs could not be adapted from tabulated design. (See "Manual Example.")

c. *Pile embedment*. A minimum embedment of 6 inches has been established as good practice with structural steel shapes to avoid use of cover plates for bearing.

If precast concrete piles are to be used in the tabulated designs, a minimum embedment of 4 inches is usually sufficient. Design depth is unaffected so only 4 inches of embedment needs to be shown, deduct 2 inches from tabulated thickness, and reduce tabulated concrete volume appropriately.

d. *Concrete cover.* The tabulated designs are based on a concrete cover (between the top of a steel pile and the reinforcing bars) of 3 inches.

e. *Pile spacing.* A minimum pile spacing of 3′-0″ c.-c. and a minimum clear distance of 2′-0″ between piles were established as generally conservative for piles up to 12 inches in diameter. For larger piles, the minimum clear distance controls, and larger spacings are required, as shown in the tabulated designs. See Fig. 13-3. If a closer spacing is used, the tabulated designs for thickness and reinforcing bars are generally conservative. The condition of overlapping critical shear sections for a pair of piles should be investigated, but should not be critical as the allowable v_c will increase if the angle of the potential crack to the vertical, $a < 45°$ . . . (ACI Commentary R11.8.7).

f. *Patterns.* Patterns for 2-pile to 30-pile pile cap layouts are included. To prevent vertical edge splitting, the minimum edge distance, E, to the center of piles is 15 inches for pile capacity $P \leq 60$ tons, 21 inches for $60 < P \leq 120$, 27 inches for $120 < P \leq 200$, and 30 inches for $P > 200$ tons. A minimum clear edge distance, $E' = E - 3$ inches ≥ 9 inches, is required for (hooked or headed) end anchorage. Where the pile diameter, d_p, exceeds 12 inches, the edge distance, E, should be increased to maintain the minimum clear edge distance. See Fig. 13-3.

Note that some tabulated designs show dimensions on the line below. These dimensions are for use with "clipped corners" to save concrete as an option. For example, the 3-pile cap shown in Fig. 13-2 would be dimensioned in the tabulated designs as:

Long A	*Short B*	
5'-6"	5'-2"	(first line)
1'-6"	1'-7"	(second line)

In other words, the "clipped corner" dimensions are the truncated dimensions of the pile cap with the corners removed.

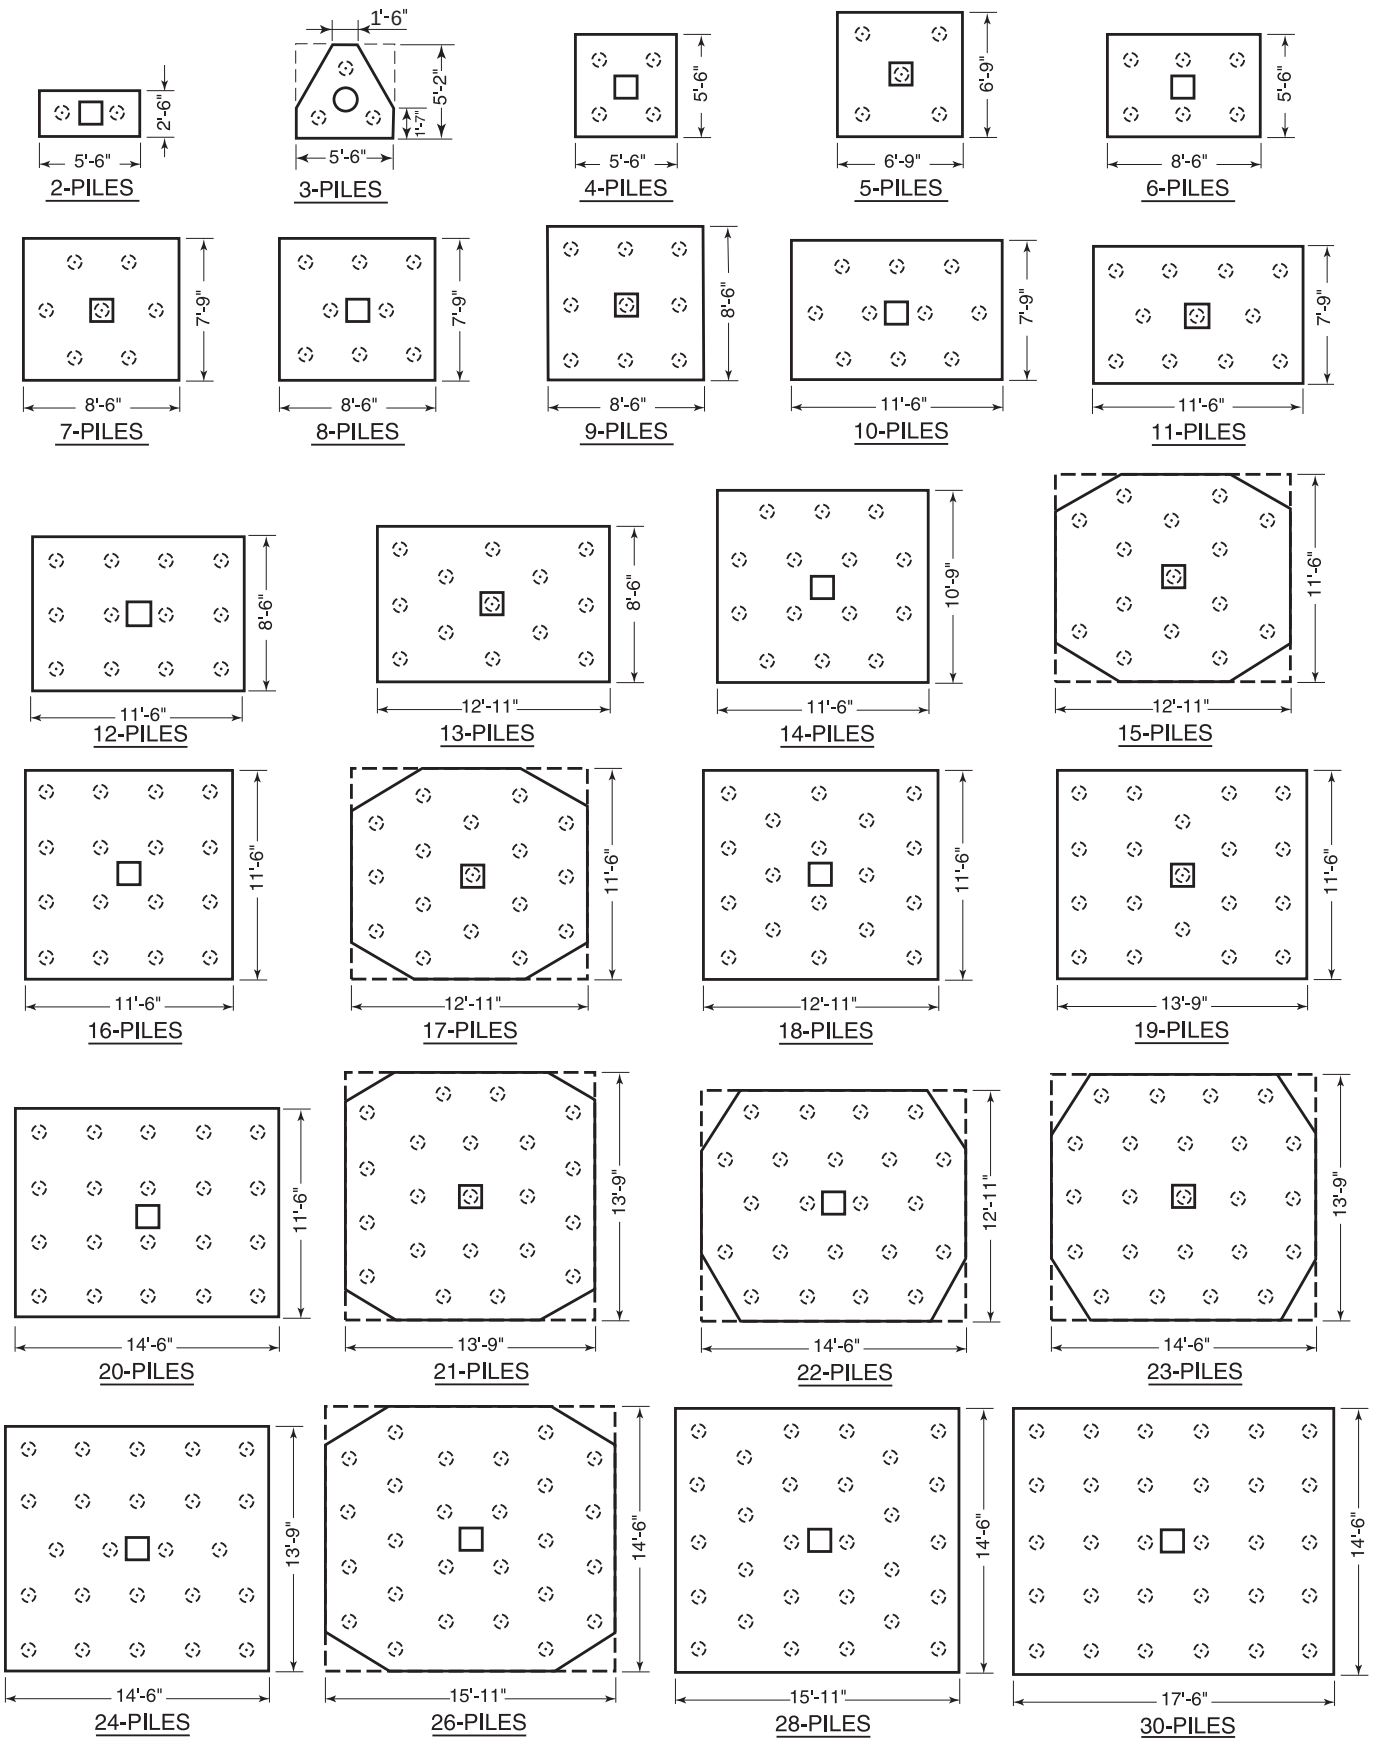

Figure 13-2 Arrangements of Piles and Plan Dimensions* of Pile Caps

*Minimum dimensions shown. See tabulated designs for dimensions used.

g. *Pile capacity.* Pile capacity is tabulated in tons, ($D + L$), as is usually done in accepted practice. The range shown, 40 tons to 200 tons, covers the usual range for precast concrete or structural steel piles. *Net* column loads, P_u, are shown (weight of pile cap has been deducted). Column load is shown in kips for strength design as $P_u = 1.6(D + L)$ where the average load factor is assumed to be 1.6.

h. *Flexural reinforcement*. All tabulated designs are based on the use of Grade 60 (f_y = 60,000 psi) reinforcing bars. Areas of required flexural reinforcement are conservatively based on an average effective depth, $d = D - d_c$, where D = total depth, and d_c = 10 inches for structural steel piles, or d_c = 8 inches for concrete piles. The requirements for minimum areas of flexural reinforcement (ACI 10.5 and 7.12) are satisfied by the following conservative interpretation, where A_s is the calculated area of reinforcement required for flexure (ACI 7.12 and 10.5):

(1) if $A_s > 0.0033bd$, use A_s (where $200/f_y = 0.0033$)
(2) if $A_s < 0.0033bd < 4/3A_s$, use $0.0033bd$
(3) if $0.0018bD < 4/3A_s < 0.0033bd$, use $4/3A_s$
(4) if $4/3A_s < 0.0018bD < 0.0033bd$, use $0.0018bD$

For 2-pile pile caps only, use (1), (2), or (3) for the required flexural (long) bars. Flexural reinforcement areas in the short direction for rectangular pile caps have been increased to permit use of uniform bar spacings to avoid errors in field placing and still conform to ACI 15.4.4.2.

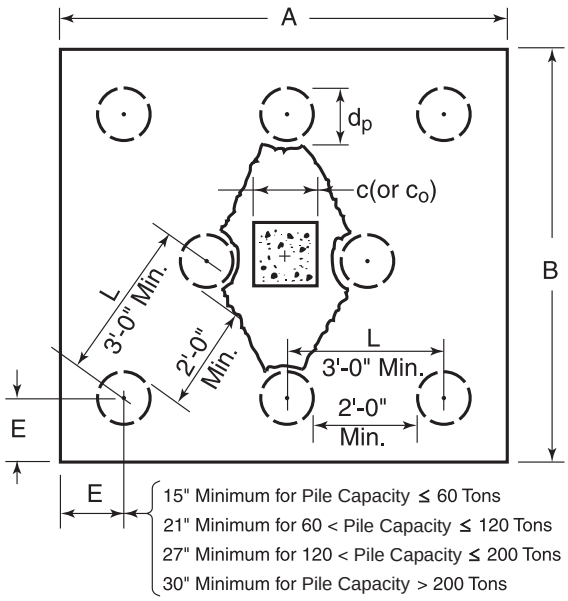
i. *Anchorage.* For pile caps with 2, 3, 4, 5, 6, 7, or 9 piles, all reinforcing bars must be provided with standard end hooks. For pile caps with 8, 10, 11, or 12 piles, only the short reinforcing bars must be provided with end hooks, and should be placed as the lower layer. As an alternative to hooked bars, the bar ends can instead be headed. See Figs. 13-12 and 13-13.

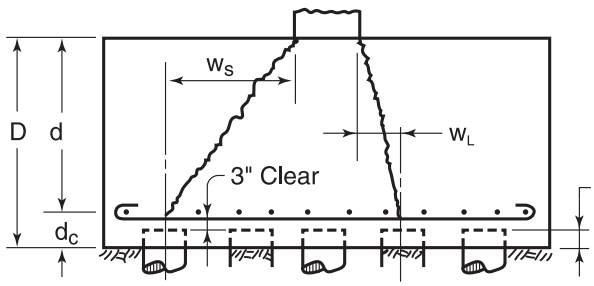
j. *Column size.* The column sizes shown are derived from square column sizes for a bearing stress of 4,000 psi on the gross column area. Tabulated designs are conservative if the column is larger than the minimum column size tabulated.

Design Procedure

a. Flexure. The design strength of the critical section for flexure and the required area of flexural reinforcement at f_y = 60,000 psi is determined by the ACI strength design method for factored pile loads equal to $1.6(D + L)$. Since the depth of the pile cap required is usually established by shear, the flexural reinforcement ratio is usually near or controlled by the minimum ratios required by ACI 10.5 and ACI 7.12.

b. Shear. Due to the variety of conditions resulting from the 26 pile cap patterns, a variable number of critical sections for shear must be investigated. See Fig. 13-4. The possibilities of shear failures at $d/2$ about a single pile or at an "overlapping" section $d/2$ about a pair of piles are most conveniently related to the footing depth using f'_c = 3,000 psi with solutions for the full range of pile loads (12-inch pile diameter and 36-inch pile spacing). See Fig. 13-5. Fig. 13-5 also includes solutions for a "corner" failure at 45° as a beam, in one-way shear with $v_c = 2\sqrt{f'_c}$. This latter condition with one (or three) pile loads on the critical section is generally precluded by the dimensions of pile diameter, pile spacing, and pile cap depths.





NOTATION

D = total depth = d + d_c
d = effective depth
d_c = average to ctr. of bars
c (or c_o) = col. side (dia.)
d_p = diameter of pile
E = edge to ℄ piles
L = spacing, c-c. piles
A = long side
B = short side
P = pile capacity (D + L) in tons
w = horizontal component col. face-to-bot. crack (sub "S" short side "L" long side)

Figure 13-3 Pile Cap Nomenclature, Dimensions, and Plan and Section Details

In addition to these possible critical sections, shear is investigated as prescribed in the Code for a "punching" failure about the column at a section located at a distance $d/2$ from the column face ($v_c = 4\sqrt{f'_c}$), and for a "beam" failure straight across the width of the pile cap in either direction at a section located at a distance d from the column face ($v_c = 2\sqrt{f'_c}$) . . . (ACI 11.12). See Fig. 13-4. Both of these Code-required investigations become inappropriate as the depth of the footing increases so that the sections at distance d (or $d/2$) exclude all or part of the pile loads causing shear or even fall outside the footing.

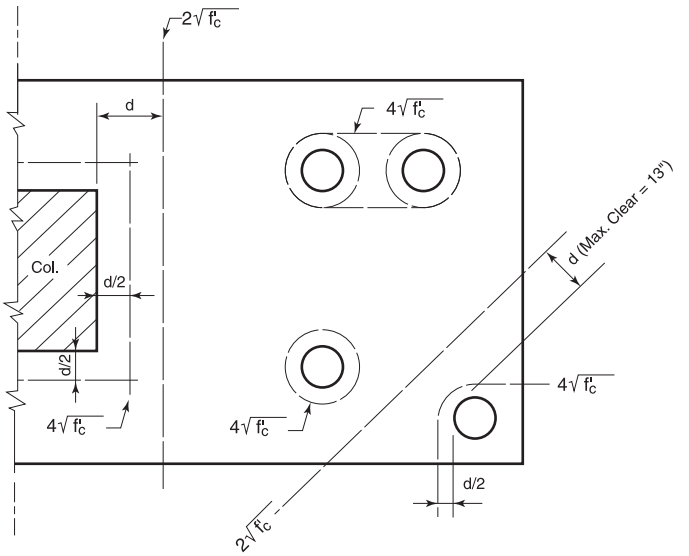


Figure 13-4 Plan of Critical Shear Sections for Code-Prescribed Allowable Shear on Concrete (One-Way, $v_c = 2\sqrt{f'_c}$; Two-Way, $v_c = 4\sqrt{f'_c}$)

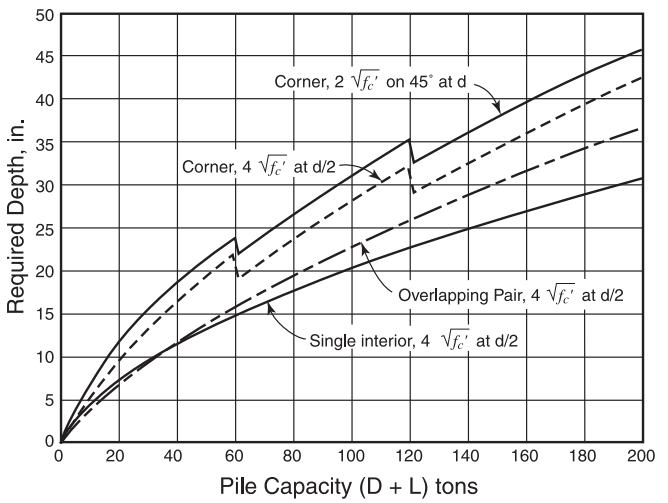

Figure 13-5 Solutions for Design Depth Required at Code-Prescribed Allowable Shear on Concrete at Critical Sections Around Piles versus Pile Capacity, Tons ($D + L$)

SPECIAL INVESTIGATIONS

As the previous Code-prescribed assumptions are not satisfied, two special investigations for possible shear failure are necessary. The investigation of a beam shear failure, cracking across the width of a footing, when footing depth creates "deep beam" shear, and a column punching failure when the nearest piles cause such failure to occur in a manner approaching "pure shear" will establish two additional rational basis for selecting the depth when "normal" shear investigations do not apply. See Figs. 13-6 and 13-7. Limiting values for v_c under these special conditions, based on research, become very high.*

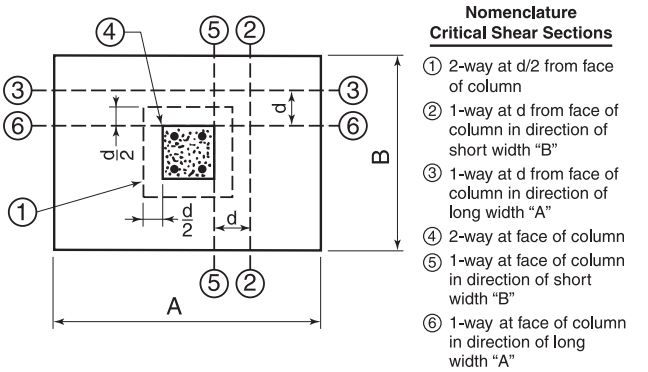

Figure 13-6 Critical Sections and Notation for Special Investigations of Deep Beam (One-Way) Shear

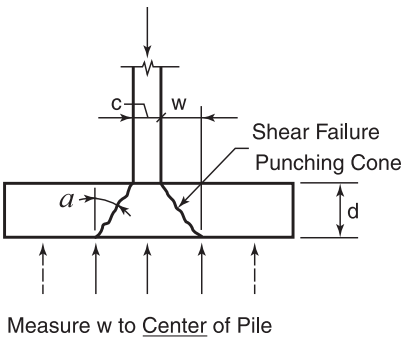

Figure 13-7 Two-Way Shear at Columns; Code-Prescribed Investigation, $v_c = 4\sqrt{f'_c}$ for $a = 45^o$; Special Deep Two-Way Corbel Investigation for $a < 45^o$**

*Joint ASCE-ACI Committee 426, "The Shear Strength of Reinforced Concrete," Journal of the Structural Division, ASCE, Part I — Beams and Special Members, June 1973 and Part II — Slabs, Aug. 1974.

**Tabulated designs reflect $w' = w + 3$ in. in all calculations for shear and flexure to include adverse tolerance effects.

SPECIAL INVESTIGATION – Two-Way Deep Corbel

For square (or equivalent round) columns. The shear failure section is a pyramidal frustrum with slope angle to the vertical, $\alpha \approx 45^o$, and $w \approx d$. This condition is part of the explicitly Code-prescribed investigation. The allowable shear stress on concrete is: $v_c = 4\sqrt{f'_c}$, at a section, which is located at a distance of $d/2$ from the perimeter of the column for all piles outside this section. The shear section perimeter is: $b_o = 4(c + d)$.

When $w < d$, and $45^o > \alpha \geq 0$, the explicit Code provisions do not apply. The condition is an inverted "deep" two-way cantilever slab with concentrated loads (pile loads, 1.6P). Providing horizontal shear-friction reinforcement distributed through 2/3 of the depth as for small one-way corbels is impracticable (ACI 11.9.4, 11.9.5). Failure when $\alpha < 45^o$ can occur, but only at increasingly higher values of v_c, approaching a theoretical strength $v_c = 0.5f'_c \approx 32\sqrt{f'_c}$ at $\alpha = 0$ ("pure" shear). The "deep" beam formulas of the Code for one-way shear omit limits for cantilever spans and are not applicable for this condition (ACI 11.8). See Figures 5.1 and 5.9 in the reference noted on Page 13-24.

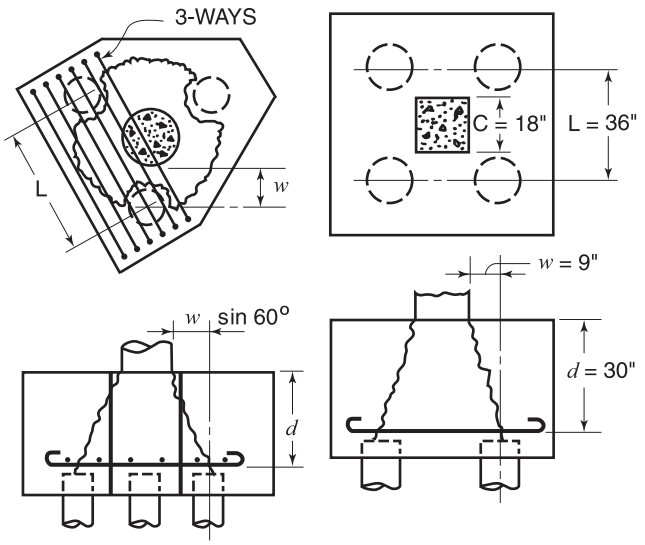

Figure 13-8 Deep Two-Way Pile Cap Slabs

Since the various pile arrangements in Fig. 13-2 include all variations of distance w from face of column to centers of first piles and w can approach zero, it is most convenient to make this special investigation on the perimeter at the **face** of the column with the special critical section $b_s = 4c$. This special investigation will be made only when $w < d/2$ since the ACI-prescribed procedure can be applied when $w \geq d/2$. Converting the ACI-prescribed v_c from $v_c = 4\sqrt{f'_c}$, at the section perimeter at $d/2$, $b_o = 4(c + d)$ to the perimeter at the column (b_s), v_c becomes

$$v_c\,(4\sqrt{f'_c}) = b_o/b_s = (1 + d/c)$$

For the special investigation then, on a section at the face of the column, when $w = d/2$ the allowable shear stress, $v_c = (1 + d/c)(4\sqrt{f'_c})$ with $b_s = 4c$. A simple conservative linear variation for v_c between the value $v_c = (1 + d/c)4\sqrt{f'_c}$ at $w = d/2$ and $v_c = 32\sqrt{f'_c}$ at $w = 0$ is used. See Fig. 13-9.

$$v_c = (d/w)(1 + d/c)(2\sqrt{f'_c}) \quad \text{(ACI Eq. 13-1)}$$

For the determination of the shear strength for design, Eq. 13-1 becomes

$$\phi V_c = 0.85\left(\frac{d}{w}\right)\left(1 + \frac{d}{c}\right)(2\sqrt{f'_c})(b_s d)$$

SPECIAL INVESTIGATION – One-Way Deep Beam

A similar special investigation is required for possible failure in one-way shear as a deep beam. See Fig. 13-6. Possible failure sections (cracks) in both directions are shown in Fig. 13-10 for a 6-pile cap arrangement. Under Code prescribed procedures, shear is investigated at a distance d from the face of the column with an allowable value, $v_c = 2\sqrt{f'_c}$, for shear on concrete. Note that for a value of $d \geq 7.25$ inches, Section S2 is outside all piles. Similarly, for $d \geq 26.5$ inches, Section S1 is outside all piles.

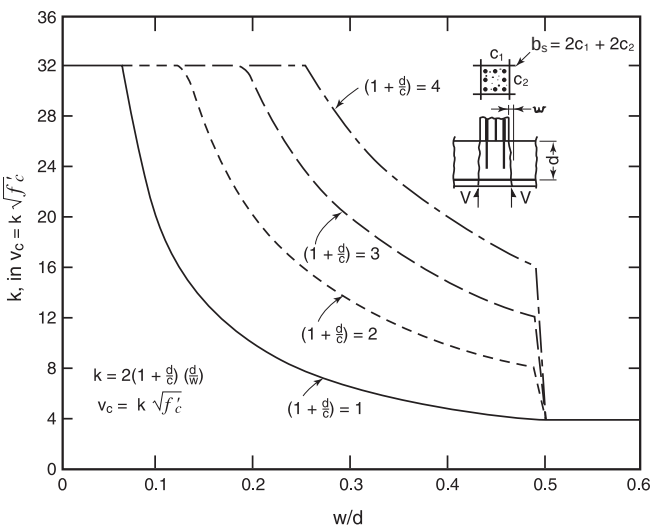

Figure 13-9 Derivation of Allowable Shear, v_c, for Two-Way Deep Corbels, $w/d < 0.5$

As for the two-way deep corbels, a one-way shear section is investigated at the *face* of the column. In this case, the width of the critical section is unchanged. No correction factor, based upon column size or ratio (d/c),

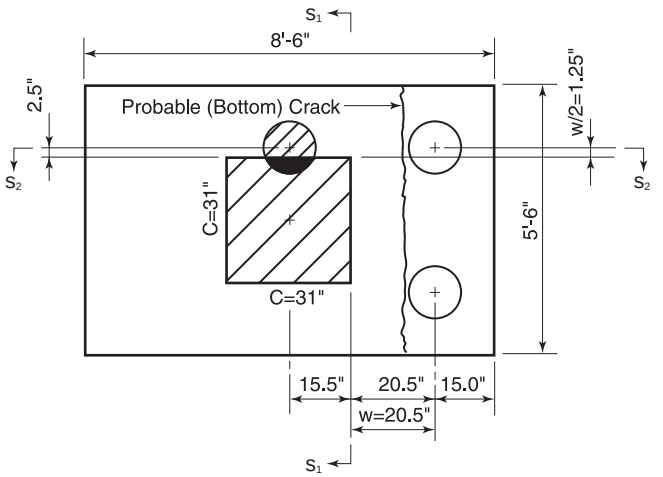

Figure 13-10 Critical Sections through 6-Pile Cap with 200-Ton Piles for One-Way Deep Beam Shear

is required. Research reports, including tests for shear with (w/d) as low as 0.5, show shear strengths of approximately 1,200 to 1,300 psi and show an exponential increase in shear strength as (w/d) decreases. These very favorable strengths develop in confined situations (at the face of a support), and the support here (upside down) is the column, the width of which involves a variable (c/A) or (c/B). No test results are available to evaluate the precise effect of the (column width/footing width) ratios nor to evaluate the precise upper value for v_c at $w = 0$, at the column. Under these conditions, no further refinement than an average value for v_c applied across the full footing width is justifiable. A conservative upper limit for the value, v_c, as w approaches zero is $10\sqrt{f'_c}$.* In order to include the effect (M_u/V_ud) for several lines of piles at varying spans, the initial value beginning at (w/d) = 1.0 will be that from ACI Eq. 11-5, and a simple linear function for the effect of (d/w) will be used for the transition.

For (w/d) ≥ 1.0, a one-way (normal) shear investigation with loads outside the critical section (located at a distance d from the face of the column, b = footing width) and

$$v_c = 1.9\sqrt{f'_c} + 2500\rho_w\left(\frac{V_ud}{M_u}\right) \geq 2\sqrt{f'_c} \quad \text{(ACI Eq. 11-5)}$$

which reduces for $\rho_w \approx 0.002$ and 3,000 psi ≤ f'_c ≤ 4,000 psi to $v_c = 1.9\sqrt{f'_c} + 0.1\sqrt{f'_c}\,(V_ud/M_u) \geq 2\sqrt{f'_c}$.

For (w/d) < 1.0, $1.0 > M_u/V_ud > 0$; $\infty > V_ud/M_u \geq 1.0$ (no limits on M_u, V_ud, other than above)

$$v_c = \left(\frac{d}{w}\right)\left[3.5 - 2.5\left(\frac{M_u}{V_ud}\right)\right]\left[1.9\sqrt{f'_c} + 2500\rho_w\left(\frac{V_ud}{M_u}\right)\right] \leq 10\sqrt{f'_c}$$

$$v_c = \left(\frac{d}{w}\right)\left[3.5 - 2.5\left(\frac{M_u}{V_ud}\right)\right]\left[1.9\sqrt{f'_c} + 0.1\sqrt{f'_c}\left(\frac{V_ud}{M_u}\right)\right] \leq 10\sqrt{f'_c} \quad \text{(ACI Eq. 13-2)}$$

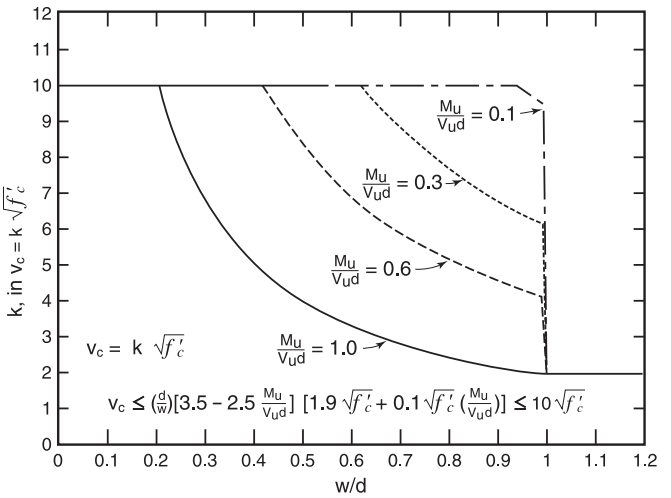

Figure 13-11 Derivation of Allowable Shear, v_c, for One-Way Deep Beam Sections, $w/d < 1.0$

For visual representation of Eq. 11-5, see Fig. 13-11. Note again that the equation permits reaching the maximum shear value in a short finite length of w, the distance from the column face to the center of the pile, which allows for the finite size of piles.

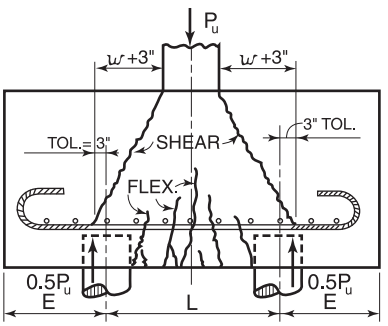

Figure 13-12 Shear Failure Model

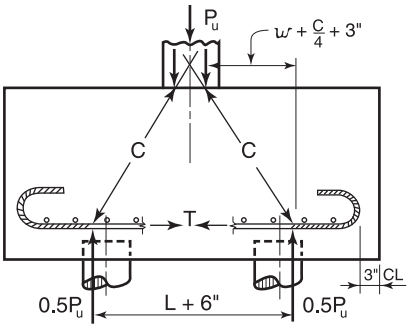

Figure 13-13 Tied-Arch Model

*Reference: footnote, Page 13-24. Also Rogowsky and MacGregor, "Shear Strength of Deep Reinforced Concrete Continuous Beams," Struct. Eng. Report No. 110, Univ. of Alberta, Nov. 1983.

"Tied-Arch" Behavior

The provision to include a 180º end hooks or heads on all reinforcing bars in pile caps with single lines of piles around the column is a prudent precaution against a premature "tied-arch" shear failure mode. See Fig. 13-13. In addition, however, the maximum bar size should be related to the embedment length available. The ACI Code establishes required development lengths required for full development of hooks and headed bars. The Code permits a 30 percent reduction in hook development where confining reinforcement and at least 2½ inches of concrete cover are present. Crossing bars provide a degree of confinement and the compressive reactions of the piles contribute also to confinement. See Chapter 5 for hook and headed bar development lengths.

Special Anchorage Requirements

High-capacity piles, up to the limits set by supporting soil strata, minimize the number of piles required as well as the area of the pile cap for a given column load. An obvious potential economy results in more "deep beam" or "deep slab" pile caps. Theoretical analyses indicating a "tied-arch" mode of failure as depth/span ratios become larger have been confirmed to some extent by model tests and reports of field behavior. See Fig. 13-13. When $w << d$ in one-way shear or flexure, and $w << 0.5d$ in two-way shear or flexure, the ordinary requirement for tension development length at simple supports is:

$$\ell_d \le (M_n/V_u) + \ell_a \quad \text{(ACI Eq. 12-2)}$$

and may not be adequate, even with the increase of 30 percent allowed in M_n/V_u.

Ordinarily, with all tension reinforcement extended to the support, the requirement can be expressed as

$$\left[\frac{M_n}{V_u}\right] = \left[\frac{(P_u L/4)}{\phi P_u/2}\right] = \frac{L}{2\phi}$$

where P_u = factored column load
$\ell_a = E - 3$ inches
$\ell_d \le (L/2\phi) + E - 3$ inches

The "tied-arch" model at failure (Fig. 13-13) indicates that full development of the bars at the **center** of the support is desirable, particularly with an adverse 3-inch tolerance.

Shear at Critical Sections Around Piles (Fig. 13-4)

Compare the graphic solutions (Fig. 13-5) for the four conditions of Fig. 13-4 to the thicknesses of pile caps tabulated. Read from Fig. 13-5 the following minimum thicknesses for 3,000 psi concrete:

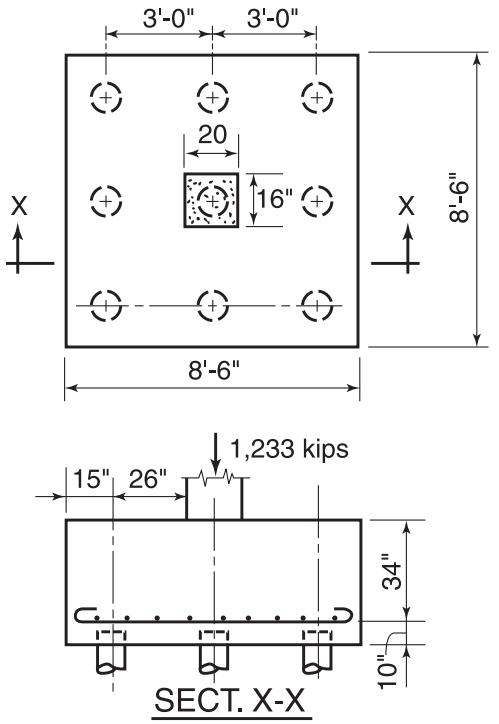
Pile Capacity (Tons)	Corner d at 45º (in.)	Corner $d/2$ Circle (in.)	Overlapping Pair (in.)	Single Interior (in.)
40	19	17	12	12
50	22	20	14	14
60	25	23	16	15
70	25	22	18	17
80	27	24	20	18
90	30	27	22	20
100	32	29	23	21
110	34	31	25	22
120	36	33	27	23
130	35	31	28	24
140	37	33	30	26
150	39	35	31	27
160	40	37	32	28
170	42	39	34	29
180	44	40	35	30
190	45	42	36	31
200	47	43	37	31

In order to check conformance with the above analyses, it is necessary to study the pile arrangement and various sections at $d/2$ and d. Take $d = (D - 10$ inches) for this purpose. See tabulated designs, Pages 13-31 to 13-37.

It will be noted that the "single interior pile punching failure" never controlled the arrangements used. The 3-pile corner failure at 45º in beam (one-way) shear cannot occur with the CRSI arrangements. Where "overlaps" exist for pairs of piles, the perimeter is usually incomplete and would not control. The single pile corner "beam" or "punching" shear failure alone of the criteria in Figs. 13-4 and 13-5 approaches critical shear for some combinations. These criteria and solutions (Figs. 13-4 and 13-5) are presented, however, for specifying piles at larger spacings than assumed for the tabulated designs (3′-0″). Smaller spacings will require even less than the thicknesses shown in Fig. 13-5 and will often make these possible failure sections inapplicable, or applicable at higher allowable stresses (v_c). Consideration of these cases is advised where pile arrangement is based on larger spacings.

USE OF TABLES

Example 1. Select a pile cap, using piles with a 50-ton capacity for the multi-story column of Example 1, Chapter 3. P_u = 1,036 kips. M_u = 0 ft-kips (calculated). Column size is 16 in. × 20 in.; f'_c = 3,000 psi.



9-Pile Pile Cap Design (Example 1)

Enter pile cap table, Page 13-31, for 50-ton piles. Try 9-pile pile cap. From the tabulated designs, P_u = 1,376 kips. Note that minimum column size tabulated is 19 in. In the 16-in. direction of the column, the pile loads will have an additional 1.5 in. moment arm distance. This effect should be negligible, but will be checked here for illustrative purposes. See Figs. 13-2 and 13-3. Note that the reaction of these 50-ton piles is located 3′-0″ from the column center. Cantilever span for the tabulated design, $\ell_c = 36 - 0.5 \times 19 = 26.5$ in. The column size of Example 1 will increase the footing moment (1.5/26.5 = 5.6 percent. The ratio of tabulated to required capacity is (1,376/1,036) = 1.33, approximately 33 percent above that required, and the listed capacity includes adverse 3 in. tolerances. No change in tabulated reinforcement nor thickness is required. Use tabulated design.

Shear. Again for illustrative purposes, note slab shear on section ① controlled. See Fig. 13-6. For this condition, the allowable shear is v_c = 219 psi. The ratios of computed/allowable shears are: 0.919 controlling slab shear on (ACI) section ①; and 0.911 controlling beam shear on both (CRSI) sections ⑤ and ⑥ due to two-way symmetry.

"Tied Arch." Note also that the tabulated design requires the same number and size of reinforcing bars in each direction, all with hooked or headed bar ends. Bar size for hooked bars is limited to #6 for which ℓ_{dh} = 0.7 (17) = 12 in. See Table 5-5(a) in Chapter 5. The edge distance, E = 15 in., provides a net hook embedment of 15 – 3 (end concrete cover) = 12 in. (For this purpose, the 3-in. tolerance was not considered.) Also note that the average effective depth, d = 44 – 10 = 34 in., and that w = 26.5 in., which definitely is within the range of proportions where tied-arch behavior should be considered in the design.

MANUAL EXAMPLE

To illustrate the design assumptions, applicable Code requirements and procedures used in the preparation of the pile cap tabulated designs, one of the designs will be reviewed with all calculations performed longhand. This review will also assist or guide anyone wishing to extend the scope of the tabulated designs to longer spans or heavier loads; to use other concrete compressive strengths or yield strengths of reinforcing bars; conditions of concrete cover other than those used (shown in Fig. 13-3); or columns smaller than the tabulated sizes.

From the table on Page 13-31, review the 12-pile pile cap with 50-ton piles.

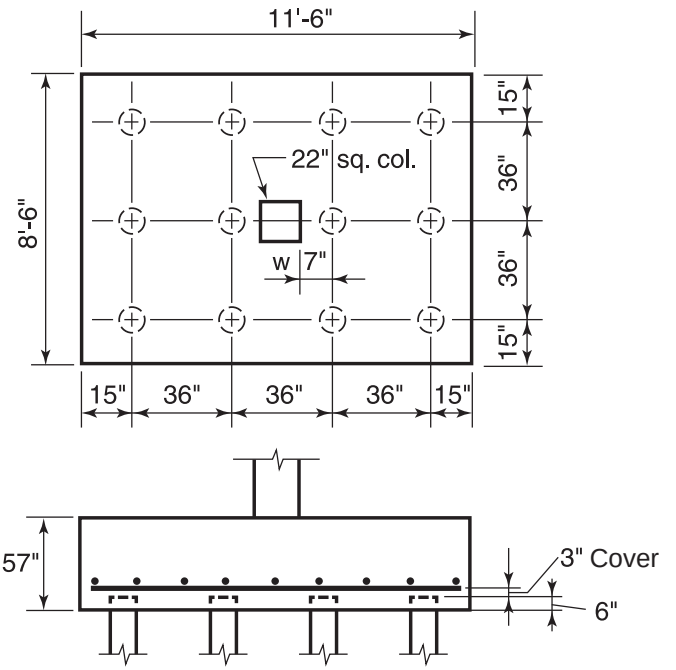


Fig. 13-14 Manual Example

12-Pile Pile Cap

Piles : Service load = 50 tons
Pile Cap: f'_c = 3,000 psi
f_y = 60,000 psi

Column : P_u/A_g = 4,000 psi

with a 1.6 load factor; a 36-in. pile spacing; and a 15-in. edge distance

1. Minimum Square Column Size

$$h = \sqrt{\frac{[12 \times 100 - 11.5 \times 8.5 \times (57/12) \times 0.15]\ 1.6}{4}}$$

= 21.26, use 22 in.

2. Required Flexural Reinforcement—Short Bars

The moment arm of M_u is taken from a point, which is located between the column center and the column face $c/4$, and includes the placing tolerance of 3 inches but neglects the pile cap dead load.

$M_u = 4 \times 1.6 \times 100\ (36 + 3 - 22/4) = 21{,}440$ in.-kips

$M_u = 21{,}440/11.5 = 1{,}864$ in.-kips/ft

$d = 57 - 9 - 1.128 - 0.375 = 46.497$ in.

For f'_c = 3,000 psi and f_y = 60,000 psi, the required area of flexural reinforcement,

$A_s = 0.51d - \sqrt{0.26d^2 - 0.0189M_u}$ (See Chapter 5)

$= 0.51(46.5) - \sqrt{0.26(46.5)^2 - 0.0189(1{,}864)}$

$= 0.759$ in.^{2}/ft

Calculated total required $A_s = 0.759 \times 11.5 = 8.73$ in.^{2}

$(4/3)\ A_s = (4/3)(8.73) = 11.64$ in.^{2}

$(200/f_y) \times 11.5 \times 12 \times 46.497 = 21.39$ in.^{2}

$0.0018 \times 11.5 \times 12 \times 57 = 14.16$ in.^{2}

Increase the calculated area in order to maintain uniform spacing of the short bars (ACI 15.4.4).

$\beta = 11.5/8.5 = 1.353$, ratio of long-to-short sides

$A_s = 8.73(2\beta)/(1 + \beta) = 10.04$ in.^{2}

Thus, use $A_s = 14.16$ in.^{2} (14.16 in.^{2} tabulated)

$E' = E - 3$ in. (concrete cover)
$E = 15 - 3 = 12$ in. for hook embedment

Maximum bar size is #6 (ℓ_{dh} = 0.7 (17) = 12 in., see Table 5-5(a) in Chapter 5)

Thus, use 32 – #6 bars with standard hooks at ends; A_s provided is 14.08 in.^{2}

3. Required Flexural Reinforcement – Long Bars

3 piles at 18 in.; 3 piles at 54 in., plus a 3-in. tolerance

$M_u = 1.6 \times 100[3 \times (18 + 3) + 3 \times (54 + 3) - 6 \times 22/4]$
$= 32{,}160$ in.-kips

$M_u = 32{,}160/8.5 = 3{,}784$ in.-kips/ft

$d = 57 - 9 - 1.128/2 = 47.44$ in.

$A_s = 0.51(47.44) - \sqrt{0.26(47.44)^2 - 0.0189(3{,}784)}$
$= 1.53$ in.^{2}/ft

Calculated total required $A_s = 1.53 \times 8.5 = 13.01$ in.^{2}

$(4/3)\ A_s = (4/3)(13.01) = 17.34$ in.^{2}

$(200/f_y)\ 8.5 \times 12 \times 47.44 = 16.13$ in.^{2}

$0.0018 \times 8.5 \times 12 \times 57 = 10.46$ in.^{2}

Thus, use $A_s = 16.13$ in.^{2} (16.13 tabulated)

Embedment length available for tension development
$= (11.5 \times 12)/2 - 3 - 11 = 55$ in.

13 – #10 bars; $A_s = 16.51$ in.^{2}
16 – #9 bars; $A_s = 16.00$ in.^{2}
Hence, use 16 - #9 bars

Check tension development length of #9 bars vs. available embedment length; c.-c. spacing of #9 bars = $((8.5 \times 12) - (4.31 \times 2))/15 = 6.23$ in. or $6.23/1.128 = 5.5d_b$; concrete cover = 3.75 in. or $3.75/1.128 = 3.3d_b$; from Table 5-3(a) for "Other Bars", $\ell_d = 41$ in. < 55 in., okay.

4. Check Shear at a distance *d*/2 from Column: Case ①

Centers of 10 piles lie outside section at $d/2$ from face of column

$V_u = 10 \times 1.6 \times 100 = 1{,}600$ kips

$d = 57 - 9 - 1 = 47$ in.

$b_o = 4\ (22 + 47) = 276$ in.

$\phi V_c = 0.85 \times 4 \times \sqrt{3000} \times 276 \times 47/1000$
$= 2{,}416$ kips > 1,600 kips

$V_u/\phi V_c = 0.662$ (0.632 tabulated, using long formula for shear strength)

5. Check One-Way Beam Shear at a distance *d* from Column: Case ② (Short Direction)

No check is necessary, because all piles are within this section.

6. Check Deep Beam (One-Way) Shear at Face of Column (When $w/d < 1.0$): Case ⑤

$w' = 7 + 3 = 10$ in.

$V_u = 6 \times 1.6 \times 100 = 960$ kips

$M_u = 1.6 \times 100\ [3 \times 10 + 3 \times 46] = 26{,}880$ in.-kips

$V_u d/M_u = 1.679$

$M_u/V_u d = 0.596$

$k = [3.5 - 2.5\ (0.596)][1.9 + 0.1\ (1.679)] \times 47/11$
$= 17.76 > 10$, use 10

$\phi V_c = 0.85 \times 10 \times \sqrt{3000} \times 8.5 \times 12 \times 47/1000$
$= 2{,}232$ kips $> V_u$

$V_u/\phi V_c = 0.430$ (0.409 tabulated, due to round-off)

7. Quantities of Concrete and Reinforcing Bars

Concrete:

8.5(11.5)(57/12)/27 = 17.197 cubic yards
(17.2 cubic yards tabulated)

Reinforcing bars:

16 – #9 bars × 11′-0″; 16(3.400)(11) =	598 pounds
32 – #6 bars × 8′-0″; 32 (1.502)(8) =	385 pounds
32 – #6 bars with standard end hooks at each end; 64 hooks at 8″; 64(64(1.502)(0.67) =	64 pounds
Total weight =	1,047 pounds

Total weight = 1,047/2,000 = 0.524 tons
(0.523 tons tabulated)

8. Compute Net Design Capacity of Pile Cap

Total design capacity = $12 \times 1.6 \times 100 = 1{,}920$ kips

Pile cap weight = $17.197 \times 27 \times 0.15 = 69.6$ kips

Factored pile cap weight = $1.4 \times 69.6 = 97.4$ kips

Net design capacity = 1,920 – 97.4 = 1,823 kips

(1,808 kips tabulated. Computer program conservatively uses the combined load factor 1.6 for the dead load of the pile cap.)

f_c' = 3,000 psi; w = 150 pcf
f_y = 60 ksi
Minimum Pile Diameter = 8 in.
spaced at 3′-0″

40-TON STEEL PILES

capacity for unfactored, service ($D + L$)

Min. cover = 3″
d_c = 10″
Edge E = 15″
See Fig. 13-3

* Concrete columns—side dimension of square column. Structural steel columns, b or t + 0.5 × sum of overhangs to edges of base plate. For 3-Pile and 7-Pile caps only, diameter of round column.
** See detail layouts for clipped corner pile cap arrangements. Concrete quantities based on clipped corners.
(1) "H"—Use hooked or headed bars.
(2) Based on calculation of A_s; (4/3)A_s; 0.0033 bd; 0.0018 bh.
(3) Total reinforcing steel weight—long plus short bars. For 3-Pile cap, total of 3 bands.

f_c' = 3,000 psi; w = 150 pcf

SUMMARY OF DERIVATIONS AND DESIGN PROCEDURES FOR DRILLED PIER (CAISSON) LOAD TABLES

ACI 318-08

Section 22.8.3 Maximum stress (due to factored axial load) on unreinforced pedestals ≤ permissible bearing stress (design bearing strength of ACI 22.5.5).

Section 15.8.1.1 Bearing stress ≤ permissible bearing stress (design bearing strength of ACI 10.14).

Section 9.3.2.2 Strength-reduction factor, $\phi = 0.65$

Section 10.14.1 Permissible (design) bearing stress ≤ $0.85\phi f'_c A_1\sqrt{A_2/A_1} \le (2)(0.85\phi f'_c)$ where $\sqrt{A_2/A_1} \le 2$, A_1 = loaded area, and supporting surface area, $A_2 \ge 4$ times (concentric) A_1.

Section 15.8.1.1 Permissible (design) bearing stress on pedestal = $0.85\phi f'_c = (0.85)(0.65)f'_c = 0.553f'_c$ assuming column or effective size of structural steel base plate is the same as shaft size.

International Building Code (Section 1810.1.2)

1. Minimum longitudinal reinforcement for axial loads: 0.0025 (Seismic Design Category C); 0.0050 (SDC D, E, or F).

2. Maximum allowable axial stress in concrete, f_c: $0.25f'_c$ for enlarged base piles and driven uncased piles; $0.33f'_c$ for drilled or augered uncased piles, caisson piles and micropiles. Both maximum limits are presented so that either may be selected ($0.33f'_c$ was conservatively rounded down to $0.30f'_c$).

3. Minimum of four longitudinal bars.

4. Maximum tie spacing: 16 longitudinal bar diameters (SDC C), 12 longitudinal bar diameters or one-half pile diameter or 12 inches, whichever is smallest (SDC D, E, or F).

Dimensional Proportions Recommended

1. Extend longitudinal reinforcement at minimum 10′-0″ ≥ 3*d*,* to provide for disturbed soil causing reduced lateral resistance at top.

2. Minimum edge of bell thickness = 12 in.

3. Minimum angle for slope of bell to horizontal = 60º.

4. Specified concrete cover to lateral ties = 3 in. (ACI 7.7.1-a).

*d is the diameter of the shaft (see Fig. 13-16).

USE OF DRILLED PIER (CAISSON) TABLES

Example 1

An interior column resists a factored load, P_u, of 2,000 kips. A rock stratum approximately 75 feet below the surface has been permitted a service load bearing value of 20,000 psf under the local building code (which has been verified by load tests). Test borings indicate feasibility of belled bottom, unlined holes, and the presence of lateral support for the full depth. Select from the tabulated designs and provide a quantity estimate of materials. Assume that $f_c = 0.30f'_c$.

Solution.

Service load, $P = \frac{P_u}{1.6} = \frac{2{,}000}{1.6} = 1{,}250$ kips

Enter "Shaft Maximum Allowable Axial Load" table with 1,250 kips and read under "$f_c = 0.30f'_c$:"

for f'_c = 3000 psi, the diameter required = 3′-6″
for f'_c = 4000 psi, the diameter required = 3′-6″
for f'_c = 5000 psi, the diameter required = 3′-0″
for f'_c = 6000 psi, the diameter required = 2′-6″

Enter "Bell Safe Bearing Load" table with P = 1,250 kips and p = 20,000 psf and read; bell diameter required = 9′-0″.

In the tabulated designs, note that the minimum shaft size recommended with a 9′-0″ bell is 3′-0″ diameter. Compare quantities for concrete with f'_c = 3,000 psi and f'_c = 5,000 psi. See table of Concrete Quantities. Read:

9′-0″ Bell + 3′-0″ Shaft: 179 + (7.07 × 75) = 709 cubic feet

9′-0″ Bell + 3′-6″ Shaft: 164 + (9.62 × 75) = 886 cubic feet

See table of minimum reinforcement:

Shaft dia. = 3′-0″: 215 pounds

Shaft dia. = 3′-6″: 278 pounds

Example 2

Same as Example 1, but assume that an intermediate stratum of soil does not provide lateral support. This stratum begins approximately 20 feet below the surface and extends 10 feet deeper (total depth to bottom = 30 feet). This soil stratum will also require a casing (which will not be considered in design calculations) (Section 3.7.3, Reference 2). The shaft must be designed for an unbraced length of 10 feet plus 2*d* (Section 3.7.5, Reference 2). Since this length will exceed 3*d* (plain concrete pedestals), the shaft will be designed as a rein-

forced concrete column with minimum longitudinal reinforcement (percentage of reinforcement ≥ 0.01). Use f'_c = 5,000 psi. See round-tied column tabulated designs, Page 4-24. Select a column at least 3 inches less in diameter than the drilled shaft (even multiples of 6 inches) to allow for 3 inches of concrete cover instead of 1½ inches in portion below casing. For P_u = 2,000 kips, read for a 32-inch diameter column, with 6-#11 bars; maximum design axial strength is 2,049 kips (percentage of reinforcement = 1.16). Check for slenderness effects. See Fig. 13-15.

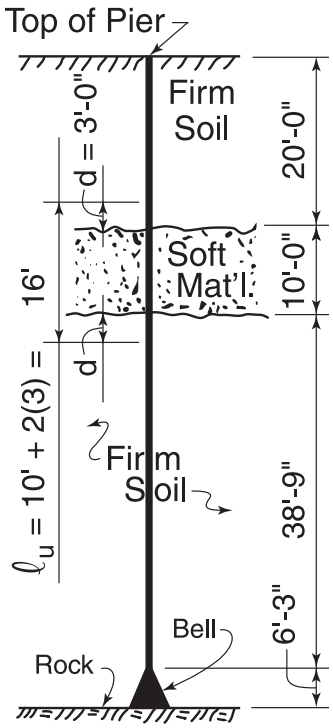

Figure 13-15 Example 3

For a 32-inch shaft diameter, slenderness effects will have to be considered. Thus, try a 36-inch shaft diameter:

Unbraced length, ℓ_u = (10 × 12) + 2(36) = 192 in.

For columns braced against sidesway, take k = 1.0 (ACI 10.10.6.3).

Compute $\frac{k\ell_u}{r} = \frac{1.0(192)}{0.25(36)} = 21.3$

Compare $\frac{k\ell_u}{r}$ vs. 34 – 12 M_1/M_2 (ACI 10.10.1)

34 – 12 M_1/M_2 = 34 – 12 (0)/(0) = 22

$\frac{k\ell_u}{r}$ = 21.3 < 22, neglect slenderness

Use a shaft diameter of 3′-0″ with a bell diameter of 9′-0″; 6-#11 bars × 36′-0″ and #4 ties spaced at 18 in.; with f'_c = 5,000 psi specified.

Quantities: See tabulated designs.

5,000 psi concrete: [(7.07)(75) + 179]/27 = 26 cubic yards

Reinforcing steel:

Longitudinal bars: (6)(5.313)(36) = 1,148 pounds
Ties: (24)(0.668)(π 32 + 24)/12 = 166 pounds
Total = 1,314 pounds

CHAPTER 14 – CANTILEVERED RETAINING WALLS

INTRODUCTION

General. The tabulated designs in this Chapter give complete dimensions and reinforcement details for cantilevered retaining walls varying from 3 to 22 feet in height above the top of footing, for two backfill conditions: level backfill and no surcharge,† and backfill sloping upward. The tabulated designs show base pressures on the earth at the heel and toe, factors of safety against sliding and overturning and calculated deflection at the top. Various soil properties and backfill conditions considered are listed in Table 14-1.

† Instead of a fixed surcharge, AASHTO recommends 2 feet of added depth of fill for walls as the equivalent loading for a normal highway surcharge. It should usually be satisfactory to select a design tabulated for 2 feet added to actual height, and to reduce reinforcement and concrete quantities for the amounts that would have been required in the top 2 feet.

The backfill material actually used in retaining wall construction will often differ from that assumed for purposes of design. The resulting differences in forces can be considerable and as a result the retaining wall could be under-designed. The determination of pressures for the actual soil conditions, allowable soil pressures, influence of foundation on under lying strata, and similar matters of judgement require consideration by an engineer familiar with soil mechanics.

TABLE 14-1 SOIL PROPERTIES AND BACKFILL CONDITIONS USED IN TABULATED DESIGNS

Backfill Condition	Internal Friction Angle, ϕ	Backfill Density, γ	Sliding Friction Coefficient, μ
Level	30°, 35°, 40°	115, 130 pcf	0.45, 0.55
Sloping*	30°, 35°, 40°,	115, 130 pcf	0.45, 0.55

*Backfill slope, β, set equal to soil angle of internal friction, ϕ

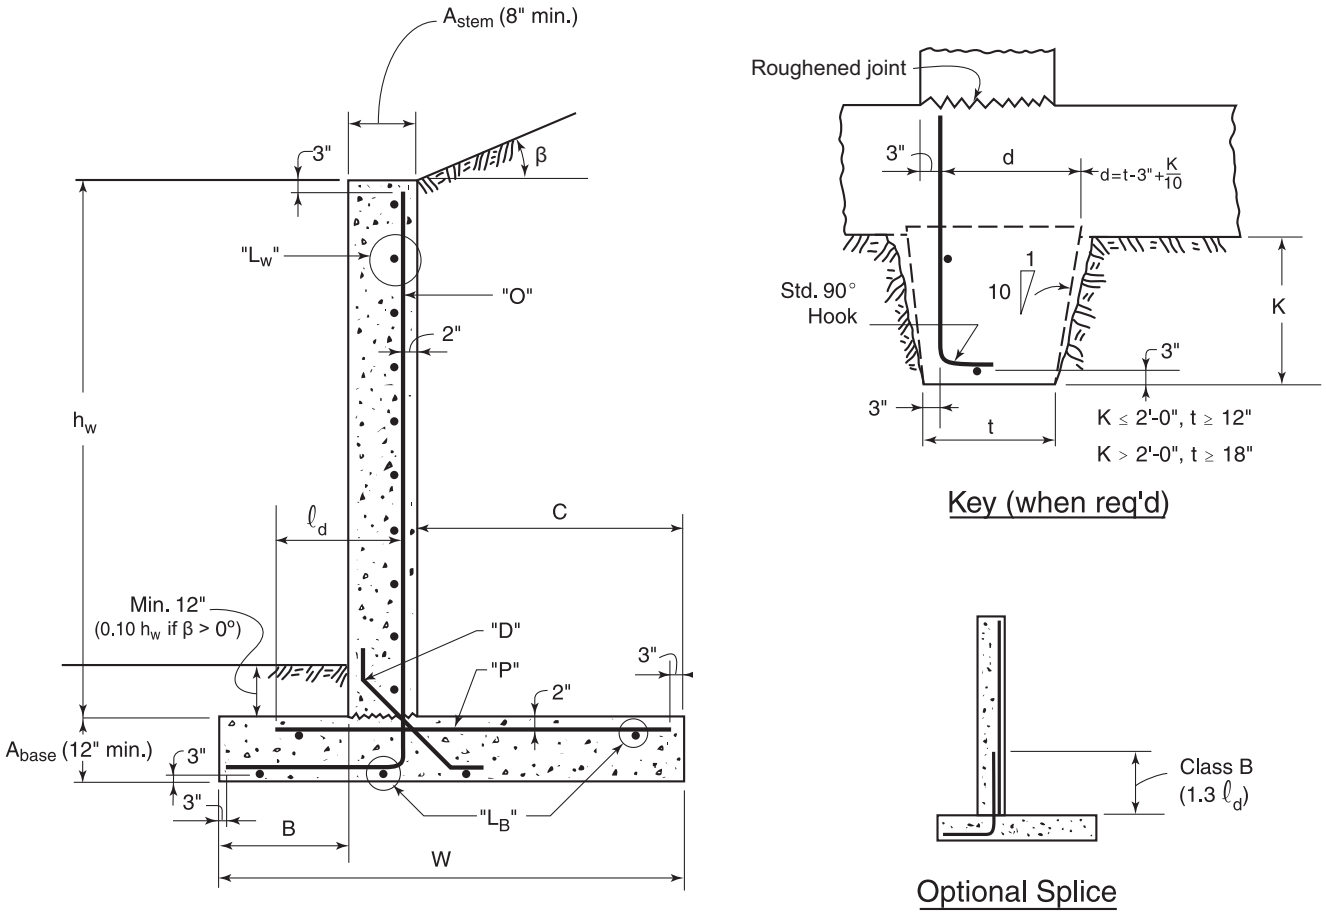

Figure 14-1 Notation for Dimensions and Reinforcement for Wall Heights ≤ 10′

The importance of drainage behind a wall cannot be overemphasized. Weep holes through the vertical stem at intervals of about 10 feet, located near the base of the wall at the exterior grade level, and a French drain of gravel, crushed stone, or equivalent, a foot or so thick, for most of the height at the back of the wall are desirable. It is also usually desirable to provide weakened plane contraction joints at intervals of about 25 feet and keyed expansion joints about every fourth contraction joint. The exact spacing will depend upon the climate, exposure, and similar factors. Weakened plane joints are made either with suitable rubber strips placed vertically full height in each face of the wall and left there or with wood strips similarly placed but eventually removed and the resulting slot filled with mastic caulking. Alternate longitudinal bars, at least, should be cut exactly opposite such weakened plane joints.

The tabulated designs in this Chapter provide for stability under service loads against overturning about a point at the toe of the footing. The minimum factor of safety against overturning under service loads is 2.0. The minimum factor of safety against horizontal sliding is 1.5. See Figs. 14-1, 14-2 and 14-3. For tall walls, it is recommended that the user provide for stability against a sliding circle failure based upon properties of the underlying soil and the actual backfill material. When keys are not feasible or where the sliding circle analysis requires additional precautions for soil-loading combinations outside the scope of the tabulated designs, some alternate wall geometries are suggested. See Fig. 14-4.

The use of a key usually adds costs for separate excavation, formwork, or concreting operations—sometimes all three. Some engineers question the effectiveness of keys unless they are cast against near-vertical undisturbed soil.

The tabulated designs were proportioned to obtain the most economical design. Three different wall configurations were investigated:

1. Length of base was varied from 0.40 h_w to 1.0 h_w while the stem and base thicknesses were varied up to 24 inches with no key.

2. Length of base was varied from 0.67 h_w to 1.0 h_w while key depth was varied from 16 to 60 inches and the stem and base thicknesses were varied up to 50 inches.

3. Key depth was varied from 16 to 60 inches while the base length was varied from 1.0 h_w to 1.5 h_w and the base and stem thicknesses were varied up to 60 inches.

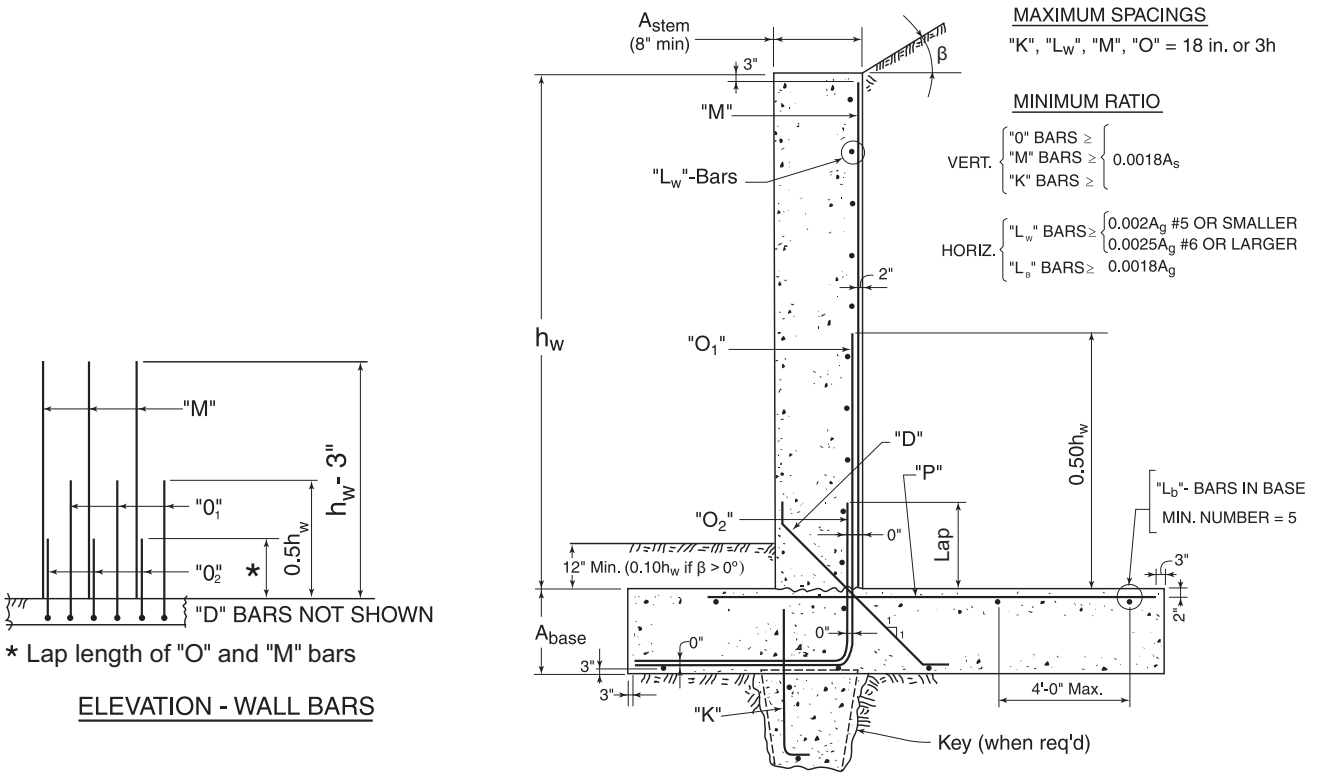

Figure 14-2 Notation for Dimensions and Reinforcement for Wall Heights > 10'

In the case where, for a specific wall height, any of the design requirements (i.e., factor of safety against sliding or overturning, deflection at the top of the wall) could not be met regardless what dimensions were tried, the computer program used to develop the tabulated designs skipped this wall height and stops. For example, on Page 14-35 for a sloping backfill with γ = 115 pcf, ϕ = 30°, and μ = 0.45, the tabulated designs stop at 18 feet. This stoppage occurs because, for any wall height greater than 18 feet with these soil properties, no dimensions for wall, base, and key could be found to satisfy all design requirements.

When the subsoil conditions are too unstable to permit trenching to the tabulated depths for keys with near-vertical sides which would serve as forms, the sides should be formed or the retaining wall should be redesigned. It may also be necessary to redesign when the actual soil can not be relied upon to develop the coefficient of friction used. Conversely, local conditions may require additional depth of front fill to protect the base against frost.

Based on local conditions, there are at least three options:

1. When frost protection is not required, the base slab and heel may be widened (to increase weight above and friction resistance). A key may be added or deepened. See Fig. 14-4 (a).

2. When the base is to be located below a frost line, the key may be eliminated or a shallower key may suffice because of the passive resistance of the soil at the toe. See Fig. 14-4 (b) and (c).

3. When the soil has a very low friction coefficient, or for some clay subsoils where cohesion is low or unreliable, and the required depth of key is impracticable, the base may be supported on battered piles.

Soil Data and Assumed Properties. Three different soil internal friction angles, two soil densities, and two sliding friction coefficients were used in the tabulated designs. See Table 14-1.

Rankine formulas were used to determine the soil pressures on the retaining wall. At a depth *h*, the active and passive earth pressures are, respectively:

$$P_a = K_a\,(h)\,\gamma$$
$$P_p = K_p\,(h)\,\gamma$$

where $K_a = \cos\beta\left[\dfrac{\cos\beta - \sqrt{\cos^2\beta - \cos^2\phi}}{\cos\beta + \sqrt{\cos^2\beta - \cos^2\phi}}\right] (\beta \neq 0^\circ)$

$= \tan^2(45^\circ - \phi/2)\ (\beta = 0^\circ)$

$K_p = \tan^2(45^\circ + \phi/2)$

To facilitate manual calculations, Table 14-2a lists various active and passive pressure coefficients, based on the Rankine formulas. Note that frontfill is conservatively assumed to be level.

TABLE 14-2b EQUIVALENT ACTIVE AND PASSIVE FLUID PRESSURES FOR SOILS IN THE TABULATED DESIGNS

Unit Density, γ (pcf)	Internal Friction Angle, ϕ	Active Fluid Pressure, γ_a (pcf)				Passive Fluid Pressure γ_p (pcf)
		$\beta = 0°$	$\beta = \phi$			
			γ_a	$\gamma_a \cos\phi$	$\gamma_a \sin\phi$	
115	30°	38	100	87	50	345
115	35°	31	94	77	54	424
115	40°	25	88	67	57	529
130	30°	43	113	98	56	390
130	35°	35	106	87	61	480
130	40°	28	100	77	64	598

In some cases, the equivalent fluid pressure of the soil can be determined, but the soil's internal angle of friction, ϕ, and its unit density, γ, will be unknown. The equivalent soil fluid pressures are defined as:

γ_a = Active fluid pressure = $K_a\,\gamma$
γ_p = Passive fluid pressure = $K_p\,\gamma$

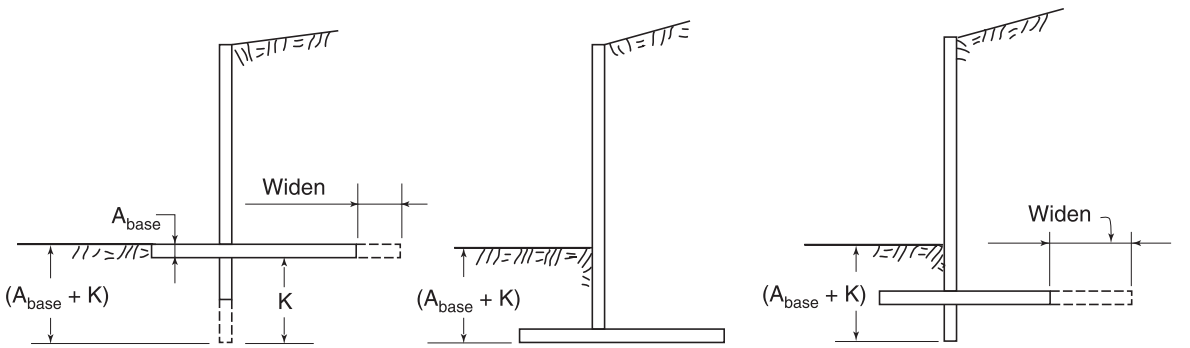
Table 14-2b shows the equivalent active and passive fluid pressures for the soil properties assumed in the tabulated designs.

Note, for the case of a sloping backfill with $\beta = \phi$, the horizontal and vertical component of the active equivalent soil pressure ($\gamma_a \cos(\phi)$ and $\gamma_a \sin(\phi)$, respectively) are also listed in Table 14-2b.

To use the tabulated designs in this Chapter, the angle of internal friction (ϕ) and unit soil density (γ) must be known. If these factors are not known, but the active and passive fluid pressures (γ_a and γ_p, respectively) are known, then for the case of a level backfill, it is possible to solve for ϕ and γ, given γ_a and γ_p:

$$\phi = 2\tan^{-1}\left[\frac{1-\sqrt[4]{\gamma_a/\gamma_p}}{1+\sqrt[4]{\gamma_a/\gamma_p}}\right]$$

$$\gamma = \gamma_a / \tan^2(45° - \phi/2)$$



(a) No Frost (b) Frost depth ≈ $(A_{base} + K)$ (c) Intermediate

Figure 14-4 Alternative Designs to Resist Horizontal Sliding

COST CONSIDERATIONS IN DESIGN

Less Thickness – More Flexural Reinforcement. Use of the minimum thickness possible for walls, principally reinforced for bending in one direction, seldom achieves overall economy. The cost of reinforcing steel is a major item in the total cost. When larger concrete cover is required and even with single curtains of reinforcing steel in both directions, wall thicknesses less than 8 inches are likely to make concrete placing and consolidation difficult. Tabulated designs in this Chapter are, therefore, based on an 8 in. minimum wall thickness. As walls become taller or more heavily loaded, greater thickness becomes economical. Reduction in weight of flexural reinforcement is directly proportional to an increase in effective depth, *d*, approximately 15 percent for the first added inch of thickness. Note, however, that horizontal (shrinkage and temperature) reinforcing steel weight *increases* approximately 15 percent for the same added inch.

More Thickness – More Horizontal Reinforcement. For taller walls, for doubly reinforced walls where lateral force may be applied from either side, or where two curtains of horizontal shrinkage and temperature bars are desired, a minimum wall thickness of 12 inches is required to provide adequate clearance for concreting.

In general, wall and base thicknesses in the tabulated designs provide a reasonably effective balance between flexural and horizontal reinforcing steel areas for overall economy. Some savings in concrete (and lesser amounts in horizontal reinforcement) may be achieved by use of tapered walls for heights above 10 feet. Since the tapered walls complicate concrete placing slightly and form construction considerably, use of tapered walls will seldom achieve overall economy without several form reuses, as on long walls.

Crack Control. Wide vertical cracks are objectionable, but the width of vertical cracks can be controlled by more horizontal reinforcing steel (increasing reinforcing steel cost) or closer spacing of control or construction joints (increasing construction time). With such joints at very close spacing (10 to 15 feet) that may happen to match the natural shrinkage crack interval, theoretically, horizontal reinforcing steel for crack control would not be necessary. Unfortunately, this "natural crack interval" is a function of the unpredictable concrete tensile strength during early curing. Cracks often occur during the first night after casting, particularly, if a large temperature drop occurs at this most crucial period. Figure 14-5 shows a general relationship developed in ACI Committee 350, Environmental Engineering Concrete Structures, between joint spacing and horizontal reinforcement for walls intended to be watertight.

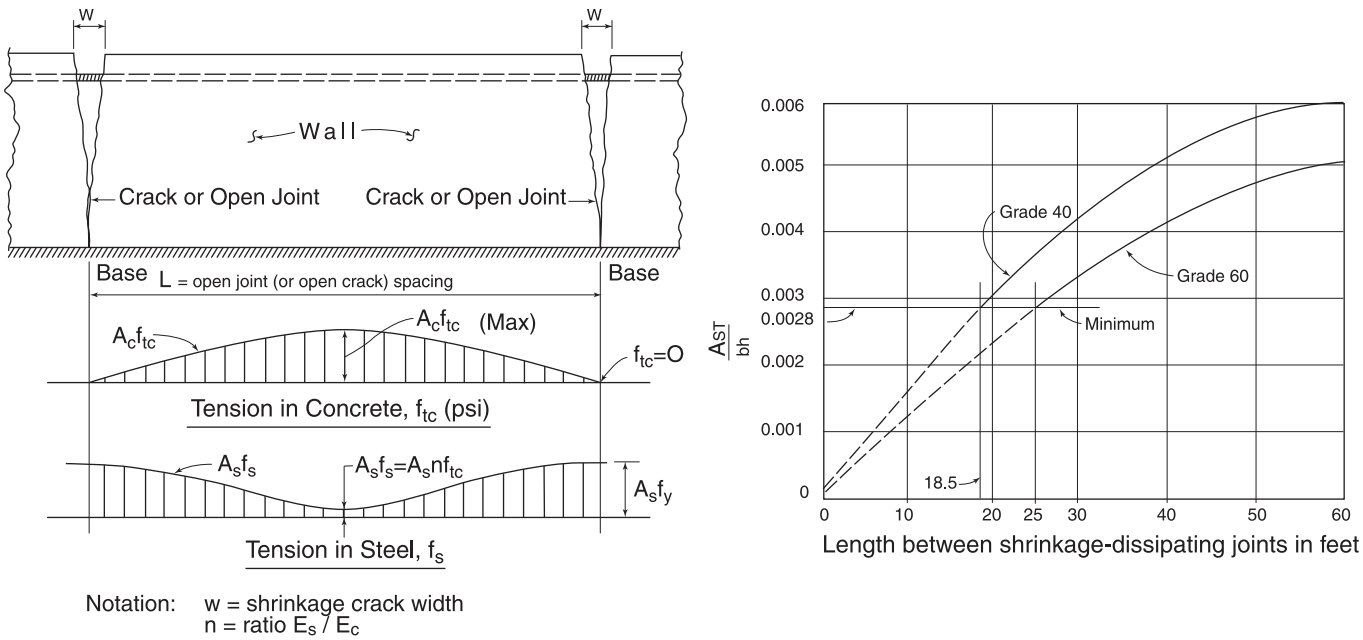


Figure 14-5 Joint Spacing Related to Reinforcing Steel for Shrinkage and Temperature

Project requirements affecting acceptable width of vertical cracks vary considerably. ACI Building Code requirements for horizontal reinforcing steel are minimum values. These minimal quantities of crack control steel are still required even with such close joints as to theoretically remove any need of reinforcing steel. The use of such minimal steel ratios could reasonably be extended also to building walls with longer joint spacings or even with no joints. Vertical cracks may not be objectionable for covered walls, retaining walls in well-drained locations well above the water table, and some interior walls.

Horizontal (Longitudinal) Reinforcement. Cantilevered retaining walls will usually require some horizontal steel. The amount required for serviceability can vary from a minimum for walls under 10 feet in length to 0.005 (for Grade 60) times the gross area for walls without contraction joints (or construction joints serving to accommodate some contraction) (see Fig. 14-5). Exposure conditions and appearance requirements for "no cracks" or minimum crack widths will also add to horizontal reinforcing steel requirements and may require both horizontal crack control steel and vertical bars for its support in the exposed face.

Horizontal reinforcement in cantilevered retaining wall designs conforming to the ACI Building Code must meet the following requirements for minimum ratios of Grade 60 reinforcing bars to gross area:

horizontally (ACI 14.3.3)
- #3, #4, and #5 bars 0.0020
- other bars 0.0025

For the base, temperature and shrinkage exposure is ordinarily less severe than for walls. Appearance and watertightness are ordinarily not design requirements. Longitudinal bars spaced no greater than approximately 4 feet are recommended, top and bottom, as practical support bars and spacers to hold the flexural and diagonal corner bars in place during construction. As shown in Figs. 14-1, 14-2, and 14-3, the tabulated designs provide for a minimum of five longitudinal bars. The longitudinal bars in the stem will provide a minimum steel ratio of 0.002, with spacing, *s*, equal to about one average wall thickness but not to exceed 18 inches in one layer as shown, which will also serve to hold the vertical flexural bars in proper position.

It would be impossible to tabulate longitudinal bars designed for each special service condition encountered. The longitudinal reinforcement in the tabulated designs is the minimum to satisfy the various Code requirements, as well as practical placing requirements. The tabulated designs are suitable for moderate exposures, with provision for shrinkage control (contraction joints) at short intervals, and where adequate drainage is provided. More longitudinal reinforcement may be needed for any special condition. For extreme exposure or watertight cracks, both vertical and horizontal crack control reinforcement near the exposed face will be desirable.

CRACK CONTROL IN CANTILEVERED WALLS

General. Observations of retaining walls in service generally show that objectionable horizontal cracks are rare and usually associated with a structural deficiency, while vertical cracks are common. As noted previously, vertical cracking is related to joint interval, for relief of tension stresses due to shrinkage, and total longitudinal reinforcing steel capacity ($A_s f_y$). See Fig. 14-5. The tension in the concrete has been relieved (to zero) at each crack. Between cracks, tensile stress in the concrete increases as shrinkage, temperature drop, or both occur. The tensile stress increases from zero at each vertical crack to a maximum at the midpoint between the vertical cracks. If tensile stresses in the concrete exceed the concrete tensile strength, a new vertical crack occurs. If this process is repeated often enough, the result will be closely spaced, *tight* vertical cracks. When the maximum force in the horizontal reinforcing steel ($A_s f_y$) is *less* than the tensile force carried by the concrete, the process of forming new cracks at closer spacings stops. Instead, the reinforcing steel yields at existing cracks which *widen* to provide needed strain relief in the concrete between them. This process provides the relationship between (relief) joint spacing and ratio of shrinkage and temperature reinforcing steel to crack width. Precise predictions of crack widths are not feasible, because early curing conditions control the tensile strength of the concrete. These same conditions vary the tensile force caused by drying and possible sudden temperature drops even during the first 24 hours. The curves in Fig. 14-5 should, therefore, be regarded merely as a guide, effective for usual applications.

Vertical Reinforcement (Flexure). Note that walls have been classified as "low" ($h_w \leq 10$ ft) and "high" ($h_w > 10$ ft) with different arrangements of vertical reinforcing steel. In low walls, lap splices of vertical reinforcement can be avoided entirely. The vertical bars are L-shaped and serve as vertical, dowel, and footing reinforcement. Temporary bracing must be provided for all dowels to ensure proper position (plumb) and location. For high walls, only 50 percent of the main flexural reinforcing steel is lap spliced at the base, using Class "B" lap splices to the short dowels.

Dimensions of the wall, base, and key (if required), as shown in Figs. 14-1, 14-2 and 14-3, are included in the tabulated designs. Note that the minimum wall thickness, 8 inches, is shown in Fig. 14-2. Sometimes, the front (exposed) face of the wall is cambered for expected lateral deflection-plus-tilt at the top. A variable thickness wall may be used, tapered from the top (8 inches) to the base, with the slope located on either face. Camber on the front face is desirable, even if a sloping back face is used.

Vertical Reinforcement (Front Face). When horizontal bars for shrinkage and temperature are used in both faces, the vertical reinforcement in the front face serves the practical purpose of spacing and supporting the longitudinal bars.*

Code Requirements for Crack Control. The Code requirements for "Distribution of Flexural Reinforcement" (ACI 10.6) provide crack control for the tensile zone in one-way beams or slabs under ordinary exposure. If desired, these provisions may be applied to cantilevered walls (designed as one-way slabs) at points of maximum flexural stress for the vertical bars in the back face. Since the tensile zone is in the back face where the horizontal flexural cracks are not objectionable for appearance, special crack control requirements on the spacing of the bars are not necessary. Tests have shown a 76 percent reduction of the crack width at the base of the cantilever stem when diagonal bars were present.**

All arbitrary maximum bar spacing requirements applicable to walls were observed in developing the tabulated designs. These include: for temperature and shrinkage (longitudinal) bars five times wall thickness, 5*h*, or 18 in. (ACI 7.12.2.2); for main bars, 3*h* or 18 in. (ACI 10.5.4 and ACI 14.3.5).

*The back face is somewhat protected from the direct effect of temperature changes, which cause warping stresses. To allow for this effect, two-thirds of the total horizontal reinforcing steel in the walls may be located in the front face.

**"Reinforced Corners and Joints Subjected to Bending Moment," I. Nilson and A. Losberg, ASCE ST 6, June, 1976.

TABULATED DESIGNS FOR RETAINING WALLS

Complete designs are presented for walls ranging from = 3 to 22 feet high, for the various soil conditions; under two backfill conditions, Level Backfill, No Surcharge; and Sloping Backfill (backfill angle $\beta = \phi$). The tabulated designs show; "Low" walls $h_w \leq 10$ feet, and "High" walls $h_w > 10$ feet. Fig 14-2 shows two bar arrangements for walls: (a) where dowels are at full height to serve as both footing and wall reinforcement, and (b) with dowels and straight bars. With the second arrangement, the full-height vertical bars are lap spliced, (Class B) to the dowels. Figures 14-2 and 14-3 show bar designations as tabulated for high walls.

The tabulated designs present the following data:

- Concrete Dimensions & Volume. Dimensions of the stem, base and key (if needed), and concrete quantity.
- Service Load Analysis. Base soil pressures at the toe and heel, safety factors against sliding and overturning, and calculated deflection at the top of the wall.
- Stem Reinforcement. Bar size and spacing for the "O", "M", "D" and "L_w" bars.
- Base Reinforcement. Bar size and spacing for the "P", "L_b" and "K" (if needed) bars.
- Total steel weight.

An analysis of on site soil conditions must be made in order to design against an overturning shear failure (sliding on a circular arc), as well as determine the actual coefficient of friction between concrete and soil.

The critical starting dimension is the height of the wall from the top to the base (h_w). The tabulated designs were prepared for a 12 in. minimum depth of soil above the base at the toe (frontfill). Note that for Sloping Backfill, the tabulated designs are based upon a minimum frontfill of $0.10h_w \geq 12$ in. Frost conditions may require greater frontfill in some areas. Consideration should be given whether to use a small camber to offset tilt and deflection or to use a tapered wall to save concrete or both.

ANALYSIS AND DESIGN PROCEDURES

Analysis. Service load analyses were used to establish concrete dimensions that control deflection at the top of the cantilever wall, limit soil stresses and tilting of the base, and provide the minimum safety factors of 1.5 against (horizontal) sliding and 2.0 against overturning about the toe.

TABLE 14-3 SERVICE LOAD BACKFILL PRESSURES, LOADS AND MOMENTS

	LEVEL BACKFILL 	SLOPING BACKFILL Soil Properties γ(pcf) / ϕ	$H = (½)\ K_a\ \gamma(h')^2$ $M = H(h'/3) = (1/6)\ K_a\ \gamma(h')^3$	$H = (½)\ K_a\ \gamma \cos(\beta)\ (h')^2$ $V = (½)\ K_a\ \gamma \sin(\beta)\ (h')^2$ $M = H\ (h'/3) = (1/6)\ K_a\ \gamma \cos(\beta)\ (h')^3$
115 / 30°	$H = 19.2\ (h')^2$ (lbs) $M = 6.39\ (h')^3$ (ft-lbs)	$H = 43.1\ (h')^2$ (lbs) $V = 24.9\ (h')^2$ (lbs) $M = 14.4\ (h')^3$ (ft-lbs)
115 / 35°	$H = 15.6\ (h')^2$ (lbs) $M = 5.19\ (h')^3$ (ft-lbs)	$H = 38.6\ (h')^2$ (lbs) $V = 27.0\ (h')^2$ (lbs) $M = 12.9\ (h')^3$ (ft-lbs)
115 / 40°	$H = 12.5\ (h')^2$ (lbs) $M = 4.17\ (h')^3$ (ft-lbs)	$H = 33.7\ (h')^2$ (lbs) $V = 28.3\ (h')^2$ (lbs) $M = 11.2\ (h')^3$ (ft-lbs)
130 / 30°	$H = 21.7\ (h')^2$ (lbs) $M = 7.22\ (h')^3$ (ft-lbs)	$H = 48.8\ (h')^2$ (lbs) $V = 28.1\ (h')^2$ (lbs) $M = 16.3\ (h')^3$ (ft-lbs)
130 / 35°	$H = 17.6\ (h')^2$ (lbs) $M = 5.87\ (h')^3$ (ft-lbs)	$H = 43.6\ (h')^2$ (lbs) $V = 30.5\ (h')^2$ (lbs) $M = 14.5\ (h')^3$ (ft-lbs)
130 / 40°	$H = 14.1\ (h')^2$ (lbs) $M = 4.71\ (h')^3$ (ft-lbs)	$H = 38.1\ (h')^2$ (lbs) $V = 32.0\ (h')^2$ (lbs) $M = 12.7\ (h')^3$ (ft-lbs)

1. Service Load Shear and Moment (See Table 14-3)

2. Service Load Analyses for Stem Deflection Control

Determination of E_cI_e:

$f_c' = 3{,}000$ psi

$E_c = 57{,}000\sqrt{f_c'} = 3{,}122{,}000$ psi

No creep factors used. Elastic deflection under full load, considering loss of stiffness in cracked section, neglecting effects of batter, and tilt:

t = Average wall thickness (in.)

Δ = Maximum lateral deflection at top of wall (in.)

H = Total lateral force (pounds)

$$I_e = \left(\frac{M_{cr}}{M_a}\right)^3 I_g + \left[1 - \left(\frac{M_{cr}}{M_a}\right)^3\right] I_{cr}$$

I_{cr}/I_g, ratio is between 0.28 and 0.38

$$\frac{M_a}{M_{cr}} = (0.266)\left(\frac{t}{t - 3''}\right)^2$$

Within limits
$\rho \cong 0.008$
10 ft < h < 22 ft

$I_e \cong 0.32t^3$

$E_cI_e \cong 1{,}000{,}000t^3$

$\Delta = W\ (h_w)^4/30EI$

$H = K_a\ (h_w)\ \gamma \cos\beta$

substituting:

$$\Delta = \frac{K_a\ (h_w)^5\ \gamma \cos\beta}{30 \times 10^6 t^3}$$

A minimum uniform wall thickness of 8 inches is used. This arbitrary minimum allows for 2 inches specified concrete cover plus two layers of reinforcing steel in the back face, say 3.5 inches, which provides a 4.5 inch space for placing and vibrating concrete to avoid honeycomb areas.

One of the criteria used in the tabulated designs to determine the stem thickness is to limit cantilever deflection of non-tapered walls (neglecting rotation) to $h_w/240$. Deflection was calculated for service load, cracked section, effective I_e, per ACI 318, with no creep (load reduces from passive to active as wall deflects) and calculated for non-tapered wall. For

Computed deflections of the stem have been tabulated. Total lateral displacement will be the sum of deflection plus tilt. See Fig. 14-6. Differential settlement of the base, $\Delta_s = \Delta_{toe} - \Delta_{heel}$. Settlement must be calculated, since it will be a function of the soil properties. Consolidation of the soil below the base slab is a function of loading on the soil or the soil pressure. For estimates, it may usually be assumed that Δ_s per 1,000 psf differential pressure ($P_{toe} - P_{heel}$) is approximately $^1/_{16}$ inch for compaction equivalent to good highway practice or $^1/_8$ inch for ordinary building construction practice. Tilt will equal $h_w \sin \theta$ where $\tan \theta = \Delta_s/W$. If such displacement is considered unsightly, some camber of the exposed face formwork is suggested where the exposed face is intended to appear vertical. Where the sloping face is the exposed face, no further precaution is required, since this slope is much larger than the small camber to offset $h_w/240$ plus tilt.

3. Service Load Analyses for Proportions of Base

The depth of the base, A_b, can vary from 12 inches to the thickness of the stem, which provides a practical, efficient connection. For large projects where potential savings in concrete quantity justify refinements in design and construction, the base may be tapered in the outer two-thirds of the heel portion to a (recommended) minimum of 12 in. See Fig. 14-7. This refinement will require complete investigation of development for top bars in the base ("P" bars), and may necessitate adjusting the size and spacing. Alternatively, with a full depth base, alternate top bars ("P" bars) may be cut-off at $0.5C$ (half-span) plus $12d_b$ or $C/16$, whichever is greater, from the back face of the wall.

SERVICE LOAD ANALYSES FOR SLIDING AND OVERTURNING

Resistance against sliding and overturning is investigated by analyzing a particular retaining wall configuration (stem thickness, base thickness, base width, and no key or with key). To investigate overturning, forces and resulting moments (about the toe) are determined, due to the soil pushing against the retaining wall and due to the stabilizing effect of the retaining wall itself and the soil backfill, and are compared. To investigate sliding, the static frictional force due to the weight of the soil above the base and the weight of the wall itself is calculated and added to the passive resisting force from the soil at the front face. This is compared to the horizontal force from the soil acting on the back face. A factor of safety of at least 2.0 against overturning and at least 1.5 against sliding is sought. If necessary, the retaining wall configuration is adjusted until both safety factors are satisfied.

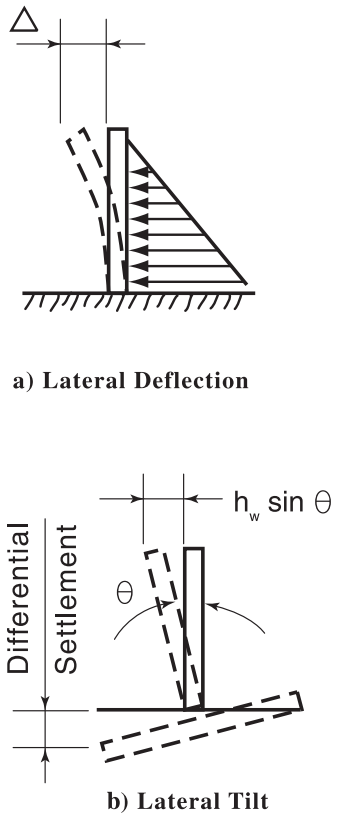

Figure 14-6 Deflection and Tilt

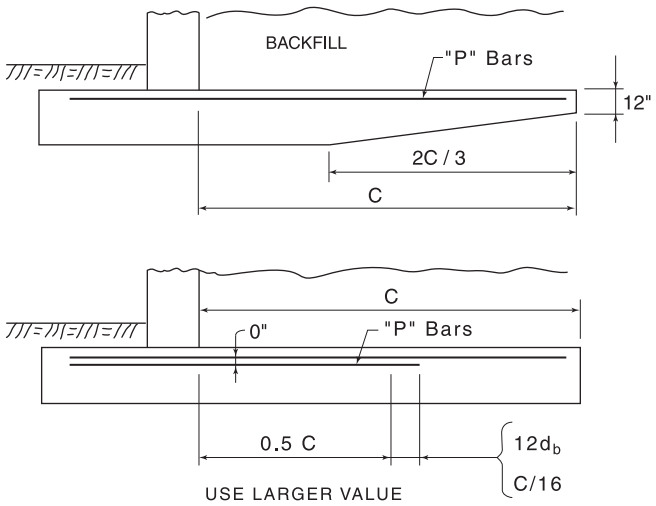

Figure 14-7 Modifications for Base Slab (Heel)

Centerline moments under elastic loads are used to calculate soil pressures for use in estimating settlement and angle of rotation ("tilt"). See Fig. 14-9.

General Notes and Assumptions on Service Load Analyses

1. Determine the safe service load bearing pressure for the in-place subbase system, q_a, and compare it to the tabulated maximum for the soil, loading condition, and wall height of design. It will be noted that the range of tabulated wall heights should be acceptable for most soils. If the bearing pressure is too large, the design of the base must be modified or the subbase improved. Battered pile supports may be required. The stem design can be utilized without redesign if the redesigned base provides the proper shear and moment resistance.

2. Sliding resistance calculations were based upon coefficients of friction, μ, concrete-to-soil in Table 14-1. Some soils with properties other than those assumed in Table 14-1 may not develop the assumed coefficient of friction. Where such soils consist of cohesive soils, calculate sliding based on tests or assume some conservative (1000 lbs/SF max) cohesion resistance. If more exact values of μ are available, and those used here are not conservative with any particular soil used, the tabulated designs must be modified to maintain the factor of safety against sliding ≥ 1.5.

3. A minimum depth of fill of 12 inches is assumed above the top of the toe. For sloping backfill designs, a depth of fill of $0.10h_w$ (minimum 12 inches) above the top of the toe was included in calculating passive pressures on toe and heel. The local Code requirement for depth below the frost line will determine whether the elevation at the bottom of the base requires more than these minimum depths above the top of the base.

4. Length of base, W, is selected such that positive pressure is provided in both the toe and the heel.

5. Length of the toe was assumed equal to $0.20h_w$ (minimum 12 inches).

6. Maximum key depth was set to $0.25h_w$ or 60 in.

FACTORED LOAD DESIGN PROCEDURES

The retaining wall tabulated designs in Chapter 14 differ from other tabulated designs in this book in one important aspect. All other design tabulations are for single *structural elements* while retaining walls are complete *structures*. Even the two-way slab *systems* tabulated in Chapter 9, 10, and 11 are not complete as structures — only the slab element is designed. The cantilevered retaining wall is actually a structure comprising three distinct connected structural elements, four if a key is required. Under ACI 318, several loading conditions must be considered, but the controling combination is assumed to be $1.2D + 1.6H$. For the tabulations herein, each element has been designed conservatively for the load condition critical for that element. Under any given load condition, static equilibrium must be satisfied for all moments of all loads taken about a common point.

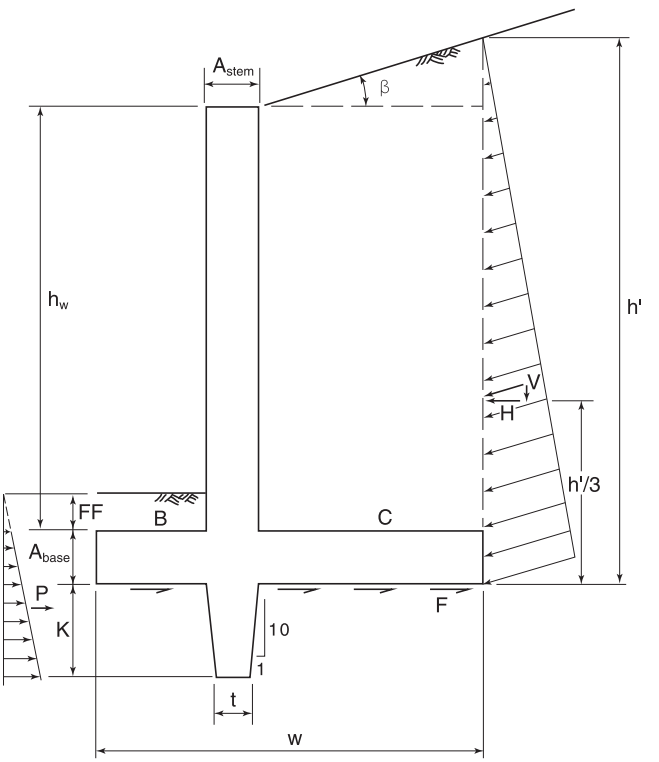

Figure 14-8 Proportioning Base Dimensions for Service Load Conditions

There is the requirement that the moments M_{us}, M_{ut}, M_{uh}, and M_{uk}, (about stem, toe, heel, and key, respectively) must be in equilibrium, that is, $M_{us}+M_{ut}+M_{uh}+M_{uk}=0$.The stem factored moment, M_{us}, is a direct function of load with a simple (1.6) load factor. The stem is the primary element directly resisting the external load. Its reaction to this load indirectly creates the moments in the other elements. The toe factored moment, M_{ut}, is based upon a loading of 1.6 times the soil service load reaction under the toe. The heel factored moment, M_{uh}, is calculated from the weight of the backfill above (with a 1.6 load factor), plus the dead load of the heel itself, minus 1.6 times the force of the soil service pressure underneath, which is also conservatively reduced by 25 percent (i.e. soil reaction is 0.75). This factored heel moment is then compared to the "global" M_{uh} of $M_{us} + M_{uk} - M_{ut}$ and the larger value is used for determining the required reinforcement in the heel. Finally, an upper limit of $M_{uh} \leq M_{us}$ is enforced. The objective is to ensure against premature failure of toe, heel, or key before the stem develops its full factored load at $1.6H$, so that the prescribed overload ($1.6/\phi$) is satisfied for the structure as a whole.

"D" bars in the stem/base were designed for shear at the base of the stem and at the face of the heel.

Stem. Stem design is straightforward with a factor of 1.6 for moment at critical section located at the top of the base. See Fig. 14-10a. Reinforcement ratio of the "O" bars must be limited to ≤ 0.0135 for 3,000 psi concrete (see Chapter 5).

Toe. Soil pressures calculated during the service load analysis are used to determine the upward soil pressures beneath the toe. Downward force of the frontfill and the dead load of the toe itself is conservatively ignored. The soil reaction is multiplied by a 1.6 load factor. See Fig. 14-10d.

The adequacy of the "O" bars in the toe must also be investigated. If the "O" bars, as detailed in Figs. 14-1 or 14-2, do not have enough available embedment length for the tension development of the bar (i.e., available length $< \ell_d$), then the bars must be hooked or headed. Where the tension development length of the "O" bars is longer than the available embedment length, an "H" flag is printed prior to the size and spacing of the "O" bars in the tabulated designs.

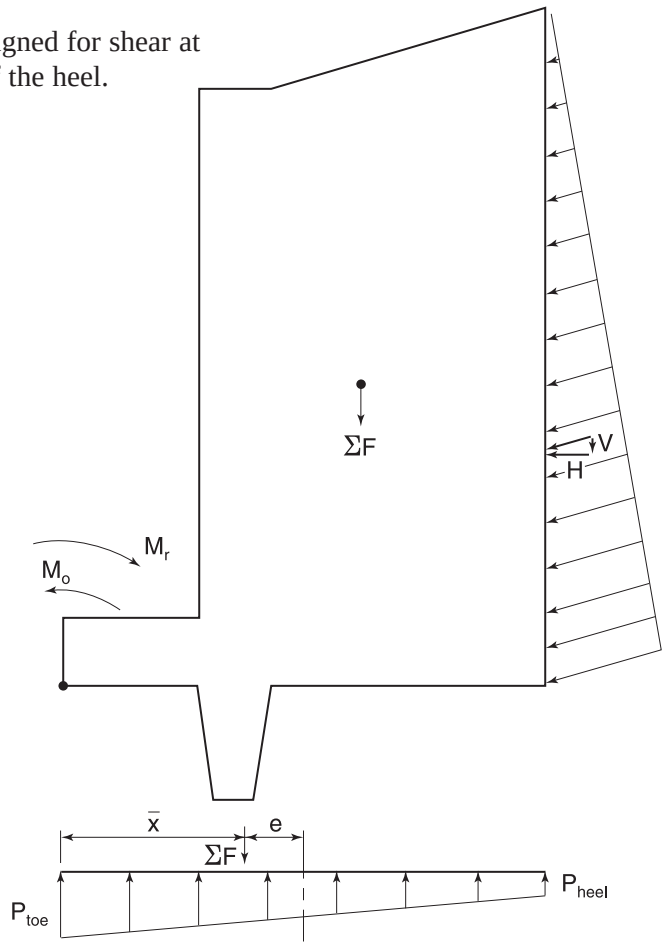

Fig. 14-9 Determination of Base Service Load Pressures

Key. The key is designed to resist the passive force of the soil at the frontface, utilizing a conservative 1.6 load factor. See Fig. 14-10e.

Heel. The heel is designed for the downward load of the soil above, plus the dead load of the heel itself, minus the upward force of the soil reaction underneath. As a conservative measure, the upward soil reaction is reduced 25 percent and a 1.6 load factor is used. The resulting factored moment is then compared to the "global" moment of $M_{us} + M_{uk} - M_{ut}$ and the larger value is selected for designing the heel. Finally, the maximum limit of M_{us} is applied. See Figs. 14-10f and 14-10g.

An "H" flag is printed prior to (indicating that a hook or headed bar is necessary in the toe) or after (hook or headed bar needed in heel) the "P" bars when the tension development length is greater than the available embedment length.

DESIGN

With all dimensions established to provide proper stiffnesses required to control deflection and to provide stability under service load without exceeding soil properties available, the strength design method is used to select Grade 60 reinforcement required under factored loads. See Figs. 14-10 and 14-11.

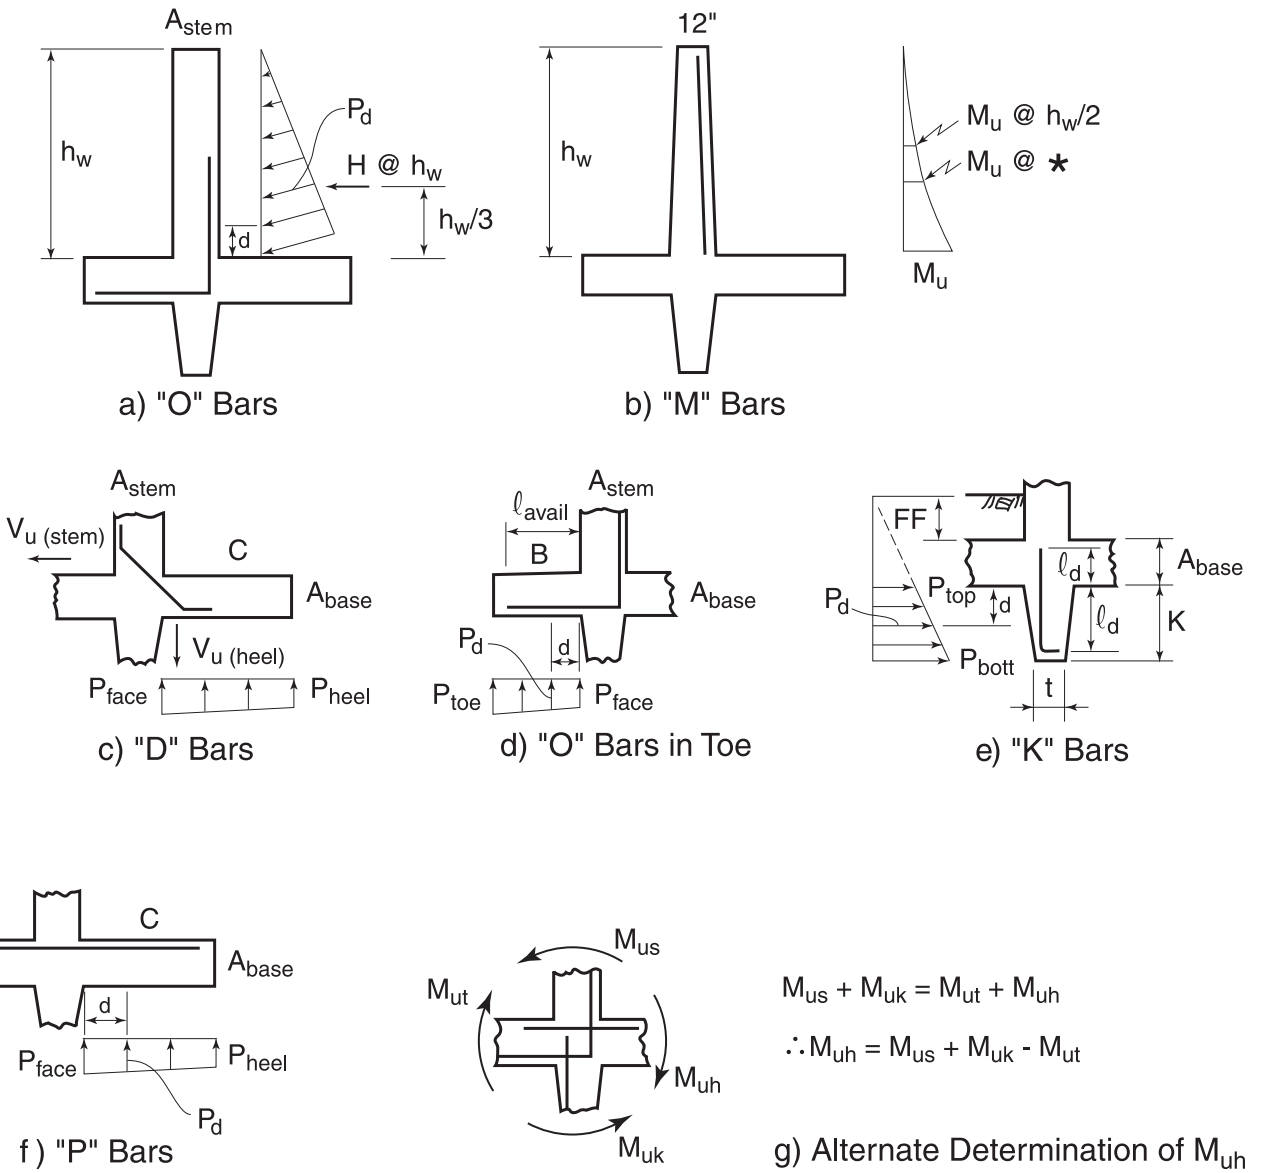

Figure 14-10 Design Loads

I. Strength Design – for Stem (See Fig. 14-10a)

V_{us} at "d" from base = $1.6H\ (h_w - \mathrm{d})^2/h_w{}^2$
$M_{us} = 1.6H\ (h_w/3)$

The quadratic equation for required area of tensile steel in strength design is $M_u = \phi M_n = \phi f_y\, A_s\, (d - a/2)$ where $a = A_s f_y / 0.85 f_c'\, b$. The general solution is,

$$A_s = \frac{1.7 f_c'\, bd}{2 f_y} - \frac{1}{2}\sqrt{\frac{2.89\,(f_c'\, bd)^2}{f_y{}^2} - \frac{6.8 f_c'\, b M_u}{\phi f_y{}^2}}$$

For $f_c' = 3$ ksi, $f_y = 60$ ksi, $b = 12''$ width, and M_u, in kip-in., the solution becomes

$A_s = 0.51\, d - \sqrt{0.26\, d^2 - 0.0189\, M_u}$ in.^{2}/ft.

The "O" bar size is based on a spacing of 15, 12, 9, or 6 inches for walls not over 10 feet high. When the wall height is over 10 feet, the spacing is 9 or 6 inches. For walls not over 10 feet high, the "O" bars extend to the height of the wall less 3 inches. Cut-off locations of the "O" bars for walls over 10 feet high alternates between 0.5 h_w and *, where * is the lap splice length of the "O" and "M" bars, which is the larger of the development length of the larger bar and the lap splice length of the smaller bar.

For walls over 10 feet in height, selection of the "M" bar size is based on the larger amount of required flexural reinforcement at two critical sections: at a distance "*" from the base where half of the "O" bars are assumed effective in flexure (along with all the "M" bars), and at a distance of 0.5 h_w, where only the "M" bars are assumed effective. Factored moments in the wall are based on a function of the cube of the depth below the top of the wall. See Fig. 14-10b. Moments at these two critical sections are calculated as:

M_u at $0.50\ h_w = 0.125\ M_{us}$
M_u at * $= M_{us}\ ((h_w - *)/h_w)^3$

Spacing of the "M" bars is set equal to twice the spacing of the "O" bars for walls over 10 feet high.

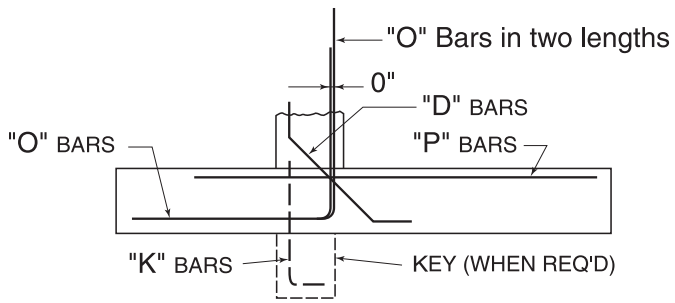

Figure 14-11 Flexural Bar Designations

II. Strength Design for Toe (See Fig. 14-10d)

V_{ut} at "d" from face = $1.6\ [P_d + P_{toe}]\ ((B - d)/2)$
$M_{ut} = 1.6\ [P_{face} + 2P_{toe}]\ (B^2/6)$

Calculate M_{ut} of factored loads on critical section at face of stem and provide A_s required in bottom of toe. Check that "O" bars in toe will be properly developed in the length between the critical section and a point 3 inches from the front of the toe.

III. Strength Design for Heel (See Figs. 14-10f and 14-10g)

V_{uh} at "d" from face
$= [1.2A_{base}(C - d)150 + 1.6(w_3 + w_4)](C - d)/C$
$- 0.75(1.6)[P_d + P_{heel}]((C - d)/2)$
$M_{uh} = [1.2A_{base}(C)150(C/2) + 1.6(w_3(C/2) + w_4(2C/3)]$
$- 0.75(1.6)[P_{face} + 2P_{heel}](C^2/6)$

Standard specifications (AREMA, etc.) require that the heel be designed to meet either of two criteria:

(1) The heel must be capable of resisting *all* vertical loads above it (as a cantilever) minus the upward soil pressure below it. Or,

(2) "More exact analyses" may be applied.

Note that criterion (1) is generally conservative, except for the reduction for upward soil pressure from below. To allow for a partial reduction of soil support under the heel, the upward soil pressure is reduced by 25 percent. Factored load moment for heel *need not be larger* than factored moment for stem: $M_{uh} \le M_{us}$. Factored load moment for the heel *must be equal or*

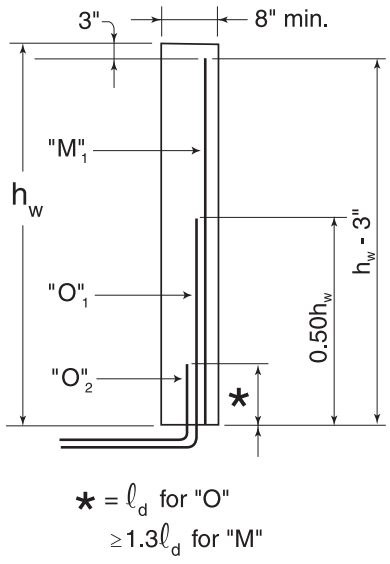

Figure 14-12 Stem Bar Designations and Cut-off Points for $h_w > 10'$

larger than the difference between factored load moments of stem, key, and toe: $M_{uh} \geq M_{us} + M_{uk} - M_{ut}$.

Development of "P" bars on both sides of the stem must be checked.

IV. Strength Design for Key (See Fig. 14-10e)

Passive soil pressures:

$P_{top} = K_p\,(FF + A_{base})\,\gamma$

$P_d = K_p\,(FF + A_{base} + d)\,\gamma$

$P_{bott} = K_p\,(FF + A_{base} + K)\,\gamma$

Factored moment:

$M_{uk} = 1.6\,[P_{top} + 2P_{bott}](K^2/6)$

Factored shear at d from face:

$V_{uk} = 1.6\,[P_d + 2P_{bott}]((K - d)/2)$

Development of "K" bars is determined and checked against the depth of the key.

Example 1

This example shows how a surcharge load can be accommodated using the tabulated designs.

Given conditions:

1. f'_c = 3,000 psi; f_y = 60,000 psi
2. 11-ft wall, level backfill, 2-ft surcharge
3. Soil properties: γ = 115 pcf, ϕ = 30°, μ = 0.45

Solution:

From Page 14-23, for a 13′ (i.e., 11′ + 2′) wall, see Fig. 14-13. Calculated deflection (0.616 in.) must be adjusted for an 11-ft wall:

$\Delta \approx 0.616\ (11/13) = 0.521$ in.

Concrete quantity (0.78 cy/lf) must also be adjusted:

0.78 – 2 * 11/12 * 1/27 = 0.78 – 0.07 = 0.71 cy/lf

Total weight of reinforcing steel (70.09 lbs/lf) must be adjusted:

"M" Bars: #5 @ 12 × 2′-0″ = 1.043 (2) 12/12 = 2.09 lbs/lf
"L_w" Bars: 2 - #5 = 2 (1.043) 1 = 2.09 lbs/lf
4.18 lbs/lf

Total weight of reinforcing steel
= 70.09 – 4.18 = 65.91 lbs/lf

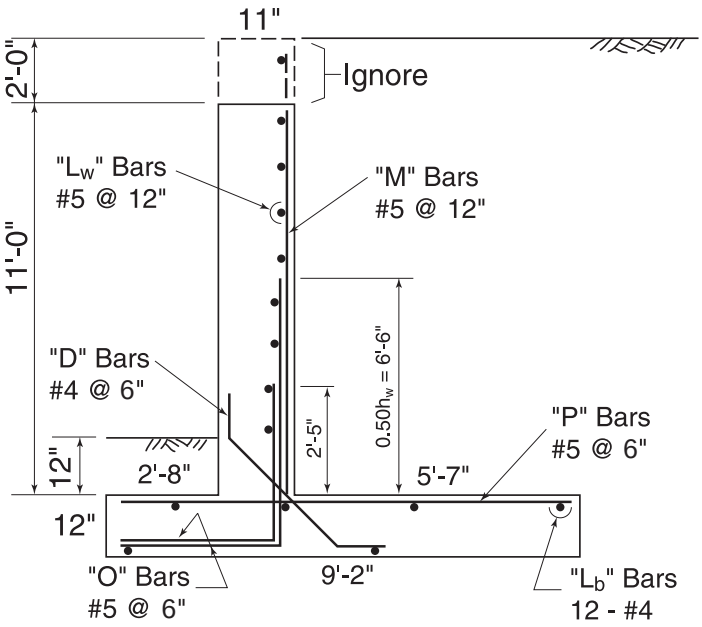

Figure 14-13 Example 1

Example 2

This example shows how a tabulated design is adjusted for contraction joints.

Given conditions:

1. f'_c = 3,000 psi; f_y = 60,000 psi
2. 18-ft wall, sloping backfill ($\beta = \phi$)
3. Soil properties: γ = 130 pcf, ϕ = 35°, μ = 0.55
4. Assume vertical shrinkage-dissipating joints in the wall at 40-ft spacing

Solution:

From Page 14-44:

Deflection = 0.892 in., Concrete quantity = 2.52 cy/lf

See Fig. 14-14. For joints spaced at 40 ft, steel ratio of 0.0041 is suggested, of which two-thirds will be placed in the front face. Resulting areas of shrinkage and temperature bars:

Front face = 0.0027 (12) 22 = 0.71 in.^{2}/ft = #8 @ 12″
Back face = 0.0014 (12) 22 = 0.37 in.^{2}/ft = #6 @ 12″

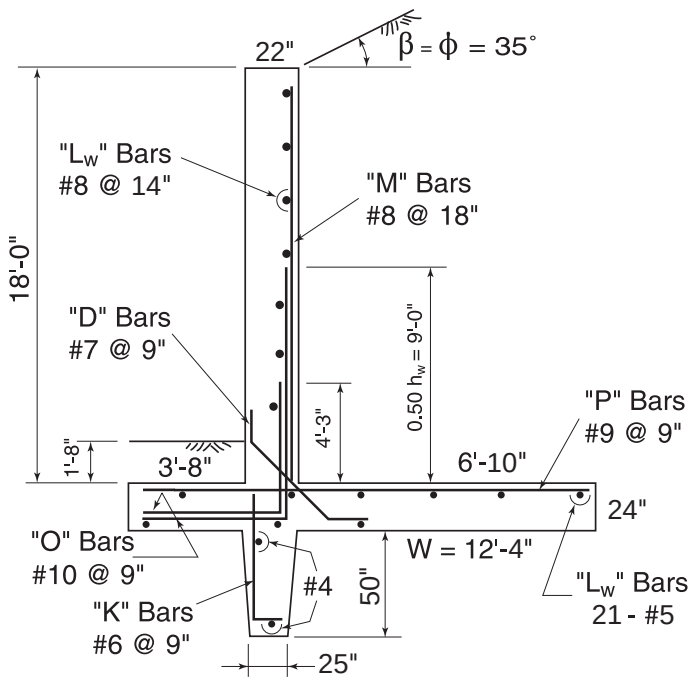

Figure 14-14 Example 2

Note that this reinforcement will replace the tabulated "L_w" bars (#8 @ 14″). Details for this reinforcement is shown in Figure 14-15.

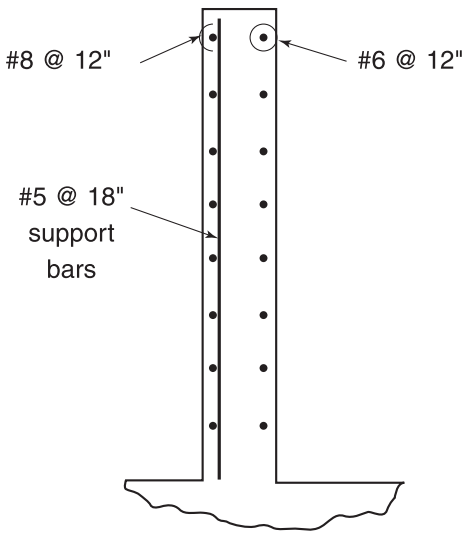

Figure 14-15 Shrinkage & Temperature Steel in Stem of Example 2

Reinforcement quantity (251.16 lbs/lf) must be adjusted:

Original "L_W" Bars: #8 @ 14″ = 1′ × 2.67 × $\frac{(18 \times 12)}{14}$
= 41.19 lbs/lf

#8 Front Face: #8 @ 12″ = 1′ × 2.67(18)
= 48.06 lbs/lf
#6 Back Face: #6 @ 12″ = 1′ × 1.502(18)
= 27.04 lbs/lf
#5 Support bars: #5 @ 18″ = 18′ × 1.043 (12/18)
= 12.52 lbs/lf
Total weight of reinforcing steel
= 251.16 – 41.19 + 48.06 + 27.04 + 12.52
= 297.59 lbs/lf

MANUAL REVIEWS

MANUAL EXAMPLE 1—LEVEL BACKFILL

f_c' = 3,000 psi; f_y = 60,000 psi, 9-ft wall
Soil: γ = 115 pcf; ϕ = 35º; μ = 0.45
Minimum safety factors:
1.50 (sliding), 2.0 (overturning)
SR = Soil Reaction = 0.75

From tabulated design on Page 14-25:

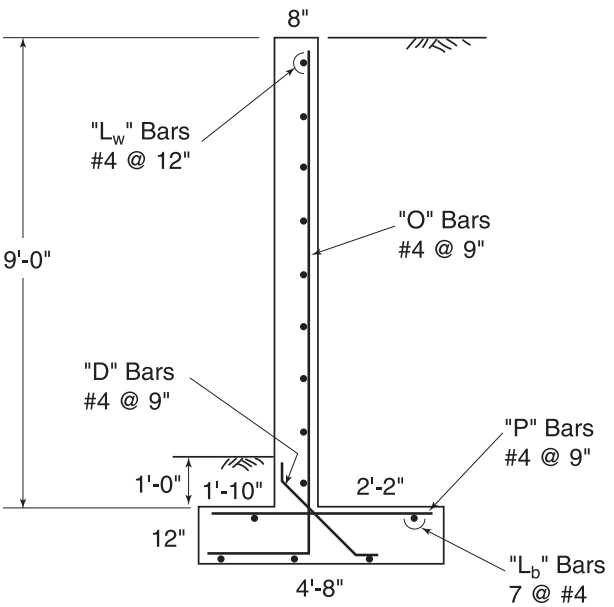

Figure 14-16 Manual Example 1

Stability (See Figure 14-8)
Weights:

Wall = $A_{stem}\ h_w\ \gamma_c$ = (8/12) 9 (150)	=	900 lbs
Base = $A_{base}\ W\ \gamma_c$ = (12/12)4.667(150)	=	700 lbs
Backfill = $C\ (h_w)\ \gamma_s$ = 2.167 (9) 115	=	2,243 lbs
W_T	=	3,843 lbs

$K_a = \tan^2 (45^o - \phi/2) = \tan^2 (45 - 35/2) = 0.271$
$h' = h_w + A_{base} = 9 + (12/12) = 10$ ft
$H = (1/2)\ Ka\ (h')^2\ \gamma_s = 0.5\ (0.271)\ 10^2\ (115) = 1{,}558$ lbs
$K_p = \tan^2 (45^o + \phi/2) = \tan^2 (45 + 35/2) = 3.690$
$P = (1/2)\ Kp\ [(FF + A_{base})^2 - FF^2]\ \gamma_s$
= 0.5 (3.690) $[(1 + 12/12)^2 - 1^2]$ 115 = 637 lbs
$F = \mu W_T$ = 0.45 (3,843) = 1,729 lbs
Safety Factor (sliding)
= $(F + P)/H$
= (1,729 + 637)/1,558
= 1.519 > 1.50, Okay (1.52 printed)

Moments about Toe:

Wall = $W_w(B + A_{stem}/2)$
= 900 (1.833 + 8/24) = 1,950 ft-lbs

Base = $W_B\,(W)/2$ = 700 (4.667)/2 = 1,633 ft-lbs

Backfill = $W_{BA}\ (W - C/2)$
= 2,243(4.667 – 2.167/2) = 8,038 ft-lbs

M_T = 11,621 ft-lbs

$M_o = H\,(h')/3$ = 1,558 (10) /3 = 5,193 ft-lbs

Safety Factor (overturning) = M_T/M_o = 11,621/5,193
= 2.238 > 2.0, Okay (2.24 printed)

Deflection

$\Delta = K_a\,(h_w)^5\gamma_c \cos\beta/(30 \times 10^6\, t^3)$
= $0.271(9)^5\,115(1)/(30 \times 10^6 8^3)1728$
= 0.207 in. (0.207 printed)

$\Delta_{max} = h_w/240$ = 12(9) / 240 = 0.450 in. > 0.207, Okay

Soil Service Pressures (See Figure 14-9)

$\Sigma F = W_T$ = 3,843 lbs, $\Sigma M_r = M_t$ = 11,621 ft-lbs

M_o = 5,193 ft-lbs

$\bar{x} = (M_r - M_o)/\Sigma F$ = (11,621 – 5,193)/3,843
= 1.673 ft

$e = W/2 - \bar{x}$ = 4.667/2 – 1.673 = 0.661 ft

$e_{max} = W/6$ = 4.667/6 = 0.778 > e, Okay

$P_{toe} = (\Sigma F/W)\,[1 + 6e/W]$
= (3,843/4.667) [1 + 6(0.661)/4.667]
= 823 + 700 = 1,523 psf (1,523 printed)

$P_{hee1} = (\Sigma F/W)\,[1 - 6e/W]$
= 823 – 700 = 123 psf (123 printed)

Reinforcement in Stem, "O" Bars (See Figure 14-10a)

$H\ @\ h_w = (1/2)\,K_a\,(h_w)^2\,\gamma_s$
= 0.5 (0.271) 9^2 (115) = 1,262 lbs

$V_u = 1.6\,(H\ @\ h_w)$ = 1.6 (1,262) = 2,019 lbs

$M_u = V_u(h_w)$ / 3 = 2,019 (9)/3
= 6,057 ft-lbs = 72.68 in.-k

$d = A_{stem} - 2'' - 0.25''$ = 8-2.25 = 5.75 in.

$C_1 = 1.7 f_c'\ bd/(2\,f_y)$ = 1.7(3)12(5.75) / (2(60))
= 2.933 in.^{2}

$C_2 = 6.8\,f_c'\,bM_u\,/(4(0.9)\,f_y{}^2)$
= $6.8(3)12\,(72.68)/(4(0.9)60^2)$ = 1.373 in.^{4}

$A_s = C_1 - \sqrt{C_1{}^2 - C_2} = 2.933 - \sqrt{2.933^2 - 1.373}$
= 0.244 in.^{2}/ft

S & T: 0.0018bt = 0.0018 (12) 8 = 0.173 in.^{2}/ft

Required A_s in toe = 0.259 in.^{2}/ft (see calculations for toe reinforcement)

$\therefore A_s$ = 0.259 in.^{2}/ft

"*O*" Bars: #4 @ 9″ = 0.20 (12/9)
= 0.267 in.^{2}/ft > 0.259, Okay

Confirm section is tension-controlled, so ϕ = 0.90

$$\rho = \frac{A_s}{bd} = \frac{0.267}{8(12)} = 0.00278$$

From Chapter 5 for f_c' = 3,000 psi and f_y = 60,000 psi:
Max ρ = 0.0135 > 0.00278
Hence, ϕ = 0.90

Shear check:

$H\ @\ (h_w - d) = H\ @\ h_w\,(h_w - d)^2/h_w{}^2$
= $1{,}262\,(9 - 5.75/12)^2/9^2$
= 1,131 lbs

$V_u = 1.6H\ @\ (h_w - d)$ = 1.6 (1,131)
= 1,810 lbs

$\phi V_c = \phi\ 2\sqrt{f_c'}\ 12(d)$
= $0.75\ (2)\sqrt{3{,}000}\ 12(5.75)$
= 5,669 lbs > 1,810 lbs, Okay

Reinforcement in Stem & Base, "D" Bars (See Figure 14-10c)

$V_{u\ (stem)}$ = 2,019 lbs

$V_{u\ (heel)}$: Backfill = $1.6W_{BA}$ = 1.6(2,243) = 3,589 lbs

Heel = $1.2A_{base}\ (C)\ \gamma_c$
= 1.2(12/12)(2.167)(150) = 390 lbs

$V_{u\ (down)}$ = 3,979 lbs

$P_{face} = P_{heel} + (P_{toe} - P_{heel})\ C/W$
= 123 + (1,523 – 123) 2.167/4.667
= 773 psf

$V_{u\ (up)} = SR\ (1.6)\ [P_{face} + P_{heel}]\ C/2$
= 0.75 (1.6) [773 + 123] 2.167/2 = 1,165 lbs

$\therefore V_{u\ (heel)} = V_{u\ (down)} - V_{u\ (up)}$ = 3,979 – 1,165
= 2,814 lbs

V_u = maximum of $V_{u\ (stem)}$ and $V_{u\ (heel)}$
= 2,814 lbs

$A_s = V_u / (0.75\ (0.707)\ f_y)$
= 2,814 / (0.75 (0.707) 60,000)
= 0.088 in.^{2}/ft

"*D*" Bars: #4 @ 9″ = 0.20 (12/9)
= 0.267 in.^{2}/ft > 0.088, Okay

Reinforcement in Stem, "L_w" Bars

For #4 bars, $A_s = 0.002bt$ = 0.002 (12) 8 = 0.192 in.^{2}/ft

"L_w" Bars: #4 @ 12″ = 0.20 in.^{2}/ft > 0.192, Okay

Reinforcement in Base (Toe), "O" Bars (See Figure 14-10d)

$P_{face} = P_{toe} - (P_{toe} - P_{heel})\,B/W$
= 1,523 – (1,523 – 123) 1.833/4.667
= 973 psf

$M_u = 1.6\ [P_{face} + 2P_{toe}]B^2/6$
= $1.6\ [973 + 2\,(1{,}523)]\ (1.833)^2/6$
= 3,601 ft-lbs = 43.21 in.-k

$d = A_{base} - 3'' - 0.5'' - 0.25''$ = 12 – 3.75 = 8.25 in.

C_1 = 1.7 (3) 12 (8.25) / (2(60)) = 4.208 in.^{2}

C_2 = 6.8 (3) 12 (43.21) / (4(0.9) 60^2) = 0.816 in.^{4}

$A_s = 4.208 - \sqrt{4.208^2 - 0.816}$ = 0.098 in.^{2}/ft

S & *T*: 0.0018bt = 0.0018 (12) 12
= 0.259 in.^{2}/ft

$\therefore A_s = 0.259$ in.^{2}/ft

$\rho = \dfrac{0.259}{12(12)} = 0.00180 < 0.0135$

Hence, $\phi = 0.90$

"*O*" Bars: #4 @ 9″ = 0.20 (12/9)
= 0.267 in.^{2}/ft > 0.259, Okay

Check development of "*O*" bars in toe:

ℓ_{avail} = B – 3″ = 22 – 3 = 19 in.

ℓ_d for #4 @ 9″ with 3″ cover = 13 in. (Table 5-3(a))

$\ell_{avail} > \ell_d$, Okay

Shear check:

P at "*d*" from face
$= P_{toe} - (P_{toe} - P_{heel})(B - d)/W$
$= 1{,}523 - (1{,}523 - 123)(22 - 8.25)/56$
= 1,180 psf

$V = (P_{toe} + P_d)(B - d)/2$
$= (1{,}523 + 1{,}180)(22 - 8.25)/12/2$

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

CANTILEVERED RETAINING WALLS

SOIL PROPERTIES: γ = 115 pcf, ϕ = 40°, μ = 0.45

BACKFILL SLOPE: 40°

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) Calculated for uniform thickness base and stem. Deduct for tapered stem or base. Nominal dimensions used for calculations. Actual quantities for concrete cast against earth, especially for keys, are larger. User should allow additional amounts based upon job conditions.

(2) 'H' designates a standard hook or headed bar. If an 'H' flag appears before 'O' or 'P' bar callout, then use hook or headed bar in toe of base. If 'H' appears after 'P' bar callout, then use hook or headed bar in heel of base. Alternatively, designer to resize bar.

(3) If optional splice is used (Fig. 14-1) for $h_w \le$ 10'-0", provide 'M' bars at same size and spacing as 'O' bars with length = h_w – 3". See Fig. 14-1 to establish cut-off height for 'O' bars.

(4) Lengths alternate for 'O' bars. See Fig. 14-2.

(5) 'Lw' bars are 0.0025 A_g (0.002 A_g for sizes #5 and smaller).

(6) 'K' bars are to have 90° hook in bottom of key. Where 'H' by 'K' bar is shown use 180° hook. Add longitudinal bars in key: 2-#4 where 'K' bars are shown.

(7) Does not include lap allowance for horizontal bars, which varies with joint spacing, stagger, etc.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 18" x 36"

Short columns – no sidesway
Bending on major or minor axis

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 20" x 38"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 24"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 30"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 34"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 38"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 40"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 24" x 30"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 24" x 38"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 24" x 42"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 24" x 48"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 5,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 18" x 36"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 6,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 20" x 34"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 6,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 24"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 6,000 psi f_y = 60,000 psi

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 34"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 6,000 psi f_y = 60,000 psi

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.
(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 22" x 44"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 6,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

(1) "0% f_y" indicates zero tension in bars on the tension side, "50% f_y" indicates 50% f_y stress in bars on the tension side, and "100% f_y" indicates 100% f_y stress (i.e., balance point) in bars on the tension side.

(2) L = long face, S = short face, E = each face; 3E = 3 bars each face; 2L-3S = 2 bars each long face and 3 short face.

RECTANGULAR TIED COLUMNS 24" x 26"

Short columns – no sidesway
Bending on major or minor axis

f'_c = 6,000 psi f_y = 60,000 psi
ϕM_n in inch-kips ϕP_n in kips

BARS	RHO	AXIS	Max Cap		0% f_y		25% f_y		50% f_y		100% f_y		ε_t = 0.005		Zero Axial Load
