Volume 2

Foreword

This comprehensive book traces the structure and economies of the healthcare system in the United States from its origins through the present day, as the foundation for the financial appraisal of healthcare enterprises, assets, and services.

It is based on exhaustive research and the 20-plus years of experience of Bob Cimasi's firm, Health Capital Consultants (its library holds over 50,000 books, papers, etc.). The book is heavily documented—the first chapter alone has more than 300 footnotes, and the second, more than 650!

While Bob is one of the most incisive authors covering the healthcare system, he is at the same time one of the system's harshest critics. For example, he makes reference to "the falling rank of U.S. health status as compared to other developed nations," and

> *The last two decades have seen the accelerated transformation of the U.S. healthcare professions into a service industry enterprise, whereby health services have been unitized, protocolized, and homogenized, in order to facilitate their sale in the market, just as if they were any other fungible market commodity, e.g., soybeans and pork bellies.*

Note his frequent use of italics for emphasis, so that the reader can almost hear him speaking.

His chapter on technology gets into the value drivers of management technology, as well as what we more conventionally think of as scientific technology. For example, he offers statistics on the rise in the incidence, complexity, and cost of both Electronic Health Records (EHRs) and the new version of the *International Statistical Classification of Diseases and Related Health Care Problems* (ICD). Originally established in 1893, the ICD is scheduled to implement its tenth revision, ICD-10, in 2014, which will increase the number of procedure codes from 4,000 to 72,000 and diagnostic codes from 14,000 to 69,000.

Bob Cimasi introduces a lot of healthcare industry–specific acronyms, (e.g., ACA for Affordable Care Act) and defines each acronym the first time it is used, but most often not subsequently, so readers need to pay attention to the sidebars of key terms included in each chapter and the acronyms

appearing at the end of each chapter (as well as the Glossary found in Volume 2) so that they don't get lost in the sea of acronyms, which are seemingly endemic in healthcare.

As a layman with respect to healthcare, I was surprised and impressed with the recent developments in clinical technology, both diagnostic and treatment, that Bob summarizes in his extensive chapter on healthcare technology.

He liberally sprinkles illustrative tables, charts, and graphs where applicable throughout the text. These are often quite helpful to the reader to give more detail or a more lucid feeling for what the text is saying.

Prior to the chapters on the valuation of specific types of healthcare entities, there are three excellent general chapters on valuation in Volume 2, "Basic Valuation Tenets"; "Valuation Approaches and Methods"; and "Costs and Sources of Capital." These comprehensive chapters delve into more detail than I perceive the average reader may need to know, so I believe that the average reader can skip over some of the more esoteric parts of these chapters without losing the central essence of them, while the more advanced professional may seek to focus on this robust content.

The several chapters on the valuation of specific types of healthcare enterprises, services, and their various tangible and intangible assets demonstrate Bob's insightful knowledge of the healthcare industry and its components. For each major category of enterprises within the healthcare professions, he explains the nature, value drivers, and relevant trends of each subcategory, from hospitals to various types of clinical and nonclinical services.

For example, in the chapter on valuing inpatient enterprises, he points out that for hospitals, both capacity and occupancy rates are among the value drivers, and he provides a table of average occupancy rates by ownership category and size from 1975 through 2009. He gives a useful chart of other variables to consider and another convenient chart of sources of benchmarking data for these variables.

Readers should not delude themselves into believing that they will become instant experts in healthcare valuation. This is not a "how to" book. However, it provides both breadth and depth of detailed understanding into many specialties within the healthcare field, for both facilities and services. At this time of the greatest evolution in the history of healthcare valuation, it provides both exhaustively researched information and keen insight into value drivers and trends in most aspects of the healthcare field. It is a monumental contribution to the literature about the valuation of the healthcare industry and the medical profession.

Preface

The great thing in this world is not so much where we stand, as in what direction we are moving.

—Oliver Wendell Holmes

This year marks my thirtieth as a healthcare appraiser and the twentieth anniversary of Health Capital Consultants (HCC), the consulting firm I started in 1993. During that period, I've witnessed and experienced unprecedented change in both the healthcare industry and the valuation profession, as described in the following sections.

THE CHANGING HEALTHCARE INDUSTRY PARADIGM: THE CORPORATIZATION OF MEDICINE

The *corporatization* of medicine and the rise of *for-profit* healthcare have replaced the cottage industry of *Marcus Welby*–physician practices and the small community hospitals that were prevalent at the start of my career. The last three decades have seen the accelerated transformation of the medical professions into U.S. healthcare service *industry* enterprises, whereby healthcare services have been *unitized*, *protocolized*, and *homogenized*, in order to facilitate their *sale* in the market, just as if they were any other fungible market commodity, little differentiated from soybeans and pork bellies. This new healthcare delivery paradigm has accelerated alongside the *corporatization* of medicine, as demonstrated by the increase in large hospital systems; the retreat from private practice of medicine to employed physicians; and the consolidation of payors by large, for-profit health insurance firms.

CHANGES IN THE ENTERPRISES, ASSETS, AND SERVICES SUBJECT TO APPRAISAL AND SCOPE OF ENGAGEMENT

This changing paradigm has resulted in an evolving array in the types of *enterprises*, *assets*, and *services* that are subject to being appraised. As the complexities associated with healthcare transactions have increased

significantly, there has been a simultaneous increase in the opportunities available for the business valuation profession in scope and diversity arising from the growing demand for analysis related to both *Fair Market Value* and *commercial reasonableness* opinions for pending transactions. There will inevitably be fewer engagements focused on appraising solo and small group medical practices, as the healthcare industry consolidates, and greater numbers of physicians and other providers form larger organizations based on new emerging models of organizing the delivery of care.

These *emerging healthcare organizations* (EHOs) will continue to be driven by the need to develop new affiliations, capital structures, and governance configurations, in order to align the interests of patients/consumers with the various U.S. healthcare industry subsectors, including *inpatient* and *outpatient* providers; *payors* and *managed care entities*; and *suppliers* and *vendors*, in such a manner as to address the emergence of *value-based reimbursement* initiatives focused on both lowering costs and improving quality. These factors have necessarily also changed the scope of appraisal assignments, with an increasing volume of appraisals focused on property interests other than at the *total enterprise* level, and more emphasis on discrete property interests and services, as well as more focused attention on the *highest and best use* concept and the selection of the appropriate *premise of value*, that is, either *value in-use as a going concern* or *value in-exchange*. Given these complexities, the opportunities for additional collaboration among the various appraisal disciplines, such as business valuation, intangible assets and intellectual property, real estate, and machinery and equipment and personal property, have never been greater.

CAPITAL MARKET CHANGES: AVAILABILITY OF CAPITAL AND NEW FINANCIAL INSTRUMENTS

Changes in the capital markets related to both the availability of capital sources and the types of financial instruments used in financing healthcare transactions, particularly in recent years following the Great Recession, have transformed the way that healthcare providers, as well as the healthcare transactional marketplace, operate.[1] Neither healthcare enterprises nor the *capital markets* in which they operate, exist within a *vacuum*. Wide-ranging *factors* have an impact on the global and national economy and *reverberate* through markets, affecting the functioning of *capital markets* in healthcare,

[1] As with other industries, healthcare was dramatically affected during the difficult years following the collapse of the capital markets from 2007 through 2009.

as well as in other industries. The effects of the economic downturn of the Great Recession included a dramatic *retraction in the availability of capital*, as well as the *imposition of strict lending conditions* on those few credits that were being granted, even for stable and profitable healthcare enterprises.[2]

CHANGES IN THE VALUATION LITERATURE AND EDUCATION

The valuation profession has also progressed significantly during the last three decades. When I first began my appraisal education in the late 1970s, the availability of business valuation literature related to the appraisal of closely held enterprises was virtually nonexistent, with only a few seminal interdisciplinary valuation works, for example, Taussig's *Principles of Economics* (1918), Bonbright's *The Valuation of Property* (1937), and Babcock's *Appraisal Principles and Procedures* (1968), with most other authoritative texts relating only to real estate appraisal and corporate finance.[3] However, starting in the 1970s, several books began to address (albeit slowly) the appraisal of other closely held businesses and business interests.[4] During the next two decades, several additional texts related to appraising closely held business enterprises were published, including:

- **1977:** *How to Price a Business: A Special Report* by Raymond C. Miles;
- **1981:** *Valuing a Business* by Shannon Pratt;
- **1984:** *Basic Business Appraisal* by Raymond C. Miles; and
- **1987:** *Appraisal and Valuation: An Interdisciplinary Approach* by Richard Rickert.[5]

[3] F. W. Taussig, *Principles of Economics* (New York: Macmillan, 1918); James C. Bonbright, *The Valuation of Property* (New York: McGraw-Hill Book Company, 1937); Henry A. Babcock, *Appraisal Principles and Procedures* (Washington, DC: American Society of Appraisers, 1989).

[4] For example, McCarthy and Healy's *Valuing a Company*, published by John Wiley & Sons, in 1971, devoted just four pages to valuing professional practices and services companies.

[5] Raymond C. Miles, *How to Price a Business: A Special Report by Raymond C. Miles* (Englewood Cliffs, NJ: Institute for Business Planning, 1977); Shannon P. Pratt, DBA, CFA, CFP, ASA, *Valuing a Business* (Homewood, IL: Dow Jones-Irwin, 1981); Raymond C. Miles, *Basic Business Appraisal* (New York: John Wiley & Sons, 1984); Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach* (Washington, DC: American Society of Appraisers, 1987).

Beginning in the 1980s, the cannon of professional valuation literature related to appraising professional practices, including medical practices, began to emerge, including such titles as:

- **1980:** *How to Value Professional Practices* by Glenn Desmond;
- **1981:** *Valuing a Medical Practice* by the American Medical Association;
- **1986:** *Valuing Small Businesses and Professional Practices* by Shannon Pratt;
- **1987:** *New Trends in Dental Practice Valuation and Associateship Arrangements* by James Jackson and Roger Hill;
- **1988:** *Selling the Medical Practice* by Madeleine Pelner Cosman;
- **1989:** *Understanding the Valuation of Medical Practices* by James Unland;
- **1990:** *Valuing Professional Practices* by James Horvath; and
- **1991:** *Financial Valuation of Your Practice* by Linda Ginsburg.[6]

Since that time, there has been a flurry of books and peer-reviewed journal articles, as well as academic research sources and industry newsletters, related to the various aspects of financial valuation, including the application of *cost of capital*, *tax affecting*, and *discounts for lack of marketability* to the valuation of closely held businesses and professional practices. Today, there are now excellent treatises and other authoritative texts and sources related to those aspects of financial valuation, as well as benchmarking and forecasting in both the transactional and litigation support arenas.

While healthcare financial appraisal literature has grown exponentially in the last 10 years, its very availability and the volume of information present a challenge to all professional consultants working at the forefront of this competitive healthcare industry. Simply stated, how do we find the

[6] Glenn M. Desmond, *How to Value Professional Practices* (Los Angeles: Valuation Press, 1980); *Valuing a Medical Practice* (Monroe, WI: American Medical Association, 1981); Shannon Pratt, DBA, CFA, CFP, ASA, *Valuing Small Businesses and Professional Practices* (Homewood, IL: Dow Jones-Irwin, 1986); James B. Jackson and Roger K. Hill, *New Trends in Dental Practice Valuation and Associateship Arrangements* (Chicago: Quintessence Publishing, 1987); Madeleine Pelner Cosman, *Selling the Medical Practice* (Tenafly, NJ: Bard Hall Press, 1988); James J. Unland, *Understanding the Valuation of Medical Practices* (Chicago: Health Capital Group, 1989); James L. Horvath, Ca, CBV, ASA, CCH, *Valuing Professional Practices* (Canadian Limited, 1990); Linda G. Ginsburg, *Financial Valuation of Your Practice* (Los Angeles: Practice Management Information Corporation, 1991).

time to sort through an accelerating ocean of information and data, select what is relevant, analyze it, and report it to our clients in a comprehensible, timely, and cost-effective manner? I addressed these challenges in my career by making a commitment to act on behalf of those providers who lacked the resources to adapt to change quickly enough to effectively compete in today's intensely competitive and dynamically turbulent market. Toward that end, the development of a disciplined healthcare finance and economics research staff and library resource was established as the focus of the core services that HCC delivers to its clients.

CHANGE IN VALUATION PROFESSION STANDARDS

Valuation standards and codes of ethics have also evolved during the last 30 years, concurrent with the development of professional business valuation designations by the American Society of Appraisers, the Institute of Business Appraisers, the National Association of Certified Valuators and Analysts, and the American Institute of Certified Public Accountants. The emergence of these various groups in promulgating standards has sometimes presented the appraisal community with conflicting valuation standards—perhaps due, in part, to changes in accounting concepts and procedures, for example, International Financial Reporting Standards (IFRS) versus Financial Accounting Standards Board (FASB) pronouncements.

More recently, the International Valuation Standards Council (IVSC) and other groups, building on the previous efforts of CLARENCE to develop the international glossary of business valuation terms, and the National Association Business Valuation Standards Council, which attempted to *harmonize* the standards of various appraisal organizations, have made efforts to consolidate professional standards. The issuance of judicial gatekeeping authority regarding expert witness testimony emanating from *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, decided by the U.S. Supreme Court in 1993, superseded the *Frye* (1923) standard in federal courts regarding the admissibility of *scientific* expert testimony, and in 1999, the *Kumho Tire v. Carmichael* case held that *Daubert*'s factors should be extended to apply to *nonscientific* expert testimony, thereby setting additional thresholds and standards for appraisers.[7]

[7] *Frye v. US,* 293 F. 1013 (D.C.C. 1923); *Daubert v. Merrell Dow Pharms., Inc.*, 509 U.S. 579 (1993); *Kumho Tire v. Carmichael*, 526 U.S. 137 (1999).

CHANGES IN REGULATORY SCRUTINY

During the last several years, there has been intensifying regulatory scrutiny related to the healthcare transactional marketplace regarding the potential for Anti-kickback, Stark, and other fraud and abuse violations involving Medicare and other government payors. Initiatives such as the Fraud Enforcement and Recovery Act (FERA), the Healthcare Fraud Prevention and Enforcement Action Team (HEAT), and the Medicare Fraud Strike Force have only been intensified with the passage of the 2010 Patient Protection and Affordable Care Act (ACA). A significant portion of this regulatory scrutiny has focused on the issues of Fair Market Value and *commercial reasonableness* related to the consideration being paid in transactions between tax-exempt hospital organizations to for-profit physician groups as part of the massive consolidation and integration initiatives currently being undertaken.

There has also been heightened regulatory scrutiny and the potential for severe penalties aimed at appraisers under Section 6695A of the Pension Protection and Affordable Care Act of 2006 for "substantial and gross valuation misstatements attributable to incorrect appraisals" that were "prepared by a person who prepared an appraisal of the value of property and who knew, or should reasonably have known, the appraisal would be used in connection with a return or claim for refund."[8]

CHANGES IN CLIENT EXPECTATIONS

Client expectations have also evolved, particularly as a result of technological advancements that have transformed the manner by which we communicate with our clients. The days of hanging wet copy fax pages on a clothesline to dry and using a 56K dial-up modem have been replaced with cell phones, e-mail, instant messaging, video teleconferencing, and secure *back offices* and *data rooms*. Each of these advances has come with an accompanying rise in client expectations and demands for access to appraisers, as well as a rise in the requirement for appraisers to be instantaneously accessible throughout the engagement. The way in which our financial models are developed and prepared has also evolved, largely due to the accessibility

[8] Substantial value is 150 percent or more than the amount determined to be correct (income tax); or the value is 65 percent or less than the amount determined to be correct (estate or gift tax). Gross value is 200 percent or more than the amount determined to be correct (income tax); or the value is 40 percent or less than the amount determined to be correct. "Substantial and gross valuation misstatements attributable to incorrect appraisals," Internal Revenue Code, 26 USC § 6695A.

of available data sources required for *due diligence* (particularly prevalent in the healthcare arena) that we receive electronically through databases and other data portals, as well as the exponential growth in the availability of healthcare financial and economic literature, and the input of academic theory, especially during the last 10 years.

HEALTHCARE INDUSTRY SPECIALIZATION

While the subject of industry specialization has been a point of contention for many years, in 1999, Chris Mercer (a valuation thought leader whom I greatly admire and respect), stated the issue succinctly as, "The basic question often boils down to: Should we hire an *industry expert* for this engagement, or is it preferable to hire a *valuation professional*?" Chris commented that "I believe I can say, based on many years of valuation experience, that *valuation expertise* combined with a broad base of industry experience, is a preferable experience set than purely industry expertise."[9] Based on my more than 30 years of healthcare valuation experience, I believe I can say that I both agree (in part) and disagree (in part) with Chris's comment.

I hold both valuation "generalists" and healthcare "industry specialists" in high regard; each group has contributed enormously to the advancement of the valuation profession. I would certainly agree that a strong base of general business knowledge and experience, as well as a thorough education in economic and financial principles, basic valuation tenets, appraisal methodology, and professional standards, are prerequisites to a successful appraisal engagement. However, given the complexities associated with understanding the value drivers that are often unique to the healthcare industry, the explosion of information and data available to appraisers, the heightened regulatory scrutiny, and the volatile dynamics of the new paradigm of healthcare reform, the valuation profession has necessarily evolved toward industry specialization. This is generally the result of the recognition that to be credible in performing a healthcare valuation, the appraiser also needs to possess an in-depth, informed understanding of the esoteric and complex attributes of the healthcare industry, which often appears to operate under a disparate, seemingly counterintuitive, framework of market economics (e.g., demand-driven, inelastic pricing).

The in-depth, robust knowledge required of a healthcare appraiser often can begin with a background of healthcare industry expertise, such

[9] Mercer Capital Management, Inc., "The 'Valuation Professional' vs. the 'Industry Expert,'" *E-Law Business Valuation Perspective Newsletter*, 1999-17 (December 15, 1999).

as in hospital financial management, but that experience alone is not sufficient without a thorough valuation education. Furthermore, credibility as an appraiser of healthcare interests requires a continuing commitment to keep abreast of the almost daily changes in national and regional economic conditions impacting the healthcare industry; payment and reform initiatives, reimbursement trends, regulatory and enforcement trends, the payor/delivery system mix, healthcare manpower and labor practices, supply-side dynamics, capital costs, emerging and declining models of healthcare organizations, and other issues related to the healthcare industry and transactional markets. For those valuation professionals who lack specific healthcare industry expertise, there has never been greater access to data and information related to the economic financial, and transactional areas of healthcare. Also, there is an increasing availability for both valuation education and professional development, as well as for obtaining a comprehensive understanding of the healthcare arena through healthcare associations and medical societies; online newsletters, journals, and health law and policy reporters; academic curricula; and courses, conferences, workshops, and symposiums, many of which are available through distance education, for example, audio conferences webinars.

There has long been a discernible pattern of consensus among healthcare industry clients to engage healthcare valuation specialists, at least for projects of any size or complexity. Recently, there also appears to be a growing acknowledgment in the valuation profession that industry specialization, in this case, with a professional focus on research and training specific to the healthcare industry, is warranted. Toward that end, on January 28, 2012, the Board of Governors of the American Society of Appraisers (ASA), "the oldest and only major appraisal organization representing all of the disciplines of appraisal specialists," passed a resolution establishing the "ASA Advanced Multidisciplinary Education in Healthcare Valuation" program as developed by the ASA Healthcare Special Interest Group (ASA HSIG) educational subcommittee.[10]

WHY I WROTE THIS BOOK

The healthcare industry is a vast and diverse part of the American economy that is undergoing a sustained and dramatic transformation. While the ultimate course that U.S. healthcare reform initiatives will follow is uncertain,

[10] "About US," American Society of Appraisers, www.appraisers.org/AboutUs/AboutUs.aspx (accessed April 22, 2013).

and there is still a quandary of unresolved issues posed by this *perfect storm*, one thing I know for certain is that whether one views it as a blessing or a curse, it is undeniable that there will be exponential growth in the demand for healthcare valuation professional services, and that the financial appraisal of healthcare enterprises, assets, and services will continue to grow in scope and complexity.[11]

In writing *Healthcare Valuation*, I focused, first and foremost, on the historical development of the U.S. healthcare industry and medical profession and the broad underlying market conditions and trends in which healthcare transactions and litigation take place, as well as the related basic tenets of financial economics in regard to the approaches and methods of healthcare valuation. The objective of this text is to gather and present the technical aspects of business valuation methodology relative to the financial appraisal of emerging healthcare organizations, within the context of the Four Pillars of the healthcare industry, that is, *reimbursement*, *regulatory*, *competition*, and *technology*.

This book is intended to *supplement*, not *supplant*, the existing cannon of professional valuation literature and builds on a solid foundation of authoritative texts, treatises, and research by professionals who have contributed greatly to that literature, as well as to the development of the business valuation profession, many of whom I am proud to call my friends and colleagues of many years and gratefully acknowledge as mentors. It is my hope that this book will augment what they have previously contributed.

Acknowledgments

The assistance and support of a number of my Health Capital Consultants (HCC) colleagues were instrumental to the development and publication of this book.

Todd A. Zigrang, MBA, MHA, FACHE, ASA, HCC President, and Anne P. Sharamitaro, Esq., HCC Executive Vice President and General Counsel, were central to the development of this project and greatly assisted by contributing to this work.

Other HCC colleagues who contributed significantly to this book include Vice President Matthew J. Wagner, MBA; Vice President John R. Chwarzinski, MSF, MAE; Senior Financial Analyst Jonathan T. Wixom; and Senior Financial Analyst Grant D. Heggie, MBA, MHA.

In addition, HCC's research and library staff, as well as members of HCC's consulting and administrative support team, were of great help.

Also, many thanks to our professional colleagues and clients who served as reviewers of, and commentators on, the various drafts of this work along the way, including Dr. Shannon Pratt, CFA, FASA, MCBA, ARM, ABAR, for his encouragement and inspiration over many years, as well as his comments on this text and his contribution of the Foreword; David Grauer, Esq., of Squire Sanders, LLP; Bob Morrison, ASA, BV/IA; Robert Schlegel, ASA, CBA, CCP, CDP, CISA, CSP; Richard M. Wise, FASA, MCBA, FCBV, FRICS, CVA, FCA, CPA, CA; Chris M. Mellen, ASA, MCBA, CVA, ABAR, CM&AA, MBA; Michael Gregory, ASA, AVA, PE; James B Lurie, ASA, CBA, CVA, BVAL; Howard Lewis, MS, GVA, AVA; Robert L. Wilson, Jr. Esq.; Lari B. Masten, MSA, CPA, ABV, CFF, CVA, ABAR; John Paglia, PhD, MBA; Dick Thorsen, CPA, CMEA, CVA; Morton Cohen, CPA; and, Tim Alexander, MLS, for their helpful review and commentary.

About the Author

Robert James Cimasi, MHA, ASA, FRICS, MCBA, AVA, CM&AA, serves as Chief Executive Officer of Health Capital Consultants (HCC), a nationally recognized healthcare financial and economic consulting firm headquartered in St. Louis, Missouri, serving clients in 49 states since 1993. Mr. Cimasi has more than 30 years of experience in serving clients, with a professional focus on the financial and economic aspects of healthcare service sector entities, including valuation consulting and capital formation services; healthcare industry transactions, including joint ventures, mergers, acquisitions, and divestitures; litigation support and expert testimony; and certificate-of-need and other regulatory and policy planning consulting.

Mr. Cimasi holds a Masters in Health Administration from the University of Maryland, as well as several professional designations: Accredited Senior Appraiser (ASA—American Society of Appraisers); Fellow—Royal Institute of Chartered Surveyors (FRICS—Royal Institute of Chartered Surveyors); Master Certified Business Appraiser (MCBA—Institute of Business Appraisers); Accredited Valuation Analyst (AVA—National Association of Certified Valuators and Analysts); and Certified Merger & Acquisition Advisor (CM&AA—Alliance of Merger & Acquisition Advisors). He has served as an expert witness on cases in numerous courts and has provided testimony before federal and state legislative committees. He is a nationally known speaker on healthcare industry topics and the author of several books, the latest of which include *Accountable Care Organizations: Value Metrics and Capital Formation* (Taylor & Francis, a division of CRC Press, 2013), *The Adviser's Guide to Healthcare*—Vols. I, II, and III (2010—AICPA), and *The U.S. Healthcare Certificate of Need Sourcebook* (2005—Beard Books). Mr. Cimasi is the author of numerous additional chapters in anthologies, books, and legal treatises, published articles in peer-reviewed and industry trade journals, and research papers and case studies, and he is often quoted by the healthcare industry press. In 2006, Mr. Cimasi was honored with the prestigious "Shannon Pratt Award in Business Valuation," conferred by the Institute of Business Appraisers. Mr. Cimasi serves on the Editorial Board of the Business Appraisals Practice of the Institute of Business Appraisers, of which he is a member of the College of Fellows. In 2011, he was named a Fellow of the Royal Institution of Chartered Surveyors (RICS).

Disclaimer

This work includes information regarding the basic characteristics of various statutes, regulations, and case law related to the healthcare industry. Introduction

Whereof what's past is prologue; what to come, in yours and my discharge.

—William Shakespeare, *The Tempest*, Act 2, scene

It may be the "*perfect storm.*" The continued rise in healthcare expenditures, the increasing segment of the U.S. population that is uninsured or underinsured, the growth in demand for care from the changing patient demographic of the aging baby-boomer population, and declining reimbursement for physician services and provider manpower shortages are just a few of the several catalysts that are driving the *turbulent transactional marketplace* for healthcare *enterprises*, *assets*, and *services* in this new *era of reform*.

Those valuation analysts, whose healthcare engagements have been focused on appraising historically *traditional* provider organizations, for example, physicians in solo and small group practices, are seeing a decline in their client base as the healthcare industry consolidates, and greater numbers of providers form new and larger *emerging healthcare organizations* (EHOs). These EHOs are driven by the need to develop new affiliations, capital structures, and governance configurations, in order to align the interests of patients/consumers, as well as various U.S. healthcare industry subsectors, including *inpatient* and *outpatient* providers, *suppliers* and *vendors*, *payors*, and *managed care entities*, in such a manner as to address the emergence of *value-based reimbursement* initiatives, such as *Accountable Care Organizations*.

This book will address the key issues that the professional appraiser should consider when undertaking a healthcare valuation assignment, set within the conceptual construct of the "*Four Pillars*" of the U.S. healthcare delivery system.

THE FOUR PILLARS OF THE HEALTHCARE INDUSTRY

In developing an understanding of the forces and the stakeholders that have the potential to drive *healthcare markets*, it is useful to examine what *value*

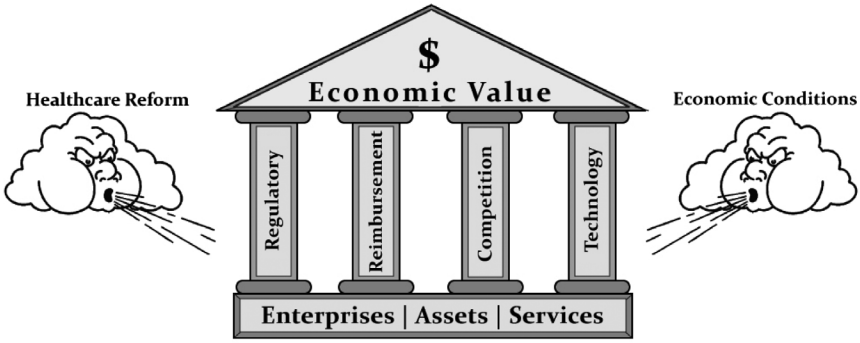

EXHIBIT I.1 The Four Pillars of the Healthcare Industry

may be attributable to healthcare *enterprises*, *assets*, and *services* as they relate to the four paramount market influences of the healthcare industry, that is, the *Four Pillars—reimbursement*, *regulatory*, *competition*, and *technology.* These four elements of the healthcare industry marketplace shape the dynamic by which providers and enterprises operate within the current transactional environment, while also serving as a conceptual framework for analyzing the *viability*, the *efficiency*, the *efficacy*, and, ultimately, the *value* that may be attributed to property interests, whether enterprises, assets, or services. Each of these *Four Pillars*, depicted in Exhibit I.1, will be further addressed in subsequent chapters.

STRUCTURE OF THIS TEXT

This text is meant to serve as both a *resource* and a *reference* and is focused on providing guidance in an era of reform related to the requisite research and analytical processes for both (1) the development of a supportable and replicable valuation conclusion and opinion in the financial appraisal of healthcare enterprises, assets, and services; and (2) the submission of a certified valuation report that is both comprehensive and credible. It is written for readers with a wide range of experience and professional focus, including healthcare industry C-suite executives; physicians and other clinical providers and their professional advisers, including attorneys, accountants, and consultants; banking, investment, and transactional advisors; and academics, researchers, and students, as well as other interested stakeholders.

This book is structured in two parts:

1. **Volume 1** consists of six chapters, beginning with a chronology of the U.S. healthcare delivery system, from the origins of medicine to the transformation of modern healthcare in the twentieth and twenty-first centuries (*Chapter 1*). *Chapters 2 through 5* explore the paramount influences of the *Four Pillars*, that is, *reimbursement*, *regulatory*, *competition*, and *technology*, as they apply to healthcare enterprises, assets, and services. *Chapter 6* provides an overview of the current healthcare environment in this new era of healthcare reform.
2. **Volume 2** consists of ten chapters, of which the first four provide a discussion of *basic valuation tenets* (*Chapter 7*), as well as a presentation of the generally accepted *valuation approaches*, *methods*, and *techniques* (*Chapter 8*), and the *costs/sources of capital* (*Chapter 9*), as these topics may be pertinent to healthcare valuation. *Chapter 10* sets forth the *planning* and *process* elements related to a healthcare valuation engagement. The next five chapters examine the following: the *value drivers* unique to each type of healthcare enterprise, asset, or service, as well as appropriate *valuation approaches*, *methodologies*, and *techniques* applicable to inpatient enterprises (*Chapter 11*), outpatient and ambulatory enterprises (*Chapter 12*), other healthcare-related enterprises (*Chapter 13*), tangible and intangible assets (*Chapter 14*), and healthcare services (*Chapter 15*). Finally, Chapter 16 provides the background and methodology regarding the regulatory threshold of *Commercial Reasonableness*.

READER TOOLS

This book will likely be used intermittently as a resource and a reference, in contrast to being read "cover to cover" in one sitting. Accordingly, to enhance the utility of this text as a navigable source for readers of various backgrounds, certain tools have been developed and appear throughout the text, including the following categories: *Key Concepts*, *Key Terms*, *Acronyms*, *Key Sources*, and *Factoids*. *Key Concepts* are the important *concepts* mentioned in the text that are significant to the healthcare valuation analysis. As an acknowledgment, *key concepts* are italicized in the text for emphasis and contrast. *Key Terms*, also italicized, refer to those significant words appearing in the text that may need to be defined for the reader and serve as a subset of the comprehensive *Glossary* that appears in Volume 2. *Acronyms*, formed by combining the initial letters or parts of a series of

words, are particularly prevalent in (and often the favorite pastime of) the healthcare industry and appear at the end of each chapter, as well as being included as part of the *Glossary*. *Key Sources* point to significant sources of data and information that are fundamental to the chapter content and serve as a subset of the comprehensive *Bibliography*, which is included in Volume 2. *Factoids* are brief, related facts of interest that are mentioned within the text. Also included are some concluding remarks and a brief epilogue.

A bedrock principle of financial valuation is that *economic value* is the *expectation* of *future economic benefit* to be derived from the *ownership* or *control of property.* The valuation analyst should, in keeping with the concept of the *principle of induction*, begin his forecast of the *future* with an in-depth understanding of the *past*, including the historical development of the U.S. healthcare delivery system within the context of the *Four Pillars*, the changing *reimbursement*, *regulatory*, *competitive*, and *technological* backdrop of an array of volatile, often complex market forces that make up the "*perfect storm*" within which the current U.S. healthcare transactional marketplace exists.[1] The first chapter of this text, "The Chronology of U.S. Healthcare Delivery: From Caduceus to Corporatization," begins the journey toward understanding the *financial appraisal of healthcare enterprises*, *assets*, and *services* in the *era of reform.*

[1]See Section 8.1.1.2.3.1, "Historical and Industry Trend Analysis," in Chapter 8, "Valuation Approaches and Methods."

CHAPTER 1

The Chronology of U.S. Healthcare Delivery: From Caduceus to Corporatization

1.1 FOUNDATION OF U.S. HEALTHCARE

Although the June 2012 decision by the Supreme Court of the United States (SCOTUS) to uphold the 2010 Patient Protection and Affordable Care Act (ACA) was one of the most anticipated rulings, for one of the most factious political debates in U.S. history, healthcare reform (in some guise) has been occurring in the U.S. healthcare delivery system for more than a century, as the manifestation of continuing evolution and change.

The foundation of the U.S. healthcare delivery system can be viewed as the product of (1) the evolution of *medical* thought and practice; and (2) the evolution of *philosophic* thought throughout many centuries. Paul Starr addresses this evolution in his book *The Social Transformation of American Medicine*, to wit: "first, the rise of professional sovereignty; and second, the transformation of medicine into an industry and the growing, though

still unsettled, role of corporations and the state."[1] This chapter addresses the chronological progression of medicine in accordance with this bimodal transformation, as related to the progress of the healthcare practitioner and professional practice credibility.

Medical historian Richard Harrison Shryock further assessed the historical context of medicine, noting:

> *Because it deals with the vital interests of both individuals and societies—with life and death, and with so much that matters in between—medicine has long had an unusually complex and intimate relationship to social and cultural developments at large . . . . In other words, medical history involves social and economic as well as biologic content and presents one of the central themes in human experience. After all, what is more basic in the life of any people than life itself?*
>
> —Richard Harrison Shryock, 1966[2]

An understanding of the chronology of both medical thought and events provides insight into the current state of healthcare delivery in the United States and shapes the trends that may affect those market factors, including valuation, that define the financial aspects of the healthcare industry.

1.1.1 Origins of Medicine

The origin of the evolution of the practice of medicine and the delivery of healthcare services can be traced to the earliest civilizations located in the Mediterranean region, which saw illness as a curse or a punishment from the gods that could befall *sinners*, their families, or their descendants.[3] The abstract notion of *medicine* was intertwined with religious concepts within Babylonian, Greek, and Roman cultures. Each of these groups depicts its respective god of healing as a figure holding a snake-coiled staff, and this symbol (often referred to as a *Caduceus*) is still widely used today to represent medicine.[4] An image of the Greek Caduceus is provided in Exhibit 1.1.

Caduceus

Double serpent winding around a staff; a symbol for medicine.

"The Symbol of Modern Medicine: Why One Snake Is More Than Two," by Robert A. Wilcox and Emma M. Whitham, Annals of Internal Medicine, *138, no. 8 (April 15, 2003).*

Factoid

The original concept of medicine derived from the concern for human pain.

A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), pp. 3–12.*

Factoid

Sumerian, Assyrian, and Babylonian civilizations studied Astronomy intently, and medical concepts developed as a result of the assumed relationships between physiology and celestial findings.

A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), pp. 31–44.*

ASSYRO-BABYLONIAN MEDICINE

A systematic medical concept established in the fourth millennia B.C. by the people of Southern Mesopotamia, under which medicine was regarded as an abstraction and was treated with priestly reverence.

"Antiquity," in The Greatest Benefit to Mankind: A Medical History of Humanity, *by Roy Porter (New York: HarperCollins, 1997), pp. 46–47;* A History of Medicine *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), p. 32.*

Greek medicine continued in this tradition (which was thought to have its origin in Egyptian medical practices and efforts toward hygiene) but began to diverge from its religious foundations to include ethical principles. Toward the end of the fifth century, Greek medicine included three elements: (1) the generally discarded religious element; (2) the strong philosophical element; and (3) a rational element relying on observation and accumulated experience.[5] Hippocrates, born in Greece in 460 BC, was both a priestly

Factoid

Hippocrates served as both a priestly and empirical authority of medicine during the golden age of Greece, responsible for compiling the Oath of Hippocrates as well as other works.

"Antiquity," in The Greatest Benefit to Mankind: A Medical History of Humanity, *by Roy Porter (New York: HarperCollins, 1997), p. 56;* A History of Medicine *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), pp. 148–49.*

[5]W. H. S. Jones, trans., *Hippocrates, Volume I* (Cambridge, MA: Harvard University Press, 1923), p. xiv.

and an empirical authority of medicine and was often recognized, in Western culture, as the *father of medicine*.[6] He wrote several ethical texts, the first of which was the *Oath of Hippocrates*. Castiglioni's book *A History of Medicine* describes the importance of this oath as covering "the duty of the physician to his teacher, his pupils, and his patients, [and] clearly shows that a relationship existed between Hippocratic medicine and priestly medicine; but it raises medicine to a height and human dignity that assures it its own position as a science."[7] Today, medical students still commonly take the Hippocratic Oath as a commitment to uphold ethical standards in their practice of medicine.[8]

1.1.2 Professional Practice and Status of the Physician

Initially, Greek physicians practicing in Rome were looked down on and regarded with little, if any, respect.[9] Many people at the time adopted the title of *physician* without any significant or standardized training, contributing to the defamation of the profession.[10] However, in 46 BC, *Julius Caesar* granted physicians the right to Roman citizenship, an honor that elevated the reputation of physicians.[11] Soon thereafter, laws requiring the training, certification, and control of physicians were established in an effort to repel the invasion of unqualified *healers* looking for easy profit in Rome.[12] The skill of these *professionals* also improved as the number of medical schools approved by the Roman Empire increased, the most celebrated of which could be found outside of Italy, in France (Marseille and Lyon), Spain

[12] Ibid., p. 235.

(Saragossa), and Greece (Antioch, Athens, and Alexandria).[13] Eventually, Greek physicians flourished intellectually and socially, playing an essential role in politics and legal affairs, and as the practice of medicine became systemized, so did the social position of physicians.[14]

Through medical experiments and dissection, Hippocratic theories were solidified, and any mystery or doubt that surrounded physicians was reduced. Furthermore, the quality of medical care in the Roman Empire was enhanced.[15] The first influential strides in this direction were made by *Claudius Galen* of Pergamon in Asia Minor (129 AD–216 AD). A student of Hippocrates, Galen was a key figure in the spread of medicine and the growth of the field. Galen's concentration on anatomical studies resulted in some of the earliest discoveries on such topics as the central nervous system, the cardiovascular system, and the anatomies of the spinal cord and the uterus.[16] Among his accomplishments, he was appointed the physician of the gladiators, an honorable and sought-after position.[17] Galen quickly became known as an extraordinary medical practitioner, writer, and student.[18]

Galen was a pioneer in the field of anatomy and one of the most influential medical writers of all time.[19] His philosophical background drove many of his hypotheses, chiefly those related to the physiological explanation that arteries contained blood, not air, and that the heart propelled blood through the body.[20] Though *Galenic medicine* represented a huge step forward for evidence-based medicine, it also served as a barrier to future advances in anatomy and physiology, due to inherent flaws, such as applying animal

physiology, including that of pigs and primates, to humans and the blind adoption of his findings by the medical and religious communities.[21]

1.1.3 Rise of the Medical University

Universities, though originating from the ancient Latin schools, did not flourish until the end of the thirteenth century.[22] Although some schools focused entirely on medicine, others (termed *Studia Generalia*) also incorporated law, theology, and philosophy in their curricula.[23] The Catholic Church's influence on medical curricula often hindered anatomical and physiological advancements due to its refusal to accept many clinical and experimental research findings.[24] Christian leaders held the belief that disease, illness, famine, war, or natural disasters were a result of God's benevolent means of punishing sinners, and, therefore, healing and medicine were seen as inferior and subordinate to theology.[25] The shortcomings of medical education in the early Middle Ages, in Western civilizations, was diminished when a trend of translating Arabian medical texts began and scholars advanced what became known as *Greco-Arabian medicine*.[26] The physician *Abu Ali al-Husayn ibn 'Abdallah ibn Sinna* (known in the west as *"Avicenna")* compiled the first comprehensive medical text in Arabic.[27] His work, entitled *Al-Quanum l-tibb (The Canon of Medicine)*,[28] organized Galen's medical writings under a system governed by Aristotelian natural

Studia Generalia

Universities in the Roman Empire where law, theology, and philosophy were taught in addition to medicine.

A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), p. 325.*

GRECO-ARABIAN MEDICINE

The solution to shortcomings of the medical education of the Middle Ages; involved incorporation of Arabian medical texts, introduced by scholars and physicians who infused Arabian medicine with the scholarship of philosophy, while attempting to compromise their differences.

"Medicine and Faith," in The Greatest Benefit to Mankind: A Medical History of Humanity, *by Roy Porter (New York: HarperCollins), pp. 98–99;* A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), pp. 325–329.*

sciences and philosophy.[29] His mastery of medical science became legendary, and some estimate that *The Canon of Medicine* has become the most studied medical text ever written.[30]

1.1.4 Eastern Medical Traditions

While Western medicine evolved through the development of hypothetical *deductions*, Eastern medicine developed using more *inductive* methods, where every individual was thought to possess a balance between *internal defenses* and *external insults*, a lack of which balance resulted in disease.[31] The theories underlying the practice of medicine in Eastern cultures emphasized the laws of nature as a parallel to bodily phenomena, leading to traditional Eastern concepts that "man is nothing but a creature living between

[29] Lawrence I. Conrad, et al., *The Western Medical Tradition: 800 BC to AD 1800,* (New York: Cambridge University Press, 1995), p. 114.

heaven and earth," the duality of *yin* and *yang*, *Buddhist* philosophy, and the teachings of *Ayurvedic medicine* (*the science of life*).[32]

Although Western and Eastern medicine advanced on significantly different time lines, within their unique foundations, their progression was somewhat parallel, growing from religious roots and ancient texts. In India, the *Vedas*, a set of ancient texts revered by Hindus as sacred, referenced medical lore through tales of demons and charms. These teachings gave way to *the science of life*, or *Ayurvedic medicine*, which applied the *theory of humors* to bodily health; however, the Ayurvedic system complicated Greek teachings on humors by also considering the five elements, the five winds, and the two souls, as well as blood, in the assessment of health.[33] Ancient Indian medicine also encompassed early forms of surgery, hospitals, and medical colleges.[34] Chinese medicine is arguably the oldest practice of medicine, with the *Huang-ti Nei Ching (The Inner Canon of the Yellow Emperor)*, published during the T'ang Dynasty (618–907) and influencing folk healing practices for more than 2,500 years, based on the balance between *yin* and *yang*, which generate five phases (wood, fire, earth, metal, and water) that affect health. Theories on anatomy, illness, and diagnosis were all founded on this duality, with the focus of Chinese healing being more preventative than reactionary.[35]

Factoid

Confucius, likely the most famous Chinese philosopher/teacher/political theorist, lived from 551 BCE to 479 BCE, making him one of the first philosophers.

The Analects of Confucius, *by Simon Leys (New York: W.W. Norton & Company, 1997), p. xxi.*

[32] From the ancient Chinese *Nei Ching (Cannon of Medicine)*, published at the end of the Chou Dynasty (1121–249 BC) or the beginning of the Chin Dynasty (221–207 BC); Julia J. Tsuei, "Eastern and Western Approaches to Medicine," *Western Journal of Medicine* 128, no. 6 (June 1978): 552; Lois N. Magner, *A History of Medicine*, 2nd ed. (New York: Informa Healthcare, 2007), pp. 53–56.

[33] The three humors (i.e., wind, bile, and phlegm) compose the bodily systems and must remain in balance to ensure good health. Lois N. Magner, *A History of Medicine*, 2nd ed. (New York: Informa Healthcare, 2007), p. 59.

[34] Lois N. Magner, *A History of Medicine*, 2nd ed. (New York: Informa Healthcare, 2007), pp. 56–65.

[35] Ibid., pp. 66–71.

VEDAS

A collection of doctrinal Ayurvedic medical texts.

A History of Medicine, *2nd ed., by Lois N. Magner (New York: Informa Healthcare, 2007), p. 56.*

Unlike Western medicine, which has changed dramatically throughout its development, the current methods and theories of Eastern medicine show a significant resemblance to their origins in India and China. Currently used alternative medical techniques, such as acupuncture, were discussed in the ancient Chinese *Inner Canon of the Yellow Emperor* and aim, even today, to restore the flow of *yin* and *yang* in the body.[36]

1.1.5 Renaissance: Revival of Anatomy and Physiology

Scientific knowledge expanded beyond the limitations of Galenic medicine through the work of early Renaissance anatomists in the late 1400s and early 1500s.[37] *Artist-anatomists* such as *Andrea Verrochio* and *Leonardo da Vinci* were pioneers in the field.[38] Da Vinci performed dissections of human cadavers and made drawings of his observations.[39] Da Vinci refuted many of the statements made by his Galenic predecessors, but due in part to his objective perspective of anatomy, his work was not immediately recognized as revolutionary to the scientific community.[40]

Andreas Vesalius also refuted aspects of Galen's work, claiming that Galen's anatomical knowledge applied only to animals and was flawed when applied to humans.[41] His discoveries in anatomy, released in the mid-1500s,

[36] Ibid., p. 76.

[37] Sherwin B. Nuland, *Doctors: The Illustrated History of Medical Practices* (New York: Random House, 1988), p. 72; Arturo Castiglioni, *A History of Medicine*, 2nd ed. (New York: Alfred A. Knopf, 1947), p. 668.

[41] Albert S. Lyons and R. Joseph Petrucelli, *Medicine: An Illustrated History* (New York: Harry N. Abrams, 1978), p. 416.

Factoid

Philosophers like Thales of Miletus, Plato, Aristotle, Anaximander, Anaximenes, Zoroaster, Confucius, Buddha, and Pythagoras contributed to a mathematical, cosmic, and physiological concept of nature and the biologic system.

A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), pp. 129–141.*

became medical landmarks.[42] In contradicting Galen's deductions from animal dissection and philosophical conjecture, Vesalius's magnum opus, *De humani corporis fabrica*, revolutionized both the study of human anatomy and general scientific teaching.[43] In daring to question the doctrinal teachings of their honored predecessors, these and other artists, anatomists, philosophers, and scientists heralded an era of enlightenment, through which "the sluices of objective inquiry and experiment had been opened."[44]

1.1.6 Seventeenth Century: The Dawn of Scientific Liberty

Countless influential figures significantly contributed to the overhaul of Galenic medicine, laying the foundation for the school of medical thought to date. The work of da Vinci and Vesalius prompted advances in anatomy and physiology.[45] The breakthroughs of *Servetus* in pulmonary circulation and *Fabricius* in the discovery of the valves in veins, as well as revelations on the enigmatic circulation of the blood by *William Harvey*, gave mathematical, mechanical, and methodical aspects and insights into the sciences of physiology and pathological anatomy.[46]

Factoid

The devastation of the seventeenth century, endured as a consequence of epidemics, such as scurvy, malaria, typhus, the Bubonic plague, smallpox, diphtheria, and influenza, prompted the dawn of epidemiology and, more important, modern hygiene.

"The New Science," in The Greatest Benefit to Mankind: A Medical History of Humanity, *by Roy Porter (New York: HarperCollins, 1997), pp. 236–240;* A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), pp. 560–563.*

Interest in the molecular implications of human anatomy was triggered by advancement in the early 1670s in the technology of microscopes by Marcello Malpighi and Antoni van Leeuwenhoek.[47] The microscope was originally developed by a Dutch spectacle-maker named Zacharias Janssen, but his early crude models could magnify an object no more than ten times.[48] Van Leeuwenhoek's microscopes could magnify up to 270 times, and he is attributed with the discovery of red blood corpuscles and the skeletal muscle structure.[49]

1.1.6.1 Progress in Hygiene A series of devastating epidemics terrorized Europe from the thirteenth century to the beginning of the eighteenth century. During this period, Europe suffered the onset of scurvy, malaria, typhus, smallpox, diphtheria, influenza, and, perhaps most notably, the various infestations of a plague known today as *the Black Death*, which decimated Europe.[50] In the 100 years preceding 1420, the population of Europe dropped by two-thirds.[51] The notable devastation endured through the seventeenth century, prompting the focused study of the causes of disease and the emergence of the field of epidemiology, as well as the rise of modern hygiene.[52]

Bernardino Ramazzini of Carpi arose to be known as the *father of industrial hygiene* and authored the first treatise on occupational disease,

Factoid

Bernardo Ramazzini of Carpi became known as the father of industrial hygiene; he authored the first treatise on occupational disease: *De morbis artificum*.

"Enlightenment," in The Greatest Benefit to Mankind: A Medical History of Humanity, *by Roy Porter (New York: HarperCollins, 1997), p. 296;* A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), p. 564.*

Factoid

Beginning in the seventeenth century and continuing through the eighteenth and nineteenth centuries, advances in hygiene, methods for arriving at pathological conclusions, and preventative and sanitary control measures became areas of legislative reform.

Industrial Hygiene

The science of keeping people safe at work and in their communities. Industrial hygienists (IHs) are professionals dedicated to the health and well-being of workers. Originally industrial hygienists worked primarily in factories and other industrial settings but as our society has changed, so has the definition of industrial hygiene. Today, IHs can be found in almost every type of work setting. Industrial hygienists also use the term OEHS or occupational and environmental health and safety to refer to the work that they do.

"Industrial Hygienists: Dedicated to Protecting People in the Workplace and the Community," American Industrial Hygiene Association, November 2, 2007, http://www.aiha.org/content/accessinfo/consumer/IHsDedicatedtoworkplaceandcommunity.htm (accessed September 10, 2009).

De morbis artificum (On the Diseases of Workers).[53] Ramazzini compiled research on the diseases of miners and studied the harmful effects of metals on artisans, the risks associated with surgeons' exposure to mercurial inunctions, and the exposure to lead, antimony, and countless other toxins that chemists, pharmacists, gilders, painters, tinners, and colored-glass workers endured.[54] Ramazzini's report of his findings resembled what today would be called *occupational risk assessment*.

Legislatures began passing sanitation laws toward the end of the seventeenth century.[55] When the plague broke out in Rome, the city took measures to contain the disease by means of regulatory sanitary controls, including isolation of the sick, the burning of bodies, the quarantine of gravediggers, and forbidding physicians to leave infected areas.[56] Physicians took appropriate measures to disinfect victims of the plague and to maintain their own safety, which included wearing elaborate costumes consisting of long robes, gloves, and bird-nosed masks, which they considered sanitary.[57] A depiction of a *plague doctor* is presented in Exhibit 1.2.

Following these largely unsuccessful efforts, military hygiene strategies were pursued.[58] From these advances in hygiene, preventative and sanitary control measures became areas of legislative reform that developed throughout the eighteenth and nineteenth centuries, for example, through the efforts of individuals such as John Snow, who used statistical prevalence models to control cholera outbreaks in London in 1849.[59]

1.1.7 Eighteenth Century: The Shift Toward the "Science" of Medicine

Scientific progress in the eighteenth century was marked by end of the *Dark Age*'s resistance to scientific advances and the resulting reformist attitude that health improvement was imperative "to human emancipation . . . from suffering, want, and fear."[60] Physicians and scientists argued that medicine

[60] Lawrence I. Conrad, et al., *The Western Medical Tradition: 800 BC to AD 1800* (New York: Cambridge University Press, 1995), p. 374.

should be more philosophical and/or method-based, notions that led to notable progress in the exact sciences.[61] Countless discoveries in various areas, including chemistry, physics, biology, physiology, anatomy, and pathology, yielded a single conclusion—without an applied understanding of each of these areas of science, the practice of medicine is arbitrary.[62]

1.1.8 Nineteenth Century: The Rise of "the Practice of Medicine" in the United States

Although the first medical schools were not established in the United States until the late eighteenth century, the nineteenth century saw an increase in medical schools and efforts to teach the advancement of the prior centuries in a focused, discipline-centric manner, which heralded the concept of the *practice* of medicine. The famed text published by Sir Thomas Watson in 1843, *Practice*, remained the prominent treatise on general medicine for more than 40 years.[63] However, as Watson's work became outdated, Sir William Osler wrote his prominent work *The Principles and Practice of Medicine: Designed for the Use of Practitioners and Students of Medicine*.[64] Osler's text, first published in 1892, established him as a leading authority on the practice of medicine, selling hundreds of thousands of copies and being published in multiple editions throughout and after his life.[65]

In the early nineteenth century, even with medical schools beginning to open across the country, medical licensure was little more than an honorary title, and some states chose not to enact medical licensure requirements.[66] Following the American Revolution, the equivalency of a medical license was obtained through membership in a state medical society.[67] Even with the lack of licensure laws in many states, membership in a medical society became

necessary if a physician were to be commercially successful. As memberships within the societies grew, and the societies themselves became more reputable, any nonmember physician was seen to be "unacceptable by his fellow-workers."[68] By the end of the nineteenth century, a trend began among states to establish licensing laws and boards of medical examiners. The popular movement continued for two decades until every state had a medical licensing law.[69]

1.1.9 Diversified Schools of Medicine

Since its initial inception, medicine has transformed into a field of rational science. Through the expansion of logical thought, studying of social value systems, increasing medical knowledge, and advancements in technological capabilities, *allopathic* (traditional) Western physicians adopted "a method of healing founded on a scientific basis."[70] At the time of its inception in 1847, the *American Medical Association* (*AMA*) largely consisted of allopathic physicians.[71] The AMA recognized the factious nature and the level of public disfavor toward the medical profession at that time and attempted to rebuild the *social connection* with the American people who had come to distrust medical providers.[72] Burrow characterized this effort toward enhanced credibility:

> *As the frontiers of scientific medicine extended, quackery found even broader fields of operation. Scientific explorations into the mysteries of vitamins, hormones, and antibiotics not only provided better medical care for the public, but also opened up new sources of gain for the unscrupulous. While scientific research kindled the imagination of crafty promoters who sought easy ways to riches, its failure to discover cures for various major ailments made the boastful claims of pretending healers all the more impressive.*[73]

As such, the AMA served as an advocate for scientifically and ethically appraising the relative value of innovative medical developments, as well as educational standards, in hopes of regaining public support and trust.[74]

Allopathic practitioners were skeptical of "cultist" or "sectarian" physicians who practiced unconventional forms of medicine such as *homeopathic*, *eclectic*, *naturopathic*, or *chiropractic* medicine.[75] Allopathic sentiments toward alternative medical practices were distrustful and condemning. Oliver Wendell Holmes, a prominent physician attributed with coining the term *anesthesia,* went as far as to call homeopathic practitioners "a mingled mass of perverse ingenuity, of tinsel erudition, of imbecile credulity, and of artful misrepresentation."[76] Though not as prominent as allopathic medicine, alternative medicine is still practiced today, and while skepticism has not vanished entirely, education and training requirements, as well as regulation and licensing measures to legitimize alternative medicine, have acted to reduce the aversion and distrust of the past.[77]

Osteopathic medicine has evolved into one of the two most widely accepted mainstream schools of medicine in the United States.[78] Andrew Taylor Still, considered to be the *founder of osteopathic medicine*, treated patients by assessing not only their symptoms but also their overall health and environment.[79] He opened the first school of osteopathic medicine, the *American School of Osteopathy* (*ASO*), in 1892 in Kirksville, Missouri.[80] As of 1985, Doctors of Osteopathy (D.O.) could be board certified in all specialties.[81]

"contain and eliminate the entire chiropractic profession" (see Section 4.3, "Supply and Demand in Healthcare").[82]

1.1.10 Diversified Roles of Medicine

In the nineteenth century, the practice of medicine expanded from strictly clinical practice to include *legal medicine*, *public health*, and *medical research*. *Legal medicine*, or *forensic medicine*, is the field of study that deals with the application of medical knowledge to the administration of justice.[83] In the latter portion of the century, the scientific and medical communities

[83] Cyril H. Wecht, "The History of Legal Medicine," *Journal of the American Academy of Psychiatry and the Law* 33, no. 2 (2005).

began to grapple with the social and economic implications of healthcare. As such, medicine's transformation into an elite and sophisticated trade was redirected to "assume its role as a social science."[84]

Public health was developed as a relationship between human beings and their social environment, rather than being a relationship between human beings and their doctors.[85] All public health research, policies, and programs have stemmed from the same objective: to provide "defen(s)e against disease as a social problem" by way of preventative medicine.[86] Unfortunately, progress in prevention is difficult to quantify, and its value within the healthcare industry cannot be precisely measured; as a result, preventative care is often dismissed as inferior. Public health has faced significant resistance and alienation from the medical community.[87]

Finally, growth in holistic *medical research*, paired with parallel growth in scientific knowledge, facilitated the publication of substantial medical literature in serial journals, with the publication of the *American Journal of Medical Sciences* beginning in 1838 and the *New England Journal of Medicine and Surgery* first entering print in 1812.[88] This constant flow of new research findings and an increasing knowledge base resulted in the perpetual tendency toward specialization that continues to drive current trends in medicine.

Legal Medicine

Referred to as medical jurisprudence, involves the implementation of medical expertise for legal and judicial purposes.

A History of Medicine, *by Arturo Castiglioni (New York: Alfred A. Knopf, 1947), p. 902.*

1.1.11 Specialization of the Sciences

A significant period in technological progress, which proved extremely important to the advance of both science and medicine, occurred in the nineteenth century, during which continued advances in both chemistry and physics led to the emergence of the disciplines of *physiological* and *pathological* chemistry.[89] A more intensive knowledge base was established for biology, chemistry, anatomy, and physiology, giving rise to distinct fields such as biochemistry, cytology, genetics, endocrinology, anthropology, immunology, and microbiology.[90]

Louis Pasteur made drastic developments in the relevance of germ theory to infectious disease, surgery, hospital management, and agriculture, and he pioneered a branch of *microbiology* that became known as *bacteriology.*[91] Pasteur's work influenced both clinical and laboratory medicine through his discovery of *pasteurization*, a process widely used today in the preservation of perishable products.[92] In addition, through the discovery of pasteurization, heralded in 1876, developments occurred in *antirabic treatment* and Pasteur's observations of *anthrax*, *chicken cholera*, *staphylococci*, and *streptococci.*[93] Pasteur became recognized as one of the "greatest scientists of history," having improved healthcare and enhanced its economic

benefits through his contributions to the fields of clinical, hygienic, and social medicine.[94]

1.1.12 Site of Care: Rise of the Hospital

With physicians developing expertise in exceedingly specialized areas of medicine, there was an expectation that their expertise would also apply to the level of care administered.[95] The demand for innovative technologies increased and allowed for the provision of services required for advanced diagnoses. Over time, demand took a different form to account for more than just advances in diagnostics and therapeutics, and it grew at astronomical rates.[96] Existing technologies evolved to improve the quality and efficiency of services delivered in response to growing and shifting demand, increased spending, and demographic and disease trends.[97]

Through the eighteenth and nineteenth centuries, hospitals began opening across the United States (the first, *the Pennsylvania Hospital*, having been established in 1751 by Benjamin Franklin and Dr. Thomas Bond), especially in large urban areas.[98] Such hospitals were plagued by high rates of infection,

and in 1859, Florence Nightingale published *Notes on Hospitals*, in which she described the optimal design for hospitals to prevent infection, which included small pavilion-type wards joined by open-air corridors.[99] Developments in organization and medical knowledge following the Civil War led to tendencies of order and cleanliness in hospitals.[100] As hospital functions and procedures changed, construction and operating costs increased. Following World War II, with advances in medical technologies and the public health movement, the modern hospital era began, with hospitals gaining strong public support and an improved reputation. Such technological advances and an increased focus on acute care caused hospital budgets to exceed the capacity of the charities that funded them.[101] As increased costs were passed on to patients, and insurance plans established new revenue streams, physician-directed revenues, rather than donations, became the main source of income for hospitals. The influence and managerial powers of physicians increased, as reliance on charitable donations became less necessary.[102]

Accompanying the increase in spending, healthcare professional practitioners became viewed not only as *healers* but also as *businessmen*. As the demand for increasingly expensive medical technology grew, the old adage "No Buck, No Buck Rogers" was often cited to define the cyclical relationship between technological demand and business capital investment. Within that context, demand for more sophisticated management technologies to enhance practice efficiency and reliability increased significantly.[103] Both management and clinical technology are addressed extensively in Chapter 5,"Technology."

In the twentieth century, healthcare reform became a highly politicized concept in the United States. With each passing decade, new technologies and regulations changed the way in which healthcare was delivered. A compressed time line of healthcare reform in the United States, for the period 1912–1940, is illustrated in Exhibit 1.3. Note that a time line of technological milestones is provided in Chapter 5, "Technology."

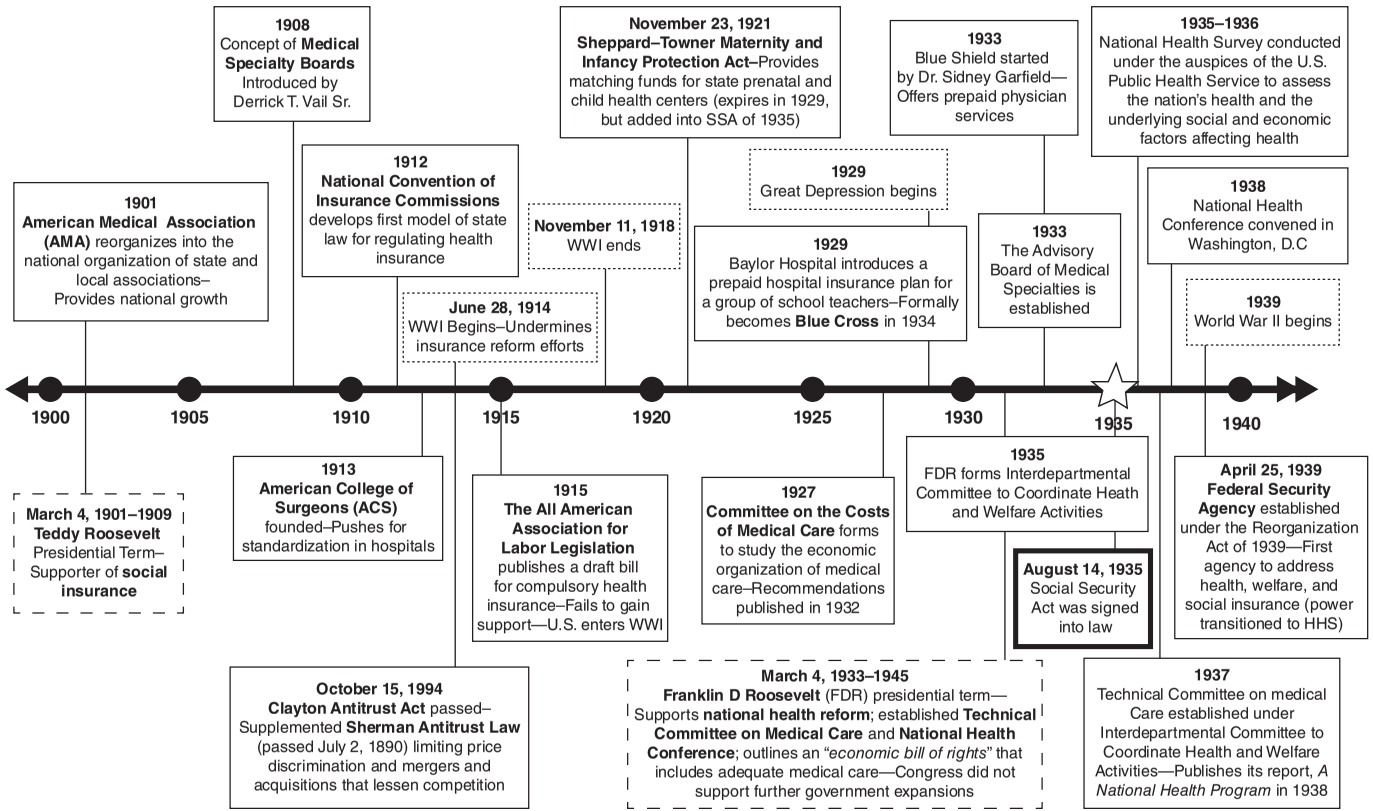

EXHIBIT 1.3 Healthcare Reform Historical Time Line: 1912–1940

1.2 EARLY 1900s

1.2.1 The Rise and Controversy of Physician Specialties

In the early 1900s, advancements in medicine and more precise instrumentation vastly improved healthcare delivery, and, as a result, specialization in specific areas became popular.[104] Although there was initial hesitation by many in the profession to the concept of specialization, pressures of scientific, social, and economic factors eventually led to the compartmentalization of medicine.[105] Physicians began to make claims as to the extent of their skill in a specific area of medicine; however, there was no formal system in place to validate such claims.[106] In 1866, the American Medical Association (AMA) issued a report outlining the benefits and risks of physician specialization.[107] These benefits and risks are set forth in Table 1.1.

The AMA's reorganization into a *national organization of state and local associations* caused membership to grow and pushed forward the notion of *organized medicine*.[108]

TABLE 1.1 Benefits and Risks of Specialization According to the AMA

Benefits	Risks
Minuteness of observation	Narrowness of view
Acuteness in study	Tendencies of specialists to magnify the effects of their covered disease
Wideness in observation	
Skill in diagnosis	Tendencies of specialists to undervalue the treatment of the disease by general practitioners

[108] James G. Burrow, *AMA: Voice of American Medicine* (Baltimore: Johns Hopkins Press, 1963), pp. 29–43.

The concept of a medical specialty board to establish minimum qualifications for specialists was first introduced by Derrick T. Vail Sr. in 1908.[109] Developing a workable plan to establish such medical specialty boards was a slow process, and, through the 1930s, individual examining boards were still working with specific specialties to advance the specialty board concept. Such boards included the *American Board of Ophthalmology*, the *American Board of Otolaryngology*, the *American Board of Obstetrics and Gynecology*, and the *American Board of Dermatology and Syphiology.* [110]

The specialty board system of the 1920s and the 1930s improved medical education and physician competence, and in 1933, the *Advisory Board of Medical Specialties* was established, operating as a federation of individual specialty boards.[111] Under the specialty board system, requirements were instituted that additional education must be either obtained through programs approved by the AMA or accredited through the boards and residency review committees.[112] Boards began to develop mandated experiential requirements, and a standard system of examinations was established, administered independently by the various specialty boards. Soon, national board organizations were able to restrain uneducated physicians from designating themselves as specialists. In 1970, the *Advisory Board of Medical Specialties* reorganized into the *American Board of Medical Specialties* (ABMS). The strong central agency was able to deal with matters common

Factoid

Some resisted specialization of medicine in the early 1900s because it too closly resembled notions of a tradesman.

to all specialty boards and act as the public representative of all specialty boards.[113]

1.2.2 Introduction of Health Insurance

Vestiges of the current U.S. health insurance system can be traced to practices arising from post–Industrial Revolution era mining and railroad behemoths providing medical treatment to employees for employment-related injuries. Individuals in that era could purchase accident or casualty insurance, which would replace their income in the case of an illness or an accident, but coverage was not offered for payment of non–casualty related medical services.[114] The first insurance company, which provided casualty insurance for rail and steamboat accidents, began offering coverage in 1847. By the end of the nineteenth century, 47 insurance companies existed in the United States offering accident insurance.[115]

Industrial medicine, as it came to be known, delineated between medical care for work-related injuries and that for work-acquired diseases. Company-employed physicians eventually began to oversee the health maintenance of a company's employees and become more involved in general employee health. As a result, companies partially competed for new employees through the relative value of their intracompany medical services.[116] At its core, the multigoal purpose of these programs was to establish a perceived

employee-employer connection, create goodwill toward the company from their employees and the public, but, most important, to reduce tort liability from work-related injuries and accidents.[117]

Ultimately, on employers realizing the potential benefits associated with providing employee health services, the movement evolved toward programs more closely resembling contemporary *health insurance*. Despite a positive reception, the early industrial health programs were one of the first casualties of the massive unemployment of the *Great Depression*, because major industries perceived in-house medical services to be an unnecessary expenditure.[118] However, during the *Great Depression*, one of today's largest and most highly publicized insurance conglomerates, Blue Cross Blue Shield, began operation.

The *Blue Cross Blue Shield Association* (BCBSA) started as two separate entities, with *Blue Cross* covering hospital services and *Blue Shield* providing coverage for physician services.[119] The first nonprofit, prepaid hospital plan that would become the *Blue Cross Organization* was first created in 1929 and was developed by Justin Ford Kimball, a vice president of the University Hospital at Baylor University, for Dallas-area teachers.[120] The plan initially covered 1,500 teachers who paid $6 per year for 21 days of hospital care at the University Hospital.[121] At that time, the *Great Depression* resulted in a growing number of patients who could not afford to pay their bills, and prepaid plans similar to the Baylor Plan quickly were established at hospitals across the country.[122] These plans, known as Blue Cross, gained formal recognition in 1934 when the *American Hospital Association* (AHA) and the *American College of Surgeons* (ACS) expressed their approval of hospital group plans.[123]

Blue Shield developed in response to the public's desire to have prepaid coverage for physician services, comparable to what *Blue Cross* offered for hospital services. Beginning in 1933, Dr. Sidney Garfield offered prepaid

physician services to 5,000 aqueduct workers in California, each of whom paid a nickel per day.[124] Admiring this success, Henry J. Kaiser adopted Dr. Garfield's approach in the late 1930s to provide his employees with physician services. The Kaiser Foundation Health Plan prospered and thrives today as the Kaiser-Permanente plan.[125] Since their formation, Blue Cross and Blue Shield have remained strong forces in the insurance market as the *Blue Cross Blue Shield Association* (the two companies combined on October 17, 1977).[126] The expansion of the insurance and other healthcare markets increased the need for regulation related to competition. A time line of reforms for the period 1940–1960 is depicted in Exhibit 1.4.

1.2.3 The Regulation of Competition in Healthcare

Competition in the healthcare industry is regulated through several means (see Chapter 4, "Competition"), but most prominently it is subject to the same legislation as all businesses under the *Sherman Antitrust Act*, which was signed into law on July 2, 1890.[127] Antitrust legislation prohibits specific activities that reduce competition in the marketplace for the purpose

of consumer protection. Signed into law on October 15, 1914, the *Clayton Act* modified the original antitrust law by addressing price discrimination (15.U.S.C.A. §13), mergers and acquisitions (15.U.S.C.A. §14), suspect sales agreements (15.U.S.C.A. §19), and conflicts of interest for corporation directors (15.U.S.C.A. §19).[128] These regulatory edicts have been significant in the regulation of healthcare entities. For more information on current antitrust laws, see Section 3.4.1, "Antitrust Regulations," in Chapter 3, "Regulatory Environment."

1.3 1930s–1950s

1.3.1 Social Security Act

Prior to the Industrial Revolution, economic stability within the United States was provided by the extended family because a majority of households resided on farms. Many families became vulnerable to economic problems and hardships, due in part to the *Great Depression*, which also acted as one of the most significant catalysts for the growth of the insurance market and Franklin D. Roosevelt's efforts to establish social-welfare programs as a social safety net for vulnerable U.S. populations, specifically the elderly, who saw a lifetime of savings disappear, and the unemployed.[129]

President Roosevelt's action to establish social security in the United States began on June 8, 1934, in a letter to Congress detailing his view of the federal government's role in securing "three great objectives" for the American people, the third being the security of social insurance. Weeks later, Roosevelt issued *Executive Order No. 6757*, establishing the *Committee on Economic Security*, consisting of high-level members of the president's cabinet.[130] Approximately seven months later, Roosevelt noted that a report released by the committee "sets forth a series of proposals that will appeal to the sound sense of the American people."[131] Based on this report, President Roosevelt proposed that social security insurance should include

[131] Ibid.

unemployment compensation, *old-age benefits*, *federal support for children* of various socioeconomic status, and *federal aid for public health agencies* throughout the nation. Later that year, on August 14, 1935, the Social Security Act was signed into law, providing many of the recommendations of the *Committee on Economic Security* and those benefits Roosevelt enumerated in his address to Congress in January 1935.[132] Since its passage, the *Social Security Act* (SSA) has been amended numerous times, with the most significant change concerning healthcare being the establishment of Medicare and Medicaid, a part of President Lyndon B. Johnson's *Great Society* initiatives during the 1960s (discussed later).

1.3.2 Disability Insurance

Only a year after it was signed into law, federal legislators discussed amending the SSA to include a disability insurance provision. Despite lengthy political debate, the SSA was not amended until 1956 to include *Social Security Disability Insurance* (SSDI), during the presidential administration of Dwight D. Eisenhower. Oveta Culp Hobby, the first *secretary of the U.S. Department of Health, Education, and Welfare* and the second female cabinet member in U.S. history, noted that "no accountant can estimate the physical rewards, the sense of independence, pride and usefulness and the relief from family strains which accrue to one of the disabled when he returns to his old job or to a newly learned job suited to his limitations."[133]

Under the original amendment, *disability* was defined as "the inability to engage in 'substantial gainful activity' (SGA) by reason of a physical or mental impairment [that is] medically determinable and expected to last for not less than 12 months, or to result in death."[134] A substantial portion of the legislative preparation occurred in the decades prior to the official amendment, a time when government officials worried about delineating between unemployment and disability benefits. Considering this environment, legislators adopted a strict definition of *disability*, partially out of fear of misuse from individuals who had been out of work for an extended period of time.

These individuals may have considered themselves "disabled" under a loose statutory definition.[135] Furthermore, from 1956 to 1960, benefits were provided only for workers over the age of 50, which limited the use of SSDI as a vocational rehabilitation program and essentially made it a retirement program.[136] It wasn't until the inclusion of supplemental security income under a 1972 amendment that social security benefits were provided for anyone over the age of 65 who was blind or disabled.[137] In 2011, Old-Age (retirement), Survivors, and Disability Insurance (OASDI) distributed more than $62 billion in Social Security benefits to 55 million U.S. citizens in all 50 states, in addition to American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, and the U.S. Virgin Islands.[138]

1.3.3 Postwar Technologies

Following World War II (WWII), the U.S. healthcare delivery system saw the advent of a plethora of new medical technologies, leading to an increased life expectancy and higher levels of health, accompanied by a drastic spike in medical costs. These costs have been associated with a decline in infant and child mortality and greater longevity, increasing the size of the population and, therefore, the number of individuals to be treated.[139] Postwar discoveries of new medical therapies, such as *sulfa drugs* and *penicillin*, quickly reduced infectious disease rates, and within two decades, such rates had decreased to current levels.[140] Similarly, longer life spans resulted in a more aged population and shifted the focus of medicine toward *degenerative* age-related diseases, such as heart disease, stroke, cancer, and senile dementia, treatment of which is often costly due to the long-term nature of the care.[141]

Dissimilar to other industries in which technological advancements are generally associated with greater *output* and equal or lesser *input*, the wave of medical technological advances following WWII correlated with a steady increase in medical costs. It has been estimated that more than 50 percent of the total rise in real medical care costs may be attributable to technological advances.[142] Since the 1970s, the perceived excessive rate of growth of healthcare spending, attributed in part to technological investments, has been seen as a serious problem by the government, insurers, employers, and individuals.[143] A further look at postwar technological advances and the associated costs on healthcare delivery can be found in Chapter 5, "Technology."

1.3.4 Hill-Burton Act of 1946

Regulation of healthcare resources began after World War II, with the passage, in 1946, of the *Hospital Survey and Construction Act*, commonly known as the *Hill-Burton Act*.[144] The passage of the Hill-Burton Act marked the beginning of 40-plus years of federally funded health policy planning.[145] It was intended to encourage the development of hospitals in rural areas because of a perceived shortage of healthcare facilities following the *Great Depression* and World War II.[146] The act required states to institute health policy planning in order to receive federal funding for hospital construction.[147] In addition to producing a healthcare plan delineating their healthcare needs, states were required to inventory existing healthcare facilities and designate a single agency to be responsible for health policy planning.[148]

Within 30 years of its enactment, the Hill-Burton program provided financial assistance to more than 4,200 hospitals, nearly 60 percent of all U.S. hospitals.[149] In addition to financial assistance, the Hill-Burton Act also prohibited discrimination against the provision of hospital services based on race and religion, and it mandated hospitals to provide a *reasonable* amount of charitable care.[150]

1.3.5 The Creation of the Joint Commission

The first onsite inspections of hospitals were performed by the American College of Surgeons (ACS), founded in 1913, in an effort to further the goal of Ernest Codman, M.D., who proposed the "end result system of hospital standardization," in 1910. In 1926, the ACS published a guide of minimum standards to further the surveyance of hospitals under an approval system, and by 1950, more than 3,200 hospitals had gained ACS approval. The ACS, along with several other organizations, that is, the American College of Physicians (ACP), the American Hospital Association (AHA), the American Medical Association (AMA), and the Canadian Medical Association (CMA), came together in 1951 to form an independent, not-for-profit organization, the Joint Commission on Accreditation of Hospitals (JCAH), currently referred to as the *Joint Commission*, whose purpose was to further standardize hospital approval through voluntary accreditation.[151] ACS's approval system was transferred to JCAH in 1952, and the organization published its own standards book, *Standards for Hospital Accreditation*, in 1953. The significance of JCAH accreditation was bolstered in 1965, when Congress amended the SSA to note that JCAH accreditation indicated compliance with the *Medicare conditions of participation* for hospitals.[152] A time line of reforms for the period 1960–1990, is depicted in Exhibit 1.5.

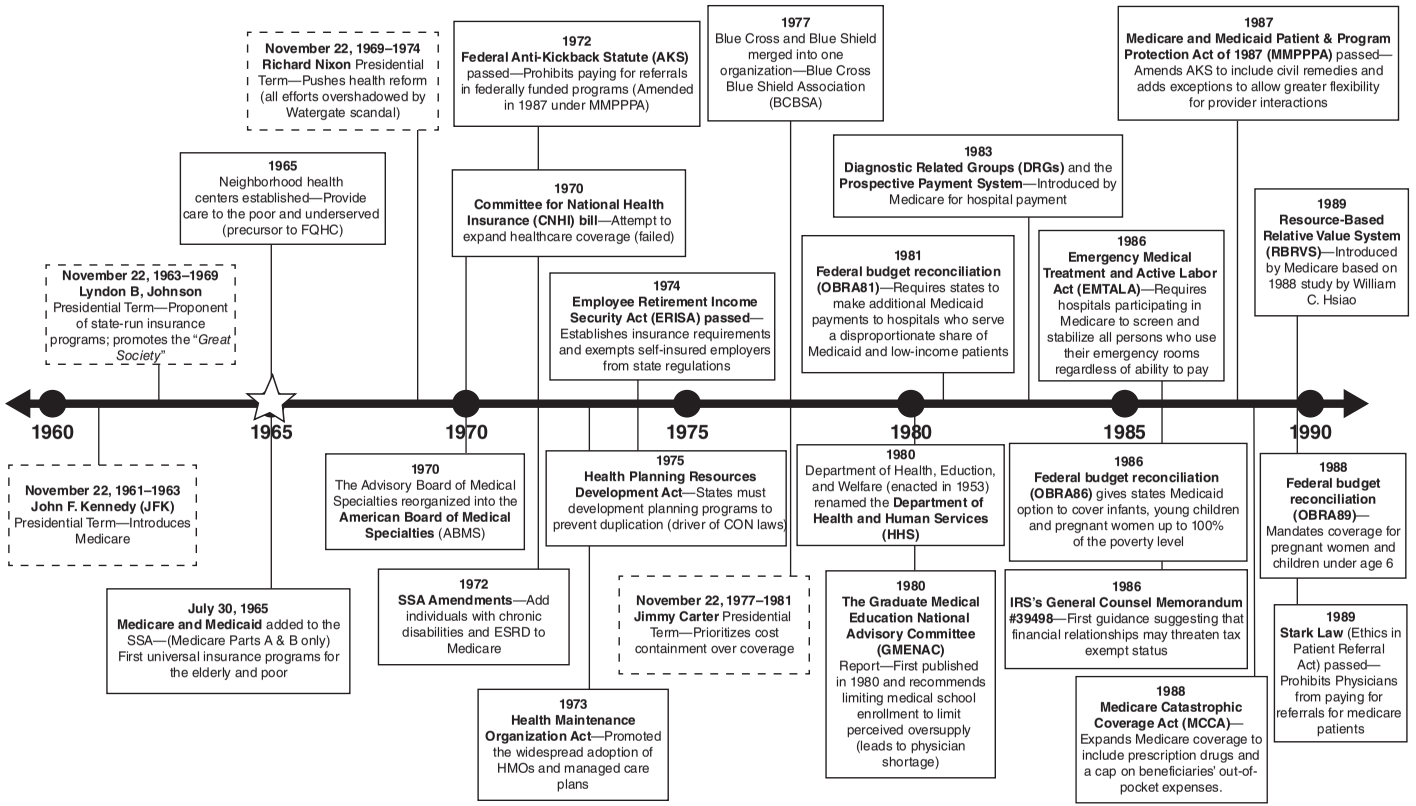

EXHIBIT 1.5 Healthcare Reform Historical Time Line: 1960–1990

1.4 1960s

1.4.1 Creation of Medicare

The groundwork for the enactment of Medicare and Medicaid began in the late 1950s and the early 1960s. As employer-based health coverage grew, private plans began to set premiums based on their experience with health costs, and the retired and disabled found it harder to get affordable coverage. Health reformers refocused their efforts toward the elderly. Introduced by U.S. president John F. Kennedy, Medicare is strictly managed by the federal government and targets the economic hardships of the elderly, who encounter rising medical costs in the face of dwindling income, frequently ending in a dire financial condition. In the aftermath of the assassination of President Kennedy and following legendary political debates, President Johnson guided the passage of Medicare and signed H.R. 6675 on July 30, 1965.[153] The bill amended the SSA and consisted of two major components, Medicare Parts A and B. Medicare Part A is "a hospital insurance plan providing protection against the costs of hospital and related care." Medicare Part B consists of "a supplementary medical insurance plan covering payments for physicians' services and other medical and health services to cover certain areas not covered by the hospital insurance plan."[154] Providing hospital insurance, Part A is financed through the Medicare Hospital Insurance (HI) Trust Fund, which is funded through payroll taxes paid by both employers and employees, enrollees who have not met the requisite requirements for automatic enrollment, government credits, interest on federal securities, and a Social Security benefits tax.[155] The Supplementary Medical Insurance (SMI) Trust Fund finances Medicare Part B and draws a majority of its resources from premiums paid by Medicare Part B enrollees, in addition to general revenue

Medicare and Medicaid

The Medicare and Medicaid Act, signed by President Johnson on July 30, 1965, was comprised of three layers: Part A, Part B, and Medicaid.

The Social Transformation of American Medicine: The Rise of a Sovereign Profession and the Making of a Vast Industry, *by Paul Starr (New York: Basic Books, 1982), p. 369.*

and payments from the disabled and enrollees with chronic renal disease.[156]

Medicare's passage was the result of longtime congressional interest in social health insurance for America's elderly, but discontent at the program's original suggestion ultimately prompted a central figure in the law's passage—Representative Wilbur Mills, a member of the House Ways and Means Committee—to combine the original proposal with two additional components.[157] The AMA pushed for more coverage of physician services under the program and even went as far to suggest an *Eldercare program*, its own version of what eventually became Medicare, but Representative Mills placated all parties involved by combining portions of each program into Medicare's final legislative package.[158] The original proposal (i.e., Part A),

coupled with the Republican suggestion of coverage for physician services, was eventually rounded out by an additional program, prompting some commentators to classify the legislation as a "three-layer cake" composed of Medicare Parts A and B and a social insurance for the healthcare of America's poor—Medicaid.[159] A further discussion of Medicare can be found in Section 2.4.1, "Medicare."

1.4.2 Creation of Medicaid

The amendment to the SSA passed in 1965, discussed earlier, also included the creation of the Medicaid program. Part of the Johnson administration's *Great Society* initiative, Medicaid provided healthcare insurance coverage for poor individuals who met requirements established by the individual states. Unlike *Medicare*, which is solely a federal initiative, *Medicaid* is a collaborative program between federal and state governments, with the individual states setting the criteria for eligible residents. Compared to Medicare, Medicaid was seen as a welfare program and did not enjoy the

widespread acclaim and admiration as its oft-cited companion.[160] Medicaid is discussed further in Section 2.4.2, "Medicaid and CHIP."

1.5 1970s

With the creation of Medicare and Medicaid and the massive amount of federal funding flowing through the two programs, it quickly became apparent that regulation of fraud and abuse was needed. The first of these legislative acts was the anti-kickback statute.

1.5.1 Anti-Kickback Statute

The Medicare *Anti-Kickback Statute* (AKS) was enacted in 1972 and amended in §1128B[b] of SSA to provide felony criminal penalties (5 years/$25,000 fine) for knowingly and willfully offering, paying, soliciting, or receiving remuneration in order to induce business reimbursed under the Medicare or state healthcare programs. The statute also included several safe harbors (exceptions to the statute) to protect legitimate business arrangements. It was the intent of Congress that the rules evolve and be updated to reflect changes within the healthcare industry and in technologies affecting the industry.[161] As intended, the safe harbors have continuously developed and changed since their enactment.[162]

1.5.2 Rising Costs of Healthcare

Health expenditures have been rising steadily since the 1970s, following the advent of the Medicare and Medicaid programs and the federal funding necessary to sustain them. A visual depiction of the rising trend of national health expenditures is set forth in Exhibit 1.6.

Policy considerations addressing the rising cost of healthcare became a priority of the administration of President Jimmy Carter and presented barriers for national reform efforts.[163] Concerns regarding the cost of healthcare continue today. In the decade from 2000 to 2010, national health expenditures per capita have increased more than 72 percent.[164]

1.5.3 Attempted Healthcare Reform

In the 1970s, the *Committee for National Health Insurance* (CNHI) bill, cosponsored by Senator Edward Kennedy (D-MA), attempted to significantly expand healthcare coverage by transforming the U.S. health insurance system. At the time, the CNHI bill was competing with 13 other health insurance proposals, including proposals sponsored by the AMA and commercial insurance companies.[165] The CNHI bill, supported primarily through Washington lobbying efforts, rather than public support, lost momentum in the wake of increasing healthcare cost inflation and a resulting focus on cost containment.[166] It was not until the 1980s, when the number of uninsured individuals in the United States began to significantly rise, that this type of reform would be revisited.[167]

1.5.4 Health Maintenance Organization Act of 1973

In response to escalating healthcare costs, employers began relying more heavily on a new prepaid health insurance model, health maintenance organizations (HMOs), a name coined by Paul Ellwood Jr. (then an aide to President Richard Nixon) in 1970. Even with increased use, in 1971 fewer than four million Americans were enrolled in prepaid health plans.[168]

[167] Ibid.

[168] Janet Firshein and Lewis G. Sandy, "The Changing Approach to Managed Care," in Stephen L Isaacs and James R. Knickman, *To Improve Health and Health Care 2001: The Robert Wood Johnson Foundation Anthology* (San Francisco: Jossey-Bass, 2001), p. 78.

To fund the development and spread of HMOs, Congress passed the *Health Maintenance Organization Act of 1973*. HMOs are a prepaid health plan model that uses provider networks with a system of *primary care gatekeepers* and capitated provider reimbursement incentivizing decreases in utilization and increases in the efficiency of care for HMO members. The stated goals and the original promises of the HMO Act, lower costs and higher quality outcomes for patients (similar to the goals of modern accountable care organizations), were not met, nor were the projected increases in the number of HMO plans—from 30 in 1970 to 1,700 by 1976 and covering 90 percent of the population by 1980—achieved. Nonetheless, HMOs did increase, and other models of managed-care plans flourished throughout the 1970s and the 1980s, maintaining prominence into the 1990s. There were more than 600 HMOs in operation by 1996, with almost 65 million enrollees—almost one-fourth of the U.S. population at the time.[169] The significant shift to HMOs was not without controversy, and during the 1990s, a significant consumer backlash followed the rapid and widespread incursion of managed-care plans, as both providers and patients turned against the model.

Of note, there has been controversy related to HMOs nearly since their inception. Recently released taped discussions between President Nixon and *Assistant to the President for Domestic Affairs* John D. Ehrlichman, in 1971, revealed what some have claimed are the underlying reasons for the Nixon administration's sudden promotion of HMOs, which cast the model as seeking to reduce patient care in pursuit of profits. Ehrlichman briefed Nixon on a previous discussion with Edgar Kaiser, to wit:

President Nixon:	*"You know I'm not too keen on any of these damn medical programs."*
Ehrlichman:	*"This . . . is a . . . private enterprise one."*
President Nixon:	*"Well, that appeals to me."*
Ehrlichman:	*"Edgar Kaiser is running his Permanente deal for profit. And the reason that . . . he can do it . . . . All the incentives are toward less medical care, because . . . the less care they give them, the more money they make."*[170]

1.6 1980s

1.6.1 The Graduate Medical Education National Advisory Committee (GMENAC)

In the 13 years preceding 1980, the ratio of actively practicing doctors to patients increased by 50 percent.[171] This increased physician-to-patient ratio led to concerns over quality of care and cost-effectiveness, which in turn caused the creation of a government committee to evaluate physician distribution. The *Graduate Medical Education National Advisory Committee* (GMENAC) was first chartered in April 1976 and later extended through September 1980.[172] Its purpose was to "analyze the distribution among specialties of physicians and medical students and to evaluate alternative approaches to ensure an appropriate balance," as well as to "encourage bodies controlling the number, types, and geographic location of graduate training positions to provide leadership in achieving the recommended balance."[173]

[173] Ibid., p. 73.

GMENAC's efforts produced seven volumes of recommendations regarding physician manpower supply, through the development of several models by which to determine the number of future physicians that would be needed by different subspecialties to achieve "a better balance of physicians."[174] Using these models, GMENAC determined that there would be a significant surplus of 70,000 physicians by 1990 and an oversupply of 150,000 doctors by 2000.[175] In order to counter this growth, the U.S. government halted its past expansionary policies within the physician sector. Specifically, the *Summary Report of GMENAC to the Secretary, Department of Health and Human Services* (HHS) recommended that medical schools reduce the size of their entering classes by 17 percent and limit the rise in the number of nonphysician healthcare providers, such as nurse practitioners and physician assistants.[176]

The GMENAC report based its model on several key assumptions: that a surplus of physicians was an undesirable situation and that physicians would have the same workload and procedures in the future as they had at the time the report was written.[177] Moreover, the report's accuracy depended on the assumption that it was possible to create an accurate computer model of physician manpower.[178] Critics of the GMENAC report stated that the GMENAC modeling

There is a projected shortage of 1.6 to 2.5 million allied health professionals.

"Workforce Shortage Crisis," by George Lauer, Allied Health Professionals Week Highlights, *January 27, 2007, http://www.californiahealthline.org/Features/2009/Shortage-of-Allied-Health-Workers (accessed April 10, 2009).*

panel failed to predict the rise of improved standards of care due to new technology, and that the effect of unanticipated changes may be large enough that the entire model should be discounted as an inaccurate prediction.[179]

In response to the GMENAC model's recommendations, ignoring critics of the report, U.S. medical schools adjusted their enrollment of students, causing a significant shift in the supply of new physicians going into the twenty-first century. Additional information concerning the impact of the GMENAC report and the perceived current shortage in physician workforce can be found in Section 4.3.4, "The Physician-Workforce Shortage: Demand Outpaces Supply."

1.6.2 Passage of the Omnibus Budget Reconciliation Act (OBRA)

The first *Omnibus Budget Reconciliation Act* (OBRA) was passed in 1981, and, along with the *Economic Recovery Tax Act* of 1981, established the fiscal priorities of President Ronald Regan. These laws implemented tax cuts, reduced domestic discretionary spending, and increased military spending.

[179] J. E. Harris, "How Many Doctors Are Enough?" *Health Affairs* 5, no. 4 (1986): 77–78.

Although OBRA was intended to reduce the federal deficit, there was instead the sharpest increase in the deficit under any single presidency at that time. By 1986, the dramatic rise in the federal deficit, partially due to depleted tax revenues, from tax cuts under these two laws resulted in a negative federal revenue impact of $200 billion.[180]

1.6.3 Passage of Emergency Medical Treatment and Active Labor Act (EMTALA)

The *Emergency Medical Treatment and Labor Act* (*EMTALA*) was enacted in 1986 by the *Consolidated Omnibus Budget Reconciliation Act of 1985* (*COBRA '85*) and applies only to hospitals that participate in the Medicare program and have an emergency room.[181] EMTALA requires covered hospitals to provide a "medical screening" and stabilization for any patient coming to the hospital's emergency department.[182] EMTALA provides that anyone suffering harm as a "direct result" of a hospital's violation of EMTALA can bring a damages claim against the hospital, as well as a claim for civil penalties against the hospital for noncompliance.[183] Further information regarding EMTALA's effect on the regulatory environment can be found in Section 3.8.1.4, "Emergency Medical Treatment and Active Labor Act (EMTALA)."

1.6.4 Development of Diagnosis Related Group (DRG)

In 1980, New Jersey implemented a new reimbursement model for hospitals based on diagnostic related groups (DRGs). This reimbursement reform was intended to realign incentives within hospitals to affect efficiency and healthcare expenditures. Despite limited evaluation of the program, many states followed suit, and in 1983, the federal government, under the Reagan administration, adopted the DRG system into the Medicare program.[184]

Diagnostic Related Groups

A classification system of patients by surgical procedure or diagnosis into major diagnostic categories for the purpose of Medicare reimbursement of hospitalization costs.

The Managed Health Care Handbook*, 3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Aspen Publishers, 1996), p. 187.*

For reimbursement under Medicare Part A, hospitals are reimbursed using DRGs, which classify patients based on the average per discharge cost of caring for their diagnosis.[185] Each DRG is assigned a relative rate based on its average cost, which is then multiplied by the input-price level of each market to determine the payment rate for the DRG.[186] Federal reimbursement methodology will be further discussed in Chapter 2, "Reimbursement Environment."

1.6.5 Development of Prospective Payment Systems

Historically, Medicare and Medicaid paid for hospital services using a *cost plus* method of reimbursement, where hospitals received reimbursement in excess of all of their costs.[187] In 1982, the federal government introduced a *prospective payment system* (*PPS*) in an effort to remedy the rising healthcare costs.[188] Under this PPS, hospitals are reimbursed an average, qualified, and predetermined fee for every recognized DRG, discussed earlier.[189] The government has also developed a PPS for ambulatory surgery centers, home healthcare, hospital outpatient services, rehabilitation facilities, and skilled nursing facilities (SNFs).[190]

Prospective Payment System (PPS)

The federal medical system that reimburses hospitals for Part A Medicare services based on diagnosis related groups.

A Guide to Consulting Services for Emerging Healthcare Organizations, *by Robert James Cimasi (New York: John Wiley and Sons, 1999), pp. 24–25.*

Factoid

In 1983, the federal government introduced a prospective payment system (PPS) in an effort to remedy the rising healthcare costs.

"Assessing Payment Adequacy and Updating Payment in Fee-for-Service Medicare," in Report to the Congress: Medicare Payment Policy, *March 2005, pp. 29–32.*

Applying microeconomic theory, the PPS was proposed at the high point in the Regan administration's "revolution" of domestic policy. HHS viewed PPS as a self-maintaining system, and it was considered by some as "a critical step in the 'deregulation' of American hospitals," in order to enhance marketplace competition by using incentives versus legislative controls.[191]

1.6.6 Development of Resource-Based Relative Value System (RBRVS)

In 1989, the *Resource-Based Relative Value System* (*RBRVS*) was introduced as a mechanism to control the costs of physicians' services borne by the Medicare program, although the program was not implemented until January 1, 1992, along with the *Medicare Fee Schedule.*[192] In 1986, in

[191] Bruce C. Vladeck, "Medicare's Prospective Payment System at Age Eight: Mature Success or Midlife Crisis," *University of Puget Sound Law Review* 14, no. 3 (Spring 1991): 453.

[192] "Financing Healthcare," in Harry A. Sultz and Kristina M. Young, *Health Care USA: Understanding Its Organization and Delivery*, 6th ed. Hsiao, et al., "An Overview of the Development and Refinement of the Resource-Based Relative Value Scale: The Foundation for Reform of U.S. Physician Payment," *Medical Care* 30, no. 11, Supp. (November 1992): NS1–NS2.

response to the growth in Medicare spending and concerns regarding claims of inequity in reimbursement rates for procedural services over cognitive clinical, the *Physician Payment Review Commission* (PPRC), the predecessor to the *Medicare Payment Advisory Commission* (MedPAC), mandated that the new resource-based physician fee schedule be developed (see Section 1.7.8.3, "Medicare Payment Advisory Commission Established").[193] Derived from the results of a 1988 study, *A National Study of Resource-Based Relative Value Scales for Physician Services*, William C. Hsiao, Ph.D., a professor at the Harvard School of Public Health, was engaged to develop the RBRVS.[194]

The study was commissioned and funded by the *Health Care Financing Administration* (HCFA), currently known as CMS, and was supported by the AMA, various specialty groups, and the PPRC.[195] Based on earlier work in 1979 and 1985 by Hsiao and others that examined the inadequacies, inconsistencies, and ambiguities in the measurement of the relative value of physician work input and the coding system used, the 1988 study allocated physician services into distinct *fungible units* consisting of *work*, *practice cost*, and *malpractice cost* inputs known as Relative Value Units (RVUs).[196]

[194] William C. Hsiao, et al., *A National Study of Resource-Based Relative Value Scales for Physician Services* (Cambridge, MA: American Medical Association, 1988), pp. 1–25; Sarah E. Johnson and Warren P. Newton, "Resource-Based Relative Value Units: A Primer for Academic Family Physicians," *Family Medicine* (March 2002): 172–173.

[195] HCFA was established in 1977 to manage the Medicare and Medicaid programs. The agency changed its name in 2001, prompting a widely distributed joke that the purpose of the change was to dissuade excessive reference to HCFA as "Hillary Can't Fix Anything," reference to the failed Clinton healthcare reform efforts of the 1990s, discussed below. "HCFA Becomes CMS: A Name to Live Up To," *American Medical News*, July 23, 2001, http://www.ama-assn.org/amednews/2001/07/23/edsa0723.htm (accessed August 23, 2012).

[196] William C. Hsiao and W. B. Stason, "Toward Developing a Relative Value Scale for Medical and Surgical Services," *Health Care Financing Review* (1979): 1–23; William C. Hsiao, et al., *Resource-Based Relative Values of Selected Medical and Surgical Procedures in Massachusetts: Final Report on Research Contract for Rate Setting Commission*, Commonwealth of Massachusetts (Boston, MA: Harvard School of Public Health, 1985); William C. Hsiao, et al., "An Overview of the Development and Refinement of the Resource-Based Relative Value Scale: The Foundation for Reform of U.S. Physician Payment," *Medical Care* 30, no. 11, Supp. (November 1992): NS1, 2, 3; William C. Hsiao, et al., *A National Study of Resource-Based Relative Value Scales for Physician Services* (Cambridge, MA: American Medical Association, 1988), pp. 1–25.

Phase I of the study examined more than 200 practicing physicians, performing more than 400 services, in 18 medical and surgical specialties, relying on the *Current Procedural Terminology* (CPT-4).[197] The process of allocating physician services into distinct fungible units of defined commodities (RVUs) embraced the concept that establishing equivalence per unit of care across physician services and specialties could enhance initiatives to ensure more equitable and reasonable reimbursement rates, while additionally providing an effective metric as a tool for cost containment.

The original 1989 legislative decision to include the RBRVS was passed on Phase I of the 1988 Hsiao study that was performed between 1986 and 1988. Following the acceptance of the RBRVS system, but prior to its 1992 implementation, Hsiao and his peers completed Phase II (1988–1990) and Phase III (1990–1992) of the study to further refine and expand the scope of the RBRVS system.[198]

The system was intended to bring payments for medical practice more in line with a prospective payment system, under which reimbursement is based on a predetermined, fixed amount and on estimates of resource costs incurred in an efficient medical practice, to replace the previous *Cost Plus*, *Customary*

REASON FOR AN RBRVS

Was intended to bring medical practice more in line with a prospective payment system where payments are made based on set fees for types of procedures or diagnosis. Medicare payments are based on the relative value assigned to each procedure's work, practice expense, and malpractice costs with payment adjusted by a geographic and a universal conversion factor. Every physician uses the same payment schedule under the Medicare program.

1.6.7 General Counsel Memorandum #39498

Published in 1986, the IRS's *General Counsel Memorandum #39498* was the first issuance of an IRS memorandum regarding a tax exempt hospital's status being contingent on the development and maintenance of appropriate financial relationships with physicians. The IRS stated that hospital physician recruitment programs that offer subsidies to recruited physicians without any repayment requirements may "constitute direct private benefits" and will adversely affect the hospital's exempt status.[201] The memorandum reinforced the IRS's traditional presumption that all persons who provide services within an exempt hospital have a private interest in the hospital and therefore creating an inurement, which, under the memorandum's guidance, could, if not compliant, potentially have a negative impact on the hospital's tax-exempt status.[202]

1.6.8 Medicare and Medicaid Patient and Program Protection Act

The *Federal Anti-Kickback Statute of 1972* was amended in 1987 with the passage of the *Medicare and Medicaid Patient & Program Protection Act of 1987* (*MMPPPA*) to include an alternative civil remedy: exclusion from the Medicare program.[203] Civil penalties were believed to be a more effective way of enforcing the statute because the government need not prove the violation by the criminal standard of *beyond a reasonable doubt*. Instead, to impose a civil penalty, the government need only prove the violation by the lesser standard of *a preponderance of the evidence*.[204] The MMPPPA also directed HHS to develop several exceptions to the Anti-Kickback Statute, to allow greater flexibility for provider interactions.[205] Additional information

concerning the Anti-Kickback Statute can be found in Chapter 3, "The Regulatory Environment."

1.6.9 Ethics in Patient Referral Act of 1989 (Stark Law)

More commonly known as the *Stark Law*, the *Ethics in Patient Referral Act of 1989* prohibited physicians from making referrals to clinical laboratories if the physician or an immediate family member of the physician had an ownership or an investment interest in the lab.[206] Furthermore, the lab was prohibited from billing for those services.[207] This act marked the beginning of the stream of numerous restrictive amendments to the *Stark Law*, which have significantly affected the ways in which physicians and healthcare enterprises interact. The physician self-referral prohibitions are named after the legislation's chief supporter, Congressman Fortney "Pete" Stark (D-CA). Congressman Stark supported the legislation based on studies indicating that despite the broad scope of the *Anti-Kickback Statute*, self-referrals were prevalent in the healthcare industry.[208] The Stark Law is discussed in detail in Section 3.3.2, "Stark Law." A time line of historical reforms for the period 1990–2010 is set forth in Exhibit 1.7.

Stark Law

Common name for the prohibition against physicians making referrals to clinical laboratories if the physician, or an immediate family member of the physician, had an ownership (first established in the Ethics in Patient Referral Act of 1989). Scope has been expanded in Stark II–IV.

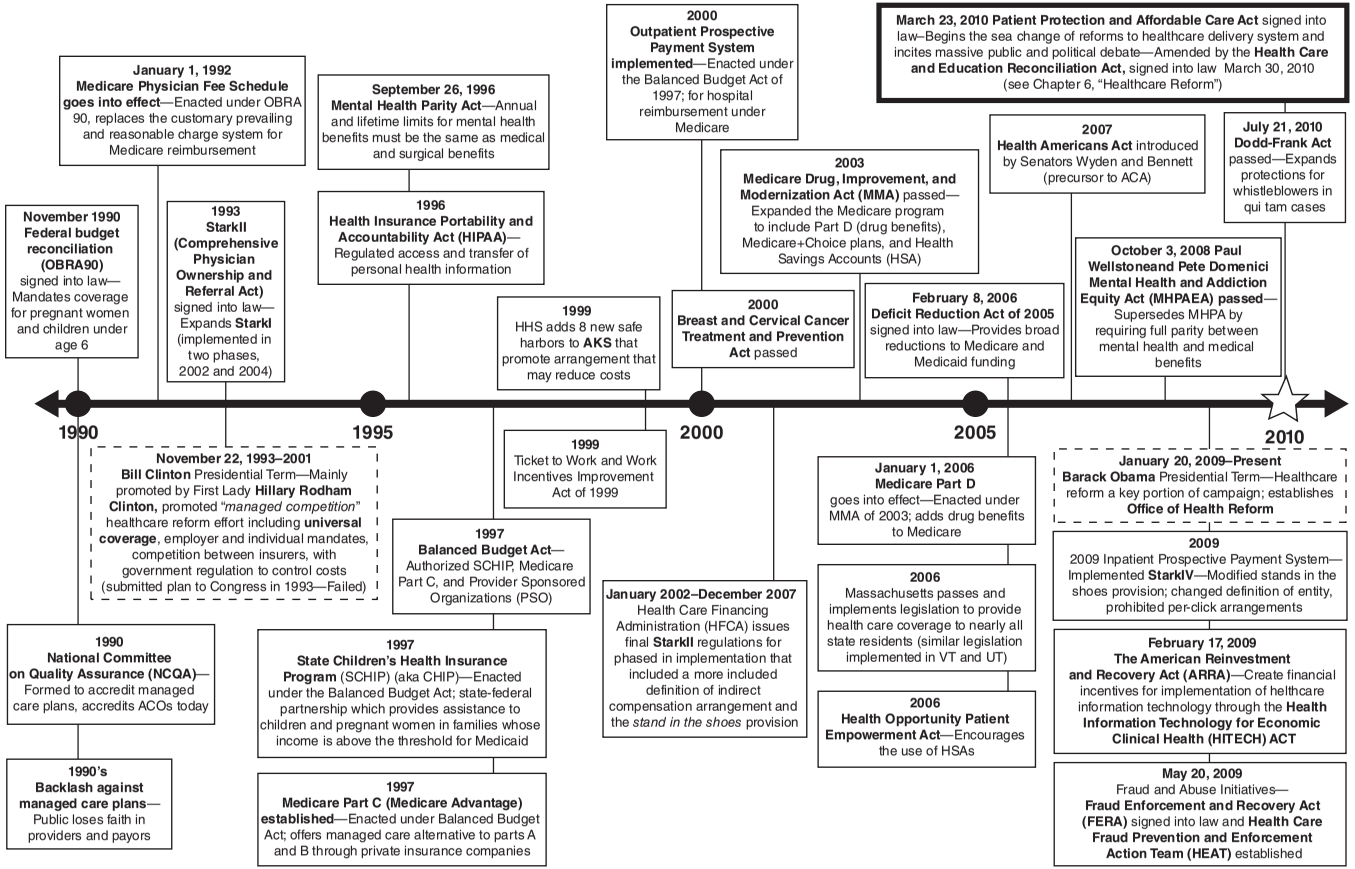

EXHIBIT 1.7 Healthcare Reform Historical Time Line: 1990–2010

1.7 1990s

1.7.1 Omnibus Budget Reconciliation Act of 1990

Signed into law in November 1990 by President George H. W. Bush, the *Omnibus Budget Reconciliation Act of 1990* (OBRA '90) aimed to reduce the federal budget deficit through a number of fiscal and tax changes.[209] While the act is primarily associated with an increase in income tax rates, it is also notable for establishing *pay-as-you-go* within the *Budget Enforcement Act of 1990* and giving states permission to create *Drug Utilization Review Boards*.[210] *Pay-as-you-go*, also known as PAYGO, requires that the *Office of Management and Budget* show the cumulative deficit impact of legislation.[211] *Drug Utilization Review Boards* ensure that prescriptions are appropriate, are medically necessary, and are not likely to result in adverse medical results.[212]

OBRA '90 implemented a new fixed fee schedule for Medicare services.[213] The *Medicare Physician Fee Schedule* (MPFS) became effective January 1, 1992, and replaced the previous customary prevailing and reasonable (CPR) charge system with the RBRVS system created by Hsiao and others and approved by Congress in 1989.[214] CPR payments were based on the similarity of a physician's charges to fees charged by other providers, by specialty, within the charging physician's market service area, whereas the RBRVS fee schedule is a prospective scheme that publishes predetermined

payments for healthcare services provided to patients.[215] The RBRVS was intended to place greater emphasis on time spent with a patient when assessing health, diagnosing conditions, and listening to complaints, thereby distributing Medicare payments more heavily to primary care and diminishing the traditionally higher payments to specialists and surgeons.[216]

1.7.2 Backlash against HMOs and Managed-Care Plans

As mentioned earlier, the 1980s saw a boom in the number of new managed-care plans. The capitation form of payment used in many plans, originally hailed as a means for reducing health costs, instead caused physicians and hospitals to underprovide services for fear of surpassing their spending thresholds.[217] Patients accused HMO gatekeeper providers and insurers of being more focused on managing the cost of care for their own financial benefit, rather than on the interests of their patients.[218] By 1997, 52 percent of U.S. citizens were in favor of the government stepping in to regulate managed-care companies, even if it resulted in increased cost. Furthermore, 54 percent believed the continued use of capitated payment models and

gate-keeping functions of managed-care plans would harm the quality of medical care.[219]

The public discontent with managed-care plans was heavily publicized, adding fuel to the eventual consumer backlash, despite surveys indicating overall satisfaction with the level of medical care received from HMO providers.[220] Since the 1990s, HMOs have continued to be used as a means of controlling costs; however, reports suggest that restrictions on provider preferences have been significantly relaxed.[221]

1.7.3 Clinton Attempted Healthcare Reforms

Healthcare reform was a key policy initiative from the beginning of the Clinton administration's campaign in 1992 and throughout his term, and the political environment during his first term seemed to support his efforts: Democrats controlled both the Senate and the House of Representatives, bipartisan concessions were offered, the public supported reform, and many influential industry organizations approved sweeping changes.[222] The bill was primarily championed by First Lady Hillary Rodham Clinton, chair of the *Task Force on National Health Care Reform*, established January 25, 1993, by President Clinton at the onset of his term.[223] The healthcare reform proposal, bill H.R.

[223] Hillary Clinton was a member of the Jackson Hole Group, a group of healthcare experts consisting of approximately 100 academics, insurance executives, hospital and pharmaceutical executives, physicians, and associated business and policy makers. Meeting at the home of Dr. Paul M. Ellwood (a main proponent of managed competition), in Jackson Hole, Wyoming, the group was one of the driving forces behind the formation of the Health Security Act, based on its publication, *The 21st Century American Health System—Managed Competition: A Proposal for Public and Private Health Care Reform*. Alan Enthoven (founder of the concept of managed competition) participated in the group, stating, "What was valuable is that we brought together people from many perspectives. We learned from each other." Robin Toner, "Hillary Clinton's Potent Brain Trust on Health Reform," *New York Times*, February 28, 1993; "President's Task Force on National Health Care Reform," *Federal Register Daily Journal*, https://www.federalregister.gov/agencies/president-s-task-force-on-national-health-care-reform (accessed August 23, 2012).

CLINTON ERA REFORM

The Clinton healthcare reform plan, submitted to Congress in 1993, attempted to institute universal coverage, regulate the private insurance market, change healthcare financing through an employer mandate, control costs to levels enforced by a national health board, and transform delivery systems through managed care.

3600, *The Health Security Act*, submitted to Congress on November 20, 1993, attempted to institute universal coverage, regulate the private insurance market, change healthcare financing through an employer mandate, control costs to levels enforced by a national health board, and transform delivery systems through managed care.[224] The plan combined the liberal *ends* of universal coverage with the conservative *means* of managed competition.[225]

1.7.4 Failure of Reform

Numerous factors had contributed to the sharp change in sentiment toward healthcare between 1993 and 1994, when the Clinton reform bill was being debated. President Clinton did not muster the political capital to finish his push for reform, expending much of his political clout on other issues, such as the federal budget and the *North American Free Trade Agreement* (NAFTA), as well as on the political fallout from the *Whitewater scandal*.[226] With the approaching midterm elections, Republicans stopped making concessions and instead positioned the bill's defeat as a means to humiliate the president.[227] Furthermore, the economy had started to improve, and as a result, many constituents were less concerned with reforming healthcare.[228] President Clinton reduced the scope of his envisioned reform, focusing on

[227] Ibid.

[228] Ibid.

universal coverage and threatening to veto any bill that did not include it.[229] In the end, no compromise was found, and the Clinton plan died in Congress.[230]

1.7.5 Comprehensive Physician Ownership and Referral Act of 1993 (Stark II)

Stark II expanded the prohibition against self-referrals. Under *Stark II*, the prohibition expanded beyond the restriction of referring to clinical laboratories established in *Stark I* and included restrictions on ten additional areas of designated health services (DHS).[231] *Stark II* was implemented in two phases, the first of which became effective on January 4, 2002.[232] The second phase of Stark II was published in 2004. The effects of Stark II are discussed in Section 3.3.2, "Stark Law."

1.7.6 Health Insurance Portability and Accountability Act of 1996 (HIPAA)

The *Health Insurance Portability and Accountability Act* (HIPAA) was signed into law on August 21, 1996, and encourages the development of health information systems, as well as regulating access to, and safeguarding the privacy of, individually identifiable health information.[233] Under HIPAA, the secretary of HHS is required to put forth standards for the electronic exchange of protected health information, which apply in all covered transactions and extend from providers to billing services and third-party contractors used by the providers.[234] Transactions falling under HIPAA include claims, benefit eligibility inquiries, referral authorization requests, and other transactions for which HHS has established particular standards.[235] A further discussion

of HIPAA can be found in Section 3.5.1, "Health Insurance Portability and Accountability Act (HIPAA)."

1.7.7 Mental Health Parity Act of 1996

The *Mental Health Parity Act* (MHPA) was passed on September 26, 1996, to prevent group health plans from limiting annual or lifetime dollar limits for mental health care. Under the act, the limits applied to mental health benefits must be equal to or greater than any medical or surgical benefits offered under a given plan.[236] The MHPA was superseded by the *Paul Wellstone and Pete Domenici Mental Health and Addiction Equity Act* (MHPAEA) passed in October 2008 (as a rider to the *Emergency Economic Stabilization Act of 2008*), which required full parity for all benefits, not simply annual or lifetime dollar limits.[237]

1.7.8 Balanced Budget Act of 1997

The *Balanced Budget Act of 1997* established Medicare Part C, or *Medicare Advantage*, and the *State Children's Health Insurance Program* (SCHIP). In addition, the act set the civil monetary penalty for violations of the Anti-Kickback Statute at treble damages, or three times the illegal remuneration, plus $50,000 per violation.[238]

1.7.8.1 Medicare Part C (Medicare Advantage) Medicare Part C, also known as *Medicare Advantage*, offers a managed-care alternative to Medicare Parts A and B.[239] After its introduction in the *Balanced Budget Act of 1997*, Medicare-approved private insurance companies were allowed to offer Medicare Part C plans.[240] These plans include the hospital coverage of Medicare Part A and medical coverage of Medicare Part B without the need for Medigap (a privately purchased supplemental coverage to aid with

expenses left uncovered under the aforementioned subparts of Medicare).[241] With *Medicare Advantage*, patients would not be liable for payments in addition to their mandatory coverage of all medically necessary services.[242]

1.7.8.2 Children's Health Insurance Program Enacted under the *Balanced Budget Act of 1997*, the *State Children's Health Insurance Program* (SCHIP) (currently known as the Children's Health Insurance Program [CHIP]) is a state-federal partnership that provides assistance to children and pregnant women in families whose income is above the threshold for Medicaid.[243] The CHIP program was reauthorized through the *Children's Health Insurance Program Reauthorization Act of 2009* (CHIPRA) through September 2013.[244] SCHIP CHIPRA extends previous SCHIP coverage to include dental benefits to children under the CHIP program and requires states offering coverage for mental health and substance abuse to have mental health parity.[245] Further information regarding the current CHIP can be found in Section 2.4.2.2, "Children's Health Insurance Program (CHIP, f/k/a SCHIP) Overview."

1.7.8.3 Medicare Payment Advisory Commission Established Under the Balanced Budget Act of 1997, the *Prospective Payment Assessment Commission* (ProPAC) and the *Physician Payment Review Commission* (PPRC), both established in 1986, merged into the *Medicare Payment Advisory Commission* (MedPAC).[246] Still operational today, *MedPAC* encompasses

the duties of both predecessor agencies and is tasked with advising Congress on issues that affect the Medicare program.[247]

1.7.8.4 The Sustainable Growth Rate Established The Medicare Physician Fee Schedule is updated annually by CMS based on a formula mandated in the *Balanced Budget Act of 1997*, which includes application of the *Sustainable Growth Rate* (SGR).[248] The SGR represents a spending target set for total annual expenditures under Medicare on Part B services and provides a calculation for annual adjustments to the Medicare Physician Fee Schedule based on whether actual spending came in above or below the target.[249] Since its inception and particularly since 2002, there has been an intense debate over the need and benefit of the SGR, which, since 2002, has required congressional intervention on an annual basis to prevent calculated decreases to physician payments. For more information on the SGR and the debates concerning its longevity, see Chapter 2, "Reimbursement Environment," and Chapter 6, "Healthcare Reform."

1.7.9 Anti-Kickback Safe Harbors of 1999

In 1999, HHS clarified the existing safe harbors and added eight additional categories to protect investments in areas such as healthcare entities located in underserved areas, ambulatory surgical centers, and group practices.[250] These safe harbors were intended to protect arrangements that "can significantly reduce the cost of Federal health care programs,

while simultaneously benefiting patients."[251] For more information on the Anti-Kickback Statute and its various safe harbors, see Sections 1.5.1, "Anti-Kickback Statute," in this chapter, and 3.3.1.2.2, "Anti-Kickback Statute Safe Harbors," in Chapter 3, "Regulatory Environment."

1.8 2000–2010

1.8.1 Final HCFA Stark II Regulations

The *Health Care Financing Administration* (HFCA) issued the final *Stark II* regulations in three phases, taking effect in January 2002 through December 2007.[252] The Final Stark II regulations were notable for the changes made to the definition of an "indirect compensation arrangement," so that physicians members, employees, and contractors of the physician organization were now deemed to "stand in the shoes" of the physician organization.[253] Under the *stand in the shoes provisions*, physicians would be deemed to have the same direct compensation arrangement as the physician organization itself.[254] This meant that physician organizations were no longer intervening entities for the purpose of establishing an indirect compensation arrangement, and many designated health services (DHS) entities were forced to restructure to avoid Stark liability.[255] A further discussion of Stark II can be found in Section 3.3.2, "Stark Law."

1.8.2 Implementation of Medicare Hospital Outpatient Prospective Payment System

Section 1833(t) of the SSA, as amended by §4533 of the *Balanced Budget Act of 1997*, expanded CMS authority under Medicare.[256] These sections provide for the implementation of a prospective payment system to include hospital outpatient services, certain Part B services to hospital inpatients who lack Part A coverage, some hospitalization services provided by hospitals and community health centers, Hepatitis B vaccines to certain patients, and initial preventative physical exams.[257] This system was put into effect on August 1, 2000, and made significant changes to hospital reimbursement, including communication, billing, and coding, as well as the organization of patient records.[258]

1.8.3 The Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003

In response to changes in the utilization of, and demand for, U.S. healthcare services and products, the passage of the *Medicare Prescription Drug, Improvement, and Modernization Act* (MMA) of 2003 during the George W. Bush administration resulted in the most significant changes to the Medicare program in the 38 years since its enactment. The MMA introduced several expansions to the Medicare Program. Effective January 1, 2006, *Medicare Part D* created an entitlement benefit for prescription drugs, which had seen drastic increased utilization. Medicare Advantage altered the insurance practices for those private insurers that had previously offered Medicare+Choice plans, allowing insurers to offer Medicare Part D coverage and to restrict patient access and prescription drug choice. The MMA also created *health savings accounts* (HSA), replacing and expanding on medical savings accounts. The controversy of the MMA is that it was largely unfunded, which many say added to the federal deficit and debt. For more information on HSAs, see Section 2.5.2.4, "Health Savings Accounts (HSA)."

1.8.4 Deficit Reduction Act of 2005

The *Deficit Reduction Act* (DRA) of 2005 was signed into law on February 8, 2006.[259] The DRA includes broad net reductions to Medicare and Medicaid, as well as a provision requiring proof of citizenship in order to apply for Medicaid and receive benefits.[260] The DRA required the creation of safeguards to assure financial accountability for *Medicare and Medicaid Programs* designed to combat fraud and abuse, in addition to controlling waste.[261] The Congressional Budget Office (CBO) estimated that the DRA would reduce federal Medicaid spending by $11.5 billion by 2010 and $43.2 billion by 2020. Half of the savings in the DRA are provisions concerning premiums and cost sharing, benefits, and asset transfers. These provisions were criticized as also having the potential for the greatest deleterious impact on beneficiaries, who may have more healthcare expenses and less access to care as a result.[262] The passage of the DRA in 2006 resulted in fraud and abuse initiatives, including the Medicaid Integrity Program, and outcome-based reimbursement models emphasizing value, including a mandate that the secretary of HHS develop a *value-based purchasing* program for hospitals, which was established under the ACA and subsequent CMS legislation, as the *Hospital Value-Based Purchasing Program*.[263] For more information on current value-based purchasing

Factoid

The Bureau of Health Professions predicted that, between 2000 and 2020, the U.S. population would increase by 18%. Also, the number of people aged 65 and older is anticipated to account for 13% of the total world population by 2030.

and fraud and abuse initiatives, see sections 2.7.1.1.2, "Value-Based Purchasing," and 3.3, "Fraud and Abuse Regulations."

1.8.5 Health Opportunity Patient Empowerment Act of 2006

The *Health Opportunity Patient Empowerment Act of 2006* (H.R. 6134), submitted to Congress on September 21, 2006, amends the 1986 IRS Code to expand health coverage for the public through the provision of high deductible health plans and by encouraging the public to use *health savings accounts* (HSA).[264] Although H.R. 6134 died in Congress, the amendments suggested in the *Health Opportunity Patient Empowerment Act of 2006* were enacted on December 20, 2006, within the *Tax Relief and Health Care Act of 2006*.[265] See Section 2.5.2.4, "Health Savings Accounts (HSA)," for more information of HSAs.

1.8.6 Stark IV

Stark IV refers to the changes made to the Stark Law in the 2009 Inpatient Prospective Payment System.[266] Most notably, Stark IV modified the "stand in the shoes" provision of the Stark Law, changed the definition of "*entity*," and prohibited the per-click leasing arrangements that were previously under four of the exceptions to the Stark Law.[267] For more information on Stark Law, see Section 3.3.2.3 for a further discussion of the regulatory provisions of the Stark IV.

1.8.7 American Reinvestment and Recovery Act of 2009

The *American Recovery and Reinvestment Act* of 2009 (ARRA), signed into law February 17, 2009, amended HIPAA's health information privacy

and security provisions and created funding incentives for the widespread implementation of healthcare information technology, specifically electronic health records (EHR) through the *Health Information Technology for Economic Clinical Health* (HITECH) Act, a portion of the ARRA.[268] These incentives totaled $19.2 billion and require providers to meet meaningful use standards before receiving funding for EHR technology.[269] The definition of *meaningful use* has been further described in several subsequent regulations, predominantly, the Medicare and Medicaid Programs and the *Electronic Health Record Incentive Program*.[270] Provisions in the HITECH Act also protect the privacy and security of personal health information (PHI) through amendments to HIPAA.[271] For further information on the impact of the ARRA and HITECH, see Sections 3.5.3, "Health Information Technology for Economic and Clinical Health (HITECH) Act," and 5.2.2.1, "Trends in EHR Utilization."

1.8.8 Fraud and Abuse Initiatives of 2009

Initiatives to prevent and punish fraud and abuse gained momentum in response to the continued growth in healthcare cost and spending in the late 2000s, resulting in the enactment, on May 20, 2012, of the *Fraud Enforcement and Recovery Act* (FERA), and the establishment of the *Health Care Fraud Prevention and Enforcement Action Team* (HEAT), announced on the same day.[272] Both actions expand the power of the government to examine Medicare claims with the purpose of identifying potential instances of Medicare fraud and ultimately lower the amount spent on the Medicare program (see Section 3.3.3.3, "Fraud Enforcement and Recovery Act [FERA]").

Similarly, the *Dodd-Frank Act*, signed into law on July 21, 2010, expanded protections for whistleblowers to incentivize qui tam actions and discourage fraud and abuse (see Section 3.3.3.5, "Dodd-Frank Act").[273]

1.8.9 Patient Protection and Affordable Care Act (ACA)

Following a period of factious political debate, one of the most significant transformations of U.S. healthcare delivery, the *Patient Protection and Affordable Care Act* (ACA), was signed into law by President Barack Obama on March 23, 2010. The ACA, along with its amendment, the *Health Care and Education Reconciliation Act* (see the next section), is commonly referred to as "healthcare reform" or "Obamacare." The regulation contains many provisions affecting the access, quality, and cost of healthcare (also referred to as the triple aim of healthcare reform), including ACA §3002, the first reference to the *Medicare Shared Savings Program* (MSSP) that governs federal Accountable Care Organizations (ACOs). The ACA is perhaps the most transformative legislation introduced to the healthcare industry since the passage of Medicare and Medicaid in 1965. Its provisions include the formation of *risk pools*, *increased transparency* through *publication of outcomes* and *fraud and abuse audits*, *expanded access* to *affordable insurance*, and expanded access to care (especially, preventative services and primary care providers). Despite the U.S. Supreme Court (SCOTUS) decision that upheld most of the provisions of the ACA, a great deal of confusion and uncertainty remain regarding the future structure of healthcare reform and its impact on the healthcare industry and markets. A detailed analysis of the ACA, the events leading up to its passage, and the SCOTUS decision can be found next and in Chapter 6, "Healthcare Reform."

1.8.10 Health Care and Education Reconciliation Act of 2010

The *Health Care and Education Reconciliation Act* of 2010 modifies several provisions of the ACA regarding Internal Revenue Service codes and employer provisions for health plans. The act includes healthcare provisions that modify individual and employer penalties for choosing not to purchase health insurance and extends parents' healthcare coverage to adult children up to age 26.[274]

1.9 ACA CONSTITUTIONALITY CHALLENGED

On June, 28, 2012, SCOTUS handed down its highly anticipated decision upholding most of the 2010 healthcare reform. This opinion addressed two cases, *National Federation of Independent Business v. Sebelius* and *HHS v. Florida*. SCOTUS stunned healthcare industry commentators by relying on a narrow interpretation of federal taxing authority to support its decision. Touted as one of the most significant SCOTUS decisions of this century, the Court's 5 to 4 ruling to uphold the ACA will have repercussions throughout the U.S. healthcare delivery system and the professionals and businesses that operate therein.[275]

A national controversy was ignited on the passage of the ACA, and the "individual mandate" was challenged in court by certain states' attorneys general, who argued that Congress overstepped its bounds to violate both the supremacy and commerce clauses.[276] These states took legal action in *Florida v. HHS*, in which the 26 states disputed the constitutionality of the ACA's *individual mandate* provision and the constitutionality of the ACA itself.[277] Similarly, the *National Federation of Independent Business* filed a suit challenging the constitutionality of the ACA's Medicaid expansion provisions, which require states to expand their Medicaid coverage to 133 percent of the Federal Poverty Line (FPL) or face revocation of *all* federal Medicaid funding.[278] After a series of opposing circuit court decisions, writs of certiorari (the motion filed to argue a case in front of SCOTUS) were filed and approved, to be combined with one final SCOTUS opinion ruling for both of the underlying cases.[279]

---

[275] *National Federation of Independent Business v. Sebelius*, Certiorari to the United States Court of Appeals for the Eleventh Circuit, S.C. Slip Opinion No. 11-393, June 28, 2011.

[276] *National Federation of Independent Business, et al., v. Kathleen Sebelius, Secretary of Health and Human Services, et al.*, Writ of Certiorari, Motion No. 11-393, November 14, 2011; *Florida, et al., v. Department of Health and Human Services, et al.*, Writ of Certiorari, Motion No. 11-400, November 14, 2011; Rich Daly and Jessica Zigmond, "Showdown Gets a Head Start," posted on *Modern Healthcare*, March 26, 2012, http://www.modernhealthcare.com/article/20120324/MAGAZINE/303249947 (accessed August 17, 2012).

[277] *Florida, et al., v. Department of Health and Human Services, et al.*, Writ of Certiorari, Motion No. 11-400, November 14, 2011.

[278] *National Federation of Independent Business, et al., v. Kathleen Sebelius, Secretary of Health and Human Services, et al.*, Writ of Certiorari, Motion No. 11-393, November 14, 2011.

[279] *National Federation of Independent Business v. Sebelius*, Certiorari to the United States Court of Appeals for the Eleventh Circuit, S.C. Slip Opinion Nos. 11-393, 11-398 and, 11-400, 2012 BL 160004, 53 EBC 1513 (U.S. June 28, 2012).

In March 2012, two years after the passage of the ACA, the Court began hearing oral arguments to consider four key questions related to the ACA: (1) whether the individual mandate is a "tax" or a "penalty," thereby addressing the question of the "ripeness" necessary for a constitutional challenge; (2) whether the individual mandate is a violation of the *U.S. Constitution's commerce clause*; (3) whether the individual mandate provision is severable from the rest of the law; and (4) whether the federal requirement that Medicaid coverage be expanded is a violation of the *U.S. Constitution's supremacy clause*.[280]

Ultimately, the June 2012 SCOTUS ruling passed over issues of *ripeness* and, despite agreeing with the argument that the *individual mandate* violated the Constitution's commerce clause, chose to uphold the provision, and the ACA, as an exercise of the *federal taxing power.* SCOTUS held that the "penalty" mandated against those individuals who do not purchase insurance under the individual mandate was a *tax*, as it (1) is paid on filing annual income tax returns; (2) applies only to those individuals who pay federal income tax; (3) takes into account similar factors as taxes, such as number of dependents, joint filing status, and taxable income; and (4) is codified in the Internal Revenue Code and is enforced by the IRS.[281] Chief Justice Roberts stated in his opinion that "the Constitution permits such a tax, it is [therefore] not our role to forbid it, or to pass upon its wisdom or fairness."[282]

Although SCOTUS upheld the provision mandating the expansion of the Medicaid program, the Court did limit Congress's attempt to "pressure" states into participating, comparing the termination of all Medicaid funding to a "gun to the head."[283] SCOTUS found that Congress can offer new funding to entice Medicaid expansion by the states, but cannot withdraw existing funds. In addition, SCOTUS noted that nonparticipation by any number of the states does not invalidate the entire provision, thus upholding its constitutionality within the ACA.[284]

1.10 CONCLUSION

Many of the healthcare reforms discussed earlier attempt to revitalize the profession of medicine toward the ethical, financial, and productive ideals envisioned by an idealistic public. New movements toward evidence-based medicine, value-based purchasing, and lowering the growth in national health spending as a percentage of GDP are all reflected in many of the legislative efforts mentioned throughout this chapter.

The practice of medicine began as hypothetical thought rooted in religion and superstition and transformed over time into a scientific industry in growing demand. Ultimately, any system's "success" is a function of market control and profit. However, it is widely believed that market competition within the healthcare industry should ultimately also be driven by the ethical duties unique to the medical profession, notwithstanding that business objectives built around these ethical values may conflict with the entrepreneurial objectives that take priority in most other industries.[285] Furthermore, due to the community-based nature of many healthcare services, industry trends are largely driven by public opinion on matters related to health status.[286] As such, perceptions as to the healthcare professional's ethical duties have historically been deeply rooted in the concept of community benefit.[287]

This is not a novel concept or a new point of discussion. In a 1908 publication, *The Doctor's Duty to the State*, the AMA advanced the notion that

> *The doctor's highest duty is to be honest and to fight for honesty in his profession and the state.... He, as others, sees in history the same process exhibited in the remote effects of corporate and governmental vice.... To whom then shall the state look for preservation of its health, to whom shall the state call for help in time of trouble, in whom shall the state place its hope for deliverance.... The honest citizen; and the honest doctor is his best representative.*[288]

Unfortunately, the public's perception of healthcare providers has gradually eroded during the last decade, with patients becoming increasingly distrustful of hospitals, doctors, and drug companies. There is a growing perception that with the increased corporatization of healthcare, there has been a lapse in attention to the healthcare professional's highest ethical duty.[289] Perhaps, the first giant leap toward the *corporatization of medicine* began with the passage of Medicare and Medicaid in 1965; however, many hold that the fate of this transition was sealed in 1989 when Congress approved the use of Hsiao's RBRVS system of reimbursement based on the concept of physician services and units of productivity as a fungible commodity. A consequence of this commoditization was to further drive the *corporatization of medicine* and diminish the role of the physician as a learned professional and a patient advocate and relegate the physician to a role of either sharecropper or employee. Ultimately, the efficacy and wisdom of this new paradigm of the corporatization of medicine will be decided in future generations. Nevertheless, the understanding of this changing paradigm of corporatization is central to any analysis of healthcare industry markets, to the valuation analytical process, and in consideration of the *four pillars of healthcare valuation*.

CHAPTER 2

Reimbursement Environment

2.1 OVERVIEW

Healthcare reimbursement may be defined as the payment received by providers for the services they render to patients. Most providers will receive

REIMBURSEMENT

Reimbursement is payment for provider services made by patients and third-party payors. Unlike most businesses, healthcare providers may have hundreds of different contracts with payors, each with varying terms and rates for the same services.

"Reimbursements," in Medical Practice Management System, *by Linda Nadeau (Clifton Park, NY: Thomson Delmar Learning, 2007), p. 198; "Financial Environment of Health Care Organizations," in* Essentials of Health Care Finance, *6th ed.," by William O. Cleverley and Andrew E. Cameron (Sudbury, MA: Jones and Bartlett, 2007), pp. 36–37.*

reimbursements for their services from *commercial payors* and other third parties, including, but not limited to, *patients*, *employers*, *insurance companies*, and *government agencies*.[1] The reimbursement levels set by federal and state *government payors* often act as *benchmarks* for all reimbursement schemes. As the largest payor of healthcare in the United States, the *federal government* has a significant impact on the potential *expectation of future return on investment* through (1) stringent provider *reimbursement regulation*; (2) regulation of the very *existence of provider entities*; (3) how providers can be *organized* and *operated*; (4) the *products* and *services* that providers may offer; and (5) the types of *technology* and *supplies* that providers may use.[2]

U.S. healthcare expenditures have exceeded general inflation for the last 20 years and in 2011 totaled $2.7 trillion, or 17.9 percent of the *U.S. Gross Domestic Product* (GDP).[3] In an attempt to combat rising costs, private payors, the federal government, and the states have each implemented

[2] Stephen C. Schoenbaum, Anne-Marie J. Audet, and Karen Davis, "Obtaining Greater Value from Health Care: The Roles of the U.S. Government," *Health Affairs* 22, no. 6 (November/December 2003): 184–188.

[3] Neil Versel, "IT Investments for Naught Unless They Cut Healthcare Costs, Says Greenspan," Healthcareitnews.com, April 09, 2009, http://www.healthcareitnews.com/news/it-investments-naught-unless-they-cut-healthcare-costs-says-greenspan (accessed August 26, 2009); Centers for Medicare and Medicaid Services, "National Health Expenditure Projections 2011–2021," January 2012, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/Proj2011PDF.pdf (accessed July 6, 2012).

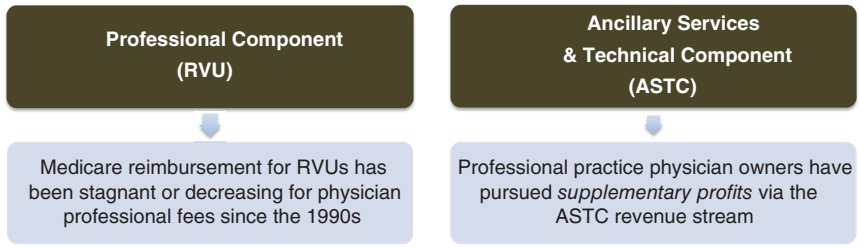

EXHIBIT 2.1 The Two Revenue Streams of Healthcare

(1) *prospective payment systems* (PPS), (2) *controlled fee schedules*, and (3) *selective contracting*, and (4) have pursued *managed care approaches* to *population health coverage*. However, to date, limited success in slowing this continued growth of costs has been achieved, and healthcare expenditures are projected to reach 24 percent of GDP by 2037.[4] Similarly, one of the aims of the 2010 *Patient Protection and Affordable Care Act* (ACA) is to reduce and control the rise in costs associated with healthcare, while improving health outcomes by (1) implementing and increasing the *coordination of care*; (2) *bundling* provider payments; (3) pursuing *value-based purchasing* initiatives; and (4) allowing providers to receive a *share* of the savings attributable to achieving specific cost-cutting efforts.

It should be noted that essentially, there are two *distinct types of revenue streams* for medical services in the healthcare industry, that is, a *professional services component* (work RVU) and an *ancillary services and technical component* (ASTC). These two types of revenue are illustrated in Exhibit 2.1.

For more information on these two distinct revenue streams, see Section 2.4.1.2, "Professional Component versus Ancillary Services and Technical Component."

2.2 HEALTHCARE REVENUE CYCLE

In healthcare, the term *revenue cycle* describes the process by which providers:

1. *Schedule patients*;
2. *Diagnose*, *code*, and *document* patient clinical conditions presented;

[4] Alma Koch, *Introduction to Health Services* (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 106; Congressional Budget Office, "The 2012 Long-Term Budget Outlook," Pub. No. 4507, June 2012, p. 3.

Revenue Cycle

The revenue cycle is the process by which a provider practice schedules patients, diagnoses conditions, documents diagnoses, bills payors, and collects billable charges from the payor and the patient to recover revenue for the services provided.

"The Revenue Cycle," in Financial Management of the Medical Practice, *2nd ed., by Max Reiboldt, CPA, and the Coker Group (Roswell, GA: American Medical Association, 2002), pp. 12–14.*

3. Bill both *primary and secondary payors*;
4. Complete *claims resolutions*; and
5. Pursue the *collection of revenue* from billable charges for goods and services rendered from both third-party payors and patients.[5]

An illustration of the *revenue cycle in healthcare* is set forth in Exhibit 2.2.

2.2.1 Step 1: Scheduling and Registration

In healthcare, the *revenue cycle* typically begins when a *patient schedules* his or her *appointment*, the importance of which should not be underestimated, as the *provider-patient relationship* and a healthy *revenue cycle* depend on it.[6] A key element of the *revenue cycle* is an effective *registration system* that accurately *collects patient information* to avoid *erroneous* or *omitted* information, which could delay reimbursement.[7] To ensure *revenue maximization*, the patient's *demographic information*, *eligibility status*, and *preauthorization requirements* should be verified at every *patient encounter* and before the patient receives services in order to avoid the potential denial of a claim.[8] Appropriate *scheduling software*

[5] Max Reiboldt and the Coker Group, *Financial Management of the Medical Practice*, 2nd ed. (Chicago: American Medical Association, 2002), pp. 12–14.

[6] Linda Nadeau, *Medical Practice Management System* (Clifton Park, NY: Thomson Delmar Learning, 2007), p. 96.

[7] Max Reiboldt and the Coker Group, *Financial Management of the Medical Practice*, 2nd ed. (Chicago: American Medical Association, 2002), p. 12.

[8] Ibid.

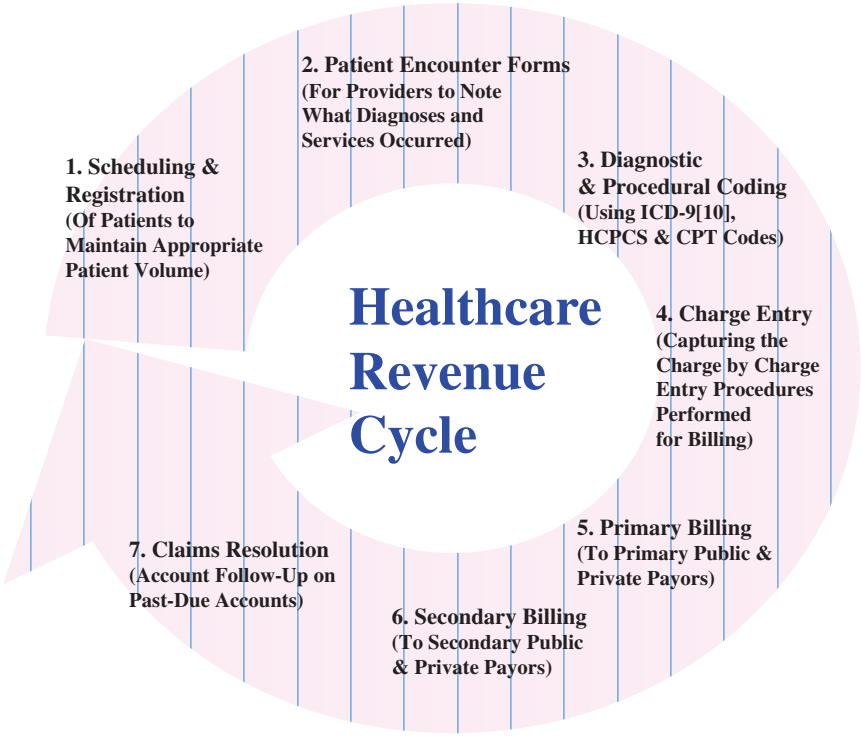

EXHIBIT 2.2 The Healthcare Revenue Cycle

is designed to assist with appointment *volume management* and *patient throughput* to enhance *provider productivity*, which is critical to any successful enterprise.[9]

2.2.2 Step 2: Patient Encounter Forms

Before services are *coded* for the *billing process*, providers must note the *principal* and *related diagnoses* and must document, with specificity, the *nature* and *scope* of services rendered during a patient encounter.[10]

[9] Linda Nadeau, *Medical Practice Management System* (Clifton Park, NY: Thomson Delmar Learning, 2007), p. 96.

[10] Cynthia Newby, *From Patient to Payment: Insurance Procedures for the Medical Office*, 3rd ed. (Columbus, OH: Glencoe/McGraw-Hill, 2002), p. 28.

Superbills and Charge Tickets

Another name for a patient encounter form.

From Patient to Payment: Insurance Procedures for the Medical Office, *3rd ed., by Cynthia Newby (Columbus, OH: Glencoe/McGraw-Hill, 2002), p. 31.*

Providers document *patient history* and *responses*, *diagnoses*, *procedures performed*, and *follow-up information* on either a paper or an electronic form, known as a *patient encounter form*, *superbill,* or *charge ticket*. This information may be incorporated into a patient's *electronic medical record* (EMR).[11]

2.2.3 Step 3: Diagnostic and Procedural Coding

Reimbursement amounts are often determined through *coding* the treatment information contained in a patient's medical record.[12] The *Health Insurance Portability and Accountability Act of 1996* (HIPAA) requires providers to *classify* both *diagnoses* and *clinical procedures*, choosing between several *coding systems*.[13] For more information on HIPAA and the law's impact on healthcare delivery, see Section 3.5.1, "Health Insurance Portability and Accountability Act (HIPAA)," in Chapter 3, "Regulatory Environment."

Factoid

The most commonly implemented coding systems include ICD-9, HCPCS, ICD-10, CPT-4, CDT, and the NDC.

"Overview: Transaction Code Sets Standards," by Centers for Medicare and Medicaid, April 26, 2009, http://www.cms.hhs.gov/TransactionCodeSetsStands/ (accessed September 15, 2009).

[11] Ibid., p. 31.

[12] William O. Cleverley and Andrew E. Cameron, *Essentials of Health Care Finance*, 6th ed. (Sudbury, MA: Jones and Bartlett Publishers, 2007), p. 17.

[13] Centers for Medicare and Medicaid, "Overview: Transaction Code Sets Standards," April 26, 2009, http://www.cms.hhs.gov/TransactionCodeSetsStands/ (accessed September 15, 2009).

Factoid

Providers typically bill for a professional component (PC), technical component (TC), or the global diagnostic code (PC + TC) when billing for diagnostic services.

"Medicare Program; Payment Policies Under the Physician Fee Schedule and Other Revisions to Part B for CY 2010; Proposed Rule," 74 Federal Register *(July 13, 2009): 33526.*

REIMBURSEMENT CODES

Numerical codes specified the type of procedure or diagnosis (different codes for each). Common code systems include CPT, ICD, and HCPCS.

"Overview: Transaction Code Sets Standards," by Centers for Medicare and Medicaid, April 26, 2009, http://www.cms.hhs.gov/TransactionCodeSetsStands/ (accessed September 15, 2009).

2.2.3.1 Diagnostic Coding *Diagnostic codes* are a numerical representation of the provider's *observations* and *conclusions* as to what health problem(s) or primary diagnoses the patient presents during a particular *patient encounter.* If a patient is treated for more than one condition, there may be both *primary* and *secondary* diagnoses, although if the secondary condition would affect the *treatment* or the *recovery* of the *primary diagnosis*, it is classified as a *coexisting condition* and must be coded as such under the *primary*

DIAGNOSIS RELATED GROUP (DRG)

Diagnosis related groups (DRGs) categorize patients in hospitals based on the relative intensity of services related to that diagnosis. Patients are typically classified based on their admitting diagnosis, which are grouped with other diagnoses into a DRG so that the hospital can identify groups of patients that require roughly the same amount of resources.

Health Law: Cases Materials and Problems, *3rd ed., by Barry R. Furrow, et al. (St. Paul, MN: West Publishing, 1997), pp. 845–846.*

International Classification of Diseases, Ninth Revision (ICD-9)

The ICD-9 system has codes that supply the payor with information regarding both the patient diagnosis and the procedures performed in treating the diagnosis. HIPAA requires all healthcare providers to use the ICD-9 codes when reporting diagnosis information to payors. In addition, HIPAA requires that hospitals use the ICD-9 procedural codes when reporting information to payors detailing the treatment of hospital inpatients.

"Billing and Coding for Health Services," in Essentials of Health Care Finance, *6th ed., by William O. Cleverley and Andrew E. Cameron (Sudbury, MA: Jones and Bartlett, 2007), p. 17.*

International Classification of Diseases, Tenth Revision (ICD-10)

In early 2009, the United States Department of Health and Human Services (HHS) announced a final rule that called for the replacement of the current ICD-9 code set used to report healthcare diagnoses and procedures with the ICD-10 code set by October 1, 2013. The adoption of the new system offers several benefits, including the facilitation of quality data reporting, support for pay for performance payment methodologies, improved billing accuracy, and allowances for international comparison of the incidence and spread of disease.

"Health Insurance Reform: Modifications to the Health Insurance Portability and Accountability Act (HIPAA); Final Rule," by the Department of Health and Human Services, Federal Register, *45 CFR Part 162, vol. 74, no. 11 (January 16, 2009): 3328; "Switching to ICD-10: The Impact on Physicians," by Lindsay Law and Mary Ann Porucznik, American Academy of Orthopaedic Surgeons/American Association of Orthopaedic Surgeons, AAOS.org, February 2009, http://www.aaos.org/news/aaosnow/feb09/reimbursement1.asp (accessed August 9, 2009); "News Release: HHS Issues Final ICD-10 Code Sets and Updated Electronic Transaction Standards Rules," by CMS Office of Public Affairs, HHS.gov, January 15, 2009, http://www.hhs.gov/news/press/2009pres/01/20090115f.html (accessed August 9, 2009).*

diagnosis.[14] *Diagnostic codes* are established within the *International Classification of Diseases and Related Health Problems*, *9th Revision* (ICD-9), soon to be replaced by the ICD-10.

The ICD was developed in 1893 to track *mortality statistics*. The ICD system is used worldwide for (1) *mortality and morbidity statistics*; (2) *reimbursement systems*; and (3) *automated decision support*.[15] The current ICD-9 system, in place since 1979, uses a *five-digit numeric coding system*, with 4,000 *diagnostic codes* and 14,000 *change codes* (modifiers).[16] The *International Classification of Diseases, Clinical Modification* (*ICD-9-CM*), uses the mortality statistics published in the ICD and creates codes for *inpatient* and *outpatient* healthcare settings.[17]

2.2.3.1.1 Shift from ICD-9 to ICD-10 Coding In early 2009, the *U.S. Department of Health and Human Services* (HHS) published a Final Rule that called for the replacement of the current *ICD-9 code* set with the *ICD-10 code*, with a deadline for full implementation of October 1, 2014.[18] The adoption of the new ICD-10 system offers several benefits, including (1) the facilitation of *quality data reporting*; (2) support for *pay-for-performance* payment methodologies; (3) improved *billing accuracy*; and (4) allowances for *international comparison* of the incidence and spread of disease.[19]

[19] Centers for Medicare and Medicaid Services, "HHS Issues Final ICD-10 Code Sets and Updated Electronic Transaction Standards Rules," News Release (January 15, 2009), http://www.hhs.gov/news/press/2009pres/01/20090115f.html (accessed August 9, 2009).

Factoid

CMS estimates that the total costs associated with the ICD-10 conversion may reach $640 million in 2013 alone.

"HIMSS: Hospitals Will Have to Shell Out Millions for ICD Conversion," by Kaitlyn Dmyterko, CMIO, October 12, 1011, http://www.cmio.net/index.php?option=com_articles&article=29 929 (accessed November 29, 2011).

Despite the perceived benefits of *the ICD-10 system*, the *conversion* may present challenges for many providers, since it will require compete *electronic health records* (EHR) implementation and, most likely, significant *capital spending*. For more information on *electronic health records* and the transition to the *ICD-10 system*, see Section 5.2.2, "Electronic Health Records," in Chapter 5, "Technology."

2.2.3.2 Procedural Coding Procedure codes are used to *identify* and *classify* medical services, including *surgical procedures* and *diagnostic tests*, as well as *evaluation and management* (E/M) codes for patient visits and examinations.[20] While ICD-9 is universally used for classifying *diagnoses* in healthcare service settings, *procedural* reporting is not as straightforward. *Procedural coding* depends on (1) whether the designated provider is a *physician* or a *facility*; and (2) in the circumstance of a facility provider, whether the service was performed within an *inpatient* or an *outpatient* setting. Services submitted for payment on a claim must be *linked*, by way of an appropriate *procedure code* that corresponds to the *diagnostic reasoning* behind the claim.[21] This *code linkage* is used by payors to evaluate the *medical necessity* of the reported charges.[22] The most commonly implemented *procedural coding systems* include (1) the *Healthcare Common Procedure Coding System* (HCPCS), for classifying *ancillary services and procedures*; (2) the *Current Procedural Terminology* (CPT), for physician procedures in both *inpatient* and *outpatient* settings; (3) the *ICD-9 Procedure Coding System* (*ICD-9-PCS*), for procedure reporting in hospital inpatient settings; (4) the

HEALTHCARE COMMON PROCEDURE CODING SYSTEM (HCPCS)

The HCPCS coding system provides the payor with information in regard to the procedures performed in the treatment of patients. The system does not relay diagnosis information. HCPCS codes are used by hospitals to report information on procedures performed for outpatient services and by physicians to report information in connection with the performance of procedures in both inpatient and outpatient settings. There are two HCPCS levels: Level I codes are referred to as Current Procedural Terminology (CPT) codes, and Level II codes are temporary codes used to represent services, supplies, and procedures for which CPT codes do not yet exist.

"Billing and Coding for Health Services," in Essentials of Health Care Finance, *6th ed., by William O. Cleverley and Andrew E. Cameron (Sudbury, MA: Jones and Bartlett, 2007), p. 18.*

National Drug Codes (NDC), which provides a list of all pharmaceuticals; and (5) the *Current Dental Terminology* (CDT), for dental procedures.[23]

2.2.3.2.1 Current Procedural Terminology (CPT) *Current Procedural Terminology* (*CPT*) is a system developed and published by the *American Medical Association* (AMA) in 1966 that is used by providers to report information to payors about the services and procedures provided to patients.[24] In 1983, in its fourth edition (published in 1977), CPT codes were added to the *Health Care Financing Administration*'s (HCFA)—currently, the *Centers for Medicare and Medicaid Services* (CMS)—HCPCS coding

Knaus, *Medicare Rules & Regulations: A Survival Guide to Policies, Procedures and Payment Reform* (Los Angeles: PMIC, 1998), pp. 4, 106.

CURRENT PROCEDURAL TERMINOLOGY (CPT)

Current Procedural Terminology (CPT) is a system developed by the AMA that is used by providers to report information to patients and insurers about services and procedures provided to patients.

"CPT Coding," in Understanding Health Insurance: A Guide to Billing and Reimbursement, *9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton, NY: Delmar Cengage Learning, 2008), p. 191.*

system and required to be used for all *Medicare billing*. Similarly, in 1986, state Medicaid agencies were required to use the HCPCS coding system and therefore CPT codes.[25] In response to the *Medicare Prescription Drug, Improvement, and Modernization Act of 2003* (MMA), CMS adopted regulations that require that "new, revised, and deleted CPT codes be implemented," on the first day of January each year.[26]

The current CPT system divides the established codes among six sections that differentiate between various *types of procedures*, including (1) *evaluation and management* (E/M); (2) *anesthesiology*; (3) *surgery*; (4) *radiology*, including *nuclear medicine* and *diagnostic ultrasound*; (5) *pathology* and *laboratory*; and (6) *medicine*, excluding anesthesiology.[27] E/M codes are used to classify patient visits where providers *assess* and *manage patients' health*. To provide structure to this vague definition, E/M codes are subdivided by (1) *type of service*; (2) *place of service*; (3) and *patient's status*.[28] The divisions used to distinguish various E/M codes are illustrated in Exhibit 2.3.

Office visits include *patient encounters* at *physician offices* and *outpatient* or *ambulatory facilities*.[29] The distinction between *new* and *established* patients is determined by whether a patient has received a *professional service*,

that is, a *face-to-face patient encounter* that was billed for by the provider, from a provider, or from another provider of the *same specialty* belonging to the *same group practice*, within the last three years. For services rendered outside of an *office*, a *domiciliary rest home*, or a *home health setting*, patients are still labeled *new* or *established*; however, the code used is unaffected, except in an *emergency department*, where no distinction is required.[30] Of note, *consultations* are applicable only to those E/M services performed at the request of another provider.[31] In determining the current coding for each E/M service, providers must determine the *level of complexity*—that is, *straightforward*, *low complexity*, *moderate complexity*, or *high complexity*—required for establishing a *diagnosis* or selecting a *care management option*. Determinants of *complexity* include (1) the number of *options available*; (2) the *amount of*, and the *complexity of*, the *patient's medical record/history*; and (3) the *risk of complications*, morbidity, mortality, and/or comorbidities with the patient's

[30] Ibid., p. 21.

current condition, the diagnosis, or the selected care management option. Each *level of complexity* for a given service is associated with its own CPT code, as well as being associated with the typical amount of time the provider must spend with the patient.[32] Of note, *complexity* determinations are not *modifiers* (discussed later); rather, they are determinants of individual E/M codes. The assignment of a *complexity level*, based on various circumstances for a given procedure, is set forth in Table 2.1.

The remaining five of the six categories of CPT codes are divided by the *location* on the patient's body where the procedure is performed and/or the *type of procedure* being performed.[33] In 2010, E/M codes accounted for approximately $33.5 billion of *Medicare Part B* Payments. Due, in part, to the vague nature of E/M services, in comparison to other procedure codes, and the addition of provider determinations of complexity, E/M billing is associated with a higher incidence of *fraud and abuse*, making claims for E/M services a target for billing audits.[34]

The procedures included under these six sections and their associated codes are referred to as *Category I* codes. *Category II and III* codes are *supplementary*, that is, they are used in addition to the appropriate main *Category I* code. *Category II* codes are optional and account for *performance assessment* and *quality improvement* activities with a four-digit numerical code, as well as describing *patient characteristics* with an alphabetic fifth character. *Category III* codes are *temporary* and are assigned to *emerging medical technologies*, *services*, and *procedures*. In addition to these optional codes, providers must also bill using appropriate *modifiers*.

[32] Ibid., p. 10.

[33] Ibid., pp. 43, 57–58, 357–359, 399, 453–555.

[34] Office of the Inspector General, "Coding Trends of Medicare Evaluation and Management Services," OEI-04-10-00180, May 2012, p. 13.

In addition to the base procedure codes, the CPT system includes *modifiers*, which are two-digit codes added to the five-digit CPT codes to further clarify the services and procedures performed.[35] Modifiers may be added to CPT codes for several reasons, including that the procedure was (1) performed more than once; (2) performed by more than one physician; (3) performed exclusively for a professional service; and/or (4) discontinued due to threats to the patient's health.[36] Both the AMA and the CMS update the list of modifiers on a continual basis.[37] For more information of the coding update process, see the unnumbered subhead "AMA/Specialty Society Relative Value Scale Update Committee," listed under Section 2.4.1.3.2.6, "Physician Reimbursement and Billing: The Resource-Based Relative Value Scale (RBRVS)."

There are often multiple combinations of HCPCS and CPT codes for a particular procedure.[38] Providers are not allowed to separate, or "unbundle," codes for different components of a comprehensive procedure if there is a code for the entire procedure.[39] The practice by providers of *unbundling* CPT codes in an effort to receive higher reimbursement payments led CMS to develop the *National Correct Coding Initiative* (*NCCI*) in 1994, administered by AdminaStar Federal, the Indiana Medicare carrier that was

[39] Centers for Medicare and Medicaid Services, "Introduction," in *National Correct Coding Initiative Policy Manual for Medicare Services*, 2008, p. xii.

awarded the HCFA contract to standardize national coding procedures as a step in addressing improper coding.[40] The edits that AdminaStar completed are now nationally recognized and were included in the *National Correct Coding Initiative Coding Policy Manual for Medicare Services*.[41] NCCI denies claims where (1) a pair of codes are reported together, despite one of the two codes representing a component procedure that is captured under the other code; or (2) the two described procedures cannot possibly be performed together.[42] The *NCCI Policy Manual* lists those HCPCS/CPT codes that cannot be reported together, unless a NCCI-associated modifier is available in a clinically appropriate manner.[43]

Diagnostic services that are necessary to establish a patient diagnosis, for example, blood tests and imaging, are captured within the *procedural coding system* and often include both a *professional fee component* and a *technical component* (see Section 2.4.1.2, "Professional Component versus Ancillary Services and Technical Component," further on). Providers may bill separately for each component, or for both, under a bundled *global diagnostic code*, which is a combination of both the *professional fee* and *technical components*.[44] If reporting is done with a *global diagnostic code*, reimbursement may or may not be equal to the sum of the *professional* and *technical* components that could have been billed separately for the services.[45]

Several recent *federal*, *state*, and *commercial payor* reimbursement initiatives require *bundling* of those procedures that are generally performed during one *episode of care*. *Bundling* can include either (1) the submission of *all related codes* for an *episode of care* for *one reimbursement payment*, or (2) the submission of *one code* encompassing all of the *related procedures for one reimbursement payment*. A further discussion of *bundling* is provided in Section 2.7.1.1.1, "Bundled Payments."

Essentials of Health Care Finance, 6th ed., by William O. Cleverley and Andrew E. Cameron (Sudbury, MA: Jones and Bartlett Publishers, 2007), p. 18.

2.2.3.3 The Link between Diagnostic and Procedural Coding As mentioned earlier, billed charges must be *medically necessary* to survive scrutiny by payors. Therefore, providers must select the *appropriate procedure* for a *given diagnosis* and submit the *appropriate codes* for each diagnostic and procedural service. The coding systems typically used for services provided by a specific *provider type* within a specific *provider setting* are illustrated in Table 2.2.

2.2.4 Step 4: Charge Entry

On completion of the *coding* and *documentation* process, "the revenue cycle moves from the clinical side to the business side."[46] *Capturing the charge* entails the transfer of the provider's coding and documentation to an actual bill or claim.[47]

To improve *charge capture* and *revenue generation*, more technologically advanced providers have begun using *personal digital assistants* (PDAs) to *capture charges*. The *electronic capture systems* are then tied into the enterprise's *practice management system*, a computer system designed to (1) collect *registration* and *insurance information*, (2) *facilitate billing* and *collections*, (3) and perform other operational functions so that charges can be downloaded and posted electronically. These systems help reduce errors that may occur in the *charge capture process* and reduce the *time* between *service* and *charge entry.*[48]

Charge Capture

Charge capture entails the transfer of the provider's coding and documentation to the actual bill. Providers are tasked with recording the appropriate procedure and diagnosis codes on an encounter form, and the business staff is responsible for ensuring that the encounter form is accurate and then using it to bill patients and third-party insurers.

"The Revenue Cycle," in Financial Management of the Medical Practice, *2nd ed., by Max Reiboldt and the Coker Group (Roswell, GA: American Medical Association, 2002), p. 13; "Pothole 3: The Charge Capture and Charge Entry Process," in* The Physician Billing Process: Avoiding Potholes in the Road to Getting Paid, *by Deborah L. Walker, Sara M. Larch, and Elizabeth W. Woodcock (Englewood, CO: Medical Group Management Association, 2004), p. 57.*

PRACTICE MANAGEMENT SYSTEM

A computer system designed to collect registration and insurance information, facilitate billing and collections, and perform other operational functions so that charges can be downloaded and posted electronically.

The Physician Billing Process: Avoiding Potholes in the Road to Getting Paid, *by Deborah L. Walker, Sara M. Larch, and Elizabeth W. Woodcock (Englewood, CO: Medical Group Management Association, 2004), pp. 51, 170.*

If a provider has *not* adopted a *computerized provider charge entry* (CPCE) system, as described earlier, the provider may rely on the older method of *charge capture*, which requires the provider to actually note every consult or procedure that is performed on a *paper form*. Other methods involve hiring staff to review hospital charts onsite and retrospectively capture *coding* and *charge entry* information into the billing system.[49] Hospitals and larger physician groups use *central billing departments* to organize and submit *captured information*.[50] *Charge capture* systems may also be

[49] Ibid., p. 51.

[50] Susan FitzGerald, "Capturing Charges on the Go: Billing Software Saves Money When It Complements Hospitalists' Workflow," ACP Hospitalist.org, May 2009, http://www.acphospitalist.org/archives/2009/05/software.htm (accessed August 26, 2009).

included in a provider's *CPOE system*, streamlining the process between a *patient encounter* and the *charge capture*. The *standardized documentation process* available through *CPOE systems* has been shown to increase provider *revenues* through *greater charge collection*.[51]

2.2.5 Step 5: Primary Insurance Billing

Once all applicable charges are *captured* by the provider or the provider's *central billing department*, they are submitted, almost always electronically, to the payor. These submissions are known as a *bill of exchange*, in other words, a written document drafted by a party ordering payment from a third party. In many instances, bills are uploaded to a *clearinghouse*, or an *electronic data interchange* (EDI), which assesses each claim for *errors* and *securely forwards* the bill to the correct payor. In addition, *clearinghouses* may also provide services to transform *paper claims* into an appropriate and efficient *electronic format*.[52] For any one patient there can be several payors, including the patient him- or herself. Providers first submit charges to the patient's *primary payor*, often an insurance company. Since October 1, 2005, mandated by the HIPAA, Medicare has refused to accept *paper claims* (accept in cases of physician practice with fewer than 10 FTEs or institutions with fewer than 25 FTEs), accepting only compliant (as defined by HIPAA) *electronic claims*.[53]

To ensure the *effectiveness* of the *billing process*, many providers (1) implement *computerized management systems* to process claims electronically; (2) work to *maintain relationships* with payors; (3) develop *internal information system processes*; and (4) require *continued staff education and*

Clearinghouses

Companies that assesses provider claims for errors and securely forward the bill to the correct payor.

"Say Goodbye to Paper: Noncompliant Medicare Claims Oct. 1," by Joyce Frieden, Family Practice News, *September 1, 2005, p. 6.*

[53]Ibid.

training.[54] Without an *effective billing process*, many claims for reimbursement may be *incorrect* or *insufficient*, resulting in either (1) the denial of the claim, or (2) lost potential revenue for the provider. More drastically, incorrect billing may trigger *fraud and abuse* audits, because intent is *not* a necessary *element* to prove fraud for a given claim.

2.2.6 Step 6: Secondary Insurance Billing

Once *primary payors* have been billed, and *copayments* and *deductibles* have been paid by the patient, any remaining amount can be billed to a *secondary payor.* Secondary insurance may be available from either (1) the benefit plan held by a *spouse* or a *parent*, (2) an *alternative public payor* for which the patient is eligible, or (3) *supplemental insurance* that was purchased to cover gaps left from *primary insurance coverage*. The billing procedure and the time line for *secondary insurance* differ, based on the type and scope of coverage/benefits.

2.2.7 Step 7: Patient Responsibility

Any *copayment,* or any portion of the charge, that is not paid at the patient encounter or paid by a *primary* or *secondary insurer* may be sent to the *patient* in the form of a bill. Of note, providers are prohibited under the *Social Security Act* from billing *qualified Medicare beneficiaries* (Medicare beneficiaries under 100 percent of the *Federal Poverty Guidelines*) for Medicare *cost-sharing*, including *deductibles*, *coinsurance*, or *copayments*. In addition, several payors prohibit providers from *balanced billing*, where the provider *bills the patient* for the amount between the *provider's charge* and the payor's *allowable fee rate*.[55] Although Medicare *participating* providers cannot bill Medicare patients above the *allowable charge* established by Medicare, these patients are responsible for 20 percent of the bill, with the remaining 80 percent reimbursed through the Medicare program.[56] The procedure for billing Medicare is discussed further in Section 2.4.1.4, "Medicare Allowable Charge: Participation versus Nonparticipation."

---

[56] Cynthia Newby, *From Patient to Payment: Insurance Procedures for the Medical Office*, 3rd ed. (Columbus, OH: Glencoe/McGraw-Hill, 2002), p. 140.

BALANCED BILLING

When a provider bills a patient some amount to close the gap between the provider's charge and the payor's allowable fee. This is not allowed for patients covered by a participating public payor.

"Prohibition on Balance Billing Qualified Medicare Beneficiaries (QMBs)," Centers for Medicare and Medicaid Services, MLN Matters® Number: SE1128, Revised, July 25, 2012, p. 2.

2.2.8 Step 8: Claims Resolution

The submission of claims to third-party payors (both *primary* and *secondary*) and the subsequent billing of patients for their portion of the payment responsibility require a process of *consistent* and *persistent* attention to *resolve the claim*. However, even *correct coding*, *timely billing,* and *aggressive claims resolution* efforts are not always sufficient to ensure *timely payment*. Those cases resulting in *overdue accounts* often require follow-up activities to *encourage payment* or to *correct billing errors*.[57]

2.2.9 Step 9: Collections

In addition to an established procedure for *submitting claims to payors*, providers must also maintain a process for *tracking payments received*. Efficient *claims resolution* and *collections systems* facilitate efficient provider *cash flow management*. Regardless of the effort a provider puts into the *collection process*, some *account balances* may never be resolved. In these instances, providers will likely write off the "balance [of] the accounts receivable as bad debt."[58] *Bad debt* accounts can also be outsourced to a *collection agency* that will attempt to recover the balance for a fee.[59]

---

[59] Ibid.

BAD DEBT

The amount of providing care that is written off by the provider from patients who do not pay, that is, the uninsured, the underinsured, and charity care. Bad debt can be deducted from a provider's income tax.

"Business Bad Debts," in Business Expenses, *Internal Revenue Service, Publication 550, 2011, http://www.irs.gov/publications/p535/index.html (accessed September 19, 2012).*

Lockboxes

Instead of handling the collection and processing of payments themselves, providers may decide to use a lockbox service. For a fee, lockbox services open a provider's mail, collect payments, and deposit the money into the provider's account.

"Pothole 5: The Payment Posting Process," in The Physician Billing Process: Avoiding Potholes in the Road to Getting Paid, *by Deborah L. Walker, Sara M. Larch, and Elizabeth W. Woodcock (Englewood, CO: Medical Group Management Association, 2004), p. 80.*

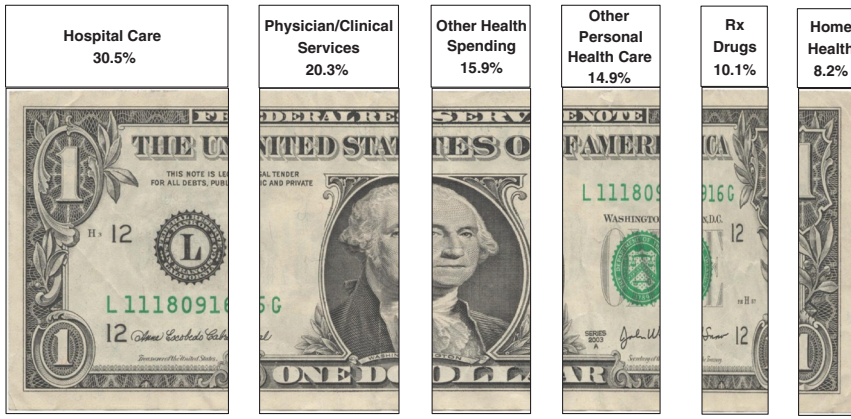
A recent inquiry against three large insurers in Massachusetts alleged that some insurance companies were participating in *anticompetitive behavior*, in what amounts were charged to specific patients. The *Department of Justice* (DOJ) inquiry, related to *Partners Healthcare System Inc.* (Partners), *Blue Cross Blue Shield of Massachusetts*, and *Tufts Health Plan and Harvard Pilgrim Health Care*, followed the release of a March 16, 2010, report published by Massachusetts Attorney General Martha Coakley, indicating that *health insurance premium costs* increased mainly due to increases in the prices negotiated between payors and healthcare providers for services, where the *highest-paid practices and hospitals* were paid approximately *twice* as much as the *lowest-paid providers* for the same services. The report further found that *price variations* for healthcare services in Massachusetts are correlated to the *relative market leverage* a provider has within a specified *geographic region.*[60]

[60] Office of Attorney General Martha Coakley, *Examination of Health Care Cost Trends and Cost Drivers*, Report for Annual Public Hearing, March 16, 2010, http://www.mass.gov/Cago/docs/healthcare/final_report_w_cover_appendices_glossary.pdf (accessed May 3, 2010).

2.3 CURRENT REIMBURSEMENT ENVIRONMENT

The U.S. healthcare delivery system includes an *elaborate set of relationships* between *providers* and *payors* that composes the infrastructure of the *healthcare reimbursement environment*. The nature of any specific relationship is characterized by (1) the *type* of service being provided, (2) the *location* where that service is provided, (3) the *type of payor* for the service, and (4) the *type of reimbursement model* being utilized. The current breakdown of healthcare expenditures by *type of service* is illustrated in Exhibit 2.4 and Exhibit 2.5.

As illustrated earlier, most healthcare expenditures are spent on *hospital care* ($814 billion in 2010) and *physician and clinical services* ($688.6 billion in 2010), which consist of *physician offices*, *freestanding ambulatory surgery centers* (ASC), and any other physician operated *specialty clinics* (e.g., *oncology clinics* or *dialysis centers*).[61] Current healthcare reimbursement



*Note: Other Personal Health Care includes, for example, dental and other professional health services, durable medical equipment, etc. Other Health Spending includes, for example, administration and net cost of private health insurance, public health activity, research, and structures and equipment, etc.

initiatives target hospital and physician clinical settings, as the *sites of service* that use the highest percentage of healthcare expenditures, to achieve the greatest impact on *cost reduction* and *quality improvement* possible. For more information on current initiatives to reform the healthcare reimbursement environment, see Section 2.7, "Emerging Reimbursement Trends and the Impact of Healthcare Reform."

Public payors represent those programs operated by both *federal* and *state governments*, while *private payors* include *for-profit* and *not-for-profit* insurance companies, as well as *self-funded* insurance options. An illustration of the typical payors operating in the current reimbursement environment is set forth in Exhibit 2.6.

Factoid

Most healthcare expenditures are spent on hospital care ($814 billion in 2010) and physician and clinical services ($688.6 billion in 2010).

"Table 2: 2 National Health Expenditure Amounts, and Annual Percent Change by Type of Expenditure: Calendar Years 2006–2021," in National Health Expenditures Projections 2011–2021, *Centers for Medicare and Medicaid Services, 2012.*

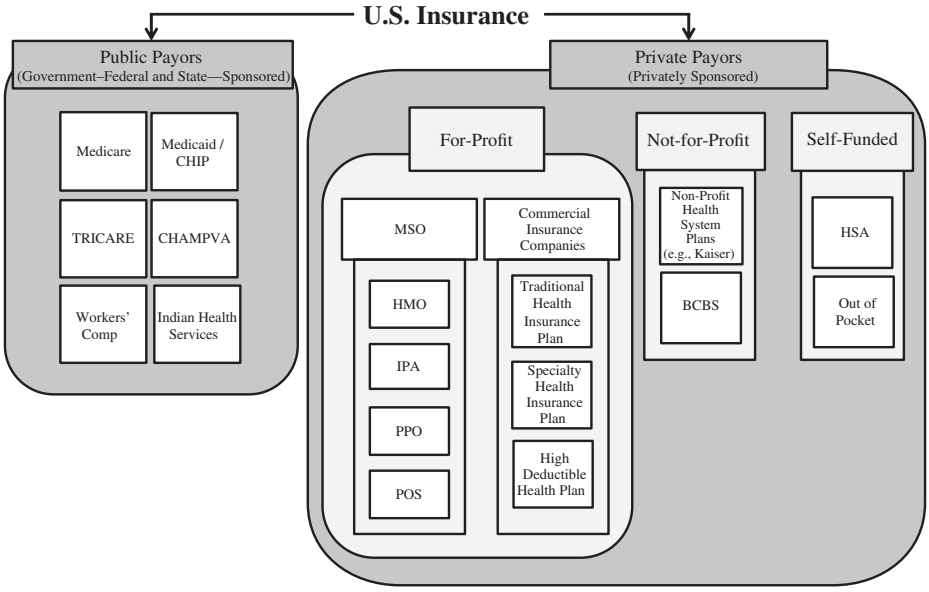

EXHIBIT 2.6 U.S. Health Insurance Providers and Plans

Note that this illustration does *not* include several new models of reimbursement, for example, *accountable care organizations* and *medical home concepts*.

The *complexity* and *competition* associated with healthcare insurance create a "multi-tiered and unequal" market for insured individuals.[62] Each payor and each plan differ in the *scope of coverage* and the *benefits* available to enrollees, as well as in the *allowable fees* reimbursed to providers for a given service. In the United States, the only *right to coverage* an individual possesses is to *emergency medical services*; however, the ACA attempts to extend *shared responsibility* between *providers*, *payors*, and *beneficiaries*, such as *value-based purchasing* programs and *state insurance exchanges*, for a broader range of *coverage*.[63] Although these initiatives are not designed to remove the so-called *actuarial fairness* that is supposed to drive the U.S. healthcare system, they may *flatten* the current *tiered system*, transforming the reimbursement environment.[64] For more information on the ACA and *state health exchanges*, see Chapter 6, "Healthcare Reform."

[63] "The Emergency Medical Treatment and Labor Act," 42 U.S.C.A. §1395dd(e)(2).

[64] Paul Starr, *Remedy and Reaction: The Peculiar American Struggle over Health Care Reform* (New Haven, CT: Yale University Press, 2011), pp. 242–243.

2.4 PUBLIC PAYORS

As indicated earlier, public payors are operated by *federal or state governments* and are often funded by a mixture of *specific designated taxes*, as well as *general fund support*. The most influential public payors are *Medicare* and *Medicaid*, regulated and monitored by CMS. In 2010, these two payors accounted for $524.6 billion and $401.4 billion, respectively, nearly 49.5 percent of *total national health insurance expenditures*.[65] The prevalence of these public payors, particularly Medicare, in the healthcare marketplace often results in their reimbursement rates being used as a *benchmark* for *private reimbursement rates*.[66] Other *public payors* include (1) the *Children's Health Insurance Program* (CHIP), (2) TRICARE, (3) *Civilian Health and Medical Program of the Department of Veteran Affairs* (CHAMPVA), (4) *workers' compensation,* and (5) *Indian Health Services* (IHS), as will be discussed later.

2.4.1 Medicare

2.4.1.1 Overview *Medicare* was created in 1965 as Title XVIII of the *Social Security Act* (see Section 1.4.1, "Creation of Medicare").[67] The program, originally known as the *Health Insurance for the Aged and Disabled Act*, is primarily an *entitlement program* that provides *health insurance benefits* to individuals *over the age of 65*.[68] During the 1970s, benefits were extended to

TABLE 2.3 The Four Parts of Medicare

Part	Description of Benefits
Part A	Covers inpatient hospital care
Part B	Covers outpatient visits
Part C	Allows beneficiaries to choose as a managed care replacement of Parts A and B, known as Medicare Advantage
Part D	Created under the Medicare Modernization Act (MMA) and implemented in 2006, covers prescription drug benefits

CCH Medicare Explained: §100, ed. Pamela K. Carron and Nicole T. Stone (Chicago: CCH, 2012), p. 17.

Superbills and Charge Tickets

Another name for a patient encounter form.

From Patient to Payment: Insurance Procedures for the Medical Office, *3rd ed., by Cynthia Newby (Columbus, OH: Glencoe/McGraw-Hill, 2002), p. 31.*

include the *disabled* and individuals with *end stage renal disease* (ESRD).[69] Medicare is divided into four parts, described in Table 2.3.

Individuals who are not *automatically eligible* may enroll in coverage for Medicare Parts A and B, for which they would either (1) pay a *premium* for *Medicare Part B*, or (2) elect to enroll in a *Medicare Advantage* (MA) (also known as *Medicare Part C*) managed care plan that covers both *inpatient* and *outpatient* services.[70] Individuals may or may not decide to enroll in *Medicare Part D*, which provides *prescription drug coverage.*[71]

Medicare reimburses providers using a combination of (1) *fee-for-service* (FFS) payments, (2) *managed care arrangements*, and (3) payments from *health savings accounts* (HSA) (see Section 2.6, "Methods of Reimbursement"). Medicare does *not process* or *pay claims directly* but, rather,

contracts with *insurance companies* (i.e., *fiscal intermediaries and carriers)* to perform these services. *Fiscal intermediaries* are insurance companies that *process Medicare claims* for (1) *hospitals*, (2) *skilled nursing facilities*, (3) *intermediate care facilities*, (4) *long-term care facilities*, and (5) *home health agencies*. In contrast, *carriers* process claims for (1) *physicians*, (2) *providers*, and (3) *suppliers*.[72] In addition, private companies may provide *medical packages* and *hospital coverage* to Medicare beneficiaries enrolled in *Medicare Advantage plans*.[73]

Medicare uses several *provider identification numbers* to *expedite* and *efficiently process claims*. To enroll in the Medicare program, providers must be assigned a specific *National Provider Identifier* (NPI), provided by the *National Plan and Provider Enumeration System* (NPPES). Physicians enter into Medicare *participating provider* (*PAR*) agreements, with CMS, under their NPI through a CMS-855 *provider enrollment application* that is sent to their region's *Medicare Administrative Contractor*'s (MAC) enrollment department.[74]

Factoid

Medicare claims for physician services must be submitted using the CMS-1500 claim form, whereas ambulance companies, ambulatory surgery centers, home healthcare agencies, hospice organizations, hospitals, psychiatric drug/alcohol treatment facilities, skilled nursing facilities, sub-acute facilities, stand-alone clinical/laboratory facilities, and walk-in clinics must submit the UB-04 claim form. Medicare claims must be filed before December 31 of the year in which the services were provided, except in instances in which the service was provided between October 1 and December 31. These claims receive an extension and must be filed before December 31 of the following year.

Understanding Health Insurance: A Guide to Billing and Reimbursement, *9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton, NY: Delmar Cengage Learning, 2008), pp. 305, 449.*

[74] "Difference between the Medicare Provider Numbers," WPS Medicare J5 MAC Part B, August 16, 2012, http://www.wpsmedicare.com/j5macpartb/resources/new_providers/providernumber.shtml (accessed September 3, 2012).

Originally, all providers seeking reimbursement under Medicare were given a *Unique Physician Identification Number* (UPIN). The UPIN was *discontinued* for its original purpose as of June 2007 and replaced by the NPI to meet the *Administrative Simplification Standard* required under HIPAA.[75] The NPI is a 10-digit *unique identification number* required for *all covered healthcare providers* seeking reimbursement under *Medicare*, *Medicaid*, or any *federal health program*.[76] NPIs contain the *entity type code*, *one*, which is used for individual practitioners, for example, (1) *physicians*, (2) *dentists*, (3) *nurses*, (4) *chiropractors*, (5) *pharmacists*, and (6) *physical therapists*, and the *entity type code, two*, which is used for healthcare provider organizations, such as (1) *hospitals*, (2) *group practices*, (3) *ambulance companies*, and (4) *medical suppliers. Mid-level providers* who "furnish healthcare but do not necessarily conduct covered transactions" are also eligible for an NPI.[77] The use of NPIs is intended to improve "the effectiveness and efficiency of the health care industry in general, by simplifying . . . administration . . . and enabling the efficient electronic transmission of certain health information."[78]

Once accepted as a Medicare provider, the MAC enrollment department issues the provider a *Provider Transaction Access Number* (PTAN) and the *National Unique Provider Identification Number Registry* issues the provider a UPIN. A description of each Medicare identification number and its purpose within the Medicare system is provided in Table 2.4.

Since 2003, CMS has used the *Provider Enrollment, Chain, and Ownership System* (PECOS) for *physician Medicare enrollment*. In December 2008, CMS launched the Internet-based PECOS, an online *provider-enrollment system* that allows (1) *physicians*, (2) *non-physician practitioners* and *providers*, and (3) *supplier organizations* to enroll in Medicare, as well as view and make any necessary changes to their enrollment.[79] Starting in October 2009, CMS contractors sent out *nonpayment warnings* to physicians *not* registered in the PECOS database. CMS has extended the date it would

TABLE 2.4 Medicare Provider Identification Numbers

Identification Number	Issuing Agency	Assignment Process	Description
National Provider Identifier (NPI)	National Plan and Provider Enumeration System (NPPES)	Provider Application—assigned per provider (Type 1 providers: physicians and mid-level providers; or Type 2 providers: enterprises) for a lifetime	Identifies providers for HIPAA standards processes and claims submission; required prior to Medicare program enrollment
Provider Transaction Access Number (PTAN)	Regional Medicare Administrative Contractor's (MAC) Enrollment Department	Request from MAC; assigned to provider based on employer entity[80]	Used by claims processing system and for provider to access information
Unique Provider Identification Number (UPIN)	National Unique Provider Identification Number Registry	Assigned	Used for ordering (tests and services) and referrals

"Difference between the Medicare Provider Numbers," WPS Medicare J5 MAC Part B, August 16, 2012, http://www.wpsmedicare.com/j5macpartb/resources/new_providers/providernumber.shtml (accessed September 3, 2012).

begin rejecting claims due to *physician nonregistration* several times and ultimately set the deadline to July 6, 2011.[81]

Since its inception, CMS has pointed out several *advantages* and *efficiencies* provided by an *online enrollment process*. Compared to the previously used *paper enrollment*, the online PECOS form is *provider-specific* and requires only responses relevant to a *single provider's specific enrollment*.

[80] Since the PTAN is specific to where a provider works, providers must make sure their PTAN is updated when they switch employment, or their claims may be denied. This is particularly important when a provider transitions to the PECOS system, discussed below.

[81] "Medicare and Medicaid Programs; Changes in Provider and Supplier Enrollment, Ordering and Referring, and Documentation Requirements; and Changes in Provider Agreements—Interim Final Rule with Comment Period," *Federal Register* 75, no. 86 (May 5, 2010): 24437; Chris Silva, "Physicians Seek More Medicare PECOS Relief," *American Medical News*, July 19, 2010, http://www.ama-assn.org/amednews/2010/07/19/gvsa0719.htm (accessed August 3, 2011).

The PECOS system is designed to make physician enrollment easier to *complete* and *update*, while requiring less staff time and administrative costs.[82] CMS has asserted that under the PECOS system, the agency averages roughly *45 days to fully process a provider's enrollment*, as compared to the *60-day processing time* typically experienced under the paper form.[83]

Participating Medicare providers agree to accept the reimbursement amount (i.e., *allowable fee*) set by the *Medicare Physician Fee Schedule* (MPFS), published annually by CMS, as payment in full for every Medicare claim.[84] The physician may collect from the patient his or her *coinsurance* and *deductible*, but the physician is *not* permitted to *balance bill* the patient, that is, to attempt to collect the difference between the physician's *usual charge* and Medicare's lower *allowed charge*.[85] Of note, under federal law, all providers and suppliers of Medicare covered services may *not* collect *directly* from the patient and must submit electronic claims to Medicare.[86] Like any other third-party payor system, Medicare beneficiaries may be

Fee Schedule

A fee schedule is a payment system under which the fees for procedures are explicitly laid out and the physician agrees to accept those fees as full payment, unless the discounted charges are less than the fee schedule, in which case the plan pays the lesser of the two.

subject to *premiums*, *deductibles*, and *coinsurance*, which vary according to their *coverage level*, their *income*, and the s*ervices sought*.[87]

Unlike *Medicare Parts A and B*, *Medicare Part C*, also called *Medicare Advantage*, is administered through private insurance companies. Federal regulation mandates that *Medicare Advantage organizations* must pay 95 percent of *clean claims* submitted by *nonparticipating providers* within 30 days and pay interest on those *clean claims* that are not paid prior to this deadline.[88] In addition, *Medicare Advantage organizations* must include a prompt payment provision in their contracts with *participating providers*, although the organization and the *participating provider* may negotiate as to the contract's terms.[89]

Medicare Advantage plans have increased in popularity in recent years, as enrollment rose from 5.6 million in 2005 to 11.8 million in 2011.[90] Under the ACA, government subsidies to insurance companies for the administration of *Medicare Advantage plans* will be reduced, leading some to conjecture that there might be an uncertain future for this popular Medicare option.[91] In contrast to forecasts of possible declining enrollments and reduced revenues for *Medicare Advantage Plans*, some industry experts suggest that the changing patient characteristics of the *aging baby boomer population* may lead to the increased popularity of the *Medicare Part C option*. Resulting, in part, from the impact of the *Great Recession*, baby boomers are likely to be *cost sensitive* and more comfortable with *managed care arrangements*, making it more likely for them to select a *Medicare Advantage plan* than to opt for traditional *Medicare Part A and B coverage*.[92]

Medicare Advantage subsidies are calculated by taking the difference between (1) the *private insurance plan predicted cost of care*, demonstrated through a bid submitted to the CMS; and (2) the *maximum*

Medicare Parts A and B payment for traditional Medicare benefits in a geographic area, referred to as the *benchmark*.[93] If the bid is *below the benchmark*, which is generally the case, the private plan receives a *rebate* (savings) equal to *75 percent of the difference*. This rebate must be used to (1) provide *additional benefits*, (2) reduce member *cost sharing*, or (3) reduce *member premiums*.[94] If the bid is *above the benchmark*, Medicare beneficiaries are *charged a premium* to cover the overage. To encourage *plan participation*, Congress has historically increased benchmark amounts, which currently range from 100 to 150 percent of the CMS established *allowable charge*.[95] As a result, it is estimated that CMS spends approximately 14 percent, or $1,000, more per enrollee on *Medicare Advantage* programs than *traditional Medicare* options.[96] Furthermore, it is currently projected that in 2012, $3.1 billion ($281 per enrollee) will be distributed in bonus payments to 91 percent of *Medicare Advantage plans*.[97]

Several ACA provisions are designed to lower the additional costs that *Medicare Advantage* plans add to the federal budget, by (1) *freezing benchmark amounts*, and (2) *reducing benchmarks over a two- to six-year phase-in period,* beginning in 2010, to be determined by CMS rankings of FFS costs in each county.[98] Once ranked, the counties in the *highest quartile* will have their *benchmark amounts* lowered to 95 percent of local FFS costs. Similarly, the *75th percent quartile* will have their *benchmark amounts* lowered to 100 percent. To promote low expenditure amounts, the lower two quartiles will have their benchmark amounts increased by 7.5 percent for the *50th percent quartile* and 15 percent for the *lowest quartile*.[99] Nationally, *benchmark amounts* in 2017 should average 101 percent of *FFS*

costs, as compared to 112 percent in 2010.[100] Based on *star quality* ratings,[101] some *Medicare Advantage* plans will receive even lower *rebates* than those established by the ACA, with *all subsidies* being lowered to between 50 and 70 percent of *current payment rates* by 2014.[102]

2.4.1.2 Professional Component versus Ancillary Services and Technical Component

The MPFS differentiates between two distinct revenue streams for diagnostic services: the *professional services component* and the *Ancillary Services and Technical Component* (*ASTC*).[103] A provider performs the *technical component* when, for example, it executes diagnostic and testing functions in taking an *x-ray* or administering an *electrocardiogram* (EKG).[104] Providers then perform the *professional component* when they interpret (*read*) the results of those tests or write reports.[105] As of 2012, *independent laboratories* providing *pathology services* to both inpatient and outpatient hospitals may also be reimbursed under the MPFS for the *technical component* for services performed after December 31, 2011.[106]

Providers must use the appropriate *procedure code modifiers* on submitted claims to distinguish between the services they performed and

---

[100] Scott Harrison, "The Medicare Advantage Program: Status Report," MedPac Presentation, November 4, 2010, p. 9.

[101] Star Quality Ratings are posted by CMS to provide Medicare beneficiaries with a means to compare Medicare Advantage plans offered in their area. Medicare Advantage plans receive one to five stars (one representing poor performance, three representing average performance, and five representing excellent performance) based on 53 performance metrics. Data for these metrics is compiled from three surveys and various administrative data. those performed by others, such as the hospital, technicians, or other staff.[107] Employers of technicians may still receive Medicare reimbursement for the services performed; however, CMS monitors these claims to ensure against fraud and abuse (see the discussion later regarding the *CMS Anti-Markup Rule*).

2.4.1.3 Reimbursement and Billing

2.4.1.3.1 Facility-Based Reimbursement Rates Medicare reimburses providers at different rates, depending on whether charges are submitted under Part A (*inpatient*) or Part B (*outpatient*), and reimburses *outpatient procedures* under Medicare Part B at different rates based on the *site of service*, for example, *physician office-based* or *hospital-based*. Medicare and Medicaid *originally* paid for *hospital services* under a *cost plus* reimbursement scenario, whereby hospitals were paid for *all of their costs*, as well as a *margin*. The rising costs associated with this system led to the introduction, by the federal government, of a *prospective pricing system* for Medicare Part A *inpatient hospital* (including specialty and surgical hospital) *payments*, whereby hospitals are reimbursed an *average*, *qualified, predetermined amount* in advance, that is, *prospectively*, for each patient treated with a *similar diagnosis* specified by a *Diagnostic Related Group* (DRG).[108]

The federal government, over the ensuing years, also developed a PPS system for (1) *ambulatory surgery centers*, (2) *home healthcare*, (3) *hospital outpatient services*, (4) *rehabilitation facilities*, and (5) *skilled nursing facilities*.[109] For example, *hospital outpatient departments* (HOPD), *ambulatory*

[107] Pam Carron and Nicole T. Stone, *2009 Master Medicare Guide* (Chicago: CCH, 2009), p. 917; "Coding and Ancillary Policies," 42 CFR. § 414.40(b)(2).

[108] DRGs were developed in 1975 at the Yale School of Management by Robert B Fetter, PhD, and John D. Thompson, MPH, and originally consisted of 383 groups; however, this first version of DRGs was never released. Version 2 was released in 1982 by CMS, although modified to include 467 groups (with the 467th defined as "ungroupable"). A new version of the DRG groups is released annually on October 1, with the current number of groups totaling 503 (including one catch-all and one invalid DRG). "Appendix B—A Brief Review of the Development of DRGs," Princeton, http://www.princeton.edu/~ota/disk3/1983/8306/830610.PDF (accessed August 27, 2012).

[109] Patricia A. Davis, "Medicare Primer," Congressional Research Service, July 1, 2010, http://aging.senate.gov/crs/medicare1.pdf (accessed August 23, 2012), pp. 7–13.

surgery centers (ASC), and *physician offices* are all reimbursed under distinct payment systems under Medicare Part B.[110] When physicians provide services and perform procedures in their *offices*, they are reimbursed under the MPFS for their *professional services*. When procedures are provided in *hospitals* or *ASCs*, however, they are reimbursed under both the MPFS (for the *physician services*) and the hospital *Outpatient Prospective Payment System* (*OPPS*), which reimburses for the *cost* of (1) *facilities*, (2) *equipment*, (3) *supplies*, and (4) *hospital staff* for services provided in a HOPD or an ASC.[111]

2.4.1.3.1.1 Hospital Inpatient Reimbursement For reimbursement under *Medicare Part A*, hospitals are reimbursed under the *Inpatient Prospective Payment System* (*IPPS*) using *DRGs*, which classify patients based on the average *per discharge cost of caring* for their particular diagnosis.[112] Each DRG is assigned a *relative rate* based on its *average cost*, which is then multiplied by the *input-price level* of each *geographic market* to determine the payment rate for the DRG.[113] Medicare payments for *acute inpatient services* are based on a *hospital inpatient PPS*, which reimburses hospitals at *per-discharge rates* based on two factors: (1) the *patient's condition* and the related *treatment* strategy, and (2) *market conditions* in the facility's location.[114] The formulas and methods detailing how *hospital inpatient reimbursement* is determined are set forth in Exhibit 2.7.

As set forth above, in certain cases, payments to *hospitals* for *inpatient care* are *increased* (1) for hospitals with *academic medical centers*, or (2) for hospitals that serve a *disproportionate amount of low-income patients*. Of note, specific payments may also be reduced to account for a patient being *transferred* to another facility. Finally, additional reimbursement may be paid for patients who represent particularly *expensive outliers*, due to

"Medicare: Acute Inpatient PPS," Centers for Medicare and Medicaid, August 1, 2012, http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html (accessed August 16, 2012).

either (1) the *acuity* of their *illness or condition*, or (2) the existence of *comorbidity* factors.[115]

To qualify for an outlier payment, a hospital's specific operating and capital costs for a given patient must exceed a fixed loss outlier threshold set by CMS. Total costs for a given patient are calculated by "multiplying the total covered charges by the operating and capital cost-to-charge ratios."[116] If a hospital's patient exceeds the outlier threshold, it is provided with an additional payment at 80 percent of the cost above the threshold. The threshold is updated annually by CMS and is published as part of the IPPS Final Rule.[117]

[117] Ibid.; "Medicare Program; Change in Methodology for Determining Payment for Extraordinarily High-Cost Cases (Cost Outliers) Under the Acute Care Hospital Inpatient and Long-Term Care Hospital Prospective Payment Systems," *Federal Register* 68, no. 110 (June 9, 2003): 34494–34515.

TABLE 2.5 Determining the Prospective Payment

Patient's Condition	Market Condition
Medicare organizes patients with similar clinical problems, requiring similar treatments, and medical resources, into groups called DRGs.	**A national average base payment rate (the amount that would be paid for an average patient in a facility located in an average market) determines the price level of the local market.**
Criteria used for determining DRG classification: (1) principal diagnosis, (2) up to 8 additional diagnoses, (3) type of procedure (up to 6 procedures performed during the stay), (4) age, (5) sex, and (6) discharge status of the patient.	This standardized base payment rate falls into two categories: (1) labor-related share: "*. . . adjusted by the wage index applicable to the area*"; and (2) nonlabor share: the nonlabor share for hospitals in Alaska or Hawaii is adjusted by a cost of living adjustment factor.
A patient is categorized by the Major Diagnostic Category (MDC).	This input-price is then multiplied with the DRG relative weight (this accounts for differences in the mix of patients treated across hospitals).
MDCs are usually grouped by organ system that is affected, although there are some exceptions. Patients are assigned according to their principle diagnosis, with distinctions for (1) surgical (differentiated based on a hierarchy that orders individual procedures or groups of procedures by resource intensity) or medical (grouped on the basis of diagnosis and age); (2) with or without an operating room; and (3) presence of comorbidities (conditions present at admission) or complications (conditions developed during the stay).	In addition, the following market factors will also influence the payment rates: (1) disproportionate share of low-income patients (DSH): "If the hospital is recognized as serving a disproportionate share of low-income patients, it receives a percentage add-on for each case paid through the PPS. This percentage varies depending on several factors, including the percentage of low-income patients served. It is applied to the DRG-adjusted base payment rate, plus any outlier payments received." And (2) teaching hospitals: "If the hospital is an approved teaching hospital it receives a percentage add-on payment for each case paid through the PPS. This percentage varies depending on the ratio of residents-to-beds."
Distinction between surgical (differentiated based on a hierarchy that orders individual procedures or groups of procedures by resource intensity) or medical (grouped on the basis of diagnosis and age).	Outliers: "*additional payment is designated to protect the hospital from large financial losses due to unusually expensive cases. Any outlier payment is added onto the DRG-adjusted base payment rate*"

TABLE 2.5 (*Continued*)

Patient's Condition	Market Condition
DRGs are assigned weights that indicate the relative costliness of a patient in the group to an average Medicare patients (i.e., above-average costs will yield higher weights).	

"Steps in Determining a PPS Payment," U.S. Health Care Financing Administration, http://hcfa/gov/medicare/ippsover.htm (accessed August 12, 2005).

2.4.1.3.1.2 Hospital Outpatient Reimbursement Medicare payments for outpatient services are based on the *Hospital Outpatient Prospective Payment System* (HOPPS). Originally, hospitals were paid for outpatient services based on the *allowable incurred costs*, set by CMS; however, §4523 of the *Balanced Budget Act of 1997* allowed CMS, then known as the HCFA, in August 2000, to implement an *outpatient prospective payment system* (OPPS) under Medicare for hospital outpatient services. Payments are based on several elements, including (1) a set of *relative weights*, (2) a *conversion factor*, and (3) an *adjustment for geographic differences* in input prices. The OPPS also includes an outlier adjustment for extraordinarily high-cost services and *pass-through* payments for new technologies.[118] CMS grouped outpatient procedures that were clinically similar and uses comparable resources in approximately 750 *Ambulatory Payment Classifications* (APC). Services provided are assigned CPT codes, discussed earlier, which are then

[118]A pass-through payment is associated with the cost of inputting a new technology (limited to medical devices, drugs, and biologicals) that does not yet have an associated code for billing into an existing service. This cost is tied to the use of the technology itself and does not consider productivity improvement or other indirect cost savings or expenses. Therefore, pass-through payments add to the payment a hospital would receive for a given service, even if the cost of care actually fell as a result of the applied technology. Pass-through payments are capped at 2.5 percent of the total OPPS payment. Medicare Payment Advisory Commission, *Report to Congress: Medicare Payment Policy*, March 2003, pp. 183, 184; "Office of the Inspector General; Medicare Program; Prospective Payment System for Hospital Outpatient Services: Final Rule with Comment Period," Centers for Medicare and Medicaid, *Federal Register* 65, no. 68 (April 7, 2000): 18476; Medicare Payment Advisory Commission, *How Medicare Pays for Services: An Overview*, Report to the Congress: Medicare Payment Policy, 2002, Washington, DC, March 2002, p. 18.

classified into APCs, each being assigned a specific payment rate.[119] Each classification group of the APC is *bundled*, meaning it includes the integral services and items used within the primary service being provided. Hospitals may bill for various services provided to an individual on a single day; however, if there are multiple surgical procedures performed on a single day, the APC payment is subject to a discounting.[120]

The payment reimbursed to the hospital, is intended to cover the hospital's operating and capital costs, which is determined by multiplying the *relative weight* for a given APC by a designated *conversion factor.*[121] The calculation for outpatient hospital reimbursement is set forth in Exhibit 2.9.

The APC groups and their relative weights are reviewed annually, with CMS updating the conversion factor for inflation using the *hospital inpatient market basket index*.[122]

2.4.1.3.1.3 Ambulatory Surgery Center Reimbursement—HOPD v. Freestanding Medicare distinguishes between those services provided at *hospital ASCs* (i.e., a HOPD), reimbursed under the HOPPS (see earlier section), and *freestanding ASCs* operated and controlled by physicians, in part, because of differences in patient demographics. The patient breakdown for ASCs and HOPDs is illustrated in Table 2.6.

Gender	Male	42.10%	43.50%
	Female	57.90%	56.50%

Medicare Payment Policies, Medicare Payment Advisory Commission, Report to the Congress, 2010, Washington, DC, March 2010, pp. 121–122.

Since 1982, Medicare has made payments for surgical procedures provided in freestanding ASCs, with physicians receiving separate payments for their professional services.[123] Medicare's ASC payment system underwent substantial modifications in 2008,[124] which included basing ASC payment rates on the APC *relative weights* for similar services, extending payment to more surgical services offered by ASCs, and aligning ASC reimbursement rates at a percentage of the OPPS rates.[125] Since 2008,

[123] Prior to 1982, free standing ASCs were not eligible for Medicare payments. Medicare Payment Advisory Commission, *Medicare Payment Policies*, Report to the Congress, 2010, Washington, D.C., March 2010, pp. 121–122.

[124] From 1982 to 2008, ASCs were still reimbursed under Medicare Part B as a standard overhead payment rate based on an estimated fair fee and the costs incurred by the ASC, but for limited surgical (no ancillary) procedures that did not exceed 90 minutes or require more than four hours of recovery time. Centers for Medicare and Medicaid Services, "Chapter 14—Ambulatory Surgical Centers," in *Medicare Claims Processing Manual*, August 6, 2010, http://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/downloads/clm104c14.pdf (accessed September 4, 2012).

[125] Centers for Medicare and Medicaid Services, "Fact Sheets: Final 2009 Policy, Payment Changes for Hospital Outpatient Departments and Ambulatory Surgery Centers," October 30, 2008, http://www.cms.hhs.gov/apps/media/fact_sheets.asp (accessed May 21, 2010).

CMS has significantly expanded the scope of procedures performed at ASCs that are eligible for Medicare reimbursement to include most procedures that do not pose a significant safety risk and do not require longer than a 24-hour stay.[126]

To receive Medicare payments, a freestanding ASC must meet Medicare's *conditions of coverage standards* that specify minimum guidelines for administration of *anesthesia*, *quality* evaluation, *operating and recovery rooms*, *medical staff*, *nursing services*, and other areas. In addition to surgical procedures, Medicare also accepts separate billings for certain nonsurgical ancillary services provided by an ASC, such as *radiology services*, *brachytherapy*, and pass-through and non-pass-through *drugs*.[127] In contrast to most procedures (discussed later), Medicare reimburses HOPD and freestanding ASCs at the same rate for *brachytherapy* and *pass-through drugs*.[128]

Overall, Medicare reimbursement for freestanding ASCs is set at a percentage of the OPPS for HOPD, with annual adjustments based on inflation (i.e., *annual conversion factor*). Freestanding ASCs are reimbursed at the lower of (1) the *ASC rate*, or (2) the *actual charge*.[129] The ASC rate is calculated as the product of the conversion factor and the ASC *relative payment weight* for a given service or procedure, which mimics the relative weight assigned to the service or procedure under the OPPS. Therefore, the conversion factor is the main distinguishing component between freestanding ASC payments and payments for services provided at HOPDs.[130] Of note is that physician professional services are reimbursed directly to the physician, while the costs of *ancillary and technical component* (ASTC) charges are reimbursed to the facility.[131]

Beginning in 2008, *new, office-based procedures* performed in ASCs are covered by Medicare Part B but are not reimbursed at the OPPS percentage.[132] Instead, these services are reimbursed at whichever rate is lower: (1) the *ASC rate* (i.e., the percentage of the OPPS rate), or (2) the *practice expense portion* of the *MPFS payment rate* that would have applied if the procedure had been performed in a physician's office.[133] This alternative reimbursement calculation was implemented by CMS in an effort to discourage physicians from moving their practices out of their offices and into ASCs. Similarly, as a disincentive to physicians shifting procedures to ASCs, CMS also excludes from the revised ASC payment rates reimbursement for separately payable radiology services and drugs, instead applying the OPPS rate to those charges.[134]

As of 2011, *freestanding ASCs* received approximately 57 percent of the reimbursement given to a *hospital-based outpatient department* for an identical service, a significant decrease from the 86 percent ASCs received for identical services in 2004. This growing gap in reimbursement amounts has caused ASC advocacy groups to encourage CMS to realign payments to ASCs. The divergence between ASC and HOPD payments arises from the conversion factor for each facility being established from different indexes (*consumer price index for all urban consumers* [CPI-U] for freestanding ASCs and the *hospital market basket* for HOPDs). Of note is that freestanding ASCs are the only healthcare entity where the conversion factor is dictated by the CPI-U, which is based on prices for energy and housing, in contrast to the *hospital market basket*, which is driven by goods and services purchased by healthcare facilities.[135] The growing reimbursement gap has resulted in many joint ownership arrangements between freestanding ASCs and hospitals. As long as the

---

[132] New, office-based procedures are those procedures traditionally performed in a physician's office, for example, separately billed radiology services, separately payable drugs, and device-intensive procedures. Approximately 50 percent of the services performed at an ASC fall into this category. Medicare Payment Advisory Commission, "Ambulatory Surgical Centers Payment System," *MedPAC Payment Basics*, October 2011, p. 2.

hospital holds a majority of the ASC's equity, most payors will reimburse the ASC as an affiliate of the hospital, allowing for more beneficial reimbursement rates.[136]

2.4.1.3.1.4 Skilled Nursing Facility Reimbursement Although Medicare covers only about 22 percent of all nursing home expenditures, Medicare paid about $26.4 billion to skilled nursing facilities in 2010.[137] Neither Medicare Part A nor Part B covers custodial care, that is, care that helps residents with daily activities.[138] Furthermore, Medicare Part A (the primary payor for covered skilled nursing services) will pay for daily skilled nursing or rehabilitation services only under the following scenario: (1) the patient had a prior stay in a general acute care hospital (for three consecutive days), (2) admission to a skilled nursing facility was within a short time period after hospital discharge, (3) the patient is receiving treatment for the same condition that was being treated in the hospital, and (4) a medical professional certified the need for daily skilled nursing or rehabilitative care.[139]

Skilled nursing days covered by Medicare Part A are limited to 100 days per *benefit period*, with the first 20 days covered at 100 percent, and a copayment of $144.50 per day required for days 21 through 100.[140] After the Medicare Part A 100-day benefit is exhausted, Medicare Part B benefits continue to reimburse for physician services and other Part B–covered services; however, the patient is liable for all other costs.[141] These incurred costs can be prohibitive for many patients, because the median annual cost

[140] Centers for Medicare and Medicaid Services, "Medicare & You 2012," 2012, http://www.medicare.gov/publications/pubs/pdf/10050.pdf (accessed August 21, 2012), p. 35.

[141] Ibid.; U.S. Office of the Inspector General, *Medicare Beneficiary Access to Skilled Nursing Facilities, 2001*, Report OEI-02-01-00160, July 2001, p. 1; MedPAC, "Prospective Payment for Post-Acute Care: Current Issues and Long-Term Agenda," *Report to the Congress: Medicare Payment Policy*, March 2001, p. 91.

of nursing home care ranges from $39,600 to $81,030.[142] Of note, with such high costs associated with care, less than 30 percent of nursing home patients are private pay patients, meaning they are not receiving benefits from Medicare or Medicaid.[143]

Prior to the July 1, 1998, implementation of the PPS, Medicare reimbursed skilled nursing facility services under a *cost-based payment system.* Under the PPS, skilled nursing facilities are reimbursed through:

> *prospective, case-mix adjusted per diem payments that cover routine, ancillary, and capital-related costs, including most items and services for which payment was previously made under Medicare Part B. The per diem payment is based on Fiscal Year 1995 Part A & B costs adjusted using the [skilled nursing facility] market basket index, the case mix from resident assessments, and geographical wage variations.*[144]

The *market basket index* is an adjustment factor made for inflation, while the *case-mix index* accounts for the different levels of care required by individual patients.[145] To determine the appropriate *case-mix*, skilled nursing facilities assign patients into 1 of 66 *Resource Utilization Groups* (RUGs), which are then divided into the following six major categories: (1) *special rehabilitation*, (2) *extensive services*, (3) *special care*, (4) *clinically complex*, (5) *impaired cognition*, and (6) *reduced physical function.*[146]

[145] U.S. Office of Inspector General, *Medicare Beneficiary Access to Skilled Nursing Facilities, 2001*, Report OEI-02-01-00160, July 2001, p. 2.

[146] Resource Utilization Groups are based on patient characteristics, including services used, that estimate what resources particular patients with similar characteristics may use. RUGs are used to adjust the daily rate for skilled nursing payments. Medicare Payment Advisory Commission, "Skilled Nursing Facility Services Payment System," *MedPAC Payment Basics*, October 2011, pp. 1–2.

In response to concerns that the implementation of the PPS for skilled nursing services had led to a reduction in payments, on November 29, 1999, Congress enacted the *Balanced Budget Refinement Act* (BBRA), which implemented, on April 1, 2001, a 4 percent *across-the-board* increase in payments to skilled nursing facilities for Fiscal Years 2001 and 2002, with a temporary 20 percent increase in payments for 15 RUGs that represented medically complex conditions.[147] In 2000, Congress further increased reimbursement rates to skilled nursing facilities under the *Benefits Improvement and Protection Act of 2000* (BIPA), which increased the inflation update to the *full market basket* in Fiscal Year 2001 and increased the nursing component of the RUGs by 16.6 percent.[148] In addition, under the BIPA, the 20 percent increase in payment for 3 of the 15 RUGs (those for rehabilitation), mandated by the BBRA, was instead allocated across 14 additional rehabilitation RUGs as a 6.7 percent increase.[149]

2.4.1.3.1.5 Home Health Reimbursement Section 1861 of the *Social Security Act* authorizes Medicare Part A payments for home health services. If a beneficiary does not have Medicare Part A coverage, home health services may also be reimbursed from available Medicare Part B benefits.[150] Medicare Part A will reimburse for home healthcare for a patient only when (1) a physician has certified that home healthcare is necessary, (2) the beneficiary has been confined to his or her home, and (3) the beneficiary requires services covered by Medicare, specifically, physical and occupational therapy, speech language pathology services, medical social services, and home health aide services for personal care related to the treatment of the beneficiary's illness or injury. Medicare Part B also covers the cost of medical supplies and durable medical equipment (DME).[151] More information regarding reimbursement for DME is provided in a later section.

[149] U.S. Office of Inspector General, *Medicare Beneficiary Access to Skilled Nursing Facilities, 2001*, Report OEI-02-01-00160, July 2001, p. 3.

[150] Office of Inspector General, "Variation among Home Health Agencies in Medicare Payments for Home Health Services," Department of Health and Human Services (July 1995), p. 1.

[151] "Requirements for Home Health Services," 42 CFR CH. IV §424.22 (October 1, 2004), p. 996.

Similar to reimbursement for skilled nursing services, the *Social Security Act* specifically denies coverage for *custodial care* and *personal comfort items*. Congressional intent for these exclusions is to provide care related only to the *skilled* treatment of a specific illness or injury.[152]

Originally, Medicare Part A benefits were limited to 100 home healthcare visits, for Medicare beneficiaries discharged from the hospital following a minimum three-day stay. Subsequent to Medicare Part A being exhausted, then Medicare Part B covers 100 home healthcare visits during a calendar year with a required deductible. The *Omnibus Budget Reconciliation Act of 1980* eliminated the three-day prior hospitalization requirement under Part A, the 100-visit limits for both Part A and Part B, and the deductible for home health services under Part B, effectively transforming Medicare home health benefits into an *unlimited benefit* serving both *chronic needs* of patients and short-term *recuperative care* after a hospital stay.[153]

Implementation of the Medicare PPS for inpatient hospital services in 1983 resulted in a large-scale shift of the provision of healthcare services from *inpatient* to *outpatient* settings. During the 1980s, the percentage of Medicare patients discharged to home health facilities increased from 9.1 percent in 1981 to 17.9 percent in 1985.[154] Furthermore, federal governmental cost control initiatives for hospital reimbursement led to a surge in home healthcare spending. As a result, the *Balanced Budget Act* of 1997 required the implementation of a PPS for home healthcare services covered under Medicare, as well as aggregate, *per patient cost caps* on the amount that agencies were reimbursed for home healthcare patients.[155]

The PPS for home healthcare was implemented on October 1, 2000, under which home healthcare agencies are paid a *predetermined pay rate* for each 60-day episode of care, based on several elements, including patients'

conditions and service usage, geographic area, case mix, and number of visits.[156] If fewer than five visits occur within the 60-day episode of care period, the home healthcare agency was paid by the *type of visit*.[157] These elements are categorized as *labor* and *nonlabor portions*. The *labor portion* is adjusted to account for geographic differences in labor input to home health services, and the remaining are *nonlabor portions*.[158] In addition to CMS-established payment rates, the ACA provided for an additional payment of 3 percent for episodes of care in rural areas from April 2010 to 2015.[159]

2.4.1.3.1.6 Independent Diagnostic Testing Facilities (IDTF) Reimbursement *Independent Diagnostic Testing Facilities* (IDTF), otherwise known as *Freestanding Diagnostic Imaging Facilities*, offer diagnostic services independently of physician offices or hospitals. Medicare Part B reimburses IDTFs according the MPFS. Significantly, the *Deficit Reduction Act of 2005* (DRA), signed into law on February 8, 2006, capped the *technical component* (including the technical component of the global fee, that is, when the technical and professional components are reimbursed as one amount—"*globally*") for certain imaging services provided in physician offices and IDTFs, which could also be provided in a hospital outpatient setting, at the OPPS rate for identical services.[160] The DRA-established cap applies to imaging services provided on or after January 1, 2007, including *x-ray*, *ultrasound*, *nuclear medicine*, *magnetic resonance imaging* (MRI), *computed tomography* (CT), and *fluoroscopy*. Excluded from the DRA-established cap are diagnostic and screening *mammographies*.[161]

Historically, reimbursement to IDTFs has been perceived by some health policy regulators as more vulnerable to a higher level of abuse than other services. A 2012 Office of the Inspector General (OIG) study found that in 2009, the 20 highest *Core Based Statistical Areas* (CBSA), based on IDTF service utilization, accounted for 10.5 percent of Medicare Part B payments to IDTF, four times the average amount received by the remaining CBSAs. Despite accounting for only 2.2 percent of the Medicare beneficiaries receiving IDTF services, 9 percent of the IDTFs in the 20 highest CBSAs provided 90.1 percent of all IDTF services. Furthermore, these 20 CBSAs are alleged to have submitted twice as many claims to Medicare that were noted as having at least two *questionable characteristics*.[162] The OIG broached its concerns regarding possible abuse of IDTF reimbursement with CMS, which concurred with the OIG recommendations to increase monitoring of IDTF billing, but postponed judgment regarding the imposition of a temporary moratorium on new IDTF Medicare enrollment.[163]

2.4.1.3.1.7 ESRD Reimbursement Since 1983, Medicare has reimbursed providers of *dialysis* services for *end stage renal disease* (ESRD) based on a *predetermined prospective payment* for each dialysis treatment they conduct, known as a *composite rate* (CR).[164] The CR covers the costs associated with a single dialysis treatment, including nursing, diet counseling, and other clinical services; social services; supplies; equipment; and certain laboratory tests and drugs.[165] Similar to other reimbursement payment models, the CR is adjusted to account for geographic differences in prices and case-mix.[166] In addition, Medicare pays separately for *drugs* and *tests* that have become a *routine part of care* since 1983, such as *erythropoietin* (EPO), *iron sucrose*, and *vitamin D*.[167]

Beginning on January 1, 2011, §153(b) of the *Medicare Improvements for Patients and Providers Act* (MIPPA) replaced the basic *composite payment system* with a bundled ESRD *prospective payment system* (ESRD PPS) for Medicare outpatient ESRD facilities.[168] The new reimbursement model was implemented during a four-year transition period, with full implementation beginning January 1, 2014.[169] Providers were given the choice to either (1) fully implement the new reimbursement system on January 1, 2011, or (2) transition to the new reimbursement system under the four-year transition model.[170] Under the four-year transition model, a blended payment rate of the initial *case-mixed adjusted composite payment rate* and the new ESRD PPS payment was to be used, unless existing ESRD facilities opted out of the ESRD PPS transition by November 1, 2010.[171]

The ESRD PPS bundled payment system consists of services included in the CR as of 2010, that is, *injectable biologicals* used to treat anemia, *erythropoiesis stimulating* agents and any oral form of such agents, other *injectable medications* that are furnished to ESRD beneficiaries and separately paid for under Medicare Part B, and *laboratory tests* and other items and services provided to beneficiaries for ESRD treatment.[172] The bundled payment rate includes adjustments for *patient case-mix*, *high-cost patients*, and *low-volume* facilities.[173] A description of the various factors that adjust the ESRD PPS base rate is set forth in Table 2.7.

Under MIPPA, a pay-for-performance program was also implemented into the payment bundle system.[174]

TABLE 2.7 Factors Used to Adjust ESRD PPS Base Rate Payments

Adjustment Factor	Description
Patient-Level Adjustments for Case-Mix	Based on demographics that play a role in the cost of providing care, including patient age, body surface area, low body mass index, onset of dialysis, and the following six specified comorbidities: (1) hereditary hemolytic and sickle cell anemia, (2) monoclonal gammopathy (in the absence of multiple myeloma), (3) myelodysplastic syndrome, (4) bacterial pneumonia, (5) gastrointestinal bleeding, and (6) pericarditis.
Facility-Level Adjustments	Facilities that are certified to furnish home or self-care dialysis training services will receive a training add-on payment. This adjustment applies to both peritoneal dialysis and hemodialysis training treatments.
Adjustments for Pediatric Patients	Treatments provided to pediatric patients (i.e., individuals under the age of 18) are subject to a payment adjustment to reflect the higher total payments for pediatric composite rate and separately billable services, compared to adult patients.
Outlier Adjustments	An additional outlier payment is applied when a beneficiary's payment per treatment for outlier services exceeds the predicted payment amount per treatment for the outlier services plus a fixed dollar amount. Outlier services include drugs, laboratory testing, and other items that facilities separately billed under the old payment system, such as ESRD-related medical and surgical supplies.

"Medicare Program; End-Stage Renal Disease Prospective Payment System and Quality Incentive Program; Ambulance Fee Schedule; Durable Medical Equipment; and Competitive Acquisition of Certain Durable Medical Equipment, Prosthetics, Orthotics and Supplies; Final Rule," Centers for Medicare and Medicaid Services, *Federal Register* 76, no. 218 (November 10, 2011): 70230.

2.4.1.3.1.8 Durable Medical Equipment Reimbursement Medicare Part B reimburses for approximately 28 percent of all spending on medically necessary and physician prescribed *durable medical equipment*, *prosthetics*, *orthotics*, *and other medical supplies* (DMEPOS). Distinctions in the scope of CMS reimbursement vary based on the definition of DMEPOS. The category with the largest scope of Medicare reimbursement is *durable medical equipment* (DME) and *prosthetics and orthotics* (PO). DME includes any equipment that "(1) can withstand repeated use, (2) is used

to serve a medical purpose, (3) generally is not useful in the absence of an illness or injury, and (4) is appropriate for use in the home."[175] PO are limited to those devices that replace all or part of an internal body organ or body part, such as colostomy bags, artificial parts, and leg braces. Medicare also covers *some* supplies (S) that are not including in DME or PO, such as disposable surgical dressings.[176]

Medicare reimbursement for DMEPOS uses a fee schedule developed from suppliers' previous charges to Medicare. The payment available by Medicare is typically 80 percent of the lesser of either (1) the supplier's actual charge, or (2) the Medicare fee schedule for an item or service. Beneficiary coinsurance accounts for the remaining 20 percent of the charge, which is accepted by the supplier. There are four specific *Medicare Administrative Contractors* that manage the payment of claims for DMEPOS Medicare billing.[177]

The *National Association of Medical Equipment Services' Six-Point Plan* was signed into law by President Ronald Reagan, as part of the *Omnibus Budget Act of 1987*. The *Six-Point Plan*, effective as of 1989, was designed to stabilize Medicare reimbursements for DMEPOS and to increase the *rent/purchase cap* from $120 to $150.[178] The *Six-Point Plan* classified DMEPOS into six categories defined as follows:

1. **Inexpensive or other routinely purchased DME (rent or purchase).** Defined as DME that does not exceed $150 or is acquired by purchase at least 75 percent of the time.
2. **Items requiring frequent and substantial servicing (rental only).** Defined as DME items that require frequent and substantial servicing to avoid a risk to a patient's health, such as ventilators and aspirators.
3. **General prosthetic and orthotic devices and supplies, miscellaneous supplies, and other Items (purchase only).** Where prosthetics are defined as

devices that replace all or part of an internal body organ or its function, orthotic devices are defined as items used for the correction or prevention of skeletal deformities, and miscellaneous supplies include items such as sterile saline or water and blood glucose test strips.

4. **Capped rental items (rent or purchase).** Defined as items that cost more than $150, are not routinely purchased, are not service intensive, are not customized, and are not oxygen or oxygen-related.
5. **Oxygen (rental only) and oxygen equipment.** With oxygen equipment defined as stationary or portable gaseous and liquid systems.
6. **Customized equipment (including customized prosthetic and orthotic devices) (purchase only).** Defined as equipment uniquely constructed or modified to meet the needs of a specific patient.[179]

These six basic categories are still used today by CMS for DMEPOS reimbursement.[180]

Under the Deficit Reduction Act (DRA) of 2005, the terms of beneficiary ownership of certain DMEPOS, including those defined in the *Six-Point Plan,* were altered. For rentals, payments must be made on a monthly basis, but not for longer than 13 months of continuous use. If the rental item is used for more than 13 continuous months, the supplier will transfer the title of the item to the individual. An exception to this is the power-driven wheelchair, which is required to be offered for purchase at a lump sum price at the time the supplier furnishes the item. Another change made by the DRA involves maintenance and servicing of DME after the title is transferred to the individual. The DRA states that reasonable and necessary maintenance and servicing for capped rental items and certain oxygen-generating equipment are the responsibility of the supplier.[181]

Unique to certain DMEPOS (i.e., patient safety items, ambulatory aids, wheelchairs, and hospital beds) is the process of *competitive bidding*, whereby DMEPOS manufacturers submit competing bids to Medicare based on the *charge per unit*, the lowest of which is granted a government

DMEPOS contract to be a Medicare provider of DMEPOS in 1 of 10 different metropolitan areas.[182] CMS chooses two or more suppliers from each *metropolitan statistical area* (MSA); however, once patient need is satisfied, CMS caps the number of *winning bidders*. Mandated under §302 of the *Medicare Prescription Drug, Improvement, and Modernization Act* of 2003 (MMA),[183] *competitive bidding* was designed to reduce out-of-pocket costs to patients, as well as costs incurred by Medicare, by combating provider fraud.[184] As such, identical products must be priced the same within an individual MSA, although prices can vary between MSAs. Of note, all contract suppliers for Medicare must be licensed and accredited by an approved agency before their bid is considered.[185] CMS

[185] To obtain a CMS contract to supply DME, suppliers must meet quality standards established by CMS and be accredited by a CMS-approved independent national Accreditation Organization (AO), of which there are 10 (approved by CMS in November 2006), including (1) Accreditation Commission for Health Care, Inc.; (2) American Board for Certification in Orthotics & Prosthetics, Inc.; (3) Board of Certification/Accreditation International; (4) Commission on Accreditation of Rehabilitation Facilities; (5) Community Health Accreditation Program; (6) HealthCare Quality Association on Accreditation; (7) National Association of Boards of Pharmacy; (8) the Compliance Team, Inc.; (9) the Joint Commission; and (10) the National Board of Accreditation for Orthotic Suppliers. Centers for Medicare and Medicaid Services, "Medicare New Deemed Accreditation Organizations for Suppliers of Durable Medical Equipment, Prosthetics, Orthotics and Supplies (DMEPOS)," May 4, 2010; Miram Lieber, "Shaping Up for NCB," HomeCare, April 1, 2007, http://www.homecaremag.com/mag/medical_shaping_ncb/index.html (May 8, 2007).

requires potential DME suppliers for the federal government to meet seven criteria:

1. Be in good standing with the Medicare program and not under any current sanctions by Medicare or any governmental agency or accreditation or licensing organization.
2. Have an active National Supplier Clearinghouse (NSC) number.[186]
3. Meet any local or state licensure requirements for the item being bid.
4. Submit a bid as a prerequisite to becoming a winning supplier.
5. Be accredited or have an application for accreditation pending in order to participate in bidding.
6. Provide capacity estimates of the number of units for each item included in the product category that the supplier would be capable of furnishing under the program.
7. Agree to service the entire *competitive bidding area* (CBA), regardless of where the beneficiary is located, although the supplier will not be required to be capable of servicing 100 percent of the beneficiaries in that geographic area.[187]

Small suppliers that generate gross revenue of $3.5 million or less in annual receipts account for approximately 85 percent of DMEPOS suppliers enrolled in the Medicare program.[188] The CMS final rule on the

[186]The National Supplier Clearinghouse (NSC) is the organization that enrolls and monitors the business information for DMEPOS suppliers in the Medicare program. NSC issues Medicare supplier numbers based on a supplier's single tax reporting or employee identification number and uses modifiers to identify geographic office locations. Although NSC is not directly involved in billing and claims, it supplies DME Medicare Administrative Contractors with the overall NSC Master File to facilitate supplier eligibility for claims payment. Centers for Medicare and Medicaid and the Medicare Contractor Management Group, *Durable Medicare Equipment Medicare Administrative Contractor: Workload Implementation Handbook*, March 1, 2007, pp. 7–3.

[188]Centers for Medicare and Medicaid Services, "Fact Sheet: Competitive Bidding Program for Certain Durable Medical Equipment, Prosthetics, Orthotics, and Supplies: Final Rule (CMS 1270-F)," April 2, 2007, http://www.cms.hhs.gov/apps/media/press/factsheet.asp?Counter=2098&intNumPerPage=10&checkDate=&checkKey=&srchType=&numDays=3500&srchOpt=0&srchData=&keywordType=All&chkNewsType=6&intPage=&showAll=&pYear=&year=&desc=&cboOrder=date (accessed August 16, 2012).

DMEPOS competitive bidding program, published on April 10, 2007, ensures small supplier participation and access to the competitive bidding market through several provisions. The final rule set a target percentage for winning bidders representing small supplier participation of 30 percent in each product category. If this percentage is not achieved during a competitive bidding cycle, CMS must offer DMEPOS supplier contracts to those small suppliers that submitted bids higher than the winning bids and represent the highest of the small supplier bids. CMS will continue using this methodology until either (1) the 30 percent goal is met, or (2) there are no additional small supplier bidders.[189] Small suppliers are also allowed to form *networks* in order to "lower bidding costs, expand service options, or attain more favorable purchasing terms," thereby facilitating their participation in the bidding process.[190] Any network formed must comply with all federal and state laws, including federal antitrust laws.[191]

The first round of competitive bidding began in 2007, and contracts were awarded and took effect on July 1, 2008, achieving an approximate 26 percent in savings as compared to prior Medicare expenditures on specific DMEPOS items.[192] However, MIPPA rescinded those contracts awarded in the first round of bidding; delayed the second round of bidding, which was scheduled for 2009; and made several other changes to the program.[193] These revisions were attributed partially to implementation difficulties with the automatic bid submission system.[194]

In order to offset the cost of the implementation delays after MIPPA, changes were made to the fee schedule. For any item selected for competitive bidding before July 1, 2008, the fee schedule did not increase but instead was reduced by 9.5 percent in 2009.[195] The *Round One Rebid* began again in October 2009, resulting in 1,217 new contracts, which became effective in

[189] "Medicare Program; Competitive Acquisition for Certain Durable Medical Equipment, Prosthetics, Orthotics, and Supplies (DMEPOS) and Other Issues," *Federal Register* 72, no. 68 (April 10, 2007): 18058.

[194] Ibid.

[195] Ibid.

January 2011 in nine MSAs for nine product categories.[196] Approximately 51 percent of the contracts were with small businesses, vastly exceeding the required target minimum of 30 percent (discussed earlier).[197] Achieving a 35 percent savings in its *first* round, the competitive bidding program has significantly reduced prices for beneficiaries in select areas.[198] CMS has estimated that due to the *competitive bidding process*, there has been an overall reduction in DMEPOS expenditures of $202.1 million (42 percent) in MSAs included in the *Round One Rebid.*[199] CMS *real-time monitoring* also indicated significantly fewer instances of inappropriate mail-order claims.[200]

CMS is required to *re-compete* DMEPOS contracts every three years; therefore, the *Round One Rebid contracts* (except for mail order diabetes products) all expire on December 31, 2013. In preparation for this, CMS began conducting the *Round One Re-Compete* in the spring of 2012 in the same geographic areas (MSAs) included in the *Round One Rebid.*[201]

The ACA expanded the *Round Two* MSAs from 70 to 91 and required further expansion in subsequent re-competes, such that the entire country is scheduled to be eligible for *competitive bidding* by 2016.[202] CMS also included mail order items as a product category for *Round Two* competitive bidding.[203] The *Round Two* competitive bidding process mirrors the process

used during *Round O*ne, which will continue, absent any negative effects on either access to supplies or beneficiary health indicators. The *Office of the Actuary* (OACT) has estimated that *competitive bidding* may achieve $25.7 billion in savings for the Medicare program and an additional $17.1 billion for beneficiaries between 2013 and 2022.[204] For more information on the impact of competitive bidding, see Section 4.6.3, "Commoditization of Healthcare," in Chapter 4, "Competition."

2.4.1.3.2 Physician Reimbursement and Billing: The Resource-Based Relative Value Scale (RBRVS) Medicare reimbursement is based on a standardized physician payment schedule based on the *Resource-Based Relative Value Scale* (*RBRVS*), the intent of which is to determine payments based on the *relative value* of the resources necessary to provide a particular service.[205] The MPFS determines payments by a procedure's *Relative Value Units* (*RVU*), which is applied across all specialties.[206]

The RBRVS was developed by Harvard economist William C. Hsiao, PhD, in 1988 (see Section 1.6.6, "Development of Resource-Based Relative Value System [RBRVS]," in Chapter 1, "The Chronology of U.S. Healthcare Delivery"). The movement toward the development of a *resource-based* physician payment schedule was a significant change to Medicare reimbursement. For 25 years, Medicare physician payments were determined by the *Customary, Prevailing, and Reasonable* (CPR) system, under which payments were based on (1) the 90th percentile of *customary charges* within the physician specialty area, (2) the median prices of physician charges, or (3) the lowest of the physician's

RELATIVE VALUE SCALE (RVS)

The RVS is the reimbursement scheme by which each procedure is assigned a relative value, which is multiplied by a negotiated factor (the multiplier), usually a discount, to arrive at a payment.

The Managed Health Care Handbook, *3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Aspen Publishers, 1996), pp. 140–141.*

Factoid

The RBRVS was created by William C. Hsiao in 1988 in order to (1) address the growing inequity of reimbursement rates for procedural services for cognitive clinical services, and (2) address the rapid increases in Medicare spending.

"Resource-Based Relative Value Units: A Primer for Academic Family Physicians," by Sarah E. Johnson and Warren P. Newton, Family Medicine *(March 2002): 172–173.*

actual fees within the geographic location.[207] Over time, the CPR was perceived as resulting in fluctuations in prices, creating pricing disparities between geographic locations, physician specialties, and third-party insurance companies.[208] For example, reimbursement rates were often higher in urban areas and for procedural-oriented services.[209] The CPR system was eventually seen as unreliable and a factor in driving up health expenditures in the United States.

In an attempt to rectify that situation, the *Physician Payment Review Commission* (PPRC), currently known as MedPAC, considered four distinct options: (1) modify the current CPR system, (2) implement a Prospective Payment System (PPS), (3) mandate the use of *health maintenance organization* (HMO) programs and capitation strategies, or (4) implement a relative value scale.[210] The PPRC eventually endorsed a *resource-based relative*

[208] Ibid.

[209] Ibid.

RESOURCE-BASED RELATIVE VALUE SYSTEM (RBRVS)

The RBRVS is the scale on which Medicare bases its standardized physician payment schedule. The RBRVS determines payments based on the value of the resources necessary to provide a particular service.

"Overview of the RBRVS," American Medical Association, http://www.ama-assn.org/ama/pub/physician-resources/solutions-managing-your-practice/coding-billing-insurance/medicare/the-resource-based-relative-value-scale/overview-of-rbrvs.shtml (accessed October 5, 2009).

value scale in efforts to project neutral values under a hypothetical competitive market and effectively present physician services as a health market commodity.

In the study used to establish the RBRVS system, that is, *A National Study of Resource-Based Relative Value Scales for Physician Services*, Hsiao examined several components making up physician services, in particular: *work*, *practice costs*, and *opportunity costs*, including the cost associated with *training*. With the aid of multidisciplinary consulting groups and physician surveys, Hsiao composed a common scale of *relative values* across physician specialties and services.[211] These components, studied by Hsiao, were the basis for the RVU calculation used in the current MPFS.

There are three RVU components: (1) *physician work*, (2) *practice expense*, and (3) *malpractice costs*, defined as:

1. **Physician work (wRVU).** "The relative levels of time, effort, skill, and stress associated with providing each service"—approximately 55 percent of the RVU value.
2. **Practice expense (PE RVU).** "The expenses physicians incur when they rent office space, buy supplies and equipment, and hire nonphysician

[211] William C. Hsiao, et al., "A National Study of Resource-Based Relative Value Scales for Physician Services," Cambridge, MA, 1988, pp. 1–25.

RELATIVE VALUE UNIT (RVU)

The RBRVS assigns each procedure a relative value unit, or RVU. There are three types of RVUs: one for physician work (wRVU), one for practice expense (PE), and one for malpractice costs. The three components of the RVU can be broken down as follows:

1. **Work.** The estimated value of the time, effort, expertise, and intensity of the service—approximately 55 percent of the RVU value.
2. **Practice expense.** The estimated value of overhead and other expenses necessary to run the practice—approximately 42 percent of the RVU value.
3. **Professional liability insurance (PLI).** The estimated value of malpractice cost for the service—approximately 3 percent of RVU value.

"Gauging Emergency Physician Productivity: Are RVUs the Answer," by John Proctor, American College of Emergency Physicians, ACEP Reimbursement Committee, http://www.acep.org/practres.aspx?id=30306 (accessed April 1, 2009).

clinical and administrative staff"—approximately 42 percent of the RVU value.

3. **Malpractice expense (MP RVU).** The "premiums physicians pay for professional liability insurance, also known as medical malpractice insurance"—approximately 3 percent of RVU value.[212]

Modifiers are often used to adjust each of these RVU components, as well as the total number of RVUs for a given service as designated by a diagnosis of procedure code (see Section 2.2.3, "Diagnostic and Procedural Coding"). Each RVU component is adjusted by its corresponding *Geographic Practice Cost Index* (*GPCI*) to account for local and geographic cost differences. The sum of the geographically adjusted RVUs is multiplied by a *conversion*

[212] Medicare Payment Advisory Committee, "Physician and Other Health Professionals Payment System" *MedPAC Payment Basics* (October 2011), http://medpac.gov/documents/MedPAC_Payment_Basics_11_Physician.pdf (accessed August 14, 2012), pp. 1–2; John Proctor, ACEP Reimbursement Committee, "Gauging Emergency Physician Productivity: Are RVUs the Answer?" posted on American College of Emergency Physicians, www.acep.org/practres.aspx?id=30306 (accessed August 14, 2012).

Key

RVU = Relative Value Unit
w = Work
PE = Practice Expense
MP = Malpractice
GPCI = Geographic Price Index
CF = Conversion Factor

Payment = [(wRVU × GPCI work) + (PE RVU × GPCI PE) + (MP RVU × GPCI malpractice)] × CF

EXHIBIT 2.9 MPFS Payment Calculation

factor (CF) to determine the dollar amount of Medicare reimbursement for a specific service at a given location.[213]

The formula for calculating the Medicare physician reimbursement amount for a specific procedure at a given location is shown in Exhibit 2.9.[214]

Each of these three RVU components, GPCI, and CF is discussed further on.

2.4.1.3.2.1 Work Component The *work RVU* (wRVU) *component* represents the physician's contribution of *time* and *effort* to the completion of a given procedure. For example, as referenced previously, an E/M procedure for a *difficult* to diagnose medical condition will have a higher wRVU than an E/M for a *preventative care* office visit. Similarly, the surgery code for a *simple closure* will result in a lower wRVU than the code for a *complex closure*. Typically, the higher the value of the code, the more *skill*, *time*, and *work necessary to complete* the service.

Hsiao and his peers considered the wRVU component of reimbursement to be the most significant aspect of their RBRVS study. The study divided *work* into three categories: (1) *pre services*, (2) *intra services* (face-to-face time with a physician), and (3) *post services*. *Pre-service* and *post-service*

[213] Medicare Payment Advisory Committee, "Physician and Other Health Professionals Payment System," *MedPAC Payment Basics* (October 2011, http://medpac.gov/documents/MedPAC_Payment_Basics_11_Physician.pdf (accessed August 14, 2012), p. 2.

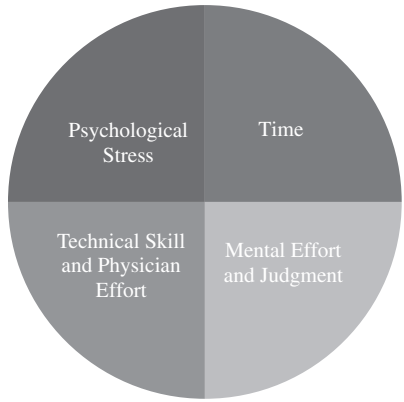

EXHIBIT 2.10 wRVU Components

work included *reviewing* data; *communicating* with colleagues, patient relatives, and staff; and *documentation*. Due to the nature of *pre-service* and *post-service* work, *intra-service* work was considered more discrete and more reliable than the other categories. Therefore, Hsiao's study focused heavily on refining and calculating *intra-service* measurements, and *pre-service* and *post-service* work measurements were extrapolated.[215]

Hsiao's preliminary studies defining the dimensions associated with *work* first assessed *time* separate from *work intensity*. Although Hsiao discovered high correlations between the duration of a procedure and the physicians' estimates of its complexity, he questioned whether the overlap would lead to an exaggerated final *work* product. The physicians serving as the study's *Technical Consulting Groups* (TCGs) confirmed that the final *work* product did *not* reflect the perceived *reasonable input*. For services that were considered *long*, physicians underestimated their work values and, conversely, for services that were *short*, physicians overestimated their work values.[216] Hsiao eventually used a *multidimensional* definition of *work*, which included the following variables: *time*, *mental effort* and *judgment*, *technical skill* and *physical effort*, and *psychological stress*.[217] The components that are used to compile an accurate wRVU are illustrated in Exhibit 2.10.

[217] William C. Hsiao et al., "A National Study of Resource-Based Relative Value Scales for Physician Services," Cambridge, MA, 1988, p. 15.

Fungible Commodity

A good whose units are freely exchangeable and interchangeable.

Dictionary of Health Economics and Finance, *ed. David E. Marchinko (New York: Springer, 2007), p. 159.*

To construct a *relative value* for intra-service *work*, Hsiao surveyed 6,841 physicians in 33 specialties across the nation. The response rate averaged 69 percent; however, within specific specialties, the response rate ranged from 56 percent in *obstetrics* and *gynecology* to 84 percent in *nuclear medicine*.[218] The 460 *Current Procedural Terminology* (CPT) codes that made up, at the time of Hsiao's study, more than 90 percent of Medicare physician payments were ranked by physicians' subjective estimations of usage. Physicians subjectively ranked their work input for a *particular service* relative to a *reference service* on a *ratio scale*, which was then cross-linked on a special panel to compose all *relative values* on one common *global scale*. The results revealed a high agreement in service rankings for physicians within specialties, as well as for physicians across specialties, and therefore suggested an indication that the work assessment was both highly reliable and valid.[219]

The underlying premise of Hsiao's work was based on the concept of the *fungible* nature of wRVUs, that is, "a work RVU is a work RVU," and that one rendering of a medical service was eminently interchangeable and replaceable by another. The application of this supposition of the *fungibility* of medical services into the RVRBS payment model for the Medicare reimbursement system is considered to be a pivotal advancement toward the *commoditization* of healthcare. For more information on the *commoditization of healthcare*, see Section 4.6.3, "Commoditization of Healthcare," in Chapter 4, "Competition."

2.4.1.3.2.2 Practice Expense Component The *practice expense RVU* (PE RVU) is based on the costs that are incurred in the provision of a medical service, for example, overhead for the practice, including, but not limited to, the costs associated with (1) office space (occupation cost), (2) medical and nonmedical supplies, (3) equipment and furniture, and (4) nonphysician

[218]William C. Hsiao et al., "Results and Impacts of the Resource-Based Relative Value Scale," *Medicare Care* 30, no.11 (November 1992): NS64.

[219]Ibid.

clinical and administrative staff.[220] Originally, in Hsiao's RBRVU study, the PE RVU was constructed based on a *practice cost index* (PCI), established by calculating physician practice costs as a percentage of physician gross revenues using two sources: (1) the AMA's *Socioeconomic Monitoring System Survey* (SMS), and (2) the *Physician Cost Income Survey*.[221] Today, the PE RVU is calculated using modern versions of the previously listed surveys, including the AMA's *Practice Information Survey* (PPIS) and various specialty-specific practice expense surveys, for example, *medical oncology supplemental survey data* and supplemental survey data from the *National Coalition of Quality Diagnostic Imaging Services* (NCQDIS).[222] However, the methodology used for the PE RVU calculation has changed.

[220] John Proctor, ACEP Reimbursement Committee, "Gauging Emergency Physician Productivity: Are RVUs the Answer?" posted on American College of Emergency Physicians, http://www.acep.org/practres.aspx?id=30306 (accessed August 14, 2012); "Introduction to Relative Value Units (RVUs) and How Medicare Reimbursement Is Calculated," American Colleges of Radiation Oncology, 2009, http://www.acro.org/washington/RVU.pdf (accessed May 1, 2009); Medicare Payment Advisory Committee, "Physician and Other Health Professionals Payment System," *MedPAC Payment Basics* (October 2011), pp. 1–2, http://medpac.gov/documents/MedPAC_Payment_Basics_11_Physician.pdf (accessed August 14, 2012).

[221] The AMA's Socioeconomic Monitoring System Survey was published annually, from 1981 to 1999, and collected data regarding physician earnings, expenses, work patterns, and fees. This survey was used to calculate PE RVU until 2010, when it was determined to be too outdated and was replaced with the AMA Practice Information Survey. "Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule, and Other Part B Payment Policies for CY 2008; Revisions to the Payment Policies of Ambulance Services Under the Ambulance Fee Schedule for CY 2008; and the Amendment of the E-Prescribing Exemption for Computer Generated Facsimile Transmissions: Final Rule," *Federal Register* 72, no. 227 (November 27, 2008): 66228. The Physician Cost Income Survey was conducted by the National Opinion Research Center and published by CMS to provide benchmarks for physician practice costs, as well as other income and practice information. William C. Hsiao, et al., "A National Study of Resource-Based Relative Value Scales for Physician Services," Cambridge, MA, 1988, pp. 623, 625; Centers for Medicare and Medicaid, "Medicare Program; Payment Policies Under the Physician Fee Schedule, Five-Year Review of Work Relative Value Units, Clinical Laboratory Fee Schedule: Signature on Requisition, and Other Revisions to Part B for CY 2012: Final Rule with Comment Period," *Federal Register* 76, no. 228 (November 28, 2011): 73036.

[222] The calculation of the PE RVU started using the AMA Practice Information Survey in 2010. This survey was conducted in 2007 and 2008 and includes physician and nonphysician practitioners. Centers for Medicare and Medicaid, "Medicare Program; Payment Policies Under the Physician Fee Schedule, Five-Year Review of Work Relative Value Units, Clinical Laboratory Fee Schedule: Signature on Requisition, and Other Revisions to Part B for CY 2012: Final Rule with Comment Period," *Federal Register* 76, no. 228 (November 28, 2011): 73036.

The PE RVU is calculated using a *bottom-up methodology*, in which *direct costs*, that is, costs that *can* be assigned, such as the cost of supplies, are *calculated* based on costs associated with the CPT codes for a given service, while *indirect costs*, in other words, costs that *cannot* be assigned but exist as a cost of owning a practice, for example, the expense burden related to a patient waiting room, are *allocated,* based on the surveys listed earlier.[223] The *bottom-up methodology* for calculating PE RVU was phased in, with the PE RVU being weighted at 25 percent in 2007, 50 percent in 2008, 75 percent in 2009, and 100 percent (i.e., full implementation) in 2010.[224]

The calculation of the PE RVU is dependent on the site of services, that is, a *facility setting* (e.g., a hospital) or a *non-facility setting* (e.g., a freestanding center), due to differences between the two types of sites of service, in the cost of operation. The assumption is that the practice expense incurred by a physician working at a hospital will likely be lower than that incurred by a physician practicing at a physician practice or a freestanding ASC.[225] The formula to calculate PE RVU for each site of service is set forth in Exhibit 2.11.[226]

---

[223] American Colleges of Radiation Oncology, "Introduction to Relative Value Units (RVUs) and How Medicare Reimbursement Is Calculated," 2009, http://www.acro.org/washington/RVU.pdf (accessed April 1, 2009); Centers for Medicare and Medicaid, "Medicare Program; Payment Policies Under the Physician Fee Schedule, Five-Year Review of Work Relative Value Units, Clinical Laboratory Fee Schedule: Signature on Requisition, and Other Revisions to Part B for CY 2012: Final Rule with Comment Period," *Federal Register* 76, no. 228 (November 28, 2011): 73035–73036.

[224] Prior to 2007 and phased out from 2007 to 2009, the PE RVU was calculated by adjusting data from the AMA Socioeconomic Monitoring System Survey to 2005, based on six categories: (1) clinical payroll expenses, (2) administrative payroll expenses, (3) office expenses, (4) medical material and supply expenses, (5) medical equipment expenses, and (6) all other expenses. The PE RVU is found by multiplying the specialty specific practice expense amount per hour, determined from the AMA survey and specialty survey data, by a specialty specific indirect percentage factor, and then scaled based on the percentage of clinical labor costs associated with the given service. "Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule, and Other Part B Payment Policies for CY 2008; Revisions to the Payment Policies of Ambulance Services Under the Ambulance Fee Schedule for CY 2008; and the Amendment of the E-Prescribing Exemption for Computer Generated Facsimile Transmissions: Final Rule," *Federal Register* 72, no. 227 (November 27, 2008): 66228–66229.

[226] Ibid.

Key

RVU = Relative Value Unit
w = Work
PE = Practice Expense
MP = Malpractice
GPCI = Geographic Price Index
CF = Conversion Factor

Facility Payment Amount:

Payment = [(wRVU × wGPCI) + (*Facility* PE RVU × PE GPCI) + (MP RVU × MP GPCI)] × [*CF adjusted for budget neutrality*]

Non-Facility Payment Amount:

Payment = [(wRVU × wGPCI) + (*Non-Facility* PE RVU × PE GPCI) + (MP RVU × MP GPCI)] × [*CF adjusted for budget neutrality*]

EXHIBIT 2.11 PE RVU Calculation

When a service is billed by a *non-facility*, the PE RVU compensates the physician for the costs of owning and operating a practice. However, when a service is billed by the *facility*, the costs associated with clinical personnel, equipment, and supplies are incurred by the *facility*, not by the *physician*.[227] Therefore, nonfacility PE RVUs are typically higher than *facility* PE RVUs.

2.4.1.3.2.3 Malpractice Expense Component The costs associated with malpractice insurance were not included in Hsiao's original RBRVS study.[228] From 1992, when the RBRVS was initially implemented, to 2000, a malpractice adjustment was included in the RBRVS; however, it was *charge-based*, that is, calculated based on *weighted specialty-specific malpractice expense percentages* and Medicare *allowable charges*.[229] Resource-based *malpractice* RVUs (MP RVU), also referred to as *professional liability insurance*

[227] Sarah E. Johnson and Warren P. Newton, "Resource-Based Relative Value Units: A Primer for Academic Family Physicians," *Family Medicine* (March 2002): 174, http://www.stfm.org/fmhub/fm2002/mar02/sa1.pdf (accessed April 1, 2009); National Health Policy Forum, "The Basics: Relative Value Units (RVUS)," George Washington University, February 2009, http://www.nhpf.org/library/the-basics/Basics_RVUs_02-12-09.pdf (accessed April 1, 2009).

[229] "Malpractice Relative Value Unit," *Federal Register* 75, no. 228 (November 29, 2010): 73208.

RVU (pli RVU), were added into the RBRVS calculation in 2000, under §1848(c), *Payment for Physician Services,* of the Social Security Act.[230]

MP RVUs correspond to the relative *malpractice practice expense* for medical procedures.[231] These values are updated at least every five years and typically make up the smallest component of the MPFS payment calculation for a given service.[232] MP RVUs are calculated based on national malpractice insurance premium data collected from commercial and physician-owned payors. In its 2010 review of RVUs, CMS adjusted each MP RVU for a given procedure by the same percentage difference between the *pre-review* RVU amount and the *post-review* RVU amount for the greater of either (1) the *wRVU*, or (2) the *clinical labor portion of the PE RVU*.[233] These revised MP RVUs were implemented in the 2012 MPFS.[234] Due to the variation in *malpractice costs* among states and specialties, the *malpractice component* must be weighted *geographically* and across *specialties*.[235]

2.4.1.3.2.4 Geographic Practice Cost Index (GPCI) The *Geographic Practice Cost Index* (*GPCI*) accounts for the geographic differences in the costs of providing healthcare services across the country. Every *Medicare payment locality* has a distinct GPCI for each of the *work*, *practice expense*, and *malpractice* components of the RBRVS.[236] A locality's GPCI is determined

by taking into consideration the median cost of (1) hourly earnings of workers in the area, (2) office rents, (3) medical equipment and supply costs, and, (4) other miscellaneous expenses.[237] As of 2012, there were 89 GPCI payment localities, which have not been revised since 1997.[238]

2.4.1.3.2.5 Conversion Factor The *conversion factor* (*CF*) is a monetary amount that is multiplied by the composite RVU from a specific locality to determine the dollar amount to reimburse for a given service.[239] Originally, there were three conversion factors: (1) *surgical*, (2) *specialty*, and (3) *primary care* services. Many believed that the three CF system facilitated disparities between *procedure-oriented* and *E/M services*, and, in 1998, a *universal conversion factor* was implemented.[240] Today, all physician services, except anesthesia services, use a single CF.[241]

The CF is updated yearly as part of the annual MPFS update done by CMS. Changes to the CF are based on an update formula, mandated in the *Balanced Budget Act of 1997*, which takes into account (1) the previous year's *conversion factor*; (2) the estimated percentage increase in the *Medicare Economic Index* (*MEI*) for the year, which accounts for inflationary changes in office expenses and physician earnings; and (3) an *update adjustment factor.*[242] The balanced budget act also replaced the *Medicare Volume Performance Standard* (MVPS) with the *Sustainable Growth Rate* (SGR)

[242] The Medicare Economic Index (MEI) is a measure of practice cost inflation that acts as a base for updates to the physician fee schedule. The MEI is multiplied by an adjustment factor established by the SGR to determine the final update to the physician fee schedule. The MEI is also used to determine the price component of the SGR formula. David O. Barbe, *Improving the Medicare Economic Index*, Report of the Council on Medicare Service, CMS Report 6-I-08, 2008, p. 2; Pam Carron and Nicole T. Stone, *2009 Master Medicare Guide* (Chicago: CCH, 2009), p. 901; "Payment for Physicians' Services," Social Security Act § 1848(d)(3), 42 U.S.C. § 1395w-4.

as the determinant of the *update adjustment factor*, implementing the new formula in 1998.[243]

2.4.1.3.2.6 The Sustainable Growth Rate—a Continuing Saga The SGR represents a spending target for the total annual expenditures on Medicare Part B services. The concept addresses the circumstance under which providers might compensate for reduced reimbursement payments per procedure by increasing the volume of procedures they perform and bill for. Annual adjustments are made to the MPFS based on whether actual spending was above or below the set target.[244] If actual spending is above the target, payment rates are adjusted down; likewise, if actual spending is below the target, payment update rates are adjusted up.[245] In this manner, the SGR serves as a "governor" toward restraining the growth of expansion to a "sustainable growth rate."[246]

The calculation of SGR relies on four factors:

1. "The estimated percentage change in fees for physicians' services;
2. The estimated percentage change in the average number of Medicare fee-for-service beneficiaries;
3. The estimated 10-year average annual percentage change in real GDP per capita; and,
4. The estimated percentage change in expenditures due to changes in law or regulations."[247]

The purpose of instituting the SGR formula was twofold: (1) to ensure patient *access* to physician services, and (2) to predictably *control federal*

[243] The SGR is used to calculate the conversion factor, which is used to calculate physician fee schedule updates. Centers for Medicare and Medicaid Services, "Medicare Program; Physician Fee Schedule Conversion Factor for Calendar Year 1998 and Sustainable Growth Rate for Fiscal Year 1998: Final Notice," *Federal Register* 62, no. 211 (October 31, 1997): 59261.

[244] Congressional Budget Office, "The Sustainable Growth Rate Formula for Setting Medicare's Physician Payment Rates," Economic and Budget Issue Brief, September 6, 2006, http://www.cbo.gov/ftpdocs/75xx/doc7542/09-07-SGR-brief.pdf (accessed October 9, 2009), pp. 2, 4–5.

[245] Ibid.

[246] A governor, in the mechanical sense of the term (e.g., as applied to internal combustion engines), is a device for maintaining a desired uniform speed, regardless of changes of load, by regulating the supply of fuel in a manner that prevents the engine from speeding out of control.

[247] Centers for Medicare & Medicaid Services, "Estimated Sustainable Growth Rate and Conversion Factor, for Medicare Payments to Physicians in 2013," 2012, p. 1.

spending on Medicare part B.[248] As a result of significant increases in per-beneficiary expenditures, the designed aims of the SGR have fallen short.[249]

The SGR formula has indicated downward adjustments to the MPFS every year since 2002. However, in what has become an almost ritual, annual response to intense pressure from providers and advocates for the Medicare population (for example, AARP, formerly the *American Association of Retired Persons*), Congress has consistently, since 2003, intervened and, often with "*Horatio-at-the-bridge*" style brinkmanship, stepped in at the last moment to override the mandated MPFS decreases to the MPFS, typically replacing scheduled cuts with increases in payment.[250] This repeated ad hoc congressional action to maintain physician payments at acceptable rates has incited an intense national debate.

The annual mandated changes to the SGR, the CF, the *Physician Fee Schedule*, and the actual changes to the *Physician Fee Schedule* (post-congressional action), from 1998 to 2012, as well as the scheduled 2013 adjustment that Congress has yet to address, are set forth in Table 2.8.

Of note is that the SGR (Column B) is used to determine the conversion factor (Column C), which is then used in the calculation of the physician fee schedule update under the CMS Final Rule (Column D); however, congressional actions forgo these calculations and simply established a physician fee schedule update (Column E).

Each time Congress offers legislative relief from pending SGR reimbursement cuts for Medicare providers (the "doc-fix"), the consequence is the requirement for billions in federal budget offsets.[251]

Footnote (*continued*)

Medical provider groups, including the AMA and the AHA, have repeatedly asked Congress for a "permanent solution" for physician payments under the SGR formula.[279] The AMA has recommended a *three-pronged approach* that includes (1) repealing the SGR, (2) incorporating positive payment updates based on the MEI for a five-year period, and (3) testing and transitioning to alternative payment models focused on cost, coordination, quality, and appropriateness of care.[280] The physician payment models referenced in the AMA proposal included (1) *partial capitation*, (2) *virtual partial capitation*, (3) *condition-specific capitation*, (4) *accountable medical home*, (5) *inpatient care warranties*, (6) *mentoring programs*, and (7) *private contracting*.[281]

On September 15, 2011, MedPAC suggested completely *repealing* the SGR, funded by cuts to provider reimbursement and increases in beneficiary costs, to be shared by "physicians, other health care professionals, providers in other sectors, and beneficiaries."[282] The MedPAC proposal estimates that the total cost of repealing the SGR would approach $300 billion. MedPAC's controversial SGR fix proposes to *freeze* payments *to primary care physicians* for 10 years and reduce payments to *specialists* by 17 percent during the first 3 years before freezing payments for the remaining seven years.[283] Many advocacy groups that support the repeal of the SGR were critical of the MedPAC proposal.

[283] Ibid.

In October 2011, the AMA, joining with 42 other professional associations and societies, sent a highly critical letter to MedPAC, which stated that the September 15 proposal "retains many of the SGR's flaws, undermines physicians' ability to participate in payment and delivery reforms, and calls for payment rates that the Commission itself has previously said could reduce Medicare beneficiaries' access to medical care."[284] The letter argued that the MedPAC proposed cuts would *threaten physician incomes* and the *capacity of physicians* to retain staff and provide services to Medicare beneficiaries. The letter also noted that due to the rising shortage of physicians, confounded by the aging baby boomer population, the proposed changes to the SGR will likely intensify existing threats to the healthcare delivery system and could stifle physician interest in new payment models, such as ACOs and other shared savings programs.[285]

Virginia L. Hood, president of American College of Physicians (ACP), stated in a September 2011 letter to Congress that "Each time that Congress postpones enactment of a permanent solution, the budget [cost] of a permanent solution to the SGR increases."[286] The ACP noted that temporary fixes only increase the inevitable cost associated with ultimately repealing the SGR. Projections estimate that by 2016, repealing the SGR could cost $600 billion, double the cost of repealing the SGR now.[287] To date, there has been no consensus regarding a long-term solution to the SGR or its possibly imminent repeal. As a result, the Medicare program may face significant financial challenges over the coming years as a result of constant SGR doc-fixes.

With the current threat from the SGR of pending physician payment cuts of 27 percent looming in 2013, *physician advocacy groups* have once again implored Congress to take *permanent action*, echoing the ACP's 2011 plea: "The status quo is unsustainable, and will do considerable harm to the Medicare program as well as the broader health care delivery system."[288] For more information on the SGR debate and its impact on medical revenues, see Section 6.3.4, "Shifting Reimbursement Trends," in Chapter 6, "Healthcare Reform."

Boehner, Speaker of the U.S. House of Representatives, and Nancy Pelosi, Democratic Leader of the U.S. House of Representatives, September 12, 2012.

The concerns of physician advocates regarding the scheduled 2013 physician payment cuts stem beyond the current SGR debate, since in 2012, the *Office of Management and Budget* (OMB), as advised by Congress, announced a plan that would cut Medicare funding by $11 billion over the next decade.[289] In response to the *Sequestration Transparency Act of 2012* (STA), which requires the production of a report on potential presidentially mandated cuts to federal programs if the *Joint Selection Committee on Deficit Reduction* fails to reduce the federal deficit by $1.5 trillion (which the committee failed to accomplish by the November 23, 2011 deadline), Congress has proposed a 2 percent cut to the Medicare budget, that is, $43 billion, for fiscal year 2013.[290]

2.4.1.3.2.7 AMA/Specialty Society Relative Value Scale Update Committee RVUs are updated annually by CMS and the AMA, who often rely on the analysis of the *AMA/Specialty Society Relative Value Scale Update Committee (RUC)*.[291] The *RUC* is a somewhat controversial panel of 29 physicians from different specialties who recommend updates to various RVUs under the *Physician Fee Schedule* to CMS.[292] Of the 29 physicians making up the RUC, 23 physicians represent the following major medical specialties: *anesthesiology*, *cardiology*, *colon and rectal surgery,* dermatology*, *emergency medicine*,

[293] An * indicates rotating seats.

[294] The RUC chair is appointed by the AMA Board of Trustees. Karen L. Hagerty, "How a Code Becomes a Code," American Society of Clinical Oncology, http://www.iom.edu/~/media/Files/Activity%20Files/Disease/NCPF/2011-Mar-21-Implementation-Workshop/Hagerty%20Presentation.pdf (accessed September 18, 2012). The RUC Health Care Professionals Advisory Committee Review Board is composed of three RUC Health Care Professionals Advisory Committee members, one of which is appointed to the position of co-chair by the RUC Health Care Professionals Advisory Committee, which is composed of limited license practitioners, including "physician assistants, chiropractors, nurses, occupational therapists, optometrists, physical therapists, podiatrists, psychologists, audiologists, speech pathologists, social workers and registered dieticians." American Medical Association, "AMA/Specialty Society: RVS Update Process," 2004, http://www.hrsonline.org/Policy/CodingReimbursement/resources/upload/2004_RVS_booklet-3.pdf (accessed September 18, 2012). The chair of the Practice Expense Review Board is appointed by the AMA House of Delegates to "participate and monitor all phases of the refinement of the new practice expense relative values and continue to advocate that they be based on valid physician practice expense data." American Medical Association, "AMA/Specialty Society: RVS Update Process," 2004, http://www.hrsonline.org/Policy/CodingReimbursement/resources/upload/2004_RVS_booklet-3.pdf (accessed September 18, 2012). The CPT Editorial Panel reviews suggestions from medical specialty societies, individual physicians, hospitals, third-party payers, and other interested parties, through coding change request (CCR) forms. Those suggestions agreed with by the editorial panel are referred to the RUC. The panel is a part of the CPT Advisory Committee. Of its 17 members, 11 are physicians nominated by National Medical Specialty Societies; 4 represent the Blue Cross Blue Shield Association (BCBSA), AHA, the American Health Insurance Plans (AHIP), CMS; and 2 are from the Health Care Professionals Advisory Committee. Karen L. Hagerty, "How a Code Becomes a Code," American Society of Clinical Oncology, http://www.iom.edu/~/media/Files/Activity%20Files/Disease/NCPF/2011-Mar-21-Implementation-Workshop/Hagerty%20Presentation.pdf (accessed September 18, 2012); American Medical Association, "The Resource Based Relative Value Scale: The RVS Update Committee," 2010, http://www.ama-assn.org/ama/pub/physician-resources/solutions-managing-your-practice/coding-billing-insurance/medicare/the-resource-based-relative-value-scale/the-rvs-update-committee.shtml (accessed November 19, 2010).

The panel convenes three times per year to discuss and make recommendations regarding a multitude of medical and surgical procedures.[295] In addition, the RUC houses various advisory committees and workgroups responsible for participating in the decision-making process, handling procedural maintenance, and developing and refining RUC and relative value methodology.[296] The RUC recommendation process begins with a proposed list of the new and revised CPT codes. Members of the *RUC Advisory Boards* complete a survey, distributed by the AMA, which amasses information regarding how physician members view the work associated with a specific service and suggested revisions to the RVUs associated with the listed CPT codes.[297] From the collected surveys, the RUC may (1) adopt the advisory board's recommendation, (2) refer it back to the specialty society, or (3) modify the recommendation.[298] When the process is complete, the RUC submits its recommendations to CMS.

Recently, there has been controversy surrounding the RUC's level of impartiality and the extent to which CMS relies on its recommendations.[299] During the last seven years, CMS approved increases in physician wRVUs by an average of 22 percent, while actual physician-reported work times declined 8.4 percent.[300] Critics of the RUC process have suggested that CMS gives the RUC too much influence in the RBRVS decision-making process. Historically, CMS has followed 90 percent of the recommendations provided by the RUC regarding physician reimbursements, basing at least 20 percent of physician payments on RUC recommendations.[301]

The RUC is Not . . . ," American Medical Association, Chicago, June 16, 2007.

RUC challengers have also noted that the RUC has facilitated disparities between specialty and primary reimbursement rates. The majority of RUC members are selected by medical-specialty trade groups, whose financial interests may incentivize increasing Medicare reimbursements rates for certain procedures used by specialty physicians. Critics have noted the RUC's reluctance to suggest increases to wRVUs for E/M services heavily used by primary care.[302] To amend the current RUC membership, primary care physicians are lobbying for more representation in the RUC. The *American Academy of Family Physicians* (AAFP), the most vocal opponent to the RUC, wrote to CMS urging it to follow a 2006 MedPAC Advisory Report to Congress, which suggested lowering reliance on the RUC by forming a group of less financially invested experts to identify overvalued services and work with the RUC to increase transparency and encourage provider efficiency.[303]

Although the RUC has claimed to have increased the use of evaluation strategies that led to "*over-reimbursements*" for certain specialties and formed an internal workgroup to identify misvalued services (due to pressures from MedPAC), the *Government Accountability Office* (GAO) in 2009 downplayed their efforts, saying that they did not focus on services that accounted for the largest Medicare payouts.[304] The GAO report also suggested that CMS should ensure that physician fees reflect efficiencies occurring through integrated care.[305] CMS officials have reported that they would be hard-pressed to replace the RUC process; however, in response to criticism, CMS has reported proposed plans to establish more extensive validation processes, to lessen disparities and overpayments and to incentivize integrated care.[306]

[306] Joe Eaton, "Little-Known AMA Group Has Big Influence on Medicare Payments," *Kaiser Health News*, October 27, 2010; Barbara S. Levy, "AMA/Specialty Society RVU Update Committee (RUC)," American Medical Association, March 5, 2010, p. 34.

2.4.1.3.3 CMS Anti-Markup Rule If a provider or a supplier orders a diagnostic test from a subcontracted provider or supplier, he may bill Medicare for the *technical component* of that diagnostic test, even though he did not perform the *technical component* himself.[307] However, CMS prohibits the billing provider from submitting a bill for an amount above what the billing provider paid for the test, that is, at a *markup*.[308] The 2008 MPFS Final Rule expanded the *anti-markup rule* to include submitted claims for both *professional* and *technical component revenue* generated by tests performed outside the office of the billing physician.[309] The *anti-markup rule* applies to the *technical* and *professional* component of a diagnostic service if either is "*(i) [p]urchased from an outside supplier; or (ii) performed or supervised by a physician who does not share a practice with the billing physician or other supplier.*"[310] Of note, if both the *professional component* and the *technical component* are performed in the same practice, rather than the *technical component* being performed at a separate diagnostic testing facility, then the *anti-markup rule* does not apply.[311]

The 2009 MPFS Final Rule lessened the rigidity of the *anti-markup rule* by incorporating two exceptions for situations where:

1. The diagnostic service is performed by a physician who performs "*substantially all*" (i.e., 75 percent or more) of his professional services for the billing physician, physician organization, or supplier; or
2. The diagnostic service is conducted and supervised in the "*same building*" where the medical office of the ordering physician or authorized nonphysician provider is located.

[310]"Changes to Reassignment Rules Related to Diagnostic Tests (Anti-Markup Provisions)," in "Medicare Program; Payment Policies Under the Physician Fee Schedule and Other Revisions to Part B for CY 2009: Final Rule with Comment Period," *Federal Register* 224, no. 73 (November 19, 2008): 69799.

[311]Thomas W. Greeson and Heather M. Zimmerman, "CMS 2008 Rulemaking Focuses on Curbing Self-Referral Imaging," *American Journal of Roentgenology* 190 (February 2008): 277–278, http://www.ajronline.org/cgi/reprint/190/2/275.pdf (accessed September 15, 2009).

According to CMS, each of these scenarios creates a "*sufficient nexus*" between the performing provider and the billing provider to alleviate the need to apply the *anti-markup rule.*[312]

2.4.1.3.4 Quality Limitations on Medicare Reimbursement To improve quality and limit costs in the healthcare delivery system, Medicare will not reimburse for those treatments that contribute to unnecessary cost and waste, in other words, those events that may indicate poor-quality care, referred to as *never events* and *sentinel events.*[313]

The *National Quality Forum* (*NQF*), a not-for-profit national coalition of physicians, hospitals, businesses, and policy-makers, has identified 28 events as occurrences that should "never" happen in a hospital and can be prevented. These occurrences are termed *serious reportable events,* or "*never events*," and include (1) *surgical events*, for example, performing the wrong surgical procedure; (2) *product or device events*, such as contaminated drugs or devices; and (3) *criminal events*, such as the abduction of a patient.[314]

The Joint Commission defines a *sentinel event* as an unexpected occurrence involving *death* or *serious physical* or *psychological injury*, or *the risk thereof.* For example, *serious injury* specifically refers to the loss of limb or function. The phrase "or the risk thereof" includes any *process variation* for which an occurrence would result in a significant chance of a serious adverse outcome. *The Joint Commission* reviews an organization's activities

[313]A focus on quality in healthcare is, in part, a response to the Institute of Medicine, in its landmark study "To Err Is Human," which stated that at least 44,000 people, and perhaps as many as 98,000 people, die in hospitals each year as a result of medical errors that could have been prevented. Furthermore, the study indicated that medical errors in hospitals (including the expense of additional care necessitated by the errors, lost income and household productivity, and disability) have been estimated to result in total costs of between $17 billion and $29 billion per year. "To Err is Human: Building a Safer Health System," Institute of Medicine, November 1999, http://www.iom.edu/~/media/Files/Report%20Files/1999/To-Err-is-Human/To%20Err%20is%20Human%201999%20%20report%20brief.pdf (accessed February 8, 2011).

in response to *sentinel events* in its accreditation process, including all full accreditation and random unannounced surveys and, as appropriate, for-cause surveys.

Similar to *never events*, *Healthcare Associated Infections* (HAIs) have been identified as a contributor to waste and unnecessary cost in the healthcare delivery system.[315] In their *National Action Plan to Prevent Healthcare-Associated Infections*, HHS, the *Centers for Disease Control and Prevention* (CDC), and many other agencies, estimated that 1 in every 20 hospital inpatients will develop an HAI, leading to $28 to $33 billion in preventable healthcare expenditures.[316] The costs associated with HAIs have been characterized as having a profound impact on the Medicare budget, and on October 1, 2008, CMS implemented a new policy to adjust reimbursement amounts so as not to include payment for services linked to HAIs that were not *present on admission* (POA) of a patient.[317]

To promote high-quality care and transparency in an era of increasing consumer awareness, CMS publishes statistics regarding *never* and

Factoid

In its landmark study *To Err Is Human*, the Institute of Medicine estimated that medical errors in hospitals result in total costs of between $17 billion and $29 billion per year.

Stone, "Changes in Medicare Reimbursement for Hospital-Acquired Conditions including Infections," *American Journal of Infection Control* 37 (2009): 17A.

sentinel events for every hospital that provides services to Medicare beneficiaries. These findings are included in the information made publicly available on CMS's hospital compare website. For more information on the evolution of consumer-driven healthcare, see Chapter 4, "Competition."

In more recent years, Medicare has also limited reimbursement for patients who are readmitted within 30 days of discharge, which circumstances might suggest poor-quality care or poor communication of post-discharge requirements from providers. Furthermore, §3025 of the ACA, the *Hospital Readmissions Reduction Program*, requires that an adjustment factor be added to the IPPS for hospitals with excessive readmissions, effective October 1, 2012.[318]

2.4.1.4 Medicare Allowable Charge: Participation versus Nonparticipation As mentioned earlier, providers who offer services to Medicare patients must choose whether to participate in the Medicare program. While nonparticipation does not bar reimbursement payments from Medicare, the amount reimbursed is significantly limited. There are three scenarios under which providers may submit claims to CMS for reimbursement under the Medicare program: (1) *participation*, (2) *nonparticipation*, and (3) *private contracting*.

2.4.1.4.1 Participation In 2011, approximately 96 percent of all physicians billing Medicare were *participating providers* (PAR).[319] PAR physicians have entered into an assumed contractual agreement with CMS to accept the Medicare *allowable fee* for a given procedure and cannot charge above that amount. The benefit of *participation*, however, is that providers are guaranteed 80 percent of the *allowable charge* as payment for services, in contrast to *nonparticipating providers*, who may charge for only a *portion* of the *allowable fee* and are reimbursed at a *portion* of the 80 percent reimbursement rate. The smaller amount that *nonparticipating providers* are allowed to charge is known as the *limiting charge rule*.[320] CMS has

[320] Pamela K. Carron and Nicole T. Stone, eds., *CCH Medicare Explained: §826* (Chicago: CCH, 2012), pp. 412–413.

Participating Provider

A participating provider is one who has agreed to accept the reimbursement amount set by the Medicare Fee Schedule as payment in full for every claim. The physician may bill the patient for his or her share of the coinsurance and the deductible, but the physician cannot balance bill the patient, (i.e., attempt to collect the difference between his or her usual fee and Medicare's lower allowed charge).

"Medicare," in From Patient to Payment: Insurance Procedures for the Medicaid Office*, 3d ed., by Cynthia Newby (Columbus, OH: Glencoe/McGraw-Hill, 2002), p. 142; "Medicare," in* Understanding Health Insurance: A Guide to Billing and Reimbursement*, 9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton, NY: Delmar Cengage Learning, 2008), p. 437.*

developed special incentives to encourage physicians to enter into PAR agreements, including:

1. Inclusion into an annually published PAR directory and toll-free telephone registry for Medicare patients;
2. Faster electronic claim submission to Medicare contractors;
3. Participation certificates for public display in-office;
4. A 5 percent higher fee schedule than for nonparticipating providers; and,
5. Freedom from the *limiting charge rule*.[321]

Factoid

In 2011, approximately 96 percent of all physicians billing Medicare were participating providers.

"Table VI.6: Medicare Participating Physician Program," in "Centers for Medicare and Medicaid Services Data Compendium" CMS/OFM, December 2011, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/DataCompendium/2011_Data_Compendium.html (accessed August 6, 2012).

[321] Pamela K. Carron and Nicole T. Stone, eds., *CCH Medicare Explained: ¶870* (Chicago: CCH, 2012), p. 426.

Of note, when a PAR bills Medicare for reimbursement, the difference between what the provider would normally *charge* for the service and the *Medicare allowable fee* is written off by the PAR.[322] Furthermore, while 80 percent of the allowable fee is paid by CMS, the other 20 percent is billed to the Medicare beneficiary or the beneficiary's secondary insurance, for example, *Medigap* (discussed later).

2.4.1.4.2 Nonparticipating Providers *Nonparticipating providers* (*non*-PARs) may still see Medicare patients; however, they must choose (1) to agree to accept the Medicare reimbursement amount on a claim-by-claim basis, or (2) to fully reject the Medicare program. Each option presents a different amount of reimbursement that the *non*PAR may receive. *Non*PARs that choose to accept Medicare assignment on a claim-by-claim basis must agree to the following criteria:

1. File all Medicare claims;
2. Restrict their fees for nonassigned claims in accordance with the aforementioned *limiting charge*;
3. Forgo balance billing patients;
4. Collect only the patient deductible and coinsurance amounts at the time of service when accepting assignment on a claim;

Nonparticipating Provider

Nonparticipating providers are providers that have not agreed to accept the Medicare reimbursement amount for every claim. Yet nonparticipating providers are allowed to accept Medicare assignment on a claim-by-claim basis, if they agree to certain conditions. However, it should be noted that even though they have not accepted Medicare's fee as payment in full, nonparticipating providers are subject to a "*limiting charge*," which dictates what they may charge Medicare beneficiaries for covered services.

"*Medicare*," *in* Understanding Health Insurance: A Guide to Billing and Reimbursement, *9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton Park, NY: Delmar Cengage Learning, 2008), p. 437.*

[322] Pamela K. Carron and Nicole T. Stone, eds., *CCH Medicare Explained: §826* (Chicago: CCH, 2012), p. 412.

5. Require patients to sign a "*Surgical Disclosure Notice"* when charges for nonassigned surgical fees exceed $500; and
6. Accept assignment on clinical laboratory charges.[323]

All *non*PARs are subject to a *limiting charge,* which dictates what they may charge Medicare beneficiaries for covered services, specifically 5 percent less than the allowable fee that PARs are paid for similar services.[324]

A *non*PAR may also treat Medicare patients without accepting any Medicare assignment, that is, *full rejection of the Medicare program*. When a *non*PAR decides not to *accept assignment* on a particular claim, he or she may charge only a maximum of 15 percent above the *non*PAR fee.[325] Furthermore, when a provider does not accept Medicare claim assignments, Medicare will only reimburse the patient. Therefore, the provider must collect the entire charge of the service from the patient. The financial benefits a *non*PAR may receive from charging more than the Medicare allowable fee is often offset by the increased risk that the *non*PAR assumes from the potential that patients will not pay their bills.

The varying reimbursement amounts for different levels of participation in the Medicare program are illustrated in Table 2.9.

2.4.1.4.3 Private Contracting Under the *Balanced Budget Act of 1997*, providers and patients may opt to privately contract for the payment of services, outside the guidelines of the Medicare program. To employ this option, providers must fully opt out of the Medicare program for a *minimum of two years* and may not implement private contracting on a case-by-case basis, that is, within the two-year time period providers are not allowed to submit any claims to Medicare for reimbursement. To opt out, providers must file an affidavit with their specific CMS carrier that meets certain requirements, including (1) a signed statement by the provider agreeing to forgo all Medicare payments for two years, (2) a statement that Medicare will not pay for any of the contracted services, (3) the contract must be in writing and signed by the beneficiary, (4) the contract cannot be entered into while the beneficiary is undergoing emergency treatment or treatment for urgent conditions, and (5) the beneficiary must sign and agree (a) not to

Amount Covered by Medicare	80%	$80	80%	$76	80% of NonPAR	$76 to patient
Amount Covered by Patient or Secondary Insurance	20%	$20	20%	$19	20% of NonPAR + 15% fee over Medicare	$33.25 once receive Medicare payment
Amount Subject to Being *Written off* by Provider (Service Charge—Allowable Fee)	15%	$10	15% (If not billed to patient)	$15 (If not billed to patient)	N/A	$0 if patient pays ($110 if not)

bill Medicare, (b) that they understand that they are forgoing Medicare payments, (c) that they understand that supplemental federal insurance (e.g., *Medigap*) will not apply toward services, and (d) that they understand that they may seek Medicare-covered services from alternative providers.[326]

Medigap Coverage *Medigap*, also known as *Medicare supplement insurance*, is designed to cover the "*gaps*" in Medicare coverage created from the percentage of the *allowable charge* remaining after Medicare reimburses a provider (e.g., 20 percent of the allowable charge for services provided by PAR providers).[327] Although *Medigap* insurance is offered by private

insurance companies, it is regulated by federal and state agencies. Beginning in 1991, insurance companies seeking to offer *Medigap* coverage must conform to a minimum set of standards established by the *National Association of Insurance Commissioners* (NAIC), which sets forth various plan models. From 1991 to 2005, NAIC presented 10 model plans for *Medigap* coverage. This number was expanded to 12 plans under the *Medicare Modernization Act of 2003*; however, *Medigap* drug benefits were removed from all new plans. Section 3210 of the ACA requires that the NAIC review the standards set for C and F plans toward including a cost-sharing component to encourage the appropriate use of Medicare Part B (Outpatient) services.[328]

Unlike traditional Medicare coverage, beneficiaries are responsible for premiums under *Medigap* plans. These premium costs to patients have risen 3.8 percent from 2001 to 2010.[329] Approximately 20 percent of Medicare beneficiaries (9.6 million individuals) were enrolled in a *Medigap* plan in 2010.[330] The premium cost varies by plan type and state; however, the rate of growth for premium costs is correlated to state trends in Medicare spending per beneficiary.[331] Medicare beneficiaries who are enrolled in *Medicare Advantage* plans already operated by private insurance companies are not eligible for *Medigap* coverage. As such, increases in *Medicare Advantage* enrollment often coincide with reduced growth in *Medigap* premiums.[332]

2.4.2 Medicaid and CHIP

2.4.2.1 Medicaid Overview *Medicaid* is a state-administered health insurance program for low-income individuals and certain federally recognized eligible groups.[333] Even though participation in the Medicaid program is "*optional*," every state and the District of Columbia have an established

Curtis, "Brief Summaries of Medicare & Medicaid: Title XVIII and Title XIX of the Social Security Act as of November 1, 2007," Centers for Medicare and Medicaid Services, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/downloads/MedicareMedicaidSummaries2007.pdf (accessed August 23, 2012).

Medicaid

Medicaid is a means-tested, state-administered health insurance program for individuals below certain income thresholds predetermined by the state in which they reside. The federal government establishes coverage requirement guidelines for the categorically needy (e.g., children, pregnant women), medically needy (e.g., individuals with income above the threshold, but who have a large amount of medical bills), and special groups. Although the federal government determines the medical services that will be covered and paid for by the federal portion of the program, Medicaid programs vary widely from state to state, because the state governments are free to add additional services or expand eligibility to additional groups.

"Medicaid at a Glance, 2005: A Medicaid Information Source," Centers for Medicaid and Medicare Services, 2005, pp. 1–2, http://www.cms.hhs.gov/MedicaidGenInfo/Downloads/MedicaidAtAGlance2005.pdf (accessed June 19, 2009); "Introduction to Medicaid," in From Patient to Payment: Insurance Procedures for the Medical Office, *3rd ed., by Cynthia Newby (Columbus, OH: Glencoe/McGraw-Hill, 2002), p. 132.*

Medicaid program. Eligibility is determined based on the federal poverty guidelines published annually by HHS, within federal and state established limits.[334] For reference, the 2012 federal poverty guidelines are presented in Table 2.10.

The medium household income in 2011 was $50,054, significantly above the federal poverty guidelines.[335] In June 2011, 52.6 million individuals were enrolled in Medicaid. Medicaid enrollment growth has slowed

[334] Note: The federal poverty guidelines are published each year by HHS to determine financial eligibility for federal programs and are a simplification of the federal poverty thresholds established by the U.S. Census Bureau that are used for administrative purposes. The federal poverty guidelines are often referred to as the federal poverty level (FPL); however, this term is ambiguous, because it does not distinguish between the thresholds and the guidelines. in recent years: with growth of 7.8 percent from 2009 to 2010, slowing to 4.4 percent from 2010 to 2011. Declines in the growth in Medicaid enrollment are likely a result of the increasing (albeit slow) recovery of the national economy after the *Great Recession*.[336]

Medicaid is funded by both state governments and the federal government. Although states have significant discretion regarding the specific parameters they set for the Medicaid benefits offered through each state's program to receive federal matching funds, states must operate their Medicaid programs within established parameters set by the federal government.[337] These parameters determine *mandatory eligibility groups* and *mandatory services*, that is, the groups and services the state *must* cover to receive federal Medicaid money.[338]

The *mandatory eligibility groups* set by the federal government include (1) elderly and disabled social security income beneficiaries; (2) children six and older who are in families earning below 100 percent of the federal

[338]"State Plans for Medical Assistance," 42 U.S.C. §1396a(a)(10)(A) (2010).

poverty guidelines; (3) children under age six who are in families earning below 133 percent of the federal poverty guidelines; (4) parents who are in families earning below a state's welfare eligibility cutoff for 1996 (roughly 50 percent of the federal poverty guidelines); (5) pregnant women who are in families earning at, or below, 133 percent of the federal poverty guidelines; (6) elderly and disabled individuals who are in families earning at, or below, 74 percent of the federal poverty guidelines who are receiving *Supplemental Security Income*; (7) certain working disabled individuals; and (8) Medicare buy-in groups.[339]

The federal government also determines the standard set of *mandatory services* that will be reimbursed by the federally funded portion of the program.[340] Mandatory services include (1) *physician services*; (2) *inpatient* and *outpatient hospital care*; (3) *nursing facility care*; (4) *laboratory* and *x-ray* services; (5) early and *periodic screening*, *diagnostic*, and *treatment* services for individuals under 21; (6) *family planning* and *supplies*; (7) *federally qualified health center* services; (8) rural *health clinic* services; (9) *nurse midwife* services; (10) certified *pediatric and family nurse practitioner* services; (11) *nursing facility* services for individuals 21 and older; and (12) *home health care* services for individuals entitled to nursing facility care.[341]

States may also receive federal matching funds for covering other *optional* services and *optional* groups, which may include (1) prescription drugs, (2) dental services, and (3) medical care provided by *allied health professionals* and other *nonphysician providers*.[342] Of note is that if a state chooses to offer an *optional service* to an *optional group*, under various Medicaid parity laws, the state generally must offer that service to the *mandatory edibility group*. Each state's Medicaid coverage manual publishes which *optional groups* and *services* that state covers.

Many states opt to extend benefits to individuals who are above the income cutoffs found in the federally established for *mandatory groups*, extending Medicaid benefits to individuals with significant *recurring* health expenses and *long-term* healthcare needs.[343] Under the 2010 ACA legislation (as modified by the June 28, 2012, U.S. Supreme Court decision), in 2014, states will have the option to expand Medicaid coverage to 133 percent of the federal poverty guidelines in exchange for federal funding for all newly eligible individuals.[344] For more information on the current debate regarding state expansion of Medicaid coverage in 2014, see Section 6.4.3.2, "ACA's Impact on the Medicaid Program," in Chapter 6, "Healthcare Reform."

2.4.2.2 Children's Health Insurance Program (CHIP, f/k/a SCHIP) Overview In addition to Medicaid, each state and territory and the District of Columbia have implemented the *Children's Health Insurance Program (CHIP)*, a state-federal partnership that provides assistance to children and pregnant women in families whose income is above the threshold for Medicaid.[345] Enacted

Children's Health Insurance Program (CHIP)

CHIP is a state-federal partnership that provides assistance to children and pregnant women in families whose income is above the threshold for Medicaid. It was formerly known as the State Children's Health Insurance Program (SCHIP).

"Medicaid at a Glance, 2005: A Medicaid Information Source," Centers for Medicaid and Medicare Services, 2005, p. 3, http://www.cms.hhs.gov/MedicaidGenInfo/Downloads/MedicaidAtAGlance2005.pdf (accessed June 19, 2009).

[345] Centers for Medicare and Medicaid Services, "Overview: The Children's Health Insurance Program (CHIP)," http://www.cms.hhs.gov/LowCostHealthInsFamChild/ (accessed October 6, 2009).

Factoid

CHIP covered approximately 7.7 million children in 2010, in addition to the 34.4 million children enrolled in Medicaid.

"Appendix 1: FY 2010 Number of Children Ever Enrolled in Medicaid and CHIP," Centers for Medicaid and Medicare Services, http://www.insurekidsnow.gov/professionals/reports/chipra/2010_enrollment_data.pdf (accessed August 6, 2012).

under the *Balanced Budget Act of 1997* and formerly known as the *State Children's Health Insurance Program* (SCHIP), CHIP covered approximately 7.7 million children in 2010, in addition to the 34.4 million children enrolled in Medicaid.[346]

Similar to Medicaid, CHIP services vary between states, which determine (within federal parameters) who may be eligible for CHIP funds, as well as other details, including *benefits*, *payment levels*, and *program administration*.[347] As part of their autonomy over CHIP services, states are free to set *premiums* and *copayment rates* on a *sliding scale based on income*. State funds are *matched* by the federal government up to a certain *capped* amount.[348]

After a temporary reauthorization of the program in 2007, the *Children's Health Insurance Program Reauthorization Act of 2009* (CHIPRA), most recently reauthorized CHIP through September 2013, expanding coverage to include *dental services* and requiring states offering coverage for *mental health* and *substance abuse* to have *mental health parity* with CHIP beneficiaries.[349]

2.4.2.2.1 Billing and Reimbursement Reimbursement for services provided to Medicaid patients are paid by states on either an FFS basis or under a *pre-paid managed care arrangement*.[350] For claims reimbursed on an FFS basis, providers must use a CMS-1500 claim form.[351] Due to variations among state Medicaid programs, each state's *Medicaid Managed Care Organization Billing Manual* must be consulted for the specific billing procedure for *noncapitated* managed care services. Deadlines for filing a Medicaid claim range from two months to one year from the date of treatment.[352] Federal regulation requires states to promptly pay providers for *clean claims* submitted for services rendered to Medicaid beneficiaries.[353] States must pay 90 percent of *clean claims* within 30 days, 99 percent of *clean claims* within 90 days, and all other claims within 12 months of receipt unless an exception applies, that is, retroactive adjustments to claims, the claim was also filed with Medicare, the provider is under investigations for fraud and abuse, and the payment was delayed by court order.[354]

Each state has the ability to develop its own reimbursement process and payment rates, with three exceptions:

1. For *institutional services*, payment may not exceed amounts that would be paid under Medicare payment rates (see Section 2.4.1, "Medicare");
2. For *disproportionate share hospitals* (DSH), hospitals that treat a disproportionate number of Medicaid patients, different limits apply; and,
3. For *hospice care* services, payment may not surpass amounts that would be paid under Medicare payment rates (see Section 2.4.1, "Medicare").[355]

Disproportionate Share Hospital (DSH) Payments

Disproportionate share hospital (DSH) payments are a form of additional reimbursement under Medicaid for hospitals that care for a large number of Medicaid and uninsured patients. DSH payments are allotments from the federal government that augment basic Medicaid reimbursement, and under federal law, states are required to supplement disproportionate share hospitals in order to receive this additional Medicaid funding.

"Medicaid Disproportionate Share Hospital (DSH) Payments: The Basics," by National Health Policy Forum, George Washington University, June 15, 2009, p. 1, http://www.nhpf.org/library/the-basics/Basics_DSH_06–15–09.pdf (accessed October 5, 2009)

Outside of these exceptions, states may impose *deductibles*, *coinsurance*, or *copayments* on certain recipients for particular services.[356] *Participating providers* in the Medicaid program must accept direct payments from Medicaid for services rendered as payment in full, and they may *not* bill patients the difference between their usual charge and the Medicaid reimbursement rate for covered benefits.[357] Medicaid reimburses on a lump-sum basis, that is, providers receive one payment for several submitted claims.[358]

Medicaid is often considered the "*payor of last resort*," in other words, if a Medicaid patient is also covered by another insurance plan or government program, then these plans or programs must be billed first.[359] Claims should be submitted to Medicaid only if an alternative payor (1) denies responsibility for payment, (2) reimburses at a rate that is less than Medicaid's fee schedule, or (3) if Medicaid reimburses for procedures that are not covered by the other plans or programs.[360] For more information on

TABLE 2.11 States with Five Highest DSH Allotments in 2011

State	DSH Allotment ($ in Billions)	DSH Allotment (Percentage of Total National Allotment—$11.3 Billion)
New York	$1.6	14.2%
California	$1	9.7%
Texas	$1	8.5%
Louisiana	$0.7	6.4
New Jersey	$0.6	5.7

"Federal Medicaid Disproportionate Share Hospital (DSH) Allotments," Kaiser Family Foundation, 2011, http://www.statehealthfacts.org/comparetable.jsp?ind=185&cat=4 (accessed August 6, 2012).

primary and secondary billing, see Section 2.2.5, "Step 5: Primary Insurance Billing," and Section 2.2.6, "Step 6: Secondary Insurance Billing," and Section 2.4.3 on "Dual Eligibles," following.

Disproportionate Share Hospital (DSH) Payments *Disproportionate share hospital (DSH) payments* are a form of *additional* reimbursement under Medicaid for hospitals that care for a large number of Medicaid and uninsured patients.[361] Under federal law, states are required to supplement reimbursements to DSHs in order to receive augmented funding allotments from the federal government.[362] DSH payments are intended to supplement hospital revenue when the large proportion of Medicaid and CHIP beneficiaries' results in their costs not being adequately covered by traditional Medicaid and Medicare payments, by CHIP payments, or by other payors.[363]

DSH payments are calculated differently for each state according to a statutory formula; however, no state receives more than 12 percent of its annual total Medicaid benefits in DSH allotments.[364] In 2011, $11.3 billion was allotted for DSHs. The states with the highest DSH allotments in 2011 are set forth in Table 2.11.

[361] Christie Provost Peters, "The Basics: Medicaid Disproportionate Share Hospital (DSH) Payments," National Health Policy Forum, George Washington University, June 15, 2009, http://www.nhpf.org/library/the-basics/Basics_DSH_06-15-09.pdf (accessed October 5, 2009), p. 1.

[362] Ibid.

[363] Ibid.

[364] Ibid.

In order to receive its DSH allotment, a state must submit an *annual report* and *certified audit* documenting payments made to DSH; however, each state has discretion over which hospitals will receive DSH distributions.[365] The only *limit on this discretion* is that the state *may not* distribute DSH payments to any hospital with a *Medicaid utilization rate* of less than 1 percent, and the state *must* distribute DSH payments to all hospitals that have either a Medicaid *inpatient utilization rate* exceeding one standard deviation of the mean for all hospitals in the state or have a *low-income utilization rate* of more than 25 percent.[366] If the state wants to distribute DSH payments to additional hospitals, it is free to do so; however, the state must distribute payments in a similar manner to the *Medicaid DSH payment methodology* or based on a hospital's *low-income utilization rate*.[367]

Long-Term Care Reimbursement Medicaid is the primary payor for *long-term care* services, accounting for 43 percent of nursing home expenditures.[368] Six percent of the Medicaid population, that is, 4 million individuals, require Medicaid coverage for long-term care. Approximately 45 percent ($54.9 Billion) of Medicaid funding covered home- and community-based services, including nursing home care, in 2010. Due, in part, to states' continual cuts to Medicaid funding, Medicaid reimbursement rate increases have not kept pace with the nursing home cost inflation.[369]

To qualify for Medicaid services, beneficiaries requiring *skilled nursing care* must have monthly incomes equal to or below the *Supplemental Security Income* (SSI), which had an eligibility level of $698 per month in

[365] "Adjustment in Payment for Inpatient Hospital Services Furnished by Disproportionate Share Hospitals," Social Security Act §§ 1923(a)(2)(D), 1923(j) (42 U.S.C. § 1396r-4); Christie Provost Peters, "The Basics: Medicaid Disproportionate Share Hospital (DSH) Payments," National Health Policy Forum, George Washington University, June 15, 2009, http://www.nhpf.org/library/the-basics/Basics_DSH_06-15-09.pdf (accessed October 5, 2009), pp. 3–4.

2012, an increase from 2005, which set eligibility at $603.00 per month.[370] While these levels are set by the federal government, many states chose to set higher *SSI limits* for the purpose of Medicaid eligibility. Most states reimburse long-term care services under an FFS model; however, as of 2011, 11 states have opted to contract with c*apitated managed care plans* to administer Medicaid reimbursement for long-term care services.[371]

2.4.3 Dual Eligibles

Dual eligibles are those beneficiaries that are eligible for benefits under *both* the *Medicare* and the *Medicaid* programs. This population of approximately 9.9 million (in 2010) *older*, *poor* individuals generally represents more *vulnerable* and *costly* patients with *lower health status*.[372] Medicare operates as the *primary payor*, covering *acute care services* for dual eligible beneficiaries, while Medicaid, as a *secondary payor*, provides coverage for *premiums*, *cost sharing*, and *long term care services*.[373] There are varying *levels*

Dual Eligibles

Those beneficiaries who are eligible for benefits under both the Medicare and the Medicaid programs, traditionally consisting of older, poor, costly patients with lower health status.

TABLE 2.12 Levels of Dual Eligibility

Eligibility Level	Medicare Coverage	Medicaid Coverage	Requirements of Eligibility
Full Dual Eligibles	Full	Full	Incomes ≤ 73 percent of poverty guidelines and assets < $2,000 for individuals and $3,000 for couples
Medicare Savings Programs (QMB)	Full	Premiums and Cost Sharing	Incomes ≤ 100 percent of poverty guidelines and assets < $4,000 for individuals and $6,000 for couples
Medicare Savings Programs (SLMB)	Full	Medicare Part B Premiums	Incomes btw 100–120 percent of poverty guidelines and assets < $4,000 for individuals and $6,000 for couples
Medicare Savings Programs (QI)	Full	Medicare Part B Premiums	Incomes btw 120–135 percent of poverty guidelines and assets < $4,000 for individuals and $6,000 for couples

"Medicaid's Role for Dual Eligible Beneficiaries," Kaiser Family Foundation, Kaiser Commission on Medicaid and the Uninsured, April 2012, p. 3.

of dual eligibility: (1) *full dual eligibles* and (2) *Medicare savings programs*, which include programs for (a) *qualified Medicare beneficiaries* (QMB), (b) *specified low-income Medicare beneficiaries* (SLMB), and (c) *qualifying individuals* (QI).[374] The various *levels of coverage* for Medicare and Medicaid for dual eligibles are set forth in Table 2.12.

The dual eligible population presents various concerns to both the Medicare and the Medicaid programs because, as a group, the population is generally more *costly* than other patient populations. While the per capita expense for dual eligibles is much higher than the per capita expense associated with nondual eligibles, the population as a whole does report *high access to care*.[375] Therefore, the issues within this population revolve around defining the *boundaries of coverage* between the two programs, which can often be *imprecise* and *subjective*.[376] Better coordination between the two programs

[374] Centers for Medicare and Medicaid Services, "Medicaid Coverage of Medicare Beneficiaries (Dual Eligibles) at a Glance," ICN 006977, January 2012, pp. 2–3.

[375] Kaiser Commission on Medicaid and the Uninsured, "Medicaid's Role for Dual Eligible Beneficiaries," Kaiser Family Foundation, April 2012, p. 1.

[376] Medicare Payment Advisory, *Report to Congress: Medicare and the Health Care Delivery System*, June 2012, p. 61; *Report to Congress: New Approaches in Medicare*, June 2004, p. 83.

regarding the proper location of care and medically necessary services may provide more control over which payor must reimburse for the services rendered. There is a general perception that some *financial tensions* between the two programs could be relieved through various *special managed care programs'* attempt to coordinate the delivery of services for dual eligibles by aligning incentives between the two payors using Medicare Advantage plans or other programs, such as the *Program of All-Inclusive Care for the Elderly* (PACE) and *dual eligible special needs plans* (D-SNPs).[377]

Several agencies established under the ACA have also been tasked with improving coordination between Medicare and Medicaid programs for dual eligibles, including (1) the *Federal Coordinated Health Care Office*, (2) the *Center for Medicare and Medicaid Innovation*, and (3) *various demonstrations involving dual eligible beneficiaries*.[378] A 2012 study, published in JAMA and supported by the *National Institute on Aging*, the *Robert Wood Johnson Foundation*, and the *Commonwealth Fund*, assessed the *outcomes* of the *Medicare Physician Group Practice* (*PGP*) *Demonstration* (the precursor demonstration to ACOs) and noted the possible benefits of *coordinated care initiatives* for the *dual eligible population*. The study found that although the mean *annual per beneficiary savings* for the *participating provider* entities was *modest* ($114), the mean *annual per beneficiary savings for dual eligibles* was *significant* ($532), especially as compared to *non-dual eligible mean annual savings per beneficiary* ($59), which was not statistically significant.[379] Overall, almost all significant savings were achieved by PGP participants through the *dual eligible population*.[380]

2.4.4 TRICARE (CHAMPUS)

TRICARE

TRICARE is the Department of Defense's healthcare program for active duty military personnel, members of the National Guard and Reserves, retirees, their dependents, survivors, and certain former spouses. The program uses military healthcare as the main provider of services, supplemented by civilian healthcare providers, facilities, pharmacies, and suppliers. TRICARE covers approximately 9.7 million beneficiaries worldwide through a variety of plans.

2.4.4.2 Billing and Reimbursement TRICARE reimburses providers for services rendered to beneficiaries using both FFS and managed care arrangements.[384] The payment rate is determined using Medicare's RBRVS system, although TRICARE uses a slightly higher *conversion factor* and has established minimal modifications to the *geographic regions*.[385] TRICARE renders payment only for services provided by *authorized providers*, that is, those providers that meet licensing and certification requirements and have been certified to treat TRICARE beneficiaries.[386] Providers seeking reimbursement must submit claims using the CMS-1500 claim form within one year from the date the services were rendered.[387] TRICARE claims to pay more than 99 percent of claims within 30 days and all claims within 60 days.[388]

[388] "Things to Consider: What TRICARE Pays to Providers," TRICARE Management Activity, TRICARE.mil, http://tricare.mil/tma/thingstoconsider.aspx (accessed August 11, 2009).

Beginning on April 1, 2013, the TRICARE regional contractor for the west region, *TriWest*, will begin limiting providers to participating in *UnitedHealthcare provider network* as a means of implementing a *managed care* reimbursement model into the TRICARE system. To continue, or begin, offering services to TRICARE beneficiaries in the west region, certified providers must join the *UnitedHealthcare provider network*.[389] The managed care arrangement with the private payor, worth $1.4 billion, will affect 2.9 million active duty and retired military personnel and their families and is designed to improve the quality of care provided to beneficiaries and, consequently, their health outcomes, while also lowering costs.[390]

TRICARE offers a variety of programs with diverse *beneficiary cost-sharing requirements*, including coinsurance, annual enrollment fees, copays, catastrophic caps, and, deductibles.[391] Similar to Medicare, TRICARE participating providers must accept the allowable fee as payment in full for covered services, which prohibits them from *balance billing* the patient.[392] Nonparticipating providers (who have been authorized by TRICARE) may accept the allowable fee on a case-by-case basis, or they can refuse to accept the fee and bill the patient an amount not exceeding 15 percent above the TRICARE fee schedule.[393] Some services are excluded from the 15 percent *limiting charge*, including claims from independent laboratory and diagnostic laboratory companies, claims for DME, and claims from medical supply companies.[394] Providers that choose to reject the TRICARE payment accept the risk associated with having to collect the entire bill from the beneficiary.[395]

TRICARE is a *primary payor* if a beneficiary qualifies for Medicaid coverage, but assumes *secondary payor* status if the patient is covered by

WORKERS' COMPENSATION

Workers' compensation laws provide healthcare coverage and monetary payments to employees injured at work or suffering from an occupational disease and monetary benefits for the dependents of employees killed on the job. In addition, the laws limit the financial liability of employers and nearly eliminate the financial liability of coworkers for most accidents.

"Workers' Compensation," in Understanding Health Insurance: A Guide to Billing and Reimbursement, *9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton, NY: Delmar Cengage Learning, 2008), p. 532.*

another primary health plan. In addition, TRICARE will *not* pay for *occupational* injuries or diseases covered by *workers' compensation* (see Section 2.4.6.1, "Workers' Compensation") unless these benefits have been exhausted.[396]

2.4.5 Civilian Health and Medical Program of the Department of Veteran Affairs (CHAMPVA)

2.4.5.1 Overview The *Civilian Health and Medical Program of the Department of Veteran Affairs (CHAMPVA)* is the U.S. Department of Veterans Affairs' (VA) healthcare program for the *spouses* and *children* of veterans who meet certain eligibility requirements (note that veterans are covered under TRICARE). To be eligible for the program, a *beneficiary* must be the *spouse* or *child* of a *veteran* who was declared to have a *permanent service-connected disability*; the surviving spouse or child of a veteran who *died* as a result of his or her service-related disability; the surviving spouse or child of a veteran who, at the time of his or her death, was determined to be *permanently or totally disabled* due to his or her service-connected disability; or, in certain instances, the surviving spouse or child of a service member who *died in the line of duty.*[397]

[402]Department of Veterans Affairs Health Administration Center, "Fact Sheet 01-15: Participating Providers VA Health Administration Center," July 2008, http://www.va.gov/hac/factsheets/factsheets.asp (accessed August 18, 2009).

or agreeing to treat a CHAMPVA beneficiary and then must accept the CHAMPVA *allowable fee* as payment in full, that is, they cannot *balance bill* the patient for the difference between their usual charge and the CHAMPVA allowable amount.[403] A provider is not restricted to accepting the CHAMPVA allowable rate if he or she makes this fact clear to the patient before treatment is rendered.[404] In these instances, the patient is responsible for paying the entire bill and submitting a claim to CHAMPVA for reimbursement up to the allowable amount.[405] CHAMPVA reimburses more than 95 percent of patients' claims within 30 days.[406]

CHAMPVA assumes the role of both *primary* and *secondary* payor, reimbursing 75 percent of a patient encounter if *primary* and 25 percent if *secondary.*[407] If a CHAMPVA beneficiary is eligible for Medicaid, has a Medicaid or CHAMPVA *supplemental insurance policy*, or is eligible for a *State Victims of Crime Compensation Program*, CHAMPVA assumes the role of *primary* payor. However, if a CHAMPVA beneficiary is enrolled in Medicare, is covered by a workers' compensation policy, or has private health insurance, the other health insurance plan should be billed first, and CHAMPVA assumes the role of *secondary* payor.[408]

2.4.6 Other Public Payors

2.4.6.1 Workers' Compensation Federal and state governments have enacted legislation establishing *workers' compensation* programs.[409] *Workers' compensation laws* provide healthcare coverage and monetary payments to

employees *injured* at their place of employment or suffering from an *occupational disease* and offer *monetary benefits* for the dependents of employees killed as a result of such injury or disease.[410] In addition, these laws *limit* the *financial liability* of employers and nearly *eliminate* the financial liability of coworkers for most accidents.[411]

The *U.S. Department of Labor's Office of Workers' Compensation Programs* (OWCP) oversees four workers' compensation programs covering federal employees: *The Energy Employees Occupational Illness Compensation Program*, the *Federal Employees' Compensation Program*, the *Longshore and Harbor Workers' Compensation Program*, and the *Black Lung Benefits Program*.[412]

On the state level, every state has an established *workers' compensation board* or *commission* that is tasked with administering workers' compensation programs that cover employees of *private companies* and *state and local governments*.[413] In every state, except Texas, and including the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands, *workers' compensation* coverage is mandatory. Texas permits employers to opt out of *workers' compensation* coverage but does not shield them from *tort liability*.[414] Depending on the state, employers can obtain workers' compensation coverage, in compliance with the state's regulation, through several sources:

1. *State Insurance* (*or Compensation*) *Funds*—Agencies that provide workers' compensation insurance coverage to both public and private employers;
2. *Self-Insurance Plans*—Plans under which employers set aside a percentage of capital funds to cover expenses that may arise;
3. *Commercial Workers' Compensation Insurance*—Policies purchased from commercial insurance companies; or
4. *Combination Programs*—Programs under which employers cover their workers through a combination of any of the aforementioned methods.[415]

[415] Michelle A. Green and JoAnn C. Rowell, *Understanding Health Insurance: A Guide to Billing and Reimbursement*, 9th ed. (Clifton, NY: Delmar Cengage Learning, 2008), p. 535.

2.4.6.1.1 Billing and Reimbursement Providers treating ill or injured employees covered under one of the four *federal workers' compensation acts* are reimbursed according to the OWCP's fee schedule; however, a modified version of the fee schedule is used to reimburse providers treating patients covered under the *Federal Black Lung Benefits Act*.[416] The OWCP's schedule is based, in part, on the MPFS with some program-specific adjustments.[417] Claims for reimbursement must be submitted to the U.S. Department of Labor using the UB-04 form for inpatient hospital charges and the CMS-1500/OWCP-1500 form for physician services.[418] Bills must be submitted to OWCP by December 31 of the year following services provided, or by December 31 of the year following the year when the condition was first accepted as covered by the workers' program, whichever is later.[419]

State workers' compensation programs reimburse providers using either an FFS model established by the state compensation board or commission or a managed care plan.[420] The required claims forms, progress reports, and supplemental reports, as well as the filing deadlines, vary from state to state.[421] Providers treating patients eligible for coverage under a workers' compensation program must accept that program's allowable fee as payment in full.[422] Furthermore, patients covered by workers' compensation programs pay no deductible and no copayment, and the patient's employer *must* pay *all* premiums.[423]

2.4.6.2 Indian Health Services (IHS) The *Indian Health Services* (*IHS*) *Agency* is located within HHS.[424] The agency serves approximately 2 million American Indians and Alaska Natives, directly through tribal healthcare programs, and indirectly, using contract health services, discussed later, for services provided by private healthcare professionals.[425] Most of the agency's resources go toward caring for *American Indians* or *Native Alaskans* living on or near reservations or Alaskan villages. However, Congress has provided some funding for programs for eligible individuals in urban areas.[426]

2.4.6.2.1 Billing and Reimbursement On occasion, IHS will need to purchase healthcare services from private providers.[427] IHS contracts with non-IHS facilities and providers to deliver healthcare services when the following criteria are met:

1. No IHS facility exists;
2. The direct care entity is incapable of providing the required emergency and/or specialty care;

INDIAN HEALTH SERVICES (IHS)

The Indian Services Agency is located within the Department of Health and Human Services. The agency provides healthcare services to approximately 1.9 million American Indians and Alaska Natives, directly through tribal healthcare programs and indirectly through purchases from private providers.

3. The direct care entity has an overflow of medical care workload; or
4. To supplement alternate resources.[428]

Typically, IHS pays providers for these services in accordance with the terms of a contract health service agreement.[429] When these services are purchased from hospitals participating in the Medicare program, the *Medicare Modernization Act* (MMA) of 2003 provides IHS with the authority to limit reimbursement rates to be similar to those established for the Medicare program.[430] Providers submit billing claims to the IHS fiscal intermediary, *Blue Cross Blue Shield of New Mexico*, using the appropriate claim form.[431]

IHS is considered a *payor of last resort*, that is, if a patient has alternative insurance, it will be billed first, "notwithstanding any state or local law or regulation to the contrary."[432] Under its contract with HIS, *Blue Cross Blue Shield of New Mexico* must pay 95 percent of *clean claims* submitted to the IHS fiscal intermediary within 21 days.[433]

2.5 PRIVATE PAYORS

Private health insurance payors consist of *for-profit commercial insurers*, *not-for-profit commercial insurers*, and *self-funded plans*. In 2010, private

health insurance accounted for $848.7 billion, or 32.7 percent of the total national expenditures.[434]

Reimbursement prices and policies in the private insurance market are significantly influenced by the level of competition in the market. Large-scale consolidations in the insurance market have created price and profit pressures on similar private payors. In addition to the current focus on *value-based reimbursement*, new products and entrants may be required to address increasingly competitive factors in the insurance market.[435] For more information regarding competition in the insurance market and its impact on the healthcare delivery system, see Chapter 4, "Competition."

Similar to the *National Provider Identifier* (NPI) used to identify providers within the Medicare program, the *Health Plan Identifier* (HPID) was implemented on August 24, 2012, by a Final Rule, as mandated by §1104 of the ACA, which required HHS to streamline healthcare administrative transactions. The HPID final rule requires all health plans to obtain an HPID by 2015 and all covered entities to obtain an HPID by 2016. The HPID is used in HIPAA standards transactions to identify the health plan being billed. This Final Rule also established the *other entity identifier* (OEID) that identifies those parties to a transaction that are not *providers*, *health plans*, or *individuals*.[436] These new HPID and OEID identification numbers were the final portion of the implementation of the ACA simplification mandate.

The ACA also implemented several *transparency initiatives*, several of which concerned the pricing of insurance premiums. These transparency initiatives are supported by free publications available to consumers that report insurance pricing, for example, the *Healthcare Blue Book*.[437] *Transparency* and *price comparison* information are anticipated to be further available via the state *health insurance exchanges* in 2014.

2.5.1 For-Profit Commercial Insurers

2.5.1.1 Overview *Commercial health insurance* refers to those healthcare plans offered by *life insurance* companies, *casualty insurance* companies, and companies that were formed for the sole purpose of offering *health insurance*.[438] *Commercial insurers* are taxable entities organized as either *mutual* or *stock insurers*. *Mutual insurance companies* are owned by their policyholders, whereas *stock insurance companies* are owned by their stockholders.[439] Commercial insurers offer a variety of health insurance plans, which offer varying trade-offs between costs, the variety of the services covered, the flexibility to see the provider of one's choice, and the risk shared between the payor and the provider. Lists of the 10 largest for-profit health plans by enrollment, in 2010, are set forth in Table 2.13.

2.5.1.1.1 Billing and Reimbursement Commercial insurers offer a variety of *plan options*, with different *copays* and *deductibles*, reimbursement methods, *claim form requirements*, *claims submission deadlines*, *remittance schedules*, and *policies*. It is uncommon for commercial insurers to publish their billing manuals or to inform providers in advance of changes to their claims process, further complicating any generalizations regarding commercial insurance billing.[440]

COMMERCIAL INSURERS

Plans that are offered by life insurance companies, casualty insurance companies, and companies that were formed for the sole purpose of offering health insurance.

Commercial payors can offer insurance plans across the *risk spectrum*, that is, from *FFS* to full *capitation*. For more information on the various models of healthcare delivery reimbursement, see Section 2.6, "Methods of Reimbursement." One payment type of commercial insurance plan is commonly referred to as *managed care*.

2.5.1.2 Managed Care

2.5.1.2.1 Overview *Managed care* plans integrate the *financing* (i.e., insurance) and *provision* of health services under the administration of a *managed care organization* (*MCO*).[441] Under *managed care*, costs are contained by holding providers *accountable* for the quality of services and care to a population at *predetermined levels of reimbursement*, using several means of monitoring, including:

1. *Clinical practice standardization*;
2. *Selective contracting*;
3. *Low-cost settings*;

[441] Louis C. Gapenski, *Healthcare Finance: An Introduction to Accounting and Financial Management*, 3rd ed. (Chicago: Health Administration Press, 2005), p. 4.

4. Reduced *discretionary hospital admissions*; and
5. Effective *staff* use.[442]

Managed Care

Managed care plans integrate the financing (i.e. insurance) and provision of health services under the administration of one organization in an effort to contain costs.

"Introduction to Healthcare Finance," in Healthcare Finance: An Introduction to Accounting and Financial Management, *3rd ed., by Louis C. Gapenski (Chicago: Health Administration Press/Arlington, VA: Association of University Programs in Health Administration, 2004), p. 4.*

FEE ALLOWANCE SCHEDULE

A managed care reimbursement scheme by which the fees for procedures are explicitly laid out and the physician agrees to accept those fees as full payment, unless the discounted charges are less than the fee schedule, in which case the plan pays the lesser of the two.

The Managed Health Care Handbook, *3rd ed., Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996), pp. 140–141.*

These mechanisms ensure that financial risk is shared by both the *managed care plan* and the *participating providers*, incentivizing both parties to be *accountable* for the *delivery*, *cost*, and *quality* of services provided to beneficiaries.

Typically, *managed care plans* are established by a *payor* who also controls its own *provider network*, or by a *payor* who creates a network via contracts with *independent providers*.[443] The various managed care plans available on the market each share risk between *payors* and *providers* in different degrees, creating a *risk continuum*. The various divisions of *risk sharing* for managed care plans are illustrated in Exhibit 2.12.

[442] Robert James Cimasi, *A Guide to Consulting Services for Emerging Healthcare Organizations* (New York: John Wiley & Sons, 1999), p. 12.

[443] Louis C. Gapenski, *Healthcare Finance: An Introduction to Accounting and Financial Management*, 3rd ed. (Chicago: Health Administration Press, 2005), p. 37.

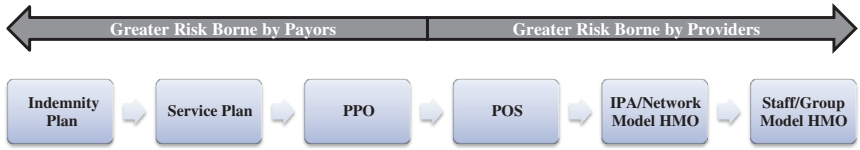

EXHIBIT 2.12 Managed Care Plan Options
Essentials of Managed Health Care, by Peter R. Kongstvedt, 6th ed. (Burlington, MA: Jones and Bartlett Learning, 2013), p. 25.

PERFORMANCE-BASED FEE-FOR-SERVICE

Performance-based fee-for-service is a managed care reimbursement scheme using a scale that adjusts fees based on individual medical specialties. In this approach, each specialty has a per-member-per-month budget (e.g., $2.00 per member per month for OB/GYN), and actual costs are measured against that budget. If costs exceed the budget, then fees are lowered, but only for that specialty, and vice versa if costs are better than budget. This system requires a highly sophisticated tracking system and a large enough patient base to make the analysis statistically significant, which makes it well suited for independent practice associations.

The Managed Health Care Handbook*, 3rd ed., Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996), p. 181.*

As indicated earlier, *managed care plans* are structured in a variety of ways, although three of the more popular models of managed care plans are (1) *health maintenance organizations* (HMOs), (2) *preferred provider organizations* (PPOs), and (3) *point of service plans* (POS).

2.5.1.2.2 Health Maintenance Organizations (HMO) *Health maintenance organizations* (HMOs) are responsible for either *providing* or *arranging* for the provision of healthcare services, including *preventive care*, for plan enrollees via *contractual arrangements with providers*.[444] The HMO structure includes benefits for both health plan enrollees and participating

[444]Daniel J. Schwartz, *Fundamentals of Health Law*, 4th ed. (Washington, DC: American Health Lawyers Association, 2008), p. 247.

Health Maintenance Organization (HMO)

HMOs are responsible for providing, or arranging for the provision of, healthcare services (including preventative care) for plan enrollees via contractual arrangements with providers. HMO enrollees must receive all of their care from the plan's participating providers, except for care provided in emergency situations or in instances in which the plan offers a point of service option.

"Regulation of Insurance," in Fundamentals of Health Law, *4th ed., by Daniel J. Schwartz (Washington, DC: American Health Lawyers Association, 2008), p. 247.*

providers. Health plans are able to limit their *financial risk* by contracting with providers to care for a specified enrolled population for a *fixed payment amount per member per month* (PMPM). The PMPM reimbursement model allows providers to more easily rely on a steady stream of income, regardless of how often enrollees seek care. The benefit for enrollees is little or no liability for *deductibles* and nominal or no liability for *copayments* for the care they receive.[445]

The limitation associated with HMOs is that enrollees must receive *all* of their medical care from the plan's *participating providers* or from providers with whom the health plan has contracted, except for care provided in emergency situations or in instances in which the plan offers a *point of service* option (discussed later).[446] Under some HMO models, enrollees must select a *primary care physician* to operate as a *gatekeeper*, to oversee and coordinate their healthcare with specialists.[447] The *gatekeeper* model was prevalent in the HMO plans of the 1990s (discussed later and in Section 1.7.2, "Backlash against HMOs and Managed-Care Plans," in Chapter 1, "The Chronology of U.S. Healthcare Delivery"). The four common models of HMOs are described in Table 2.14.

Significant consumer backlash ensued following the rapid and widespread incursion of managed care and the imposition of the *gatekeeper function* in the early 1990s, wherein providers were accused of diminishing

[445] Alma Koch, *Introduction to Health Services* (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 126.

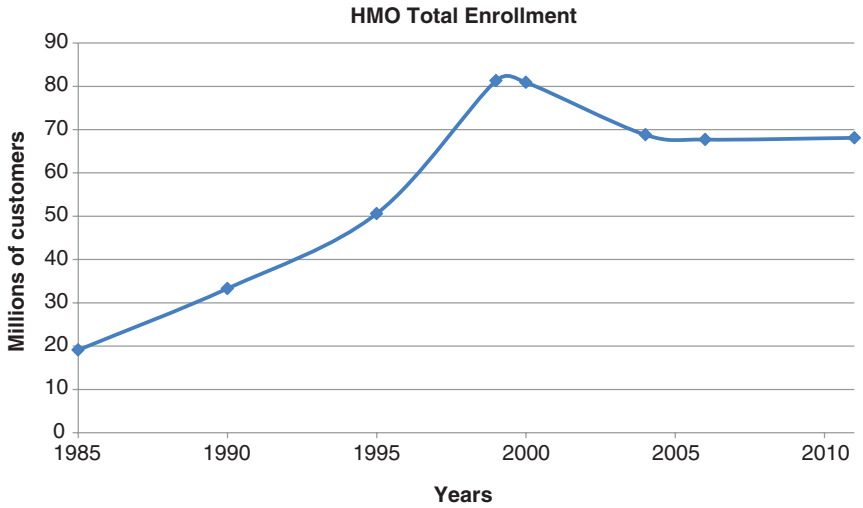

EXHIBIT 2.13 National HMO Enrollment: 1987–2011
"Managed Care Museum Time Line: The History of Managed Care and More" (Modesto, CA: Managed Care Museum, February 2011, http://www.managedcaremuseum.com/timeline.htm (accessed April 10, 2012).

late 1990s, and their subsequent decline but ultimate staying power, is illustrated in Exhibit 2.13.

2.5.1.2.2.1 Billing and Reimbursement Patients in HMOs (*covered lives*) generally pay a *fixed premium*, typically monthly, to be enrolled in a plan and *copayments* at the time of treatment, unless the *copayment* is waived due to a *coinsurance payment* requirement (i.e., a fixed percentage of the bill the patient is required to pay after meeting his or her deductible). It

Factoid

The HMO came into existence in Los Angeles in 1923 with the founding of the Ross-Loos Clinic. The clinic, founded by two physicians, Donald E. Ross and H. Clifford Loos, provided medical and hospital care to Los Angeles Department of Water and Power employees and their families in exchange for monthly payments.

"Private Health Insurance and Managed Care," in Introduction to Health Services, *7th ed., by Alma Koch (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 115, http://www.economicexpert.com/a/Ross:Loos:Medical:Group.htm.*

should be noted that providers, even those providers *directly employed* by the HMO and or compensated on a *capitated* basis, are typically required to file claims with all appropriate *procedure codes* for services rendered to HMO enrollees. HMOs use those submitted claims to *adjust rates* and *track the quality of care* provided, based on readmissions and other indicators of *poor quality*.[450]

2.5.1.2.3 Preferred Provider Organizations (PPO) A *Preferred Provider Organization* (*PPO*) is a hybrid of an HMO and a health insurance plan and is currently the most popular model of managed care.[451] A PPO is a *managed care plan* that allows members to choose from an array of *participating healthcare providers* that have *contracted* with the *health plan* to provide services at a *discount*.[452] PPOs manage costs by incentivizing enrollees to choose to receive services from a select panel of providers on a *preferred provider list*, also referred to as *in-network providers*. Limiting access to a *preferred provider network panel* provides health plans with greater *purchasing power*, which allows them to negotiate lower prices. Members benefit from PPOs due to lower *coinsurance* and *deductibles* when they see

Preferred Provider Organization (PPO)

The PPO, a hybrid of an HMO and a traditional health insurance plan, is a managed care plan that allows members to choose from an array of healthcare providers that have contracted with the plan to provide services on a discounted basis.

in-network providers. Providers benefit from the increased probability and stability of plan enrollees choosing them when seeking medical treatment, due to their *preferred provider status*.[453]

Unlike the HMO models of the 1990s, PPO members are not required to have a *gatekeeper* physician authorize the care they receive, nor are PPO members *required* to use the *preferred providers* on their plan's list, although going outside the network will result in higher *coinsurance rates* and *deductibles*.[454] PPOs also do not transfer *financial risk* to their *preferred providers,* through the *PMPM* reimbursement model used by HMOs.[455]

Concerns regarding the *restrictive practice of managed care plans* toward provider participation have prompted many states to introduce *any willing provider* legislation. *Any Willing Provider* laws are state statutes that require that a payor accept into its network *any* health care provider that is willing to *agree to all the plan's terms and conditions*, including reimbursement rates. Currently, 22 states have some form of an *Any Willing Provider* statute, which affects any reimbursement plan that includes a *preferred provider network* and is designed to increase patient access and limit anticompetitive behavior by payors.[456]

Factoid

The PPO evolved in California in 1982 in response to the legislature's desire to have a system that "would allow selective contracting for Medicaid through private insurers."

"Understanding Health Insurance and the PPO," by Shiela Guilloton, Examiner, *June 15, 2009, http://www.examiner.com/x-11804-Health-Care-Examiner~y2009m6d15-Understanding-health-insurance-and-the-PPO (accessed July 10, 2009).*

A submodel of a PPO is the *exclusive provider organization* (EPO). Most often using the *preferred provider network* established for an existing PPO, the EPO *limits* the benefits offered by the PPO to only those services provided by *participating providers* and eliminates the *out-of-network option*, except for emergency services. Recently, EPOs have gained some popularity (while maintaining a small presence in the insurance market) as an option for *self-funded employer plans* (discussed later) as a means of cost savings.[457]

Billing and Reimbursement Health plans create a PPO by contracting with providers to render services to the plan's enrollees on a reduced fee basis.[458] As mentioned earlier, most patients enrolled in a PPO are permitted to receive care from providers outside the plan's *preferred provider network*, with the trade-off of higher out-of-pocket expenses. Even when receiving care from an *in-network provider*, PPO enrollees tend to pay higher *premiums*, *deductibles*, and *copayments* than those paid by HMO enrollees for similar services; however, these payments are generally lower than those seen in typical FFS reimbursement models.[459]

2.5.1.2.4 Point-of-Service (POS) Plans *Point-of-Service (POS) plans* combine many of the elements of HMOs and PPOs. POS plans are generally an addition to an HMO product that allows enrollees the benefit of seeking care from *nonparticipating* providers.[460] Similar to the incentives within an HMO model, when POS enrollees seek care from *in-network providers*, they typically pay no *deductible* or *coinsurance*.[461] However, similar to a PPO, POS enrollees may receive services *out-of-network*, subject to higher *cost-sharing* in the form of *deductibles* and *coinsurance*.[462] This *freedom of choice*, along with the incentive of *no cost sharing* for *in-network services*, is why POS plans are considered to be one of the *least restrictive* forms of managed care.[463]

Point-of-Service Plans (POS)

POS plans combine many of the elements of HMOs and PPOs. POS plans are usually an addition to an HMO product that allows members the benefit of seeking care from nonparticipating providers. As with an HMO, when members seek care from in-network providers, they typically pay no deductible or coinsurance. However, similar to a PPO, members are free to seek services outside the network, subject to higher cost sharing in the form of deductibles and coinsurance.

"Regulation of Insurance," in Fundamentals of Health Law, *4th ed., by Daniel J. Schwartz (Washington, DC: American Health Lawyers Association, 2008), p. 258; "Private Health Insurance and Managed Care," in* Introduction to Health Services," *by Alma Koch (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 127.*

Similar to the *gatekeeper* model used within some HMOs, enrollees in 1990s POS plans *had* to choose a *primary care physician* from a list of *in-network providers* to oversee the provision of healthcare services and facilitate referrals to *specialists* and *hospitals*, that is, the *gatekeeper function.*[464] Although POS plans expanded along with HMOs in the 1990s, their prevalence has contracted in recent years, due in part to lackluster evidence of significant cost savings.[465]

Billing and Reimbursement Providers in POS plans are generally reimbursed according to the terms of their contract with the managing health plan, with specialty services traditionally being paid on an FFS basis and the *primary care gatekeeper* typically receiving a *capitated* per person fee.[466] Patients enrolled in a *POS plan* generally pay only a small *copayment*, with no *coinsurance* and no *deductibles* for care received from *in-network providers* and *out-of-network providers* to whom they have obtained a referral

from their *primary care provider.* However, when a *POS plan enrollee* seeks treatment from a *non-network specialist*, without first obtaining a referral from his or her primary care physician, the enrollee will often be subject to higher *out-of-pocket expenses* in the form of a large *deductible* and a 20 to 25 percent increase in *coinsurance* charges.[467]

2.5.2 Not-for-Profit Commercial Insurers

Non-for-profit commercial insurers encompass a majority of the large health plans in the United States. In 2011, these plans represented 63 percent of all health plans with at least 100,000 enrollees and accounted for 45 percent of the insurance market, covering 104 million enrollees.[468] A list of the 10 largest *not-for-profit health plans* by size is set forth in Table 2.15.

[468] Susan Namovicz-Peat, "Basic Facts and Figures: Nonprofit Health Plans," Alliance for Advancing Nonprofit Health Care, calculated from *AIS's Directory of Health Plans: 2012* (Washington, DC: Atlantic Information Services, 2012), pp. 3–10.

2.5.2.1 Health System Plans

2.5.2.1.1 Overview A *hospital system health plan* is controlled by the health system that also manages the delivery of medical services, for example, *Kaiser Permanente* and *Geisinger Health Plan*, with the size and scope of the *health system* generally determined by the size and scope of the *health plan*. Of note is that *Kaiser Permanente* was officially founded as a healthcare organization in 1945, after serving as a *health benefits program* for *industrial workers* in the 1930s and 1940s.[469] The organization offers a large assortment of not-for-profit healthcare plans for its enrollees and their dependents, with a nationwide market presence. In contrast, *Geisinger Health Plan* operates exclusively in Pennsylvania.[470] However, both health systems offer similar innovative services and programs, including *patient-centered medical homes* and *electronic health records* (EHRs).[471] In 2011, *Geisinger* and *Kaiser Permanente* combined resources with three other health systems to form the *Care Connectivity Consortium*, which provided a medium through which the organizations could *collaborate* and *securely exchange their data*.[472]

2.5.2.1.2 Billing and Reimbursement By serving as the *primary payor* for those services provided at their own healthcare facilities, health system plans can *streamline billing* and *reimbursement* departments, limiting the cost and complexity of their payment systems. This model of plan also offers various benefits for *care coordination efforts*, that is, *accountable care organizations* (ACOs).

Health systems with internal health plans may be able to better align *financial incentives* and *clinical operations* in an *ACO arrangement* by

having one entity represent both the *provider* and the *payor.* Furthermore, entities where the ACO and payor are under the same overall organizational structure may be more apt to implement *pay-for-performance* (P4P) initiatives to improve *cost* and *quality outcomes*, because they are more able to monitor and influence the performance of individual providers by incorporating *physician compensation* into *incentive programs*. The existence of the internal payor function may also permit these entities to *control the scope* of a potential ACO, allowing for the option to focus either on (1) *all providers* or (2) a *single service line*.

2.5.2.2 Blue Cross Blue Shield (BCBS)

2.5.2.2.1 Overview In 1977, the independent boards of directors of the *Blue Cross and Blue Shield* accrediting associations merged to form a single not-for-profit, *Blue Cross Blue Shield Association (BCBSA)*.[473] Prior to this merger, *Blue Cross* (created in 1929) provided private health insurance for *hospital* expenses and *Blue Shield* (created in 1939) provided insurance for *physician services*.[474] Today, the BCBSA consists of 38 independent BCBS companies.[475] The BCBSA coordinates these nationwide plans by establishing *standards* for new plans and programs; assisting local plans with *enrollment activities*, *national advertising*, *public education*, *professional relations*, and *statistical* and *research activities*; and, serving as the *primary contractor* for processing *Medicare hospital*, *hospice*, and *home health* claims.[476]

Although BCBSA includes several of the largest not-for-profit insurance plans, not all BCBS plans are not-for-profit. During the 1990s, many *not-for-profit BCBS plans* required additional capital in order to compete with *for-profit insurers* and requested permission from their respective state governments to convert to *for-profit corporations*. In the instances in which the plans were allowed to convert to a for-profit entity, the transitions were

BlueCross BlueShield

BlueCross provides beneficiaries with health insurance to cover hospital expenses, while BlueShield provides insurance to cover expenses associated with physician services. Together, they form BlueCross BlueShield, and the BlueCross Blue Shield Association (BCBSA) works to coordinate the nationwide plans by establishing standards for new plans and programs; assisting local plans with enrollment activities, national advertising, public education, professional relations, and statistical and research activities; and serving as the primary contractor for processing Medicare hospital, hospice, and home health claims.

"Private Health Insurance and Managed Care," in Introduction to Health Services, *7th ed., by Alma Koch (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 114; "Blue Cross Blue Shield," in* Understanding Health Insurance: A Guide to Billing and Reimbursement, *9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton, NY: Delmar Cengage Learning, 2008), p. 399.*

closely monitored by state agencies in order to protect the plans' *charitable assets*.[477] For a further discussion of conversions, see Section 3.2.2, "501(c)(3) Exempt Organizations," in Chapter 3, "Regulatory Environment."

BCBS plans represent a multibillion-dollar industry offering coverage to millions of individuals. In the 83 years since the establishment of its two original component organizations, BCBSA has become the largest *managed care network* in the United States.[478]

2.5.2.2.2 Billing and Reimbursement BCBS reimburses providers using a *FFS reimbursement model* and various *managed care arrangements*. The *allowable fee* varies based on the plan, with some plans using the MPFS to determine the amount commonly reimbursed to providers in a given region, for a given service, under a specific plan. BCBS requires participating providers to accept the *allowable fee* as payment in full. Similar to the system used by Medicare, *nonparticipating providers* may collect the full *allowable fee* from the patient, who will in turn receive payment *directly* from the BCBS plan in which he or she is enrolled.[479]

[477] Ibid., pp. 224–247.

[478] Ibid., p. vii.

[479] Michelle A. Green and JoAnn C. Rowell, *Understanding Health Insurance: A Guide to Billing and Reimbursement*, 9th ed. (Clifton, NY: Delmar Cengage Learning, 2008), pp. 402–408.

For billing purposes, the CMS-1500 claim form is accepted by most BCBS plans and typically must be filed within one year from the date of service unless the provider's contract states otherwise.[480] Although reimbursement for claims processed by BCBS varies by plan, some plans pay electronically submitted claims within 15 days.[481]

2.5.2.3 Consumer-Driven Health Plans To combat the problem of ever-increasing premiums for *employee health insurance*, many employers have begun to implement *defined contribution* health insurance plans, modeled after *defined contribution* pension programs, such as 401(k), instead of the traditional *defined benefit* plans.[482] Unlike a *defined benefit* system, where an employer has the obligation to contribute the necessary premium for a specified package of health insurance benefits, a *defined contribution* system allows the employer to contribute a designated amount of funding and gives the employee significant freedom to choose how to spend it, leaving substantial decision making to the employee.[483] For example, employers will occasionally present employees with a *voucher* to purchase insurance on their own. More often, employers will create an account for each employee into which the employer, the employee, or both, will contribute funds and from which the employee will be able to draw to purchase his or her selection of health services, for example, a *health savings account*.[484]

2.5.2.4 Health Savings Accounts (HSA) One of the most common models of *defined contribution* health insurance is a *health savings account* (*HSA*), coupled with enrollment in a *high deductible health plan* (HDHP), whereby employers and employees both contribute to a special account from which

Health Savings Accounts (HSA)

HSAs are special accounts into which employers and employees both contribute, and from which the employee can draw funds to pay for health services. If the employer contributes, the value of those contributions is not taxable to the employee. Similarly, if the employee makes contributions, they count as "above-the-line" deductions.

"All about HSAs," U.S. Treasury Department, July 22, 2007, p. 14, http://www.treas.gov/offices/public-affairs/hsa/pdf/all-about-HSAs_072208.pdf (accessed July 1, 2009).

the employee can draw funds to pay for health services.[485] One driver of HSA implementation is that funds contributed by an employer are not taxable to the employee. Similarly, contributions made by the employee count as *above-the-line* deductions, meaning they are subtracted from an individual's total income, lowering the amount of income tax owed.[486]

Individuals excluded from HSA eligibility include (1) those covered by insurance other than an HDHP; (2) those who can be claimed as a *dependent* on another's tax return, (3) *veterans* who have received medical care or prescription drugs from a *Veterans Administration facility* within the last three months, (4) active duty *military personnel*, and (5) *Medicare recipients* who did not have an HSA prior to enrolling in Medicare.[487] However, individuals are *not* precluded from enrolling in HSAs if they have automobile, dental, vision, disability, or long-term care insurance or are covered by their employer's wellness plan, as long as the wellness plan does not pay for a significant portion of the individual's medical care.[488] In addition, enrollees are allowed to have insurance coverage for a specific disease or illness, as long as the coverage, when invoked, pays only a set monetary amount.[489]

[489] Ibid.

Factoid

According to a 2012 census conducted by America's Health Insurance Plans (AHIP), the number of individuals covered by HSAs/HDHPs has increased steadily every year since their inception, with more than 13.5 million individuals covered under a HSA in January 2012.

"January 2012 Census Shows 13.5 Million People Covered by Health Savings Account/High-Deductible Health Plans (HSA/HDHPs)," America's Health Insurance Plans, May 2012, p. 1.

Legislative support of HSAs has largely focused on setting tighter limits for contributions and increased oversight of how the money is spent.[490] In 2006, President George W. Bush signed into law the *Health Opportunity Patient Empowerment Act of 2006*, which provided new opportunities for HSA participants to build their funds. One provision of the act was an allowance for employers to transfer funds from *Flexible Spending Arrangements* (FSA) or *Health Reimbursement Arrangements* (HRA) to an HSA plan for employees wishing to switch. The act also (1) increased the maximum HSA contribution amount to a statutorily defined quantity that was indexed for inflation, (2) eliminated the system of pro-rating HSA contributions based on the number of months that an individual was eligible, and (3) replaced it with a system allowing individuals who enrolled in a month other than January to make a contribution equal to a full year's enrollment. In addition, the act (1) allowed for a onetime transfer from an *Individual Retirement Arrangement* (IRA) to an HSA, which avoided early withdrawal and income taxes; (2) eliminated FSA coverage previously deemed as disregarded coverage, which reduced HSA contributions for a given year; (3) set an earlier date for cost of living index adjustments; and (4) allowed greater employer contributions for lower-paid employees.[491]

In 2010, the ACA also affected the regulation of HSAs by increasing the *penalty* for *noneligible services* from 10 percent to 20 percent and limiting

[490] Victoria E. Knight, "Health Savings Accounts Come Under Fire," *Wall Street Journal Online*, June 26, 2009, http://blogs.wsj.com/wallet/2009/06/26/health-savings-accounts-come-under-fire/ (accessed July 1, 2009).

drug eligibility to prescription drugs (with the exception of *insulin*).[492] Noneligible services are any service not included in the benefits approved for coverage under an HSA, as established by legislation. If an individual chooses to remove money from an HSA account for a noncovered service, he or she is charged a *penalty* (described earlier), designed to provide a disincentive for financially insecure individuals from using their HSA as a bank account.

2.5.2.4.1 Billing and Reimbursement Providers may receive reimbursement from an individual with an HSA in a variety of forms, including *debit card*, *checks*, and *automatic claims forwarding*.[493] Even though patients with HSAs generally pay with these cash alternatives, providers do not necessarily receive payment on the same day that services are provided, because some HSAs encourage their enrollees not to pay for the provider's services until the plan informs the patient of the *allowable fee* amount.[494] This delay may generate concerns for providers regarding nonpayment and *bad debt*. As with any form of insurance, billing departments should be aware of patient's *copayments*, *deductibles*, and the presence of *secondary insurance* to ease payment-related concerns.[495]

2.5.2.5 Employer Self-Insurance *Self-insurance plans*, often referred to as *self-funded* plans, have been one of the leading trends in the health insurance industry since the late 1970s.[496] Self-insuring employers make a conscious choice to undertake at least a portion of the risks associated with the cost of

Self-Insurance

Self-insuring employers make a conscious choice to undertake the risks associated with the cost of healthcare and set aside money to pay these costs as they arise. Often, a self-insurer will hire a commercial insurer or a third-party administrator to run the firm's medical benefits program and adjudicate claims.

"The Financial Environment," in Healthcare Finance: An Introduction to Accounting and Financial Management*, 3rd ed., by Louis C. Gapenski (Chicago: Health Administration Press/Arlington, VA: Association of University Programs in Health Administration, 2005), p. 36; "Private Health Insurance and Managed Care,"* in Introduction to Health Services*, by Alma Koch, (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 113.*

healthcare and set aside money to pay these costs as they arise.[497] Often, a self-insurer will hire a commercial insurer or a third-party administrator to administer the firm's medical benefits program and adjudicate claims.

Self-insurance plans vary by the amount of risk the employer is willing to assume.[498] In a *fully self-funded plan*, the employer undertakes the responsibility for 100 percent of the healthcare expenses submitted for reimbursement.[499] Typically, this type of funding is limited to employers or groups of 5,000 or more, because medical expenses for large groups can be reasonably predicted. In contrast, employers with fewer than 5,000 employees are often unwilling to assume the risk of funding their entire health insurance program and may opt for a *partially self-funded plan*, the most common type of partially self-funded plans being the "*minimum premium plan.*"[500] Under a minimum premium plan, the employer covers claims up to a predetermined amount, and an insurance policy assumes liability for claims thereafter. Another popular form of partially self-funded plan involves combining self-funding with *stop-loss insurance*.[501] Under these plans, the employer covers employee claims up until a predetermined amount per employee or

[501] Ibid.

per claim period, at which time *stop-loss insurance* covers any payment that exceeds the predetermined maximum.

Employers choose to self-insure as an alternative to purchasing health insurance policies for several reasons. First, self-insurers avoid the charges, fees, and profits that insurance companies build into the price of insurance premiums. In addition, because *self-insurance* is technically not insurance, state taxes assessed on premium revenue may be avoided. Perhaps the most important benefit of *self-insurance* is the fact that the *Employee Retirement Income Security Act of 1974* (ERISA) exempts self-insured plans from state regulation.[502] This exemption provides employers with considerable flexibility to design *self-insurance benefit programs* as they see fit and provides them with the opportunity to save considerable money by avoiding *state mandates* requiring the *coverage* of particular services.

Self-insured employers typically contract directly with providers and reimburse them according to the terms of their specific contract or contract with managed care plans to *rent* (gain access to) their credentialed provider panel. Employers have designed self-insurance programs to provide coverage for their employees using a variety of plans, including indemnity, HMOs, PPOs, and POS. However, some states may prohibit a *self-insured employer* from signing capitated contracts with physicians.[503] The forms and the claims process used will likely vary by employer and by the provider contract established, as will the coverage, coinsurance amount, and length of time for remittance. Although *self-insurance* may limit the employer's negotiating leverage, the flexibility allows the employer more latitude for designing the firm's plan in accordance with its particular needs.

2.5.2.6 Self-Pay Individuals may pay out of pocket for their own healthcare costs for a number of reasons, including (1) a lack of certain health insurance benefits, (2) a desire to keep a medical condition from their health insurer, or (3) the conscious, or forced, decision not to purchase health insurance.

2.5.2.6.1 Billing and Reimbursement Services provided to a *self-pay patient* are reimbursed by the patient and are paid in a variety of ways, primarily determined by the provider. Providers must establish what *form of payment* they will accept for their services, what they will *charge* for these services, and, how they will *collect* the payment due. Lacking the *bargaining power* to negotiate

[502] Ibid.

[503] Jon R. Gabel, Gail A. Jensen, and Samantha Hawkins, "Self-Insurance in Times of Growing and Retreating Managed Care," *Health Affairs* 22, no. 3 (March/April 2003): 203.

discounts, most *self-pay patients* lack the knowledge, ability, or market leverage to negotiate lower charges in establishing their payment amount. As a result, self-payors may be presented with charges for care up to two and a half times higher than what public or commercial payors would pay for the same procedure.[504] This billing practice has led to multiple class action lawsuits against providers and has resulted in settlements under which the providers offer both *prospective* and *retrospective* discounts to their *self-pay patients*.[505] To avoid costly litigation at a later date, some providers may choose to offer all self-pay patients discounts similar to those negotiated by other payors.

Self-pay patients may also present issues regarding collection of payment for services rendered, causing many providers to require that self-pay patients pay their bill in full at the time of service to reduce the chance that a provider will have to write off a patient encounter as bad debt.[506] In addition, some providers require self-pay patients to give both their driver's license and social security number to ensure that they are more readily pursuable should collection become an issue.[507]

2.6 METHODS OF REIMBURSEMENT

As mentioned earlier, there are many types of payors, each with its own methods of reimbursement. In recent years, with the increased focus on transparency and accountability due to rising healthcare costs and various ACA provisions (e.g., *value-based purchasing*), there has been an expanded level of options and choices across the *continuum of reimbursement models* based on the level of risk-sharing each offers. An illustration of this *continuum* is set forth in Exhibit 2.14.

[505] One example of this is a settlement between BJC HealthCare and a class of uninsured patients that called for a "Self-Pay Discount Policy" to be implemented at the system's hospitals. The discount is to apply prospectively for at least four years for all self-pay patients, regardless of income level. In addition, on request, the discount is to be available retroactively to all uninsured patients with bills dating back to January 1, 1999. EXHIBIT 2.14 U.S. Health Insurance Reimbursement Options

HOURLY AND SALARY REIMBURSEMENT

Hourly and salary reimbursement pays physicians at an hourly rate or a salary for performing services. This type of arrangement is common in emergency departments or other settings when a physician needs to be available for a defined period of time. This arrangement also works when buying on-call coverage to back up an in-house physician.

The Managed Health Care Handbook, *3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996,) p. 186.*

RETAINER

A retainer is a managed care reimbursement scheme that involves a set monthly payment amount for each physician, reconciled at periodic intervals based on actual utilization, either as a prenegotiated discount on charges or on some other objective measure. This ensures the availability of physicians to members and provides for the steady income desired by physicians, while still allowing payment on the basis of actual use.

The Managed Health Care Handbook, *3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996), p. 186.*

SINGLE FEE REIMBURSEMENT

Single fee reimbursement is a scheme under which fees are paid for a procedure no matter how much time and effort is required. There are two applications of this method:

Case Rates/Flat Rates. The same rate is paid for a procedure no matter what choice of treatment is used; for example, a physician is reimbursed the same amount for delivering a baby regardless of whether it was a vaginal birth or delivery via a cesarean section surgery.

Global Fees. A flat rate encompassing more than a single type of service. For example, a global fee for surgery may include all preoperative and postoperative care, as well as one or two follow-up office visits. A global fee for obstetrics may include all prenatal and postnatal care.

The Managed Health Care Handbook, *3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996), pp. 186–187.*

PERIODIC INTERIM PAYMENTS (PIPs) AND CASH ADVANCES

PIPs and cash advances are a managed care reimbursement plan that advances the provider a set amount of cash equivalent to a defined time period's expected reimbursable charges. As claims come in from a physician, the claims are subtracted from the PIP, which is routinely replenished. In this way, the physician has a positive cash flow, as well as the use of the plan's money, interest free. This method may be employed in a plan with a heavy POS enrollment.

The Managed Health Care Handbook, *3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996), p. 187.*

2.6.1 Cost of Care

This reimbursement model is determined by the provider and is *equal to its charge* for a given procedure. In contrast to Fee for Service (FFS), *cost of care reimbursement* is not set by legislation or a private company. *Cost of care* is not a typical reimbursement model because it does not offer any of the benefits or discounts seen under public or private payors. Furthermore, a provider may charge more for procedures under a *cost of care model* to offset perceived losses or reimbursement cuts under public options. *Cost of care models* may increase the likelihood of bad debt because they are most often used under self-payors.

2.6.2 Fee-for-Service (FFS)

Fee-for-service (FFS) health coverage occurs when healthcare providers receive *separate compensation* for each service they provide, such as an *office visit* or a *procedure*.[508] Critics condemn *FFS systems*, stating that physicians tend to *over-treat* patients or *upcode* and *unbundle* services in order to receive higher reimbursements.[509] Nonetheless, and despite current initiatives to move away from FFS arrangements, FFS systems are the most common form of reimbursement used in the current healthcare environment. The current shift away from traditional FFS arrangements is discussed further in Section 2.7.1, "The Shift from Fee-for-Service."

FFS arrangements were previously used as an incentive for healthcare providers to join a *managed care organization* (MCO) in markets where managed care penetration was low.[510] MCOs, due to their size, may have

Fee-for-Service (FFS)

FFS is a payment policy under which providers receive a fee for each service provided (e.g., an office visit, a test, a procedure, etc.).

[510] Ibid., p. 139.

been able to negotiate discounts with providers, based directly on charges or on volume, including:

1. **Straight discount on charges.** Discounting a specific amount off the reimbursement rate for every procedure code;
2. **Discount based on volume or a sliding scale.** The degree of discount was based on a pre-agreed set of procedural volume ranges. For example, if the provider performed five or less of a specific procedure per month, there was a 10 percent discount. However, should the provider perform six to ten procedures per month, there would be a 15 percent discount. Many plans combined a discount arrangement with a *fee maximum*, that is, a fee schedule, whereby the plan paid the lesser of the *discounted charge* or the *fee maximum*.[511]

While these modified FFS arrangements are still in use in some geographic areas, they are steadily being replaced with other reimbursement models.[512]

2.6.3 Pay-for-Performance (P4P)

Pay-for-performance (*P4P*) is a remuneration system in which part of the payment is dependent on performance, as measured against a defined set of criteria.[513] Although a P4P system can be structured in several ways, the common elements of all systems include (1) a set of *targets* or *objectives* that defines what will be evaluated, (2) *measures and performance standards* for establishing the *target criteria*, and (3) *rewards* (typically, financial incentives) that are at risk, including the amount and the method for *allocating the payments* among those who meet or exceed the *reward threshold*.[514] Proponents of *P4P remuneration systems* argue that they have the potential to *improve the quality of care* and *slow the growth* in healthcare costs through improvements in quality and provider efficiency.[515]

Pay-for-Performance (P4P)

Pay-for-performance (P4P) is a remuneration system in which part of the payment is dependent on performance, as measured against a defined set of criteria. Although a P4P system can be structured in several ways, the common elements of all systems are (1) a set of targets or objectives that defines what will be evaluated, (2) measures and performance standards for establishing the target criteria, and (3) rewards—typically, financial incentives—that are at risk, including the amount and the method for allocating the payments among those who meet or exceed the reward threshold.

"Pay-for-Performance in Health Care," by Jim Hahn, Congressional Research Service, Library of Congress, November 2, 2006, pp. CRS-2–4.

2.6.3.1 P4P's Impact on Practice Revenue The potential positive impact of P4P on *quality outcomes* has been suggested by two distinct studies. A study conducted in 2007 by researchers from the *University of California, Los Angeles* (UCLA), and supported by the *Hawaii Medical Service Association* in Honolulu, showed improved quality of care among P4P providers in PPO settings, as well as an increased number of patients choosing to receive care from P4P physicians.[516] The study analyzed 11 *quality indicators* for patients enrolled in PPOs over six years and found that the patients who visited only physicians who were participating in the study had significantly higher odds of receiving *recommended* care, as measured by the specified indicators.[517]

The results of the *Hospital Quality Incentive Demonstration* (HQID) conducted from 2003 to 2009 by CMS and Premier, Inc., concluded that the participating hospitals improved their *quality average* 18.3 percent over the five-year demonstration and earned $12 million in *incentive payments* from CMS.[518] Of note, contradictory assessments of the HQID have indicated

[516] Amanda S. Gilmore, et al., "Patient Outcomes and Evidence-Based Medicine in a Preferred Provider Organization Setting: A Six-Year Evaluation of a Physician Pay-for-Performance Program," *Health Services Research* 42, no. 6, part I (December 2007): 2140–2159.

[517] Ibid.

[518] Alven Weil, "Hospitals in demonstration project continue to improve patient outcomes, provide lessons learned for health reform value-based purchasing program," Premier Inc. Press Release, December 17, 2010, https://www.premierinc.com/about/news/10-dec/hqid121710.jsp (accessed September 17, 2012).

limited impact of P4P on reducing *mortality* or *cost growth*.[519] Further, initial positive findings, such as a 2012 study released by the *Harvard School of Public Health,* indicate that to date, there is scant evidence that hospital participation in P4P incentive programs has produced meaningful improvements in *patient outcomes*.[520] The 252 hospitals that participated in Premier Inc.'s HQID and treated more than 2.7 million patients during the course of six years failed to achieve lower 30-day mortality rates when compared to their *nonparticipating counterparts*.[521] In addition, the Harvard study did *not* reveal *any significant differences in mortality trends* between the conditions whose outcomes were explicitly *linked to payment incentives* and the outcomes for those *conditions that were not*.[522] Although the study did indicate some impact of financial incentives on *process improvement*, it may cast at least some level of doubt on the enthusiasm for current *value-based purchasing strategies*. Similar *Congressional Budget Office* (CBO) evaluations appear to indicate that in nearly every program involving *disease management* or *care coordination* spending either *increased* or remained *unchanged* when incentive costs were included.[523]

Factoid

Recent findings suggest that pay-for-performance initiatives may not have a significant impact on quality outcomes.

"The Long-Term Effect of Premier Pay for Performance on Patient Outcomes," by Ashish K. Jha, et al., New England Journal of Medicine *(March 28, 2012): 9.*

Beyond these uncertainties regarding quality improvements, providers have expressed concern that the transition from an *FFS payment system* to a *P4P model* could have a profound impact on *practice revenue*, due to (1) the time required to *collect* and *review* the data needed to satisfy *reporting requirements*, or (2) the potential *capital investment* required to implement an *electronic health records system*.[524] In addition, it has yet to be established if providers that practice in *low income*, *minority communities* can benefit from *P4P incentive programs*, because the patients treated are associated with *lower-quality scores*.[525] While there is growing concern regarding the efficacy of current P4P initiatives to transition from FFS, the jury is still out on a final assessment and widespread acceptance of the P4P model.[526]

2.6.4 Capitation

In order to reduce healthcare service *utilization and cost*, *payors* have historically transitioned some of their *risk* to *providers* in the form of *capitated payments*.[527] *Capitation* is a *prepaid reimbursement method* that reimburses providers a set price for providing medical services to a *defined population* for a *defined set of services*, regardless of service *utilization*. The capitated fee rate is determined on a *per member per month* (PMPM) basis, whereby the provider is paid a predetermined PMPM amount for each beneficiary (member). Providers are accountable for managing the *financial risk* of providing adequate care by calculating (1) the *expected volume of referrals*, (2) the *average cost per beneficiary*, and (3) their ability to *control utilization*.[528] Capitated contracts offer providers both financial risk and potential rewards. By *controlling* and *accepting responsibility* for utilization, providers may maximize the amount of the capitated payment they retain versus

Capitation

Capitation is a prepaid reimbursement method that pays a provider a set price for providing medical services to a defined population for a defined set of services, regardless of service utilization. Providers must manage the financial risk of providing adequate care by calculating the expected volume of referrals, the average cost, and their ability to control utilization.

The Complete Capitation Handbook: How to Design and Implement At-Risk Contracts for Behavioral Healthcare, *by Gayle L. Zieman (Tiburon, CA: CentraLink Publications, 1995), pp. 30, 294.*

the amount they need to spend on providing care.[529] Payors may offer providers either a *full* or a *partial* (blended) *capitated model of reimbursement.*

2.6.4.1 Full Risk Capitation *Full risk capitation,* also referred to as *global capitation,* occurs when a *health plan*, *facility*, or *provider* accepts the *entire financial risk* for a plan's members and is responsible for payments, for example, for all medical services, including physician visits and outpatient procedures, as well as the cost of impatient hospitalization.[530] However, due to the significant risk involved, any entity undertaking *full risk capitation* must have strong financial management skills and management information systems, most likely available in large groups or an organized system of providers.[531] In the absence of such safeguards, many payors may refuse such arrangements in order to avoid the risk of failure.[532]

Full risk capitation models have been historically associated with HMO plans and the perceived failures of 1990s managed care plans (discussed earlier). However, more recent surveys suggest that providers believe new, *improved* models of *global payments* may overcome the errors of the past and be effective at lower costs, while not impeding quality of care by *aligning payment and quality incentives.* Furthermore, experts have estimated

[529]Peter Boland, *The Capitation Sourcebook: A Practical Guide to Managing At-Risk Arrangements* (Berkeley, CA: Boland Healthcare, 1996), p. 107.

[530]David Edward Marcinko and Hope Rachel Hetico, *Dictionary of Health Insurance and Managed Care* (New York: Springer, 2006), p. 126.

[531]Peter Boland, *The Capitation Sourcebook: A Practical Guide to Managing At-Risk Arrangements* (Berkeley, CA: Boland Healthcare, 1996), p. 107.

[532]Ibid.

that new global payment models could lower healthcare costs by 20 to 30 percent for participating providers.[533] The renewed interest in capitation models of reimbursement is discussed further in Section 2.7.1, "Shift from Fee-for-Service."

2.6.4.2 Blended Capitation *Blended capitation* is a payment method that combines *PMPM rates* and *FFS remuneration*, based on the *service* being provided. These models of reimbursement were designed to counterbalance the perceived faults identified with a *pure FFS payment system* or a *pure capitated system*, that is, *overincentivizing* the volume of services provided or *underincentivizing* the quality of services provide. While a *pure capitated form of reimbursement* is more likely to encourage *cooperation among providers* and *cost reductions*, the rewards associated with *high clinical quality* and *customer service* may not be greater than the rewards associated with *withholding, or limiting, care*. Furthermore, providers may be incentivized to refuse high-cost patients due to the fear of *financial burden*.[534] As a result, organizations have moved toward *blended capitation models* for specified procedures in an attempt to better balance the multiple objectives of encouraging "*individual productivity and clinical cooperation.*"[535]

Some of the current *value-based purchasing* initiatives use a form of *blended capitation* known as *population-based payments*. *Pioneer Accountable Care Organizations* (ACO), developed by the *Centers for*

BLENDED CAPITATION

Blended capitation is a payment method that combines PMPM rates and FFS remuneration, designed to counterbalance the perceived faults identified with a pure FFS payment system or a pure capitated system.

"Blended Payment Methods in Physician Organizations Under Managed Care," by James C. Robinson, Journal of the American Medical Association 282*, no. 13 (October 6, 1999): 1262.*

[535] Ibid., 1263.

Medicare and Medicaid Innovation (CMI) to incentivize provider participation in ACOs, use *population-based payments* to tie *quality outcomes* to *partial capitation payments* for a *specified population*. Under the Pioneer ACO model, after the first two years of an ACO's *contract term*, the entity is given the option to transition from a *volume-based FFS reimbursement model* to a *population-based payment model* that incentivizes the *value* of services provided. The *population-based payment* model resembles a *capitated reimbursement structure*, whereby ACOs would receive a *prospective per-beneficiary monthly payment*.[536] HHS has estimated that the Pioneer ACO model participants could save up to $1.1 billion over five years through better, more coordinated care for Medicare beneficiaries.[537]

2.6.5 Payor Mix and the Effect on the Revenue Cycle

A healthcare provider's *payor mix* (i.e., the percentage mix of different payors representing the patient population served) can have a profound impact on *revenue streams* and the overall *financial performance* of a provider enterprise.

An appropriate *payor mix* may ensure *financial viability*, because Medicare, Medicaid, and major health plans often reimburse at levels that are under the full or average cost of providing the services.[538] Of note, in contrast to concerns from providers that Medicare and Medicaid reimbursement cuts will hinder their ability to *generate adequate revenue*, a 2010 study found that despite increases in the number of publicly insured patients seen by hospitals, these providers *were* able to *generate adequate revenue* in a timely manner.[539] As *healthcare expenditures* continue to rise and the *threat of physician payment cuts* grows, that is, the SGR debate, establishing

[539] Simone Rauscher and John R.C. Wheeler, "Hospital Revenue Cycle Management and Payer Mix: Do Medicare and Medicaid Undermine Hospitals' Ability to Generate and Collect Patient Revenue?" *Journal of Healthcare Finance* 37, no. 2 (2010): 82.

PAYOR MIX

The percentage mix of different payors representing the patient population served by a given provider.

Essentials of Health Care Finance, *6th ed., by William O. Cleverley and Andrew E. Cameron (Sudbury, MA: Jones and Bartlett Publishers, 2007), p. 106.*

and maintaining a beneficial *payor mix* may become an important function of maintaining *financial viability* for many providers.

The effect of a provider's *payor mix* on its *anticipated revenue stream* may also be influenced by *discounts* offered on billed charges to *health plans* and the *uninsured*, as well as the likelihood that providers may not *collect* a large portion of the charges billed to the *uninsured patients* and *private pay patients* with a *high deductible health plan* (HDHP).[540] Accordingly, to remain viable, a provider may need to offset the losses incurred on *uninsured* or *underinsured* patients by increasing the *prices charged* to *insured* patients, specifically marketing their services to attract more reliable and lucrative payors, and the patients enrolled in those plans, which traditionally reimburse at a *more favorable level*. Alternatively, providers may have to limit the number of patients they will accept from *lower-reimbursing payors*.

In addition to having an appropriate *payor mix*, the *financial viability* of providers may depend on its mix of payment methods. Too many or too few of one type of method may *negatively* affect practice revenue because complementary reimbursement models incentivize and reward providers for various activities. For example, when providers are reimbursed on an *FFS basis*, practice revenues *increase* as patient visits and the intensity of the services provided increase.[541] However, under a *capitation* payment method, a provider's margins are higher if his or her patients require *minimal medical services* and have few, if any, chronic conditions.[542] Significantly, the impact of *self-pay* and *uninsured* patients, that is, the likelihood of the costs

[540] William O. Cleverley and Andrew E. Cameron, *Essentials of Health Care Finance*, 6th ed. (Sudbury, MA: Jones and Bartlett, 2007), p. 106.

[541] Judi Binderman, "Variables Affecting the Financial Viability of Your Practice," in *Basics of Financial Management for the Medical Practice* (Phoenix, MD: Greenbranch Publishing, 2003), p. 24.

[542] Ibid.

associated with providing care to these patients being converted to *bad debt*, may require a provider to be aware of the patient's *socioeconomic status*, *financial condition*, and *stability* prior to providing care. If a majority of the *self-pay* and *uninsured* patients are *affluent* and have the means to reimburse providers at the time of service, a provider's revenue may *increase*, because they can avoid the billing and collection process altogether and are not subject to any *limiting charge rules*. However, if these patients are experiencing *financial hardships*, it is likely that the provider's revenue will *decrease*, due to failed attempts to receive payment through the billing and collection process or from writing off the debt altogether.

The challenge of less than optimal *payor mix* has been a growing concern regarding the efficacy of *safety net hospitals*, that is, those hospitals that serve a high proportion of low-income, uninsured patients, because the revenue from *insured patients* is insufficient to offset the losses incurred through *bad debt* and *charity care*, resulting from serving *uninsured* and *underinsured* patients. There are several programs, for example, Medicaid DSH payments (as discussed earlier) and legislative funding from the *American Recovery and Reinvestment Act of 2009*, that are designed to augment the revenues of these provider entities to ensure continued *access* for this vulnerable population.[543] Many providers have also implemented internal policies, such as upgrading facilities to attract more *insured patients*, expanding into more *profitable service lines*, and instituting *patient fees* and *donations*, to enhance their ability to manage the challenges of a diminished revenue stream and the resulting financial losses.[544]

Variations in *payor mix* have been shown to have an impact on the tendency of providers to implement those *technological advances* necessary to track patient data for *efficient claims reporting* and to participate in various *value-based purchasing initiatives*, such as *electronic health records* (EHR) and *computerized physician order entry* (CPOE). A 2010 study found that providers with a high percentage of patients covered by Medicare were significantly more likely to *e-prescribe*, that is, submit *drug prescriptions*

[543]Thomas Rundall, et al., "Success Under Duress: Policies and Practices Managers View as Keys to Profitability in Five California Hospitals with Challenging Payer Mix," *Journal of Healthcare Management* 57, no. 2 (March/April 2012): 95; Laurie E. Felland, et al., "The Economic Recession: Early Impacts on Health Care Safety Net Providers" Center for Studying Health System Change, Research Brief no. 15, December 2010, pp. 1–2.

to pharmacies via an *electronic system*, in an outpatient setting, especially among *primary care providers*.[545]

2.7 EMERGING REIMBURSEMENT TRENDS AND THE IMPACT OF HEALTHCARE REFORM

The ACA includes many provisions that aim to use *financial incentives* and *policies* to (1) address the rising *cost* of services, (2) improve *health outcomes*, and (3) improve *access* to healthcare services. Federal policy debates, for example, the repeal of the SGR (see the earlier discussion regarding the SGR), also have the potential to change the way reimbursement is *provided* and affect provider *compensation*. Many of these reimbursement initiatives share the common trend of *shifting away* from traditional *FFS models*.

2.7.1 Shift from Fee-for-Service

The current trend toward *value-based reimbursement* (VBR) initiatives is not new, and neither is the policy movement away from FFS arrangements. As the two extremes of the reimbursement spectrum, the pendulum has swung between *FFS* and *capitation* throughout the years. In the 1990s, under several managed care plan models, *capitation* flourished. However, a

[545] David W. Au, et al., "The Influence of Payer Mix on Electronic Prescribing by Physicians," *Health Care Management Review* 36, no. 1 (2011): 99.

study released by the *Center for Studying Health System Change* showed that the shift from *FFS* remuneration toward *capitation* as a method of physician reimbursement waned after the mid-nineties.[546] According to the data, the number of physicians accepting *capitated payments* fell from 54.2 percent of providers in 1996 to 44.7 percent of providers in 2004.[547]

Beginning in 2008, the pendulum swung back, and *capitation* as a replacement for *FFS* once again began to increase, due in part to the implementation of the *Blue Cross Blue Shield of Massachusetts Alternative Quality Contract*.[548] Unlike earlier generations of *capitation plans*, designed by insurance companies to place a substantial portion of the risk on providers, while offering little or no rewards for improved quality of care, the *Alternative Quality Contract* offers providers the opportunity to earn substantial *rewards* in return for improved *quality*.[549] This new type of contract reimburses providers on a *PMPM basis*, with yearly increases for inflation, combined with "performance incentives tied to the latest nationally accepted measures of quality, effectiveness, and patient experience of care."[550] In many respects, the *Alternative Quality Contract* was one of the first modern day steps toward *VBR*.

Driven by many of the provisions of 2010 healthcare reform, especially ACOs (discussed later), *capitation* (in this instance referenced as *population-based payment*) and other reimbursement models that *shift risk to providers* in exchange for potential financial gains, have been gaining acceptance throughout the healthcare delivery market. Unlike the demise of the capitated model in the 1990s, commentators have suggested that the new trend toward *capitated* and *VBR models* would likely persist, despite any fallout, although with greater provider hardships, in contrast to the decreased prevalence of these payment methodologies, as experienced in the early 2000s.[551]

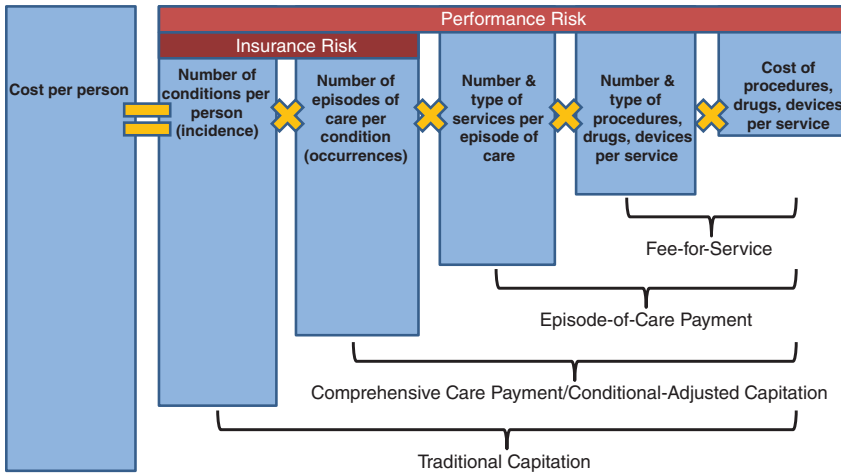

EXHIBIT 2.15 Variable Provider Risk under Alternative Payment Systems
"From Volume to Value: Better Ways to Pay for Health Care," by Harold D. Miller, *Health Affairs* 28, no. 5 (2009): 1418–1428.

Factoid

Commentators have suggested that in contrast to the decreased prevalence of managed care plans in the early 2000s, any fallout from the new trend toward capitated and VBR models would likely plead to greater provider hardships, but the models will ultimately persist.

"The Return of Capitation: Preparing for Population-Based Health," by Jonathan W. Pearce, Healthcare Financial Management Association, July 2, 2012.

As mentioned earlier, the *continuum of reimbursement models*, from fee-for-service to capitation, must be assessed based on the level of *risk allocated to the provider* versus the *payor.* This risk may be calculated, considering *performance risk* and insurance risk, as illustrated in Exhibit 2.15.

Many of the reimbursement initiatives supported by healthcare reform efforts use the cost management requirements associated with *capitated models* and add a *value-based purchasing* (VBP) component, placing many initiatives at the middle of the *reimbursement continuum*, that is, *episode-of-care payments.*

2.7.1.1 Episode-of-Care Payments *Episode-of-care payment* refers to one reimbursement payment made to providers for at least a portion of the medical

services provided within a *particular course of treatment*. These reimbursement models are designed to lower the occurrence of *fraud and abuse* (e.g., double billing and unnecessary care) and to incentivize the *value of care* provided, in contrast to the *volume of care* incentives produced under traditional *FFS reimbursement models*. *Episode-of-care payments* represent the larger umbrella encompassing many of the current healthcare reform initiatives designed to improve the *quality of care*, while lowering the *cost of care*, and can be modeled in two ways: *episode-based payments* (*episodes of care* are defined by a series of services) or *value-based purchasing* (*episodes of care* are defined by a population, either patients or providers). The distinction between *episode-based* and *value-based episode-of-care* structures is illustrated in Exhibit 2.16.

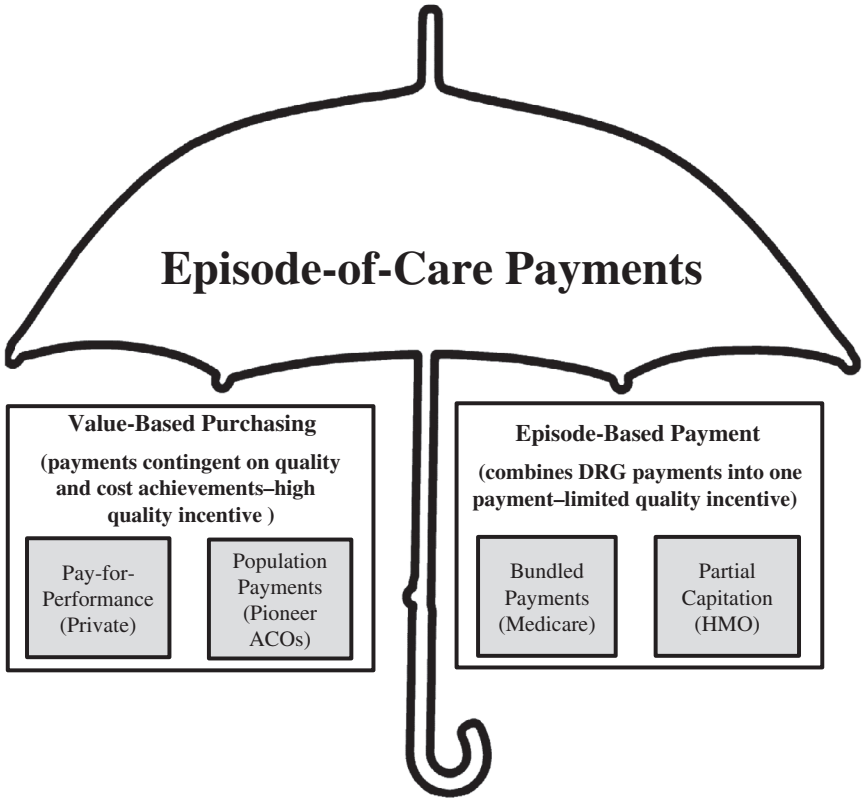

EXHIBIT 2.16 Episode-of-Care Payment Models
"Opportunities and Challenges for Episode-Based Payment," by Robert E. Mechanic, *New England Journal of Medicine* 365, no. 9 (September 1, 2011): 777.

Of note, the construct of either subgroup (i.e., *value-based* or *episode-based*) can expand beyond the scope of a single *episode of care* and therefore beyond the umbrella definition of *episode-of-care payments*; however, two established models of *episode-of-care payments* currently being used are (1) the *Prometheus payment model*, and (2) the *Geisinger Health system* model, known as *ProvenCare*. The *Prometheus payment model* is based on the acronym PROMETHEUS: *Provider Payment Reform for Outcomes, Margins, Evidence, Transparency Hassle-Reduction, Excellence, Understandability, and Sustainability.*[552] The system was developed under a 2007 grant for $6 million from the *Robert Wood Johnson Foundation,* by leading experts in (1) *health care law*, (2) *quality measurement*, (3) *economics*, (4) *benefits*, (5) *operations*, and (6) related fields. There are currently two programs testing pilots of the *Prometheus payment model*: (1) *Aligning Forces for Quality program* and (2) *Bridges to Excellence Inc.*, supported by the *Colorado Health Foundation.*[553] The system itself is an "[e]pisode-based payment model that defines global case rates for given conditions (e.g., acute myocardial infarction, diabetes, and knee replacement); payment amounts informed by cost of adhering to clinical standards of care; risk stratification and complication allowance; performance incentives based on comprehensive score card."[554]

[554]Meredith B. Rosenthal, "Beyond Pay for Performance—Emerging Models of Provider-Payment Reform," *New England Journal of Medicine* (September 18, 2008): 1198–1199.

EPISODE-OF-CARE PAYMENT MODEL

A reimbursement model where one reimbursement payment is made to providers for at least a portion of the medical services provided within a particular course of treatment.

"Beyond Pay for Performance—Emerging Models of Provider-Payment Reform," by Meredith B. Rosenthal, New England Journal of Medicine *(September 18, 2008): 1198–1199.*

A slightly more developed model is *ProvenCare*, which was established in February 2006 by the *Geisinger Health System* for use under its *health system insurance plan.*[555] *ProvenCare* uses an "episode-based payment for elective coronary-artery bypass grafting; 90-day global fee paired with high-reliability process improvements to achieve 40 best-practice standards."[556] Although only 34 percent of those beneficiaries enrolled in the *Geisinger Health plan* are eligible to participate in *ProvenCare* (due to limitations on those services covered under the reimbursement model, for example, on cardiac surgery), the program has already established positive findings. The average total length of stay for *ProvenCare* patients fell by 0.5 days (6.2 days for other beneficiaries versus 5.7 days for *ProvenCare* beneficiaries), and the 30-day readmission rate fell by 44 percent.[557]

Bundling initiatives most often remain under the umbrella of *episode of care payments* (because they are traditionally linked to procedural and diagnostic codes for services that are generally performed together during one episode of care), explaining why the two terms are sometimes *incorrectly* categorized as being synonymous.

2.7.1.1.1 Bundled Payments A *bundled payment* (also referred to as an *episode-based payment*) occurs when payments for multiple *related procedures or diagnoses* are combined, or *bundled*, to reimburse for the entirety of one *episode of care.* One of the first instances of *episode-based payments* occurred in 1991, when CMS proposed to *bundle* payments for coronary

[555] Please see Section 2.5.2.1, "Health System Plans," for more information on health system insurance plan models.

[557] Geisinger, "ProvenCare by the Numbers" http://www.geisinger.org/provencare/numbers.html (accessed September 12, 2012).

bypass surgery patients who were readmitted within 72 hours of discharge. Although this program was never fully adopted, due to provider opposition, CMS has continued to establish bundling demonstrations.[558] On April 29, 2009, as part of the *Proposals to Improve Patient Care and Reduce Health Care Costs Report*, the *Senate Finance Committee* released a plan to bundle payments for *inpatient* and *post-discharge care* to reduce Medicare spending by $16 billion.[559] In addition, Medicare has established *DRG bundling* for certain services, such as *end stage renal disease* (ESRD), whereby if two procedures are *inextricably linked*, then reimbursement cannot be claimed for each procedure separately but only for one *episode of care*.[560]

While bundling initiatives are designed to *lower costs* and increase *efficient and high-quality* care, not everyone is optimistic about the potential success of this reimbursement model. Critics have articulated concerns regarding the *level of cost savings* and *patient care improvement* that a

Bundling

A form of reimbursement that combines institutional and professional charges into a single payment, including all staff for preoperative and postoperative care. Bundled payment schemes generally include outlier provisions for cases that become catastrophic.

[560] Statement by the HHS Office of Inspector General Daniel R. Levinson, "End Stage Renal Disease Drugs: Facility Acquisition Costs and Future Medicare Payment Concerns," September 2010, pp. i–iv.

blanket bundling of payments could actually generate. The AMA expressed concern with the 2009 *Senate Finance Committee*'s proposal, stating that the method of *bundling* that was proposed could result in the *withholding* or the *limiting* of appropriate *post-discharge* or *inpatient* services.[561] The AMA also noted issues regarding (1) the appropriate *distribution* of payments to individual providers, (2) the *risk-adjustment* for patients whose care exceeds an established *bundled payment target*, and (3) *safeguards* to ensure that patient care decisions remain in the hands of individual providers.[562] Similarly, in a letter to the *Senate Finance Committee*, the AHA stated that the administration's approach to *bundling payments* was "problematic" and would require a "paradigm shift in health service delivery," resulting in the necessary revision or withdrawal of numerous *regulations* implemented to manage the current healthcare system.[563] While there is some debate as to whether *bundling* will be *effective* and *accepted* by *providers*, *hospitals*, and *beneficiaries*, there appears to be *universal agreement* that *bundled payments* will increasingly be a feature of healthcare reform.

On August 23, 2011, as mandated by the ACA, CMS announced the *Bundled Payments for Care Improvement Initiative* (*Bundled Payments*

BUNDLED CASE RATES/PACKAGE PRICING

Bundled case rates/package pricing is a form of reimbursement that combines institutional and professional charges into a single payment; for example, a plan may negotiate a bundled case rate of $20,000 for cardiac bypass surgery, which covers all staff for preoperative and postoperative care. There are usually outlier provisions for cases that become catastrophic.

The Managed Health Care Handbook, *3rd ed., by Peter R. Kongstvedt (Gaithersburg, MD: Ernst & Young, 1996), p. 187.*

Initiative).[564] The *Bundled Payments Initiative* includes four approaches to *bundled payments*. *One model* is based on a *single prospective payment* for all services provided during a single *inpatient stay*, while the remaining *three models* are based on a *retrospective payment system* that sets a *target cost* for an established *episode of care*.[565] The *Bundled Payments Initiative* aims to improve patient care through a *patient-centered approach*, emphasizing care *coordination* and *quality*.[566] Though *evidence-based literature* regarding the efficacy of *bundled payments* is still limited, currently available data indicates (1) that *bundled payments* may *reduce spending* for an *episode of care*, (2) that some *providers are ready* to participate in a *bundled payments program*, and (3) that *bundled payments* can promote *quality improvements*. Each of the four models presented by CMS is designed to incentivize *coordination of care* and *lower costs* by allowing providers to *share in any cost savings achieved* based on a historic *fee for service payment rate* and a *discounted target price per episode of care*.[567] The key features of the four models offered under the *Bundled Payments Initiative* are described in Table 2.16.

TABLE 2.16 Key Features of Bundled Payment Models Compared

Model Feature	Model 1 Inpatient Stay Only	Model 2 Inpatient Stay Plus Postdischarge Services	Model 3 Postdischarge Services Only	Model 4 Inpatient Stay Only
Eligible Awardees	Physician group practices; acute care hospitals paid under the IPPS, health systems Physician-hospital organizations, and conveners of participating health care providers	Physician group practices; acute care hospitals paid under the IPPS, health systems physician-hospital organizations, post-acute providers, and conveners of participating health care providers	Physician group practices; acute care hospitals paid under the IPPS; health systems, long-term care hospitals, inpatient rehabilitation facilities, skilled nursing facilities; home health agency, physician-owned hospital organizations, and conveners of participating healthcare providers	Physician group practices; acute care hospitals paid under the IPPS; health systems; physician-hospital organizations; and conveners of participating healthcare providers
Payment of Bundle and Target Price	Discounted IPPS payment; no separate target price	Retrospective comparison of target price and actual FFS payment	Retrospective comparison of target price and actual FFS payment	Prospectively set payment
Clinical Conditions Targeted	All MS-DRGs	Applicants to propose based on MS-DRG for inpatient hospital stay	Applicants to propose based on MS-DRG for inpatient hospital stay	Applicants to propose based on MS-DRG for inpatient hospital stay

Types of Services Included in Bundle	Inpatient hospital services	Inpatient hospital and physician services, related post-acute care services, related readmissions, and other services defined in the bundle	Post-acute care services, related readmissions, and other services defined in the bundle	Inpatient hospital and physician services and related admissions
Expected Discount Provided to Medicare	To be proposed by applicant; CMS requires minimum discounts increasing from 0% in first 6 mos. to 2% in year 3	To be proposed by applicant; CMS requires minimum discount of 3% for 30–89 days postdischarge episode; 2% for 90 days or longer episode	To be proposed by applicant	To be proposed by applicant; subject to minimum discount of 3%; larger discount for MS-DRGs in ACE Demonstration
Payment from CMS to Providers	Acute care hospital: IPPS payment less predetermined discount, and physician: traditional fee schedule payment (not included in episode or subject to discount)	Traditional fee-for-service payment to all providers and suppliers, subject to reconciliation with predetermined target price	Traditional fee-for-service payment to all providers and suppliers, subject to reconciliation with predetermined target price	Prospectively established and bundled payment to admitting hospital; hospitals distribute payments from bundled payment
Quality Measures	All hospital IQR measures and additional measures to be proposed by applicants	To be proposed by applicants, but CMS will ultimately establish a standardized set of measures that will be aligned to the greatest extent possible with measures in other CMS programs		

"Bundled Payments for Care Improvement Initiative," Centers for Medicare and Medicaid Services, August 23, 2011, pp. 5–6, http://www.innovations.cms.gov/areas-of-focus/patient-care-models/bundled-payments-for-care-improvement.html (accessed October 24, 2011).

2.7.1.1.2 Value-Based Purchasing The definition of *value-based purchasing* (VBP) encompasses any model of *provider payments* that links *reimbursement* or *incentive bonus payments* to the *quality* and the *cost of care* that a provider can achieve for a *defined patient population*. Most often, these *rewards* are offered to providers who meet (1) established standards for *patient health outcomes*, and (2) set *percentage reductions* in actual *patient expenditures*.[568] One example of VBP is the *Medicare Shared Savings Program* (MSSP), mandated under the ACA, which links *shared savings incentive payments* to ACO participants that achieve established *quality metrics* and *expenditure reductions* for Medicare beneficiaries.[569] There is some recent evidence that results from past VBP demonstrations have been *inconclusive*, with most *demonstrations* indicating that no *significant reductions in healthcare expenditures were achieved*, while others were able to achieve statistically significant reductions in expenditures, for example, the *Medicare Participating Heart Bypass Center Demonstration*,[570] which indicated a 10 percent *reduction*.[571]

VALUE-BASED PURCHASING (VBP)

Any reimbursement model that links reimbursement or incentive bonus payments to quality of care.

"Lessons from Medicare's Demonstration Projects on Disease Management, Care Coordination and Value-Based Payment," by Lyle Nelson, Congressional Budget Office, January 2012, p. 1.

[568] Lyle Nelson, "Lessons from Medicare's Demonstration Projects on Disease Management, Care Coordination and Value-Based Payment," Congressional Budget Office, January 2012, p. 1.

[569] "Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," *Federal Register* 76, no. 212 (November 2, 2011).

[570] The Medicare Participating Heart Bypass Center Demonstration used bundled payments for all inpatient hospital care for coronary artery bypass graft surgeries at seven hospitals to lower the amount spent on each patient. Lyle Nelson, "Lessons from Medicare's Demonstration Projects on Disease Management, Care Coordination and Value-Based Payment," Congressional Budget Office, January 2012, p. 5.

[571] Lyle Nelson, "Lessons from Medicare's Demonstration Projects on Disease Management, Care Coordination and Value-Based Payment," Congressional Budget Office, January 2012, p. 2.

VBP initiatives that *determine provider reimbursement*, based on *quality outcome achievements*, may also be referred to as *value-based reimbursement* initiatives, in contrast to initiatives that merely provide a *bonus payment* for quality and cost achievements, which fall under the larger definition of VBP. The most significant *value-based reimbursement* initiative currently being undertaken is the CMS *Hospital Value-Based Purchasing* program. This *value-based reimbursement* initiative, mandated under the ACA, is set to distribute, beginning in October 2012, approximately $850 million to hospitals, based on *self-reported quality performance measurements,*.[572] Various ACA provisions also require that similar *CMS VBP programs* be developed for *home health agencies* and *ambulatory service centers*.[573] An illustration of the differences between two current VBP programs, that is, *ACOs* and the *Hospital Value-Based Purchasing program*, is set forth in Exhibit 2.17.

In order to *record* and *report* the requisite *quality* and *cost* data to participate in *VBP initiatives,* providers will likely have to implement effective, compliant *health information technology.*

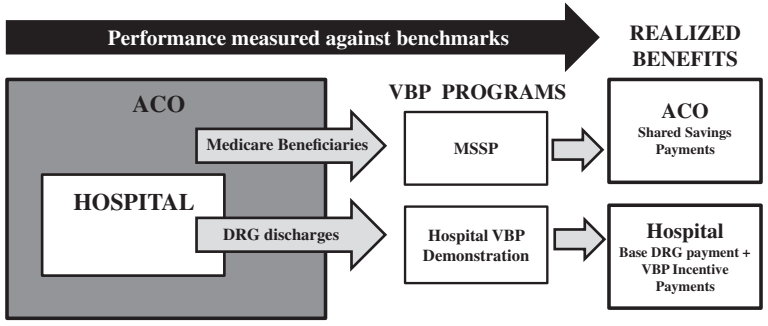

EXHIBIT 2.17 Illustration of Value-Based Purchasing Models

Accountable Care Organizations: A Roadmap for Success: Guidance on First Steps, 1st ed., by Bruce Flareau and Joe Bohn (Virginia Beach, VA: Convergent Publishing, LLC, 2011), p. 22.

VALUE-BASED REIMBURSEMENT (VBR)

VBP initiatives that quantify provider reimbursement based on quality outcome achievements are known as value-based reimbursement initiatives.

Nathaniel Weixel, "CMS Final Rule Implements $850 Million Hospital Value-Based Purchasing Program," Health Law Reporter, *May 5, 2011, http://healthlawrc.bna.com/hlrc/display/batch_print_display.edp (accessed June 16, 2011).*

2.7.1.2 Increased Reimbursement to Encourage Implementation of Electronic Health Records (EHR) With the passage of the *American Recovery and Reinvestment Act of 2009* (ARRA), the government adopted, as part of the economic stimulus package, a plan to promote the *universal* implementation of *electronic health records* (EHR), through the *Health Information Technology for Economic Clinical Health* (HITECH) Act.[574] HITECH incentivizes providers to implement *health information technology* (HIT) and *certified EHR systems* that function within established *meaningful use standards*, through increased reimbursement rates.[575] For a thorough discussion of meaningful use requirements, see Section 5.2.2.2.1, "Meaningful Use," in Chapter 5, "Technology."

The ARRA provides a total of $1.5 billion in federal grants to assist providers with the capital requirements for either (1) *implementing* an EHR system or (2) *upgrading* an existing EHR system to meet *meaningful use standards*.[576] In 2011, for every *ten dollars* the federal government provided toward *state planning* and *implementation grants* to promote HIT, the state was required to provide *one dollar* toward *state planning* and *implementation grants*. In 2012, this ratio dropped to *seven to one*, and beginning in 2013, for every *three dollars* of federal grant money the state must only provide *one dollar.*[577] For more

2.7.2 ACOs

Accountable care organizations (ACOs), established under §3002 of the ACA, and the subsequent *CMS Final Rule* published on November 2, 2011, are the latest iteration in a dialogue that has been evolving for generations on how to *manage* the *rising cost of healthcare* in a manner that addresses both *cost* and *quality*. Specifically, ACOs are healthcare organizations in which a *set of providers*, usually physicians and hospitals, is held *accountable* under *an ACO contract* with a payor, that is, *Medicare* for *federal ACOs* and any number of *commercial payors* for *commercial ACOs*, for the *cost* and *quality* of care delivered to a specific local population.[578]

ACOs may experience *financial incentives* through two VBP models: (1) *shared savings (bonus) payments* or (2) *commercial value-based reimbursement arrangements*. The specifics of the reimbursement model implemented within the *ACO contract* will vary for both *federal ACOs and commercial ACOs*, as will the *distribution of shared risk* associated with each reimbursement model.

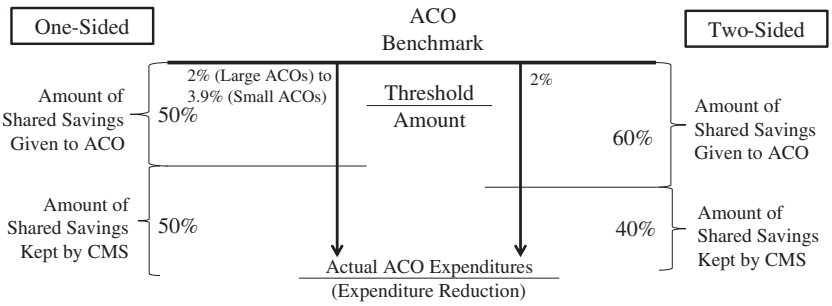
Federal ACOs are reimbursed under a *traditional FFS model*. As such, *participating providers* are likely to focus on the *volume* of services provided rather than on the *value* of services provided. While *FFS*

Accountable Care Organization

A healthcare organization in which a set of providers, usually physicians and hospitals, is held accountable under a contract with a payor(s) (i.e., Medicare for federal ACOs and any number of commercial payors for commercial ACOs) for the cost and quality of care delivered to a specific local population.

"Can Accountable Care Organizations Improve the Value of Health Care by Solving the Cost and Quality Quandaries?" by Kelly Devers and Robert Berenson, Robert Wood Johnson Foundation, Urban Institute, October 2009, http://www.rwjf.org/files/research/acosummaryfinal.pdf *(accessed January 19, 2012), p. 1.*

[578]Kelly Devers and Robert Berenson, "Can Accountable Care Organizations Improve the Value of Health Care by Solving the Cost and Quality Quandaries?" Robert Wood Johnson Foundation, Urban Institute, October 2009, p. 1, http://www.rwjf.org/files/research/acosummaryfinal.pdf (accessed January 19, 2012).



Note: The expenditure reduction is capped at 10% of Benchmark for one-sided, and 15% of Benchmark for two-sided

EXHIBIT 2.18 One- and Two-Sided Distribution Models for Federal ACOs

reimbursement places *little to no risk* on the provider, federal ACOs experience risk through their *shared savings payments*, which may be *managed* under either (1) a *one-sided distribution model* or (2) a *two-sided distribution model*. The *one-sided distribution model* allows federal ACOs to *avoid risk* (i.e., no shared losses) during their initial three-year contract in exchange for a *smaller percentage* of the achieved *shared savings* distributed to the ACO.[579] The *two-sided distribution model* offsets the additional *risk* of possible *shared losses* by allowing the ACO to partake in a *greater percentage* of the *shared savings* (i.e., patient expenditure reductions) it can demonstrate and document has been achieved.[580] The two models for shared savings distribution available to a federal ACO are illustrated in Exhibit 2.18.

To incentivize provider participation in the MSSP program, CMI created the *Pioneer ACO program*, which offers *higher rewards* than traditional federal ACOs can achieve in exchange for *higher risks*. Significantly, as discussed earlier, a *Pioneer ACO* will, after the first two years of its contract term with CMS, be given the option to *transition* from a *volume-based FFS reimbursement model* to a *population-based payment model* for its Medicare beneficiaries. In addition, by *performance year two*, at least 50 percent of a Pioneer ACO's revenue must be generated by *alternative VBP arrangements* with *non-Medicare payors* (either

[579] "Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," *Federal Register* 76, no. 212 (November 2, 2011): 67985–67986.

[580] Ibid., 67986–67987.

commercial or public).[581] By the end of its *second performance year*, the VBP models within Pioneer ACOs may more closely resemble some of the reimbursement models used within the *commercial ACO* market than used for traditional federal ACOs.

Commercial ACOs contract with *private payors* and use a variety of *value-based purchasing* arrangements. Some commercial ACOs may choose to emulate the federal MSSP, opting for a basic *FFS reimbursement model,* accompanied by a *shared savings arrangement.* Other commercial ACOs may use any number of reimbursement models, ranging from *pay-for-performance* to *capitation.*[582]

2.7.3 Patient-Centered Medical Homes

Similar to an ACO, the *patient-centered medical home* (PCMH) *model* approaches the delivery of healthcare services through *coordinated patient care*, centered on a *primary care physician* who accepts responsibility for managing across the continuum of care for a beneficiary and the spectrum of services he or she may require.[583] PCMHs are designed to improve the *quality of patient care* through the incorporation of a *value-based payment model.*[584] The *essential difference* between a PCMH and an ACO lies in the *scale of their operation.* A PCMH is limited to a *single physician practice setting*, with *one primary care physician* coordinating the patient's care (similar to the *gatekeeper* function), whereas an ACO typically operates as an *entire organization,* within which providers *coordinate care* and are *accountable* for patient *health outcomes* and *costs.*[585] However, PCMHs may be an essential component of an ACO, by using

[581] Centers for Medicare and Medicaid Services, "Pioneer Accountable Care Organization Model: Fact Sheet," December 19, 2011, pp. 6, 7.

[582] "Global Cap Dominates Some Private-Sector Payment Models; Others Seek Partial Cap," *ACO Business News* 1, no. 1 (November 2010): 1.

[585] Academy Health, "Medical Homes and Accountable Care Organizations: If We Build It, Will They Come?" 2009 Annual Research Meeting Brief, http://www.academyhealth.org/files/publications/RschInsightMedHomes.pdf (accessed January 4, 2012).

Patient-Centered Medical Home

A model of healthcare delivery that approaches the delivery of services through coordinated, centralized patient care, with an emphasis on the primary care physician as the manager of a beneficiary's care.

Medical Home Models: Improving Care and Reducing Costs in Healthcare, White Paper Analysis of HIN Monthly E-Survey Results on Trends Shaping the Healthcare Industry, *by Laura M. Greene, Healthcare Intelligence Network, May 2009*.

the function of the *primary care physician* to improve health outcomes for ACO patients.

The PCMH concept first appeared in federal legislation as a demonstration project, the *Medicare Medical Homes Demonstration Project*, created under the *Tax Relief and Health Care Act of 2006* (TRHCA).[586] Eventually, two initiatives developed by CMI superseded the *Medicare Medical Homes Demonstration Project*, that is, (1) the *Multi-payer Advanced Primary Care Practice Demonstration* (Comprehensive Primary Care Initiative) and (2) the *Federally Qualified Health Centers (FQHC) Advanced Primary Care Practice Demonstratio*n (APCP).[587]

[586] "Tax Relief and Health Care Act of 2006," H.R. 6111 (2006), Section 204.

[587] Centers for Medicare and Medicaid Services, "Medicare Demonstrations: Details for Medicare Medical Home Demonstration," https://www.cms.gov/DemoProjectsEvalRpts/MD/itemdetail.asp?itemID=CMS1199247 (accessed January 4, 2012). The Comprehensive Primary Care Initiative mimics successful financial incentives used by large employers and other private healthcare enterprises (e.g., commercial ACOs) in seven markets, chosen to represent every major U.S. region. This initiative provides bonus payments to primary care physicians who "better coordinate" their Medicare patients' care. Primary care physician practices participating in the program will have access to resources that may improve the likelihood that physicians will improve care coordination. U.S. Department of Health and Human Services, "Fact Sheet: Comprehensive Primary Care Initiative," September 28, 2011, http://innovations.cms.gov/initiatives/cpci/index.html (accessed January 4, 2012). In October 2011, CMS published the list of 500 FQHC applicants chosen to participate in the Medicare Federally Qualified Health Center Advanced Primary Care Practice (FQHC APCP), a three-year demonstration project intended to "evaluate the impact of the advanced primary care practice model, also known as the patient-centered medical home." U.S. Department of Health and Human Services, "Fact Sheet: Comprehensive Primary Care Initiative," September 28, 2011, http://innovations.cms.gov/initiatives/cpci/index.html (accessed January 4, 2012).

Furthermore, several provisions within the ACA support the further development of PCMHs, including:

1. §3502, *Establishing Community Health Teams to Support the Patient-Centered Medical Home,* which stipulates that CMS will establish a program to *spur national use* of the PCMH model through grants and/or contracts with (1) *states and/or state-designated entities*, and (2) *Indian tribes and/or tribal organizations*;
2. §2703, *State Option to Provide Health Homes for Enrollees with Chronic Conditions*, which, beginning in January 1, 2011, focused on implementing *medical home models* for *state Medicaid populations*; and
3. §5405, *Primary Care Extension Program*, which provides funding for *state organized programs* to educate *primary care physicians* on *preventative care* and *health literacy* to assist providers in providing services to their communities.[588]

In addition to the 2010 landmark passage of the ACA, and the subsequent *U.S. Supreme Court* decision upholding its *constitutionality* in 2011, several states have recently passed legislation designed to further *quality*, *access*, and *lower costs*, which is transforming their healthcare reimbursement systems through *small-scale*, incremental, *health reform initiatives*, limited, however, to the *populations of that specific state.* One of the most recent efforts in this vein is the implementation of a *single payor insurance system* in Vermont.

2.7.4 Vermont's Single Payor Insurance System

On May 26, 2011, Vermont governor Peter Shumlin signed H.202 into law, a significant step toward Vermont being able to offer the *first state-financed single-payor health insurance system* in the United States.[589] The bill lays out a framework to provide "a universal and unified health system" to each of the

[588] Amended by §10321 of the Health Care Education and Reconciliation Act; "Patient Protection and Affordable Care Act," *Pub. L.* 111-148 (March 23, 2010), p. 513; "Patient Protection and Affordable Care Act," *Pub. L.* 111-148 (March 23, 2010), p. 156; "Patient Protection and Affordable Care Act," *Pub. L.* 111-148 (March 23, 2010), p. 649.

[589] Margaret Dick Tocknell, "VT Governor Signs Single-Payer Bill," Health Leaders Media, May 27, 2011, http://www.healthleadersmedia.com/print/TEC-266668/VTGovernor-Signs-SinglePayer-Bill (accessed May 31, 2011).

SINGLE PAYOR INSURANCE MODEL

Whereby one payor provides universal insurance for a designated population. Generally operated, or monitored, by a state government or the federal government.

"VT Governor Signs Single-Payer Bill," by Margaret Dick Tocknell, Health Leaders Media, May 27, 2011, http://www.healthleadersmedia.com/print/TEC-266668/VTGovernor-Signs-Single Payer-Bill (accessed May 31, 2011).

600,000-plus Vermont residents by 2017 and aims to control rapidly growing *healthcare costs* within the state.[590] Pursuant to provisions in the ACA, the Vermont legislation *first* establishes an *initial insurance exchange*, that is, *Green Mountain Care*, and then plans to *subsequently* transfer individuals covered through *private*, *state*, or *federal* health insurance, as well as the *uninsured*, into a single *statewide insurance payor* funded by Vermont *tax dollars*, rather than by private insurance *copayments* or *premiums*.[591] In developing H.202, the Vermont legislature commissioned a report, titled *Health System Reform Design: Achieving Affordable Universal Health Care in Vermont*, authored by several *key healthcare economists*, including *Harvard Professor*

Factoid

The creator of the Medicare RBRVS was also a key designer for Vermont's single payor reimbursement system.

"Vermont Gov. Proposes Single-Payer Health Plan," by Aimee Miles, National Public Radio, February 11, 2011, http://www.npr.org/2011/02/11/133657928/vermont-govproposes-single-payer-health-plan (accessed June 15, 2011).

William Hsiao, who is well known for his work in healthcare financing, specifically the development of the *resource-based relative value scale* (RBRVS) in 1988, as the basis for the *Medicare physician fee schedule* (MPFS).

Several provisions of the ACA have presented hurdles for the Vermont law, despite having similar goals, such as securing waivers from the *federal government* in order to fully implement the *single payor insurance system* and disband the *state insurance exchange*.[592] Although there has been *resistance* to the Vermont *single payor* legislation, *widespread adoption* is not inconceivable. According to Hsiao, since completing the Vermont report, six other states have approached him to develop similar *single payor systems*.[593]

2.8 CONCLUSION

The major changes taking place in the *healthcare reimbursement environment* are significant enough in scale to be accurately characterized as a *paradigm shift*. As *healthcare reform efforts*, focused on *slowing the rise of costs*, continue to gain *public attention* and *policy traction*, providers may feel *conflicted* between *competing goals and objectives*, for example, fixating on reducing the *cost of services* provided or, in the alternative, pursuing potential *value-based reimbursement incentive* payments. It is possible that this *competition* between *emphases* may result in the type of *discontent* and *dysfunction* that was experienced with the rise of *managed care* in the 1990s, described as:

> *Managed care has somewhat compromised physician's powers, leaving some senior physicians despairing about the loss of the golden age of medicine, and younger physicians feeling duped by an unfilled vision of autonomous medical practice*.[594]

[594] Stated by Charles W. Plows, M.D., chair of the *American Medical Association's Council on Ethics and Judicial Affairs*, and Rosemary Quigley, senior associate in the *AMA Division of Ethics Standards*. John G. Day, "Managed Care and the Medical Profession: Old Issues and Old Tensions the Building Blocks of Tomorrow's Health Care Delivery and Financing System," *Connecticut Insurance Law Journal*, 3, no. 1 (1996–1997): 6.

The failure of previous attempts to restructure healthcare reimbursement is addressed in the authoritative work *Redefining Health Care: Creating Value-Based Competition on Results*, by Harvard business professor Michael E. Porter and Professor Elizabeth Olmsted Teisberg of the University of Virginia:

> *In a normal market, competition drives relentless improvements in quality and cost.... Quality adjusted prices fall, value improves, and the market expands to meet the needs of more consumers.... Health care competition could not be more different. Costs are high and rising despite the fierce struggle to control them. Quality problems persist.... Why is competition failing in health care? Why is value for patients not higher and improving faster? The reason is not a lack of competition, but the wrong kind of competition. Competition has taken place at the wrong levels, and on the wrong things. It has gravitated to a zero-sum competition, in which the gains of one system participant come at the expense of others. Participants compete to shift costs to one another, accumulate bargaining power, and limit services. This kind of competition does not create value for patients, but erodes quality, fosters inefficiency, creates excess capacity, and drives up administrative costs, among other nefarious effects.... The dysfunctional competition in health care results from misaligned incentives and a series of understandable but unfortunate strategic, organizational, and regulatory choices by each participant in the system that feed on and exacerbate each other.... The way to transform health care is to realign competition with value for patients. Value in health care is the health outcome per dollar of cost expended. If all system participants have to compete on value, value will improve dramatically."*[595]

While the *future design* of healthcare reimbursement is still uncertain, there is growing accord that the current system is *unsustainable* and the need for change is *urgent* and *unavoidable*.[596] As more emphasis is placed on *quality improvement efforts*, for example, *P4P* and *value-based purchasing*,

---

[596] Kenneth Kaufman and Mark E. Grube, "The Transformation of America's Hospitals: The Economics Drives New Business Model," *Futurescan 2012: Healthcare Trends and Implications 2012–2017* (2012): 6.

providers are likely to see *increased efficiency*, which should reduce the *cost of services* and give providers some degree of *reprieve* against continued *federal reimbursement cutbacks* and the *uncertain financial benefits* of *value-based purchasing initiatives*. *Financial concerns* and an increased *focus on care coordination* have also lead to an increased *consolidation* among *providers* and *payors*, in many cases *blurring* the traditional lines between *for-profit* and *not-for-profit* care, and between various *types of providers*, for example, *payors*, *hospitals*, and *physicians*.[597] These trends will, to a great extent, be influenced by the reimbursement schemes of *federal* and *state government payors*, which act as the *benchmarks* for most *healthcare reimbursement* and will likely drive the *transformation* of the overall *reimbursement environment* by influencing *new business* and *reimbursement models*.[598]

The advocates of *public responsibility* for *access to healthcare* in the United States have been fighting an intense political debate since 1915, and the passage of the ACA has not eased this struggle. Through this contentious process, the United States has fallen into a "*policy trap*," where extraordinarily *high costs* and *complex structures* hinder the healthcare industry's ability to *accept* and *accommodate* change. Although the ACA was a significant leap in the transformation of the healthcare reimbursement industry, the United States may be too ensnared in its own political struggles to resolve the problems it currently faces without *severe limitations*.[599] Only time will tell whether the current effort toward *healthcare reform* will be remembered in history as a *historic triumph* or yet another example of *failure to reach a consensus* regarding the crossroads of *morals* and *politics*.[600] For further information on healthcare reform, see Chapter 6, "Healthcare Reform."

A thorough and in-depth understanding of the *historical background*, *current environment*, and *future trends* of healthcare reimbursement models is an *essential* and *requisite* element in the development of a *valuation analysis*. Ultimately, the reimbursement environment determines the *revenue stream of enterprises*, the *foundation of asset capitalization*, and the *structure of compensation* for services that are the subject of *healthcare financial appraisal*.

Regulatory Environment

3.1 OVERVIEW AND TRENDS

> *With its choreography of public and private interests and its balance between different levels of government, America's system of health care regulation can certainly be characterized as complex. In its continual evolution, it thrives on confrontation between competing interests but survives on its ability to engender compromise. Intertwining regulatory structures can be overwhelming in their intricacy, but a more direct system would not necessarily be fairer or more effective.*
>
> —Robert I. Field[1]

With the passage of the 2010 *Patient Protection and Affordable Care Act* (*ACA)*, that is, "*Obamacare*," providers are facing even more extensive regulatory scrutiny, much of which attention is focused on increased rules and strict prosecution of *fraud and abuse* violations, the latest, in particular, as an avenue to help finance the ACA.[2] Despite the June 2012 U.S. Supreme Court decision upholding the constitutionality of the *ACA* (as discussed in Chapter 1, "The Chronology of U.S. Healthcare Delivery"), significant issues related to the regulation of healthcare enterprises, assets, and services on both a federal and a state level are yet to be resolved.[3] Regardless of how these issues are ultimately decided, the sweeping nature of the ACA will continue to drive ongoing changes in the structure, operation, and financing of many healthcare provider enterprises, likely resulting in an even further increase in hospital/physician practice integration/transactional activities, as well as an increase in the number of U.S. physicians who are currently employed by hospitals.[4] These

PATIENT PROTECTION AND AFFORDABLE CARE ACT (ACA)

Enacted March 23, 2010, and amended March 30, 2010, the ACA comprehensively reformed the U.S. healthcare delivery system, especially with regard to patient access to affordable care.

"Patient Protection and Affordable Care Act," Pub. L. *111–148, 124 Stat 119 (March 23, 2010), as amended by "Health Care and Education Reconciliation Act,"* Pub. L. *111–152, 124 Stat 1029 (March 30, 2010).*

Factoid

The IRS has developed an 11-factor test, broken out into three general categories, that is, (1) behavioral control, (2) financial control, and (3) type of relationship between the parties, for determining bona fide employment relationships.

"Employer's Supplemental Tax Guide (Supplement to Publication 15 (Circular E), Employer's Tax Guide," Publication 15-A, Department of the Treasury, Internal Revenue Service, 2012, p. 7.

increases have served as a catalyst for enhanced regulatory scrutiny from the *Office of Inspector General* (*OIG*), the *Internal Revenue Service* (*IRS*), and the *Department of Justice (DOJ*), through the development of such initiatives as the *Fraud Enforcement and Recovery Act* (*FERA*) and the *Healthcare Enforcement Action Team* (*HEAT*).[5]

Among the valuation issues arising from these regulatory concerns are (1) establishing the *very existence* of certain *tangible* and *intangible assets* within a healthcare enterprise, (2) whether (and under which circumstances) it is *legally permissible* for those assets to be acquired, and (3) the selection of the applicable *valuation methodologies, approaches, and techniques* related to establishing the *Fair Market Value* of healthcare enterprises, assets, and services, as will be discussed in (1) Chapter 8, "Valuation Approaches and

[5] Office of the Inspector General (OIG), Internal Revenue Service (IRS), Fraud Enforcement and Recovery Act (FERA), Healthcare Fraud Prevention and Enforcement Action Team (HEAT), Patient Protection and Affordable Care Act (ACA).

Methods"; (2) Chapter 11, "Inpatient Enterprises"; (3) Chapter 12, "The Valuation of Outpatient Enterprises"; (4) Chapter 14, "The Valuation of Tangible and Intangible Assets"; and (5) Chapter 15, "Healthcare Services."

In many cases, this heightened regulatory environment takes place at a state, as well as a federal, level. In fact, state legislative and regulatory enforcement measures may actually stem from federally elicited incentives or compliance standards, such as those federal regulations governing Medicaid eligibility and reimbursement. Conversely, there are matters that are federally regulated, which in turn constitutionally bind states to comply with them, for example, so that federal edicts are preserved but tailored through supplemental state laws to meet state-specific needs. As characterized by Paul Field in *Health Care Regulation in America: Complexity, Confrontation, and Compromise,*

> *State and federal public health regulators, for example, have struggled for supremacy since the earliest days of government health programs in the nineteenth century.*[6] *They did so when the first quarantine and immunization efforts to control the spread of infectious diseases were developed, when the licensure programs that control access to the health care professions were established, and when the initial regulation of health insurance was implemented. They continue to do so in many spheres, including the oversight of clinical practice, the regulation of insurance under the Employee Retirement Income Security Act (ERISA), the shared administrative structure of the Medicaid program, and the emerging regulatory apparatus to handle public health preparedness.*[7]

The framework through which this interplay between the various federal and state laws within the U.S. healthcare delivery system will be discussed throughout this chapter is within the context of the following categories of regulations: (1) *Tax*, (2) *Fraud and Abuse*, (3) *Antitrust*, (4) *Privacy*, (5) *Safety*, (6) *Corporate/Organizational*, and (7) *Licensure, Certification, and Accreditation*, as set forth in Exhibit 3.1.

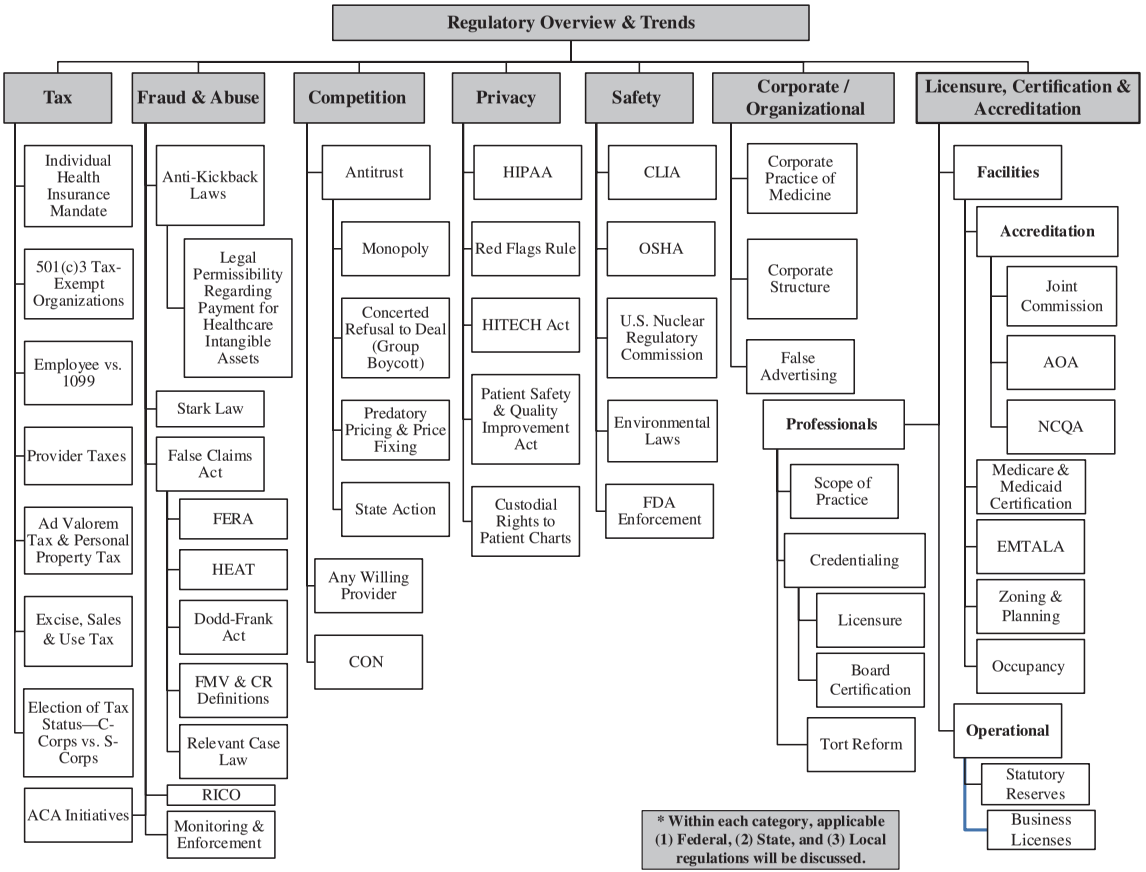

EXHIBIT 3.1 Overview of U.S. Healthcare Regulatory Scheme

3.2 TAX REGULATIONS

There are a variety of *tax regulations* that govern the healthcare transactional marketplace, including those that mandate the *Standard of Value* to be used in appraising the particular property interest, those that set the requirements for establishing the basic legal business structure of the operating healthcare enterprise, and those that establish the *commercial reasonableness* of the transaction. Furthermore, as many hospitals and health system providers have obtained tax-exempt status from the IRS, an additional layer of tax-related regulatory restrictions is applicable to transactions involving tax-exempt hospitals and health systems. These tax-exempt organizations determine which restrictions are often intertwined with, or parallel to, various *fraud and abuse* regulations, as will be discussed throughout this chapter.

3.2.1 Individual Health Insurance Mandate

Perhaps the most publicized—and criticized—provision of the ACA, known as the "*individual mandate*," is the requirement that U.S. citizens and legal residents maintain minimum amounts of health insurance coverage, that is, "*essential coverage*." *Essential coverage* includes (1) government-sponsored programs, (2) eligible employer-sponsored programs, (3) plans in the individual market, and (4) grandfathered group health plans, as well as (5) some other types of coverage.[8] Those individuals exempt from this requirement include, but are not limited to, (1) conscientiously opposed members of a recognized religion, (2) members of a healthcare sharing ministry, (3) individuals not lawfully present in the United States, (4) incarcerated individuals, (5) individuals who cannot afford coverage, (6) taxpayers who make less than 100 percent of the FPL, and (7) members of Indian tribes.[9] To assist U.S. citizens in paying for health insurance premiums purchased through a state health benefit exchange, the ACA provides a refundable "*premium tax credit*" for taxpayers whose income is 9.5 percent under the lowest-cost plan.[10] The *individual mandate* becomes effective on January 1, 2014, and individuals who are not in compliance with the law are subject to the greater

[8] "Patient Protection and Affordable Care Act, Sec. 1501," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010), pp. 242–249.

[9] Ibid., pp. 246–248.

[10] Ibid., pp. 224–231. Of note, this section was amended to include Social Security benefits in the modified adjusted gross income in order to calculate the premium tax credit. "Three Percent Withholding Repeal and Job Creation Act, Sec. 401," *Pub. L.* 112-56, 125 Stat 711 (November 21, 2011), p. 734.

Individual Mandate

An ACA requirement that U.S. citizens and legal residents maintain minimum amounts of health insurance coverage, that is, "essential coverage."

"Patient Protection and Affordable Care Act, Sec. 1501," Pub. L. *111–148, 124 Stat 119 (March 23, 2010), pp. 242–249.*

Essential Coverage

A federally mandated minimum level of coverage that every U.S. citizen must obtain, unless an exemption applies. Coverage includes government-sponsored programs, eligible employer-sponsored programs, plans in the individual market, and grandfathered group health plans, as well as some other types of coverage.

"Patient Protection and Affordable Care Act, Sec. 1501," Pub. L. *111–148, 124 Stat 119 (March 23, 2010), pp. 242–249.*

of (1) $95 per individual or (2) 1 percent of household income over the filing threshold.[11] By January 1, 2016, these penalties increase to (1) $695 per individual or (2) 2.5 percent of household income over the filing threshold, respectively.[12]

As a result of the June 28, 2012, *ACA Decision*, the U.S. Supreme Court's finding that the *individual mandate*, and its associated "*tax*," are constitutional, most U.S. citizens will be required to obtain a health insurance plan that meets the ACA's requirements in 2014.[13] Although it will not be illegal

L.* 111-148, 124 Stat 119 (March 23, 2010), p. 249, as amended by "Health Care and Education Reconciliation Act, Sec. 1002," *Pub. L.* 111-152, 124 Stat 1029 (March 30, 2010), pp. 1032–1033.

to disregard the ACA's mandate to obtain insurance, it will be illegal to "*not buy health insurance and not pay the resulting tax*."[14] The impact of this decision was stated by Chief Justice Roberts in his opinion that

> *By requiring that individuals purchase health insurance, the mandate prevents cost-shifting by those who would otherwise go without it. In addition, the mandate forces into the insurance risk pool more healthy individuals, whose premiums on average will be higher than their health care expenses. This allows insurers to subsidize the costs of covering the unhealthy individuals the reforms require them to accept.*[15]

3.2.2 501(c)(3) Tax-Exempt Organizations

In addition to the recent SCOTUS pronouncements regarding the applicability of a "*tax*" as related to the *individual mandate,* healthcare providers may qualify for federal *tax exemption* if they meet the IRS requirements for *charitable organizations* under section *501*(*c*)(*3*) of the *Internal Revenue Code* (IRC) if the enterprise is "*organized and operated exclusively for exempt purposes*" and none of its earnings are allocated to private shareholders or individuals.[16] *Exempt purposes* include those that are *charitable*, *religious*, *educational*, and *scientific*. Most healthcare organizations that hold federal tax-exempt status qualify under this *charitable purpose* classification, which includes (1) relief of the poor, the distressed, or the underprivileged; (2) lessening the burdens of government; (3) lessening neighborhood tensions; and (4) combating community deterioration and juvenile delinquency.[17]

501(c)(3) Exemption

Healthcare providers may qualify for a federal tax exemption if they meet the Internal Revenue Service (IRS) requirements for charitable organizations under section 501(c)(3) of the Internal Revenue Code (IRC), if the enterprise is "organized and operated exclusively for exempt purposes," and none of its earnings are allocated to private shareholders or individuals. Exempt purposes include those that are charitable, religious, educational, and scientific.

"Exemption Requirements," I.R.C. § 501(c)(3).

The IRS classifies general and rehabilitative tax-exempt healthcare organization into 28 categories, assigning each a *National Taxonomy of Exempt Entities* (*NTEE*) *Code*.[18] Table 3.1 sets forth, by state, the number of each type of exempt healthcare organization, as well as the number of exempt organizations classified as "*Insurance Providers, Services*" and "*Mutual Insurance Company of Association.*"

In addition, Table 3.2 sets forth, on a national level, the cumulative number of each type of exempt healthcare organizations and those exempt organizations classified as "*Insurance Providers, Services*" and "*Mutual Insurance Company of Association.*"

3.2.2.1 "Charitable Purpose" and Community Benefit Requirements In 1969, the IRS expanded the definition of the term "*charitable*" to include the requirement that an organization must meet *community benefit* standards as described in *Revenue Ruling 69–545* in order to qualify for tax-exempt status, including (1) *operating a full-time emergency room*, offering services to all patients, despite their ability to pay; (2) using net earnings to *improve quality of care, advance medical education, and further research initiatives*; and (3) establishing a *board of trustees composed of financially disinterested community leaders.*[19]

3.2.2.2 ACA Requirements The ACA created additional requirements for tax-exempt charitable hospitals related to (1) conducting *community health needs assessments* (CHNAs), (2) establishing *financial assistance policies* (FAPs), (3) *limiting their charges* for individuals who qualify for financial assistance, and (4) *refraining from certain collections* actions.[20]

3.2.2.2.1 Community Health Needs Assessments (CHNAs) Effective March 23, 2012, the CHNA is to be conducted every three years with the following requirements: "(i) take into account input from persons who represent the broad interests of the community served by the hospital facility, including those with special knowledge of or expertise in public health and (ii) be made widely available to the public."[21] The CHNA is an effective way to delineate how the hospital and its departments currently interact with the residents, key stakeholders, and other organizations in the community in order to maintain and streamline these relationships moving forward.[22] It may also allow hospital community outreach departments to shift into a more central role for tracking and coordinating departmental outreach programs.[23]

3.2.2.2.2 Financial Assistance Policy Tax-exempt hospital organizations must in addition adopt a written policy providing emergency medical care to individuals without discrimination or regard for their ability to pay.[24] The *financial assistance policy* must include the following:

> *(i) eligibility criteria for financial assistance, and whether such assistance includes free or discounted care; (ii) the basis for calculating*

> *amounts charged to patients; (iii) the method for applying for financial assistance; (iv) in the case of an organization which does not have a separate billing and collections policy, the actions the organization may take in the event of nonpayment, including collections action and reporting to credit agencies; and, (v) measures to widely publicize the policy within the community to be served by the organization.*[25]

3.2.2.2.3 Limiting Charges for FAP-Eligible Individuals The ACA prohibits organizations from charging uninsured *FAP-eligible* individuals any more than the lowest "*amount generally billed*" (AGB) for emergency or medically necessary care that would be charged to an individual who does have insurance.[26] In its proposed rule, "*Additional Requirements for Charitable Hospitals*," released for comments on June 26, 2012, the IRS discusses how to calculate the AGB via one of two calculation methods: the "*look back method*" and the "*prospective Medicare method.*"[27] First, the "*look back method*" calculates the AGB by multiplying the hospital's gross charges for the care to one *FAP-eligible individual* by an annually calculated "*AGB percentage.*"[28] That *AGB percentage* is determined by dividing the "*sum of all claims for emergency and other medically necessary care . . . that have been paid in full . . . during a prior 12-month period*" by the sum of all of the associated gross charges for those claims.[29]

In aggregating the claims for emergency and medically necessary care, the hospital may choose to (1) include only Medicare *fee-for-service* (FFS) as the primary payor (including beneficiaries' out-of-pocket expenses) or (2) include all private health insurers and their beneficiaries' *out-of-pocket costs* as well.[30] The less complex "*prospective Medicare method*" calculates the AGB for any *FAP-eligible individual's* emergency or medically necessary care

[28] Ibid.

[29] Ibid.

[30] Ibid.

using existing billing and coding processes that the hospital would use if the *FAP-eligible individual* were a Medicare FFS beneficiary.[31] The proposed rule does permit a *safe harbor* for hospitals that charge *FAP-eligible individuals* more than AGB for emergency and medically necessary care if (1) the individual did not submit a complete FAP application at the time of the charge, (2) the hospital still made reasonable efforts to determine the individual's FAP status during that applicable time frame, and (3) if the individual was found to be *FAP-eligible*, the hospital corrected the billing charges.[32]

3.2.2.2.4 Extraordinary Collection Action Limitations Finally, the ACA prohibits "*extraordinary collection actions*" (ECAs) before the organization determines whether the individual qualifies for financial assistance.[33] The IRS defines ECAs as "*actions taken by a hospital facility against an individual related to obtaining payment of a bill for care covered under the hospital facility's FAP that require (1) a legal or judicial process; (2) involve selling an individuals' debt to another party; or, (3) reporting adverse information . . . to consumer credit reporting agencies or credit bureaus.*"[34] Any hospital that fails to meet these new requirements will be subject to a $50,000 excise tax under I.R.C. § 4959.[35]

Extraordinary Collection Actions

Actions taken by a hospital facility against an individual related to obtaining payment of a bill for care covered under the hospital facility's FAP that require (1) a legal or judicial process; (2) involve selling an individuals' debt to another party; or (3) reporting adverse information . . . to consumer credit reporting agencies or credit bureaus.

3.2.2.3 Impact of Friendly Hills Ruling on Definition of "Community Benefit" A 1993 IRS exemption ruling for the *Friendly Hills HealthCare Network* and its nonprofit branch, *Friendly Hills HealthCare Foundation*, represented a landmark determination in defining what constituted a "*community benefit*" for purposes of determining an organization's tax-exempt status. *Loma Linda University Medical Center*, a 501(c)(3) organization and the sole corporate member of the *Friendly Hills HealthCare Foundation*, was one of the first vertically *Integrated Delivery Systems* (IDS) organized under a foundation to receive 501(c)(3) tax-exemption status.[36] *Friendly Hills HealthCare Network* had acquired an acute care general hospital and several primary care clinics, as well as the assets of a medical group, through the purchase and donation by the physician owners of the medical group and financed in part through *tax-exempt bonds*.[37] To gain tax-exempt approval, the *Friendly Hills HealthCare Network* agreed to pay no more than $110 million for the hospital, the clinics, and other assets.[38]

The IRS granted the *foundation model IDS* tax-exempt status after identifying several critical elements regarding *Friendly Hills HealthCare Network*'s acquisitions and operation of the medical practice, that is, (1) the stated goal of the reorganization into the IDS was to "enhance the accessibility, quality and cost-efficiency of services rendered to the community"; (2) the *community benefit* provided by the IDS against the private benefits provided to the physicians by *Friendly Hills HealthCare Network* was considered by the IRS to be part *purchase* and part *donation*; and (3) the board of directors had established a "*20 percent safe harbor*" of physician membership on the board.[39] Finally, the IRS required the *foundation model IDS* to treat Medicaid patients, provide charity care, and engage in medical research, in addition to maintaining an open medical staff and a 24-hour emergency room.[40]

3.2.2.4 Exempt Organizations: Disposition of Transaction Proceeds A tax-exempt organization, such as a nonprofit hospital, is generally permitted to sell one or more of its assets to another tax-exempt organization or a for-profit entity, so long as *fair market value* consideration is received for the sale.[41] In those circumstances in which the purchaser of the tax-exempt organization's assets is an organization created by individuals related to the exempt organization, such as physicians practicing at the nonprofit hospital or members of the nonprofit hospital's board of directors, these individuals will be treated as *insiders* by the IRS, and the transaction will receive strict scrutiny by the IRS to ensure that there is no *inurement of private benefit*, as will be discussed in more detail later in this chapter.[42] It should be noted that many *tax-exempt organizations* are *nonprofit corporations* and subject to the individual *state's nonprofit corporation act*, which state regulations often have varying requirements regarding the disposition of exempt organization sale proceeds vis-à-vis the authority of the *state attorney general* to directly control the proceeds from an exempt organization's sale of assets by requiring them to be distributed to a charitable trust.[43]

3.2.2.5 Prohibition against Excess Benefit Transactions and "Inurement of Private Benefit" In addition to the requirement that a tax-exempt organization meet *charitable purpose* requirements, the IRS prohibits *excess benefit*

Excess Benefit Transaction

A transaction in which an economic benefit is provided by an applicable tax-exempt organization, directly or indirectly, to or for the use of a disqualified person, and the value of the economic benefit provided by the organization exceeds the value of the consideration received by the organization.

"Taxes on Excess Benefit Transactions," 26 U.S.C. § 4958(c)(1)(a).

[42] Ibid.

[43] Ibid., pp. 954–955; Michael W. Peregrine, Esq., et al., "Hot Developments in Non-Profit Corporations Law: HealthMidwest, HealthPartners and Attorney General Spitzer," American Health Lawyers Association, http://www.healthlawyers.org/News/Connections/Health%20Lawyers%20News%20Analysis/Pages/Hot_Developments_In_Non-Profit_Corporation_Law_Health_Midwest,_HealthPartners_And_Attorney_General_S.aspx (accessed October 3, 2012).

transactions and *inurement of private benefits* between tax-exempt organizations (such as a hospital) and other parties, in which "the value of the economic benefit provided exceeds the value of the consideration received for providing the benefit."[44]

According to the IRS, an "excess benefit transaction [is a] transaction in which an economic benefit is provided by an applicable tax-exempt organization, directly or indirectly, to or for the use of any disqualified person, if the value of the economic benefit provided [by the organization] exceeds the value of the consideration received for providing such benefits."[45] In addition, the IRS has strictly *prohibited the inurement of private benefits*, that is, when an exempt organization is "organized or operated for the benefit of private interests." Specifically, the IRS has stated that

> *[n]o part of the net earnings of a section 501(c)(3) organization may inure to the benefit of any private shareholder or individual[, whereby] a private shareholder or individual is a person having a personal and private interest in the activities of the organization.*[46]

It is important to note that despite the IRS prohibitions against *excess benefit transactions*, compensation arrangements involving tax-exempt organizations *may* include *financial incentives*. In *General Counsel Memorandum* (*GCM*) *35638*, published on January 28, 1974, the IRS noted that even compensation arrangements that involved *shared savings* related to quality improvements could be acceptable if they were at arm's length and were "a means of providing *reasonable* compensation to employees without

Reasonable Compensation

The amount that would ordinarily be paid for like services by the enterprises (whether taxable or tax-exempt) under like circumstances.

any potential for reducing the charitable services or benefits otherwise provided"[47] (emphasis added).

Compensation models using financial incentives may arise in certain *physician group practice* structures, such as *PODs*, whereby a group of physicians, employed by a tax-exempt organization, *combines the group's total reimbursement* dollars and distributes compensation to the *individual* physician members of the POD according to a set methodology *decided by the POD*. (See Chapter 15, "Valuation of Services," for a further discussion of POD compensation arrangements.) The IRS has provided guidance during the last several decades regarding the compensation paid to physicians by an exempt organization that is tied to achieving a certain performance level. For example, the *IRS GCM 32453*, issued in November 30, 1962, stated that a *percentage-based* compensation arrangement based on net revenues was acceptable if (among other factors) the total compensation amount had "a ceiling or reasonable maximum so as to avoid the possibility of a windfall benefit to the service provider."[48] In its 2002 *Exempt Organization CPE Text*, the IRS identified several factors that it considers when determining whether *incentive compensation arrangements* between physicians and an exempt organization are appropriate and are not in conflict with the IRS prohibitions against *excess benefit transactions* and *inurement of private benefits*, including:

1. Whether the compensation arrangement was established by an *independent board of directors* or an *independent compensation committee*.
2. Does the incentive arrangement result in a *total compensation arrangement that is reasonable*?
3. Are the exempt organization and the physician at *arm's length* (e.g., the physician does not have a significant impact on the management or control of compensation)?
4. Is a *reasonable ceiling on the amount a physician may earn* included in the arrangement?
5. Does the arrangement *reduce charitable services* or benefits of the organization?
6. Does the arrangement use *quality of care or patient satisfaction metrics*?
7. If the compensation arrangement is tied to the net revenues of a physician, does the *arrangement reflect the charitable purpose of the organization*?

---

[48] General Counsel Memorandum 32453 (November 30, 1962).

8. Does the arrangement *create a joint venture* between the organization and a group of physicians?
9. Does the arrangement *operate as a means to distribute profits to controlling members* of the organization?
10. Does the arrangement *serve a business purpose* of the organization?
11. Would the arrangement *result in no abuse or unwarranted benefits*, or include devices to guard against such?
12. Is the compensation *incentive tied to services a physician actually performs*?[49]

The IRS echoed the previous list of criteria in a subsequent *March 29, 2002, Information Letter* related to incentive payments for cardiovascular and orthopedic services, which stated that

> *In summary, there is no prohibition or per se rule that prevents health care organizations from making incentive payments to physicians. In determining whether a health care organization utilizing an incentive compensation program for physicians complies with the proscriptions against private inurement and impermissible private benefits, the Internal Revenue Service will examine all the relevant incentive compensation factors discussed above.*[50]

3.2.2.6 IRS Enforcement: Intermediate Sanctions vs. Loss of Exempt Status Should the IRS become aware that an exempt organization has engaged in an *excess benefit transaction*, the IRS may impose as punishment an *excise tax* on the individual and/or the exempt organization. In the past, *excess benefit transactions* were considered together with other *private benefit inurements*, and violations were subject to total revocation of the organizations tax exempt status as the sole remedy.[51] In 1996, the *Taxpayer Bill of Rights 2* authorized the IRS to impose *intermediate excise taxes* (a penalty short of *exempt status* revocation) against the *disqualified person* who received the *excess*

[49] Lawrence M. Brauer and Marvin Friedlander, "Section 4958 Update," in "2000 Exempt Organization (EO) CPE Text," Internal Revenue Service, 2000, pp. 30–33.

benefit and on the organizational manager who *knowingly* participated in the transaction.[52]

In the final regulations published on March 28, 2008, the IRS identified five factors to be considered when determining whether the organization should be subject to an *intermediate excise tax* or whether the organization's exempt status should be revoked: (1) the size and scope of the organization's *ongoing activities*; (2) the size and scope of the *excess benefit transaction* in relation to regular activities; (3) whether *excess benefit transactions* happened in the past; (4) whether the organization has implemented *safeguards* against this type of transaction; and, (5) whether the *excess benefit transaction* has been corrected, or there has been a *good faith effort* to do so.[53] These last two factors are given a greater weight when considering whether to allow EO's *tax-exempt status* to remain in those cases in which the EO has taken steps to remedy the situation.[54]

3.2.2.7 IRS Determinants of "Reasonable Compensation" Under Treasury Regulation 53.4958–4, the IRS equates reasonable compensation to the value of services provided, and further defines reasonable compensation as "the amount that would ordinarily be paid for like services by the enterprises (whether taxable or tax-exempt) under like circumstances."[55] Significantly, the valuation standard, as cited by the IRS, is that of "fair market value (i.e., the price at which property or the right to use property would change hands between a willing buyer and a willing seller, neither being under any compulsion to buy, sell or transfer property or the right to use property, and both having reasonable knowledge of relevant facts)."[56]

Items included in determining the *value* of compensation for purposes of determining *reasonableness* under the *excess benefit transaction* rule are:

> *all forms of cash and noncash compensation, including salary, fees, bonuses, severance payments and deferred and noncash*

[52] "Taxpayer Bill of Rights, Sec. 1311," *Pub. L.* 104-168, 110 Stat 1452 (July 30, 1996), pp. 1475–1479.

compensation";[57] *"payment of liability insurance premiums";*[58] *and, "all other compensatory benefits, whether or not included in gross income for tax purposes, including payments to welfare benefit plans, such as plans providing medical, dental, life insurance, severance pay, and disability benefits."*[59]

Treasury Regulation 53.4958–6 further states that "payments under a compensation arrangement are *presumed to be reasonable . . . if the following conditions are satisfied:*

1. *The compensation arrangement . . . [is] approved in advance by an authorized body of the applicable tax-exempt organization composed entirely of individuals who do not have a conflict of interest with respect to the compensation arrangement;*
2. *The authorized body obtained and relied upon appropriate data as to comparability prior to making its determination; and*
3. *The authorized body adequately documented the basis for its determination concurrently with making that determination.*[60] *[Emphasis added.]*

If these three criteria are satisfied, the IRS may rebut only a presumption of reasonableness by developing "sufficient contrary evidence to rebut the probative value of the comparability of data relied on by the authorized body."[61]

3.2.2.8 IRS Updates to Form 990 In 2007, the IRS issued an updated version of *Form 990*, the return that charities and other tax-exempt organizations are required to file annually. The redesign of *Form 990* was based on three guiding principles: (1) enhancing transparency, (2) promoting tax compliance, and (3) minimizing the burden on the filing organization.[62] The most significant changes to *Form 990* include (1) adding a summary page that

[57] "Excess Benefit Transaction," 26 CFR 53.4958-4(b)(ii)(B)(1).

[58] "Excess Benefit Transaction," 26 CFR 53.4958-4(b)(ii)(B)(2).

[59] "Excess Benefit Transaction," 26 CFR 53.4958-4(b)(ii)(B)(3).

provides "a snapshot of the organization's key financial, compensation, governance, and operational information"; (2) "requiring governance information, including the composition of the board" and financial practices; and (3) revising and adding "schedules that will focus reporting on certain areas of interest to the public and the IRS."[63]

In 2012, the IRS made additional changes to *Form 990* in order to enhance its readability.[64] Organizations that are part of a joint venture must now *proportionately report the joint venture's activities* as their own, *based on their percentage of ownership interest* held in the joint venture using a *Form 1065-K-1*.[65] In addition, exempt organizations must demonstrate that they had certain policies in place, such as those related to the governing body, as of the last day of the tax period, rather than the filing deadline, which prevents attempts to achieve *retroactive compliance*.[66] In other areas, the new *Form 990* loosens the "*business relationship*" reporting requirements.[67] Prior to the new 990 changes, organizations were required to report *business relationships* between and among their *officers, directors, trustees, and key employees* (ODTKEs). Under the new *Form 990*, certain *business relationships* are exempt from the reporting requirements where the ODTKE is only a *key employee* of the *other organization*.[68] Other definitional changes incorporate state law considerations, for example, an exempt organization's qualification as a "*hospital*" or "*hospital facility,*" based solely on state law requirements for licensure.[69]

3.2.2.9 IRS Scrutiny of Executive Compensation Beginning in February 2010, the *Tax Exempt and Government Entities Division* of the IRS initiated

random audits of tax-exempt organizations to ensure their compliance with IRS § 409A, which requires the inclusion of employee *nonqualified deferred compensation* (i.e., compensation earned in one year that is paid in a future year) in an individual's *gross income* for the tax year in which it is actually paid.[70] Approximately 1,500 exempt organizations across all industries are anticipated to be examined during a three-year time period from 2010 to 2013.[71] During the audit process, the IRS will be seeking a thorough examination of all *executive compensation and benefit arrangements*, including *executive retirement contracts* and *deferred compensation arrangements*.[72] If an exempt organization is found not to be in compliance with 409A, the IRS has the ability to impose (1) *additional payroll taxes* and interest, (2) significant *tax penalties* on individuals for failure of nonqualified deferred compensation plans to meet the requirements of 409A, and (3) *substantial monetary sanctions* if the IRS determines that the *executive compensation arrangement* constitutes an *excess benefit transaction*.[73]

3.2.2.10 ACA Establishment of the Tax Exempt Consumer Operated and Oriented Plan (CO-OP) Program The ACA created the *Consumer Operated and Oriented Plan (CO-OP) Program*, another type of tax-exempt organization under I.R.C. § 501(c)(29)[74], with the goal of incentivizing tax-exempt health insurers to offer health plans in individual and small group markets.[75] The ACA provides funding for these new plans, provided that they qualify under the

I.R.C. § 501(c)(29) exemption and agree to the ACA's *Consumer Operated and Oriented Plan (CO-OP) Program* requirements that

1. The organization has given *notice* to the secretary that it is applying for § 501(c)(29) status;
2. *Net profits will be inured only to benefit members* of the health plan (e.g., lower premiums, improve benefits, etc.), not to private individuals;
3. It *does not propagandize or otherwise attempt to influence legislation*; and
4. It *refrains from any participation* in, on behalf of, or in opposition to any *campaign or candidate for political office*.[76]

Failure of the exempt organization to meet the above criteria under the ACA will result in a penalty mandating repayment of 110 percent of its loan or grant, plus interest.[77]

3.2.3 Bona Fide Employees vs. Form 1099 Independent Contractors

The IRS definition of "*employees*" versus "*1099 independent contractors*," as set forth in 26 U.S.C. § 312(d)(2), is significant for purposes of many *fraud and abuse* regulations governing healthcare providers.[78] For example, the term "*employee*" has the same meaning for purposes of the *Anti-Kickback Statute* and the *Stark Law* as it does for the IRS. By way of guidance, the IRS has developed an *11 factor test*, broken out into three general categories, that is, (1) *behavioral control*, (2) *financial control*, and (3) *type of*

Factoid

The IRS has developed an 11 factor test, broken out into three general categories, that is, (1) behavioral control, (2) financial control, and (3) type of relationship between the parties, for determining bona fide employment relationships.

"Employer's Supplemental Tax Guide (Supplement to Publication 15 (Circular E), Employer's Tax Guide," Publication 15-A, Department of the Treasury, Internal Revenue Service, 2012, p. 7.

TABLE 3.3 IRS Determinates of "*Employee*" Status

Behavioral Control
1. Instructions that the business gives to the worker.
2. Training that the business gives to the worker.
Financial Control
1. The extent to which the worker has unreimbursed business expenses.
2. The extent of the worker's investment.
3. The extent to which the worker makes his or her services available to the relevant market.
4. How the business pays the worker.
5. The extent to which the worker can realize a profit or a loss.
Type of Relationship
1. Written contracts describing the relationship the parties intended to create.
2. Whether the business provides the worker with employee-type benefits, such as insurance, a pension plan, vacation pay, or sick pay.
3. The permanency of the relationship.
4. The extent to which services performed by the worker are a key aspect of the regular business of the company.

"Employer's Supplemental Tax Guide (Supplement to Publication 15 [Circular E]), Employer's Tax Guide," Publication 15-A, Department of the Treasury, Internal Revenue Service, 2012, p. 7.

relationship between the parties, for determining *bona fide employment relationships*.[79] It is not necessary that all 11 factors be met, and no single factor is dispositive in determining employment status. Rather, the 11 factors, taken together in the aggregate, are evidence of a *bona fide employee* relationship.[80] See Table 3.3 for a description of the 11 factors.

Full-Time Employees

Employees who work, on average, at least 30 hours of service per week.

[80] Ibid.

A further discussion of the interplay between the IRS's definition of an "*employee*" vis-à-vis the *Anti-Kickback Statute* and *Stark Law* regulations will be discussed later in this chapter.

3.2.4 Provider Taxes

Generally, *provider taxes* are funneled back to providers by way of increased Medicaid reimbursement rates, while states can retain the *federally matched funds*.[81] The state may not tax providers more than 25 percent of its share of Medicaid expenditures and may not guarantee any return of that tax to providers.[82] The 2011 U.S. legislative sessions resulted in 15 states enacting or expanding *provider tax laws*, generating more than $1.8 billion for states.[83] This increase may be driven, in part, by the *American Reinvestment and Recovery Act*'s (ARRA) significant increase—an average of 8.7 percent—*in federal matching funds* (FMAP) between October 1, 2008, and December 31, 2010.[84] As of 2012, 47 states and Washington, DC, have some type of Medicaid-related *provider tax*. The three states without a Medicaid-related *provider tax* are Alaska, Delaware, and Hawaii.[85] Furthermore, according to *The Fiscal Survey of States* report issued by the *National Governor's Association* and the *National Association of State Budget Officers* in the spring of 2012, 16 states had either increased or planned to increase Medicaid-related provider taxes during fiscal year 2012. Ten additional states had similar plans to increase Medicaid-related provider taxes included within their proposed state budgets for fiscal year 2013.[86] See Table 3.4 for a list of those states with recent (or planned) increase to Medicaid-related provider taxes.

3.2.5 Ad Valorem Tax and Personal Property Tax

In addition to *provider taxes*, healthcare providers may also be subject to personal property taxes and *ad valorem* taxes. An *ad valorem tax* is a tax that is generally determined to be a fixed or calculated proportion of the value of the property "as assessed or appraised on a regular basis."[87] Frequently assessed by state and local authorities, *ad valorem taxes* generally pertain to *real property and sales* but are also applicable to *imported goods*. For example, in February 2002, a Michigan appellate court ruled that *ProMed Healthcare*, a nonprofit hospital, was not exempt from paying *ad valorem* taxes on the personal property owned by the hospital.[88] In that

Ad Valorem Tax

A tax that is generally determined to be a fixed or calculated proportion of the value of the property as assessed or appraised on a regular basis.

"State and Local Taxation," 71 Am. Jur. *2d, § 18 (2010).*

case, *ProMed Healthcare* argued for exemption under either the IRS "*charitable purpose*" or "*public health*" exemptions; however, the court rejected those arguments, stating that while it *owned the personal property subject to the tax*, it *did not own the real property where the personal property was located*.[89] The court indicated that IRC § 501(25)(F) referred only to personal property that was located on real property, both of which must be owned and operated by the tax-exempt organization.[90]

As related to imported goods, the ACA includes a provision that "any manufacturer or importer with gross receipts from branded prescription drug sales" must pay an annual fee for any drugs that were submitted for U.S. Food and Drug Administration (FDA) approval (excluding orphan drugs) and any biological products submitted for licensing under the Public Health Service Act.[91] Despite the ACA's treatment of this provision as an excise tax for refund purposes, this fee is not officially a tax. The IRS does not require a tax return filing for this fee but, rather, mails each "covered entity" a final fee calculation by August 31 of each year to be paid by September 30 of that year.[92] Sales that did not exceed $5 million in a calendar year are not taken into account for the fee calculation.[93]

3.2.6 Excise, Sales, and Use Tax

Effective January 1, 2018, a 40 percent *excise tax* will be levied against employees with *high-cost health coverage*, that is, an employer-sponsored health insurance plan that provides the employee with an *excess benefit* above the determined thresholds.[94] These thresholds include (1) for employees with self-only coverage, the product of $10,200 and the health cost adjustment percentage for such employees; and (2) for employees with any other type of coverage, the product of $27,500 and the health cost adjustment percentage for such employees.[95] In addition, the ACA includes an *excise tax* on *medical devices*, effective January 1, 2013, in which the device *manufacturer, producer, or importer* must pay a tax equivalent to 2.3 percent of the *sale price of the medical device*.[96] The IRS clarified the ACA's definition of "*taxable medical device*" and made further differentiations between *dual-use devices*, which have both medical and nonmedical uses, and *research-only devices* in a February 2012 proposed rule, and has exempted from this provision items that are "generally purchased by the general public at retail for individual use," for example, eyeglasses, contact lenses, and hearing aids.[97] In the "*Taxable Medical Devices*" proposed rule, which has yet to be finalized, the IRS proposed a safe harbor exemption that allows certain taxable medical devices to qualify for the *retail exemption*, including many *over-the-counter* (OTC) tests; *durable medical equipment, prosthetics, orthotics, and supplies* (DMEPOS); and *parenteral and enteral nutrition supplies*.[98] Of note, while the U.S. House of Representatives passed the *Health Care Cost Reduction Act* on February 7, 2012, which would repeal the 2.3 percent tax, the U.S. Senate has yet to call a vote on the bill since it was placed on the calendar on June 12, 2012.[99]

3.2.7 Election of Tax Status: C-Corporations vs. S-Corporations

In addition to the many taxes healthcare providers may be subject to, there are various tax-related provisions regarding a healthcare enterprise's election of tax status, for example, a *C-corporation* is a taxable entity, whereas an *S-corporation* is a flow-through entity that allows taxation at the taxpayer level. A *C-corporation*'s earnings given to shareholders are subject to double taxation (as corporate earnings and as personal dividends), while an *S-corporation*'s income goes directly to the shareholders and is only taxed once.

The taxable income of an *S-corporation* is *calculated like an individual's tax*, except that a shareholder's *pro rata* portion of items of income, loss (gross income minus the deductions allowed to the corporation), deduction, or credit (the separate treatment of which could affect the liability for tax of any shareholder) must be listed separately.[100] The *pro rata* share is determined by the number of shares the individual held on each day of the tax year. Shareholders cannot claim losses that exceed their amount at risk, generally the maximum amount the shareholder could lose.[101]

A conversion from a *C-corporation* to an *S-corporation* does not invoke any immediate tax liabilities; however, a business valuation is necessary during this conversion to determine future tax liability.[102] In addition, while a *C-corporation*'s assets are subject to *double taxation* on the sale, *an S-corporation* is not subject to such taxation if sold more than 10 years after conversion to an *S-corporation*. However, the *double taxation* is limited to the extent of the asset's *built-in gain* (the amount by which the *fair*

market value exceeds its adjusted tax basis as of the conversion date). The amount of the sale price in excess of the built-in gain amount is subject to taxation at only one level. Therefore, it is important to get a *business valuation* when converting to an *S-corporation* and to allocate a value to each of the company's assets.

In addition, an *S-corporation* may be *liable for*:

Tax imposed on built-in gains or capital gains;
Tax on excess net passive income;
Tax from the recapture of a prior year's investment credit; and
A "Last in, first out" (LIFO) recapture tax.[103]

Taxes on *built-in* or *capital gains* occur when an *S-corporation* sells assets that gained value while the company was a *C-corporation*. However, this is applicable only to companies that became *S-corporation*s after 1986. Also, this tax does not apply if "the net recognized built-in gain for the tax year does not exceed the net unrealized built-in gain minus the net recognized built-in gain for prior years in the recognition period, to the extent that such gains were subject to tax."[104] The recognition period is defined as the five-year period after the company converts to an *S-corporation* or acquires *C-corporation* assets in a *carryover basis transaction*.[105] Taxes on *excess net passive income* occur only when the *S-corporation* has *C-corporation* subsidiaries.[106]

"*Last in, first out*" (LIFO) recapture taxes apply only if the corporation used an *LIFO inventory method* for its last year before converting to an *S-corporation*. This tax is required when converting to an S-corporation or for a transfer of inventory from a *C-corporation* to an S-*corporation* in a

[103] Ibid., p. 174.
[104] Ibid.
[105] Ibid.
[106] Ibid., p. 175.

tax-free reorganization.[107] A company is responsible for the *LIFO recapture* amount when it converts into an *S-corporation*, equal to the amount by which the inventory under a "*first in, first out*" (FIFO) method would exceed the inventory under LIFO.[108]

Between 2002 and 2011, the IRS has been increasing its scrutiny of "*risky*" businesses, such as partnerships and *S-corporations*, in particular, those related to *mid-market companies* (assets between $10 million and $50 million).[109] IRS audits of *mid-market companies* increased from 11.7 percent to 13.3 percent in the three-year period of 2008 to 2011.[110] In the same period, the number of new *S-corporations* and partnership filings significantly increased, as did the total number of audits of partnerships and *S-corporations*.[111]

3.3 FRAUD AND ABUSE REGULATIONS

As indicated earlier in this chapter, healthcare is arguably the most heavily regulated industry in the United States and also represents one of the largest areas of government expenditures. Those relevant legal constraints and regulatory considerations related to *fraud*, which uniquely affect healthcare enterprises, assets, and services, have often had a significant impact on not only the *value* that may be attributable to each property interest, but also on the *valuation process* itself. Financial markets often consider the term "*fraud*" within a context of misrepresentation of financial information. However, "*fraud*" has several distinct meanings within the context of the healthcare regulatory framework that may affect the *profitability and sustainability* (and ultimate *value*) of the given property interest *going forward*.

The increasing government scrutiny of the business activities of healthcare providers during the last several decades has led to tightened restrictions and increased regulatory enforcement. Many types of business arrangements,

[110] Ibid.

[111] Ibid.

which would be regarded as typical motivations inherent in commercial relationships between parties in other industries, are perceived as exhibiting the potential for a *significant risk* of fraud in the healthcare industry. For example, referral relationships that would be lawful and expected in other industries and would exhibit the potential for significant value may violate both federal and state *Anti-Kickback* and/or *self-referral laws* when they are found to exist between healthcare providers. Changes in the scope and nature of Medicare *fraud and abuse* enforcement, as it relates to physician *self-referral laws*, has resulted in the transactional market for healthcare enterprises that provide "*designated health services*" (DHS) becoming an area of significant investment uncertainty, thereby resulting in a *greater perception of risk* to be considered in the healthcare valuation engagement.

3.3.1 Anti-Kickback Statute

Enacted in 1972, the federal *Anti-Kickback Statute* makes it a felony for any person (physician, allied health professional, or paraprofessional with a Medicare provider number) to "*knowingly and willfully*" solicit or receive, or to offer or pay, any "*remuneration*," *directly or indirectly,* in exchange for the referral of a patient for a healthcare service paid for by a federal healthcare program.[112] Violations of the *Anti-Kickback Statute* are punishable by up to five years in prison, criminal fines up to $25,000, or both.[113]

The original statute was amended in 1987 with the passage of the *Medicare and Medicaid Patient & Program Protection Act of 1987* (*MMPPPA*) to include exclusion from the Medicare and Medicaid program as an alternative civil remedy to criminal penalties.[114] Also, under the *MMPPA*, the language describing *intent* changed from a party who "knows or has reason to know" that a particular billing or referral action might be considered

Factoid

More than half of all practicing physicians in the United States are currently employed by hospitals, and 74 percent of hospitals are planning to increase current physician employment from 2010 to 2013.

"Hospitals' Race to Employ Physicians—The Logic Behind a Money-Losing Proposition," by Robert Kocher and Nikhil R. Sahni, New England Journal of Medicine *364, no. 19 (May 12, 2011): 1790–1791.*

Anti-Kickback Statute

Enacted in 1972, the federal Anti-Kickback Statute makes it a felony for any person to "*knowingly and willfully*" solicit or receive or to offer or pay any "remuneration" directly or indirectly in exchange for the referral of a patient for a healthcare service paid for by a federal healthcare program. Penalties were amended by Medicare and Medicaid Patient and Program Protection Act of 1987 and the Balanced Budget Act of 1997. Congress enacted *safe harbors*, which detail specific regulatory criteria that must be met to shield an arrangement from liability and are meant to protect practices unlikely to result in fraud or abuse.

"Criminal Penalties for Acts Involving Federal Health Care Programs," 42 U.S.C.A. § 1320a-7b(b).

Kickback

Remuneration received in return for referring an individual to a person for the furnishing of any item or service for which payment may be made under a federal health care program or remuneration received in return for purchasing, leasing, ordering, or arranging for or recommending purchasing, leasing, or ordering any good, facility, service, or item for which payment may be made under a federal health care program.

"Criminal Penalties for Acts involving Federal Health Care Programs," 42 U.S.C. 1320a-7b(b).

MEDICARE AND MEDICAID PATIENT AND PROGRAM PROTECTION ACT OF 1987 (MMPPPA)

Amended the 1987 Anti-Kickback Statute by including an alternative civil remedy to violation: exclusion from the Medicare Program.

"Medicare and State Health Care Programs: Fraud and Abuse," OIG Anti-Kickback, Department of Health and Human Services, July 29, 1991, 42 CFR Part 1001; "Medicare and Medicaid Patient and Program Protection Act of 1987," Pub. L. *100–93 (August 18, 1987).*

fraud, to any party who "knows or should know."[115] The *Balanced Budget Act of 1997* added a *civil monetary penalty* of *treble damages*, or three times the illegal *remuneration*, plus $50,000 per violation. *Civil monetary penalties* are believed to be a more *effective* way of enforcing the statute, as the government need not prove the *Anti-Kickback* violation by the criminal standard of *beyond a reasonable doubt*.[116]

Treble Damages

Damages equal to three times the amount of the illegal remuneration in violation of the Anti-Kickback Statute.

Black's Law Dictionary, *edited by Bryan A. Garner, 9th ed. (St. Paul, MN: Thomson Reuters, 2009), p. 449.*

Civil Monetary Penalty

Financial penalties levied against parties found guilty of violating the Anti-Kickback Statute or submitting false claims for government reimbursement.

[116] "The Balanced Budget Act of 1997," *Pub. L.* 105-33, Section 4304 (August 5, 1997).

The 1995 *Inspector General v. Hanlester Network* case was the first instance in which the OIG asserted its authority to *impose civil sanctions* in the *Anti-Kickback* arena, which required that the government prove that the defendant "*knowingly and willfully committed acts which are alleged to violate the anti-kickback statute.*"[117] CMS initially found that physicians in the laboratory limited partnership violated the *Anti-Kickback* prohibitions by selecting physician investors, *in part*, based on the volume of laboratory tests they were expected to order from the defendant *Hanlester* and barred the physicians from future participation in the Medicare program.[118] Subsequently, the CMS *Final Decision on Review of Administrative Law Judge Decision on Remand* concluded that the *Anti-Kickback Statute* was violated by offering and *paying profit distributions to the limited partner physicians*, as well as by *soliciting or receiving remuneration in return for referrals* of laboratory tests, stating that

> *[A]n intent to induce referrals could be inferred from the structure of the joint ventures, including the fact that Respondents were paying substantial cash distributions and relatively high rates of return (FFCLs 238 and 241), warning about possible failure absent physician investor referrals (FFCLs 233 and 243), and presenting opportunities to earn income otherwise barred by law on laboratory tests (FFCL 239).*[119]

On April 6, 1995, *Hanlester* was affirmed, in part, in the U.S. Court of Appeals, Ninth Circuit, holding that the *healthcare network itself* was *vicariously liable* for violations of the *Anti-Kickback Statute*, but that the liability did not extend to the individual partner physicians.[120] Although the *Network* was found liable for violations of the *Anti-Kickback Statute*, the court ruled that there was no proof of harm to the *Medicare or Medicaid programs*, and the civil penalty imposed mandating the physicians' *exclusion* from the *programs* was unnecessary.[121]

BALANCED BUDGET ACT OF 1997

Enacted in 1997, the act added a civil monetary penalty of treble damages, or three times the illegal remuneration, plus $50,000 per violation of the Anti-Kickback Statute.

"The Balanced Budget Act of 1997," Pub. L. *105-33, Section 4304 (August 5, 1997).*

3.3.1.1 "One Purpose Test" The *Anti-Kickback one purpose test*, established in the 1985 *United States v. Greber* case, is one of the most far-reaching interpretations of the *Anti-Kickback Statute*. Under the one purpose test, the *Anti-Kickback Statute* is violated if even *one purpose* of the arrangement is to offer illegal remuneration.[122] Subsequently, under the *one purpose test* adopted by the OIG, *providers can reasonably expect referrals* to result from the business arrangement, but the expectation must not be a reason for entering into the arrangement.[123] Critics of the *one purpose test* claimed that it treated a legitimate relationship with a referral component in the same manner as an arrangement primarily intended to violate the statute.[124]

In a more narrow interpretation of the *Anti-Kickback Statute*, the 2002 *United States ex rel. Obert-Hong v. Advocate Health Care* case established that hospitals are not precluded from purchasing physician practices under the *Anti-Kickback Statute*, provided that payment for the practice and its assets was not in excess of *Fair Market Value*.[125] In *Advocate*, a former employee-physician of the defendant, *Advocate Health Care*, claimed that the entity engaged in multiple illegal activities, including the manner in which it acquired physician practices.[126] In dismissing the case, the court

[126] Ibid.

stated that the *Anti-Kickback Statute* does not prohibit hospitals from purchasing physician practices, so long as the practice is bought at *Fair Market Value*. Furthermore, the former physician-owners of the given practice(s) are not prohibited from referring future patients to the purchaser, so long as there is no economic inducement for the referrals.[127] A further discussion regarding the legal permissibility of a hospital's purchase of a physician practice's *intangible assets* occurs later in this chapter.

3.3.1.2 "OIG Fraud Alerts" In furthering its efforts to reduce Medicare and Medicaid *fraud and abuse*, the OIG periodically releases *Special Fraud Alerts* when it identifies areas in the healthcare industry that are particularly vulnerable to abuse. These alerts provide insight into how the OIG believes the *Anti-Kickback Statute* should be applied to particular business arrangements (e.g., joint venture arrangements and rental agreements for space in physician offices), and which arrangements are likely to be found legally impermissible under the *Anti-Kickback Statute*.[128] Examples of past OIG alerts are set forth in Table 3.5. In addition, the OIG regularly posts on its website detailed information regarding its most "*wanted fugitives*." As of September 2012, there are more than 170 fugitives on the OIG's "*most wanted list*" for alleged healthcare fraud and abuse violations.[129]

3.3.1.2.1 Legal Permissibility regarding Payment for Healthcare Intangible Assets The increased OIG review and overall heightened amount of regulatory scrutiny of the U.S. healthcare industry has coincided with the most recent surge in exempt hospital/physician practice transactions. While the issue over the legal permissibility regarding the payment of consideration for *intangible assets* in exempt hospital/physician practice transactions is not new, the *concern* as to when payments of consideration for physician practice *intangible assets* would be considered legally permissible under the *Anti-Kickback Statute* and the IRC has not gained such a

significant level of attention since the 1990s.[131] This regulatory scrutiny was particularly prevalent during the period immediately following the much-publicized December 22, 1992, letter from D. McCarty Thornton, Esq., to T. J. Sullivan, Esq., the history and evolution of which are instructive.[132] That letter stated that "accordingly, when attempting to assess the fair market value attributable to a physician's practice, it may be necessary to exclude from consideration any amounts which reflect, facilitate or otherwise relate to the continuing treatment of the former practice's patients."[133] Thornton further stated that "specific items that we believe would raise a question as to whether payment was being made for the value of a referral stream would include, among other things: payment for goodwill."[134]

At the time of its issuance, it was widely asserted that Thornton's statements should be interpreted to mean that hospitals could legally pay *only* for the *tangible* assets of a physician practice. However, the letter was not, in and of itself, a regulatory ruling regarding the legal permissibility of including payment of consideration for *intangibles* in the transaction price. Rather, it was an *advisory admonition* that payments for these items "*may*" or "*would likely*" be held to a higher level of scrutiny.[135] In fact, subsequent to the December 1992 letter, in a November 2, 1993, letter responding to John E. Steiner, Esq., Thornton further explained his position regarding the payment for *intangibles*.[136] He "*clarified*" that

> *I would like to emphasize that the position I articulated in the December 22, 1992 letter to T. J. Sullivan remains the same.* I did

[136] On November 2, 1993, John E. Steiner, Esq., was then assistant general counsel of the American Hospital Association. On November 2, 1993, D. McCarty Thornton, Esq., was then associate general counsel, within the Office of Inspector General Department of Health and Human Services (HHS). "HHS' Thornton Writes AHAs' Steiner: Response to Steiner's July 20, 1993, Letter regarding Thornton's December 22, 1992, Letter to T. J. Sullivan," by D. McCarty Thornton to J. E. Steiner, November 2, 1993, http://oig.hhs.gov/fraud/docs/safeharborregulations/acquisition110293.htm (accessed May 10, 2012).

> not state that payments for intangible assets are illegal per se. *Nor have I indicated approval of any particular acquisition practices or valuation methodologies. Since payments for items other than the hard assets of a physician practice* could *be a payment to induce referrals or* could *be in return for future referrals, any such payments are subject to scrutiny to determine whether they violate the Anti-kickback statute. The fact that the parties may identify the purpose of the payment as something other than a payment for referrals is not determinative.*[137] *[Emphasis added.]*

Thereafter, in the seminar materials for Thornton's 1994 presentation before the American Health Lawyers Association (AHLA), he continued to "*clarify*" that

> *Often times, what the hospital is really interested in is the future flow of business from the practice to the hospital. When the CEO of the hospital sits down to think about doing such an acquisition, and calculating the price that he or she is willing to pay, what they are really thinking about is what the flow of business is going to look like from the group practice to the hospital over the next 15, 20, 25 years, however long they figure the doctors are going to be around to refer business. What is it worth to the hospital to lock in the stream of business? It is illegal under the Anti-kickback statute to pay doctors now for the flow of business that you expect from them in the next 15 to 20 years. Everyone knows this, at least everyone experienced in the health care bar, so you never see payments allocated to the value of the future referral stream. What we have seen is that the value of the future referral stream sometimes is disguised as things like goodwill of the patients to the group practice, the value of patient records, the value of an ongoing business, etc. These are all intangibles.* I am **not** saying that it is unlawful to pay for intangibles, *but we see the valuation of these intangibles puffed up through creative accounting games to disguise payment for what is often one of the primary intentions of the hospital, that is, to lock*

[137] On December 22, 1992, T. J. Sullivan, Esq., was then technical assistant (Health Care Information) in the Office of the Associate Chief Counsel of the IRS. "HHS' Thornton Writes AHAs' Steiner: Response to Steiner's July 20, 1993, Letter regarding Thornton's December 22, 1992, Letter to T. J. Sullivan," by D. McCarty Thornton to J. E. Steiner, November 2, 1993, http://oig.hhs.gov/fraud/docs/safeharborregulations/acquisition110293.htm (accessed May 10, 2012).

> *in the referral stream from the practice to the hospital.*[138] *[Emphasis added.]*

It is important to note that the matter of the recipient of the economic benefit derived from the *intangible asset* in question is the often overlooked and misunderstood gravamen of the entire issue as to the legal permissibility regarding the payment of consideration for *goodwill* and *intangible assets*. (See Chapter 14 in Volume 2, "The Valuation of Tangible and Intangible Assets," for a discussion of the distinction between "*intangible assets*" and "*goodwill.*") With careful consideration of the fact that the *intangible asset* being valued does not constitute a disguised payment to physicians for future referrals to the hospital and instead reflects only the current *Fair Market Value* of those *intangible assets* typically found to exist in physician practice enterprises, it would comport with the statements made in Thornton's continued "*clarification*" in his 1994 AHLA presentation, which stated that exempt hospital organizations can, in fact, pay for the *intangible assets* of a physician practice, to wit:

> *In December 1992 I wrote a letter to the IRS that has gotten a fair amount of publicity in the trade press*. There has been somewhat of an **overreaction** to this letter, because I am not saying you can never pay for goodwill, that you can never pay for the value of an ongoing business unit, etc. *Our concern is where the payment for intangibles is used as a disguise for the intention of the parties to recompensate the practice for the future flow of patients from the practice to the hospital. That would be illegal.*[139] *[Emphasis added.]*

The evolving nature of Thornton's comments demonstrates the misinterpretation ascribed to it by some in the valuation community immediately following the initial issuance of the December 1992 letter. The valuation of *intangible assets* (in particular, the intangible asset known as *trained and assembled workforce in place)*, within the current regulatory environment is discussed in depth in Chapter 14, "The Valuation of Tangible and Intangible Assets."

3.3.1.2.2 Anti-Kickback Statute Safe Harbors Due to the broadness of the *Anti-Kickback Statute*, legitimate business arrangements may also appear

---

[139] Ibid.

to be prohibited. For example, a literal interpretation of the statute would prohibit a physician from receiving *dividend payments* from a publicly traded pharmaceutical company if the physician prescribed products produced by that company.[140] In response to these concerns, Congress created a number of statutory exceptions and gave HHS authority to protect certain business arrangements by means of the creation of several *safe harbors*.[141] These *safe harbors* detail specific regulatory criteria that must be met to shield an arrangement from regulatory liability and are meant to protect transactional arrangements unlikely to result in *fraud or abuse*.[142] It should be noted that the failure to comply with every requirement of the *safe harbor* does not mean that the arrangement is *illegal per se*, if it is determined that the arrangement presents a *low risk of fraud and abuse*.[143] These *safe harbors* were intended to "permit physicians to freely engage in business practices and arrangements that encourage competition, innovation and economy."[144]

Safe Harbor

Specific regulatory criteria that must be met to shield an arrangement from liability and are meant to protect practices unlikely to result in fraud or abuse.

[144] Department of Health and Human Services, "Medicare and Medicaid Programs; Fraud and Abuse OIG Anti-Kickback Provisions," *Federal Register* 54 (January 23, 1989).

There are a total of 25 *regulatory safe harbors* under the *Anti-Kickback Statute*. Each *safe harbor* describes a business arrangement that is *not* considered to be legally impermissible remuneration for referrals under the *Anti-Kickback Statute*. The following is a brief description of each safe harbor:[145]

1. **Returns on Investment Interests.** Payments that are in the form of a return on an investment;
2. **Space Rental.** Payments for the use of premises made by a lessee to a lessor;
3. **Equipment Rental.** Payments for the use of equipment made by equipment lessees to equipment lessors;
4. **Personal Services and Management Contracts.** A principal's payments to an agent for the agent's services;
5. **Sale of a Practice.** A payment made by one practitioner for the purchase of the practice of another practitioner;
6. **Referral Services.** Payments for the exchange of anything of value between a "participant" and a referral service;
7. **Warranties.** Payments or the exchange of anything of value under a manufacturer's or a supplier's warranty;
8. **Discounts.** A discount given on an item or a service for which a payment may be made in full or in part by Medicare, Medicaid, or other federal healthcare programs;
9. **Employees.** A payment made by an employer to an employee who has a bona fide employment relationship with the employer, to deliver any item or service for which a payment may be made in full or in part by Medicare, Medicaid, or other federal healthcare programs;
10. **Group Purchasing Organizations (GPO).** Payments made by a vendor of goods or services to a GPO, pursuant to an agreement to furnish the goods or services;
11. **Waiver of Beneficiary Coinsurance and Deductible Amount.** A reduction or waiver of a Medicare or state healthcare program beneficiary's coinsurance or deductible;
12. **Increased Coverage, Reduced Cost-Sharing Amounts, or Reduced Premium Amounts Offered by Health Plans.** The additional coverage of items or services offered by health plans to enrollees, reductions in the enrollee's obligation to pay the health plan or healthcare provider, or reductions in premiums for items and services covered by the health plan, Medicare, or a state healthcare program;

[145] 42 CFR. 1001.952(a)–(x).

13. **Price Reductions Offered to Health Plans.** Price reductions found in a contract between a provider and a health plan, for the provision of items or services to enrollees covered by the health plan, Medicare, or a state healthcare program;
14. **Practitioner Recruitment.** Payments or the exchange of anything of value given by an entity to influence the relocation of a practitioner who has been practicing in his or her current specialty for less than one year, or to influence any other practitioner, to relocate his or her practice into an HPSA for his or her specialty that is served by the entity;
15. **Obstetrical Malpractice Insurance Subsidies.** Payments made by hospitals or entities that are providing malpractice insurance, when the payments are used to subsidize or pay all of the costs of malpractice insurance premiums for practitioners who routinely engage in obstetrical practice as a part of their medical practice in a primary care HPSA;
16. **Investments in Group Practices.** Payments, in the form of a return on an investment, made to a practitioner investing in his or her own practice or a group practice;
17. **Cooperative Hospital Services Organizations (CHSO).** Payments between a CHSO and its patron hospital, tax-exempt entities described in *section 501(e) of the Internal Revenue Code of 1986*, where the CHSO is owned by two or more patron hospitals;
18. **Referral Arrangements for Specialty Services.** Exchanges of value between individuals and entities, where one party has agreed to refer a patient for specialty care payable in full or in part by Medicare, Medicaid, or any other federal healthcare program, in return for an agreement to refer the patient back at an agreed-on time or circumstance;
19. **Price Reductions Offered to Eligible Managed Care Organizations.** Payments in the form of price reductions offered between eligible managed care organizations and any first tier contractor for providing for or arranging for items or services, or between a first tier contractor and a downstream contractor or between two downstream contractors for the provision or arrangement of items or services;
20. **Price Reductions Offered by Contractors with Substantial Financial Risk to Managed Care Organizations.** Payments in the form of price reductions offered between a qualified managed care plan and a first tier contractor for the provision of, or arrangement for, items and services, or between a first tier contractor and a downstream contractor or between two downstream contractors for the provision of or arrangement for items or services;
21. **Ambulance Replenishing.** Gifts or transfers of drugs or medical supplies from a hospital or another receiving facility to an ambulance provider, in order to restock the drugs and medical supplies used in connection with the transport of the patient. To qualify for this exception, the

ambulance must be used to provide emergency ambulance services an average of three times per week;

22. **Health Centers.** The transfer of any goods, items, services donations, loans, or a combination thereof from an individual or an entity to a health center;
23. **Electronic Prescribing Items and Services.** Nonmonetary remuneration that is necessary for, and used solely to, send and receive electronic prescription information;
24. **Electronic Health Record Items and Services.** Nonmonetary remuneration that is necessary for, and used predominantly to, create, maintain, transmit, or receive electronic health records; and,
25. **Ambulatory Surgery Centers (ASC).** Payment that is a return on an investment, as long as the entity is certified in accordance with part 416 of this title, its operating and recovery room space is exclusively dedicated to the ASC, all patients referred to the entity by an investor are fully informed of the investor's ownership interest, and all the following applicable standards are met within one of the following categories:
    a. **Surgeon-Owned ASCs.** To fall within the safe harbor for surgeon-owned ASCs:
        i. The investment terms offered to an investor may not be tied to the previous or expected number of referrals, services furnished, or the amount of business for the entity otherwise generated by the investor;
        ii. At least one-third of the surgeon investor's practice income for the prior fiscal year or the prior 12-month period must come from the surgeon's performance of procedures;
        iii. Neither the entity nor any investor can loan funds or guarantee a loan for an investor, if the investor uses any portion of the loan to acquire the investment interest;
        iv. An investor's payment in return for his or her investment must be directly proportional to the amount of capital he or she invested; and
        v. Ancillary services performed for beneficiaries of federal healthcare programs must be related to the primary procedures performed at the entity and may not be billed separately to Medicare or other federal healthcare programs.

Ambulatory Surgery Center

A Medicare-certified healthcare facility that exclusively provides surgical services to patients not requiring an overnight stay.

42 Federal Register, *Part 416, p. 14.*

b. Single-Specialty ASCs. To fall within the safe harbor for *single-specialty ASCs*:

i. The investment terms offered to an investor may not be tied to the previous or expected number of referrals, the services furnished, or the amount of business for the entity otherwise generated by the investor;

ii. At least one-third of the surgeon investor's practice income for the prior fiscal year or the prior 12-month period must come from the surgeon's performance of procedures;

iii. Neither the entity nor any investor can loan funds or guarantee a loan for an investor, if the investor uses any portion of the loan to acquire the investment interest;

iv. An investor's payment in return for his or her investment must be directly proportional to the amount of capital he or she invested;

v. Ancillary services performed for beneficiaries of federal healthcare programs must be related to the primary procedures performed at the entity and may not be billed separately to Medicare or other federal healthcare programs; and

vi. Patients receiving medical benefits or assistance under any federal healthcare program must not be discriminated against by the entity or any physician investor.

c. Multi-Specialty ASCs. To fall within the safe harbor for *multi-specialty ASCs*:

i. The investment terms offered to an investor may not be tied to the previous or expected number of referrals, services furnished, or the amount of business for the entity otherwise generated by the investor;

ii. At least one-third of the surgeon investor's practice income for the prior fiscal year or the prior 12-month period must come from the physician's performance of procedures;

iii. Physician investors must perform at least one-third of their procedures for the prior fiscal year or the prior 12-month period at the investment entity;

iv. Neither the entity nor any investor can loan funds or guarantee a loan for an investor, if the investor uses any portion of the loan to acquire the investment interest;

v. An investor's payment in return for his or her investment must be directly proportional to the amount of capital he or she invested;

vi. Ancillary services performed for beneficiaries of federal healthcare programs must be related to the primary procedures performed at the entity and may not be billed separately to Medicare or other federal healthcare programs; and

vii. Patients receiving medical benefits or assistance under any federal healthcare program must not be discriminated against by the entity or any physician investor.

d. Hospital/Physician ASCs. To fall within the safe harbor for *hospital/physician ASCs:*

i. The investment terms offered to an investor may not be tied to the previous or expected number of referrals, the services furnished, or the amount of business for the entity otherwise generated by the investor;

ii. Neither the entity nor any investor can loan funds or guarantee a loan for an investor, if the investor uses any portion of the loan to acquire the investment interest;

iii. An investor's payment in return for his or her investment must be directly proportional to the amount of capital he or she invested;

iv. Patients receiving medical benefits or assistance under any federal healthcare program must not be discriminated against by the entity, an investor in the entity, or any physician investor;

v. Ancillary services performed for beneficiaries of federal healthcare programs must be related to the primary procedures performed at the entity and may not be billed separately to Medicare or other federal healthcare programs;

vi. The hospital's report or any other claim for payment from a federal healthcare program may not include any costs associated with the ASC unless the federal healthcare program requires their inclusion; and

vii. The hospital cannot directly or indirectly make or influence referrals to any investor or entity.

The most important safe *harbors* for the purposes of *physician/hospital integration* protect certain *physician investment interests*, which Congress intended to safeguard because "[it] did not intend to absolutely bar any investment by physicians in other health care entities" and certain business investments "represent the extension of a physician's office space and not a means to profit from referrals."[146] Further, CMS believed that the risk of improper

[146] Department of Health and Human Services, "Medicare and Medicaid Programs; Fraud and Abuse OIG Anti-Kickback Provisions," *Federal Register* 54, no. 13 (January 23, 1989): 3090; "Medicare and State Health Care Programs: Fraud and Abuse; Clarification of the Initial OIG Safe Harbor Provisions and Establishment of Additional Safe Harbor Provisions under the Anti-Kickback Statute; Final Rule," *Federal Register* 64, no. 223 (November 19, 1999): 63535–63536.

referrals was relatively low when the *physician personally performed services at his or her own facility*, such as an ASC, and on his or her own patients.[147] In addition, the *investment safe harbors* were enacted with the intent of protecting arrangements that "[could] significantly reduce costs for Federal health care programs, while simultaneously benefiting patients."[148] In particular, HHS wanted to avoid "chill[ing] group practice integration that [was] crucial in an increasingly managed care environment."[149]

While the *exemptions* allow federally funded healthcare programs to reduce their potential liability under the *Anti-Kickback Statute*, many healthcare transactional arrangements business interactions may still be suspect under the *Stark Law*.

3.3.2 Stark Law

The federal prohibition against physician self-referral, or the *Stark Law*, named after the legislation's chief supporter, Congressman Fortney "Pete" Stark (D-CA), prohibits physicians from *referring Medicare or Medicaid patients* to an entity for *Designated Health Services (DHS)*, if the physician, or an immediate family member, has a *financial relationship* with that entity.[150] HHS defines "*physician*" under *Stark Law*, as a "doctor of medicine or osteopathy, a doctor of dental surgery or dental medicine, a doctor of podiatric medicine, a doctor of optometry, or a chiropractor, as defined in section 1861(r) of the [Social Security] Act."[151] Since its promulgation in 1989, the *Stark Law* has gone through multiple revisions, which have both increased the scope of its provisions and added *exceptions* to the types of transactions that the prohibitions apply to.

While the self-referral prohibition addresses the financial incentives related to the physician who makes the referral under Stark, the

[151] "Definitions," 42 CFR § 411.351 (October 9, 2008), p. 423.

STARK LAW

The Federal Physician Self-Referral, or "Stark Law," prohibits physicians from referring Medicare or Medicaid patients to an entity for designated health services ("DHS," defined by HHS) if the physician or an immediate family member has a financial relationship with that entity. It began in 1989 and has been revised many times. Stark I, 1989, The Ethics in Patient Referrals Act, says physicians can't refer to family members; Stark II—Phase 1 (2002) and Phase 2 (2004), says physicians can't refer if they have an ownership interest; Phase 3 (2007) states that any financial arrangement is a direct compensation arrangement; "Stark IV"(2009) says physicians with any ownership are considered part of the whole physician organization. There are many specified exceptions to Stark Law.

"Limitation on Certain Physician Referrals," 42 U.S.C. 1395nn(a)(1)(A); Federal Register *60 (August 14, 1995): 41914;* Federal Register *69 (March 26, 2004): 16054; "Phase III Regulations Result in Dramatic Changes to Stark Law," by J. Kelly Barnes, et al.,* BNA Health Law Reporter *16, no. 40 (October 11, 2007): 1220;* Federal Register *72 (September 5, 2007): 51028.*

Financial Relationship

An ownership or an investment interest in the DHS entity, or a compensation arrangement between the DHS entity and the referring physician or a member of his or her immediate family. The law further describes "ownership/investment interest" to include debt, equity, or other means. The term also includes an interest in an entity that holds an ownership or investment interest in any entity providing DHS services.

"Limitation on Certain Physician Referrals," 42 U.S.C. 1395nn(a)(2).

Anti-Kickback Statute is concerned with the financial relationship between providers.[152] Another important difference between Stark and Anti-Kickback is that the self-referral prohibitions apply only to Medicare and

[152] "Criminal Penalties for Acts Involving Federal Health Care Programs," 42 U.S.C.A. § 1320a-7b(b); 42 U.S.C. 1395nn, Social Security Act, Sec. 1877, "Limitations on Certain Physician Referrals," http://www.cms.hhs.gov/PhysicianSelfReferral/Downloads/section_1877.pdf (accessed October 21, 2009).

Factoid

Note that the various Stark Law exceptions related to physician ownership and compensation arrangements apply in three categories, that is, there are 9 "general exceptions" that apply to both physician ownership/investment and compensation arrangements, regardless of the type of financial arrangement; 5 "ownership/investment exceptions," which apply only to physician ownership and investment arrangements; and 23 "compensation-related exceptions," which apply only to physician compensation arrangements with a DHS entity.

A Guide to Complying with Stark Physician Self-Referral Rules, *by Douglas M. Mancino, et al. (Washington, DC: Atlantic Information Services, 2008), pp. 400.101, 400.204, 400.301.*

Medicaid, while the Anti-Kickback legislation applies to all federally funded state healthcare programs.[153]

The *Ethics in Patient Referrals Act* (*Stark I*) was promulgated in 1989 and was implemented in various stages during the early 1990s.[154] *Stark I* prohibited physicians from making *referrals to clinical laboratories* if the physician, or an immediate family member of the physician, had an *ownership or investment* interest in the lab.[155] The lab was also prohibited from billing for those "*referral*" services.[156] In 1993, *Stark I* was amended to expand the prohibition against *self-referrals* to 10 additional categories of *designated health services* (*DHS*).[157] *Stark II* was implemented in two phases, the first of which became effective on January 4, 2002.[158] In 2004, the second phase of *Stark* was published, which implemented *Stark II* as an

TABLE 3.6 List of Designated Health Services

Clinical laboratory services.
Physical therapy, occupational therapy, and speech-language pathology services.
Radiology and certain other imaging services, including magnetic resonance imaging, computerized axial tomography scans, and ultrasound services.
Radiation therapy services and supplies.
Parenteral and enteral nutrients, equipment, and supplies.
Prosthetics, orthotics, and prosthetic devices and supplies.
Home health services.
Outpatient prescription drugs.
Inpatient and outpatient hospital services.

"Limitation on Certain Physician Referrals," 42 U.S.C. § 1395nn(h)(6). Note the distinction in 42 C.F.R. § 411.351 regarding what services are included as DHS: "Except as otherwise noted in this subpart, the term 'designated health services' or DHS means only DHS payable, in whole or in part, by Medicare. DHS do not include services that are reimbursed by Medicare as part of a composite rate (for example, ambulatory surgery center services [identified at § 416.164(a)] SNF Part A payments), except to the extent that services listed in paragraphs (1)(i) through (1)(x) of this definition are themselves payable through a composite rate (for example, all services provided as home health services or inpatient and outpatient hospital services are DHS)." "Definitions," 42 C.F.R. § 411.351 (October 1, 2009).

Designated Health Service

Categories of healthcare entities subject to the Stark Law:

1. Clinical lab services.
2. Physical therapy, occupational therapy, and speech-language pathology services.
3. Radiology and other imaging services (including nuclear medicine as of January 1, 2007).
4. Radiation therapy services and supplies.
5. Durable medical equipment and supplies.
6. Prosthetics, orthotics, and prosthetic devices and supplies.
7. Home health services.
8. Outpatient prescription drugs.
9. Inpatient hospital services.
10. Outpatient hospital services.
11. Parental and enteral nutrients, associated equipment and supplies.

"Limitation on Certain Physician Referrals," 42 U.S.C. § 1395nn(h)(6).

interim final rule to replace the *Stark I* final rule.[159] Those services that CMS has included in the definition of DHS are set forth in Table 3.6.

3.3.2.1 Stark Law Exceptions The very broad prohibition against physician *self-referrals* is limited by a number of *statutory exceptions*, which Congress passed to *promote practice integration* and to protect arrangements where there is little risk of abuse.[160] There are currently 35 total exceptions to the *Stark Law*, which also give the secretary of HHS the authority to promulgate additional exceptions.[161] A significant difference between the *Anti-Kickback Statute* and the *Stark Law* is that under *Stark*, *any financial relationship* between a healthcare entity and a physician providing a DHS service *must fall within one of the statutory or regulatory exceptions to be found legally permissible.*[162]

The 35 exceptions to the *Stark Law* are divided between exceptions that apply to (1) *both ownership/investment interests and compensation arrangements*, (2) exceptions that apply *only to ownership/investment interests*, and (3) exceptions that apply *only to compensation arrangements.*[163]

Self-Referral

The practice of referring a patient for a designated health service (DHS) to an entity in which the referring physician (or a member of his immediate family) has an ownership or investment interest.

"Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," Federal Register *63, no. 6 (January 9, 1998): 1700–1703.*

3.3.2.1.1 Ownership/Investment Interests and Compensation Arrangement Exceptions Exceptions that apply to both *ownership/investment interests* and *compensation arrangements* include exceptions for:

1. Physician services;
2. In-office ancillary services;

3. Prepaid plans;
4. Academic medical centers;
5. Implants furnished by an ASC;
6. EPO and other dialysis-related drugs;
7. Preventative screening tests, immunizations, and vaccines;
8. Eyeglasses and contact lenses following cataract surgery; and
9. Intra-family rural referrals.[164]

3.3.2.1.2 Ownership/Investment Interests Exceptions Exceptions that apply *only to ownership or investment interests* include exceptions for:

1. Publicly traded securities;
2. Regulated investment companies; and
3. Specific providers, including rural providers, hospitals located in Puerto Rico, and (previously) whole hospital ownership.[165]

The final subpart to this last exception, commonly known as the *whole hospital exception*, allowed physicians to refer patients to hospitals in which they have an ownership interest so long as the physicians are authorized to perform services at the hospital and the *ownership or investment interest is in the entire hospital.*[166]

ACA Restrictions on Stark "*Whole Hospital*" *Exception*" Included in the ACA was a set of requirements that significantly narrowed the applicability of the *whole hospital exception* and *rural hospital exception* for most hospitals.[167] CMS released two Final Rules to implement the ACA provisions. The first, published on November 24, 2010, set forth the requirements regarding obtaining "*grandfather status*" and restrictions for the use of the *whole hospital exception*. The second rule, published November 30, 2011, established the *exemption application process* for physician-owned hospitals in existence prior to December 31, 2010, that were considering facility expansion; however, expansions may only be granted for a facility's *main campus*, and reviews are subject to community

[167] Frances R. Fernald, *A Guide to Complying with Stark Physician Self-Referral Rules* (Washington, DC: Atlantic Information Services, 2010), pp. 400:207, 400:210, 400:217–400:218.

MEDICARE PRESCRIPTION DRUG, MODERNIZATION, AND IMPROVEMENT ACT OF 2003 (MMA)

Implemented an 18-month moratorium on the development of new specialty hospitals, which represented a compromise between the idea that the "whole hospital" exception should be removed for all hospitals, and the position of removing it only for specialty hospitals. The moratorium officially ended on June 8, 2005.

"Medicare Prescription Drug, Modernization, and Improvement Act of 2003," §507(a)(1)(B); "Valuation of Healthcare Ancillary Service Providers," by Robert James Cimasi, President, Health Capital Consultants, National Association of Certified Valuation Analysts: Consultants' Training Institute 2007, September 13, 2007, p. 10.

input.[168] Prior to the ACA's restriction on physician ownership and investment in hospitals, the *Medicare Prescription Drug, Modernization, and Improvement Act of 2003* (MMA) placed a temporary 18-month moratorium on the development of new physician-owned specialty/surgical hospitals, which officially ended on June 8, 2005.[169]

By eliminating the *whole hospital* and *rural provider exceptions*, the ACA indirectly prohibits the establishment of physician-owned hospitals that were not Medicare-certified by December 31, 2010.[170] Hospitals with a *Medicare Provider Agreement* prior to December 31, 2010, can be granted

[168] "Medicare and Medicaid Programs: Hospital Outpatient Prospective Payment; Ambulatory Surgical Center Payment; Hospital Value-Based Purchasing Program; Physician Self-Referral; and Patient Notification Requirements in Provider Agreements; Final Rule," *Federal Register* 76, no. 230 (November 30, 2011): 74518, 74523.

[169] "The Medicare Prescription Drug, Modernization, and Improvement Act of 2003, Sec. 507," *Pub. L.* 108-173, 117 Stat 2066 (December 8, 2003), p. 2295.

[170] "Patient Protection and Affordable Care Act, Sec. 6001," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010), pp. 684–689, as amended by "Health Care and Education Reconciliation Act, Sec. 1106," *Pub. L.* 111-152 (March 30, 2010), pp. 1049–1050. The HCERA changes the effective date to December 31, 2010.

"*grandfather status*" and allowed to continue to participate in Medicare if the following four criteria are met:

1. The hospital is located in a county with a population growth rate of at least 150 percent of the state's population growth over the last five years;
2. The hospital has a Medicaid inpatient admission percentage of at least the average of all hospitals in the county;
3. The hospital is located in a state with below-national-average bed capacity; and
4. The hospital has a bed occupancy rate greater than state average.[171]

It should be noted that those physician-owned hospitals that are granted *grandfather status* are nevertheless subject to restrictions on the *total percentage in which individual physicians may own or invest* in a hospital, and physicians are limited to their *individual* ownership or investment percentages as of March 23, 2010.[172] In addition, if a *grandfathered* physician-owned hospital is approved for an *exception* to the *expansion limits,* the physician-owned hospital may not grow more than 200 percent from its base rate.[173]

3.3.2.1.3 Compensation Arrangement Exceptions The *Stark* exceptions that apply *only* to *compensation arrangements* include exceptions for:

1. Rental of office space;
2. Rental of equipment;
3. *Bona fide employment* relationships;
4. *Personal service* arrangements;
5. Physician recruitment;
6. Isolated financial transactions;
7. Certain arrangements with hospitals;
8. Group practice arrangements with hospitals;
9. Payments by attending physicians;
10. Charitable donations by attending physicians;

[171] Ibid.

[172] "Final Rule: Changes to Whole Hospital and Rural Provider Exceptions to the Physician Self-Referral Prohibition and Related Changes to Provider Agreement Regulations," *Federal Register* 75, no. 226, section XXII (November 24, 2010): 72241.

[173] "Medicare and Medicaid Programs: Hospital Outpatient Prospective Payment; Ambulatory Surgical Center Payment; Hospital Value-Based Purchasing Program; Physician Self-Referral; and Patient Notification Requirements in Provider Agreements; Final Rule," *Federal Register* 76, no. 230 (November 30, 2011): 74524.

11. Nonmonetary compensation;
12. *Fair Market Value* compensation;
13. Medical staff incidental benefits;
14. Risk-sharing arrangements;
15. Compliance training;
16. Indirect compensation arrangements;
17. Referral services;
18. Obstetrical malpractice insurance subsidies;
19. Professional courtesy;
20. Retention payments;
21. Community-wide HIT systems;
22. Electronic prescription items and services; and
23. Electronic health records items and services.[174]

Two key compensation-related exceptions are the *bona fide employment exception* and the *personal services exception*. Physicians may be directly employed by hospitals and, accordingly, fall within the *"bona fide employment relationship"* exception, which requires that (1) employment be for *identifiable services*, (2) the amount of *remuneration* be consistent with *Fair Market Value* and "not determined in a manner that takes into account (directly or indirectly) the volume or value of any referrals," and (3) employment to be made under an agreement that would be *commercially reasonable absent referrals* between the physician and the employer.[175]

The applicable *Stark Law* exception for those physicians who provide services to a hospital on an *independent contractor* basis is the "*personal service arrangements*" exception, which requires that

1. Each arrangement is set out in writing, is signed by the parties, and specifies the services covered by the arrangement.
2. The arrangement(s) covers all of the services to be furnished by the physician (or an immediate family member of the physician) to the entity.
3. The aggregate services contracted for do not exceed those that are reasonable and necessary for the legitimate business purposes of the arrangement.
4. The term of each arrangement is for at least one year.
5. The compensation to be paid over the term of each arrangement is set in advance, does not exceed fair market value, and, except in the case of

[174] "Exceptions to the Referral Prohibition Related to Compensation Arrangements," 42 CFR. 411.357(c) (October 1, 2011).

[175] Ibid.

a physician incentive plan, is not determined in a manner that takes into account the volume or value of any referrals or other business generated between the parties.

6. The services to be furnished under each arrangement do not involve the counseling or promotion of a business arrangement or other activity that violates any federal or state law.[176]

It should be noted that the earlier discussion regarding the *Fair Market Value* and the *commercial reasonableness* of compensation paid to physicians under the *Stark bona fide employment exception* and the *personal services agreement exception* does not apply to compensation paid or distributed to physician members of a "*group practice*" as defined within the *Stark Law.*[177] Specifically, while *Fair Market Value* is a requirement for the *compensation-related* exceptions under Stark, it is *not* a requirement under the "*ancillary services exception*" for "*group practices*," which is one of the *general exceptions* to the *Stark Law.* This is an important distinction, as compensation paid under the *ancillary services exception* within the "*group practice*" setting has fewer regulatory restrictions placed on its distribution and allows for the referral of patients for *in-office ancillary services* (e.g., X-rays) if the *physician group practice* meets the following three thresholds:

1. *Services are provided either by the referring physician*, a physician within the same group practice as the referring physician, or an individual supervised by either of the former;
2. *Services are performed in the same building* as services provided by the referring physician, or in a building considered to be "centralized" for that group practice; and
3. *Billing for services must be done by the physician either performing or supervising the service*, the group practice for which one of those physicians is assigned a billing number, or an independent third party acting on behalf of the group practice in question.[178]

A visual depiction of allowed compensation arrangements under Stark II is set forth in Table 3.7.

[179] "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," *Federal Register* 69, no. 59 (March 26, 2004): 16067–16068. Please note that the "*group practice*" exception requires the members of the group practice to furnish "substantially the full range of patient care services that the physician routinely furnishes, including medical care, consultation, diagnosis, and treatment through the joint use of shared office space, equipment and personnel." Source: "Group Practice," 42 CFR. 411.352 (October 1, 2011).

3.3.2.2 Stark II, Phase III On September 5, 2007, CMS issued the final rule establishing the *Stark II, Phase III*, regulations, which contained many changes that were predicted to have a significant impact on healthcare provider relationships.[180] One requirement, as set forth in the *Stark II, Phase I*, regulations, has previously stipulated that there must be *at least two financial relationships between the physician and the DHS entity* in order for an *indirect compensation* arrangement to exist.[181] However, the *Stark II, Phase III*, regulations modified the definition of *indirect compensation arrangement* for purposes of the *Stark Law* so that *physician members, physician employees*, and *physician contractors* of the *physician organization* were now deemed to *stand in the shoes of that physician organization*, that is, they would have the same *direct compensation* arrangement as the *physician organization itself*.[182] The physician "*collapses*" into the *physician organization*, resulting in the *physician organization* no longer being considered an *intervening entity* for the purpose of establishing an *indirect compensation arrangement* with the *DHS entity*.[183] For example, a hospital that has a contract for professional services with a *physician group practice*, considered *indirect* under the *Stark II, Phase I* regulations (due to the existence of a *financial relationship* between individual physicians and their group practice, as well as a relationship between the group practice and the hospital), is considered to have a *direct compensation* arrangement under *Stark II, Phase III*.[184] In addition, arrangements between a DHS entity, a leasing company, and a physician continue to be analyzed as an *indirect compensation* arrangement.[185]

[185] Ibid.

3.3.2.3 Stark IV *Stark IV* refers to the changes made to the *Stark Law* in the *2009 Inpatient Prospective Payment System Final Rule*, effective October 1, 2009.[186] Most notably, *Stark IV* (1) modified the "*stand in the shoes*" provision contained in *Stark II, Phase III*; (2) changed the definition of "*entity*"; and (3) prohibited *per-click leasing arrangements*, which had been permissible under four of the exceptions to the *Stark Law.* In S*tark IV*, CMS modified the "*stand in the shoes*" provision first introduced in *Stark II, Phase III*, for situations in which a physician organization employs *both physician owners* and *nonphysician owners*. In these circumstances, DHS entities are permitted to treat the *nonphysician owners* as *standing in the shoes* of the physician organization so that two different compensation analyses are not required.[187] Exempted from the *Stark IV* provisions are arrangements that meet the requirements of the *academic medical centers exception*.[188]

Stark IV also modified the legal permissibility of *under arrangement transactions* such that *both* the *physician-owned entity* that *provides the service*, as well as the *enterprise* (typically, the hospital) that *bills for the service*, are considered DHS entities for purposes of the *Stark Law.*[189] This provision precludes *physician-owned entities* from performing services *under arrangement* with the hospital unless the *physician-owned entity* can satisfy one of the *ownership exceptions* under *Stark*. Specifically, any *physician-owned entity* that performs a service *under arrangement* for a hospital that is then billed by that hospital is considered a *DHS entity*, even if that *physician-owned entity* would not have been considered a *DHS entity* if the service was performed outside of the hospital setting. The only exception to the *Stark IV* prohibitions against *under arrangements* is for *lithotripsy services*, a procedure to

break up stones in urinary organs.[190] Those *physician-owned entities* that fall within the *Stark rural provider exception* will generally survive scrutiny.[191]

Stark IV also modified the exceptions for *space and equipment leases*, *Fair Market Value compensation,* and *indirect compensation arrangements* to prohibit basing the charge for rented space and equipment on a *per-click* or *per-unit* basis.[192] This means that *DHS entity lessors* may not charge *physician lessees* rent based on the *number of services provided by the lessee* that were referred to them by the lessors. *On-demand*, *time-based rental arrangements* were also considered *per-click arrangements* for purposes of the *Stark IV* prohibitions.[193]

Similarly, *Stark IV* also finalized a rule prohibiting *rental charges based on a percentage of revenues earned in the space rented* by the *physician lessee* or with the rented equipment operated by the lessee, regardless of whether the services were referred from the *DHS entity lessor.*[194] *Excluded from this prohibition* are arrangements in which a *physician lessee pays the lessor on a percentage basis for management and billing services.*[195] CMS also stated that the rule would not prohibit *gainsharing arrangements*, so

long as they were a *properly structured incentive payment* and part of a *shared savings program.*[196]

3.3.2.4 Stark Self-Referral Disclosure Protocol In recent years, CMS has increased its auditing efforts and pursued aggressive enforcement of *fraud and abuse* laws, which the agency has anticipated will lead to the recovery of billions of dollars in penalties.[197] In addition, CMS has implemented new technology and new programs under which to recover additional funds, for example, by using *predictive modeling software*, the agency intends to transition away from its traditional "*pay and chase*" auditing method, to a system in which claims can be audited in order to identify fraudulent billings before payments are disbursed.[198] CMS has also established a method for providers to voluntarily report their own violations in exchange for lesser sanctions. Under the ACA, the *Self-Referral Disclosure Protocol* (SRDP) was created as a *reporting mechanism* for providers who suspect that they

may be in violation of the *Stark Law* to *voluntarily disclose* their conduct in exchange for *reduced financial liability.*[199] As of September 2012, 14 SDRP settlements have been published, with several providers having been assessed a mere fraction of their actual *Stark* liability.[200] The details of the settlements can be found in Table 3.8.

In addition to the federal *Stark Law* prohibitions, 42 states and the District of Columbia have laws prohibiting *self-referrals*. States with *self-referral* legislation are set forth in Table 3.9.

The State of New Jersey's prohibition against *self-referrals* gained significant public attention following the 2007 *Health Net of New Jersey, Inc. v. Wayne Surgical Center, LLC*, decision, in which New Jersey physicians who referred patients to an ASC in which they had an ownership interest were suddenly at risk of being in violation of the *Codey Law.*[201] Unexpectedly, the *Health Net* decision rejected a widely relied on 1997 *New Jersey Board of Medical Examiners* (BME) advisory opinion, which held that an ASC constituted an "extension of the physician's medical office," such that the arrangement did not violate the *Codey Law* prohibitions against physician referrals to a facility in which they had an ownership interest.[202] In response to the 2007 *Health Net* decision, the New Jersey legislature (led by Senate president Richard Codey, who first introduced the original law) proposed amending the *Codey Law* to allow *self-referrals* to physician-owned ASCs.[203] In 2009, New Jersey amended the *Codey Law* to permit physician

TABLE 3.8 Stark SRDP Settlements

	Date	State	Settlement Amount	CMS Settlement Description
1	February 10, 2011	Massachusetts	$579,000	Hospital disclosed under the SRDP that it violated the physician self-referral statute by (1) failing to satisfy the requirements of the personal services arrangements exception for arrangements with certain hospital department chiefs and the medical staff for leadership services, and (2) failing to satisfy the requirements of the personal services arrangements exception for arrangements with certain physician groups for on-site overnight coverage for patients at the hospital.
2	September 10, 2011	Ohio	$60	Practice disclosed under the SRDP that it violated the physician self-referral statute in two instances by prescribing and supplying a certain type of Durable Medical Equipment that did not satisfy the requirements of the in-office ancillary services exception.
3	November 11, 2011	Mississippi	$130,000	Hospital disclosed under the SRDP that it violated the physician self-referral statute by failing to satisfy the requirements of the personal services arrangements exception for arrangements with certain hospital and emergency room physicians.
4	January 5, 2012	California	$6,700	Hospital disclosed under the SRDP that it violated the physician self-referral statute by exceeding the calendar year nonmonetary compensation limit for a physician.
5	January 5, 2012	Georgia	$4,500	Hospital disclosed under the SRDP that it violated the physician self-referral statute by exceeding the calendar year nonmonetary compensation limit for two physicians.

(*continued*)

TABLE 3.8 Stark SRDP Settlements (*continued*)

	Date	State	Settlement Amount	CMS Settlement Description
6	March 9, 2012	Iowa	$74,000	Practice disclosed under the SRDP that it violated the physician self-referral statute because the compensation methodology for certain employed physicians did not satisfy the requirements of the bona fide employment relationships exception.
7	March 20, 2012	Arizona	$22,000	Hospital disclosed under the SRDP that it violated the physician self-referral statute by not satisfying the requirements of the personal service arrangements exception for an arrangement with a physician for the provision of locum tenens hospitalist services.
8	April 5, 2012	North Carolina	$6,800	Hospital disclosed under the SRDP that it violated the physician self-referral statute by exceeding the calendar year nonmonetary compensation limit for two physicians during three consecutive years.
9	June 13, 2012	Alabama	$42,000	Hospital disclosed under the SRDP that it violated the physician self-referral statute by using a rental charge formula that did not satisfy the requirements of the rental of equipment exception.
10	June 28, 2012	Maine	$59,000	Hospital disclosed under the SRDP that arrangements with a physician and a physician group practice had lapsed and may have violated the physician self-referral law, because those arrangements did not satisfy the requirements of the personal service arrangements exception.

11	July 31, 2012	Massachusetts	$208,000	Hospital disclosed under the SRDP that arrangements with two physician practices for call coverage were not set out in writing and may have violated the physician self-referral law, because those arrangements did not satisfy the requirements of the personal service arrangements exception.
12	August 15, 2012	Florida	$22,000	Hospital disclosed under the SRDP that arrangements with three physicians for certain services may have violated the physician self-referral law, because those arrangements did not satisfy the requirements of the personal service arrangements exception.
13	August 22, 2012	Missouri	$125,000	Hospital disclosed under the SRDP that arrangements with two physicians for the provision of dental services to certain patients may have violated the physician self-referral law, because those arrangements did not satisfy the requirements of the personal service arrangements exception.

TABLE 3.9 States with Self-Referral Statutes

A	B	C	D	E
State	Citation	Statute Effective Date	Scope of Law	Description of Prohibited Activities
Federal	42 U.S.C. 1395nn	2007	Physicians	Prohibits physicians from making a referral for the furnishing of designated health services to an entity with which the physician or an immediate family member has a financial relationship.
Arizona	Ariz. Rev. State. § 32–1401(27)(ff)	1998	Doctors and surgeons	Makes it unprofessional conduct for a doctor to knowingly fail to disclose a direct financial interest when referring patients.
California	Cal Bus. & Prof. Code § 650.01 –02	1993	Licensees in health arts	Prohibits referrals if licensee or his or her immediate family has a financial interest.
	Cal. Bus. & Prof. Code § 654.2	1984	Licensees in health arts	Prohibits referrals unless the licensee first discloses the interest in writing and advises the patient that s/he may choose another entity.
	Cal. Lab. Code § 139.3—.31	1993	Workers' compensation; applies to physicians	Prohibits referrals if the physician or his or her immediate family has a financial interest.
	Cal. Health & Saf. Code § 1323(c)	1985	Health facilities	Prohibits referrals to other health facilities in which the health facility has a significant beneficial interest, unless with a written disclosure that patient may choose another facility.
	Cal. Wel. & Isnt. Code § 14022	1980	Medi-Cal (Medicaid)	Prohibits payments by Medi-Cal to providers for services rendered in connection with a referral.

Connecticut	Conn. Gen. Stat. § 20–7a(c)	1973	Practitioners of the healing arts	Requires disclosure of ownership or investment interest prior to referring to an entity for diagnostic or therapeutic services, and requires the practitioner to provide reasonable referral alternatives.
Florida	Fla. Stat. § 456.053	2009	Healthcare providers	Prohibits referring a patient for healthcare services or items to an entity in which the provider has an investment interest.
Georgia	O.C.G.A. § 43–1 B-1 et seq.	1993	Healthcare providers	Prohibits referring a patient for the provision of designated health services to an entity in which the healthcare provider has an investment interest.
Hawaii	Haw. Rev. Stat. § 431:10C-308.7(c)	1992	Healthcare providers for treatments paid for by a motor vehicle insurance policy	Prohibits self-referral without disclosure for any service or treatment authorized under the chapter.
Illinois	225 I.L.C.S. 47/1 et seq.	1992	Healthcare workers	Prohibits self-referrals and self-referral arrangements to an entity outside the healthcare worker's office or group practice.
Kansas	Kan. Stat. Ann. § 65–2837(b)(29)	1957	All persons with a license, a permit, or a special permit issued under Kan. Stat. Ann. § 65–28	Makes it unprofessional conduct to self-refer when there is a significant interest, unless the licensee informs the patient in writing of the interest and that the patient may obtain such services elsewhere.
Louisiana	La. Rev. Stat. Ann. § 37:1744	1993	Healthcare providers	Self-referrals outside the same practice group as the referring provider, where the provider or a member of that provider's immediate family has a financial interest that will be served by the referral.

(*continued*)

TABLE 3.9 States with Self-Referral Statutes (*continued*)

A	B	C	D	E
State	Citation	Statute Effective Date	Scope of Law	Description of Prohibited Activities
	La. Admin. Code tit. 46, § 4211	1994	Physicians	Self-referrals outside the physician's group practice when there is a financial interest.
	La. Admin. Code tit. 46, § 4213	1994	Physicians	Arrangements or schemes that the physician knows or should know have a principle purpose of inducing referrals in violation of La. Admin. Code tit. 46, § 4211.
Maine	Me. Rev. Stat. Ann. Tit. 22, §§ 2081 et seq.	1993	Healthcare practitioners	Self-referrals to an outside facility in which the referring practitioner is an investor.
	Code Me. R. § 02–031–870	1998	Healthcare practitioners	Self-referrals to an outside facility in which the referring practitioner is an investor.
Maryland	Md. Code Ann. §§ 1–301 et seq.	1993	Healthcare practitioners	Referrals to a healthcare entity in which the practitioner or his/her immediate family owns a beneficial interest or has a compensation arrangement.
Michigan	Mich. Comp. Laws § 333.16221(e)	1986	Physicians	Stark and its regulations are specifically incorporated into Michigan law, making a physician subject to discipline if he or she self-refers in violation of Stark. Unprofessional conduct also includes directing or requiring an individual to purchase or secure a drug, device, treatment, procedure, or service from another person, place, facility, or business in which the licensee has a financial interest.

Minnesota	Minn. Stat. § 147.091	1971	Physicians	Referrals to a healthcare provider in which the referring physician has a significant financial interest.
Montana	Mont. Code Ann. § 39–71–315	1993	Workers' compensation	Referring a workers' compensation–eligible patient to a facility owned by the provider.
	Mont. Code Ann. § 39–71–1108	1993	Workers' compensation	Referring a workers' compensation–eligible patient to a facility where the provider has an investment interest.
	Mont. Code Ann. § 37–2–103	N/A	Medical practitioners and pharmacies	Montana also has a pharmacy ownership law that prohibits medical practitioners from owning a community pharmacy.
Nevada	Nev. Rev. Stat. 630.305	1983	Physicians	Referrals to facilities in which the licensee has a financial interest.
New Hampshire	N.H. Rev. Stat. Ann. § 125:25b	1993	Healthcare practitioners	Referrals to diagnostic or therapeutic entities in which the practitioner has an interest.
	N.H. Rev. Stat. Ann. § 125:25c	1993	Healthcare practitioners	Referrals to diagnostic or therapeutic entities in which the practitioner has an ownership interest or from which the practitioner receives remuneration.

"State Health Care Fraud Laws, 2009," Kaiser State Health Facts, 2009, http://www.statehealthfacts.org/comparemaptable.jsp?ind=790&cat=4 (accessed August 3, 2012).

referrals to ASCs in which they had a financial interest if (1) they *performed the procedure personally*, (2) their *compensation as an owner was directly proportional to their ownership interest*, (3) *all patient-related decisions* at facilities with nonphysician owners *were made by physicians*, and (4) the physicians *informed the patients of their ownership share* at the time of referral.[204]

3.3.3 False Claims Act (FCA)

The False Claims Act (FCA) is a federal law that creates civil liability for any person who "knowingly presents, or causes to be presented, to an officer or employee of the United States government or a member of the Armed Forces of the United States a false or fraudulent claim for payment or approval, e.g., upcoding."[205] Since Congress passed extensive amendments to the FCA in 1986, it has become one of the most significant enforcement methods used to combat healthcare fraud, particularly when used in conjunction with the federal Stark Law and the federal Anti-Kickback Statute.[206]

FALSE CLAIMS ACT (FCA)

Creates civil liability for knowingly presenting false or fraudulent claims for reimbursement to the federal government. Amended in 1986, it has become one of the primary weapons used to combat healthcare fraud. Under the statute's qui tam (whistleblower) provisions, any private citizen can enforce the FCA by filing a complaint alleging fraud against the federal government. The incentive is the potential to share in the recovery of any ill-gotten funds. In 1998, the OIG and the Department of Justice issued guidelines limiting enforcement actions.

"False Claims Act," 31 U.S.C. 3729; "Health Care Fraud Report: Fiscal Year 1998," Department of Justice, justice.gov, 1998, http://www.justice.gov/dag/pubdoc/health98.htm#national (accessed December 9, 2009); "False Claims Act," 31 U.S.C.A. §3730(d)(1).

[204] "Referral of Patient by Practitioner Regulated," N.J.C. 45:9-22.5 (enacted 1991, amended 2009, effective March 1, 2010).

[205] "False Claims Act," 31 U.S.C. 3729(a) (2006)

[206] Linda A. Baumann, ed., *Health Care Fraud and Abuse: Practical Perspectives* (Washington, DC: American Bar Association, 2002), p. 112.

Qui Tam Action

Also known as a *whistleblower* suit, a qui tam action is an action brought under the False Claims Act or a similar statute that allows a private person (e.g., employees, former employees, competitors, subcontractors) to sue for a penalty, part of which the government or some specified public institution will receive.

Black's Law Dictionary, *edited by Bryan A. Garner, 9th ed. (St. Paul, MN: Thomson Reuters, 2009), p. 1368.*

The 1986 amendments strengthened the statute's qui tam, or whistleblower provision, under which any private citizen can enforce the FCA by filing a complaint alleging fraud against the federal government.[207] The Department of Justice (DOJ) assumes primary responsibility for prosecuting the claim if it believes the claim has merit,[208] and the whistleblower is entitled to share in a portion of any recovery the government obtains.[209] Potential liability can be significant, as the FCA provides for treble damages plus an additional penalty for each false claim.[210]

3.3.3.1 FCA Prohibitions against Upcoding and Outlier Payments One of the primary provisions contained in the FCA is the prohibition against the practice of provider "*upcoding*" and submitting claims to the federal government for "*outlier payments*." The DOJ defines *upcoding* as "the practice of improperly assigning a diagnosis code to a patient discharge that is not supported by the medical record for the purpose of obtaining a higher level of reimbursement from Medicare for that hospital discharge than the hospital would otherwise receive."[211] In February 2002, Tenet Hospital paid the United States $55.8 million to settle various Medicare fraud allegations, some initiated by whistleblowers' claims related to *upcoding* for laboratory and rehabilitation services and cost-report violations. In

[207] "False Claims Amendment Act of 1986," *Pub. L.* 99-562, 100 Stat 3153 (October 27, 1986), p. 3154; "False Claims Act," 31 U.S.C.A. §3730(b).

[210] "False Claims Act," 31 U.S.C.A. § 3729(a).

[211] U.S. Department of Justice, "Five Tenet Hospitals in Florida Pay United States $4.3 Million for Allegedly Violating False Claims Act," press release, February 10, 2003.

Upcoding

The practice of improperly assigning a diagnosis code to a patient discharge that is not supported by the medical record for the purpose of obtaining a higher level of reimbursement from Medicare for that hospital discharge than the hospital would otherwise receive.

"Five Tenet Hospitals in Florida Pay United States $4.3 Million for Allegedly Violating False Claims Act," U.S. Department of Justice, press release, February 10, 2003.

February 2003, the DOJ announced that Tenet had paid the United States $4.3 million to settle claims that five of its Florida hospitals submitted fraudulent Medicare claims by engaging in *upcoding* pneumonia and septicemia diagnosis codes for inpatient reimbursement.[212] Similar claims have been brought by the United States against 104 Tenet hospitals in January 2003.[213]

The terms "*outlier*" and "*stop-loss*" payments likewise refer to *remuneration* provided for *complicated* and/or *costly procedures* that are not adequately covered by the *Diagnostic Related Groups* (DRG) formula used for hospital inpatient reimbursement (See Chapter 2, "Reimbursement Environment"). *Outlier payments* refer to remuneration from Medicare, while "*stop-loss*" payments refer to reimbursement from managed care organizations. In Fiscal Year (FY) 2002, Medicare outlier payments as a percentage of Medicare inpatient revenue for Tenet hospitals was 16.7 percent, as compared to 4.6 percent for all other U.S. hospitals. Estimated figures for FY 2003 indicated that Medicare outlier payments as a percentage of Medicare inpatient revenue for Tenet hospitals was 23.5 percent, as compared to 4.5 percent for all other U.S. hospitals.[214]

3.3.3.2 State False Claims Act Statutes Violations of *state false claims acts* can result in fines as high as $15,000 per false claim.[215] While *state false claims* statutes typically echo the federal FCA, some states *false claims acts* include

[215] Robert Fabrikant, et al., *Health Care Fraud: Enforcement and Compliance* (New York: Law Journal Press, 2007), p. 4-72.4.

expanded liability provisions, *jurisdictional and scope of employment limitations* for *whistleblowers*, and different *damage and penalty* provisions.[216] In September 2012, the DOJ and the State of Tennessee settled a qui tam lawsuit for $16.5 million against *HCA, Inc.*, one of the largest for-profit hospital chains in the United States, after allegations that *HCA* entered into improper financial transactions in which it traded office space rental payments in *excess of fair market value* to induce physician referrals to its facilities.[217]

Following the passage of the *Deficit Reduction Act* (*DRA*) by Congress in 2005, it was projected that the number of states with *false claims acts* would increase due to DRA provisions that *incentivized* state governments to enact *state false claims acts* by promising to return 10 percent of the funds recovered from *Medicaid* enforcement actions to the state.[218] Prior to the DRA's enactment, the money would have gone to the federal government.[219] The DRA also required that entities receiving more than $5 million annually from Medicaid establish an employee education plan regarding

DEFICIT REDUCTION ACT (DRA)

Enacted February 8, 2006, and continued the suspension of the CMS's enrollment of new specialty hospitals (from MMA) for about six months, until the release of the CMS's final report on specialty hospitals as required by the DRA.

L.* 109-171 (2006), pp. 51–53.

state and federal *false claims acts* and whistleblower protections.[220] The education plan must provide information related to (1) the federal FCA, (2) administrative remedies for false claims and statements, (3) any civil or criminal penalties under state *false claims acts*, and (4) any whistleblower protections under federal and state law.[221] Since the DRA's implementation in January 2007, many states have broadened their existing *false claims laws*, and additional states have developed their own *false claims acts*.[222]

The OIG for HHS is charged with reviewing state *false claims acts* to ensure that they meet the requisite criteria related to the *DRA incentive program*, including that they:

1. Establish liability to the state for false or fraudulent claims described in the False Claims Act (FCA) with respect to any expenditures related to the State Medicaid plans described in section 1903(a) of the Social Security Act;
2. Contain provisions that are at least as effective in rewarding and facilitating qui tam actions for false or fraudulent claims as those described in the FCA;
3. Contain a requirement for filing an action under seal for 60 days with review by the State Attorney General; and
4. Contain a civil penalty that is not less than the amount of the civil penalty authorized under the FCA.[223]

Since 1986, the FCA has been amended by several legislative acts, including the *Fraud Enforcement and Recovery Act of 2009* (FERA), the *ACA*, and *the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010* (the Dodd-Frank Act).[224] Beginning on March 31, 2013, a previously

approved state *false claims act* will no longer be deemed "approved" unless it has been amended and resubmitted to the OIG for review.[225] A list of those states that have submitted their respective statutes to be reviewed by the OIG is set forth in Table 3.10.

Included in Table 3.10 is a given state's resubmission status with the OIG. As of September 2012, of the 27 states that have resubmitted their *false claims act* statutes for approval, only 2 states, Connecticut and Iowa, have been approved by the OIG as being in compliance with the *DRA incentive program requirements* beyond March 31, 2013.[226]

3.3.3.3 Fraud Enforcement and Recovery Act (FERA) Signed by President Obama on May 20, 2009, the *Fraud Enforcement and Recovery Act* (FERA) significantly modified the FCA's definition of "*knowingly*."[227] Under the new definition, the government need only show by a *preponderance of the evidence* that a person acted "*knowingly*" by "(1) [having] actual knowledge of the information; (2) act[ing] in deliberate ignorance of the truth or falsity of the information; or (3) act[ing] in reckless disregard of the truth or falsity of the information," thereby reducing the government's *burden of proof* by no longer requiring it to show a person's *specific intent* to defraud.[228]

FERA also expanded the FCA's definition of "*claim*" to include any request for money or property offered to a government employee, regardless of whether the government is currently in possession of the money or whether the accused party intended to defraud the government.[229]

Another FERA amendment to the FCA was related to *civil investigative demands* (CIDs).[230] Akin to a subpoena, the U.S. Attorney General can use it to gather evidence without court approval before filing an official complaint against parties suspected of violating the FCA. The amendment also expands the definition of "*official use*" to allow the government to use the information obtained through *CID communications* with other government departments.[231]

FRAUD ENFORCEMENT AND RECOVERY ACT OF 2009 (FERA)

Expands government resources to combat fraud in the housing and mortgage arena and expands the scope of the FCA by clarifying the term *knowingly* to mean a person who "(1) has actual knowledge of the information; (2) acts in deliberate ignorance of the truth or falsity of the information; or (3) acts in reckless disregard of the truth or falsity of the information." FERA also reduces the government's burden of proof, no longer requiring it to provide "proof of specific intent to defraud," and expanded the definition of *claim*.

Sec. 4, "Clarifications to the False Claims Act to Reflect the Original Intent of the law," United States Senate, Fraud Enforcement and Recovery Act S.386, April 2009, http://thomas.loc.gov/cgi-bin/query/F?c111:3:./temp/~c111f3yFGF:e10867 (accessed May 1, 2009); "Fraud Enforcement and Recovery Act of 2009 (FERA)," by Anne Sharamitaro and Kelly Gordon, Health Capital Topics *2, no. 5 (May 2009).*

3.3.3.4 Health Care Fraud Prevention and Enforcement Action Team (HEAT) In May 2009, HHS secretary Kathleen Sebelius and Attorney General Eric Holder announced the establishment of the HHS's *Healthcare Fraud Prevention and Enforcement Action Team* (HEAT), a group composed of both DOJ and HHS members.[232] Funded by allocations in President Obama's budget, the *Health Care Fraud and Abuse Control* (HCFAC) *Program account*, HEAT focuses on fraud prevention and elimination by identifying patterns of potentially fraudulent activity.[233] Its efforts have also bolstered the *Medicare Fraud Strike Force*, another HHS-DOJ collaboration founded in 2007.[234] In

May 2012, the *Medicare Fraud Strike Force* led a coordinated investigation across seven cities to obtain one of the largest healthcare fraud recoveries to date by successfully charging 107 medical professionals for fraudulently billing Medicare more than $452 billion.[235]

3.3.3.5 Dodd-Frank Act Signed into law on July 21, 2010, the *Dodd-Frank Act* expanded the scope of the FCA's protections from *employer retaliation*, creating new protections and financial incentives for whistle-blowing employees who disclose violations of federal securities and consumer protection laws.[236] In addition, the *Dodd-Frank Act* amends the FCA to *expand the scope of potential whistleblowers* to include both *current and former employees*, vendors, and independent contractors.[237] Furthermore, *Dodd-Frank* allows employees a three-year statute of limitations to bring an FCA civil claim against the employer for retaliatory actions.[238] *Dodd-Frank* applies to *any* type of *financial fraud* by a company under the jurisdiction of the *Securities and Exchange Commission* (SEC) or the *Commodities Futures Trading Commission* (CFTC), whereas the FCA applies only to financial fraud against the government.[239] For example, the government can bring claims under *Dodd-Frank* against an employer for off-label pharmaceutical marketing, defective pricing, or falsely charging for goods or services that it did not provide (akin to filing false Medicare claims).[240]

3.3.3.6 Success of Anti-Fraud Efforts In 2011 alone, the previously mentioned anti-fraud initiatives have recovered more than $4 billion, a record-breaking

[240] Ibid.

year in *fraud and abuse* recovery efforts.[241] Since its January 2009 inception, HEAT has recovered more than $6.6 billion for the federal government under the FCA.[242] These fraud prevention efforts have proved to be a successful investment, saving the government four dollars for every one dollar spent on anti-fraud programs.[243] To further these efforts, federal budget appropriations are increasing every year, from roughly $198 million in 2009 to $310 million in 2010, 2011, and 2012, as well as an estimated $610 million for 2013.[244]

According to an April 2012 HHS news release, *fraud prevention efforts* appear to have been as successful as *fraud recovery efforts*:

- In the early phase of revalidating the enrollment of providers in Medicare, 234 providers were removed from the program because they were deceased, debarred, or excluded by other federal agencies, or were found to be in false storefronts or otherwise invalid business locations.
- In 2011, HHS revoked 4,850 Medicaid providers and suppliers and deactivated 56,733 Medicare providers and suppliers as it took steps to close vulnerabilities in Medicare.
- In 2011, HHS saved $208 million through prepayment edits that stop implausible claims before they are paid.
- Prosecutions are up: the number of individuals charged with fraud increased from 797 in fiscal year 2008 to 1,430 in fiscal year 2011—nearly a 75 percent increase.

- In the first few weeks of enhanced site visits required under the ACA screening requirements, HHS found 15 providers and suppliers whose business locations were nonoperational and terminated their billing privileges.[245]

Commercial Reasonableness

The Department of Health and Human Services has interpreted *commercially reasonable* to mean that an arrangement appears to be "a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals." The Stark II, Phase II, commentary also suggests that "an arrangement will be considered 'commercially reasonable' in the absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential DHS referrals."

Federal Register *63 (January 9, 1998): 1700;* Federal Register *69 (March 26, 2004): 16093.*

Fair Market Value

As defined by Stark II, Phase I, for the purpose of scrutinizing transactions between healthcare professionals, FMV is defined as "the value in arm's-length transactions, consistent with general market value," without taking into account any ability between parties to refer business to each other.

Federal Register *66 (January 4, 2001): 944;* Federal Register *69 (March 26, 2004): 16107.*

3.3.3.7 Fair Market Value as Defined by Fraud and Abuse Laws Many aspects of healthcare transactions, for example, physician compensation arrangements and lease agreements, are scrutinized under the traditional concepts

[245] U.S. Department of Health and Human Services, "HHS, Department of Justice Highlight Obama Administration Efforts, Health Reform Tools to Combat Medicare Fraud," news release (April 4, 2012), http://www.hhs.gov/news/press/2012pres/04/20120404a.html (accessed September 12, 2012).

of *Fair Market Value* and the related threshold of *commercial reasonableness*, meaning that an arrangement must be simultaneously at *Fair Market Value* and also be determined to be *commercially reasonable* in order to be deemed legally permissible under federal *fraud and abuse* laws. While *Fair Market Value* looks to the reasonableness of the range of dollars paid for a product or a service, the standard of *commercial reasonableness* looks to the reasonableness of the business arrangement generally.[246]

In addition to the definition of *Fair Market Value* set forth by the IRS governing transactions involving tax-exempt organizations, as discussed earlier, the definition of *Fair Market Value* is further established, for the purposes of valuation, through federal and state legislation, as well as by the regulatory agencies that monitor the compliance of various financial arrangements between healthcare providers, that is, the *Federal Anti-Kickback Statute*, the *Stark Law*, and *CMS*. The definition of *Fair Market Value*, as established by each of these regulatory bodies, is set forth in Table 3.11.

TABLE 3.11 Regulatory Definitions of Fair Market Value

Anti-Kickback Statute
"[F]air market value in arms-length transactions . . . not determined in a manner that takes into account the volume or value of any referrals or business otherwise generated between the parties for which payment may be made in whole or in part under Medicare or a State health care program."[247]
Stark Law
"*Fair market value* means the value in arm's-length transactions, consistent with the general market value. '*General market value*' means the price that an asset would bring as the result of bona fide bargaining between well-informed buyers and sellers who are *not otherwise in a position to generate business for the other party*, or the compensation that would be included in a service agreement as the result of bona fide bargaining between well-informed parties to the agreement who are not otherwise in a position to generate business for the other party, on the date of acquisition of the asset or at the time of the service agreement."[248] [Emphasis added.]

TABLE 3.11 (*continued*)

CMS
"We believe the relevant comparison is aggregate compensation paid to physicians practicing in similar academic settings located in similar environments. ***Relevant factors include geographic location, size of the academic institutions, scope of clinical and academic programs offered, and the nature of the local health care marketplace.***" [Emphasis added.][249]
"[W]e intend to accept any method [for establishing FMV] that is ***commercially reasonable and provides us with evidence that the compensation is comparable to what is ordinarily paid for an item or service in the location at issue, by parties in arm's-length transactions who are not in a position to refer to one another*** . . . . The amount of documentation that will be sufficient to confirm **fair market value** (and general market value) will vary depending on the circumstances in any given case; that is, there is no rule of thumb that will suffice for all situations."[250] [Emphasis added.]

Elaborating on the 2001 *Stark Law* definition of *Fair Market Value*, CMS (formerly, HCFA) provided the following guidance for determining when a compensation amount is at *Fair Market Value*:

> *We believe the relevant comparison is aggregate compensation paid to physicians practicing in similar academic settings located in similar environments. Relevant factors include geographic location, size of the academic institutions, scope of clinical and academic programs offered, and the nature of the local health care marketplace. . . . We intend to accept any method [for establishing FMV] that is commercially reasonable and provides us with evidence that the compensation is comparable to what is ordinarily paid for an*

Register 72, no. 171 (September 5, 2007): 51081. The Stark Law (as stated in the U.S. code) also equates the terms *Fair Market Value* and *General Market Value*, to wit: "The term 'fair market value' means the value in arm's length transactions, consistent with the general market value." From "Limitation on Certain Physician Referrals," 42 U.S. 1395nn (April 4, 2012).

[249] "Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," *Federal Register* 66, no. 3 (January 4, 2001): 916. Citing the CMS response to various comments given to provide guidance to practitioners as to the definition of *Fair Market Value*.

[250] Ibid.

> *item or service in the location at issue, by parties in arm's-length transactions who are not in a position to refer to one another. . . . The amount of documentation that will be sufficient to confirm FMV . . . will vary depending on the circumstances in any given case; that is, there is no rule of thumb that will suffice for all situations.*[251]

CMS has additionally noted that valuation methods under the Stark Law "must exclude valuation where the parties to the transaction are at arm's-length but in a position to refer each other," and that the definition of Fair Market Value under the Stark Law does not "necessarily comport with the usage of the term in standard valuation techniques and methodologies."[252]

In the March 2004 Stark II, Phase II, legislation, CMS stated that it "will consider a range of methods of determining [FMV] and that the appropriate method will depend on the nature of the transaction, its location, and other factors."[253] In addition, in the Stark II, Phase II, legislation, CMS created a voluntary safe harbor provision within the regulatory definition of Fair Market Value for hourly compensation paid by a DHS entity to a physician for his personal services.[254] Under the Fair Market Value safe harbor, there were two methodologies that could result in an hourly arrangement being considered to be at Fair Market Value: (1) where the physician's hourly rate is less than, or equal to, the hourly rate for emergency room physician services in the relevant geographic market, provided that there are at least three hospitals with emergency rooms in the geographic market; or (2) where the physician's hourly rate is calculated by averaging the fiftieth percentile of the national compensation level for physicians within the same specialty (or general practice if the specialty is not identified) in at least four of six specified salary surveys and then dividing that figure by 2,000 hours.[255]

[255] "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," *Federal Register* 69, no. 59 (March 26, 2004): 16092.

Concerns regarding the impracticality and infeasibility of the CMS Fair Market Value voluntary safe harbor for hourly payments to physicians resulted in CMS eliminating the safe harbor in the September 2007 Stark II, Phase III, legislation. At that time, however, CMS emphasized that it would continue to scrutinize the Fair Market Value of arrangements under Stark and indicated that parties to a transaction may "calculate [Fair Market Value] using any commercially reasonable methodology that is appropriate under the circumstances and otherwise fits [within] the definition [of Fair Market Value]."[256] In response to a request for confirmation as to whether a Fair Market Value hourly rate could be used to compensate physicians for *both* their clinical and administrative services, and whether that hourly rate could be used to determine an annual salary, CMS stated in the Stark II, Phase III, provisions that

> *A fair market value hourly rate may be used to compensate physicians for both administrative and clinical work, provided that the rate paid for clinical work is fair market value for the clinical work performed and the rate paid for administrative work is fair market value for the administrative work performed. We note that the fair market value of administrative services may differ from the . . . value of clinical services. A fair market value hourly rate may be used to determine an annual salary, provided that the multiplier used to calculate the annual salary accurately reflects the number of hours actually worked by the physician.*[257]

3.3.3.8 Commercial Reasonableness as Defined by Fraud and Abuse Laws HHS has interpreted *commercially reasonable* to mean that an arrangement appears to be "a sensible, prudent business agreement, from the perspective of the

[256] "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase III)," *Federal Register* 72, no. 171 (September 5, 2007): 51015; Andrew Wachler and Adrienne Dresevic, "Over a Decade Later, the Third and Final Phase in the Rulemaking of the Stark Regulations Is Finally Here!" [257] Ibid., p. 51016.

particular parties involved, even in the absence of any potential referrals."[258] The Stark II, Phase II, commentary also suggests that "an arrangement will be considered 'commercially reasonable' in the absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential DHS referrals."[259]

In addition to pronouncements under Stark and by CMS regarding the definition of "commercial reasonableness," the IRS has listed several specific factors to consider in determining the commercial reasonableness of a physician compensation arrangement:

1. *"The nature of the employee's duties;*
2. *The employee's background and experience;*
3. *The employee's knowledge of the business;*
4. *The size of the business;*
5. *The employee's contribution to the profit making;*
6. *The time devoted by the employee to the business;*
7. *The economic conditions in general and locally;*
8. *The character and amount of responsibility of the employee;*
9. *The time of year when compensation is determined;*
10. *The relationship of shareholder-officer's compensation to stock holdings;*
11. *Whether the alleged compensation is in reality, in whole or in part, payment; and*
12. *The amount paid by similar size businesses in the same area to equally qualified employees for similar services."*[260]

In determining the *commercial reasonableness* of a given compensation arrangement, the appraiser should consider (1) whether it is necessary to have a physician perform a certain service, and (2) if it is necessary to have

[259] "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," *Federal Register* 69, no. 59 (March 26, 2004): 16093.

[260] Jean Wright and Jay H. Rotz, "Reasonable Compensation," *Exempt Organizations Continuing Professional Education* (1993), http://www.irs.gov/pub/irs-tege/eotopici93.pdf (accessed September 4, 2012), citing *Internal Revenue Manual*, section 4233.27.

a *physician of that specialty* perform a certain service. For example, the *Fair Market Value* compensation paid for more specialized physicians and surgeons is generally higher than that of general practitioners and nonphysician practitioners. As a result, if a specialized physician is receiving compensation within the higher range of *Fair Market Value* to perform the same *tasks, duties, responsibilities, and accountabilities* that a less-skilled practitioner could perform for less compensation, the arrangement may not be deemed to be *commercially reasonable*, despite the fact that it is within the range of *Fair Market Value* for that particular medical specialty. In such situations, there tends to be a *presumption of fraud*, unless the healthcare provider can demonstrate that using that particular physician specialist was *reasonably necessary* for specified reasons, for example, that physician's specific experience or that the position's requirements could not have been done sufficiently by a less-skilled practitioner.

With regard to *Fair Market Value* under the *Stark Law* and the *Anti-Kickback Statute*, a 2002 federal district court stated, "Payments exceeding FMV are in effect deemed 'payment for referrals.'"[261] Later courts have developed more analytical approaches to determining whether a compensation arrangement will survive fraud and abuse scrutiny, particularly by looking at whether *physicians are actually performing the services outlined in the agreement*. In those circumstances where the physicians are not actually performing the services that are required within the scope of the *compensation agreement*, courts have found that the *compensation arrangement* does not meet the standards of *commercial reasonableness*.[262] For this reason, a typical medical director or physician executive agreement requires that contemporaneous logs are kept, which document the number of actual hours worked, as well as the physician's fulfillment of the *tasks, duties, responsibilities, and accountabilities* that are set forth in the compensation agreement for the given position.[263] A detailed discussion of the applicability of the *Fair Market Value standard* to the valuation of medical directorship, as well as the physician's clinical, on-call, and executive/administrative services, will be discussed in Chapter 15, "Valuation of Healthcare Services."

3.3.3.9 Relevant Case Law Interpretations of Fair Market Value and Commercial Reasonableness There is an evolving body of case law that has emerged in recent years, due to the heightened scrutiny related to the healthcare transactional marketplace, which provides interpretations of the various *fraud and abuse* prohibitions related to *Anti-Kickback*, *Stark*, and the *FCA*. Several of those cases that provide the most helpful guidance related to the definitions of *Fair Market Value* and *commercial reasonableness* are discussed next.

3.3.3.9.1 ***U.S. v. Covenant Medical Center*** An example of the potential liability faced by hospitals and physicians for not abiding by *commercial reasonableness* standards is a 2009 case against an Iowa hospital system, which settled for $4.5 million after the DOG alleged that Iowa's *Covenant Medical Center* compensated five referring physicians at rates far above *Fair Market Value*.[264] The DOJ alleged that the Covenant physicians—specifically, two orthopedic surgeons, two neurosurgeons, and a gastroenterologist—were reportedly among the highest-paid physicians in the entire United States, making as much as $2.1 million yearly, despite *Covenant*'s tax exempt status.[265] The DOJ cited significant discrepancies between the compensation paid to the five Covenant physicians, as compared to the compensation paid to physicians in the region and around the country, which led the DOJ to conclude that the hospital was paying the physicians for referrals, in violation of the *Stark Law*.[266]

3.3.3.9.2 ***U.S. ex rel. Drakeford v. Tuomey*** On March 30, 2012, the Fourth Circuit Court of Appeals issued its decision in *U.S. ex rel. Drakeford v. Tuomey*, a qui tam suit that involved an appeal from the March 2010 District Court of South Carolina decision, in which a jury found that Tuomey, the defendant healthcare system, had violated the *Stark Law* but not the FCA.[267] In this case, Tuomey Hospital signed part-time employment agreements with 18 specialists, offering each of the physicians a 10-year compensation agreement. Under the *employment agreement*, each specialist employed by Tuomey would perform all outpatient procedures at Tuomey Hospital or its affiliated facilities. The specialists would receive an *annual salary base that varied according to net cash collections*. In addition, the specialists would receive a *productivity bonus* equal to 80 percent of net collections. Furthermore, the specialists could receive an *incentive bonus* equal to 7 percent of their *productivity bonus*.[268]

After setting aside the jury verdict in a June 2010 post-trial hearing, the District Court of South Carolina ordered a new trial on the FCA claim but found in favor of the United States on its equitable claims.[269] In a July 2010 post-trial hearing, the District Court entered a judgment allowing the United States to recover damages from Tuomey in the amount of $44,888,651 plus interest, from which Tuomey appealed.[270] In its March 2012 decision, the Fourth Circuit found that the District Court had violated Tuomey's *Seventh Amendment* right to a jury trial because it decided the government's equitable claims based on the jury's interrogatory answer to the *Stark Law* issue, despite the District Court having already set aside the jury's verdict in its entirety.[271] The Fourth Circuit then vacated the District Court's judgment and remanded the case for further proceedings.[272] In considering the appeal, however, the Fourth Circuit addressed several issues related to the *Stark Law* that it anticipated were likely to arise on retrial.[273]

[273] Ibid.

As indicated earlier in this chapter, under the *Stark Law*, if a physician or an immediate family member of the physician has a financial relationship with a qualifying healthcare entity, that physician "may not make a referral to the entity for the furnishing of designated health services" unless the arrangement qualifies for a *Stark* exception.[274] In the *Tuomey* appeal, the Fourth Circuit found that the *facility,* or "*technical*" component of the physicians' personally performed services, and the resulting *facility fee* that Tuomey billed based on that component, constituted a "*referral*" as defined by the *Stark Law.*[275]

Further, under *Stark*, a "*financial relationship*" includes a compensation arrangement in which a hospital pays remuneration to a referring physician either "directly or indirectly, overtly or covertly, in cash or in kind."[276] In considering the Tuomey physician employment agreements, the Fourth Circuit determined that the *Stark* "indirect compensation arrangements" exception was applicable, which requires that the compensation received by the referring physician be (1) equal to the *Fair Market Value* for services and items *actually provided*, (2) not determined in any manner that takes into account the *volume or value of referrals* or other business generated by the referring physician for the hospital, and (3) *commercially reasonable*.[277] In considering whether the Tuomey physician agreements implicated the "*volume or value*" standard, the court noted that the parties disagreed as to what conduct would actually implicate the standard.[278] The government argued that Tuomey implicated the standard because it "included a portion of the value of the anticipated facility component referrals in the physicians' fixed compensation," while Tuomey contended that the appropriate inquiry merely concerns whether the physicians' compensation "takes into account the volume or value of referrals" and not whether the parties to the agreements considered referrals when deciding whether to enter into the agreements at all.[279]

Examining *Stark* and official agency commentary, the court found that "compensation based on the volume or value of anticipated referrals implicates the volume or value standard."[280] Official agency commentary states that agreements that require a physician to "refer patients to a particular provider as a condition of compensation" do not violate the *Stark Law* as long as certain conditions are satisfied, one of which is that the "physician's compensation must not take into account the volume or value of anticipated referrals."[281] However, the court found that "if a hospital provides fixed compensation to a physician that is not based solely on the value of the services the physician is expected to perform, but also takes into account additional revenue the hospital anticipates will result from the physician's referrals, such compensation by necessity takes into account the volume or value of such referrals."[282] The court also referenced agency commentary, which suggests that even when fixed compensation does not "*fluctuate*" with referrals, it may still "*take into account*" referrals if it "exceeds fair market value and was inflated to compensate the physician for generating other revenue."[283]

As detailed earlier, under the *Tuomey* agreements, each physician was to be paid an annual base salary that fluctuated based on the hospital's net cash collections for the outpatient services and a "*productivity bonus*" equivalent of 80 percent of the net collections.[284] In addition, each physician was eligible for up to 7 percent of the productivity bonus as an additional incentive.[285] Given these agreement terms, the Fourth Circuit stated that the proper question for the jury on retrial is whether Tuomey's physician employment agreements, "on their face, took into account the value or volume of anticipated

[285] Ibid.

referrals."[286] Legal commentators have presumed that this statement implies that the relevant inquiry under a *Stark* analysis is whether the compensation was set in a way that considered the "*volume or value*" of referrals *anticipated to stem from the arrangement*, and that the phrase "*on their face*" could be a disputed issue in future litigation.[287] It should be noted that the concurring opinion issued by Judge Wynn criticized the majority for issuing what he considered to be an *advisory opinion* on these *Stark* issues.[288] On May 8, 2013, a federal jury in the District Court of South Carolina found that Tuomey violated the Stark Law and False Claims Act by filing claims under the 19 part-time physician employment agreements, with damages assessed against Tuomey in the amount of $39,313,065.[289]

3.3.3.9.3 *U.S. v. Campbell* As with *Tuomey*, the 2011 *U.S. v. Campbell* case explores the possibility of potential *Stark* violations arising through referrals for DHS services by physicians to healthcare enterprises with whom they have a *fixed compensation arrangement*.[290] In *Campbell*, the *University of Medicine and Dentistry of New Jersey* (UMDNJ) operated a university hospital accredited and licensed as a Level 1 Trauma Center and required the hospital to perform a requisite number of cardiac procedures each year to maintain its accreditation. In an effort to increase the number of cardiac procedures referred to, and performed at, the hospital, UMDNJ began a recruitment initiative that included "entering into part-time employment contracts with local community cardiologists in private practices, who had

[290] *U.S. v. Campbell*, 2011 U.S. Dist. LEXIS 1207.

patients they could refer to University Hospital for cardiac-related procedures."[291] One cardiologist, *Campbell,* entered into a contract with UMDNJ and was compensated $75,000 annually for his *part-time services*, which included teaching and lecturing for hospital fellows and medical students, interpreting hospital electrocardiograms, attending weekly cardiology conferences, supporting research efforts, and completing Medicare time studies. Following a federal investigation into UMDNJ's employment and referral practices, UMNDJ entered into a settlement with the federal government, paying approximately $8.33 million in FCA damages for *knowingly* submitting claims to Medicare that it *knew* to be in violation of the *Stark Law.*[292] Subsequent to UMDNJ's settlement, the United States brought an action against Campbell as an *individual*, claiming that Campbell's primary service for UMDNJ was *referring* cardiology patients to the hospital from his private medical practice, because he failed to perform most of the services identified in his employment agreement with UMDNJ, despite remaining to be compensated at his fixed annual salary.[293] *Campbell* establishes that healthcare providers may open themselves up to potential *Stark* liability *as individuals* by referring patients to healthcare entities with whom they have a financial relationship if a fixed compensation amount can be seen as remuneration for patient referrals in the absence of services performed by the physician as called for in the employment agreement. As of the date of this publication, the *Campbell* matter was ongoing.

3.3.3.9.4 ***U.S. ex. rel. Baklid-Kunz v. Halifax*** In *U.S. ex. rel. Baklid-Kunz v. Halifax*, a 2012 qui tam case involving *Stark* and the FCA, the government alleged that *Halifax* violated the FCA by submitting, and causing others to submit, false and fraudulent Medicaid claims arising from *improper referrals*.[294] The Plaintiff, a *Halifax* employee, alleged that *Halifax* (1) permitted thousands of hospital admissions without medical necessity; (2) routinely paid excessive compensation, including illegal kickbacks; (3) permitted profit-sharing incentives; and (4) allowed compensation pooling, all in violation of *Stark* or *Anti-Kickback* laws.[295]

[295] *U.S. ex. rel. Baklid-Kunz v. Halifax*, Case No. 6:09-cv-1002-Orl-31DAB (M.D. Fla. February 18, 2011), Plaintiff's Second Amended Complaint, pp. 1, 2, 25–66.

In its *Motions to Dismiss*, which the Florida district court denied, *Halifax* made numerous arguments attempting to invalidate the government's claims:

1. *First*, Halifax argued Eleventh Amendment immunity as a "*state agency or instrumentality*" and thus an "*arm of the state*" under Florida law.[296] [The court rejected this notion, holding that the defendant failed to demonstrate any "*unusual degree of control by the state*" in order to fall under *state immunity*.[297]]
2. *Second*, Halifax argued Medicaid reimbursement is not covered by federal *Stark Law* and could not result in a federal FCA violation. [The court cited the Medicaid program's limitation of physician referrals and *Stark*'s corresponding provisions, finding that improper referrals that resulted in improperly submitted Medicaid claims can give rise to FCA violations.[298]]
3. *Third*, Halifax argued that the government's complaint did not specify whether the hospital-physician relationship was "*direct*" or "*indirect*" or that the hospital had a specific intent to violate *Stark*. [The court found that the government is not required to make any such a distinctions in its complaint, merely that the relationship was improper.[299]]
4. *Fourth*, Halifax argued that the government failed to demonstrate that the arrangement at issue did not meet an applicable *Stark* exception. [The court reinforced the notion that *Stark exceptions* and statute of limitation exceptions are *affirmative defenses* and are neither bars to, nor required elements of, the plaintiff's cause of action.[300]]

As of the date of this publication, the case has yet to be decided.

3.3.3.9.5 *U.S. v. SCCI Hospital Houston* As part of the development of the *commercial reasonableness* threshold for purposes of the *Stark Law*, a more detailed analysis for determining whether a given compensation

[296] Halifax is a public hospital district created by Florida statute to provide services to state residents, regardless of their ability to pay.

[297] *U.S. ex. rel. Baklid-Kunz v. Halifax*, Case No. 6:09-cv-1002-Orl-31DAB (M.D. Fla. June 6, 2011), Order on Motion to Dismiss, pp. 2, 6, 9.

[298] *U.S. ex. rel. Baklid-Kunz v. Halifax*, Case No. 6:09-cv-1002-Orl-31DAB (M.D. Fla. March 19, 2012), Order on Motion to Dismiss the Complaint in Intervention, pp. 6–7.

[299] Ibid., p. 8.

[300] Ibid., pp. 8, 9, 11.

arrangement was *commercially reasonable* was proposed by the government's expert in the 2004 *U.S. v. SCCI Hospital Houston* case, a qui tam whistleblower suit that eventually settled. In this case, the United States challenged the *commercial reasonableness* of the compensation paid by the hospital to three physician medical directors.[301] The government's financial expert stated that *commercial reasonableness* depended on the agreement being "essential to the functioning of the hospital," and emphasized that there had to be "sound business reasons for paying medical director fees to referring physicians."[302] Furthermore, the government's expert analyzed several factors in assessing the *commercial reasonableness* of the compensation, including (1) the size of the hospital, the number of patients, and the patient acuity level needs; (2) the quality of activities and the involvement of medical staff in need of medical direction; (3) the number of regular committees and meetings that required physician involvement; and (4) the quality of hospital management and the interdisciplinary coordination of patient services.[303]

While medical director compensation may be based on either (1) an hourly payment, with the maximum number of hours specified in the contract or (2) an annual payment that is determined by a projected number of hours multiplied by a *Fair Market Value* hourly rate, it may be critical to surviving regulatory scrutiny for the employer to track *and* document the *actual* number of hours the medical director spends performing the services, that is, *[j]ustifying the need for . . . medical director services goes hand-in-hand with showing that the services are actually furnished. Any situation with more than one medical director for a single department is likely to be viewed with suspicion. If such arrangements exist, hospitals should be especially thorough in demonstrating the necessity for the arrangements.*[304]

3.3.3.9.6 *U.S. v. Bradford Regional Medical Center* In addition to *hospital-physician compensation arrangements* facing increased scrutiny for potential *Stark Law* violations, *hospital-physician lease arrangements* have also come under heightened scrutiny in recent years. Perhaps the most widely publicized case involving such an arrangement was the 2010 *U.S. v. Bradford Regional Medical Center,* a *qui tam action* in which the Court found that two physicians and *Bradford Regional Medical Center* had an *indirect financial relationship* through their noncompete clause of a *lease agreement*, whereby the consideration provided under the sublease *explicitly* took into account anticipated referral volumes, in violation of the *Stark Law.*[305] The court used a *Fair Market Value* analysis to determine the legal impermissibility of the sublease arrangement and applied *Stark*'s definition of *Fair Market Value* and the *value or volume standard* (i.e., if the consideration takes into account the *value* or *volume* of referrals, it is not at *Fair Market Value*) to determine whether the lease took into account anticipated referrals.[306] Although the court was unable to conclude *as a matter of law* that the defendants "*knowingly or willingly*" paid and received remuneration under the sublease and other arrangements in exchange for referrals in violation of the *Anti-Kickback Statute*, the court applied the *Stark Law*'s definition of *Fair Market Value* and the *value or volume standard* in determining the legal impermissibility of the arrangement.[307] It is of significant note that when applying a *Bradford* analysis to future hospital/physician lease arrangements, in making its determination that the financial relationship at issue in *Bradford* did not fall within the *Fair Market Value exception* to the *Stark Law*, the court looked to the defendant's expert report, which specifically stated that it took referrals into account when valuing the consideration paid for the nuclear camera sublease, that is,

> *When modified to reflect the aforementioned incremental/variable costs for providing the MRI and CT services the following table shows the expected quantitative revenues (000s omitted) that would accrue to the Hospital with the non-competition agreement in place and a comparison of those benefits to the amounts payable under the non-competition agreement. This is based on the assumption that the Physicians would likely refer this business to the Hospital in the absence of a financial interest in their own facilities*

> *or services, although they are not required to do so by virtue of any of the covenants contained in the Agreements or otherwise.*[308]

3.3.3.9.7 McLeod Regional Medical Center One of the earliest and most widely circulated qui tam actions regarding the applicability of the Fair Market Value standard as applied to the Stark Law and the Anti-Kickback Statute was the 1998 *United States ex rel. Richard Raugh v. McLeod Regional Medical Center of the Pee Dee, Inc., McLeod Physician Services, Inc., D. Laurence McIntosh, and Ernst and Young, LLP.* Raugh, an individual whistleblower, filed suit against McLeod Regional Medical Center, a tax-exempt organization, alleging that McLeod submitted false claims to Medicare in violation of Stark II and the Anti-Kickback Statute in connection with its purchase of several physician practices and the execution of subsequent employment arrangements. The relator, Raugh, additionally alleged that McLeod's purchase of the physician practices exceeded Fair Market Value, stating that the compensation paid to the physicians under the terms of the physician employment agreements evidenced an intent to buy future referrals.[309] Specifically, as the DOJ explained that

> *[t]he claims for services referred, ordered or arranged by those physicians were alleged to be false in three respects: First, Section 1877 of the Social Security Act, 42 USC 139nn (also known as Stark II), prohibited McLeod from billing Medicare for items or services referred or ordered by physicians with whom it had such financial relationships. Second, McLeod forfeited its right to submit those claims to the federal health care programs by paying remuneration intended to induce those and other referrals in violation of the Anti-Kickback Statute, 42 USC 1320a-7(b). And third, McLeod certified falsely on Medicare cost reports that the services identified or summarized were not provided or procured through payment directly or indirectly of a kickback or billed in violation of federal law.*[310]

[308] *Report of Charles T. Day, CPA*, Case 1:04-cv-00186-MBC, September 10, 2008, p. 17.

[309] Bernadette M. Broccolo, "Spotlight on Compensation Practices: Where We Have Been and Where Are We Going?" presented at Hospitals and Health Systems Law Institute, February 10–11, 2005, Tucson, Arizona, p. 70, compiled in "Physicians/Hospitals: Recruitment, Compensation, and Contracting Issues," American Health Lawyers Association, May 2005.

[310] U.S. Dept. of Justice, "McLeod Regional Medical Center to Pay U.S. Over $15 Million to Resolve False Claims Act Allegations," press release, November 1, 2002, http://www.justice.gov/opa/pr/2002/November/02_civ_634.htm (accessed September 19, 2012).

The case settled for $15,485,000 in October 2002.[311] It is of particular note that although the relator, who was previously the head of physician network development at *McLeod*, was released from criminal and civil liability, he received no financial share of the settlement paid by the defendant.[312]

3.3.3.9.8 OIG Guidance Regarding Coverage and Call Compensation While there has been relatively no case law related to the payment for coverage and call compensation, the OIG has provided some guidance in this area through the release of several *Advisory Opinions*. In 2000, the OIG issued a notice that suggested that a compliance program in which regular internal monitoring and auditing is conducted may be an effective way to ensure both that the services provided are considered to be *reasonable and necessary* and to determine whether any *incentives for unnecessary services* exist.[313] Reflecting on the importance of establishing a *reasonable necessity*, the OIG determined in a September 20, 2007, *Advisory Opinion* that an on-call physician compensation arrangement that did not meet an *Anti-Kickback Statute safe harbor* was nevertheless reasonable because the structure of the arrangement was tailored to the specific unmet needs of the hospital.[314] In issuing its *Advisory Opinion No. 07-10*, the OIG stated that the key inquiry for determining whether the compensation arrangement for providing emergency on-call coverage violated the *Anti-Kickback Statute* "is whether compensation is: (i)[at] fair market value in an arm's length transaction for actual and necessary items or services; and, (ii) not determined in any manner that takes into account the volume or value of referrals or other business generated between the parties."[315]

In making its determination regarding the *reasonable necessity* of the compensation arrangement, the OIG considered the fact that the subject arrangement involved a tax-exempt hospital that did not have the physician manpower required to provide emergency department coverage and follow-up care to the high volume of indigent patients unable to pay for services who were presented at the hospital emergency department. Furthermore, the OIG found that the subject arrangement did not "fit squarely into the terms of the safe harbor" for *personal services and management agreements*

[311] Ibid.

[312] Ibid.

[313] Department of Health and Human Services, "OIG Compliance Program for Individual and Small Group Physician Practices," 65 *Federal Register* 194 (October 5, 2000): 59434.

[314] "OIG Advisory Opinion No. 07-10," September 27, 2007, p. 10.

[315] Ibid., pp. 6–7.

because the amount of compensation was *not set in advance* and *varied monthly*. However, the compensation arrangement was nevertheless deemed by the OIG to be at a low risk of violating any *fraud and abuse* provisions because (1) the per diem rates were at *Fair Market Value* consideration of referrals; (2) the physicians were required to treat any patient who entered the emergency department until discharge, with no additional compensation; and (3) the physicians provided certain volunteer, or uncompensated, services. The OIG reasoned that because the emergency department was understaffed prior to on-call compensation being paid and all physician employees of the hospital were given a chance to participate in the on-call program on equal ground, the likelihood that the arrangement was instituted to provide *remuneration* to physicians for referrals was minimized.[316]

Similarly, in a May 14, 2009, *Advisory Opinion 09-05*, the OIG analyzed a tax-exempt hospital's proposed compensation arrangement for physician on-call services performed on behalf of the hospital's uninsured patients. In finding that the proposed compensation arrangement provided a *reasonable basis* for *reducing the risk of unlawful remuneration* under the *Anti-Kickback Statute*, the OIG noted that

> *with respect to compensation for on-call coverage, the key inquiry is whether the compensation is: (i) fair market value in an arm's length transaction for actual and necessary items or services; and (ii) not determined in a manner that takes into account the volume or value of referrals or other business generated between the parties.*[317]

In issuing its Advisory Opinion, the OIG was persuaded by the fact that the proposed compensation arrangement only allowed for payments to be made for *on-call services actually rendered* and did not include any "lost opportunity or other amorphous payments" for "non-tangible" services.[318]

3.3.4 Fraud and Abuse Reimbursement Monitoring Programs

There are several *fraud and abuse* monitoring programs that *review*, or *audit*, payments made to providers for submitted *Medicare and Medicaid* claims. CMS initiated *Medicare and Medicaid payment audits* to identify

fraudulent billing practices, which, once uncovered, may subject providers to *repayment, regulatory sanctions, and civil fines*. Most allegations are resolved through negotiation and settlement with the OIG before a formal hearing occurs; however, providers have the right to appeal determinations made by OIG.[319]

3.3.4.1 Recovery Audit Contractors (RACs) Established through the *Medicare Modernization Act of 2003* (*MMA*) as a three-year demonstration project beginning in 2005, the *RAC program* is tasked with improving payment accuracy and increased program transparency by identifying improper Medicare *overpayments* and *underpayments* to providers based on three categories of errors: (1) payment for *medically unnecessary services*, (2) payment for *incorrectly coded services*, and (3) payment for *services not supported by sufficient documentation.*[320] An *overpayment* occurs when the provider is reimbursed an excess amount for a given claim and results in a provider owing Medicare the overpaid amount. Conversely, an *underpayment* occurs when the Medicare reimbursement received by a provider is less than the cost of providing care and results in Medicare owing the provider additional reimbursement funds.[321]

From 2005 to 2008, the Medicare *RAC demonstration project* recovered $1.03 billion in improper Medicare payments, returning $693.6 million to the *Medicare Trust Funds*.[322] During that three-year time period, approximately two-thirds of all hospital payment errors were due to a failure of hospitals to demonstrate the *medical necessity* of the care provided.[323] Following the three-year demonstration period, the *Tax Relief and Health Care*

Act of 2006 required that the *RAC program* be permanently established in all 50 states by January 1, 2010.[324] In 2008, CMS awarded contracts to four commercial RAC auditing firms (RACs), each responsible for a specified region of the United States, which compensated these RACs with a percentage of the improper *overpayments* collected from providers.[325] The ACA expanded the role of the *RAC program* to cover Medicaid, as well as Medicare Parts C and D beginning on January 1, 2012.[326]

In 2011, CMS issued its first annual report to Congress regarding the RAC program.[327] Through a post-payment review of the 2010 Fiscal Year (October 1, 2009, to September 20, 2010), the *Implementation of Recovery Auditing at the Centers for Medicare and Medicaid Services: FY 2010 Report to Congress* presented and analyzed data regarding *Medicare reimbursement errors* to *hospitals, physician offices, medical suppliers, ambulance services, nursing homes*, and other providers.[328] Within the 2010 fiscal year, the RAC program corrected 191,878 claims, adjusting $92.34 million in reimbursement errors.[329] This included 185,065 claims classified as *overpayments*, totaling $75.44 million, with an average claim amount of $408. Conversely 6,813 claims were classified as *underpayments*, totaling $16.90 million, with a $2,481 average claim amount.[330] After both *overpayments* and *underpayments* were accounted for, CMS was owed

[330] Ibid.

approximately $58.5 million, nationally.[331] When total corrections were taken into account, Missouri providers were owed the greatest amount by CMS (approximately $693,373), followed by providers in the states of Iowa (approximately $240,997); Nebraska (approximately $118,807); Nevada (approximately $39,527); Vermont (approximately $39,371); and Maine (approximately $14,708).[332] During the *FY 2010* period, most states had providers that owed funds to the Medicare program. California providers owed the most, approximately $6,687,702, followed by providers in Florida (nearly $6,537,578) and Texas (approximately $5,579,543).[333] HHS has indicated that it expects an additional savings of $2.1 billion for Medicaid between 2012 and 2017, with $900 million going back to the respective state Medicaid programs.[334]

3.3.4.2 Audit Medicaid Integrity Contractors (Audit MICs) In its March 2012 report *Early Assessment of Audit Medicaid Integrity Contractors*, the OIG assessed the efforts of the *Medicaid Integrity Contractors* (*MICs*) in order to determine the effectiveness of the *Medicaid Integrity Program*.[335] Of the 370 audits conducted as of March 2012 (consisting of a potential $80 million in overpayments), 81 percent of those audits were identified by the OIG as being ones in which the *Audit MICs* were unable, or unlikely, to discover overpayments to Medicaid providers.[336] The remaining 11 percent of the audits conducted accounted for *$6.9 million in overpayments*, $6.2 million of which were attributed to program areas that had previously been identified as vulnerable to *overpayments*.[337] The OIG concluded that the MICs' audits were hindered by the CMS's selection of poorly identified *audit targets*, as MICs are not contracted to identify targets for potential fraud but to audit the ones provided to them by the CMS.[338] The *March 2012 Report*

[338] Ibid., pp. 11–12.

further indicated that *audit targets* were mistakenly selected based on either incorrect data or the improper application of state policies for identifying audit targets.[339]

In its recommendations, the OIG encouraged CMS to make greater use of *collaborative audits* conducted with *MICs* and to improve its current process for identifying and selecting audit targets, particularly where vulnerable program areas had been identified.[340] The OIG also recommended that CMS improve both the quality of, and the level of access to, data that *MICs* collect when conducting their audits.[341] In its response, CMS stated that it had already encouraged the increased use of *collaborative audits,* and that it had several initiatives in place to improve the audit target selection process.[342]

3.3.4.3 Comprehensive Error Rate Testing (CERT) Program The *Comprehensive Error Rate Testing* (CERT) program was created by CMS in order to determine improper *Medicare fee-for-service payments*.[343] CMS uses the results of the *CERT program* to provide Congress with an estimate of the annual amount of improper Medicare payments made to providers during a given year. However, a March 2012 OIG report titled *Review of CERT Errors Overturned through the Appeals Process for Fiscal Years 2009 and 2010* suggested that this estimate *did not account* for any *payment errors* that were *overturned through the appeals process* and may therefore have *inflated* the number of improper payments made in a given year.[344]

In its review of the error rates for FY 2009 and FY 2010, the OIG determined that based on the number of claim payment denials that were overturned on appeal after the cutoff date for determining the annual error rate, the *error rate would have been reduced* from 7.8 percent to 7.2 percent for FY 2009 and from 10.5 percent to 9.9 percent for FY2010.[345] Had

[345] Ibid., p. 3.

these overturned claim payment denials been included in CMS's error rate calculation, there would have been an approximate $2 billion reduction in the estimated value of reported errors for both FY 2009 and FY 2010.[346] In its recommendations to CMS, the OIG encouraged the agency to develop a reliable method for adjusting the error rate and incorporating the outcome of appealed claim payment denials in order to generate a more accurate report regarding improper Medicare payments to providers.[347] CMS agreed with the OIG's recommendations and outlined the steps that it intended to take in implementing an improved *CERT program* methodology.[348]

3.3.4.4 Medicare-Medicaid (Medi-Medi) Data Match Program The *Medicare-Medicaid (Medi-Medi) Data Match Program* was established to identify areas of potential fraud, abuse, and waste in Medicare and Medicaid billing.[349] State participation in the *Medi-Medi* program is voluntary, and states must fund their own programs.[350] The *Medi-Medi* program initially started in 2001 as a *pilot program* in one state and expanded significantly over the course of a decade, garnering annual funding of $60 million during the last several years.[351] The goal of the program is to *analyze Medicare and Medicaid claims data collectively* in order to identify potentially fraudulent billing activities that might not have been observed when analyzing *Medicare* and *Medicaid* claims data separately.[352] In its review of the *Medi-Medi* program's operation in 10 states for 2007 and 2008, the OIG found that the *Medi-Medi program* "produced limited results and few fraud referrals," that is, the program's efforts resulted in 66 *referrals* of potential fraud to enforcement agencies, of which, 27 *referrals* were accepted for further investigation.[353]

In 2012, based on the limited gains of the *Medi-Medi* program, the OIG recommended that CMS reevaluate the program to determine what

role, if any, it should play in the OIG's overall strategy for the *Medi-Medi* program's integrity. In response to the OIG's recommendations, CMS indicated that it had already taken steps to improve the *Medi-Medi* program's effectiveness.[354] However, the OIG noted that as of January 2012, CMS had failed to provide any data to support its assertion that the program's effectiveness had improved and stated that this information was necessary to both future funding decisions and considerations by states as to whether to participate in the program.[355]

3.3.5 ACA Initiatives Aimed at Combating Fraud and Abuse

The ACA included several additional initiatives aimed at combating *fraud and abuse* in the U.S. healthcare delivery system. First, it amended *Federal Sentencing Guidelines* to strengthen prison sentences for convictions involving $1 million or more in losses to the federal Medicare and Medicaid programs.[356] Further, the ACA made intergovernmental agency collaboration easier by integrating—and increasing access to—data repositories and allowing authorities to suspend provider or supplier payments where fraudulent activity is suspected.[357] The ACA also established the *Physician Payments Sunshine Act* as part of the ACA's promotion of *transparency* in the healthcare industry.[358] On December 19, 2011, CMS published a proposed rule to implement the act, which included certain *reporting requirements* regarding certain payments (or gifts) received by physicians, as well as disclosures related to physician ownership or investment in a facility at which they treat patients.[359] While CMS has yet to release a final rule promulgating these reporting requirements, the ACA indicated that data submission requirements could begin as early as March 31, 2013.[360]

3.3.6 Racketeer Influenced and Corrupt Organizations Act (RICO)

In addition to the multitude of *fraud and abuse* prohibitions aimed at healthcare providers, the *Racketeer Influenced and Corrupt Organizations Act* (*RICO*) is a federal law that carries both *criminal and civil penalties* for illegal conduct by *organized enterprises* (such as healthcare providers) dealing in *interstate or foreign commerce*.[361] RICO makes it illegal for any person to (1) use or invest any income derived from a pattern of racketeering activity in an enterprise; (2) acquire or maintain control of any enterprise through a pattern of racketeering activity; and (3) for any person employed by, or associated with, any enterprise to conduct the affairs of the enterprise through a pattern of racketeering activity.[362] It is also a RICO violation to *conspire to engage* in any of these three activities.[363] RICO has been used

RACKETEER INFLUENCED AND CORRUPT ORGANIZATIONS ACT (RICO)

A federal law that carries both criminal and civil penalties with the aim of protecting the public from "parties who conduct organizations affecting interstate commerce through a pattern of criminal activity." Makes it illegal for any person to use or invest any income derived from a "pattern of racketeering activity" in an enterprise, to acquire or maintain control of any enterprise through a pattern of racketeering activity, and for any person employed by or associated with any enterprise to conduct the affairs of the enterprise through a pattern of racketeering activity.

to prosecute physicians, attorneys, and patients who conspire to defraud payors through such practices as billing for services not actually rendered and unnecessarily prescribing controlled substances.[364]

3.4 COMPETITION

3.4.1 Antitrust Regulations

Antitrust is a body of law that aims to combat anticompetitive behavior. The *Sherman Anti-Trust Act* (Sherman Act), the *Clayton Act*, and Section 5 of the *Federal Trade Commission Act* are the federal government's primary means of combating unfair competition and the abuse of monopolistic power. Generally, the *Sherman Act* prohibits any "contract, combination . . . or conspiracy, in restraint of trade or commerce," while the *Clayton Act* prohibits (1) price discrimination, (2) exclusive dealing arrangements, and (3) mergers and joint ventures that could create a monopoly.[365] *The Federal Trade Commission Act* prohibits "unfair methods of competition in or affecting commerce," and gives the FTC authority to bring enforcement actions against *anticompetitive practices*.[366]

Antitrust

A body of law charged with combating anticompetitive behavior, which would impair the ability of free markets to function properly. Antitrust involves the regulation of mergers and acquisitions, as well as scrutiny of behavior between competitors that may restrain trade.

15 U.S.C. § 1; 15 U.S.C. § 45.

[366] "Sherman Antitrust Act" 15 U.S.C. § 1; "Federal Trade Commission Act," 15 U.S.C. § 45 ; "Federal Trade Commission; Promotion of Export Trade and Prevention of Unfair Methods of Competition," 15 U.S.C.A. §41–58 (2012).

SHERMAN ANTI-TRUST ACT

Prohibits any "contract, combination . . . or conspiracy, in restraint of trade or commerce" to combat unfair competition and abuse of monopolistic power. Used by the federal government to combat kick-backs and self-referral joint ventures.

"Sherman Antitrust Act," 15 U.S.C. § 1.

FEDERAL TRADE COMMISSION (FTC) ACT

Prohibits "unfair methods of competition in or affecting commerce." One of the federal government's primary means of combating unfair competition and abuse of monopolistic power.

"Federal Trade Commission Act," 15 U.S.C. § 45.

Typically, antitrust law considers "naked price-mixing and market-allocation agreements among competitors" as "per-se" violations of anti-trust law.[367] In contrast, a "rule of reason analysis evaluates whether the collaboration is likely to have anticompetitive effects, and, if so, whether the collaboration's potential procompetitive efficiencies are likely to outweigh those effects. The greater the likely anticompetitive effects, the greater the likely efficiencies must be for the collaboration to pass muster under the antitrust laws."[368]

Over the years, scrutiny of the *anticompetitive effects* of healthcare joint ventures and the mergers of healthcare providers has been inconsistent.[369] Because the FTC believes that most mergers between hospitals present no

[367] Federal Trade Commission, "Statement of Antitrust Enforcement Policy regarding Accountable Care Organizations Participating in the Medicare Shared Savings Program," U.S. Department of Justice, *Federal Register* 76, no. 209 (October 28, 2011): 67027.

[368] Ibid.

anticompetitive concerns, it issued a hospital joint venture "*safety zone*" such that mergers falling within the *safety zone* will not be challenged by the FTC, except in certain extraordinary circumstances.[370]

3.4.1.1 Monopoly *The Sherman Act* prohibits the abuse of monopoly power and has been used to address concerns related to physician integration under *Physician Hospital Organization* (PHO) *models*, *Independent Practice Associations* (IPAs), and the ability of such organizations to negotiate on behalf of their physician members.[371] The FTC typically examines such arrangements under a *rule of reason* analysis, balancing the *procompetitive* and *anticompetitive* effects of the subject integration arrangement on the market.[372]

Antitrust concerns have become more pronounced in recent years, as hospitals, health systems, and physician practices have increased their integration with one another, including integration in the context of ACO formation. (See Chapter 4, "Competition.") In order to encourage providers to develop ACOs, and in response to provider concerns regarding potential *antitrust* violations, the DOJ and the FTC issued a joint policy statement in October 2011 clarifying the agencies' enforcement policies, as well as preserving a "*safety zone*" for certain ACOs.[373] Under an *ACO safety zone,* the ACO's individual participants must not have a *combined share of more than 30 percent of each common service* within each participant's "*primary service area.*"[374] In their final policy statement, the agencies also removed the mandatory review requirements related to ACOs, thereby allowing newly formed ACOs that desire additional agency guidance to submit to a voluntary expedited review, rather than the previously required mandatory review.[375]

[374] Ibid.

[375] Ibid.

Outside of the ACO context, other healthcare providers are continuing to consolidate (see Chapter 4, "Competition"). In light of this circumstance, traditional *antitrust enforcement* will likely continue, and recent cases demonstrate that the FTC is aggressively pursuing anticompetitive conduct. In the 2011 case *FTC v. Phoebe Putney Health System*, the sole pair of hospitals in Albany, Georgia, were consolidated when Phoebe Putney Health System acquired Palmyra Park Hospital. The FTC's efforts to prevent the merger of the two systems were unsuccessful in lower courts, due to the utilization of the *state actor immunity defense*.[376] On losing at the District Court level because of the health system's successful *state actor immunity defense*, the FTC appealed to the Eleventh Circuit, which affirmed the district court's decision.[377] After another appeal, the U.S. Supreme Court granted certiorari in June 2012 to decide the issue of state actor immunity, the outcome of which may have a far-reaching impact on other providers seeking to subvert *antitrust enforcement*.[378]

In 2011, the FTC released a final opinion *In the Matter of ProMedica Health System, Inc.*, which required ProMedica Health System, a nonprofit healthcare system in Toledo, Ohio, to divest its recently acquired interest in St. Luke's Hospital, a former competitor to ProMedica located in nearby Maumee, Ohio.[379] Following the merger of the two hospital enterprises, the number of ProMedica's competitors was reduced, leaving the health system with a *60 percent market share for general acute-care inpatient hospital services* and an *80 percent market share for inpatient obstetrical services.* In issuing its decision, the FTC reasoned that ProMedica's acquisition of St. Luke's significantly reduced prices for general acute-care inpatient hospital services and inpatient obstetric services in the market, and prices would increase for commercial health plans.[380]

[380] Federal Trade Commission, "Citing Likely Anticompetitive Effects, FTC Requires PreMedica Health System to Divest St. Luke's Hospital in Toledo, Ohio, Area: Final Opinion and Order Uphold Initial Decision Issued in December 2011," March 28, 2012, http://www.ftc.gov/opa/2012/09/promedica.shtm (accessed November 6, 2012).

In addition to reviewing hospital merger activities, the FTC has continued to scrutinize hospital acquisition of physician practices, as was seen in an August 2012 settlement between the FTC and *Renown Health*. In 2010, *Renown Health,* located in Reno, Nevada, *acquired* 31 *cardiologists*, all of whom signed *two-year noncompete agreements*.[381] The acquisition represented 97 percent of the *cardiologists* in the Reno *market area* at the time the government filed its August 2012 complaint.[382] The FTC argued that this acquisition essentially *eliminated* any *competition* for cardiology services and exposed the local market to the risk of *increased prices* and/or *reduced quality of care*.[383] Subsequently, the FTC ordered a suspension of the *noncompete agreements*, which could be lifted only once the FTC received verified documentation that at least six of the cardiologists had left *Renown* to work in *direct competition* with the corporation.[384] Further, the FTC prohibited *Renown* from discouraging former employees from practicing in the area.[385]

3.4.1.2 Concerted Refusal to Deal (Group Boycott) In a landmark concerted refusal to deal/group boycotting case, *Wilk v. American Medical Association*, a group of chiropractors alleged that the AMA, the Joint Commission, the American College of Physicians, and the American Academy of Orthopaedic Surgeons all conspired to eliminate the chiropractic profession by refusing to deal with any chiropractors and labeling the profession "unscientific quackery."[386] The Seventh Circuit Court of Appeals affirmed the lower decision that the boycott created an "unreasonable restraint of trade" in violation of the Sherman Act and prohibited any future behavior.[387]

In a 2008 matter in which the FTC settled an investigation related to the Connecticut Chiropractic Association, the FTC alleged that the defendants conspired to collectively refuse to deal with American Specialty Health (ASH), an in-state health plan, in order to prevent ASH's cost-saving

chiropractic benefits plan from being administered in Connecticut.[388] The FTC found this to be a clear "per se" antitrust violation as a boycott among competitors in the same product market, and it resulted in the defendants being prohibited from "(1) negotiate[ing] on behalf of any chiropractor . . . [or] (2) . . . refus[ing] to deal, or threate[ing] to refuse to deal . . . with any payor."[389] Similarly, in August 2010, the DOJ and the State of Idaho reached a settlement with the Idaho Orthopaedic Society, the Ohio Sports Medicine Institute, and five orthopedic surgeons, over allegations that these parties conspired together in a group boycott initiative to gain more favorable fees by denying care to patients covered by worker's compensation insurance and threatening to withdraw from the Blue Cross of Idaho network unless they received more favorable contract terms.[390]

3.4.1.3 Predatory Pricing and Price Fixing Several cases over the years have been instrumental in providing guidance about what types of activities the FTC and the DOJ will consider to be anticompetitive as a result of *predatory pricing* and/or *price fixing* tactics. Traditionally, IPAs have been able to negotiate on behalf of their members only if the *joint-contracting agreement* has an element of *risk-sharing* built into it, or if the IPA has embarked on a *clinical integration* scheme to improve efficiency among its members.[391] In 2009, the FTC settled *price-fixing* charges made against a San Francisco IPA, Alta Bates Medical Group. The FTC's complaint alleged that since 2001, the 600-physician member IPA had conspired to orchestrate *collective negotiations* regarding *fee-for-service contracts* by *disallowing individual*

members of the IPA from participating in the IPA's negotiations related to the *individual reimbursement rates* they would receive until the IPA had approved the negotiated prices. Significantly, the FTC did not find that Alta Bates Medical Group conducted any of the alleged anticompetitive activities in furtherance of *clinical or financial integration* or in an effort to achieve efficiencies between the member physician practices.[392] One year earlier, an FTC finding of illegal price fixing by *North Texas Specialty Physicians*, an *IPA*, was upheld by a federal appellate court.[393] The court held that IPA's negotiation conducted on behalf of physician members that does not involve *risk sharing with payors* or any form of *improved efficiency* from *clinical integration* runs afoul of *antitrust laws*.[394]

Following the *Alta Bates* settlement, in 2010, the FTC settled *price-fixing* charges with a Colorado physician group related to allegations that the physician practice, making up approximately 80 percent of the market in Garfield County, Colorado, entered into insurance contracts that contained automatic cost-of-living increases and a ban on often-used "*cost-lowering*" provisions that linked its commercial reimbursement rates to Medicare rates. The physicians were additionally accused of discouraging its members to directly contract with the insurer, and would only accept commercial contracts in which 80 percent of the group's primary care physicians, and 50 percent of the group's specialty physicians accepted the proposed contract terms.[395]

3.4.2 Any Willing Provider Statutes

"*Any Willing Provider*" laws are typically state statutes that require that health insurance plans accept any healthcare provider into their network that is willing to agree to each of the terms and conditions of the plan, including reimbursement rates.[396] These statutes vary by state as to the type of organization they regulate and which providers they affect, with some states providing this protection only to pharmacists or pharmacies, while others regulate coverage of physicians, dentists, hospitals, mid-level providers, allied health professionals, and other providers.[397] As of December 2011, 38 states had some type of "*any willing provider*" statute.[398]

Opponents of "*any willing provider*" statutes argue that by expanding the number of providers available to a *managed care organization*'s (an *MCO*'s) participants, they restrict the ability of MCOs to negotiate discounts for a guaranteed level of patient utilization.[399] Arguments have also been made that "*any willing provider*" statutes lower the quality of care by restricting the ability of managed care organizations to limit their network to a small group of high-quality or cost-effective providers. Supporters of "*any willing provider*" statutes counter that MCOs still retain their ability to limit providers in their network by the terms and conditions of their plans, including reimbursement rates and quality and utilization metrics.[400]

3.4.3 Certificate of Need

Certificate of Need (*CON*) laws are one of the most significant market entrance barriers affecting the U.S. healthcare delivery system. A state CON program is one in which a government determines where, when, and how capital expenditures will be made for public healthcare facilities, services, and major equipment.[401] CON requirements are based on the highly contested theory that in an unregulated market, healthcare providers will

Note Although not every state has an active CON program, each state does have a Health Planning Agency which deals with many of the same issues covered by CON legislation.

CERTIFICATE OF NEED (CON LAW)

Requires that healthcare providers obtain state approval before either developing new services or expanding existing services.

"Certificate-of-Need Law in Illinois Slammed by Feds, AMA," by Amy Lynn Sorrel, American Medical News, *October 6, 2008, http://www.ama-assn.org/amednews/2008/10/06/gvsb1006.htm (accessed on June 22, 2009).*

3.4.3.1 History of CON Program Development The enactment of federally mandated CON laws was the product of government-mandated health policy planning efforts that dated back to the post–World War II era. While federal regulations provided legislation and enforcement provisions, program development and implementation generally took place on the state or local level.[404] The *National Health Planning and Resources Development Act of 1974* pushed CON regulations to the forefront of government healthcare cost containment efforts and required that federal agencies pass health policy planning guidelines and establish "a statement of national health planning goals."[405] The act prompted states to enact CON programs by guaranteeing federal funding for state CON review programs and conditioned the receipt of certain healthcare funding on states' enactment of CON programs.[406] It also specified that state CON programs must meet federal guidelines in order to receive federal funding.[407] In response to the act, all 50 states developed

NATIONAL HEALTH PLANNING AND RESOURCES DEVELOPMENT ACT OF 1974

Legislation that pushed CON regulations to the forefront of government healthcare cost containment efforts. The act required that federal agencies pass health policy planning guidelines and establish "a statement of national health planning goals."

"The National Health Planning and Resources Development Act of 1974," Pub. L. *93–641, January 4, 1975, § 1501; Frank A. Sloan, et al.*, Cost, Quality, and Access in Health Care: New Roles for Health Planning in a Competitive Environment *(San Francisco: Jossey-Bass Publishers 1988), p. 31.*

some form of *CON review.*[408] In 1987, Congress repealed the act, leading to 14 states discontinuing their CON programs.[409] Despite the elimination of a formal CON program, all 14 states retained certain regulatory mechanisms aimed at preventing "*duplication*" of healthcare services.[410]

3.4.3.2 Current CON Regulatory Environment Although early state CON laws were modeled after federal legislation, current CON regulation is based on various state statutes, rules, and regulations that designate an agency or a board to administer the application approval process.[411] State CON programs are administered according to statutes and regulations controlling market entry for regulated facilities, services, and equipment. Hospitals, nursing homes, certain freestanding clinics, home health agencies, and ASCs are often among the healthcare enterprises covered by CON restrictions.[412]

CON restrictions also often apply to healthcare services (including the change of one service to another), as well as healthcare assets, for example, the purchase of medical equipment and new technology.

CON regulatory policy has been highly contentious in both the state legislative and the judicial arena for many years and has been the subject of significant administrative agency study and review. Beyond these activities, the grant or denial of a CON application has frequently resulted in complex and costly litigation.[413] One argument against CON regulatory policy is that its intervention disrupts natural market forces and limits competition.[414] Seeking to preserve competition in healthcare markets, the FTC has consistently criticized the CON concept as a failed public health regulatory policy that creates barriers to new market competitors.[415] Another contention of CON is that it elicits political fraud within the states. For example, former Alabama governor Don Siegelman was resentenced in 2012 for convictions of bribery, conspiracy, fraud, and obstruction of justice charges involving former HealthSouth CEO Richard Scrushy, in connection with Alabama's CON program, while former Illinois governor Rod Blagojevich was sentenced in 2011 for convictions on 18 counts of corruption, in part related to fraudulent conduct with the Illinois Health Facilities Planning Board.[416]

3.4.3.3 FTC Pronouncements on CON The FTC has evaluated the impact of CON restrictions on competition for many years. A 1988 FTC study estimated that total hospital costs might decline by 1.4 percent, or $1.3 billion per year, if all states with CON laws doubled the dollar thresholds at which

they required CON review of hospital expenditures.[417] In November 2002, then FTC chairman Timothy J. Muris announced that the FTC would hold joint hearings with the DOJ in 2003 regarding competition in healthcare.[418] On July 23, 2004, following the conclusion of the hearings, the FTC and the DOJ issued a joint report, in which the agencies *recommended that states decrease barriers to entry into provider markets*.[419] Following the testimony, the agencies suggested that instead of reducing costs, there is evidence that CON programs actually increase costs by "fostering anticompetitive barriers to entry."[420] In addition to raising prices, the FTC has *condemned CON regulation as causing lower quality and reduced innovation* in healthcare markets.[421]

3.4.3.4 The Application Process Every CON state has its own unique CON application process; however, general procedures tend to guide the application process in all CON states. The typical application process involves submission of an application for review, followed by agency review for consistency with planning criteria, and a public hearing and issuance of a decision by the granting authority.[422] In addition, each state will have its own unique criteria and thresholds related to what type of CON "review" will be required, for example, (1) *Full Review*: both utilization and population thresholds must be met; (2) *Expedited Review*: utilization threshold standards are not used, but rather "questions" related to "quality of care" and "technological advancements" must be answered; and (3) *Non-Substantive Review*: no formal application is required. If an application is approved, the project must typically begin within a specified amount of

time.[423] If a CON holder fails to fulfill the requirements of the CON, the state may retain the right to revoke it.[424] In some states, a CON may be transferable (and valued), but laws governing such rights to ownership differ from state to state. Because obtaining a CON is an administrative process, appeals of a negative application decision must first go through the proper administrative channels in jurisdictions with an applicable administrative procedures act and may then be appealed to the appropriate state court.[425]

3.4.4 Covenants Not to Compete

Covenants not to compete, in a general sense, restrict one party from competing with another party in a geographically defined area for a specific period of time and are often considered *intangible assets* of an organization that have the potential to hold significant value to that organization.[426] (See Chapter 14, "The Valuation of Tangible and Intangible Assets.") *Covenants not to compete* may be agreements between buyers and sellers, as well as between employers and employees. For example, *covenants not to compete* are often desirable for hospitals to possess in order to prevent an employed physician from establishing a competing medical practice on termination of his hospital employment or following a physician's sale of his practice to another healthcare enterprise, such as a medical group practice.[427] However, some states have passed legislation prohibiting the use of *noncompete agreements* among certain healthcare providers. See Table 3.13 for a further description of states that have statutes that expressly allow, or prohibit, *covenants not to compete* for certain healthcare providers.

3.5 PRIVACY REGULATIONS

Due to the fact that healthcare practitioners, providers, and organizations have regular access to patient health records, the possession of *confidential healthcare information* is regulated on a federal level to ensure that

TABLE 3.13 State Covenants Not to Compete (*continued*)

	A	B	C	D	E
	State	**Statute**	**Effective Date**	**Noncompete Covenants Permitted?**	**Healthcare Specific Provision**
21	South Dakota	SDC §§ 53–9–1–53–9–12	1939	Yes	
22	Tennessee	Tenn. Code. Ann. § 63–1–148	January 1, 2012	Yes	Restrictions on the rights of contracted healthcare providers are deemed reasonable as specified by the conditions of the statute. The statute does not apply to emergency medicine providers.
23	Texas	Tex. Bus. & Com. Code §§ 15.50-.52	September 1, 2009	Yes	A covenant not to compete relating to the practice of medicine is enforceable against a person licensed as a physician by the Texas Medical Board if such covenant complies with the requirements specified in the statute.

Covenants Not to Compete: A State-by-State Survey, 7th ed., by Brian M. Malsberger (Arlington, VA: BNA Books, 2010); *Covenants Not to Compete: A State-by-State Survey*, 2011 Supplement, by Brian M. Malsberger (Arlington, VA: BNA Books, 2011).

patient privacy is maintained. Specifically, the *Health Insurance Portability and Accountability Act of 1996* (HIPAA) regulates access to *medical information*, while the *Red Flag Rules* regulate access to certain *financial information*. With healthcare organizations typically managing both patient medical information and billing for services, healthcare enterprises with varying degrees of complexity and size are expected to comply with both laws, with *HIPPA* containing provisions for criminal penalties, in addition to civil penalties, for violations of the law. The *FTC* may seek both civil penalties and injunctive relief under the *Red Flag Rules*.[428]

3.5.1 Health Insurance Portability and Accountability Act (HIPAA)

While *HIPAA* serves many purposes, it is most widely used for safeguarding the privacy of *Protected Health Information* (*PHI*), that is, individually identifiable health information.[429] This protection extends to information related to the "past, present or future physical or mental health condition of an individual; the provision of healthcare services to an individual; or the past, present or future payment for the provision of healthcare to an individual."[430] The *HIPAA Privacy Rule* provides standards for the use and disclosure of PHI by *covered entities*, as well as rights for individuals to control how their PHI is used.[431] The *Privacy Rule* governs covered entities, such as "health plans, healthcare clearinghouses, and any health care provider who transmits health information in electronic form in connection with a transaction for which the Secretary of HHS has adopted [HIPAA] standards."[432]

COVERED ENTITIES UNDER HIPAA

Health plans, healthcare clearinghouses, and any healthcare provider who transmits health information in electronic form in connection with a transaction for which the secretary of HHS has adopted HIPAA standards.

"Summary of the HIPAA Privacy Rule," OCR Privacy Brief, United States Department of Health and Human Services, May 2003, p. 2, http://www.hhs.gov/ocr/privacy/hipaa/understanding/summary/privacysummary.pdf (accessed June 17, 2009).

HEALTH INSURANCE PORTABILITY AND ACCOUNTABILITY ACT OF 1996 (HIPPA)

The HIPAA Privacy Rule provides standards for the use and disclosure of "protected health information" (PHI) to safeguard patient privacy. PHI is anything that relates to a patient's past, present, or future physical or mental health condition and the provision of healthcare services to the patient, and to the past, present or future payment for the provision of healthcare to the individual. The Privacy Rule governs health plans, healthcare clearinghouses, and any healthcare provider who transmits health information in electronic form in connection with a transaction for which the secretary of HHS has adopted HIPPA standards ("covered entities"). The act was updated by the Health Information Technology for Economic Clinical Health (HITECH) Act, within the Recovery and Reinvestment Act of 2009, allowing patients to request an audit trail that shows all disclosures of their PHI, prohibiting the sale of a patient's PHI without his or her authorization and requiring individuals to be notified if there is an unauthorized disclosure or use of their PHI.

45 CFR. 160.103; 45 CFR. 164; "Summary of the HIPAA Privacy Rule," OCR Privacy Brief, United States Department of Health and Human Services, May 2003, p. 4, http://www.hhs.gov/ocr/privacy/hipaa/understanding/summary/privacysummary.pdf (accessed June 17, 2009).

Protected Health Information

Protected health information is individually identifiable health information that is transmitted by, or maintained in, electronic media or any other form or medium. This information must relate to (1) the past, present, or future physical or mental health, or condition of an individual; (2) the provision of healthcare to an individual; or (3) the payment for the provision of healthcare to an individual.

"Definitions," 45 CFR. 160.103 (May 31, 2002), p. 701; "Health Insurance Portability and Accountability Act of 1996," Pub. L. *No. 104–191 (August 21, 1996).*

Transactions by healthcare providers falling under the *Privacy Rule* include claims, benefit eligibility inquiries, referral authorization requests, and other transactions for which HHS has established particular standards.[433] These transactions are covered regardless of whether they are performed by the healthcare provider, a billing service, or any other third party under contract with the provider.[434] When a *covered entity* contracts with a third-party entity to perform billing or other *business associate* activities, such as claims processing, data analysis, or utilization review, the *covered entity* must impose specific safeguards to protect PHI.[435] *Unintentional HIPAA violations* carry fines of $100 per occurrence, up to $25,000 per year. However, *intentional HIPAA violations* carry criminal penalties that include fines of up to $250,000 and 10 years in prison.[436] Significantly, though, HIPAA *does not provide for private rights of action* for patients who were harmed by the dissemination of their PHI, but rather it provides patients with the option of filing a complaint with the *HHS Office for Civil Rights*

(OCR) in the event of a violation that resulted in harm to the patient.[437] The proper destruction of PHI is also protected under HIPAA.[438]

As the healthcare industry transitions to *electronic transactions*, the current version of the HIPAA standards that regulate the transmission of specific health care information, known as the *Accredited Standards Committee X12 Version 4010/4010AI*, has become increasingly less functional for the coding and transactional updates providers are currently required to accommodate (i.e., the coming *ICD-10 transition*). To rectify any inefficiency, the HHS approved *ASC X12 Version 5010*, whose improvements in Version 5010 include technical, structural, and data content requirements; transactional business standardization; data transmission specifications; and delineation of various patient codes.[439] The transition to *HIPAA Version 5010* will affect many healthcare industry stakeholders, including providers, health plans, healthcare clearinghouses, and business associates who participate in electronic transactions, such as billing/service agents and vendors.[440] According to a *2011 Medical Group Management Association report*, 45 percent of practices would have to replace their practice management systems completely to manage Version 5010, and 50.3 percent of practices would need to install upgrades to accommodate Version 5010.[441]

Despite the fact that according to the 2011 *MGMA report*, 34.5 percent of private physician practices did not currently have practice management

vendors that can upgrade their current systems, 42.5 percent of practices had not started the implementation of Version 5010.[442] One barrier to implementation is the cost of the new HIPAA Version 5010 software, hardware, and staff training, which may total approximately $16,575 per practice.[443] Although the final HIPAA rule introducing the changes was published on January 16, 2009, the *CMS Office of E-Health standards and Services (OESS*), responsible for enforcement of compliance with electronic transaction standards, delayed enforcement until July 1, 2012, partially due to industry feedback suggesting that many covered entities would be unable to comply with the new transaction standards by the original January 1, 2012, deadline.[444]

3.5.2 Red Flags Rules

On November 9, 2007, the FTC and other agencies published a list of "*red flags*," or "*warnings*" related to potential indicators of identity theft and mandated the implementation of an *Identity Theft Prevention Program* that is intended to apply to all creditors who deal with "*covered accounts.*"[445] Under the "*Red Flag Clarification Act of 2010*," a creditor is defined as one who "regularly, and in the ordinary course of business . . . obtains or uses consumer reports . . . in connection with a credit transaction; furnishes information to consumer reporting agencies . . . in connection with a credit transaction; or, advances funds to or on behalf of a person," except for funds for expenses "incidental to a service provided by the creditor to that person."[446]

[446] "Red Flag Program Clarification Act of 2010," *Pub. L.* No. 111-319, 124 Stat 3457 (December 18, 2010).

Under the *Red Flag Rules*, a *covered account* includes:

1. *A [consumer] account primarily for personal, family or household purposes, that involves or is designed to permit multiple payments or transactions; or,*
2. *Any other account for which there is a reasonably foreseeable risk to customers or the safety and soundness of the financial institution or creditor from identity theft . . . including financial, operational, compliance, reputation, or litigation risks.*[447]

According to the FTC's *Fighting Fraud with the Red Flag Rules: A How-to Guide for Business*, healthcare enterprise creditors must (1) review their billing practices and payment procedures, and (2) create a program to ensure compliance.[448] Written compliance programs must include (1) strategies and procedures for *identifying* existing "*red flags*," (2) *avoiding* future "*red flag*" violations, (3) *preventing and mitigating* identity theft, and (4) *developing and implementing* a procedure for reevaluating and updating program protocols.[449] Penalties for noncompliance with the *Red Flag Rules* include monetary civil penalties, with a maximum amount per violation set at $3,500 as of October 2012. In addition, the FTC may seek injunctive relief, requiring companies to comply with the *Red Flag Rules* and maintain certain records documenting their compliance going forward.[450]

3.5.3 Health Information Technology for Economic and Clinical Health (HITECH) Act

The American Recovery and Reinvestment Act of 2009 (ARRA) made significant changes to HIPAA's health information privacy and security provisions.[451] The ARRA enacted the *Health Information Technology for*

L.* No. 111-5, 123 Stat 115 (February 17, 2009).

Electronic Health Records

An electronic record of patient health information, such as patient demographics, notes, medications, medical history, laboratory dates, or medical reports, which are generated by one or more encounters in any care delivery setting.

"Electronic Health Record," Healthcare Information and Management Systems Society, 2009, http://www.himss.org/ASP/topics_ehr.asp (accessed September 22, 2009).

Economic Clinical Health (HITECH) Act in order to promote widespread adoption of health information technology, particularly *electronic health records* (*EHR*).[452] (See Chapter 5, "Technology," for an in-depth discussion of *EHR* as related to the *HITECH Act.*) Provisions in the *HITECH Act* protect the privacy and security of *PHI* by:

1. *Allowing patients to request an electronic copy of their records*, as well as an audit trail that shows all disclosures of their PHI;
2. *Prohibiting the sale of a patient's PHI* without his or her authorization; and,
3. Requiring individuals to be *notified if there is an unauthorized disclosure* or use of their PHI.[453]

This latter provision requires *public notification* to the HHS website, prominent media outlets, and the secretary of HHS when breaches affecting 500 patients or more occur.[454] Though these new notification requirements were effective as of September 23, 2009, enforcement was delayed until February 22, 2010.[455]

Exceptions to the *HITECH Act* for *PHI* include:

1. *Unintentional access* to, acquisition of, or use of PHI by a worker of the *covered entity*, acting in good faith, within the scope and course of duties, as long as the act does not lead to disclosure under HIPAA;

[452] "American Recovery and Reinvestment Act of 2009, Sec. 3001, 13400 et seq.," *Pub. L.* No. 111-5, 123 Stat 115 (February 17, 2009), pp. 230, 258.

[453] Ibid., pp. 260–268.

[455] "Breach Notification for Unsecured Protected Health Information," *Federal Register* 74, no. 162 (August 24, 2009): 42740, 42756–42757.

2. *Inadvertent disclosure* from one worker of the *covered entity* to another, where both workers were authorized to access information and no future disclosure occurs; and
3. *Unauthorized disclosure* to an unauthorized person, where there is reasonable belief that the recipient would not retain information.[456]

HEALTH INFORMATION TECHNOLOGY FOR ECONOMIC CLINICAL HEALTH (HITECH) ACT

Legislation used to promote widespread adoption of health information technology, particularly electronic health records (EHR). Also used to protect the privacy and security of PHI by allowing patients to request an audit trail that shows all disclosures of their PHI, prohibiting the sale of a patient's PHI without his or her authorization, and requiring individuals to be notified if there is an unauthorized disclosure or use of their PHI.

"Health Information Technology for Economic and Clinical Health," found in "American Recovery and Reinvestment Act of 2009," Pub. L. *111–5 (February 17, 2009), Title XIII.*

In addition, the *HITECH Act* expanded the applicability of privacy laws to "*business associates*" (who are defined as people who are not employees but act on behalf of a "*covered entity or organized health care arrangement*" to perform a *function or activity* that involves disclosure of an individual's PHI) by requiring them to enter into a *written contract with the covered entity* for which it provides services detailing the contractual relationship and agreement provisions.[457] *Functions and activities* can include, but are not limited to:

1. Billing, claims, and data processing or administration;
2. Utilization review and quality assurance;

3. Benefit management;
4. Practice management;
5. Legal, actuarial, accounting, consulting, or data aggregation; and
6. Management, administrative, accreditation, or financial services.[458]

PATIENT SAFETY AND QUALITY IMPROVEMENT ACT (PSQIA)

Legislation that established a voluntary reporting system for medical errors to increase the availability of such and more efficiently address issues related to patient care and quality.

"Patient Safety and Quality Improvement; Final Rule," 42 CFR. Part 3, Centers for Medicare and Medicaid Services, November 21, 2008, p. 70732.

Significant attention has been given to the *HITECH Act*, with the passage of the ACA in regards to the adoption of *electronic health records*. For example, since 2011, more than 3,300 hospitals and 120,000 eligible healthcare professionals have qualified for participation in the *Electronic Health Record Incentive Program*, exceeding the government's target by approximately 23,000 individuals.[459] (See Chapter 5, "Technology.")

3.5.4 Patient Safety and Quality Improvement Act

The Patient Safety and Quality Improvement Act (PSQIA) of 2005, effective January 19, 2009, established a voluntary reporting system for medical errors.[460] Under PSQIA, confidentiality provisions regarding the protection of "patient safety work product" were established, which mandated

[458] "Definitions," 45 CFR. § 160.103 (2010).

[459] Diana Manos and Mary Mosquera, "Final Rules for Stage 2 Meaningful Use Released," *Healthcare IT News*, August 23, 2012, http://www.healthcareitnews.com/news/final-rules-stage-2-meaningful-use-released (accessed September 22, 2012).

[460] U.S. Department of Health and Human Services, "Health Information Privacy: Understanding Patient Safety Confidentiality," http://www.hhs.gov/ocr/privacy/psa/understanding/index.html (accessed February 4, 2010); Centers for Medicare and Medicaid Services, "Patient Safety and Quality Improvement; Final Rule," 42 CFR. Part 3, November 21, 2008, p. 70732.

that reporting organizations must maintain compliance with HIPAA and other regulations, guidelines, and rules.[461] "Patient safety work product" includes any information that is collected while reporting and analyzing a patient safety event, that is, "a process or act of omission or commissions that resulted in hazardous health care conditions and/or unintended harm to the patient."[462] Under PSQIA, Patient Safety Organizations (PSOs) are charged with collecting and analyzing data under the supervision of the Agency for Healthcare Research and Quality (AHRQ), one of the 12 agencies within HHS that is tasked with improving the quality, safety, efficiency, and effectiveness of healthcare in the United States through conducting and supporting research that is then translated into improved healthcare delivery and policy initiatives.[463]

3.5.5 Custodial Rights to Patient Charts

As discussed in Chapter 14, "The Valuation of Tangible and Intangible Assets," patient medical charts and records are a significant asset of a physician's professional practice enterprise. The *patient information and data recorded* and contained within the medical records themselves belong to the patient, not to the physician or the owner of the physician practice and, accordingly, cannot be sold. However, the *custody* of the medical charts and records and patient recall lists does, in fact, constitute an *intangible asset* of the physician practice that may be (and often is) *transferred and valued.* That confidential *PHI* contained within the medical chart/record is subject to the privacy regulations (e.g., *HIPAA, HITECH*) discussed earlier in this chapter. A description of state *medical record retention laws* for both hospitals and physicians is set forth in Table 3.14 and Table 3.15.

3.6 SAFETY REGULATIONS

According to the Economic Research Institute's "*Top 10 Health Technology Hazards for 2013*," the following healthcare technologies have been identified as potential "*hazards*" to the delivery of high-quality and safe patient care in the United States:

1. Medical device alarm hazards;
2. Medication administration errors using infusion pumps;
3. Unnecessary exposures and radiation burns from diagnostic radiology procedures;
4. Patient/data mismatches in EHRs and other health IT systems;
5. Interoperability failures with medical devices and health IT systems;
6. Air embolism hazards;
7. Inattention to the needs of pediatric patients when using "adult" technologies;
8. Inadequate reprocessing of endoscopic devices and surgical instruments;
9. Patient caregiver distractions from smartphones and other mobile devices and surgical fires.[464]

A variety of safety regulations applicable to healthcare enterprises and providers have been enacted at the federal and state level that aim to improve patient safety, several of which will be discussed next.

3.6.1 Clinical Laboratory Improvement Amendments (CLIA)

Prior to 1988, only independent and hospital laboratories were subject to federal regulation under the *Medicare, Medicaid, and Clinical Laboratories Improvement Act of 1967*.[465] Following a public outcry after numerous reports of inaccurate Pap smear results, Congress passed the *Clinical Laboratory Improvement Amendments* (CLIA) in 1988 (and its subsequent amendments) in order to improve the *accuracy, reliability, and timeliness* of laboratory test results.[466]

[465] "Medicare, Medicaid, and Clinical Laboratories Improvement Act," *Pub. L.* 90-174, 81 Stat 536 (December 5, 1967), pp. 536, 538.

[466] "Laboratory Requirements," 42 CFR. § 493 (2003); Centers for Medicare and Medicaid Services, "Clinical Laboratory Improvement Amendments: Overview," May 07, 2009, http://www.cms.hhs.gov/clia/ (accessed June 30, 2009); United States Food and Drug Administration, "Clinical Laboratory Improvement Amendments," June 16, 2009, http://www.fda.gov/MedicalDevices/DeviceRegulationandGuidance/IVDRegulatoryAssistance/ucm124105.htm (accessed June 30, 2009).

CMS assumes the responsibility for overseeing the CLIA program and is charged with regulating healthcare providers who perform laboratory testing on specimens derived from humans for the "*diagnosis, prevention, or treatment of disease*" to ensure that they abide by federally established quality standards.[467] Laboratory testing performed for forensic purposes, on human specimens without patient-specific results, or drug testing by *Substance Abuse and Mental Health Service Administration* (SAMHSA) laboratories are exempted from CLIA's requirements.[468]

CLIA regulations categorize laboratory testing procedures by *complexity*, assigning each test to a *low, moderate, or high level*, that is, a test's category is determined by assessing its complexity, on a scale of 1 to 3, based on seven distinct areas:

CLINICAL LABORATORY IMPROVEMENT ACT (CLIA)

The act requires laboratories to regulate all laboratory testing performed on humans, except the testing performed for research purposes, in order to improve the accuracy, reliability, and timeliness of test results. It requires that healthcare providers who perform laboratory testing on specimens derived from humans obtain a certificate and abide by established standards in order to operate these services. Overseen by the Centers for Medicare and Medicaid Services.

"Overview: Clinical Laboratory Improvement Amendments," Centers for Medicare and Medicaid Services, May 07, 2009, http://www.cms.hhs.gov/clia/ (accessed June 30, 2009); "Clinical Laboratory Improvement Amendments," United States Food and Drug Administration, June 16, 2009.

[467] Centers for Medicare and Medicaid Services, "Clinical Laboratory Improvement Amendments: Overview," May 07, 2009, http://www.cms.hhs.gov/clia/ (accessed on June 30, 2009); "Laboratory Requirements," 42 CFR. § 493, (2003); United States Food and Drug Administration, "Clinical Laboratory Improvement Amendments," June 16, 2009, http://www.fda.gov/MedicalDevices/DeviceRegulationandGuidance/IVDRegulatoryAssistance/ucm124105.htm (accessed June 30, 2009); Centers for Medicare and Medicaid Services, "CMS Initiatives to Improve Quality of Laboratory Testing under the CLIA Program," July 2006, http://www.cms.hhs.gov/CLIA/downloads/060630.Backgrounder.rlEG.pdf (accessed November 2, 2009).

[468] "Laboratory Requirements," 42 CFR. § 493.3 (2003).

1. The level of scientific and technical knowledge required to perform the test;
2. The level of training and experience required for the three *preanalytic*, *perianalytic*, and *postanalytic* phases of the test;
3. The stability and reliability of the materials needed for the test;
4. The relative ease or difficulty of each step of the testing process;
5. The calibration, control, and proficiency of the testing materials;
6. The relative ease or difficulty of maintaining or troubleshooting the testing system; and
7. The amount of interpretation and judgment needed during the three phases of the test.[469]

Lowest level complexity tests, known as "*waived tests*," are virtually exempt from CLIA rules and must only follow the instructions provided by the manufacturer.[470] *Moderate* and *high level complexity tests* are subject to more stringent rules that set minimum qualifications for individuals who perform or supervise testing procedures. The labs themselves are also required to pass an external evaluation program every two years, which tests the proficiency and accuracy of results and maintains a system to monitor and calibrate equipment.[471] In addition to CMS's enforcement of CLIA regulations, the CDC monitors laboratory quality improvement measures.[472] Penalties for noncompliance include "(A) Use of intermediate sanctions; (B) Suspension, limitation, or revocation of the certificate of a laboratory that is out of compliance with one or more requirements for a certificate; and, (C) Civil suit to enjoin any laboratory activity that constitutes a significant hazard to the public health."[473]

3.6.2 Occupational Safety and Health Act (OSHA)

The *Occupational Safety and Health Act of 1970* (OSHA) established standards for occupational health and safety and required states to enact legislation implementing standards and procedures developed by the *Department of Labor* regarding the protection of healthcare employees from *blood borne diseases, latex allergies, needle sticks, tuberculosis, patient violence, ionizing radiation,* and *anesthetic gasses* that leak into the surrounding room during medical procedures, among others.[474] OSHA works closely with the *National Institute for Occupational Safety and Health* (NIOOSH), a CDC agency dedicated to researching and developing occupational and health standards for the workplace.[475] The NIOSH *Health Hazard Evaluation Program* specifically evaluates whether a workplace exposes employees to *hazardous materials* or *harmful conditions* that have the potential to be damaging to the employee's health.[476] Penalties for noncompliance with OSHA include, generally, "a civil penalty of not more than $70,000 for each violation, but not less than $5,000 for each willful violation."[477] *Willful*

THE OCCUPATIONAL SAFETY AND HEALTH ACT OF 1970 (OSHA)

The OSHA Act established standards for occupational health and safety and requires states to enact legislation implementing standards and procedures developed by the Department of Labor.

violations causing death to an employee "shall, upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than six months, or by both; except that if the conviction is for a violation committed after a first conviction of such person, punishment shall be by a fine of not more than $20,000 or by imprisonment for not more than one year, or by both."[478]

3.6.3 United States Nuclear Regulatory Commission (NRC)

The *United States Nuclear Regulatory Commission* (*NRC*), an independent agency created by Congress in 1974, is tasked with ensuring the safe use of *radioactive material* for civilian purposes through a combination of regulatory requirements, licensing, safety oversight, operational evaluation, and support activities.[479] Under § 274 of *the Atomic Energy Act of 1954*, the NRC is authorized to delegate its authority to oversee the licensing of certain radioactive material to *state regulatory commissions*, otherwise known as *Agreement States*.[480] A state must sign a formal agreement with the RNC to become an *Agreement State*.[481] On the NRC delegating authority to a state regulatory commission, that *Agreement State* may then regulate the *use* of nuclear material by certain licensees related to (1) the production of radiation from imaging devices used by hospitals, physicians, dental offices, and podiatry offices; (2) the use of nuclear material to deliver pain-relieving or therapeutic doses to parts of the body; and (3) medical research involving the use of nuclear material in human subjects.[482]

As of October 2012, the NRC has entered into agreements with 37 states.[483]

3.6.4 Environmental Laws

3.6.4.1 Disposal of Hazardous Waste While hazardous waste rules may often be seen as being directed more toward industrial facilities, hazardous waste disposal regulation applies to healthcare providers as well. Title 40, Part 262, of the U.S. Code contains the federal requirements specified by the Environmental Protection Agency (EPA) for "*hazardous waste generators*," defined as any *person*, by site, whose *processes* and *actions create hazardous waste*.[484] *Hazardous waste generators* are divided into three classes, each with its own set of regulations, by the amount of monthly hazardous waste produced, that is, (1) *Conditionally Exempt Small Quantity Generators* produce less than 100 kilograms per month; (2) *Small Quantity Generators* produce between 100 and 1,000 kilograms per month; and (3) *Large Quantity Generators* produce more than 1,000 kilograms per month.[485] Similar to the regulation of *hazardous waste generators*, the EPA is also charged with the regulation of *hazardous waste incinerators*, which are defined as being "any enclosed device that: (1) Uses controlled flame combustion and neither meets the criteria for classification as a boiler, sludge dryer, or carbon

[484] EPA Hazardous Waste Management System: General, "Definitions," 40 CFR. § 260.10.

[485] U.S. Environmental Protection Agency, "Hazardous Waste Generators," http://www.epa.gov/waste/hazard/generation/index.htm (accessed September 13, 2012).

regenerator unit, nor is listed as an industrial furnace; or (2) Meets the definition of infrared incinerator or plasma arc incinerator."[486]

The Resource Conservation and Recovery Act (RCRA) of 1976 provided the EPA with "the authority to control hazardous waste from the 'cradle-to-grave'. . . [which] includes the generation, transportation, treatment, storage, and disposal of hazardous waste."[487] In 1984, the Federal Hazardous and Solid Waste Amendments Act amended the RCRA, emphasizing waste minimization and the transition to eliminate land disposal of hazardous waste and the consequences for violations of proper disposal.[488] Typically, however, medical waste disposal is often more specifically regulated on a state level, with all 50 U.S. states having some type of state regulation governing the disposal of medical waste.[489]

The RCRA also regulates the proper management of unused pharmaceuticals that fall under the act's definition of "hazardous waste."[490] In addition to pharmaceutical waste, "hazardous waste" includes, generally, "a solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical or infectious characteristics may (A) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (B) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposes of, or otherwise managed."[491] Similar to the definition of "hazardous waste," the RCRA defines "medical waste" as "any solid waste which is generated in the diagnosis, treatment, or immunization of human beings or animals, in research pertaining thereto, or in the production or testing of biologicals."[492] In regulating

the handling and disposal of controlled substances, the U.S. Drug Enforcement Agency (DEA) has different rules for registered (e.g., hospitals) and nonregistered (e.g., nursing homes) entities.[493] In December 2008, the EPA proposed adding hazardous waste pharmaceuticals to the Universal Waste Program.[494] However, that proposal was never finalized, due to numerous industry concerns regarding lack of notification and tracking requirements.[495] The EPA has attempted to address these concerns in a proposed rule slated for release in 2013, which is anticipated to cover pharmaceutical waste that is (1) produced by "healthcare-related facilities," and (2) falls under RCRA's hazardous waste definition.

3.6.4.2 Regulation of Chemotherapy/Cancer Treatment Drugs *Cytotoxic drugs* used during cancer treatment affect not only harmful cancerous cells but "can also harm normal cells and their DNA," thereby posing risks to those exposed to these drugs, including hospital pharmacy and drug infusion center employees.[496] Exposure to *cytotoxic drugs* is associated with increased rates of DNA damage, infertility, miscarriage, premature birth, and congenital problems in children exposed in utero (e.g., low birth weight, learning disabilities, and physical abnormalities).[497] While such drugs may have significant benefits during cancer treatment, the *Centers for Disease Control*

(*CDC*) has recommended that healthcare personnel who are exposed to these types of *antineoplastic agents* should take appropriate precautions to eliminate or reduce exposure. Other healthcare personnel who may be exposed to the *antineoplastic drugs* include, but are not limited to, physicians, operating room personnel, hospital staff (shipping and receiving personnel, custodial workers, laundry room employees, and waste handlers).[498]

Activities using hazardous drugs in a powdered form, such as *cytotoxic drug*s, may be conducted only in a controlled environment, such as in a *biological safety cabinet* (BSC) or a *chemical fume hood*, both of which may be referred to as a *vertical flow hood*.[499] The exhaust fan within the BSC must remain on at all times, except during repair or movement of the BSC. Other components of the use, maintenance, storage, and cleaning of the BSC are regulated by the *American Society of Hospital Pharmacists* (ASHP) and OSHA.[500]

3.6.5 Food and Drug Administration (FDA) Enforcement

The *Food and Drug Administration* (FDA) regulates food, dietary supplements, pharmaceuticals, vaccines, blood products and other biologics, medical devices, electronic products, cosmetics, veterinary products, and tobacco products.[501] Some of the most valuable assets held by healthcare enterprises include the patents related to *pharmaceuticals* and *medical devices*. Both pharmaceuticals and medical devices are *required* to have *approval* from the Food and Drug Administration (FDA) prior to *commercialization* of the pharmaceutical or medical device. Therefore, the future economic benefit from the patent cannot be realized until *after* the approval is gained from the FDA.

The requirement of obtaining approval from the FDA as a precondition to creating a revenue stream and subsequent economic benefit stream

[501] U.S. Food and Drug Administration," "What Does FDA Regulate?" http://www.fda.gov (accessed November 6, 2012).

represents a *risk* to the future economic benefit to be obtained from the ownership of the patent. This risk, and the concomitant economic value of a patent without FDA approval, is manifest in the perception of the probability of obtaining FDA approval for the patent and therefore a reasonable likelihood of exceptional returns related to an investment in the patent. Because the healthcare enterprise can typically control the price of the product, and the population of potential customers is typically well known, gaining FDA approval removes the single largest uncertainty related to the future economic benefit to be derived from ownership of the patent. This explains the means by which patents may hold significant value after the pharmaceutical or medical device has gained FDA approval.

As applied to pharmaceuticals, this risk (i.e., not obtaining FDA approval) has been stratified into a minimum of four measurable levels:

1. *Investigational New Drug permission* is a pretrial approval with the intent to ensure that the new drug is safe for clinical trials;
2. *New Drug Application—Phase 1 Clinical Trials*: Testing on healthy volunteers to determine toxicity;
3. *New Drug Application—Phase 2 Clinical Trials*: Testing on patients to determine appropriate doses;
4. *New Drug Application—Phase 3 Clinical Trials*: Double-blind, placebo-controlled trials for a demonstration of efficacy.[502]

Sometimes the FDA will require a *Phase 4 Clinical Trial* after approval has already been given, to collect further evidence of efficacy and any other side effects related to the new drug. Advancement to each step in the approval process may increase the value of patents in two ways. First, the investment time horizon of achieving the future economic benefit is reduced. That is, there is a reduction in the *future* part of the *future* economic benefit, in that both the holding period and the carrying cost of illiquidity are reduced. Second, advancement to the next step in the approval process reduces the risk related to the investment, achieving the future economic benefit of the patent. This reduction in risk correspondingly reduces the risk-adjusted required rate of return demanded by investors, resulting in a higher economic value.

Once a pharmaceutical or medical device has been approved by the FDA, ongoing regulatory compliance is often required. For example, in addition to the approval process, the FDA regulates medical devices through such measures as (1) medical device reporting regulations, (2) good

[502] 21 CFR. 312.21.

manufacturing practice requirements, and (3) inspection requirements. The FDA's authority to regulate medical devices was first granted in 1976 under the *Medical Device Amendments* to the *Food, Drug, and Cosmetic Act of 1938*, which *amendments* required the registration and premarket approval for medical devices.[503]

The FDA *Medical Device Reporting Regulations* (MDR) require manufacturers to notify the FDA if they receive complaints of *device malfunctions*, *serious injuries*, or *deaths* associated with the device. The goal of the regulation is to detect and correct problems in a timely manner, such that manufacturers are required to have the following information in a format that allows timely follow-up and inspection by the FDA.[504]

In 1978, the FDA prescribed *Current Good Manufacturing Practices (CGMP)* requirements to regulate the methods used in, and the facilities and controls used for, the manufacture, packing, storage, and installation of medical devices.[505] The *Safe Medical Devices Act of 1990* (*SMDA*) gave the FDA the authority to impose *GMP* controls necessary to ensure proper device design but did not extend its authority to include an evaluation of device safety and effectiveness.[506] In 1996, the FDA revised the *CGMP* requirements for medical devices and incorporated them into a *quality system regulation*. In addition to the requirements set forth in the *CGMP* for the *manufacture, packing, storage and installation of medical devices*, the *quality system regulations* added controls for the *designing, labeling, and servicing of medical devices* intended for human use. These regulations became effective June 1, 1997, and the name of the regulation was changed from *Good Manufacturing Practice* to *Quality System* (*QS*) regulation to reflect that the *CGMP* requirements now cover a *full quality system spectrum*.[507]

Under the *QS/CGMP* regulations, manufacturers are expected to control their products from "*cradle to grave*," that is, from *design process through postmarket surveillance* through implementation of the *Quality Systems Inspections Technique* (*QSIT*), a top-down inspection of a manufacturer's quality system that places responsibility on the manufacturer to monitor its compliance with the *QS/CGMP* requirements. In addition to requirements that manufacturers establish and maintain plans that describe or reference their design and development activities, the *QS* requires that manufacturers ensure that a formal, documented review process is conducted at appropriate stages during the design development process.[508] Continuing compliance with these standards requires technical information, drawings, written procedures, software configuration, and other records, all of which must be recreated if lost or absent.[509] Penalties for noncompliance can range from warning letters to "any necessary regulatory action for violations of all other provisions of the CGMP final rule."[510] The *QS* applies to all devices introduced after 1997 and for changes made to pre-1997 devices.[511]

3.7 CORPORATE PRACTICE OF MEDICINE AND RELATED PROVISIONS

The *Corporate Practice of Medicine* doctrine is perhaps the most fundamental legislative manifestation of healthcare's transition from a "*cottage industry*," with little crossover between medical specialties and physician professional practices, to the *corporatization of medicine*. The *American Medical Association* (*AMA*) promulgated the *Corporate Practice of Medicine* (*CPOM*) doctrine to prohibit unlicensed individuals or corporations from engaging in the practice of medicine by employing licensed physicians.[512] CPOM was established with the intent of ensuring that licensed

CORPORATE PRACTICE OF MEDICINE (CPOM)

The Corporate Practice of Medicine doctrine was created to prevent the practice of medicine by unlicensed individuals and ensured that entities could hire only licensed physicians. The intent of the CPOM doctrine was to prevent lay people from influencing physicians' treatment decisions.

"Corporate Medicine in 21st Century Health Care," by John W. Jones, Esq., Physician's News Digest, *June 2007, http://www.physiciansnews.com/law/607jones.html (accessed July 9, 2009);* People v. United Medical Services, *362 Ill. 442, 200 N.E. 157, 163 (1936).*

physicians could practice medicine without pressure from lay persons or being "subject to commercialization or exploitation."[513]

The CPOM is regulated on a state level, with regulations varying significantly by state.[514] Restrictions on the CPOM vary by jurisdiction, with some states expressly prohibiting the practice, including laws restricting unlicensed individuals from owning or operating a business in which medical services are provided to patients. For example, several states, that is, (1) *California*, (2) *Colorado*, (3) *Illinois*, (4) *Iowa*, (5) *New York*, (6) *New Jersey*, and (7) *Texas*, prohibit hospital employment of physicians for the provision of *outpatient services*.[515] Other restrictions include placing limitations on physicians and their ability to enter into professional relationships with unlicensed individuals or nonprofessional business entities. In addition, some states may limit the number of offices a physician may operate.[516] Collectively, each state and the District of Columbia have an extensive collection of statutory legislature dealing with topics affecting the CPOM. Set forth in Table 3.16 is a summary of the CPOM legislation that has been enacted by all 50 U.S. states and the District of Columbia.

"Corporate Practice of Medicine," Thomson Reuters/West, 50 State Statutory Surveys, October 2011.

A comprehensive look at the consolidated state CPOM legislation can be found online at www.wiley.com/go/healthcarevaluation.

Certain healthcare organizations are generally exempt from the application of the CPOM doctrine, for example, physicians are allowed to incorporate as *professional corporations* in all 50 states. In some states, the organization of *Health Maintenance Organizations* (*HMOs*) and contracts between HMOs and professionals for the provision of services are specifically exempted from the doctrine.[517] Further, some states except tax-exempt healthcare entities from liability under the CPOM, with the rationale that the lack of a "*profit incentive*" eliminates the dangers associated with the CPOM.[518] In states that do not provide an *exception* for *tax-exempt organizations* from CPOM laws, due to IRC 501(c)(3) exemption mandates requiring that a *charitable purpose* is met, tax-exempt hospitals may experience the increased challenge of fitting into safeguards that establish *wholly-owned outpatient clinics*. The status of a 501(c)(3) *sub-organization* is determined by providing evidence that the *sub-organization* furthers the exclusive *charitable purpose of the exempt parent organization.*[519]

As a result of changes in the delivery of healthcare, new practice areas have surfaced that may be prone to running afoul of current statutes restricting the CPOM, for example, the growth in "*quick clinics*," or physician offices generally found in large "*doc-in-a-box*" stores or pharmacies.[520] Although retailers in states with CPOM restrictions typically cannot open in-store clinics with staffed physicians, CPOM laws generally allow corporations to rent or lease space to providers.[521] In addition, *nonphysician-owned spas* offering Botox injections and other medical procedures with

physicians staffed as medical directors also have the potential to run afoul of CPOM regulations.[522]

Related to the CPOM doctrine, states also often restrict the legal structure by which healthcare enterprises may choose to organize. For example, 37 states and the District of Columbia have specific restrictions related to a medical practice's organization as a *limited liability company.*[523] Healthcare enterprises structured as *limited liability companies* (LLC) have the advantages of both *partnerships* and *corporations*, in that LLCs *shield members* from the general liabilities and debts of the business, with the exception of personal liability for negligence, wrongful acts, or misconduct while operating within the scope of their employment. In addition, revenues of an LLC are not taxed; rather, each individual's share of the income is taxed.[524] A discussion of the prospective benefits of a healthcare enterprise electing to *S-Corp* versus *C-Corp* status is discussed earlier in this chapter in Section 3.2, "Tax Regulations."

3.7.1 False Advertising

In the last several years, the healthcare industry has seen increased scrutiny by the FTC regarding how healthcare goods, services, and procedures are advertised or labeled. *Prescription drug labeling* encompasses all labeling that is attached to, or accompanies, the medication, including dosage information and package inserts.[525] General requirements for prescription drug labeling include instructions for safe and effective use of the drug that (1) are informative and accurate; (2) are not promotional, false, or misleading; (3) do not imply any claims or suggestions for use if there is insufficient evidence of safety for that use; and (4) are based on human clinical trials whenever possible.[526]

In 2003, the FTC charged two of the largest providers of *LASIK* eye surgery with false advertising violations, asserting that their marketing claims were not sufficiently supported by scientific evidence. The advertisements claimed that after undergoing the eye surgery, patients would no longer have any need for glasses or bifocals for the remainder of their lives.[527] In their settlement agreements, *LCA Vision, Inc.* and *The Laser Vision Institute* were barred from making any similar claims in the future.[528] In a 2006 push for more *transparent* drug labeling, the FDA and HHS released a final rule requiring manufacturers to assess the effect of any change in "*identity, strength, quality, purity, and potency*" of a drug as it relates to the safety and effectiveness of that drug, as well as requiring manufacturers to submit the changes for FDA approval at least 30 days prior to public distribution.[529]

In addition, while false advertising in the pharmaceutical industry has been regulated for several years, advertising by the hospitals and the physicians, while legal, has come under increasing scrutiny in recent years.[530] For example, in May 2012, Memorial Healthcare Group, d/b/a Memorial Hospital in Jacksonville, Florida, was ordered to pay $10 million in punitive

damages for what a jury deemed to be fraudulent advertising related to its weight loss "*Center of Excellence*" designation.[531]

3.8 LICENSURE, CERTIFICATION, AND ACCREDITATION REGULATIONS

State laws typically control the *licensure, certification*, and *accreditation* of *healthcare facilities* and *healthcare providers* under the state's *police powers*, which allow states to regulate entry into the medical field, restrict the professional scope of practice, and, accordingly, hold professionals accountable for the delivery of healthcare services. State licensing requirements specify the minimum level of qualification needed for *healthcare facilities* to operate and *healthcare services* to be delivered.[532]

3.8.1 Healthcare Facilities

Licensure is the primary way that states regulate healthcare facilities, often by mandating the range of services a given facility may provide.[533] Although the licensing of healthcare enterprises is typically handled by state governments, there is significant interplay between state and federal government regulations, as most states require healthcare enterprises to meet the practice standards set forth by Medicare as a *condition of licensure*, and participation in the *Medicare* and *Medicaid program* requires *certification* through CMS and *accreditation* by a national accrediting agency.[534]

Each state governs healthcare enterprises via boards or agencies that are authorized to regulate minimum educational and experience requirements, scope of practice, employment of professionals by for-profit entities, use of trade names, and the operation and location of multiple-branch offices,

Licensure

Licensure is a governmental body's process of issuing a license, or a federal or state charter granting its holder the right to practice a profession, such as medicine, podiatry, dentistry, law, and so on.

Black's Law Dictionary, *9th ed., edited by Bryan Garner (St. Paul, MN: Thompson Reuters, 2009), p. 1005;* Dictionary of Health Economics and Finance, *by David E. Marcinko (New York: Springer, 2007), p. 214.*

among others.[535] Business *licensing regulations* vary by the regulated entity. Hospitals regulations generally require an organized governing board, medical and nursing staff, and administration staff, as well as minimum services (e.g., radiology, pharmacy, laboratory, and emergency services).[536] Other facility and equipment standards will address issues such as safety, sanitation and infection control, and record management and retention.[537]

3.8.1.1 Licensure As with other types of *professional licensure*, the *licensure* of healthcare facilities is intended to ensure that patients receive quality healthcare. All 50 states require hospitals and skilled nursing facilities to be licensed.[538] Many states require further *licensure* of specialized areas within an already-licensed facility, including clinical laboratories and hospital-based ASCs.[539] In order to maintain *licensure*, facilities may need to meet certain building requirements, as well as comply with limits on the number of beds allowed in a given facility.[540]

[540] "Excluded Hospital Units: Common Requirements," 42 CFR. 412.25, Centers for Medicare and Medicaid Services.

Despite their prevalence, other types of healthcare services or facilities may not be subject to licensure requirements. For example, while the prevalence of *office-based surgeries* (*OBSs*) has increased significantly in recent years, with the number of surgeries performed in 2010 totaling 10 million procedures, there is no *federal regulation* of surgeries performed in this setting.[541] As only approximately half of the states currently regulate OBSs, some in the healthcare industry have deemed it the "*Wild West of healthcare.*"[542]

Similar to *healthcare facility licensure,* health insurance plans, such as HMOs and PPOs, must meet certain state regulatory requirements related to the level of *statutory reserves* the plan must maintain in order to operate; *in other words, state regulations require that health insurance providers, such as HMOs and PPOs, maintain* liquefiable assets, *known as* statutory reserves, *in their operational budgets that can be readily available in the wake of a catastrophic event (e.g., the 2008 banking crisis) in order to prevent the organization from irreparable financial harm.* Statutory reserves, *which are held against anticipated claims and related commitments, are distinct from an insurance organization's uncommitted assets, known as* "surplus."[543] *While the computational methods by which states calculate the amount of statutory reserves required may vary between the states, the reserved funds must be able to support all of the financial risks and liabilities (e.g., insurance policies and contracts) that the insurance provider has assumed or underwritten.*[544]

Accreditation

Accreditation is a process in which private organizations assess participating institutions and programs and issue accreditation certificates to those that meet their requirements. Ensuring the quality and safety of services is the focus of most accreditation standards; however, many also include documentation and other requirements.

Problems in Health Care Law, *8th ed., by Robert D. Miller (Sudbury, MA: Jones and Bartlett, 2004), pp. 59, 84.*

3.8.1.2 Medicare and Medicaid Certification Healthcare provider organizations must be *certified participants* in the *Medicare and Medicaid programs* in order to receive reimbursement for services provided to patients who are Medicare or Medicaid beneficiaries. *Certification* for participation in the programs is contingent on an organization having been "*deemed*" to satisfy the health and safety standards component of the Medicare certification process.[545] As indicated earlier in this chapter, providers can achieve "*deemed status*" by earning a *certificate of compliance* with the *Conditions of Participation* established in federal regulations.[546] *Section 1864(a) of the Social Security Act* requires the secretary of *HHS* to grant state health agencies the authority to approve, disapprove, or terminate the Medicare participation of certified providers, based on whether providers have met the *Conditions of Participation*.[547] Medicaid eligibility for providers is determined by the same state agencies that determine Medicare eligibility.[548] Alternatively, a

[547] "Use of State Agencies to Determine Compliance by Providers of Services with Conditions of Participation," 42 U.S.C. § 1395aa(a); *Facts about Federal Deemed Status and State Recognition*, Joint Commission, June 19, 2012, http://www.jointcommission.org/assets/1/18/Facts_about_Federal_Deemed_Status.pdf (accessed September 14, 2012).

[548] Centers for Medicare and Medicaid Services, *State Operations Manual*, May 21, 2004, http://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c01.pdf (accessed September 14, 2012), Sections 1008A, 1008B.

healthcare provider has the option of achieving *Medicare certification* by obtaining accreditation through an accepted national *accreditation organization* (*AO*). Currently, CMS uses *seven AOs* for the purpose of overseeing the health and safety compliance of accredited program participants.[549] An AO may obtain CMS "*deeming*" authority if it enforces standards that meet or exceed the *Conditions of Participation*.[550] Additional information on Medicare and Medicaid reimbursement can be found in Chapter 2, "Reimbursement Environment."

Unlike Medicare and Medicaid, *TRICARE*, the military healthcare program for uniformed service members, their families, and survivors, is available worldwide. *TRICARE* uses healthcare resources of both military services and civilian networks to maximize access for beneficiaries.[551] *TRICARE* providers are classified into six regions: North United States, South United States, West United States, Eurasia-Africa, Latin America and Canada, and the Pacific. Structurally, *TRICARE* providers are classified into a hierarchy of *network* and *non-network providers*. To be authorized to provide services to *TRICARE* beneficiaries, a healthcare provider must meet *TRICARE's licensing and certification requirements*, in addition to obtaining certification from a *managed care support contractor* (*MCSC*).

Each *TRICARE* region maintains its own *MCSC*. *TRICARE* providers have the option of being designated as either a *networ*k or a *non-network* provider. *Network providers* participate in contractual agreements with their respective region's *MCSC* and provide care at a negotiated rate.[552] *Non-network providers* are still certified through the *MCSC*, but are *not* under any contractual obligation. *Participating non-network providers* file claims for beneficiaries and accept payment directly from *TRICARE* for the *maximum allowable charge as payment in full for their services*.

Nonparticipating non-network providers do not file claims for *TRICARE* beneficiaries, nor do they agree to accept the *TRICARE* maximum allowable charge as payment in full.[553]

3.8.1.3 Accreditation *Accreditation* is the process by which private organizations evaluate participating institutions and programs and issue accreditation certificates to institutions that meet their organization's requirements.[554] If a participating institution or program fails to maintain the requisite standards, it may not incur penalties, other than the loss of its accreditation by the given organization. In most states, there is no "*link*" between *accreditation* and *institutional licensure*; however, some states will forgo further inspection and accept accreditation by certain organizations, such as *the Joint Commission*, as the basis for the state licensure of certain providers.[555]

Accreditation can be beneficial to organizations for purposes of federal compliance. Medicare grants "*deemed status*" to hospitals accredited by the

EMERGENCY MEDICAL TREATMENT AND ACTIVE LABOR ACT (EMTALA)

Enacted by Congress in 1986 "to ensure public access to emergency services regardless of ability to pay. Section 1867 of the Social Security Act imposes specific obligations on Medicare-participating hospitals that offer emergency services to provide a medical screening examination (MSE) when a request is made for examination or treatment for an emergency medical condition (EMC), including active labor, regardless of an individual's ability to pay. Hospitals are then required to provide stabilizing treatment for patients with EMCs. If a hospital is unable to stabilize a patient within its capability, or if the patient requests, an appropriate transfer should be implemented."

National Committee on Quality Assurance (NCQA)

A not-for-profit organization that works to improve the quality of healthcare through the accreditation of managed care plans. NCQA performs this duty, much as do other accrediting bodies, through the setting of standards and the collection of outcome and performance data.

"About NCQA," National Committee for Quality Assurance, http://www.ncqa.org/tabid/675/Default.aspx (accessed September 22, 2009).

Joint Commission or the *American Osteopathic Association.*[556] *Deemed status* allows providers to be *certified to participate in the Medicare and Medicaid Program* unless a later validation survey finds noncompliance with the *Conditions of Participation* (*CoP*) requirements set forth in the federal regulations.[557] In addition, some payors will only enter into contacts with providers who have been accredited by a specific organization.[558] Major accrediting bodies in the United States include *the Joint Commission*, *the American Osteopathic Association* (AOA), and the *National Committee for Quality Assurance* (NCQA).

3.8.1.3.1 The Joint Commission The *Joint Commission* is a nongovernmental organization that strives to ensure the safety and quality of healthcare services provided to the public by providing *accreditation* for ambulatory care centers, behavioral health centers, critical access hospitals, home care, general hospitals, laboratory services, long-term care facilities,

office-based surgery centers, and international healthcare providers.[559] The *Joint Commission* pursues this goal by conducting on-site reviews and setting standards for institutional governance, support services, and patient care.[560] As indicated earlier, in some states, *Joint Commission accreditation* may be a requirement for the *licensure* of certain facilities.[561]

3.8.1.3.2 American Osteopathic Association The *American Osteopathic Association* (*AOA*) is the primary board-certifying entity for *osteopathic physicians* (D.O.) and is the accrediting body for *every osteopathic healthcare facility and medical college*.[562] The AOA strives to promote the practice of osteopathic medicine by ensuring quality in education, research, and the delivery of healthcare services and functions similarly to *the Joint Commission*.[563]

3.8.1.3.3 National Committee on Quality Assurance (NCQA) The *National Committee for Quality Assurance* (*NCQA*) is a not-for-profit organization that works with employers, physicians, policy makers, patients, and health plans to improve the quality of healthcare through the *accreditation of managed care plans*.[564] The NCQA functions much as other accrediting bodies do, through the setting of standards and the collection of *outcome and performance data*.[565] In 1991, the NCQA accredited its first HMO and focused its accreditation efforts during the 1990s primarily on

the development of *quality metrics* for *managed care organizations*. These efforts led to the development of the *Health Employer Data Information Set* (HEDIS), which measured essential elements of clinical care. By 1998, 75 percent of all HMO enrollees were enrolled in plans that were subject to NCQA accreditation.[566] HEDIS was formally integrated into NCQA's accreditation procedures in 1999, with an emphasis on establishing preventive services (e.g., immunizations and screening tests) in the primary care setting. Since that time, HEDIS has grown to include additional programs related to disease management and the protection of human research test subjects.[567]

3.8.1.3.4 Accreditation Association for Ambulatory Health Care (AAAHC) Founded in 1979, the *Accreditation Association for Ambulatory Health Care* (AAAHC) has evaluated thousands of organizations, including *federally qualified health centers* (FQHCs), *office-based surgery* centers, and ASCs. In April 2012, the AAAHC announced a new hospital accreditation program to be offered through the independently operated and governed *Accreditation Association for Hospital/Health Systems, Inc.* (AAHHS).[568] Set to launch as a pilot program, it will limit its scope to small hospitals located in rural, suburban, and urban settings. The AAHHS program has attempted to distinguish itself from other accreditation organizations by stating that it takes a more "*consultative*" approach, rather than a "*punitive*" one.[569]

3.8.1.4 Emergency Medical Treatment and Active Labor Act (EMTALA) The Emergency Medical Treatment and Labor Act (EMTALA) was enacted in 1986 by the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA '85) and requires "covered hospitals" that participate in the Medicare program and have an emergency room to provide a "medical screening" to any patient coming to the hospital's emergency department.[570] In addition, EMTALA

provides for civil penalties against the hospital for noncompliance, and if anyone suffers harm as a "direct result" of a hospital's violation of EMTALA, he or she can bring a claim against the hospital.[571] While EMTALA does not require hospitals to have an emergency department, some specialty/surgical hospitals are required by state licensure laws to have an emergency department for participation in the Medicare program.[572]

3.8.1.5 Occupancy Regulations In order for a healthcare facility or any new building to be operational, it must pass a building inspection by a licensing agency in order to secure a *certificate of occupancy* (CO) from the local municipal government.[573] In some circumstances, local authorities may grant waivers or vary the rules if (1) strict enforcement causes an "*undue hardship*" for the healthcare provider, (2) the rules are so complex that they begin to conflict with one another as applied, (3) the public purpose would be better served, or (4) a waiver would allow for experimentation with innovative practices.[574]

In recent years, healthcare facility occupancy regulations have shifted in focus from the "*well-established" building safety regulation*s to those regulations aimed at preventing infection. The *National Fire Protection Association* reported in 2009 that hospital fires—most in cooking and laundry areas—resulted in only five patient deaths since 2004.[575] Yet the CDC reported in 2009 that 4.5 percent of all hospital inpatients suffered a *healthcare associated infection* (HAI), with associated costs of approximately $6.65 billion in 2007.[576] In an effort to combat this problem, healthcare

Erickson, "The Lean Approach to

facility designs have begun taking into account the *infection control risk assessment* (ICRA) *process* to focus on prevention when designing the *environment of care* (EoC) at the given healthcare facility.[577] Supported by the *Facility Guidelines Institute*, the most important design elements to reduce *HAIs* have been shown to be *single-occupancy patient rooms* and *better ventilation* in operating and patient rooms.[578] Other design elements include redesigning restrooms to improve hand hygiene and waste management.[579]

In addition to municipal occupancy permits, healthcare facilities must meet the requirements of the *National Fire Protection Association's Life Safety Code* (LSC) in order to comply with Medicare's *Conditions of Participation*. In a December 17, 2010, letter to *State Survey Agency Director*s, CMS clarified the applicable LSC *occupancy classifications* for healthcare entities.[580] To satisfy the LSC requirements, any hospital must be classified as a *Health Care Occupancy* facility. Facilities falling under this classification are required to (1) provide sleeping accommodations, (2) maintain the availability of medical treatment on a 24-hour basis, and ensure that patients are *mostly incapable* of self-preservation. An *Ambulatory Health Care Occupancy* clarification applies to a facility, or a portion thereof, used to provide ambulatory healthcare services to at least four patients who are *mostly incapable* of self-preservation. An *Ambulatory Health Care Occupancy* facility does not provide sleeping accommodations, nor does it provide healthcare services on a 24-hour basis; however, it must provide anesthesia services. A *Business Occupancy* classification is similar in nature to an *Ambulatory Health Care Occupancy* classification, but the facility does not provide anesthesia services, and the patients treated in *Business Occupancy* facilities are *mostly capable* of self-preservation.[581]

[581] Ibid.

In addition to certain healthcare provider occupancy requirements, local municipalities and counties have the authority to regulate healthcare facility development through zoning and planning laws. Most municipalities have complex zoning programs in place, dictating how land can be used.[582] The municipality may also prohibit certain land uses within its boundaries.[583]

3.8.2 Healthcare Professionals

The practice of medicine within the U.S. healthcare delivery system has historically been viewed as a learned profession, where physicians were perceived as professionals who applied significant training and knowledge to provide quality patient care from within their independent practice "*silos*." However, the recent shift from small, physician-owned, independent private practices to *captive* practices with multiple provider affiliations within larger integrated health systems has been yet another step toward the "*corporatization*" of healthcare, resulting in a new paradigm for healthcare delivery that promotes a managed "*continuum of care*," across a spectrum of providers.[584] This shift toward the further *corporatization* of medicine has led to the development of an increasing array of federal and state laws that regulate the scope of services physicians are permitted to provide.

3.8.2.1 Scope of Practice A physician's scope of practice is typically limited by state *credentialing* and *licensing* regulations, as well as by *specialty board certification* requirements. The unique aspects and distinctions between the types of regulatory oversight governing physicians' scope of practice will be discussed next.

3.8.2.2 Licensure *Every state and the District of Columbia require licensure of all allopathic (M.D.) and osteopathic (D.O.)* physicians.[585] Although the

specific criteria for licensure vary by state, each state requires candidates to submit proof of completion of the requisite number of years of *graduate medical education* and passage of examinations verifying that "the physician is ready and able to practice competently and safely in an independent setting."[586]

A physician applying for licensure is typically found to be of "*good moral character*" absent his or her involvement in illegal activities.[587] Most physicians satisfy the exam requirement by submitting proof of their successful completion of the *United States Medical Licensing Examination* (*USMLE*) or the *Comprehensive Osteopathic Medical Licensing Examination* (*COMLEX-USA*) to the licensure board.[588] However, as some practicing physicians may have been licensed under a previously administered exam, certain state licensing boards may consider a combination of other examinations sufficient to meet licensure requirements, so long as those exams were completed prior to 2000.[589]

As part of the *Health Care Quality Improvement Act of 1986*, Congress established the *National Practitioner Data Bank* to improve the availability of information obtained during the peer review process.[590] HHS is responsible for overseeing the *National Practitioner Data Bank* system and requires state medical and dental licensing boards to report *disciplinary action* taken against a licensed professional in regard to his or her professional competence and professional conduct.[591] Hospitals are also required to periodically check the status of the database for each member of their medical staff. The general public does not currently have access to the data bank.[592]

HEALTH CARE QUALITY IMPROVEMENT ACT OF 1986

Among other things, it established the National Practitioner Data Bank to improve the availability of information obtained during the peer review process.

"Title IV of Public Law 99–660: The Health Care Quality Improvement Act of 1986."

In addition to physician *licensure* requirements, all states mandate the *licensure* of dentists, registered nurses, practical nurses, and pharmacists.[593] Frequently, physical therapists, dental hygienists, physicians' assistants, midwives, psychologists, social workers, opticians, physical therapy assistants, audiologists, speech pathologists, optometrists, podiatrists, chiropractors, and nursing home administrators are also subject to *state licensure laws*.[594] As with physician licensure regulation, state rules vary on *licensure requirements* for these professions.

Technological advances during the last few decades have resulted in a greater amount of specialization in the healthcare workforce.[595] Accompanying this rise in specialization is the development of new categories of providers, for example, hospitalists.[596] The creation of these specialties has been mirrored by a rise in various professional medical associations, which have created their own systems for *credentialing* specialists.[597] Although *certification requirements* vary by medical specialty, these requirements typically

include additional educational attainment, examinations, and work experience.[598] Unlike a state licensure board, a *professional association* cannot bar a licensed physician from practicing in a particular specialty for failing to obtain *board certification*, although board certification is viewed favorably by hospitals and healthcare providers as an indicator of a provider's competence.[599]

3.8.2.2.1 Board Certification Physicians can seek specialty *certification* through the *American Board of Medical Specialties* (*ABMS*), an organization of 24 approved medical specialty boards.[600] As specialization took hold in the early and mid-1900s (ophthalmology being the first in 1917), medical professionals began to self-regulate the profession by forming boards to establish *standards of practice*.[601] Established in 1933, the ABMS certifies physicians in more than 150 general specialties and subspecialties, ensuring that they have completed the requisite training programs necessary for their areas of expertise, and that they can demonstrate competence in their specialties or subspecialties through a board-executed *evaluation*.[602] While *board certification* is not required of U.S. physicians in order to practice their chosen specialty, it has become the "*gold standard*" for demonstrating expertise and commitment in their field to patients, providers, insurance companies, and quality organizations across the nation.[603]

In 2000, the 24 member specialty boards of the ABMS agreed to a universal recertification program for all medical specialties, the *ABMC Maintenance of Certification* (*MOC*), which was formally approved in 2006. The MOC evaluates physician expertise in six core competencies: (1) patient care, (2) interpersonal and communication skills, (3) medical knowledge, (4) practice-based learning, (5) systems-based practice, and (6) professionalism, which are measured using a four-part process.[604] In 2010, some U.S.

physicians began facing the necessity of taking *board recertification exams*. In the past, physicians were issued lifetime certification without renewal requirements; however, in recent years, the member boards of the ABMS have begun instituting a *continuing education and recertification program*, requiring that certified physicians renew their certification every 6 to 10 years.[605] While some subspecialty boards began issuing time-limited certification as early as the late 1980s, others did not implement such certification limits until much later.[606]

Doctors of Osteopathy seek board certification through 1 of 18 specialty boards approved by the AOA.[607] Once an osteopathic physician has acquired *primary certification*, he or she may seek *subspecialty certification* as well. Under *Resolution 56: Certification Eligibility for ABMS-Certified D.O.s*, the following eligibility criteria must be met:

1. Certification by the ABMS;
2. Completion of residency training prior to submitting an application;
3. Good standing as an AOA member; and
4. Maintenance of specified continuing medical education (CME) requirements.[608]

As communication and diagnostic technologies continue to advance, the trend of *telemedicine* has become increasingly prevalent (see Chapter 5, "Technology"). *Telemedicine* refers to the transfer of medical information via electronic communication from one location to another to enhance the quality and efficiency of patient comfort and care.[609] Instead of practicing at

a *fixed location*, physicians are able to confer with colleagues, read patient charts and diagnostic images, and even meet with patients, all from a *remote location*. *Licensing* and *accreditation* requirements may present obstacles to *telemedicine* implementation. Depending on state licensing rules, practitioners using interstate *telemedicine* may have to obtain licenses in each state in which they treat patients. State *licensure laws* generally have some exceptions for the provision *interstate telemedicine*, such as *reciprocal licensure provisions*, which allows for a *mutual exchange of privileges between states*.[610] Additional regulatory concerns may arise as *telemedicine* falls under both the scope of the *Joint Commission's accreditation* standards and CMS *credentialing* requirements.[611]

On May 5, 2011, CMS issued a final rule on telemedicine *credentialing* and *privileging* that may help facilitate implementation of innovative medicine at non-urban hospitals. Under the newly established rule, effective July 5, 2011, CMS will allow *privileges and credentialing reciprocity* between an institution where a physician seeks to provide *telemedicine* services to Medicare and Medicaid patients and the hospital where a physician is already privileged.[612] To circumvent the more cumbersome *Conditions of Participation* previously required, hospitals seeking to provide telemedicine to their patients may simply form an agreement with the remote-site hospital.[613] This streamlined process may potentially lessen the challenges faced by rural hospitals in physician credentialing and may enable quicker and better access to care.

3.8.2.2.2 Nonphysician Scope of Practice The physician shortage, paired with declining reimbursement rates, has fueled demand for physician manpower relief (see Chapter 6, "Healthcare Reform"). To meet this demand,

the healthcare workforce has continued to diversify, with versatility no longer limited to the *horizontal* expansion of specialty and subspecialty areas of medical expertise. Rather, current trends have solicited a *vertical* expansion in the role of the *nonphysician workforce* to provide services that *support, supplement, and parallel physician services*.[614]

Traditionally, nonphysician providers (NPPs) were referred to, collectively, as "*allied health professionals.*"[615] However, NPPs have assumed multiple roles in the provision of healthcare services. They may work *synergistically with* physicians, *supplemental to* physicians for the provision of select services, or in *parallel to* physicians for the provision of services that, though comparable to physician services, are entirely outside the scope of physician practice. (See Chapter 4, "Competition.") As such, NPPs may be further classified into three categories based on the *types of services* they provide:

1. *Technicians and Paraprofessionals* (*a/k/a "Physician extenders"*), who provide either manpower support or highly technical services, both necessary for and contingent on the provision of certain specialized physician services;
2. *Allied Health Professionals* (*a/k/a "Parallel providers"*), whose scope of professional practice is separate, distinct, and essentially parallel to the scope of physician practice; and
3. *Mid-Level Providers* (*a/k/a "Triage providers"*), who are trained to provide a specific subset of physician services, with the *original* objective of providing "*triage*" relief for physicians by enhancing patient throughput.[616] *Mid-Level Providers* are afforded a significant level of *autonomy* within their scope of practice, and as such, they may act alongside—or independent of—physicians under certain conditions for the provision of previously determined services.

The most predominant regulatory question pending for mid-level providers is *the level of physician supervision* mandated by federal and state law. Regulations governing the supervision and *scope of mid-level providers* differ by state, specialty, practice setting, and the provider's role in the

provision of care. For example, federal Medicare rules and state laws overlap, so *Certified Registered Nurse Anesthetists* (*CRNAs*) are authorized to administer anesthesia, without supervision, to Medicare patients if a state's governor petitions CMS on the basis of state need.[617]

Incident-to services are defined as services provided by qualified NPPs that are integral to, and continuous with, the services provided by the primary/supervising physician.[618] While mid-level providers are relied on for the provision of specialized services that are *incident to* physician services, they may also exercise a certain measure of *independence*, because they can autonomously provide a specified scope of service *in lieu* of physicians. Services billed under Medicare *incident-to* rules include those services provided by an NPP without the direct supervision of a licensed physician, regardless of specialty or whether the NPP was the primary service provider.[619] Furthermore, Medicare allows physicians to bill for *incident-to* services provided by NPPs at 100 percent of the *Physician Fee Schedule*.

Some NPPs, that is, physician assistants, nurse practitioners, and clinical nurse specialists, are generally permitted to act as independent contractors and bill directly for their services at 85 percent of the *Physician Fee Schedule* amount when working *in lieu* of a physician-collaborator.[620] The autonomy afforded to these and other mid-level providers has even expanded to include supervision of other NPPs *in lieu* of physician supervision.[621] Under the January 2010 update of the *Hospital Outpatient Prospective Payment System Final Rule*, outpatient therapeutic services provided in a hospital setting may be directly supervised by certain NPPs, that is, clinical psychologists, physician assistants, nurse practitioners, clinical nurse specialists, and certified nurse midwives, who are permitted to provide direct supervision *in lieu* of physicians if they are *authorized to personally perform* the services they are overseeing.[622]

[622] Ibid.

3.8.2.3 Tort Reform Malpractice, defined as "professional misconduct or unreasonable lack of skill," has always been a risk inherent in the practice of medicine.[623] As malpractice litigation has increased since the 1970s, physicians have been forced to pay higher premiums for malpractice insurance, which in turn has contributed, it is thought, to increases in the cost of healthcare services.[624]

Though medical malpractice law has traditionally been regulated at the state level, the federal government has taken an interest in tort reform. While there have been efforts at federal tort reform, a *federal cap* on damages has yet to be signed into law. Despite this lack of regulation at a federal level, many states have caps already in place.[625] Such caps, often modeled after California's *Medical Injury Compensation Reform Act* (*MICRA*), place limits on pain and suffering awards to plaintiffs.[626] As of

Factoid

Tort reform proponents have alleged that the United States has the most expensive tort system in the world.

MEDICAL INJURY COMPENSATION REFORM ACT (MICRA)

California legislation that caps pain and suffering/malpractice damages.

"Cal. Civ. Code," § 3333.2.

2011, 38 jurisdictions had passed laws that place concrete limits, or caps, on noneconomic and/or punitive damages in medical malpractice suits. Other states (e.g., Connecticut and Minnesota) allow for judicial review of the damage awarded, rather than specifying a particular limit or cap. Of the 14 jurisdictions that do not place caps on damages, 5 have determined such caps to be unconstitutional.[627] Additional tort reform proposals include shifting *tribunals* from *judicial* to *administrative panels* and/or the creation of *federal safe harbors* for physicians who practice in accordance with credible comparative-effectiveness research.[628] Furthermore, some insurance companies are experimenting with *disclosure-and-offer programs*, in which providers offer compensation to patients immediately on disclosure of a negative outcome, with the hope of reducing the number of malpractice lawsuits.[629]

3.9 CONCLUSION

> *Perhaps this complex, hybrid regulatory structure has emerged because it fits America's temperament. It may, in fact, be the only kind with which the country would be truly comfortable. The decentralization and complexity of health care regulation are distinctively American in the interplay of layers of government, different agencies within each level, and private forces. It is a system of checks and balances that prevents any single regulatory authority*

[627] National Conference of State Legislatures, "Medical Liability/Malpractice Laws," September 4, 2009, http://www.ncsl.org/issues-research/banking/medical-liability-medical-malpractice-laws.aspx (accessed August 3, 2011).

[629] Ibid.

> *from becoming too influential and that encourages diversity in programs and approaches. There is almost a "marketplace" of regulation, with a competitive harness that disciplines government policy in a similar manner to the discipline of a private market for goods and services. The system is unquestionably less efficient than one that is more centralized, but perhaps the inefficiency has its advantages. It may even enhance overall regulatory effectiveness.*[630]
>
> —Robert I. Field

In his 1982 book *The Social Transformation of American Medicine*, Paul Starr asserted that the *once sovereign medical profession* (at the turn of the twentieth century) was relatively free from government regulation of the profession's control over its organization, standard of practice, and the markets in which it operated. More recently, the rise of the "*corporatization of medicine*" has led to "[e]mployers and the government becom[ing] critical intermediaries in the system because of their financial role, and they are using their power to reorient the system."[631]

Arising from the *corporatization* of the U.S. healthcare delivery system, the ever-changing regulatory environment in which healthcare enterprises and providers operate presents the potential for severe penalties for entering into transactions and arrangements that may subsequently be found to be legally impermissible. In light of this heightened regulatory environment, healthcare providers should work closely and in a timely manner with competent healthcare legal counsel and certified valuation professionals to ensure that the prospective transactional arrangementsare in compliance with current laws and meet applicable regulatory thresholds. In addition to obtaining a determination that the transaction has met the requisite tax, corporate, organizational, licensure, and certification requirements, a certified opinion prepared in compliance with professional standards by an independent credential valuation professional (under the advice of legal counsel), and supported by adequate documentation as to whether each of the proposed elements of the transaction are both at *Fair Market Value* and *commercially reasonable* will significantly enhance the efforts of healthcare providers in establishing a risk-adverse, defensible position that the transactional arrangement is in compliance, in the event that it faces regulatory scrutiny.

CHAPTER 4

Competition

4.1 OVERVIEW

The potential benefits and costs of free market competition within the healthcare arena have been, and will continue to be, the focus of intense debate. Those who advocate market competition in healthcare stress numerous benefits, which include reduced costs, increased quality, improved efficiencies,

and an incentive to innovate. Those who oppose competition in healthcare argue that unique differences exist between healthcare provider and payor markets and the markets for other industry sectors, thus cautioning against the use of basic, and broadly applied, economic models when drawing conclusions concerning improving the healthcare delivery system.

In recent years, consumer-driven healthcare has increased due to the shift away from *defined benefits* to *defined contributions* of premium coverage plans, where more of the responsibility for premium payment is placed directly on the insured patients (see Section 2.5.2.3, "Consumer-Driven Health Plans," in Chapter 2, "Reimbursement Environment"). The resulting economic pressures from this new paradigm have been accompanied by greater direct-to-consumer advertising by providers, as well as by pharmaceutical companies.[1] As a result of soaring healthcare costs, with limited perceived improvements in the quality of care provided, economists and policy makers have advocated for a more standardized care process in which the patient is relegated to the role of a *consumer* and the physician is relegated to the role of the *provider* of healthcare services.[2] Other policy experts and physicians have decried the new consumer-driven aspects of healthcare delivery, which they believe removes the more traditional, humanistic elements from the *learned physician*/patient trust relationship.[3]

The debate regarding the importance of consumer-driven healthcare is further complicated by those unique characteristics of the healthcare industry that hinder the traditional notion of economic behavior. For example, as the relationship between price and quality of care is generally defined by providers, rather than by consumers, patients are less equipped to make informed healthcare purchase decisions in comparison to other markets. Further, the healthcare market's intensive regulation of medical professionals and historical and heretofore pervasive resistance to transparency and disclosure, as well as new facilities, technologies, treatments, and evolving drug therapies, may delay or disable the development of alternative substitutes of care. In addition to accentuating the knowledge imbalance between *patients* and *providers* as to the types of service needed and available alternatives, delays in the development of

substitutes may also stymie innovation, which is one of the *fundamental drivers* of quality improvement and affects an organization's ability to compete.[4]

The last two decades have seen the accelerated transformation of the U.S. healthcare professions into a service *industry* enterprise, whereby health services have been *unitized*, *protocolized*, and *homogenized*, in order to facilitate their *sale* in the market, just as if they were any other fungible market commodity, for example, soybeans and pork bellies. These changes have accelerated the "*corporatization*" of medicine, as demonstrated by the increase in for-profit hospitals, outpatient/ambulatory facilities (e.g., *independent diagnostic testing facilities* [*IDTF*] and *ambulatory surgery centers* [*ASC*]) and large for-profit health insurance payors.

Several issues brought healthcare to the forefront of both consumer and political discourse, which led to the passage of the 2010 *Patient Protection and Affordable Care Act* (*ACA*), including the persistent disproportionate rise in the cost of healthcare, the perceived disproportionate breakdown of healthcare costs across industry segments, the socioeconomic disparities in access and quality, the falling rank of U.S. health status as compared to other developed nations, and the perceived threats of budget deficits and national debt related to the cost of care for a baby-boomer generation now becoming eligible for Medicare.[5]

The ACA has several provisions to address these concerns, including the development of new emerging healthcare organizations (EHOs) and healthcare delivery models, for example, *accountable care organizations* (*ACOs*) and *patient-centered medical homes* (*PCMHs*), with the goal of improving quality, while reducing cost, by providing for better communication and collaboration among providers within patients' continuum of care. Other ACA provisions that will likely affect competition in the healthcare marketplace

Ambulatory Surgery Center (ASC)

A freestanding facility that is certified by Medicare that performs certain types of same-day procedures on an outpatient basis without hospitalization.

Dictionary of Health Insurance and Managed Care *by David Marcinko (New York: Springer, 2006), p. 22.*

Emerging Healthcare Organization (EHO)

Physicians, hospitals, healthcare systems, clinics, and payors who are innovating, integrating, or merging because of the constant competitive influx of the healthcare industry.

A Guide to Consulting Services for Emerging Healthcare Organizations *by Robert James Cimasi (New York: John Wiley & Sons, 1999).*

Health Insurance Exchange (HIE)

"Public markets" for health insurance plans available within a state.

"Explaining Health Care Reform: What Are Health Insurance Exchanges?" Kaiser Family Foundation, May 2009.

Patient Centered Medical Home (PCMH)

A model of healthcare delivery that approaches the delivery of services through coordinated, centralized patient care, with an emphasis on the primary care physician as the manager of a beneficiary's care.

"Joint Principles of the Patient-Centered Medical Home," American Academy of Family Physicians, American Academy of Pediatrics, American College of Physicians, and American Osteopathic Association, February 2007.

Patient Protection and Affordable Care Act (ACA)

Landmark U.S. healthcare reform legislation passed on March 23, 2010.

Patient Protection and Affordable Care Act, Pub. L. *111-148 (March 23, 2010).*

VALUE-BASED PURCHASING (VBP)

Any reimbursement model that links reimbursement or incentive bonus payments to quality of care.

"Lessons from Medicare's Demonstration Projects on Disease Management, Care Coordination and Value-based Payment," by Lyle Nelson, Congressional Budget Office, January 2012, p. 1.

"CORPORATIZATION" OF MEDICINE

The transformation of vertically organized bureaucracies into government-owned corporations that are exposed to marketlike pressures. In healthcare this means the establishment of publically owned hospitals as private corporations. Corporatization is usually seen along with autonomization.

"Understanding Organizational Reforms: The Corporatization of Public Hospitals," by April Harding and Alexander S. Preker, in "Health, Nutrition, and Population," World Bank, September 2000, pp. vii, 15.

include those establishing *health insurance exchanges* (*HIEs*) and various *value-based purchasing* (*VBP*) initiatives.[6]

4.2 ECONOMICS OF HEALTHCARE

4.2.1 Healthcare Costs and the Gross Domestic Product (GDP)

Healthcare costs are not just rising but are growing disproportionately to the rise in the cost of other goods and services in the U.S. economy.[7] The percentage of the gross domestic product (GDP) devoted to healthcare services grew from 5.2 percent in 1960 to 17.9 percent in 2011 and is projected to surpass 20 percent by 2018.[8] While there are many causes

[6] Ibid.

[8] "Table 1: National Health Expenditures Aggregate, Per Capita Amounts, Percent Distribution, and Average Annual Percent Change: Selected Calendar Years 1960–2010," in *National Health Expenditures Data*, Centers for Medicare and Medicaid Services, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/tables.pdf (accessed June 25, 2012); Centers for Medicare and Medicaid Services, "National Health Expenditure Projections 2011–2021," January 2012, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/Proj2011PDF.pdf (accessed June 25, 2012).

for the disproportionate growth between healthcare spending and the GDP (resulting in the higher percentage of the GDP being associated with healthcare costs), it should be noted that the discrepancy may be caused, in part, by the most recent economic recession, which started in 2008 and had a greater impact on the GDP than the discernibly lesser impact on healthcare spending.[9]

Some economists have cited the aging population as a reason for the increase in healthcare's share of the GDP.[10] In reality, the rise in healthcare expenditures is, at least in large part, the result of much deeper economic forces. As economist William J. Baumol explains, "[T]he relative increase in healthcare costs compared with the rest of the economy is [an] inevitable and ineradicable part of a developed economy. The attempt [to control relative costs] may be as foolhardy as it is impossible."[11] Baumol's observation is based on documented and significant differences in productivity growth between the healthcare sector of the economy and the economy as a whole.

Factoid

The percentage of the gross domestic product (GDP) devoted to healthcare services grew from 5.2 percent in 1960 to 17.9 percent in 2011, and is projected to surpass 20 percent by 2018.

Gross Domestic Product (GDP)

A measure of the total flow of goods and services produced by the economy over a specified time period (e.g., one year), calculated using an aggregate value of the outputs of goods and services used for final consumption or investment.

The American Dictionary of Economics, *3rd ed., by Douglas A. L. Auld, et al., (New York: Facts on File, 1983).*

4.2.2 Productivity Growth Rates of Healthcare Services

Documented and significant differences exist in productivity growth between the healthcare sector of the U.S. economy and the U.S. economy as a whole, with three predominant explanations as to why healthcare services experience significantly lower productivity growth rates, compared to other industry sectors.

First, because healthcare services are inherently resistant to automation, innovation (in the form of technological advancement) has not made the same impact on healthcare productivity as it has in other industry sectors of the economy. The manufacturing assembly line increases productivity by accelerating the process and by reducing labor input. Generally speaking, many healthcare providers cannot (and, most would agree, should not) try to operate as mass assemblage factories, because patients are each unique and disease is widely variable and, as such, cannot be readily adapted in order to achieve the productivity gains and efficiency derived from mass production techniques. In contrast, most healthcare delivery services are still applied in a labor-intensive process, that is, patients are cared for one at a time, and ill patients cannot be disposed of as routine work product error in the way automated factories can regularly accept the rejection of a percentage of defective items, under the concept of statistical process quality control, as the mere (and unavoidable) expected cost of manufacturing.

Second, unlike more labor-intensive industries, healthcare is complicated and local in nature and cannot be delegated to less expensive unskilled workers in foreign labor markets. Although advances in technology (especially in telehealth and medical tourism) have widened the geographic scope of access to healthcare services, most are still largely provided by skilled workers within the local market who are compensated at relatively higher

levels.[12] U.S. healthcare organizations must compete within a local community for high-quality skilled workers at a higher cost.

Third, in mass production, while the number of skilled, highly educated man-hours per unit is not a perceived predictor of product quality, in healthcare, consumers believe that quality is correlated with the amount of physician labor expended in providing an associated service, for example, the length of a physician/patient encounter.[13]

Since healthcare productivity grows at a slower rate than other industries, the higher *relative* costs for healthcare services pose a serious consequence, even though that circumstance is an inevitable and ineradicable part of a developed economy. For example, as technological advancements increased productivity in the computer manufacturing industry, wages for computer industry labor likewise increased. However, the *total cost* per computer produced actually declined. But in healthcare (where technological advancements do not currently have the same impact on the rate of growth of productivity), wage increases that would be consistent with other sectors of the economy yield a problem, that is, the cost per unit of healthcare produced increases, resulting in healthcare's share of the U.S. GDP growing, relative to other industry sectors, which have experienced greater productivity (see earlier discussion).

Despite slow productivity growth and the continually rising percentage of GDP spent on healthcare, Baumol noted that growth in other areas of the economy may be used to offset the relative growth in costs seen within the healthcare sector, to wit:

> *[P]roductivity growth in the entire economy means we can afford more of everything. In an economy in which productivity is growing in almost every sector and declining in none . . . consumers can have more of every good and service; they simply have to transfer gains from the sector that's becoming more productive into the sector that's only becoming a little more productive.*[14]

Escarse, "The Effect of Health Care Cost Growth on the U.S. Economy," Office of the Assistant Secretary for Planning and Evaluation, U.S. Department of Health and Human Services, September 2007, pp. 6, 9, 15, 22.

[13] William J. Baumol, "Do Health Care Costs Matter?" *New Republic*, November 22, 1993, p. 17.

[14] Ibid.

Factoid

Three reasons the healthcare sector is different from the rest of the U.S. economy:

1. Innovation does not impact healthcare productivity as it does in other industry sectors;
2. Skilled healthcare labor cannot be delegated to less expensive unskilled workers in foreign labor markets; and,
3. Unlike mass production, healthcare consumers believe that quality is correlated with the amount of physician labor expended, unlike mass production.

"A Checkup on Health Care Markets," by Patricia E. Powers and Michael W. Painter, Robert Wood Johnson Foundation, 2007, p. 2; "The Effect of Health Care Cost Growth on the U.S. Economy," by Neeraj Sood, Arkadipta Ghosh, and Jose J. Escarse, Office of the Assistant Secretary for Planning and Evaluation, U.S. Department of Health and Human Services, Washington, DC, September 2007, p. 6, 9, 15, 22; "Do Health Care Costs Matter?" by William J. Baumol, New Republic *(November 1993): 17.*

Therefore, Baumol posits that if the U.S. society deems health to be important, then its employers and governments must be willing to adopt policies that share productivity gains in other sectors with healthcare providers. Businesses cannot take increasing profits and governments cannot take burgeoning taxes from a growing, technologically efficient economy and expect healthcare services to survive at acceptable levels of quality and access. This economic theory has been implemented through several provisions of the ACA and other policies that affect the supply of, and demand for, healthcare services.

4.3 SUPPLY AND DEMAND IN HEALTHCARE

4.3.1 Healthcare Model

Historically, healthcare was considered a "*special*" economic market, where quality of care was perceived as more important than general economic notions of supply and demand. Competitive market theory, which considers quality as only one element of a good or a service, inherently conflicts with the traditional perspectives of providers and policy experts, who see quality

as "an irreducible minimum standard, to be determined by physicians without reference to cost."[15] Prior to the mid-twentieth century, healthcare was dominated by groups of providers who attempted to justify anticompetitive behavior under the guise of quality control, for example, restrictions by the American Medical Association (AMA) on chiropractors.[16] Soon afterward, debates over competitive policy became more strident in addressing anticompetitive behavior among provider segments. Subsequent laws regulating competition (e.g., antitrust law—see Section 3.4.1, "Antitrust Regulations," in Chapter 3, "Regulatory Environment") have recently begun to focus more on the healthcare industry directly.[17]

The traditional notion of the "*three-legged stool*" model of healthcare, under which cost, quality, and access are considered distinct elements of healthcare administration, has with the impact of new regulations now been shown to be interconnected, with price having a direct impact on quality of care. The laws regulating healthcare delivery system competition have been used to combat the practice of increasing prices above competitive levels, as well as to prevent providers from blocking new market entrant competitors from the market in the pursuit of "*higher quality of care.*"[18] (See Section 3.4.1, "Antitrust Regulations," in Chapter 3, "Regulatory Environment," and Section 4.4.2, "The Bargaining Power of Suppliers.")

Also unique to the healthcare sector is the widespread practice of healthcare providers supplying services irrespective of the "*client's*" ability to pay. Under laws such as the *Emergency Medical Treatment and Labor Act* (*EMTALA*), general hospital emergency departments are required to provide stabilizing care, even to patients who are uninsured and unable to pay for services rendered.[19] In addition, federal and state programs (which account for nearly 60 percent of hospital revenue) typically reimburse

providers for only a fraction of the cost of those services, which is not a cost/price relationship experienced in other industries.[20]

4.3.2 Supply-Side

Contributing to the complexity of competition within the healthcare market is that the healthcare industry does not display the traditional relationship between supply and demand. Major *private payor* healthcare industry *suppliers*, encompassing the largest percentage of market power, are private insurance companies and large hospital systems. Insurance companies are able to limit access to services through the use of provider networks, for example, health maintenance organizations (HMOs) and preferred provider organizations (PPOs). In contrast to payors, hospitals and physician providers are incentivized to both keep costs low and maximize those services that offer the highest reimbursement yield.[21] HMOs and PPOs have sought to

[20] Stuart H. Altman, David Shactman, and Efrat Eilat, "Could U.S. Hospitals Go the Way of U.S. Airlines?" *Health Affairs* 25, no. 1 (January/February 2006): 14.

[21] Michael E. Porter and Elizabeth Olmsted Teisberg, "Redefining Competition in Health Care," *Harvard Business Review* (June 2004): 3.

combine the roles of insurance companies, utilization review organizations, and healthcare providers in order to offer prepaid medical plans to subscribers. *Primary care physicians* practicing within an HMO or a PPO are often relied on to act as a "*gatekeeper*" in order to restrict access to, and utilization of, services in order to contain costs.

Cost containment has continued to affect the way in which healthcare is delivered today, and current reform efforts tie reimbursement to cost and quality metrics. For example, bundled payment initiatives are designed to "align the incentives for both hospitals and physicians, leading to better quality and greater efficiency in the care that is delivered."[22] (See Section 2.7.1.1.1, "Bundled Payments," in Chapter 2, "Reimbursement Environment.") Public and private payors have implemented bundling into provider reimbursement models.

Payors operate as both *suppliers* and *consumers* of healthcare services by supplying insurance and paying for the services provided and deferring the direct payment of that cost from the patient.[23] On this side of the equation, large insurance companies have been able to enjoy *monopsony* (i.e., one buyer, many sellers) power in the United States, which has allowed them to demand "*Most Favored Nation*" status in their contracts with providers; that is, the provider contractually charges the insurance company the same as (or less than) any other customer.[24] This provision has allowed insurance companies to prevent competitors from entering the market and, combined with numerous insurance company mergers, has led to a highly concentrated U.S. medical insurance market, which reimburses providers at lower rates. This results in significant fiscal stress for physician groups and small hospitals, driving them out of business or forcing them to join large hospital system conglomerations.[25]

Conversely, private payors have stated that due to increasing hospital leverage, they are often unable to contain rate increases, which in turn are

passed along to employers in the form of premium increases.[26] Despite the potential to raise premiums, most of the consolidation occurring in healthcare markets will likely avoid scrutiny under antitrust regulations, because many mergers take place over broad geographic areas and do not result in excessive market concentration as it has been defined, to date, by the Federal Trade Commission (FTC) and the Department of Justice (DOJ).[27] Several factors beyond mergers and acquisitions can contribute to hospitals' increased market power.[28] For example, a hospital's brand recognition or its ability to provide a specialized service confers significant leverage in negotiations with private payors.[29] With respect to multihospital systems, the ability to negotiate a single contract on behalf of all of the facilities allows systems to bargain for higher reimbursement rates.[30]

Many community hospitals are asserting that it is increasingly difficult to cost shift and cross-subsidize more expensive and less remunerative courses of treatment, due to competition from specialty providers and increased demands for price transparency by consumers.[31] Decreasing reimbursement yields that have limited hospitals' revenue streams, as well as difficulties in gaining access to capital to support the provision of money-losing services, are among the reasons that many smaller hospital systems have decided to consolidate with larger, for-profit systems.[32] By merging with larger health systems, *smaller hospitals* may be able to maintain viable margins, by increasing efficiency and lowering costs, and may more easily address their capital requirements. In addition, these mergers may help *larger*

health systems reduce costs through economies of scale, care coordination, and consolidation.[33] The acquisition of other hospitals and physician group practices confers significant leverage to the acquiring hospitals when they are negotiating rates with private payors.[34] Hospital expansion through mergers and acquisitions of physician practices is further discussed in Section 4.6.4, "Provider Consolidation."

Within the current trend in hospital growth, hospitals have developed a new method for securing revenue that may result in disparities in the supply of providers. In what has been termed the "*geographic expansion race*," U.S. hospitals have begun employing new strategies to expand their market presence and compete for valuable insured patients.[35] In a 14-year study of 12 healthcare markets, the Center for Studying Health System Change observed facility growth in large metropolitan areas, analyzing the different expansion strategies employed and the market composition that resulted.[36] Though the study acknowledges it is likely too early to predict the impact that hospitals' geographic expansion will have on access, quality, and costs, others in the industry have both praised and sharply criticized this new trend for its anticipated effects.[37]

In order to target well-insured patients during geographic expansion, hospitals are increasingly using one or more expansion strategies, including acquiring existing full-service hospitals or constructing new ones, building freestanding emergency departments, building ambulatory care facilities,

Preferred Provider Organization (PPO)

The PPO, a hybrid of an HMO and traditional health insurance plan, is a managed care plan that allows members to choose from an array of healthcare providers that have contracted with the plan to provide services on a discounted basis.

"Introduction to Healthcare Finance," by Louis C. Gapenski, in Louis C. Gapenski, ed., Healthcare Finance: An Introduction to Accounting and Financial Management, *3rd ed. (Chicago: Health Administration Press/Association of University Programs in Health Administration, 2004), p. 38; "Private Health Insurance and Managed Care," by Alma Koch, in Stephen Joseph Williams, Paul and Roger Torrens, eds.* Introduction to Health Services, *7th ed. (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 124.*

and strengthening relationships with emergency medical transport systems or operating their own transport services. Though hospitals offer efficiency and quality justifications for these expansion methods, others in the healthcare industry assert that these strategies pose the potential to raise costs, reduce quality, and eliminate some patients' access to care.[38] The addition of locations may encourage overutilization of services, and quality of care may be diminished as a result. Furthermore, patients in lower-income communities may not experience any improvement in access to care, as resources continue to be invested elsewhere and hospitals abandon struggling facilities, despite considerations of community need, in favor of more profitable ventures.[39]

Monopsony

"MOST FAVORED NATION" STATUS

The provider contractually agrees to not charge the insurance company any more than it charges any other customer.

"Improving Health Care: A Dose of Competition: Competition Law: Insurers," report by the Federal Trade Commission and Department of Justice, July 2004, p. 20.

GEOGRAPHIC EXPANSION RACE

U.S. hospitals have begun employing new strategies to expand their market presence and compete for valuable insured patients.

"Hospitals' Geographic Expansion in Quest of Well-Insured Patients: Will the Outcome be Better Care, More Cost, or Both?" by Emily R. Carrier, et al., Health Affairs *31, no. 4 (April 2012): 827.*

4.3.3 Demand-Side

With regard to demand, the presence of third-party payors in the healthcare industry may distort a traditional supply-and-demand model by shifting the direct financial risks associated with ill health from the patient (i.e., consumer) to a third party who pays for the services rendered and, consequently, the management of those risks (i.e., a *defined benefits* model).[40] Since, under a traditional *defined benefits* model, the *direct* financial risk is shifted to payors, consumers are insulated from the *direct* cost of the services needed to manage their health and therefore most often do not consciously balance costs with benefits when making choices regarding

[40] "Improving Health Care: A Dose of Competition," report by the Federal Trade Commission and Department of Justice, July 2004, p. 5.

their care, resulting in an imperfect demand curve.[41] Conversely, although insurance companies bear the costs associated with healthcare delivery, they generally do not bear the full *benefit* or *consequence* of the quality of care provided, which may also diminish the applicability of a traditional supply-and-demand model to the healthcare competitive market.[42]

The insurance industry, however, has not been immune from the drivers (or the impact) of consumer-driven healthcare. Consumers, or the employers who pay their healthcare coverage premiums, have endured the repercussions of high insurance premiums and the continued impact of the recent recession. In response, many have chosen to use *health savings accounts* (*HSAs*) to pay their medical expenses, then to supplement the HSAs with *high-deductible health plans* (*HDHPs*) to cover catastrophic conditions.[43] This shift to *defined contributions*, consumer-driven healthcare, has changed the demand environment of the healthcare industry such that providers are now dealing more directly with patients, who are starting to more closely scrutinize the type, cost, and quality of the medical procedures and services they purchase.[44] By making these purchasing decisions and bearing more of the cost directly, rather than relying on an insurance provider to directly pay most of the cost of treatment, consumers' ability to affect demand in the healthcare market has increased. This change has affected the demand side of the healthcare sector so that it has now begun to resemble more traditional business enterprises.[45]

The state health insurance exchange (HIE) provision of the ACA, set to begin in 2014, is designed to have a significant impact on competition between private payors by providing patients with a portal to compare various options for coverage. (See Section 6.4.3.3, "ACA's Establishment of Health Insurance Exchanges," in Chapter 6, "Healthcare Reform.") Although these exchanges were under contention by many states, the U.S. Supreme Court's decision upholding the constitutionality of the ACA, and specifically the individual mandate provision, has ensured that these managed competition marketplaces will

Factoid

The ACA's state health insurance exchange (HIE) and individual mandate provisions are set to begin in 2014.

be fully implemented in 2014.[46] At this time, 15 states and the District of Columbia have established state exchanges, and 34 states and the District of Columbia have already received about $850 million to fund their state-designed exchanges from federal grants.[47] The remaining states, many of which opposed the law and had postponed exchange development, dependent on the June 28, 2012, U.S. Supreme Court ruling, will (now that the constitutionality of the provision has been upheld) be required to either submit a signed (by the governor) blueprint for a state-designed exchange to the U.S. Department of Health and Human Services (HHS) by November 16, 2012, and receive HHS approval, or a federal model for their state's exchange will be implemented.[48] (See Section 6.4.3.3, "ACA's Establishment of Health Insurance Exchanges," in Chapter 6, "Healthcare Reform.")

Health Savings Account (HSA)

HSAs are special accounts into which employers and employees both contribute, and from which the employee can draw funds to pay for health services. If the employer contributes, the value of those contributions is not taxable to the employee. Similarly, if the employee makes contributions, they are counted as "above-the-line" deductions.

U.S. Treasury Department, "All About HSAs," July 22, 2007, p. 14, http://www.treas.gov/offices/public-affairs/hsa/pdf/all-about-HSAs_072208.pdf (accessed July 1, 2009).

High Deductible Health Plan (HDHP)

A type of "catastrophic coverage" health insurance coverage with lower premiums and higher deductibles than traditional plans, and is a requirement for having an HSA. Defined by the IRS as "health plan with an annual deductible that is not less than $1,200 for self-only coverage or $2,400 for family coverage, and the annual out-of pocket expenses (deductibles, co-payments, and other amounts, but not premiums) do not exceed $6,050 for self-only coverage or $12,100 for family coverage."

IRC § 223(c)(2)(A) (2012).

DEFINED BENEFITS MODEL

A supply and demand model in which direct financial risk is shifted to payors, consumers are insulated from the direct cost of the services needed to manage their health, and therefore most often do not consciously balance costs with benefits when making choices regarding their care, resulting in an imperfect demand curve.

"Improving Health Care: A Dose of Competition," report by the Federal Trade Commission and Department of Justice, July 2004, p. 5.

DEFINED CONTRIBUTIONS MODEL

Also known as "consumer-driven healthcare," a supply and demand model that allows the patient-consumer to make purchasing decisions and bear more of the cost directly, rather than relying on an insurance provider to directly pay most of the cost of treatment.

"Defined Contribution: From Managed Care to Patient-Managed Care," by E. Haavi Morreim, Cato Journal *22, no 1 (Spring/Summer 2002): 112; U.S. Treasury Department, "All About HSAs," July 22, 2007, p. 33, http://www.treas.gov/offices/public-affairs/hsa/pdf/all-about-HSAs_072208.pdf (accessed July 1, 2009).*

4.3.4 The Physician-Workforce Shortage: Demand Outpaces Supply

The supply of physicians in the United States has not kept pace with the demand for healthcare services. In fact, the gap between supply and demand is projected to increase significantly, as the *sources* of physician supply remain insufficient and the *drivers* of demand (i.e., the aging population and the increase in the number of insured under the ACA's individual mandate) intensify. The deficiency of the physician workforce was, in part, the result of the implementation of recommendations made in the 1980 report by the Graduate Medical Education National Advisory Committee (GMENAC) that U.S. medical school enrollment be reduced due to a perceived oversupply of physicians.[49] In contrast, by the 1990s, an undersupply of physicians in primary care, internal medicine, and pediatrics had developed.[50] Despite several failed government programs, initiatives, and aggressive actions to alleviate aspects of physician manpower shortages, to date, the shortage is projected to continue at an increasing rate, especially in primary care.[51]

In its recent assessment of the physician workforce, despite a projected 22 percent increase in the demand for physicians' services by 2020, HHS noted that the physician-to-population ratio is expected to decline going forward.[52] HHS attributed a large portion of the growth in demand to specialties that care for elderly patients, that is, cardiology and internal medicine. Despite the growing need for primary care physicians, medical students' interest in the field remains low.[53] Lower incomes, less prestige, and difficult workloads are all cited as major factors in medical students' decision to enter specialties instead of primary care, and rural areas in

particular are seen as nonviable locations for physician practices.[54] In addition to a declining supply of new primary care physicians, the existing workforce is anticipated to undergo a significant shift during the next two decades, as one in three physicians is currently over the age of 55 and likely to retire in the near term, with many of the soon-to-be retirees being primary care physicians.[55] Combined with an aging population and healthcare reform's significant expansion in access to care, the strain on the physician workforce is rapidly becoming untenable.

The historic and projected increase in the perceived physician shortage is illustrated in Exhibit 4.1.

---

[54]Ibid.; George E. Wright et al., "Rural Research Focus: Rural Physician Shortages," Health Resources and Services Administration, ftp://ftp.hrsa.gov/ruralhealth/RRF-RHHA.pdf (accessed June 30, 2012).

[55]Association of American Medical Colleges, "Why Is There a Shortage of Primary Care Doctors?" https://www.aamc.org/linkableblob/70310-6/data/primarycarefs-data.pdf (accessed June 30, 2012).

Further, the shortage is not projected to be restricted to primary care providers. A comparison between the perceived physician shortage for both primary and specialist care is illustrated in Exhibit 4.2.

These projections and subsequent concerns regarding access have prompted several initiatives, including increased funding incentives for primary care students (part of the ACA), increased incentives for physician movement to rural and underserved areas (part of the ACA), and less restrictive scope of practice laws for midlevel providers (i.e., various state laws allowing the unsupervised practice of medicine by *physician assistants*, *nurse practitioners*, and *certified registered nurses*).

The current and impending physician shortage, paired with declining reimbursement rates, has fueled physician demand for manpower relief. To meet this demand, the healthcare workforce continues to diversify, with versatility no longer limited to the *horizontal* expansion of specialty and subspecialty areas of medical expertise. Rather, current trends have solicited a *vertical* expansion in the role of the nonphysician workforce to provide services that support, supplement, and parallel physician services. *Mid-level providers* are afforded a significant degree of autonomy within their scope of practice, which authorizes them to act, not only *incident-to*, but also *in lieu* of physicians, under certain conditions, and for the provision of previously

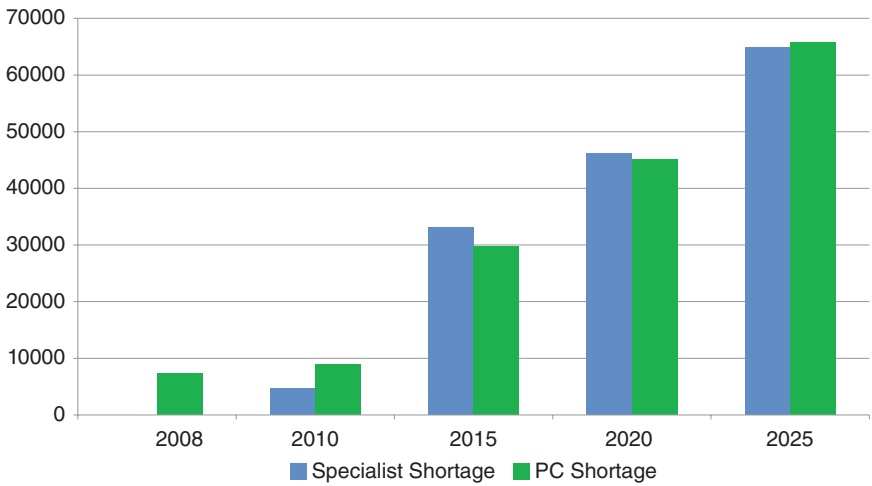

EXHIBIT 4.2 The Physician Shortage for Both Primary and Specialist Care

determined services.[56] The degree of practice autonomy differs for each type of mid-level provider and is typically mandated on a state-by-state basis.[57]

In the coming years, the mid-level provider population is expected to see continued growth in scope and volume. From 1987 to 1997 alone, the number of patients treated by nonphysician clinicians grew to 1.4 times the original amount.[58] According to a 2009 Office of the Inspector General (OIG) report, approximately 50 percent of Medicare-billed physician services that exceed a 24-hour workday were actually performed by qualified nonphysician practitioners, that is, mid-level providers.[59] Further, the services provided by nonphysician clinicians (both qualified and nonqualified) during a three-month period accounted for approximately $85 million in Medicare claims.[60]

Several recent federal and state initiatives specifically address the downturn in primary care physicians (PCP) entering the physician workforce and counteract the effect of the GMENAC report and current trends that favor specialist care (i.e., higher reimbursement yields). (See Section 1.6.1, "The Graduate Medical Education National Advisory Committee," in Chapter 1, "The Chronology of U.S. Healthcare Delivery.") One of the main aims of the ACA is to increase access to preventative care, and one means of achieving this goal is to increase the number of PCPs in the market. To incentivize physicians to focus in primary care, the ACA (and subsequent provisions) increases reimbursement to PCPs and offers tuition forgiveness to those PCPs who practice in rural areas, where access is traditionally lower.[61] Similarly, increasing expected reimbursement for primary care services may

incentivize physicians who were concerned about compensation amounts relative to educational debt to focus in primary care.

The healthcare industry has also begun to address anticipated PCP shortages by establishing new medical schools and residency programs, some of which specifically promote a focus on primary care. In 2006, the Association of American Medical Colleges (AAMC) set a goal of increasing medical school enrollment by 30 percent by 2015 (based on 2002 enrollment statistics).[62] Current estimates suggest that this goal may be achieved by 2016, with a 2012 increase of 16.6 percent, as compared to the 2002 baseline.[63] The projected growth in enrollment is expected to be attributed to both *current* (56.1 percent) and *new* (24.4 percent) medical schools.[64] In response to the pending shortage and the AAMC goal, 18 institutions have begun the process of developing new medical schools.[65] This is in contrast to the period between 1980 and 1990, when *no* new medical schools were established (due to the GMENAC report).[66] While academic institutions may be motivated by the prestige a medical school affiliation generally lends to a university and the surrounding community, the establishment of new sources of physicians may have a positive impact on the physician shortage.[67] In addition to the development of new medical schools, some existing facilities have established broader primary care programs within rural

communities to address the physician shortage and access to care issues, for example, the *University of Kansas School of Medicine* north-central campus rural program and *Columbia University College of Physicians and Surgeons* Columbia-Basset rural program, both established in the fall of 2011.[68]

4.4 PORTER'S FIVE FORCES OF COMPETITION

Harvard Business School professor *Michael Porter* is considered to be one of the world's leading authorities on competitive strategy and international competitiveness. Porter argues that all businesses must respond to *five competitive forces*: (1) the threat of new market entrants, (2) the bargaining power of suppliers, (3) threats from substitute products or services, (4) the bargaining

[68] Gina Shaw, AAMC Reporter, "More Medical Schools Boost Primary Care Doctors through Small-Town Campuses," Association of American Medical Colleges, July 2012, https://www.aamc.org/newsroom/reporter/july2012/297208/small-town.html (accessed August 14, 2012).

EXHIBIT 4.3 Porter's Five Forces

power of buyers, and (5) rivalry among existing firms.[69] A visual depiction of the five fundamental forces of competition is set forth in Exhibit 4.3.

A review of these five forces may be useful to help us understand the underlying drivers of competition.[70] Porter explores the value of this model as a process or a framework for use in examining competition in the healthcare industry.[71]

1. **The threat of new market entrants.** This force may be defined as the risk of a similar company entering your marketplace and taking current or potential business from you.
2. **The bargaining power of suppliers.** This force is the negotiating power of suppliers. Suppliers can be defined as any business you rely on to deliver your product, service, or outcome.

[69] Michael E. Porter, *Competitive Strategy: Techniques for Analyzing Industries and Competitors* (New York: Free Press, 1980), p. 4.

[70] Ibid.

[71] Michael E. Porter, et al., "Making Competition in Health Care Work," *Harvard Business Review* (July/August 1994): 131–141.

3. **Threats from substitute products or services.** This refers to substitute products or services that your customers will purchase instead of your product or service.
4. **The bargaining power of buyers.** This force is the degree of negotiating leverage of industry buyers or customers.
5. **Rivalry among existing firms.** This is ongoing rivalry between existing firms and is often assumed to be the sole expression of competition, without consideration of the other competitive forces that define industries.

Factoid

Porter's three generic strategies to out-perform competitors or maintain a market position against competition are: (1) overall cost leadership, (2) differentiation, and (3) market niche/segmentation.

"Making Competition in Health Care Work," by Michael E. Porter, et al., Harvard Business Review *(July/August 1994).*

Porter recommends *three generic strategies to outperform competitors or maintain a market position against competition*: (1) overall cost leadership, (2) differentiation, and (3) market niche/segmentation. Each strategy has a different set of ethical consideration related to its application to a care and treatment environment by healthcare providers.[72] There is a complex relationship between the various subsets of the healthcare industry and any competitive evaluation should take several different perspectives on these relationships.

NICHE PROVIDERS

Providers who focus on a section or group of buyers, a segment of a product line, or a specific area of a geographic market. What specific area niche providers focus on changes based on who is creating the definition.

"Limited Service—Niche Providers," American Hospital Association, 2005, www.hospitalconnect.com/aha/key_issues/niche/ (accessed February 27, 2005).

[72] Ibid.

PORTER'S FIVE FORCES OF COMPETITION

Competitive strategy devised by Harvard's Michael D. Porter. Includes: (1) the threat of new market entrants, (2) the bargaining power of suppliers, (3) threats from substitute products or services, (4) the bargaining power of buyers, and (5) rivalry among existing firms.

Competitive Strategy: Techniques for Analyzing Industries and Competitors, *by Michael E. Porter (New York: Free Press, 1980), pp. 7–10.*

4.4.1 The Threat of New Market Entrants

Historically, many healthcare providers have believed that there is a low risk (or even no risk) of new market competitors, due to the entry barriers in their segments of the industry, for example, CON laws and the notion that healthcare is a local business (discussed earlier). However, technology and communications, as well as the ability to recruit providers internationally, are changing some aspects of the physician-patient relationship so that this is no longer universally or absolutely true. New entrants may no longer necessarily have to be based in their local market. In addition, new market entrants may not be new enterprises at all, but the consolidation of existing healthcare enterprises into one entity (e.g., ACOs, patient-centered medical homes, co-management and joint venture arrangements) with renewed competitive prowess.

Overall, the threat from new entrants may be related to the size of the financial return in that particular segment of the industry. Healthcare differs from many industries, because financial return does not always drive the decision process. The goals of charity, education, and community service make some decisions in the business of healthcare seem financially or economically irrational. The interest(s) held by society in the consolidation and creation of new entrants represents a *positive social externality.* The value a new entrant conveys to society can be described as the perceived future benefits the entrant will contribute to the U.S. population, or a subpopulation. Especially important when identifying and establishing the scope of a positive externality within a large external group is the appropriate selection of defined measures of comparison (such as benchmarking health outcomes against industry norms and historical trends) that must be in place in order to quantify the value added by such entrants. Benchmarks for patient populations, before and after its creation, on both a regional and/or a national level, are useful in determining the existence of statistically significant

Factoid

Healthcare differs from many industries as financial return does not always drive the decision to enter a new market.

evidence of improved population health outcomes, which can be used as an indication of whether a new market entrant has truly added *societal value*.

4.4.2 The Bargaining Power of Suppliers

"Suppliers of products, technology, and services to the health care sector include a wide range of companies producing a vast array of products."[73] Clinical providers (i.e., healthcare enterprises and physicians) are, in this sense, a significant type, but only one type, of healthcare supplier. Other suppliers may include landlords, medical supply companies, pharmaceutical companies, billing outsourcers, maintenance firms, and insurance companies. Suppliers may gain competitive leverage if they can raise a provider's costs, that is, a higher percentage of risk is held by the provider, instead of by the supplier. However, the leverage or bargaining power of suppliers is often affected by new technologies, standards of care, and regulatory initiatives.

Providers gain a significant amount of their bargaining power from their size. Larger health systems with greater patient populations have more negotiating power with commercial payors than does a small physician practice. The benefits of market leverage are one driver of the recent increase in provider consolidation and physician employment. (See Section 4.6.4, "Provider Consolidation.")

New technologies that change the standard of care, as well as the efficiency with which care is provided, also affect the bargaining power of providers, as well as the medical device companies that supply them. Technologies, such as the *da Vinci* robot, a robotic system created by Intuitive Surgical in 1998, improve outcomes and productivity and may make many earlier means of treatment obsolete or increase physician productivity to greater levels than traditional procedure methods allow.[74] A study examining one institution's use of the *da Vinci* for cardiac surgery to perform 50 mitral

[73] Michael E. Porter and Elizabeth Olmsted Teisberg, *Redefining Health Care: Creating Value-Based Competition on Results* (Boston: Harvard Business School Press, 2006), p. 283.

[74] Intuitive Surgical Inc., "History—The da Vinci System," http://www.intuitivesurgical.com/company/history/system.html (accessed August 24, 2012).

repairs found that procedure time decreased from 1.9 hours to 1.5 hours during the course of the study.[75] Further, the *da Vinci* system has been found to reduce aortic clamping time, thereby cutting down total operative time and lessening blood loss.[76] Physicians who resist learning to operate technologies such as the *da Vinci* or facilities that resist purchase of such technologies may lose some competitive advantage in the marketplace. Further, due to brand recognition, as compared to similar substitutes, device companies have exploited the current popularity of the *da Vinci* to gain market power. (See Section 4.4.3, "Threats from Substitute Products or Services.")

Outside of the antitrust monitoring of the consolidation of providers, one prevalent type of healthcare industry supplier regulation is the Food and Drug Administration's (FDA) regulation of pharmaceuticals. Since the Thalidomide scandal of the 1960s, regulation of new drugs and devices through the FDA has been associated with high levels of scrutiny and long wait periods, due to complicated approval processes. Further, although the FDA has eased the approval process for some generic drugs to promote their use and lower the cost of drugs for consumers, the brand name power of many pharmaceutical companies has generally prevailed.

Another complication of the pharmaceutical industry that affects its bargaining power as a supplier is the institution of the publication of an *Average Whole Sale Price* (*AWP*). To determine the price that a pharmacy benefits manager or another commercial seller will apply to a given drug, the pharmaceutical industry uses a benchmark, the AWP, which is designed to be the average price for which a drug wholesaler sells a particular drug. Of note is that this benchmark was not originally monitored or regulated by any agency or law. Because it is based on data provided by drug companies and commercially published by firms, including *First DataBank* and *Thomson Medical Economics*, many believed that the AWP is often inflated. Under the *Medicare Prescription Drug, Improvement, and Modernization Act* (*MMA*) *of 2003*, CMS is required to calculate the *Average Sales Price* (*ASP*) of drugs to gain a more accurate benchmark. However, since this calculation is also based on the average manufacturer price supplied by pharmaceutical companies, it has faced similar concern.[77]

The da Vinci surgical robotic system decreased mitral valve repair time from 1.9 to 1.5 hours.

"History—The da Vinci System," Intuitive Surgical, http://www.intuitivesurgical.com/company/history/system.html (accessed August 24, 2012).

The shift toward commercially driven healthcare has had an effect on the bargaining power of pharmaceutical industry suppliers. While physicians traditionally have been the "*gatekeepers*" of medical information, with the surge in direct-to-consumer advertising and the Internet, consumer-driven healthcare has provided patients with a say in what treatments and services they may want to purchase. In 2004, the pharmaceutical industry spent more money on promotion (24.4 percent) than it did on research and development (13.4 percent).[78]

Average Whole Sale Price (AWP)

A way of calculating a benchmark from which pharmacy contracting and Medicare reimbursement for drugs may be determined, based on the average price a drug wholesaler sells a particular drug.

"One Pill, Many Prices: Variation in Prescription Drug Prices in Select Government Programs," by Dawn M. Gencarelli, National Health Policy Forum, Issue Brief No. 807, August 29, 2005, pp. 3, 4.

4.4.3 Threats from Substitute Products or Services

Nontraditional healthcare providers are increasingly competing with traditional healthcare. Alternative providers such as chiropractors have taken a larger market share, and some healthcare systems and emerging healthcare organizations have embraced the changes in patient preferences and regulatory/reimbursement incentives.

Technology has fueled the entry of new competitors in many other industries, and healthcare is no exception. Patients are gaining access to medical advice and information through the Internet and becoming more informed about care and treatment options. Increasingly, pharmaceuticals offer alternatives to surgery and other medical procedures, and often at a lower cost, reducing hospital stays or the need for costly surgical procedures For example, the introduction of Nexium, "*The Purple Pill*," revolutionized the treatment of bleeding ulcer patients with a proton pump inhibitor prior to endoscopy, thereby reducing both the need for surgery and the length of hospital stays. With advances in medical imaging communication, radiologists in remote locations can outsource X-ray film readings for hospitals at lower prices. As discussed earlier regarding the *da Vinci* robot, brand recognition and the popularity of various technological innovations can skew the perceived threat of new market entrants.

Robotic technologies are a popular feature of many minimally invasive procedures. Robot-assisted procedures provide additional benefit over traditional laparoscopic methods, because the robot increases the physician's maneuverability, visibility, and precision.[79] The FDA's approval of the *da Vinci* in 2000 represents a substantial progression in the field of minimally

[79] Mayo Clinic, "Robot-Assisted Surgery," 2009, http://www.mayoclinic.org/robotic-surgery/ (accessed April 6, 2009).

invasive surgery.[80] (See Section 5.3.4.2.1, "Robotic-Assisted Surgery, in Chapter 5, "Technology.")

Although the *da Vinci* system has been used successfully in an array of surgical procedures, many surgeons remain skeptical of its continued use in the medical profession. In a 2006 questionnaire sent to all institutions in possession of a *da Vinci* robot, researchers found a gradual annual increase in the number of operational robots in the United States (approximately 400), with 25 percent of all cardiac surgical programs having procured a robot and performing approximately 1,700 robotic or robotically assisted surgeries annually.[81] During the last 5 years, there has been widespread adoption of robotic-assisted surgery for radical prostatectomies, with approximately 54 percent of all radical prostatectomies in the United States performed with the *da Vinici* system as of 2010.[82]

Despite industry concerns, the da Vinci has several competitive advantages, as compared to traditional procedures. FDA approval provides a buffer between current technology and market entrants, as use will be significantly hindered by the FDA approval process. Furthermore, surgeons' acceptance and support of robotic technology into their programs is a trend that may lead to a new standard in medical care. In addition, as more studies show that noninvasive cardiac technology is improving patient outcome metrics (which will, by default, become more apparent with increased surgeon use of the technology), and policymakers move toward programs that give incentives to providers who improve the quality of robotically assisted cardiac procedures similar to those performed using the *da Vinci*, this may procure higher reimbursement than at present.[83] New market entrants may pose less of a threat if payors are timid about reimbursing providers for new technologies before their improved effect on outcomes has been established.

As mid-level providers secure expanded scope of practices allowances to address the provider shortage (see Section 4.3.4, "The Physician-Workforce Shortage: Demand Outpaces Supply"), these professionals will become a greater competitive threat to physicians who provide similar services. A significant factor in the level of competition between physicians and mid-level providers is the regulation of scope of practice and reimbursement procedures. Although supervision and scope requirements differ for each type of mid-level provider, *incident-to* services billed under Medicare allow nonphysician providers to work without the direct supervision of a licensed physician, regardless of their specialty or whether they are acting as primary care providers.[84] In contrast, state laws differ widely with regard to supervision requirements, as well as to the responsibilities and tasks delegated to mid-level providers.[85] The final rules of the 2010 *Outpatient Prospective Payment System* (*OPPS*) and *Medical Physician Fee Schedule* (*MPFS*) served a multifaceted role in the regulation of mid-level providers, by imposing more stringent supervision requirements on some and relegating accountability for the supervision of select diagnostic and therapeutic services to others.[86] As mid-level providers' scope of practice broadens, the competition between them and physicians is likely to increase, especially

Fee Schedule

A fee schedule is a payment system under which the fees for procedures are explicitly laid out and the physician agrees to accept those fees as full payment unless the discounted charges are less than the fee schedule; in which case, the plan pays the lesser of the two.

given that the growth in PA and NP supply has outpaced physician supply during the last 20 years.[87]

4.4.4 The Bargaining Power of Buyers

Healthcare services are primarily paid for by insurance organizations, whether private or governmental. Most private health insurance is purchased through employers who, to a great degree, make most of the buying decisions. Prior to the passage of the ACA, small businesses did not receive discounts on health insurance plans, mainly due to a lack of buying power, as compared to larger employers.[88] As a result, on average, small firms paid up to 18 percent more in premiums than did large firms for the same health insurance coverage.[89] Employer coalitions have emerged, but most command leverage on price, rather than on quality or value. This often leaves healthcare providers as the only advocates for consumers. These traditional means of procuring insurance may change dramatically in 2014, with the advent of state health insurance exchanges and the small business health options program, mandated under the ACA. The ACA provision requiring minimal essential health benefits and restricting the payor's ability to reject coverage has further decreased the bargaining power of buyers in healthcare

[87] Michael J. Dill and Edward S. Salsberg, "The Complexities of Physician Supply and Demand: Projections through 2025," Center for Workforce Studies, Association of American Medical Colleges, November 2008, p. 65.

[88] Amanda Cassidy, "Small Business Tax Credits. The Affordable Care Act Offers Incentives So That More of These Companies Will Help Provide Their Employees with Health Insurance," *Health Affairs*, Health Policy Brief, January 14, 2011.

[89] Ibid.

and placed more decision power into the hands of patients. To ease the burden on small businesses with 25 or fewer full-time employees, the ACA implements a federal tax credit, which, depending on need, will offset up to half of insurance premiums.[90] To qualify for the credits, an employer must pay at least half of the premium for each employee. Currently, more than 4 million companies have been deemed eligible for the credit.[91] (See Section 6.4.2, "Impact on Employers," in Chapter 6, "Healthcare Reform.")

The bargaining power of buyers, particularly insurance companies, is also subject to increasing scrutiny under the ACA, specifically regarding new limitations on the medical loss ratio. On December 2, 2011, HHS issued a final rule regarding the Medical Loss Ratio (MLR), implementing changes required under the ACA. The final rule creates a significant change in industry oversight by considering insurance broker and agent fees as administrative costs for purposes of an MLR calculation, in other words, that portion of insurance premium revenues spent on items other than clinical services, quality improvement, and other nonadministrative activities.[92]

The final rule requires insurance companies to spend 80 percent of insurance premiums on medical care and healthcare quality improvement in the individual and small group markets, and 85 percent of premiums on these components in the large group markets, exclusive of administrative costs.[93] Beginning in 2011, insurance companies have been required to report their MLR data to HHS annually, in an effort to allow consumers to evaluate available health plans based on the value they provide. Starting in 2012, private payors who fail to meet MLR requirements are required to provide a rebate to their customers.[94] The final rule allows the secretary of HHS, through *the Center for Consumer Information and Insurance Oversight* (*CCIIO*), to adjust the MLR standard in states where it is determined that meeting the 80 percent MLR standard might destabilize the individual

[94] Ibid.

market. In order to qualify, a state must demonstrate that requiring its payors to meet this standard would decrease the availability of insurance plan choices for consumers.[95] To date, more than a dozen states have applied for an adjustment to the MLR standard; however, only Maine received an overall downward adjustment (lowered to 65 percent). Yet CCIIMO has allowed various models of leniency regarding the MLR standard for those approved, including gradual adjustments and temporary adjustments.[96]

The main critics of the MLR rebate are insurance companies, because only 36 percent of all private payors were expected to be under the MLR

Factoid

The ACA mandates that insurance companies must spend at least 80 percent of insurance premiums on medical care and healthcare quality improvements in the individual and small group markets, and 85 percent of premiums on these components in the large group markets, exclusive of administrative costs.

standard in 2011, with the remaining 64 percent of companies required to provide consumer rebates.[97] Specifically, the inclusion of insurance broker and agent fees as administrative costs has created concerns, with the insurance industry claiming such activities are necessary services for consumers that will likely be hindered by the new regulations. While the insurance industry claims the MLR rule will create a "*desperate economic situation*," consumer groups support the inclusion of insurance broker and agent fees as administrative costs, calling the rule, "a great victory for consumers … maintain[ing] the integrity of incredibly important consumer protections that hold the insurance industry accountable."[98]

4.5 BARRIERS TO FREE MARKET COMPETITION IN HEALTHCARE

Perfectly competitive markets exist only in economic theory. In reality, industries and markets have varying constraints on competition. The healthcare industry has often been characterized as unique, with its many significant barriers to free market competition, such as market controls on price and quality. There are three main reasons for these barriers in healthcare:

1. The nature of healthcare creates an unpredictable, urgent, and "*infinite*" level of demand.

[97] "Letter from GAO to HHS Regarding Private Health Insurance: Early Indicators Show That Most Insurers Would Have Met or Exceeded New Medical Loss Ratio Standards," by John E. Dicken, Director, Health Care, to Robert E. Andrews, Subcommittee on Health, Employment, Labor, and Pensions, October 31, 2011, p. 6.

TABLE 4.1 Barriers to Competition in Healthcare

Patients	Patients Do Not Purchase Services Directly from Providers.
	Patients Do Not Compare Prices between Providers.
Payors	The Government Is the Largest Purchaser of Healthcare.
	Private Purchasers Often Lack Market Power.
Providers	Many Providers Have Monopoly or Near Monopoly Power (yet Antitrust Laws Prevent Some Potentially Beneficial Integration).
	Providers Are Rewarded for Increasing Costs.
	Capital Investments Are Overly Subsidized.
	Certificate of Need, Regulation, and Licensing Laws Are an Entry Barrier to Competing and Substitute Providers and Services.
	Exit Barriers Protect Low-Quality Providers.
Patients, Payors, and Providers Lack Information.	

2. The ubiquitous involvement of insurance companies, private and governmental, as intermediary organizations in the purchase of healthcare interferes with consumer motivations and consequently their choice of providers and services.
3. The difficulties in measuring healthcare quality and beneficial outcomes (both of quantifying and qualifying them) and the lack of information on the relative costs of healthcare providers and services also inhibit consumer selection, further removing incentives to providers to increase quality and lower costs.

More specific examples of barriers to competition in healthcare delivery are provided in Table 4.1.

4.5.1 Intermediary Role of Insurance

One of the main differences between healthcare and other industries is the intermediary role of insurance. While payors are traditionally consumers of healthcare services, some would also see them as suppliers of "coverage," that is, repackaging the care given by providers. This dual role, as discussed earlier, affords significant market leverage to payors in the healthcare industry. Many of the provisions of the ACA address concerns related to the rising cost of insurance premiums, forcing greater price transparency within the insurance market, for example, medical loss ratio regulations and minimum essential health benefit requirements.

The government's role as the single largest payor for healthcare services also exerts enormous pressure on providers to reduce costs, due to various

regulatory initiatives. (See Section 2.7.1.1, "Episode-of-Care-Payments," and Section 2.7.1.1.2, "Value-Based Purchasing," in Chapter 2, "Reimbursement Environment.") Uncertainty still rages regarding the fate of Medicare reimbursement under the sustainable growth rate (SGR) formula, bringing instability to revenue forecasting within the insurance market. Government payors, for example, Medicare, rely on *Medicare Payment Advisory Commission* (*MedPAC*), an independent congressional agency that advises Congress on issues of Medicare reimbursement, access and quality of care, and other related issues to wield substantial competitive leverage in the market.[99]

The *Bundled Payments for Care Improvement Initiative* (*Bundled Payments Initiative*) is one of several provisions of the ACA that encourages alignment, collaboration, and communication among providers and is expected to provide better outcomes in environments where physicians and hospitals have already established strong communication and collaboration.[100] (See Section 2.7.1.1.1, "Bundled Payments," in Chapter 2, "Reimbursement Environment.") Similar episodes of care reimbursement initiatives such as *value based purchasing* (see Section 2.7.1.1.2, "Value-Based Purchasing," in Chapter 2, "Reimbursement Environment") and those reimbursement models used in ACOs (i.e., the Medicare Shared Savings Program) all emphasize cost and quality as a means of maximizing reimbursement and demonstrate the market power of the federal government as a payor.

This preeminent influence on, and pervasive dominance of, government over the healthcare industry presents a significant and unique differential

SUSTAINABLE GROWTH RATE (SGR)

The target rate of expenditure growth set by the SGR system for adjusting fee updates for the Medicare Fee Schedule; based on GDP growth and uses a conversion factor.

between the healthcare industry and other industries. However, the impact of these changes has not been limited to Medicare and Medicaid reimbursement cuts but is also reflected in the reimbursement policies of other third-party payors.

4.5.2 Difficulties in Measuring Quality and Outcomes

Difficulties in measuring healthcare quality and beneficial outcomes (both of *quantifying* and *qualifying* outcomes data) and the lack of information related to the relative costs of healthcare providers and services also inhibit consumer selection. However, as transparency initiatives and electronic health record (EHR) technologies become more commonplace, difficulties associated with measuring quality and outcomes may be reduced. More significantly, the current spread of various value-based purchasing initiatives tying reimbursement to quality and cost metrics will likely incentivize providers to use those health information technologies (HIT), more so than the mere existence of HIT. CMS is funding many of these incentives through the *Hospital Value-Based Purchasing* (*VBP*) program. The VBP program will make distributions to hospitals, home health agencies, and ambulatory service centers based on quality performance measurements. The hospital VBP program is set to make its first payments to providers in FY 2013, although the performance year that will be used to establish benchmarks began in 2011.[101] A further discussion of value-based reimbursement can be found in Section 2.7.1.1.2, "Value-Based Purchasing," in Chapter 2, "Reimbursement Environment."

Electronic Health Record (EHR)

A longitudinal collection of electron health information about individual patients and populations.

"The Emergence of National Electronic Health Record Architectures in the United States and Australia: Models, Costs and Questions," by T. D. Gunter and N. P. Terry, Journal of Medical Internet Research, *http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1550638/ (accessed May 24, 2012).*

Associated with improving "the health of individuals and the performance of providers, yielding improved quality, cost savings, and greater engagement by patients in their own health care."

"The Benefits of Health Information Technology: A Review of the Recent Literature Shows Predominantly Positive Results," by Melinda Beeuwkes Buntin, Health Affairs *30, no. 3 (March 2011): 464.*

4.5.3 Certificates of Need as Barriers to Entry

A *Certificate of Need* (*CON*) program is one in which a state government determines where, when, how, and at what scope capital projects for healthcare facilities, service line expansion, and major equipment acquisition may be undertaken (see Section 3.4.3, "Certificate of Need," in Chapter 3, "Regulatory Environment").[102] By their very nature, CON programs are anticompetitive, a principle that serves as, de minimis, part of the rationale for the inception of CON programs, in response to the concern that market forces were not adequate to prevent providers from overinvesting in equipment and facilities, resulting in the inflation of healthcare costs.[103] CON is based on the theory that in an unregulated market, healthcare providers will provide the latest costly technology and equipment, regardless of duplication or need.[104] However, various shifts in the healthcare industry in the years since CON legislation (see Section 3.4.3, "Certificate of Need") was first introduced have fueled disputes against the implementation of CON programs.[105]

A central argument against CON regulatory policy asserts that intervention disrupts natural market forces and is significantly anticompetitive. As a

[102] National Conference of State Legislatures, "Certificate of Need: State Health Laws and Programs," April 30, 2009, http://www.ncsl.org/IssuesResearch/Health/CONCertificateofNeedStateLaws/tabid/14373/Default.aspx (accessed June 24, 2009).

[105] Ibid., pp. 2, 5, 6.

result, CON may serve as a barrier to new market entrants and has been viewed by many healthcare economists as a strong disincentive to the introduction of potentially advantageous innovations and technologies.

A consensus exists among health economic analysts that competition between providers drives patient quality of care and beneficial outcomes and is a force for cost efficiency. Hospitals in more competitive markets have exhibited lower levels of spending on average than hospitals in less competitive markets.[106] Healthy competition appears to offer patients and payers a means of economic leverage by creating choices for consumers and raising quality standards as providers compete for patient loyalty. When patient choice is diminished, decisions about access, quality, and beneficial outcomes become the sole purview of oligopoly market players who, as decision makers acting in the absence of healthy competition, are free to ignore patient demands and needs.

Current implementations of CON legislation in markets that are competitive have been perceived as a notable shift from CON's original purpose, to support competition by preventing overinvestment in healthcare facilities.[107] With continued evidence refuting the efficacy of CON legislation in reducing healthcare costs, supporters of CON legislative action have now shifted the argument to suggest that implementation and enforcement of CON laws may prevent overutilization due to physician self-referrals to

Factoid

In the United States, 37 states retain some sort of CON program restricting capital projects for healthcare facilities, service line expansion, and major equipment acquisitions.

physician-owned facilities and may act to support the continued viability of community hospitals' charity care policies.[108]

4.5.4 Physician-Owned Healthcare Facilities

Historically, physicians and hospitals each provided distinct services to patients, with physicians providing physician services, and hospitals providing surgical and other related services to referred patients.[109] Under this symbiotic dynamic, little to no competition existed between physicians and hospitals.[110] However, this trend shifted as physicians became owners and investors in surgical facilities, such as ambulatory surgery centers and specialty hospitals, which compete with the same general hospitals where physicians had traditionally referred their patients.

Physician-owned hospitals have long created debate, due to the potential for ethical violations related to physician referrals and the perception that these physician-owned hospitals often *cherry-pick* patients.[111] Despite contentions that general hospital profitability has been negatively affected as specialty hospitals have selectively siphoned off more profitable services, such as surgical and specialty procedures (e.g., orthopedic surgery, cardiac

Ginsburg, and Jessica H. May, "Hospital-Physician Relations: Cooperation, Competition, or Separation?" *Health Affairs*, Web Exclusive (December 5, 2006): w31.

[110] Ibid.

[111] Chris Silva, "Physician-Owned Hospitals: Endangered Species?" American Medical News, June 28, 2010, http://www.ama-assn.org/amednews/2010/06/28/gvsa06028.htm (accessed July 10, 2012).

services), there is no conclusive evidence to support this claim.[112] Further, proponents of physician-owned enterprises cite statistics demonstrating that patients are more satisfied with their care at physician-owned hospitals and often receive higher-quality care.[113] Recently, supporters have suggested that action against physician-ownership is counterproductive to the aims of healthcare reform, that is, to limit care facilities just as health insurance coverage is expanded to improve access to care for a greater percentage of the U.S. population.[114]

As physician ownership of hospitals and other facilities has expanded, so has the legislation that restricts it. There have been incessant legislative and regulatory efforts undertaken at the federal and state levels, in large part due to massive lobbying initiatives by oligopoly hospitals and their trade associations, to reverse the trend of, and restrict physician ownership in, investment in ASTC revenue stream enterprises, for example, ASCs, independent diagnostic testing facilities (IDTFs), surgical/specialty hospitals, physical therapy, and so on. These measures have served to relegate independent physicians in private practice to receiving only professional fee component revenues or to acquiesce by accepting employee status under the substantial control of hospital systems or large corporate players.

The Stark Law prohibits physicians from referring their patients to facilities in which they have a financial interest.[115] However, physicians were often able to refer patients through the "*whole hospital*" exception. This exception allowed a physician to perform certain services despite his or her financial interests, so long as the physician's financial interest was invested in the hospital generally and not in a particular subdivision.[116] Elimination of the Stark *whole hospital exception* was first suggested in

[116] Ibid.

§651 of the July 24, 2007, U.S. House of Representatives Bill 3162, *The Children's Health and Medicare Protection Act of 2007* (CHAMP). While CHAMP §651 was never signed into law, §6001 of the ACA bans future physician-owned hospitals from forming and also limits the expansion of existing facilities, effectively eliminating use of the whole hospital exception for any healthcare facility established after 2010.[117]

Other legislative actions against physician ownership include:

- The November 20, 2007, New Jersey court holding in *Health Net of New Jersey, Inc. v. Wayne Surgical Center, LLC*, that physicians who refer their patients to an ASC in which they have an ownership interest violate the 1989 Codey Act prohibitions against self-referral.[118]
- Stark III updates prohibiting "*under arrangements*" and "*per click*" leasing ventures. [119]

Accountable Care Organization (ACO)

Healthcare organizations in which a set of providers, usually physicians and hospitals, are held accountable under a contract with a payor(s) (i.e., Medicare for Federal ACOs and any number of commercial payors for commercial ACOs) for the cost and quality of care delivered to a specific local population.

"Can Accountable Care Organizations Improve the Value of Health Care by Solving the Cost and Quality Quandaries?" by Kelly Devers and Robert Berenson, Robert Wood Johnson Foundation, Urban Institute, October 2009, http://www.rwjf.org/files/research/acosummaryfinal.pdf (accessed January 19, 2012), p. 1.

Ancillary Services and Technical Component (ASTC)

Professional charges for patient services that are delivered in conjunction with the principle practitioner that diagnoses and treats the patient. The technical component of billing, with its own CPT codes, includes equipment, supplies, and facilities.

Dictionary of Health Insurance and Managed Care, *by David Marcinko (New York: Springer, 2006), pp. 24, 282.*

Stark Law

The physician self-referral law that prohibits referrals to an organization of which that physician or his or her family has a financial relationship.

"Stark Law: Civil Monetary Penalties," 42 U.S.C. 1320a-7a (1989).

- Various state tax acts (applicable only to ASCs, IDTFs, and cancer treatment centers) whereby physicians subsidize care provided in hospitals.
- CMS's 2008 restrictions, whereby IDTFs are no longer allowed to share practice locations, operations, and diagnostic testing equipment with other Medicare-enrolled providers, including leasing and subleasing agreements.[120]

4.5.5 Exclusionary Boycotts

In response to the perceived competitive threat of specialty hospitals, many community hospitals have started to respond in ways that may be perceived as being in violation of antitrust laws. In situations where specialty hospitals are owned in whole or in part by physicians with privileges on the medical staff of a general acute care hospital, and where the specialty hospital competes with the general hospital on either an inpatient or an outpatient basis, many general hospitals have engaged in activities that attempt to shut the

[120] McDermott Will & Emery, "2008 Physician Fee Schedule Regulations Include Anti-Markup and IDTF Rule Change," *McDermott Newsletters*, November 16, 2007.

physician-owned facility out of the market. Some of these practices include refusing to assist or cooperate with specialty hospitals, pressuring other members of the medical staff and/or community physicians not to engage in business with the specialty hospital, pressuring payors to exclude specialty hospitals from the payors' networks, and limiting or terminating physician-investors' privileges and medical staff membership (*conflict of interest credentialing*).[121] In response to these practices, some physician-owned facilities (POF) have initiated antitrust suits, claiming that general hospitals are engaging in illegal exclusionary boycotts.[122]

While courts have typically favored general hospitals' attempts to combat *cream skimming* by specialty hospitals, one notable case brought forth in 2005 by a Kansas City area hospital, Heartland Surgical Specialty Hospital, demonstrated that courts do not overlook anticompetitive behavior by hospitals. The specialty hospital filed an antitrust lawsuit alleging horizontal conspiracies between multiple health plans and multiple hospitals, as well as vertical conspiracies between the hospitals and the payors directly, resulting in pressure on payors, as well as direct agreements with them, to exclude the Specialty Service Hospital (SSH) from their networks.[123] The eventual settlement in this case demonstrated that antitrust laws protect against entities with market power using their power to pressure others (e.g., other hospitals and payors) into agreeing to exclude a competitor from the market.[124]

Specialty Service Hospital (SSH)

A hospital that limits its focus and scope of services to provide treatment for a single medical specialty or cluster of specialties (e.g., surgical, pediatric, or women's care).

Dictionary of Health Economics and Finance, *by David Marcinko (New York: Springer, 2007), pp. 338–339.*

4.5.6 Antitrust Regulations

The purposes of antitrust laws are to prevent monopolies and predatory pricing and to encourage competition in the marketplace (see Section 3.4.1, "Antitrust Regulations," in Chapter 3, "Regulatory Environment"). The Sherman Antitrust Act prohibits monopolies (i.e., monopolization, attempted monopolization, and conspiracies to monopolize), contracts, combinations, and conspiracies that unreasonably restrain trade.[125] However, substantial regulation also has the capacity to limit free market competition in the healthcare industry.[126]

Antitrust law has traditionally been used to combat anticompetitive behavior arising from provider- and payer-imposed barriers to competition, as well as against consolidations (either by collaboration or merger) by provider groups and health systems.[127] However, at the beginning of this decade, strict antitrust enforcement in the healthcare sector focused on pharmaceuticals.[128] During that time frame, a significantly increased level of judicial deference tended to be given to providers, causing federal enforcement, which had won cases against hospital mergers in the 1980s and the 1990s, to lose all hospital merger cases brought in federal court between 1995 and 2001.[129] During this period, courts tended to take a purely economic look at elements of antitrust decisions, such as a provider's market share and price, while ignoring other germane elements to healthcare, such as patients' personal and logistical considerations for choosing a provider.[130]

Promulgated by recent healthcare reform efforts, the Federal Trade Commission and the Department of Justice have expressed renewed concern regarding the adequacy of existing standards for horizontal mergers, maintaining that fortified measures of antitrust enforcement are crucial to

cutting costs and improving the quality of healthcare.[131] Most recently, the DOJ and the FTC have focused their efforts on evaluating the impact of horizontal consolidation of certain healthcare organizations (e.g., large pharmaceutical companies, payors, outpatient clinics, hospitals) to determine whether their respective market sectors experience a decrease in competition as a result.[132] While most research suggests a potential correlation between hospital consolidation and higher prices for hospital services, the magnitude of price increase estimated by these studies ranges from 5 percent to greater than 50 percent, leading to uncertainty regarding these findings.[133] The impact of consolidation has become more pertinent in recent years, due to the many provisions of the ACA that promote the coordination of care (e.g., ACOs).

4.6 HISTORICAL REFORM EFFORTS AND THEIR EFFECT ON COMPETITION

4.6.1 Managed Competition

Managed competition was a dominant theory of the 1990s healthcare reform.[134] As envisioned by Alain Enthoven of Stanford University, competing

[131] "The Importance of Competition and Antitrust Enforcement to Lower-Cost, Higher-Quality Health Care," prepared statement of the Federal Trade Commission before the U.S. Senate Subcommittee on Consumer Protection, Product Safety, and Insurance, Committee on Commerce, Science, and Transportation, July 16, 2009, pp. 1–2, 9.

1st Generation	2nd Generation	3rd Generation	4th Generation
Managed Access	**Managed Benefits**	**Managed Care**	**Managed Outcomes**
• Emphasis on managing/restricting patient access • Administrative burdens (e.g., precertification, significant copays) • Reliance primarily on non-clinical reviewers • Physician totally outside system	• Emphasis on managing benefits • Precertification primary and treatment planning secondary • Cost containment emphasized over clinical management • Traditional treatment models employed • Physicians "*included*," but their care delivery "*inspected*"	• Greater emphasis on treatment planning and quality management • Focus on most appropriate care in most appropriate setting • Patients managed through continuum of care • Clinical management of network; provider-care manager collegiality • Shift toward improving access and benefits to reduce costs	• Operational, clinical, and financial integration • Locally responsive delivery systems and services based on national standards and capabilities • Mutually benefical partnerships with physician community • Effective use of technology to measure, report, and enhance quality and outcomes • Proof of value for patients • Full accountability for costs and quality

EXHIBIT 4.4 The Four Phases of Managed Competition

healthcare entities, particularly payors, were to be monitored by a supervisory structure that established equitable rules, created price-elastic demand, and avoided uncompensated risk selection—not a far cry from the emerging structure of the ACO/payor relationships.[135] Enthoven's model represented a combination of competitive and regulatory strategies that he suggested must seek to coexist in the healthcare industry as an aim to achieve maximum value for both consumers and providers.[136] Several commentators viewed this compromise as springing from a "belief that health care is both a right and an obligation"—heralding the individual mandate of the current healthcare reform, in other words, that people have a right to access and an obligation to pay for their portion.[137] An illustration of the comparative features of the evolution of models of managed competition, from managed access to managed outcomes (i.e., the current notion of value-based purchasing), is set forth in Exhibit 4.4.

Factoid

The four stages of managed competition are "managed access," "managed benefits," "managed care," and "managed outcomes."

The regulatory safeguards regarding competition in healthcare go beyond specific laws monitoring the market size of various enterprises. As shown by the theory of managed competition, regulations monitoring what must be publicly reported will also affect the competitive nature of the industry.

4.6.2 Reform of the Insurance Industry

From 2000 to 2009, more than 400 health insurance company mergers occurred, resulting in a highly consolidated market and negative consequences for consumers today. Part of the explanation for this consolidation trend was the lack of legislation concerning merger agreements. Of note is that in the last decade, there were only two cases where the DOJ required the restructuring of a merger agreement between two insurance companies.[138] The prevalence of these mergers without a strong enforcement of antitrust laws has permitted a variety of anticompetitive behavior by major insurance companies, resulting in higher costs (whether from higher premiums, deductibles, or copays), compromised patient care, and a record high level of uninsured people in the United States.[139]

In order to reverse the trend of payor consolidation, healthcare reform proposals have included provisions for identifying exclusionary conduct by private payors. Some politicians suggest that the federal antitrust exemption

for insurance companies contained in the *McCarran-Ferguson Act* has allowed for insurance companies to consolidate, and they have advanced reform initiatives to modify or repeal the exemption.[140] While the act exempts all types of insurance providers, the application of the act to the healthcare industry has drawn particular criticism from the DOJ and lawmakers, who claim that the exemption has led to anticompetitive behavior, which has resulted in higher healthcare costs to both providers and patients.[141] Proponents of the exemption argue that states have proved themselves capable of preventing anticompetitive behavior by private payors, and that there is no conclusive evidence that such a repeal will have any positive impact on the insurance industry.[142] Although all attempts to repeal the insurance company exemption to date have failed, such legislation demonstrates the beginning of the potential widespread impact of health reform on antitrust enforcement.

Related to the insurance industry is the constantly maturing *pharmaceutical benefit management* (*PBM*) industry. This area of the healthcare industry has grown as consumers' use of pharmaceutical drugs has increased and payors have added more pharmacy benefits into their plans.[143] While there are 40 to 50 PBMs throughout the United States, and some payors manage pharmacy benefits internally, only three major national pharmacy benefit managers are present in the U.S. marketplace, which necessitates careful attention to ensure fair competition in this industry, as more and more healthcare spending is devoted to pharmaceuticals.[144]

Factoid

Over 400 mergers occurred in the health insurance industry from 1995 to 2007.

Competition in Health Insurance: A Comprehensive Study of U.S. Markets—2007 Update *(Chicago: American Medical Association, 2007), p. 1.*

Specific competition concerns include the impact of factors such as PBM pricing, generic substitution, therapeutic interchange, and repackaging practices, in addition to industry practices such as PBM ownership of mail-order pharmacies.[145]

Expansion of the PBM industry has experienced both positive and negative responses from the healthcare industry, especially with the April 2012 acquisition of Medco Health Solutions, Inc., by Express Scripts Inc., which created one of the largest PBM companies in the United States. After eight months of investigation, the FTC approved the merger, noting that it was not an "easy decision." FTC commissioner Julie Brill disagreed with the commission's final vote and issued a separate opinion, labeling the transaction a "merger to duopoly" and cited to congressional intent under Section 7 of the Clayton Act. After the merger of the two largest PBMs, CVS Caremark is the sole remaining entity of what was previously referred to as the "Big Three" by Commissioner Brill. Despite Brill's

Pharmaceutical Benefit Management (PBM)

Generally, a private firm who contracts with pharmacies to provide drug administration services, particularly claims processing and administrative functions.

"Cost Control for Prescription Drug Programs: Pharmacy Benefit Manager (PBM) Efforts, Effects, and Implications," by David H. Kreling, Sonderegger Research Center, University of Wisconsin School of Pharmacy, Conference on Pharmaceutical Pricing Practices, Utilization and Costs, Washington, DC, August 8–9, 2000.

[145] Federal Trade Commission and Department of Justice, "Industry Snapshot and Competition Law: Pharmaceuticals," in *Improving Health Care: A Dose of Competition*," July 2004, pp. 11–16.

dissent, the FTC's opinion notes that with at least 10 significant competitors, the PBM industry is only moderately concentrated and will remain competitive after the proposed merger. Ultimately, Chairman Jon Leibowitz and Commissioners J. Thomas Rosch and Edith Ramirez reasoned that although the merger would result in higher market concentration, the market would still be highly competitive, due to the remaining nine firms' presence, and noted that the merged company poses little risk of using monopsony power because the PBM market does not foster coordinated interaction.

4.6.3 Commoditization of Healthcare

Payment for healthcare services has evolved over time, starting with the implementation of Medicare in 1965 under a fee-for-service paradigm, followed by the creation of the *prospective payment system* (*PPS*) for hospital and physician services through the 1980s and the 1990s (see Section 2.4.1, "Medicare," in Chapter 2, "Reimbursement Environment") to the current reform efforts based on bundled payments that combine institutional and professional charges, or inpatient and postdischarge fees, into a single payment.[146] Beginning with the implementation of the PPS, whereby patients were classified into *diagnosis related groups* (*DRGs*) based on the average cost of services for a particular diagnosis, healthcare services have evolved into homogenous, fungible units that are bought and sold.[147] The term "*commoditization*" can be defined as the process of making an item that is not distinguished by a brand name or label into something that can be purchased in bulk quantities and sold by retailers at a standardized per unit basis. Of note is that even MedPAC discusses Medicare reimbursement as consideration paid in return for a commodity by describing healthcare services as "the products that Medicare buys."[148]

In addition to DRGs, other standardized per unit cost Medicare reimbursement systems, such as the *Resource Based Relative Value Scale* (*RBRVS*) and the *Current Procedural Terminology* (*CPT*) have also advanced

[146] Office of the Inspector General, "Medicare Hospital Prospective Payment System: How DRG Rates Are Calculated and Updated," Office of Evaluation and Inspections, Region IX (OEI-09-00-00200), August 2001, pp. 1, 5.

[147] Ibid.

[148] "Ambulatory Surgical Centers Payment System," *MedPAC Payment Basics*, October 2008, p. 1, http://www.medpac.gov/documents/MedPAC_Payment_Basics_08_ASC.pdf (accessed September 24, 2009).

healthcare services as commodities. Even during the current transition to value-based reimbursement models, instead of volume-based payment models (i.e., bundled payments and value-based purchasing), these standardized units remain.

Further evidence of the commoditization of the U.S. healthcare system is reflected in the presence of a marketplace for *Durable Medical Equipment, Prosthetics, Orthotics, and Supplies* (DMEPOS), whereby DMEPOS manufacturers submit competing bids to Medicare based on the charge per unit, the lowest of which is then chosen to be the only Medicare provider of DMEPOS in 10 different metropolitan areas.[149] The competitive bidding program was implemented in 2008, but an 18-month moratorium was put in place and all contracts were canceled under the *Medicare Improvements for Patients and Providers Act of 2008*, in response to pressure from DMEPOS suppliers, who claimed that the program would damage quality of care and reduce access.[150] The program was tested again in 2009, in what CMS referred to as the "*Round One Rebid*," and officially began on January 1, 2011. CMS is required to recomplete contracts once every three years, and the ACA mandates that the program be available in all areas of the United States by 2016.[151] The program has generated controversy, receiving more than 250 complaints from Medicare patients, and comments by the *American Association of Homecare* (AAH) reporting that the program is creating additional expenses for Medicare patients and hurting local businesses.[152]

Commoditization is an often criticized aspect of the healthcare market, yet its development may be essential to the continued growth of the healthcare industry. Mass retailers have been providing access to in-store health clinics and low-cost generic drugs in order to simplify the supply chain and increase volume, in an attempt to save money and improve care. The retail industry has become involved with healthcare as a result of a number of

factors, including (1) rising healthcare costs, (2) customers' increased access to health information, (3) evidenced-based medicine approaches, and (4) increased scope of practice considerations for midlevel providers (i.e., including physician assistants and nurse practitioners).

Timothy P. Doty wrote regarding the commoditization of healthcare:

> *[I]f health care is "fungible," then by implication the parts of health care are also interchangeable. Practically speaking, this also includes providers and patients as they are simply reduced to their identity and purpose within the confines of a business relationship. Just as the seller is interested only in providing that which the buyer needs (or desires) in so far as there is sufficient financial reward, the buyer is only concerned with obtaining the desired object (or service). Who they are makes no real difference. Commodification dictates that a physician is like any other, as long as they are matched with respect to specialty. He or she ceases to be the indispensable community caregiver, and instead becomes the link between company and profit, or shareholder and dividend. Patients, by the same token, are no longer seen as individuals with unique personalities and health care needs but as a source of revenue; they become "covered lives" and a "business asset whose value is inversely proportional to the cost of health care resources their care is predicted (statistically or otherwise) to consume."*[153]

Current Procedural Terminology (CPT)

Current procedural terminology is a system developed by the AMA that is used by providers to report information to patients and insurers about services and procedures provided to patients.

Michelle A. Green and JoAnn C. Rowell, CPT Coding" In "Understanding Health Insurance: A Guide to Billing and Reimbursement, *9th ed., by Michelle A. Green and JoAnn C. Rowell (Clifton, NY: Delmar Cengage Learning, 2008), p. 191.*

Diagnosis Related Group (DRG)

An insurer reimburses hospitals and physicians for all services that a patient receives in the hospital based on a patient's specific grouping.

"Bundled Payment: AHA Research Synthesis Report," American Hospital Association Committee on Research (May 2010), p. 3.

Prospective Payment System (PPS)

A system used by Medicare to pay medical providers, hospitals, and clinics a set amount of money per diagnostic related group (DRG).

Dictionary of Health Economics and Finance, *by David Marcinko (New York: Springer, 2007), p. 293.*

Resource Based Relative Value Scale (RBRVS)

The RBRVS is the scale on which Medicare bases its standardized physician payment schedule. The RBRVS determines payments based on the value of the resources necessary to provide a particular service.

"Overview of the RBRVS," American Medical Association, http://www.ama-assn.org/ama/pub/physician-resources/solutions-managing-your-practice/coding-billing-insurance/medicare/the-resource-based-relative-value-scale/overview-of-rbrvs.shtml (accessed October 5, 2009).

REIMBURSEMENT CODES

Numerical codes that specify type of procedure or diagnosis (different codes for each). Common code systems include CPT, ICD, HCPCS.

Centers for Medicare and Medicaid, "Overview: Transaction Code Sets Standards," http://www.cms.hhs.gov/TransactionCodeSetsStands/ (accessed September 15, 2009).

4.6.4 Provider Consolidation

There has also been a noticeable shift in competition among physicians in recent years. Originally, many physicians operated as independent competitors, perhaps allied only with the hospital(s) to which they referred patients.[154] The mid-1990s experienced a *frenzy* of physician practice acquisitions by hospitals, health systems, and large integrated groups as managed care organizations (and HMOs) boomed. With the collapse of the managed care–driven integration efforts of that era, buyers experienced significant financial losses on their practice acquisitions, and many integrated systems divested physician practices.[155] Of note is that several physicians bought back elements of their practices.[156]

Although the managed care boom was short-lived, consolidation efforts have rekindled in recent years, due to various legislative initiatives (i.e., ACOs, PCMH), increases in the cost to maintain independent practices, reimbursement cuts, restrictions on physician ownership, increased regulatory scrutiny, increased technological demands for reporting (i.e., ICD-10 conversion), and changing physician demographics and demands (e.g., a greater number of older physicians and the increased importance of work/life balance). The number of hospital mergers and acquisitions increased 33 percent in 2010, as compared to 2009.[157]

Consolidation among providers (either through physician employment or mergers and joint ventures between healthcare enterprises) has already

begun to affect the competitive nature of the healthcare industry. Regulations designed to limit and monitor competition have been modified to facilitate ACA initiatives, that is, Stark, Anti-Kickback, and antitrust waivers for ACOs. Hospital leverage has increased, especially in urban areas, as more physicians enter into employment arrangements. Coordination of care efforts will force cooperation between primary care providers and specialist physicians from all disciplines, which will require a new alignment of objectives among hospitals, physicians, and outpatient facilities. With the rapid sea change resulting from reform and environmental drivers, the once well-defined, relatively stable business landscape of U.S. healthcare delivery now presents an unpredictable milieu of new provider configurations, strategies, and tactics that the healthcare industry, and the competitive forces that govern it, must adapt to.

4.6.4.1 Comanagement Arrangements Increasingly, physicians and hospitals are trying to become more integrated in order to effectively respond to healthcare reforms (e.g., ACOs and PCMH) and provide more coordinated care. One method of achieving this common goal is through comanagement arrangements, which have reemerged in recent years as an alternative care model.[158]

Under new comanagement models, a hospital may enter into a management agreement with an organization that is either jointly owned or completely owned by a physician, in order to provide daily management services for the inpatient and/or outpatient components of a medical specialty service line.[159] A comanagement arrangement incentivizes physicians for the development, management, and improvement of quality and efficiency, as well as for making the service line more competitive in the target market.[160]

4.6.4.2 Accountable Care Organizations (ACOs) ACOs are the latest iteration in a dialogue that has been evolving for generations as to how to manage the rising cost of healthcare in a manner that addresses both *cost* and *quality.*

[158] Melanie Evans, "Co-Management Emerges As Alternative to Joint Ventures, Employment by Hospitals" *Modern Physician*, May 10, 2010, http://www.modernphysician.com/apps/pbcs.dll/article?AID=/20100510/MODERNPHYSI# (accessed July 18, 2012).

[159] Paul F. Danello, "Clinical Co-Management: Hospitals and Oncologists Working Together," *Journal of Oncology Practice* 2, no. 1 (2006).

[160] Ibid.

The concept of *accountable care* has existed in the American healthcare industry for decades—long before the emergence of ACOs. Most notably, the managed care boom of the 1990s promised some of the same major fundamental objectives of accountable care, that is, lower costs and higher-quality outcomes for patients. Managed care took off in response to the advent of HMOs, a prepaid health plan model that used provider networks with a system of *primary care gatekeepers* and capitated provider reimbursement incentivizing decreases in utilization and increases in the efficiency of care for HMO members.

ACOs hold out the promise of being more successful than their managed care predecessors. Current trends in hospital-physician alignment have led to a consolidation of physicians and have made incentives for physician compensation more amenable to realignment with reform goals and reimbursement models. Integrated health systems, especially those with an internal payor, have already noted the benefits of physician employment on quality and cost efficiencies. The clinical and management collaborations between healthcare providers within ACOs will likely result in the desired coordination of patient care and reduction in the duplication of patient care, necessary to lower healthcare costs for both providers and payors.

Overall, the success or failure of ACOs will be in their ability to achieve the required cost reductions and quality goals. ACOs' success may not be contingent on addressing other healthcare reform issues, such as the referral of primary care patients to specialists, healthcare access, and the increasing health disparities across socioeconomic classes. Their potential success, their continued evolution, and their positive public perception within the healthcare industry may be the definitive distinction between ACOs and managed care and are likely to be the primary measure of their value.

4.7 CONCLUSION

Michael Porter and colleagues wrote in the *Harvard Business Review* that

> *In industry after industry, the underlying dynamic is the same: competition compels companies to deliver increasing value to customers. The fundamental driver of this continuous quality improvement and cost reduction is innovation. Without incentives to sustain innovation in health care, short-term cost savings will soon be overwhelmed by the desire to widen access, the growing health needs of an aging population, and the unwillingness of Americans to settle for anything less than the best treatments*

> *available. Inevitably, the failure to promote innovation will lead to lower quality or more rationing of care—two equally undesirable results.*[161]

If the barriers to competition continue to be barriers to healthcare market innovation (as many are now), healthcare purchasers, managers, and legislators must act through incentives such as ACOs and VBP program initiatives to ensure that innovation takes the forefront of any reform efforts, if it is to be effective in responding successfully to public and governmental pressures to reduce and improve costs.

As Michael Porter and Elizabeth Omstead Teisberg stated in their 2006 book, *Redefining Health Care*, limiting competition is not the solution but, rather, "The only way to truly reform health care is to reform the nature of competition itself."[162] Porter explained that

> *Because of the lack of effective competition at the condition level, the actual organization and structure of care delivery by most providers is not aligned with patient value. Lack of value-based competition on results has allowed care of a patient to be fractured across numerous specialties, hospital departments, and physician practices, each of which focuses on its discrete intervention. Nobody integrates care for the medical conditions as a whole and across the full care cycle, including early detection, treatment, rehabilitation, and long-term management.*[163]

This concept foreshadowed many of the current healthcare reform initiatives and associated market trends. Competition in healthcare, over the coming years, will likely be fueled in greater degrees by patient outcomes and coordinated care efforts across specialties and facility types, under the drive of provisions of the ACA, including value-based purchasing, accountable care organizations, medical model homes, and other changing reimbursement quality paradigms.

CHAPTER 5

Technology

Furthermore, science and Western medicine are associated with technology and innovation. The idea that "new" means "improved" and that "cutting-edge" implies "better" greatly affects the way in which Americans view medical interventions.

—William Wiist, *The Bottom Line on Public Health*[1]

5.1 OVERVIEW

Technology has a broad meaning when applied to healthcare. It can range from the tangible tools, pharmaceuticals, and software that providers use during the provision of clinical services and the management of patient records to the procedures that constitute the standardized course of care. The word itself comes from the Greek *tekhnologia*, meaning "systematic

[1]William H. Wiist, ed., *The Bottom Line on Public Health* (New York: Oxford University Press, 2010), p. 204.

treatment." While the scope of technology has changed dramatically since the seventeenth century, the concept of *technology* still resembles its origins.[2]

Healthcare technology has been evolving since the beginning of medical science. For more information on the evolution of medical science, see Chapter 1, "Chronology of U.S. Healthcare." A time line of technological innovations is illustrated in Exhibits 5.1 through 5.3.[3]

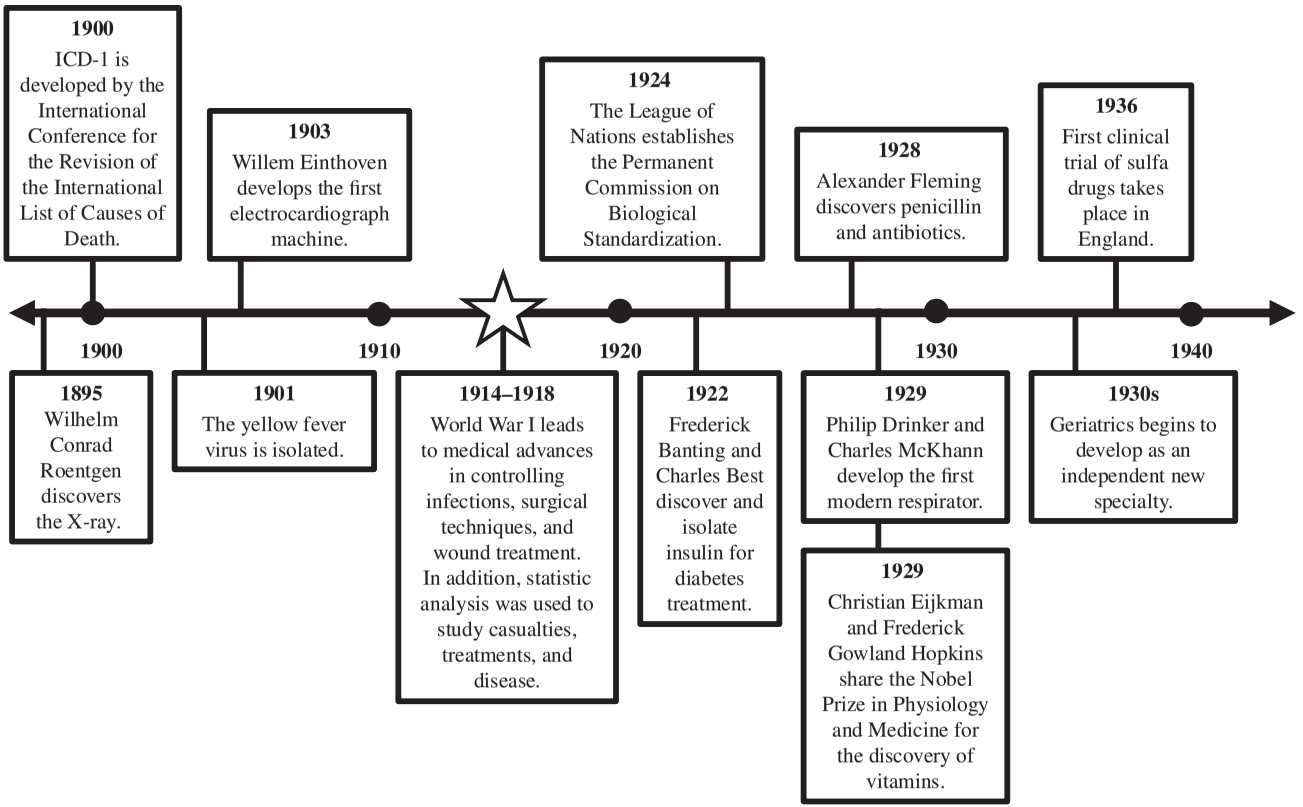

EXHIBIT 5.1 Milestones of Technological Innovations: 1895–1940

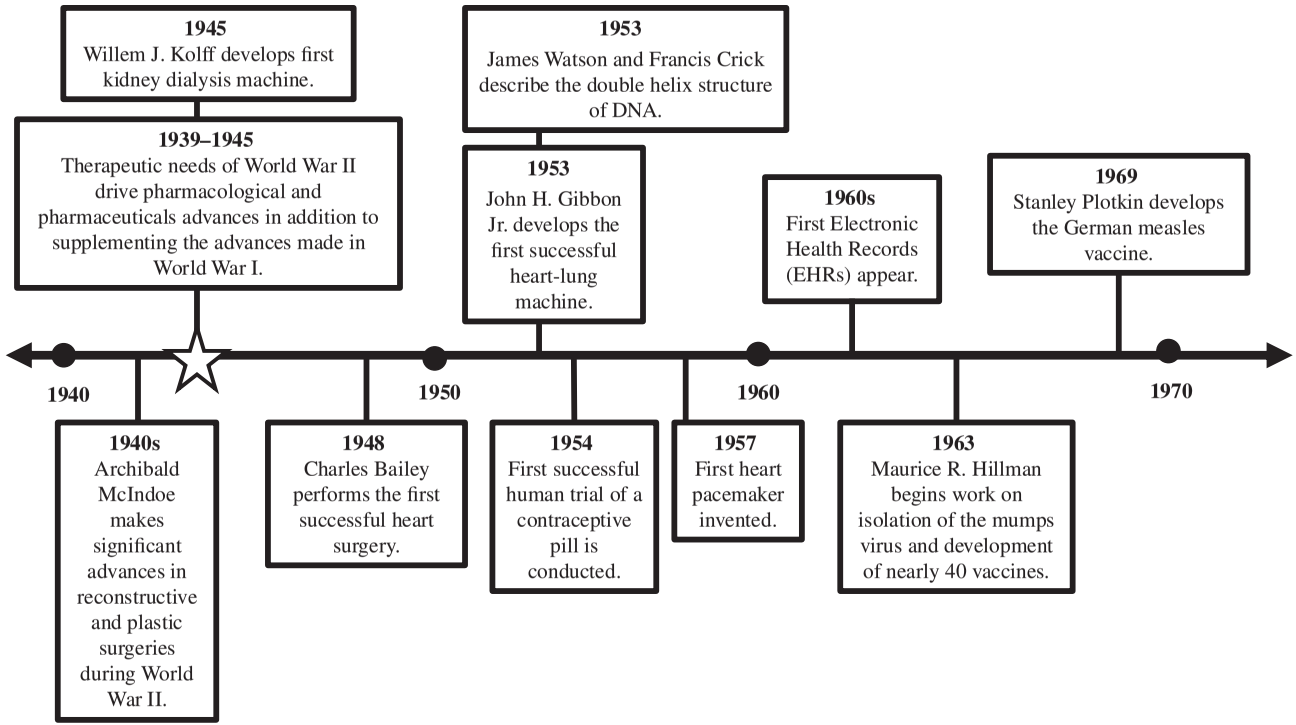

EXHIBIT 5.2 Milestones of Technological Innovations: 1940–1970

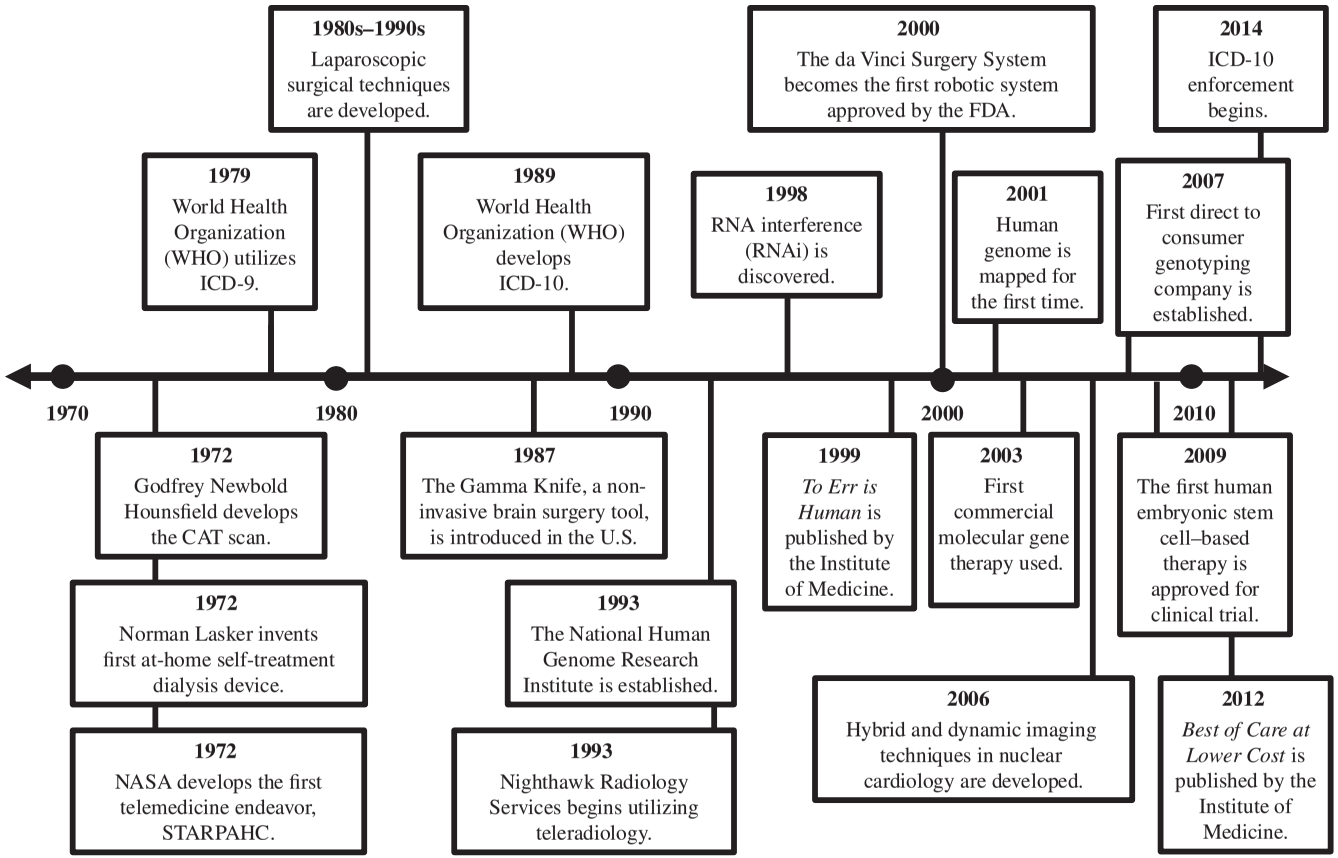

EXHIBIT 5.3 Milestones of Technological Innovations: 1970–2014

Medical technologies experienced a drastic increase in the rate of development resulting from the innovations discovered during World War II (WWII). WWII was an "*industrial*," or factory war, resulting in industrialized countries, especially the United States, producing infinitely expendable machines to feed their war efforts.[4] The lasting global impact of the atrocities of WWII led to a variety of responses among developed countries as to the ethical and philosophical implications of technology.[5] While European nations developed healthcare delivery systems that focused on access, the United States took on a more conservative approach that saw the boom in technology as a neutral tool that could be used for the betterment, or the destruction, of humanity.[6] To correct for the more politically "*unethical utilization choices*" made during WWII, the United States instituted reactive bodies and agencies to assess technologies, for example, ethics committees. With the ethical dilemmas addressed, the United States aggressively used technological innovations as a significant element in the advancement of healthcare delivery.

The industrialization of manpower following WWII included the industrialization of medicine. The decades following WWII saw medical advances, such as *penicillin*, resulting in decreases in infectious disease rates, increases in life expectancy, decreases in infant mortality rates, and decreases in deaths from cardiovascular diseases. Pharmaceutical advances resulted in continual new discoveries, and by the 1990s, 35 percent of the 200 largest-selling prescriptions

in the United States were new drugs.[7] The post-WWII era also saw impressive growth in federal funding for biomedical research and medical education.[8]

All of these advances were not without related costs. Decreased mortality rates led to a longer life expectancy, resulting in increased medical costs for care of an aging geriatric population. Technological advances themselves put a drastic increased burden on medical costs, with technological changes being a significant factor in the continued growth of health expenditures.[9] The United States exhibits an intensive technologically focused style in the practice of medicine that is unseen elsewhere.[10] In the United States, technology-driven medicine is perceived as a source of professional prestige, with society generally favoring the application by providers of even more advanced medical technologies.[11] The focus on using new, costly technologies has led to intense debate as to whether the effects of such new technologies are worth the high cost, especially in light of the recent global recession and increasing U.S. deficits.

The struggle of the healthcare system to fund emerging technologies in the capital environment is the result of multiple factors, including the recent economic downturn of indefinite duration, the failure of the market to rebound to prerecession levels, the uncertainty surrounding the state of healthcare reform, limited access to capital, and ongoing issues related to reimbursement.[12] Despite the recession, recent data suggests that healthcare leaders are still committed to capital spending and may remain confident that they will be able to secure funding for future projects.[13] *Premier, Inc.* reported in a 2011 survey that 69 percent of healthcare organizations had a capital budget that had remained stable or increased from the previous

year.[14] Of those surveyed, most organizations indicated that their future spending would be directed toward information technology and telecommunications.[15] A similar survey conducted by *HealthLeaders Media* indicated that 39 percent of healthcare organizations anticipate that they will allocate most of their 2012 capital funds to new medical technologies, including *electronic medical record* (EMR) systems[16] (see Chapter 9, "Costs and Sources of Capital," for a further discussion of healthcare capital financing).

5.2 MANAGEMENT TECHNOLOGY

Demand for healthcare services is expected to increase dramatically in the coming years, as (1) *access improves*, (2) the *general population grows*, (3) the number of individuals *over the age of 65 increases*, and (4) the *physician shortage worsens*.[17] Particularly in 2014, when an anticipated 22 million individuals enter the insurance market under the *individual mandate*, providers will have to implement *methods of managing* added patient throughput.[18] This anticipated growth in demand is a significant driver of more sophisticated *patient management technologies*, as well as the *infrastructure* for *gathering* and *interpreting quality and outcomes data* to support *evidence-based performance metrics* as the foundation for *value-based reimbursement*. The demand for *management technology* vis-à-vis the current U.S. healthcare delivery system was characterized in the *2012 Futurescan Report* as

> *The healthcare industry cannot bend the cost and quality curve without relentless technology-enhanced innovation—a constant stream of new ideas, new methods, and new ways of providing and*

> *payment for care. Such innovation will be most effective if it comes from healthcare executives and clinicians "in the trenches" who are no longer willing to do things in ways that clearly have been shown not to work.*[19]

Management technologies include (1) the *processes* and *procedures* through which providers organize *patient encounters*, *charge entry*, and the *billing process*; as well as (2) the *software* and *devices* that support these endeavors. Although there are numerous methods through which a healthcare entity may choose to approach *management*, the most publicized involve the *interoperable exchange* and *consolidation* of *patient data* and *treatment standards*. While most of the current *management systems* are implemented as a single package, many contain (1) *electronic health records* (EHRs), (2) *computerized physician order entry* (CPOE), and (3) *billing* components.

5.2.1 Technology as "Process"

Typically, the term "*medical technology*" brings to mind images of large industrial machines or complex computer programs used to organize and track patient data. While this chapter focuses on *management* and *clinical technologies*, the term *healthcare technology* goes beyond the simple hardware and software used by providers and includes such intangible concepts as *healthcare processes*.

Process technologies can affect the manner and structure by which healthcare is *delivered* and *measured* on both a *clinical* and a *management* level, including *treatment protocols*, *care mapping*, and *case management*. For example, a three-year study of a pediatric intensive care unit found that more stringent hand hygiene, oral care, and central-line catheter care protocols reduced hospital-acquired infections, and associated healthcare costs, as patients spent an average of 2.3 fewer days in the hospital.[20]

Management protocols aim to reduce healthcare spending without lowering the level of quality care delivered by establishing protocols that allow providers to appropriately identify those procedures in which the expected treatment benefits to the patient are outweighed by the costs of delivering

[20] Bradford D. Harris, et al., "Strict Hand Hygiene and Other Practices Shortened Stats and Cut Costs and Mortality in a Pediatric Intensive Care Unit," *Health Affairs* 30, no. 9 (September 2011): 1756.

such care, including early prostate cancer detection testing, routine EKGs, or yearly Pap smears.[21] In addition to the voluntary utilization of such *management technologies* by providers, payors may also influence providers in this regard. For example, in 2008, Medicare began withholding payments for the treatment of conditions arising from 28 "*never events,*" defined by the *National Quality Forum* (NQF) as serious medical errors, such as performing the wrong surgical procedure; product or device events, such as contaminated drugs or devices; and criminal events, such as abduction of a patient.[22]

While not specifically defining the concept of technology as process, the *2012 Institute of Medicine Report* titled *Best Care at Lower Cost: The Path to Continuously Learning Health Care in America* nevertheless recommended several steps to facilitate the development of relationships between technology and providers if the U.S. healthcare delivery system is to learn from its past errors, stating that "[t]o achieve a learning healthcare system, digital technology developers need to play the following roles:

- Ensure that electronic health record systems and other digital technologies capture and deliver the core data elements needed to support knowledge generation;
- Partner with patients, the delivery system, insurers, researchers, innovators, regulators, and other stakeholders;
- Collaborate in the development of core data sets for different diseases and conditions to support clinical care, improvement, and research;
- Develop tools that assist individuals in managing their health and health care and that provide opportunities for building communities to support patient efforts;
- Consider interoperability and integration in clinical workflows in designing digital health systems.[23]

[22] Henry J. Aaron and Paul B. Ginsberg, "Is Health Spending Excessive? If So, What Can We Do about It?" *Health Affairs* 28, no. 5 (September/October 2009); Herb B. Kuhn, "State Medical Director Letter," Centers for Medicare and Medicaid Services, to State Medical Director, July 31, 2008, http://downloads.cms.gov/cmsgov/archived-downloads/SMDL/downloads/SMD073108.pdf (accessed October 7, 2012); The Leapfrog Group, "Never Event Fact Sheet," March 2008, http://www.leapfroggroup.org/media/file/Leapfrog-Never_Events_Fact_Sheet.pdf (accessed February 8, 2011).

[23] Mark Smith, et al., *Best Care at Lower Cost: The Path to Continuously Learning Health Care in America,* Institute of Medicine (Washington, DC: The National Academics Press, 2012), (prepublication copy–uncorrected page proofs).

Furthermore, the *2012 IOM Report* emphasized the importance of maintaining a "*digital infrastructure*" as the backbone for healthcare delivery in the United States, recommending that the U.S. healthcare system should "Improve the capacity to capture clinical, care delivery process and financial data for better care, system improvement, and the generation of new knowledge. Data generated in the course of care delivery should be digitally collected, compiled and protected as a reliable and accessible resource for care management, *process improvement*, public health, and the generation of new knowledge."[24] [Emphasis added.]

5.2.2 Electronic Health Records

Individual healthcare providers are responsible for *collecting*, *maintaining*, and *analyzing* patient data during the course of each *patient encounter*.[25] Electronic patient records may avoid some of the pitfalls of *paper records*, for example, (1) *wasted resources*, (2) *storage concerns*, (3) *misplacement*, and (4) *retrieval issues*. Furthermore, *paper records* do not allow for the efficient search for the requisite data extraction and analysis of voluminous *patient clinical*, *demographic*, and *financial information*.[26] Unlike *paper records*, most *electronic record systems* can be electronically and instantly *searched*, *categorized*, and *analyzed*, thereby improving providers' ability to offer more *informed treatment plans* to patients.[27] Although *electronic record systems* have been in the market for more than a decade, the *prevalence* of these systems has been low, until recent promotion under various *health reform efforts* and *legislations*. Electronic health record systems come in a variety of forms with small, but important, differences.

Of note, there is a distinction between an *electronic medical record* (EMR) and an *electronic health record* (EHR), although the two terms are often incorrectly treated as synonyms. Both terms refer to the *electronic collection* and *management* of *health related information*; however, EHRs are subject to additional *regulatory scrutiny* and *interoperability*

standards, that is, *meaningful use* (discussed later). Both terms can be juxtaposed with *personal health records* (PHRs), another related but distinct term that describes an *electronic record system* that is controlled by the *patient*, in contrast to the *provider*.[28] For the purposes of this book, to note the importance of *interoperability* in regards to *regulation*, *funding*, and *emerging healthcare initiatives*, our discussion will be focused on EHRs and PHRs. The varying scopes of these terms are illustrated in Exhibit 5.4.

Electronic Medical Record (EMR)

An electronic record of health-related information on an individual that can be created, gathered, managed, and consulted by authorized clinicians and staff *within one health care organization*.

Electronic Health Record (EHR)

An electronic record of health-related information on an individual that comes to nationally recognized interoperability stands and that can be created, managed, and consulted by authorized clinicians and staff *across more than one healthcare organization.*

"Table 5: Electronic Health Records Definitions," in "Defining Key Health Information Technology Terms," *by the National Alliance for Health Information Technology, to the National Coordinator for Health Information Technology—Department of Health and Human Services, April 28, 2008, p. 15.*

Personal Health Record (PHR)

An electronic record of health-related information on an individual that conforms to nationally recognized standards and that can be drawn from multiple source while being managed, shared, and controlled by the individual.

"Table 5: Electronic Health Records Definitions," in "Defining Key Health Information Technology Terms," by the National Alliance for Health Information Technology, to the National Coordinator for Health Information Technology—Department of Health and Human Services, April 28, 2008, p. 19.

Through the use of EHRs, *providers* can create and maintain a complete record of a clinical patient encounter, as well as supporting other care-related activities, including evidence-based decision support, quality management, and outcomes reporting.[29] Enabled by advances in computers and electronic communication, EHRs compile observations, test results, and narratives by multiple providers in one location, which allows for communication among different providers in the treatment of a patient.[30] Facilities that use EHR systems increase the efficiency at which practitioners can file, manage, organize, and find their patients' demographic data, progress notes, problems, medications, vital signs, past medical histories, immunizations, laboratory

[30] "Defining Key Health Information Technology Terms," National Alliance for Health Information Technology, to the National Coordinator for Health Information Technology, Department of Health and Human Services, April 28, 2008, p. 17.

data, and radiology reports.[31] If presented in a simple, user-friendly interface, EHRs have the potential to improve the ability of providers to make diagnosis, treatment, and health management decisions.[32]

5.2.2.1 Trends in EHR Utilization The first EHRs were adopted in the 1960s, but many healthcare providers at the time did not view updates to their "*anachronistic*" medical record systems as a priority.[33] Modern EHR systems are based on the research and pilot testing conducted in academic medical centers, developed for use by governmental clinical care organizations. Some noteworthy attempts in EHR development are set forth in Table 5.1.

Early attempts to design and implement EHR technology faced several challenges, and while improvements have been made, significant difficulties remain, impeding the pace of more widespread acceptance and efficiencies. The status of EHR implementation, as of 2011, is set forth in Table 5.2.

Of note, the *Healthcare Information and Management Systems Society* (HIMSS) survey, cited for Table 5.2, discontinued reporting EHR status in 2012.[34]

Since 2001, the number of office-based physicians who used EHR systems has increased from 18 percent to 51 percent in 2010, 57 percent in 2011. Despite only 33.9 percent of those EHR systems used by office-based physicians being considered "*basic*" under *meaningful use standards*, 52 percent of physicians planned to apply for *meaningful use* incentives in 2011, up from 41 percent in 2010.[35] The states with the greatest percentage of office-based physicians using EHR systems include (1) North Dakota, 84 percent; (2) Utah, 80.8 percent; (3) Minnesota, 77.6 percent;

TABLE 5.1 Notable Precursors of EHR Technology[36]

Year	Program	Developer	Impact
1960s–1970s	Technicon Data System (TDS)	Lockheed and El Camino Hospital	Processing speed and flexibility let multiple users into the system at one time.
1960s	Health Evaluation through Logical Processing (HELP)	University of Utah and Latter-Day Saints Hospital (brought to market by the 3M Corporation)	One of the first clinical decision-support programs.
1968–1975	Computer-Stored Ambulatory Record (COSTAR)	Harvard University and Massachusetts General Hospital	Compartmentalized design increased efficiency, flexible vocabulary accounted for terminology variations, and was first to be made available in public domain.
1970s	Decentralized Hospital Computer Program (DHCP)	U.S. Department of Veterans' Affairs	First time the federal government began using EHR.
1983	THERESA	Emory University and Grady Memorial Hospital	First system to encourage direct physician data entry.
1986	The Medical Record (TMR)	Duke University Medical Center	Made data easy to manipulate and sort for ease of reference, giving way to Duke's Health Information System.
1988	Composite Health Care System (CHCS)	U.S. Departments of Defense	Renowned for lowering medical errors integrating various health record components.

[37] Ibid.

The adoption of the EHR system also appears to be creating a widening divide between specialists (32 percent) and primary care providers (41 percent), whereby significantly more primary care practices have implemented EHR systems that meet *meaningful use* criteria. Other discrepancies in EHR adoption include (1) *age*, that is, physicians age 45 and younger are 17 percent more likely to use an EHR system than are physicians age 55 and older; (2) *practice size*, that is, practices with 10 or more physicians are 42 percent more likely to use EHR systems than practices with 1 to 2 physicians; and (3) *ownership*, that is, practices owned by hospitals/health systems are more likely to adopt an EHR system than are those owned by a physician or a physician groups.[38] Outside of physician practices, EHR adoption seems to be further along, with 99 percent of physicians in *health maintenance organization* (HMOs) using EHRs in 2011, and 73 percent of physicians in *academic health centers* using EHRs in 2011.[39]

It is estimated that the cost of implementing a small-scale EHR system (for a small physician group practice) can equal approximately $162,000, with $85,000 in maintenance expenses in the first year.[40] Furthermore, accounting for the potential loss of productivity associated with the initial implementation may increase the cost of transitioning to an EHR system.[41] However, research suggests that physicians who use EHRs, with sophisticated Medicare coding support, could see a revenue increase of up to 30 percent over physicians who continue using paper records.[42] Some cardiology practices have already reported substantial EHR benefits, including improvements in lowering Medicare rejection rates; improvements in their days in accounts receivable; increased patient volume, without increasing staff; increased revenue; and reduction in transcription and postage costs.[43]

Factoid

Physicians who use EHRs with sophisticated Medicare coding support could see a revenue increase of up to 30 percent more than doctors who continue using paper records.

"The Benefits of Evidence Based Medicine in EHR Systems," by Tom Doerr, EHR Scope *(Spring 2008).*

In addition to governmental incentives and requirements (discussed further), EHRs are imperative for current emerging value-based purchasing and evidence-based trends, for example, *accountable care organizations* (ACOs) and the *hospital value-based purchasing program*. Variations on, or extensions of, EHR systems facilitate the growth and success of such programs, in addition to furthering consumer-driven healthcare and accountability, as well as access to care.

5.2.2.1.1 Patient Health Records In 2010, the market for *personal health record* (PHR) software generated revenues of approximately $312.2 million. Market researcher *Frost & Sullivan* estimates that PHR software market revenue will reach approximately $414.8 million by 2015.[44] The anticipation of 5.8 percent compounded annual growth, during the next 4 years,

(accessed September 22, 2009) (Cardiology practice, MMC, stated that since the implementation of an EMR system, their rejection rate for Medicare claims has been reduced to 0.05 percent and their days in accounts receivable has dropped from 110 days to 34 days); Cardiology Practice Advisor, "How One Practice Made EMR Improve Workflow, Patient Care, & Revenue," Advisor Publications, May 2001, http://www.medinformatix.com/pdf/pr_Case_Studies_cardiology_Practice_advisor.pdf (accessed August 13, 2009) (stating that EMR has facilitated 25 percent patient increase without increase in staff, 35 percent more revenue, substantially improved Medicare denial rate, reduction in transcription and postage costs, and improved accounts receivable); Clear Technologies, "Cardiology Practice Raises the Level of Patient Care: Electronic Medical Records Prove to Pay at a Higher Rate than Paper Claims," 2004, http://www.comparecrm.com/crm-vendors/c2crm/case-studies/csant.pdf (accessed August 13, 2009) (stating that a cardiology practice in Texas has seen substantial improvements in Medicare and Medicaid reimbursements since implementation of EMR).

[44] Frost & Sullivan, "Personal Health Record Use Is Poised for a Significant Upswing, Finds Frost & Sullivan" July 11, 2011, http://www.frost.com/prod/servlet/press-release.pag?docid=237681098&gon1106A3=HCITMI1 (accessed October 11, 2012).

comes as a surprise in light of the rate at which caregivers have adopted the use of PHRs into their practice.

PHRs provide individuals with the means to *document*, *track,* and *evaluate* their health conditions to (1) *facilitate more informed healthcare decisions*, (2) *improve personal health status*, (3) *reduce costs*, and (4) *improve the quality of healthcare*.[45] A PHR is a digital record of one individual's personal health information. Although still in its early stages, the use of PHR gives a more complete and organized portrayal of an individual's health condition over time and allows patients to maintain their personal health information in one place and, should they wish, share recent health services or conditions with providers. Some PHRs also allow patients to refill prescriptions, schedule appointments, and email their provider(s).[46]

There are three forms of PHRs: (1) *Untethered*, (2) *Tethered*, and (3) *Payor-Tethered*.[47] *Untethered* PHRs are *electronic* or *paper systems* created and managed solely by the *patient*, in contrast to *tethered* PHRs, which are systems controlled by the healthcare provider and updated automatically by the physician-controlled EHR. *Tethered* PHRs restrict the patients from making changes to their records. *Payor-Tethered* PHR systems refer to those managed by a third party and primarily generated through the use of claims information, which allow the patient to manage limited demographic information.

Physicians have expressed some concern surrounding patient autonomy and healthcare records.[48] According to Matthew Wynia, MD, MPH, director at the *Institute for Ethics and Center for Patient Safety* at the *American Medical Association* in Chicago, as of February 2011, only 14 percent of the 856 responding physicians reported using PHRs on a daily basis, perhaps attributable to patient ignorance about the existence of such a program or

the fact that 79 percent of physicians reported concerns with the validity of data retrieved from a PHR.[49] Allowing patients to manage and update their PHR may create opportunities for inaccuracies and errors that could potentially lead to errors in treatment. In addition to concerns regarding validity, physicians expressed other concerns, for example, tethered PHRs that are updated by the clinicians' EHR systems may send patients their lab results prior to physician review, presenting concerns surrounding the improper release of highly sensitive medical information and related potential risks such as breach of Internet security and identity theft.[50]

5.2.2.1.2 Patient Registries Patient registries are defined by the Agency for Healthcare Research and Quality as "an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes."[51] Registries collect and "clean" patient data to allow the provision of population-based reports to participants by collecting and storing patient diagnosis data, generating output that facilitates individual patient care delivery and coordination, assisting in population management, and supporting essential research applications.[52]

5.2.2.2 American Recovery and Reinvestment Act of 2009 and Health Information Technology for Economic Clinical Health Act President Obama signed the *American Recovery and Reinvestment Act of 2009* (ARRA) into law on February 17, 2009, which allotted $19.2 billion to ensure that *every patient has a complete,*

interoperable EHR by 2014.[53] The net return of this investment was anticipated to include long-term cost savings, improved outcomes, and increased ease of communication between physicians. In an effort to incentivize the implementation of EHR use, beginning in 2011, reimbursement funding increased for Medicare and Medicaid providers (up to $65,000 per physician and $11 million per hospital) who use EHRs.[54] Conversely, in 2015, physicians who are not using EHRs will be penalized through reduced reimbursement.[55]

The ARRA established both the *Health Information Technology for Economic and Clinical Health Act* (HITECH) and an *Office of National Coordinator for Health Information Technology* (ONC) within the *Department of Health and Human Services* (HHS).[56] HITECH requires Medicare providers to obtain "*meaningful use*" of EHR by the end of 2014 to avoid reimbursement penalties and provides both financial incentives and programmatic support to overcome obstacles that have previously kept providers from adopting some form of an electronic record system.[57]

Factoid

The ARRA allotted $19.2 billion to ensure that each American has a complete, interoperable EHR by 2014.

"Healthcare and the American Recovery and Reinvestment Act," by Robert Steinbrook, MD, New England Journal of Medicine *(March12, 2009), http://content.nejm.org/cgi/content/full/NEJMp0900665 (accessed February 20, 2009).*

[56] Specific provisions of the ARRA, namely, Title IV of Division B and Title XIII of Division A, are collectively known as the Health Information Technology for Economic and Clinical Health Act (HITECH Act). "Office of the National Coordinator for Health Information Technology," 42 U.S.C. § 300JJ-11 (July 9, 2010); "American Recovery and Reinvestment Act of 2009, Sec. 13101," *Pub. L.* 111-5, 123 Stat 115 (February 17, 2009), pp. 226, 230–234.

[57] "American Reinvestment and Recovery Act, Sec. 13101," *Pub. L.* 111-5, 123 Stat 115 (February 7, 2009), p. 231; Paul Tang, "Meaningful Use of Health Information Technology: From Public Policy to Changing Care," *Future Scan 2011: Healthcare Trends and Implications 2011–2016*, 2011, p. 33.

Under HITECH, the *HIT Policy Committee* was established for the purpose of developing a framework to be used by CMS to decide whether a provider has met the "*meaningful use*" requirements.[58] The framework established by the *HIT Policy Committee* consists of five categories (four clinical and one foundational), including (1) improving the *quality*, *safety*, and *efficiency* of healthcare to *reduce healthcare disparities*; (2) *engaging patients* and families; (3) improving *care coordination*; (4) improving population and *public health*; and (5) ensuring *privacy and security of health information*.[59]

For both Medicare and Medicaid healthcare providers to qualify for HITECH incentives, they must demonstrate fulfillment of three requirements for "*meaningful use*" of EHRs:

1. *Use of certified EHR technology in a meaningful manner (for example, electronic prescribing);*
2. *That the certified EHR technology is connected in a manner that provides for the electronic exchange of health information to improve the quality of care; and*
3. *That, in using certified EHR technology, the provider submits . . . information on clinical quality measures and such other measures selected by the Secretary.*[60]

Medicaid also requires that healthcare providers receiving incentives under HITECH must indicate efforts to "*adopt, implement, or upgrade certified EHR*

Factoid

Between 2004 and 2005, the agency for healthcare research and quality awarded more than $166 million in funding for health IT, much of which focused on the implementation and evaluation of CPOE. Today, funding is tied to meaningful use through the HITECH Act.

"Inpatient Computerized Provider Order Entry (CPOE): Findings from the AHRQ Health IT Portfolio," by Brian E. Dixon and Atif Zafar, U.S. Department of Health and Human Services, Agency for Healthcare Research and Quality, January 2009, http://healthit.ahrq.gov/images/jan09cpoerport/cpoe_issue_paper.htm (accessed June 22, 2009), p.2.

technology" wherever possible.[61] States also reserve the right to implement additional requirements for "*meaningful use*" beyond the minimum standard upheld by Medicare, which will undergo additional changes as definitions for "*certified EHR technology*" and a "*qualified EHR*" are finalized.[62]

5.2.2.2.1 Meaningful Use "*Meaningful use*" is the vague standard named by CMS to determine whether providers are eligible for EHR implementation incentive payments under the *Medicare and Medicaid Electronic Health Record Incentive Program*. *Meaningful use* is an evolving term with three stages. Since the program's inception in 2011, more than 3,300 hospitals and 120,000 eligible healthcare professionals have qualified for participation, exceeding the government's target by approximately 23,000 individuals.[63] To date, only Stage 1 has been implemented; however, the Final Rule for Stage 2 was published on September 2, 2012.

According to the latest HIMSS survey of healthcare IT executives, achieving *meaningful use* requirements has fallen as a top priority status from nearly 50 percent in 2011 to 38 percent in 2012, implying that many organizations believe they have achieved *meaningful use*.[64] A description of healthcare organizations level of preparedness for Stage 1 meaningful use is set forth in Table 5.3.

TABLE 5.3 Percent of Organizations Expecting to Qualify for Stage 1 Meaningful Use

Qualification Stage	Percentage of Surveyed Programs
Have Already Attested	26%
Will Attest by End of 2011	4%
First Six Months of 2012	27%
Second Six Months of 2012	22%
Wait until 2013	17%
Not Planning to Attest	2%
Don't Know	3%

[64] Healthcare Information and Management Systems Society, "2012 HIMSS Leadership Survey: Senior IT Executive Results," February 21, 2012, p. 7.

While Stage 1 of "*meaningful use*" focused on *collecting data* and moving toward the use of *clinical decision support*, Stage 2 is designed to improve care and lay the foundation for Stage 3's goal to *promote quality outcomes*. Several features of the Final Rule are designed to streamline the process for participating providers, as well as provide advance assurance that their systems comply with program requirements and qualify them for incentive payments under the program.[65]

In the Final Rule, CMS made a number of changes from the proposed rule, which was published March 7, 2012, with respect to both (1) *eligible providers* (EPs), and (2) *eligible hospitals and critical access hospitals* (CAHs), as well as added new measures to the program's existing framework. While Stage 1 merely required providers to demonstrate widespread use of EHR, Stage 2 eliminates this requirement for both EPs and hospitals and instead imposes a *summary of care record* measure, whereby providers must electronically transmit the summary of care record in 10 percent of instances, in addition to providing that summary through an unspecified means for at least 50 percent of referrals and transitions of care.[66] This change represents a reduction in the proposed rule's requirement for the percentage of summary of care records electronically transmitted from

Clinical Decision Support (CDS)

Clinical decision support is a technology that provides clinicians with real-time feedback about a wide range of diagnostic and treatment-related information as they are entering electronic orders.

"Inpatient Computerized Provider Order Entry (CPOE): Findings from the AHRQ Health IT Portfolio," by Brian E. Dixon and Atif Zafar, U.S. Department of Health and Human Services, Agency for Healthcare Research and Quality, January 2009, http://healthit.ahrq.gov/images/jan09cpoerport/cpoe_issue_paper.htm (accessed June 22, 2009), p.1.

---

[65] Diana Manos and Mary Mosquera, "Final Rules for Stage 2 Meaningful Use Released," *Healthcare IT News*, August 23, 2012, http://www.healthcareitnews.com/news/final-rules-stage-2-meaningful-use-released (accessed September 22, 2012).

[66] Robin Raiford et al., "Detailed Analysis of the Final Rules on Stage 2 of Meaningful Use: The Journey Continues," The Advisory Board Company, September 2012, p. 4; Centers for Medicare and Medicaid Services, "Stage 1 vs. Stage 2 Comparison Table for Eligible Professionals," August 2012, http://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/Downloads/Stage1vsStage2CompTablesforEP.pdf (accessed September 20, 2012), pp. 5–8.

65 percent to 50.[67] In addition, Stage 2 now requires only hospitals to grant patients "*electronic or online access*" to their data, as opposed to the "*electronic copy of their health information*" initially required of both EPs and hospitals under Stage 1.[68] One of the other changes to Stage 2 allows for "*batch attestation*" of providers, eliminating the requirement that group providers perform attestation on an individual basis.[69] In exchange for streamlining the existing requirements, Stage 2 now requires both EPs and hospitals to select and report on 3 of 6 new *menu objectives*, which include objectives such as recording whether a patient of age 65 years or older has an advance directive in place; generating and electronically transmitting discharge prescriptions; submitting surveillance data to public health agencies, where legally permissible; and recording electronic notes in patient records.[70]

Despite several significant changes, some aspects of the proposed Stage 2 rule remain intact or have otherwise been incorporated into other objectives. The 2014 start date did not change from the proposed rule, and the Final Rule allows providers to continue using the current standards and implementation specifications laid out in the "*2011 Edition Certified EHR Technology*" certification criteria publication until 2014.[71] The drug-drug and drug-allergy interaction checks no longer make up a separate Stage 2 objective and instead have been incorporated into the Stage 2 clinical

decision support measure for both EPs and hospitals.[72] Each of the requirements pertaining to the maintenance of an up-to-date problem list of current and active diagnoses, active medication lists, and active medication allergy lists have been incorporated into the Stage 2 summary of care document required of both EPs and hospitals when making referrals or transitions of care.[73] While the requirement that EPs and hospitals report their clinical quality measures (CQMs) to CMS or the states has been eliminated as a separate Stage 2 objective, providers must still meet this requirement, and beginning in 2014, all CQMs must be submitted electronically to CMS in order to demonstrate meaningful use.[74]

To date, incentive payments under the program have already reached $6.6 billion. Although providers are not required to comply with Stage 2 requirements before 2014, the Final Rule allows that any Medicare EP or hospital that can demonstrate *meaningful use* in the two-year reporting period, prior to the 2015 payment adjustment year, will be able to avert the Medicare payment adjustments.[75] Providers that first demonstrate *meaningful use* in 2014 may avoid this penalty if they register and attest to their achievement of *meaningful use* standards by July 1, 2014, for hospitals or October 1, 2014, for EPs.[76] EPs who are eligible for either Medicare or Medicaid may also make meaningful use attestations to state Medicaid agencies in order to avoid the Medicare penalty.[77]

5.2.2.2.2 ICD-10 Conversion Each service provided to a patient requires two codes: a procedure code (Current Procedural Technology) and a diagnosis code (*International Statistical Classification of Diseases*

and Related Health Problems [*ICD*]). The ICD was developed in 1893 to track mortality statistics. The system is used worldwide for mortality and morbidity statistics, reimbursement systems, and automated decision support.[78] Used since 1979, the ICD-9 excludes many recently discovered diseases, conditions, and treatments currently used.[79] The ICD-10 conversion represents a practical overhaul of the ICD system, increasing its complexity in hopes to "*better tailor patient care*."[80] The ICD-10 will increase the number of procedure codes from 4,000 to 72,000 and diagnostic codes from 14,000 to 69,000, as well as change the coding structure from a five-digit numeric code to a seven-digit alphanumeric code, resulting in more specific coding and documentation of medical conditions and procedures than used by the ICD-9.[81]

The *Centers for Medicare and Medicaid Services* (CMS) estimates that the total costs associated with the ICD-10 conversion may reach $640 million in 2013 alone.[82] According to HIMSS, hospitals with fewer than 100 beds are expected to pay between $100,000 to $250,000 for the conversion, with projected expenditures totaling from $1.5 million to $5 million for enterprises with more than 400 beds.[83] Challenges associated with improper and returned claims will account for an estimated $329 million in productivity losses by 2015, as organizations may be hindered by the learning curve associated with a more comprehensive coding system.[84]

[84] Ibid.

The significant costs associated with the transition and the upcoming 2014 deadline have raised concerns in the healthcare industry, because providers are already burdened with the obligations of the ACA and other healthcare reform mandates.[85] The *American Medical Association* (AMA) held a vote in the House of Delegates to "*vigorously work to stop the implementation*" of what they consider an "*onerous*" transition.[86] Approximately 60 percent of providers expect the ICD-10 transition to negatively affect short-term cash flow and 46 percent anticipate overall revenue loss.[87] Similarly, poor ICD-10 implementation could potentially increase claim denial rates by 1 to 3 percent.[88] Beyond direct challenges, the ICD-10 transition will likely require significant physician and staff buy-in and support. Critics also assert that the ICD-10 may gather an unprecedented amount of data too extensive to efficiently analyze.[89] Despite the AMA's push against ICD-10, supporters maintain the benefits outweigh potential costs.

The increased specificity of ICD-10 has the potential to provide more thorough information, allowing providers to improve patient outcomes, with 72 percent of providers agreeing that ICD-10 will ultimately help with achieving increased patient quality initiatives.[90] In addition, the added specificity may help deter fraudulent billing and reduce complications associated

with reporting, which closely aligns with current EMR adoption initiatives.[91] As with any significant change in practice operations, providers may experience a decrease in coding productivity, with estimates of approximately 30 percent, with the result of the benefits of the ICD-10 conversion taking up to five years to realize.[92]

As of October 2011, nearly 86 percent of inpatient facilities indicated they had begun ICD-10 implementation planning.[93] However, only 50 percent of other healthcare entities claimed to have done so, and only 29 percent of facilities that have begun planning are beyond the initial assessment phase.[94] As of July 2011, only 3 percent of providers claimed to be fully prepared for ICD-10 and 16 percent had not yet started the conversion process. Industry experts suggest that healthcare organizations should be ready for ICD-10 six months prior to the 2013 deadlines, and those who have yet to begin may face significant challenges to completing the conversion in time for the October 2013 deadline.[95] One commentator noted that some providers "may not totally appreciate the enormity of [the] task, and that might be something that comes back to bite them."[96] For more information on the ICD and the conversion to ICD-10 in relation to reimbursement

Factoid

In 2010, 21.7 percent of all providers had implemented a CPOE system.

"CPOE Rates Ratchet up with Passage of ARRA-HITECH," by Jennifer Prestigiacomo, Healthcare Informatics, *August 16, 2011, citing "CPOE 2011: The ARRA Effect," by Jason Hess, KLAS, July 2011.*

see Section 2.2.3.1.1, "Shift from ICD-9 to ICD-10 Coding," in Chapter 2, "Reimbursement Environment."

As EHRs *improve* and *comply* with *meaningful use standards*, most systems will likely include both an *electronic prescribing component* and a *clinical decision support component*. However, each of these additional operating components offers specific *benefits* and *challenges*; therefore, they can be addressed *individually*, despite being *packaged as one system*.

5.2.3 Electronic Prescribing: Computerized Physician Order Entry (CPOE)

Approximately 44,000 deaths occur every year in the United States as the result of *medication errors*.[97] In 2008, one *adverse drug effect* (*ADE*) added, on average, $2,000 to the cost of hospitalization, and in 2010, $21 billion in *healthcare spending* was *wasted* on *preventable medication errors*.[98] An ADE is any *injury caused* by a *medication error*, typically in the form of an *allergic reaction* or *adverse physiological response* to a certain combination of medications, that is, (1) a *drug to drug interaction*, or (2) a *drug to allergy interaction*, while *preventable ADEs* are injuries resulting from *human error*, such as *prescribing* or *administering* the *wrong dose* of a drug.[99] *Computerized Physician Order Entry* (*CPOE*) allows physicians

[97] Leapfrog Group, "Fact Sheet: Computerized Physician Order Entry," Washington, DC, March 3, 2009, http://www.leapfroggroup.org/media/file/FactSheet_CPOE.pdf (accessed October 9, 2012); Institute of Medicine, *To Err Is Human: Building a Safer Health System* (Washington, DC: National Academy Press, 2000), p. 1, citing Eric J. Thomas, et al., "Incidence of Types of Adverse Events and Negligent Care in Utah and Colorado," *Medical Care* 38, no. 3 (March 2000): 261–271.

[99] Massachusetts Technology Collaborative, "Saving Lives, Saving Money: The Imperative for Computerized Physician Order Entry in Massachusetts Hospitals," New England Healthcare Institute, February 2008, p. 14.

Factoid

On average, one adverse drug effect adds $2,000 to the cost of hospitalization, which is more than $7.5 billion per year nationwide in hospital costs.

"Leapfrog Hospital Survey Results," Leapfrog Group, 2008, p. 3.

and providers to electronically order *laboratory*, *pharmacy*, and *radiology services*, with the objective of minimizing error by eliminating the difficulties and ambiguity associated with *hand-written orders*.[100] CPOE is designed to "streamline medication ordering by standardizing the process, introducing controls, eliminating bad handwriting, making an order easily traceable to a provider; additionally, with decision support installed, CPOE can also help assure adherence to evidence-based guidelines."[101]

CPOE systems were first introduced in the late 1960s, but their use was fairly sporadic until the uproar about the publication of a 1999 study by the *Institute of Medicine* (IOM), titled *To Err Is Human*, which found that 44,000 deaths annually were attributable to medical errors. The study touted CPOE adoption as one of the potential solutions to this newly

Adverse Drug Effect (ADE)

An injury caused by drugs, typically in the form of an allergic reaction or adverse physiological responses to a certain combination of medications. Preventable ADEs are injuries that are caused by human error.

"Saving Lives, Saving Money: The Imperative for Computerized Physician Order Entry in Massachusetts Hospitals," by Mitchell Adams et al., Massachusetts Technology Collaborative, New England Healthcare Institute, February 2008, p. 14.

Factoid

More than one million serious medication errors occur every year in the United States, and 44,000 deaths annually are due to medication errors.

To Err Is Human: Building a Safer Health System, *by the Institute of Medicine (Washington, DC: National Academy Press, 2000), p. 1.*

publicized national crisis, and the IOM endorsed the implementation of CPOE.[102] However, as of 2008, only 20.4 percent of office-based physicians reported any level of CPOE use as part of their EMR system.[103] Even by 2012, the IOM's goal of full CPOE implementation had not been achieved, with physicians presenting resistance to utilization of CPOE systems, even when implemented.[104]

A 2008 study by *the Leapfrog Group* further publicized the benefits of CPOE systems for *hospitals*, finding that *fully implemented* CPOE systems could potentially *reduce the frequency* of ADEs by as much at 88 percent.[105] To qualify as having a "*fully implemented*" CPOE system, hospitals needed to achieve certain requirements, including 75 percent of all orders must go through its CPOE system, the system must alert physicians of possible errors, and the system must require a physician response if

Computerized Physician Order Entry (CPOE)

A computer system that permits clinical providers to electronically order laboratory, pharmacy, and radiology services.

"Electronic Health Records Overview," National Institute of Health, National Center for Research Resources, April 2006, p. 7.

[109] Ibid.

5.2.3.1 CPOE Quality of Care Improvements A study in the June 2009 issue of the *American Journal of Medical Quality* found significant positive associations between specific objective quality indicators and CPOE implementation.[110] Hospitals with CPOE systems noted that errors related to legibility of paper orders were eliminated, and alerts for potential allergies, drug interactions, and dosing standards improved patient safety. Further, the ability of a pharmacy to receive orders instantaneously resulted in "*stat*" orders being fulfilled more quickly.[111] In addition to preventing ADEs, CPOE systems alert physicians to available generic options for any prescription drug, alert clinicians of redundant orders or laboratory test entries, and list the drug delivery methods suitable for any prescribed drug to prevent delivery errors (e.g., intravenous administration of orally administered drugs). CPOE systems could be even more beneficial to residents in long-term care facilities who, on average, have more than six concurrent drug therapies, which, exacerbated by problems associated with advanced age, can increase the risk of an ADE.[112]

Alert Fatigue

CPOE error caused by a combination of critical medical alerts and a high volume of marginally medically consequential alerts.

"Inpatient Computerized Provider Order Entry (CPOE): Findings from the AHRQ Health IT Portfolio," by Brian E. Dixon and Atif Zafar, U.S. Department of Health and Human Services, Agency for Healthcare Research and Quality, January 2009.

5.2.3.2 CPOE Barriers to Implementation In addition to the costs associated with implementing a CPOE system, other challenges include (1) technical issues, (2) capital requirements, (3) resistance to workflow changes,

[110] Feliciano B. Yu, et al., "Full Implementation of Computerized Physician Order Entry and Medication-Related Quality Outcomes: A Study of 3364 Hospitals," *American Journal of Medical Quality*, American College of Medical Quality (June 5, 2009): 1.

[111] The term "stat" is short for the Latin word "immediately." Howard J. Anderson, "CPOE: It Don't Come Easy," *Health Data Management* 17, no. 1 (January 2009): 20.

[112] Paula A. Rochon, et al., "Clinical Application of a Computerized System for Physician Order Entry with Clinical Decision Support to Prevent Adverse Drug Events in Long-Term Care," *Canadian Medical Association Journal* 174, no. 1 (January 3, 2006): 52.

and (4) clinician compliance.[113] No "*one size fits all*" CPOE system exists, requiring customization for hospital systems, which may include integration of current systems that are already in place.[114] While many barriers exist, the two most significant current concerns are not related to implementation but to utilization by providers, that is, (1) resistance to workflow changes (63 percent), and (2) too many clicks to place an order (32 percent).[115]

User satisfaction has been identified as an important predictor of the success of CPOE adoption and compliance.[116] Generally, younger interns and residents are more willing to use CPOE, while older, more experienced physicians tend to be less satisfied with CPOE.[117] For example, physicians have reported a loss of professional autonomy, as CPOE systems can prevent them from ordering the type of tests or medication(s) they prefer, force them to comply with clinical guidelines they do not embrace, and limit their flexibility through structured, rather than free-text, clinical documentation.[118]

Despite documented benefits, emerging CPOE technology introduces the potential for unintended errors, which include incorrect patient orders, errors of clinician omission, lack of communication among clinical staff regarding the status of an order, loss of information during care transitions, and overlapping medication orders.[119] A 2005 study found that utilization of one CPOE system resulted in 22 types of medication error risks, generated by

[119] William M. Stone et al., "Impact of a Computerized Physician Order-Entry System," *Journal of the American College of Surgeons* 208, no. 5 (May 2009): 7.

(1) the fragmentation of data, (2) failure to integrate the hospital's multiple computer and information systems, and (3) human-machine interface flaws in light of generally accepted workplace practices and dynamics.[120] However, as systems become more advanced, some of these unforeseen problems are decreasing in frequency, for example, the average number of electronic patient entries being reentered was 48 percent in 2003, whereas this percentage had dropped to 21 percent by 2008.[121]

5.2.4 Telemedicine and Telehealth

Telemedicine is the transfer of *electronic medical data* (*high-resolution images*, *sounds, live video,* and *patient records*) from one location to another by using a variety of *telecommunication* technologies, including, but not limited to, *ordinary phone lines, integrated services digital network*, *fractional to full T-1s*, *the Internet*, and *satellites*.[122] *Telehealth* is closely related to *telemedicine* and is used to describe the broader definition of remote healthcare that does not always involve clinical services, although the two terms are often used interchangeably.[123] According to CMS administrator Kerry Weems, using communication equipment to link healthcare practitioners and patients in different locations "results in cost efficiency, reduced transportation expenses, improved patient access to specialists and mental health providers, improved quality of care, and better communication among providers."[124]

As of 2012, telemedicine services have been successfully integrated into approximately 50 different medical subspecialties, and approximately 200 telemedicine networks are established in the United States, involving more than 2,500 medical and healthcare institutions throughout the country.[125]

Telemedicine

The transfer of electronic medical data (high-resolution images, sounds, live video, and patient records) from one location to another in order to enhance the quality and efficiency of patient comfort and care.

"Telemedicine 101: A Brief History of Telemedicine," by Nancy Brown, Telemedicine Information Exchange, American Telemedicine Association, May 30, 1995. http://tie.telemed.org/articles/article.asp?path=telemed101&article=tmhistory_nb tie95.xm (website is no longer in existence but was a live page when it was accessed on June 30, 2009).

Telehealth

Closely related to telemedicine, it is used to describe the broader definition of remote healthcare that does not always involve clinical services, although the two terms are often used interchangeably.

"What is Telemedicine?" American Telemedicine Association, http://www.americantelemed.org/i4a/pagees/index.cfm?pageid=3333 (accessed June 30, 2009).

Some of the services offered through telemedicine include specialized and primary care consultations; imaging services; remote patient monitoring; remote medical education and consumer information; networked programs linking hospitals to rural clinics; point-to-point connection, using private networks between hospitals and ambulatory care sites; primary or specialty care to the home connections; home to monitoring centers; and Web-based e-health patient service sites.[126]

The range of telemedicine technology is divided into two main application groups:

1. *Store and forward* is the transfer of digital images between locations, most commonly seen in *teleradiology* and *telepathology* (the use of pathology slides for diagnostic consultation).[127]

[126] American Telemedicine Association, "What Is Telemedicine?," http://www.americantelemed.org/i4a/pages/index.cfm?pageid=3333 (accessed July 16, 2012).

RURAL HEALTHCARE PILOT PROGRAM

Created by the Federal Communications Commission to increase patient access to telemedicine and support the transfer of HERs. Sixty-seven nationwide projects in 42 states and 6,000 health facilities are eligible for the $417 million in grants under the program.

"FCC Update on Rural Healthcare Pilot Program Initiative," by Federal Communications Commission, April 16, 2009, http://www.fcc.gov/Daily_Releases/Daily_Business/2009/db0416/DOC-290141A1.pdf.

Factoid

Telemedicine services have been successfully integrated into approximately 60 different medical subspecialties.

"What Is Telemedicine?," American Telemedicine Association, http://www.americantelemed.org/i4a/pagees/index.cfm?pageid=3333 (accessed June 30, 2009).

2. *Two-way interactive television* (IATV) is used in telemedicine for face-to-face consultation. These real-time consultations often occur between patients (or nurses) in rural environments and practitioners located in a more suburban or urban setting.[128]

Some states have begun to implement *virtual clinics* using telehealth technologies. The virtual clinic is a program, initially only fully adopted in Hawaii, where for a flat fee a patient can communicate with a physician via a webcam and through instant message over the Internet for approximately

Two-Way Interactive Television (IATV)

Uses telemedicine for face–to–face consultations.

[128] Ibid.

Factoid

Telemedicine also allows hospitals to expand their market area by employing telemedicine technology at outlying medical clinics and offices.

"Night-Shift Solutions," by Lisa Ryan, The Hospitalist, *April 2009, http://www.the-hospitalist.org/detains/article/183090/NightShift_Solutions.html (accessed June 20, 2009).*

10 minutes.[129] Since its inception, this type of *virtual clinic* modality has spread across the country, reaching 22 states as of 2011.[130]

One form of *store and forward* technology is related to the use of *patient monitoring*. Some of the conditions that are most associated with telemedicine are those where patients' levels are monitored via a device that reports their health status to a remote provider through a cellular or satellite network. The top five conditions for *remote monitoring* are (1) *active heart monitoring*, (2) *blood pressure*, (3) *diabetes*, (4) *prescription compliance*, and (5) *sleep apnea*.[131] Remote monitoring allows patients to receive more treatments on an outpatient basis and to be discharged sooner, since observation can be done outside of the inpatient setting. Furthermore, as access to

faster and higher bandwidth Internet and cellular providers grows, so may access to remote technologies.[132]

One example of *remote monitoring*, the *Savacor Dynamic Rx* patient-operated handheld digital assistant, is part of an integrated system that, using implantable heart monitoring devices, constantly monitors the patient for specific indicators preprogrammed by the physician that are specific to the individual patient. Those *indicators* then instruct the patient how to adjust his or her medication and even provide instructions in the event the patient requires medical attention.[133] As of January 2012, clinical studies have been undertaken related to devices such as *Dynamic Rx* that may help predict the risk of a cardiac event up to 30 days in advance.[134] A potentially viable alternative to invasive techniques, set to begin clinical trials in 2012, is *noninvasive physiologic monitoring*, such as *body sensors* that are wearable on the body and *measure heart and respiratory rates*, *posture*, and *activity levels*. These indicators are then analyzed to *identify potential diseases* before the patient becomes symptomatic.[135]

Hospitals, in efforts to reduce readmission rates, are starting to use telehealth technology as well. One such patient monitoring system, *VitalPoint Pro,* by *CJPS Healthcare Supplies & Equipment, LLC*, communicates with clinicians *via email* or *text*, measuring and automatically sending patient data to clinicians for monitoring, as well as alerting clinicians whenever any of the 61 physiological indicators falls out of the preset parameters.[136] The ability to manage patients through *telemedicine* and the use of a *monitoring network* accessible through mobile technology has improved patient

Factoid

Through telemedicine, the VA has reduced the average number of days hospitalized by 25 percent (25%) and reduced hospitalization by 19 percent (19%) for patients using home health.

outcomes for conditions such as stroke, by allowing providers to view patient scans and send ER notifications to specialists immediately, facilitating more accurate care decisions.[137]

One of the fastest growing telemedicine specialties is *teleradiology*, that is, the *electronic transfer* and *storage* of *electronic imaging data*, which allows for an increased reliance on the *remote reading* of scans, thereby alleviating the off-hour burden that *night reads* pose to radiology groups.[138] Other advances in *teleradiology* technology have allowed for the connection of *digital X-rays* and other *imaging modalities* to *Picture Archives and Communications Systems* (PACS), which has greatly improved the efficiency of imaging care by providing improved access to even higher-quality images with reduced delays. Many of these systems are derived from infrastructures implemented in hospital radiology departments and have since expanded into a wider area of networks for *health systems*, *managed care organizations*, and *outpatient providers*.[139]

[139] Barbara Kram, "DOTmed Industry Sector Report: PACS/RIS/HIS," *DOTmed Business News*, March 2009, http://www.dotmed.com/news/story/8313/.

The main driver of *teleradiology* is the demand for *night coverage*, also known as *nighthawk coverage*, that is, where distant physicians provide preliminary readings when a patient need arises when the hospital is operating at night, with a limited staff. Nearly half of all radiology practices supplement their staff with external, distant providers, and many teleradiology firms are competing for contracts.[140] As competition in this field has increased, pricing has become a significant market factor, and, as such, the *average price per procedure* has begun to decline, which, in turn, has triggered aggressive *merger and acquisition* activities among *teleradiology firms*. The largest provider on the market is currently *Virtual Radiologic*, which acquired its main competitor, *Nighthawk*, in September 2010.[141]

NIGHTHAWK COVERAGE

5.2.4.1 Cost-Benefit Analysis A 2011 study by the *Association of American Medical Colleges* (AAMC) predicted that by 2020, there might be a shortage of 91,500 physicians, that is, "an estimated 45,000 primary care physicians and 46,000 surgeons and medical specialists."[142] For hospitals incurring physician shortages, telemedicine facilitates *hospitalist recruitment*, providing more attractive work hours and the ability for a single practitioner to provide services to multiple hospitals at one time. In addition, *telemedicine* has enhanced access between *hospitalists* and a patient's treating medical specialist provider. Furthermore, it allows hospitals to expand their market service area by employing *telemedicine technology* at *outlying medical clinics* and *offices*.[143]

On May 5, 2011, CMS issued a *Final Rule* on telemedicine *credentialing* and *privileging* that may help facilitate implementation of *innovative medicine* at nonurban hospitals. This rule allows *privileges* and *credentialing reciprocity* between an institution where a physician seeks to provide *telemedicine services* to Medicare and Medicaid patients and the hospital where a physician is *already privileged*.[144] (See Chapter 3, "Regulatory Environment," for a further discussion of the regulatory requirements applicable to telemedicine providers).

Many professional associations have expressed approval of the new regulations. *The Joint Commission*, which controls much of telemedicine accreditation and has been heavily involved with CMS policy surrounding this topic, applauded the *Final Rule* as a positive step for improving access to care for rural patients.[145] The *American Hospital Association* specifically commended the rule's flexibility and the inclusion of nonhospital entities, such as independent physicians and radiology groups, within the scope of the law.[146]

THE JOINT COMMISSION'S REVISED STANDARDS (SECTION MS.13.01.01)

The revised standards released in November 2008 compromise the difference between JCAHO and CMS standards, but the commission reverted back to its original opinion in March of 2009.

"The Joint Commission and Telemedicine: The Final Word?" Accreditation Monthly, *May 13, 2009*.

Factoid

Telehealth and telemedicine are also subject to the Joint Commission of Accreditation of Healthcare Organizations (JCAHO) standards.

"Hospital-Wide PACS Need Tighter Data Security," Diagnostic Imaging, *PACS Supplement, February 2000, http://www.dimag.com/db_area/archives/2000/0002pnews.3-7.html (accessed March 31, 2000)*.

While the burden on remote hospitals has been lessened and providers have supported the movement toward expanded access to *telemedicine*, regulatory hurdles remain despite the new *rule*. Physicians still face restrictions by state licensure laws in areas that do not extend *reciprocity* to physicians looking to provide *telemedicine services* to hospitals in another state. Although every state, the District of Columbia, Guam, and Puerto Rico have some form of legislation addressing licensure for *telemedicine services*, laws vary widely in flexibility and the scope of services covered, with many only permitting consultations.[147] Additionally, the extent of regulatory variations becomes even more fragmented within some states, with different laws for allopathic physicians (MD) in contrast to osteopathic physicians (DO).[148]

5.2.4.2 Reimbursement for Telehealth Services The *Balanced Budget Act of 1997* limited the scope of Medicare telehealth coverage to services related to consultation only. However, Section 223 of the *Medicare, Medicaid and SCHIP*

[147] Federation of State Medical Boards, "Telemedicine Overview: Board-by-Board Approach," August 2012.

[148] Ibid.

Benefits Improvement and Protection Act of 2000 (BIPA) revised Medicare reimbursement to cover *telehealth* services provided on or after October 1, 2001, to include *consultations*, *office visits*, *individual psychotherapy*, and *pharmacologic management*. Services are covered only for cases that use *interactive audio* and *video telecommunication systems*, and where the patient was present and participating in the telemedicine visit. Eligible geographic areas included *rural health areas with practitioner shortages*, as well as counties not classified as part of an established *Metropolitan Statistical Area*.[149]

Section 149 of *MIPPA* amended *BIPA* to reimburse services provided on or after January 1, 2009, for *telehealth services* performed in the office of a *physician or practitioner*, a hospital, a *critical access hospital* (CAH), a *rural health clinic*, a *federally qualified health center*, a *hospital-based* or a *CAH-based dialysis facility*, a *skilled nursing facility*, or a *community medical center*.[150] As of 2012, while approximately 13 states have laws requiring private insurers to reimburse for telehealth related services, in states without such laws, it is at the discretion of the insurer whether to reimburse providers for services provided through telehealth.[151] Approximately 35 states provided at least some reimbursement through Medicaid as of 2011.[152]

THE MEDICARE TELEHEALTH ENHANCEMENT ACT (H.R. 2068)

Provides $30 million in grants to health facilities to pay for telehealth equipment and expand telehealth support services. Also expected to address JCAHO/CMS credentialing issues

5.3 CLINICAL TECHNOLOGY

In addition to increases in the *development* and *utilization* of *health care management information technology*, there have also been *advances* in the *development* of *clinical technology*, which have led to *numerous treatment discoveries* and innovations. *Clinical technology* encompasses any *method* or *device* used for *patient treatment procedures*, for example, (1) *pharmaceuticals*, (2) *surgical devices*, and (3) *minimally invasive techniques*. Of note, in an *effective* and *efficiently* operated provider enterprise, *management* and *clinical technologies* will complement each other and may, in many cases, *overlap*, as discussed Section 5.2.1, "Technology as 'Process'," in Chapter 5, "Technology."

One significant consequence of advancements in *clinical technology* is the transition to more procedures being offered in outpatient settings. Specifically, advancements make available (1) less *invasive procedures*, (2) shorter *recovery times*, and (3) lower probability of *complications* during and after a procedure, all of which have allowed for procedures that traditionally had to be performed in an *inpatient setting* to be offered on an *outpatient basis*, which made up 64 percent of U.S. surgeries in 2010.[153] The higher costs associated with inpatient care and the overall increase in healthcare demand have contributed to increased *outpatient service utilization* from 300 million visits in 1990 to more than 650 million in 2010, a growth pattern that will likely continue in response to persistent *cost containment pressures* and the advancements in technology that have permitted the shift from inpatient to outpatient.[154]

As technology has advanced, the way patient care is viewed has changed dramatically, leading to technological developments related not only to the *treatment setting* (e.g., movement from *inpatient* to *outpatient*), but also the manner by which diseases are understood and treatments are approached by providers. Recent developments related to *genetics*, *gene therapy*, and *personalized medicine* have been made possible by the science of *genomics*.

application of *methods for large-scale analyses* of *gene expression* and *genomic data*.[158]

The advent and advancement of *genomic mapping* have allowed for the flourishing of *personalized medicine*. A 2012 *Health Affairs* article stated that

> *In recent years, the sequencing of the human genome—along with technological advances that dramatically lowered the cost of DNA sequencing and enabled rapid, accurate measurement of proteins and metabolites in blood and tissue—has given rise to the fields of genomics, proteomics and metabolomics.*[159]

While *personalized medicine* is a relatively recent medicotechnology field, two related fields that have seen significant clinical progress are *cancer treatment* and *pharmacogenomics*.[160] Also, several areas of *genomics*, *cell-based therapies*, and *molecular targeting therapies* appear to hold promise for future advancements in the treatment of cardiac disease. For example, *pharmacogenomics* applies the "genetic variability in patients' responsiveness to a drug in order to inform clinical decisions about dosing and selection."[161] Furthermore, a broader "*vision*" for *personalized medicine* extends beyond the development of *individual treatment plans to individualized disease prevention* and early intervention strategies, for example, *Type 2 diabetes*.[162]

One way to achieve this "*vision*" of *personalized medicine* may be through the use of mobile medical applications ("*m-health apps*") that possess capabilities that allow them to be downloaded onto smartphones and computer tablets. It is hoped that these "*m-health apps*," which are rapidly expanding in the marketplace, will allow healthcare providers

Spiegel and Meredith Hawkins, "Personalized Medicine to Identify Genetic Risks for Type 2 Diabetes and Focus," *Health Affairs* 31, no. 1 (January 2012): 44, quoting Ralph Snyderman and Michaela A. Dinan, "Improving Health by Taking It Personally," *Journal of the American Medical Association* 303, no. 4 (January 27, 2010): 363.

CLINICAL UTILITY VERSUS CLINICAL VALIDITY

Two standards for new products. Clinical utility proves benefit through clinical testing and is a higher standard used by the FDA. Clinical validity is a lower standard that proves that accurate measurements are provided within a target population.

"The Human Genome and Translational Research: How Much Evidence Is Enough?" by Janet Woodcock, Health Affairs *27, no. 6 (November/December 2008): 1616–1617.*

to efficiently develop and distribute "*best-practice*" standards and treatment protocols to providers.[163] In addition, "*m-health apps*" may, in the future, likely be used by patients to monitor chronic conditions by reporting such information as blood pressure levels or sugar levels to their physicians.[164]

The term *personalized medicine* has been used in several venues, including *customized pharmaceuticals* and *customized diagnoses*. The *mapping of the human genome* was the first step toward much technological advancement that served as the foundation for a new genre of *pharmaceutical* and *therapeutic medicine*. *Biotechnology* and *biopharmaceuticals* are a significant portion of the current healthcare market, accounting for as much as 93 percent of the total dollars spent on healthcare merger and acquisition activity in recent years.[165]

Genomic understanding has provided pharmaceutical companies with new *therapeutic targets*, as well as *improving existing drugs*.[166] There has been some suggestion that *genetic composition* may be responsible, in part,

[163] Kenneth Kaufman and Mark E. Grubs, *Futurescan 2012: Healthcare Trends and Implications 2012–2017*, Chapter 1: "Healthcare Reform: The Transformation of America's Hospitals: Economics Drives a New Business Model," VHA Inc., Irving, Texas (2012), p. 8.

[164] Michelle McNickle, "5 Critical Technologies Health Systems Should Require," *Healthcare IT News*, http://www.healthcareitnews.com/news/5-critical-technologies-health-systems-should-require, July 30, 2012 (accessed September 21, 2012).

for some *adverse drug reactions*, and understanding that *genetic component* may allow *pharmaceutical companies* to design more *compatible* drugs or *identify* those individuals who should not be given particular therapies.[167] In recent years, genes have been associated with an increased risk of developing certain diseases or conditions. Some research suggests that the identification of such genes may allow individuals to take preventative measures against such conditions, particularly various forms of cancer. However, other findings indicate that such "*unsubstantiated information*" may present more harm than benefits, for example, (1) stress for the individual being "*diagnoses*," or (2) *unnecessary medical procedures*, such as *premature mastectomies*.[168]

As the market for *personalized medicine* expands and more research regarding genetic diagnoses saturates consumer-driven healthcare channels, a number of companies offering personalized genetic mapping, known as *genotyping*, have appeared, for example, *23andme.com*. These *direct-to-consumer genetic testing* companies offer genetic kits that take a small sample of cells, such as a check swab, and create a quick genetic profile for the customer that indicates any diseases the individual may be prone to.[169] A 2011 study of 23 direct-to-consumer testing websites found that 78 percent listed at least one limitation of their testing procedure and may present hurdles for an informed patient decision.[170] Some states, for example, California and New York, have intervened in the distribution of an individual's genetic profile and potential future diseases without physician direction, sending cease and desist letters to several companies.[171] Furthermore, four states, that is, (1) California, (2) Nevada, (3) Nebraska, and (4) Pennsylvania, have passed legislation prohibiting misleading advertisements for genetic tests.[172]

The realities of *personalized medicine*, that is, *pharagogenetics* and *genetic testing*, create a multitude of regulatory and reimbursement issues. Although *the Health Insurance Portability and Accountability Act of 1996* (HIPAA) was designed to protect individuals' health information, the advancement of genetic testing has surpassed the regulatory standards set under HIPAA. Subsequent legislation has attempted to protect individuals' genetic information and allow for the furtherance of personalized medicine.[173] (See Chapter 3, "Regulatory Environment," for a further discussion of HIPPA and *protected health information*.) Similar to HIPAA, the *Genetic Information Nondiscrimination Act of 2008* (GINA), enacted on May 21, 2008, is designed to protect individuals from the *misuse* of their *personal health information*. The act prohibits the use of genetic information for *discriminatory* purposes by *health insurance companies* and *employers*. GINA amends both the *Employee Retirement Income Security Act* and the *Internal Revenue Code*.[174]

5.3.2 Stem Cell Research

Within any living organism, each cell is specialized to a specific biological system. *Stem cells* are unspecialized cells capable of renewing themselves through cell division, sometimes after long periods of inactivity, and adapting their function to accommodate a certain type of tissue or organ under the proper conditions. The unique regenerative capacity of stem cells has the potential to change the way health problems such as diabetes and heart disease are treated. As such, efforts to advance *reparative medicine* (therapies that heal the body's natural tissue) by developing efficacious cell therapies are at the forefront of medical research.[175] In July 2011, the first *completely synthetic human organ*, a trachea, was grown from human *stem cells* and successfully *transplanted*.[176] However, *synthetic organs* function at a fraction of their *natural counterparts*, for example, a *synthetic lung* grown from

stem cells functions at approximately 5 percent of the effective rate of a *human lung*.[177]

The completion of the draft human genome sequence in 2001 was followed by research inquiries targeting transcripts (*transcriptomics*), RNAi/miRNAs (*interferomics and micro-RNomics*), proteins (*proteomics*), interacting proteins (*interactomics*), DNA and chromatin modifications (*epigenomics*), and metabolites (*metabolomics*).[178] A major breakthrough occurred when researchers were able to reprogram an individual's own *somatic* cells to create new *induced pluripotent stem* (iPS) *cells* to provide a new method for *autologous* stem cell generation, where cells are removed, stored, and later reintroduced to the same person without having to use *embryonic stem cells* (ESC).[179] Developments in these areas contributed significantly to the molecular understanding of biology, pathology, and pharmacology, with molecular diagnostics representing the sector of the genomics market with the most promise.[180]

On January 23, 2009, the first *human embryonic stem cell*–based therapy was approved for clinical trial; *Geron Corporation* announced clearance

5.3.3 Diagnostic Technology

Diagnostic medicine is used in both the *acute* and the *chronic* patient treatment setting for the purposes of *prevention*, *screening*, *disease detection*, and *care management*. Recent diagnostic advances support an attitude of *prevention* that although inherently accepted, has not been supported by systems and processes in healthcare to date. Diagnostic technology is also the backbone of much technological advancement, including (1) *minimally invasive surgery*, (2) *preventative procedures*, (3) *telemedicine*, and (4) *therapeutics*, to name a few. *Diagnostics* may also play a significant role in the advancement of *quality outcomes reporting* and associated *value-based purchasing* initiatives. While the characteristics mentioned provide *clinical benefits* to providers, payors, and patients, the *economic value metrics* of *diagnostic imaging* is unclear, as the technology is also associated with *patterns of overuse* and subsequent *increased healthcare costs*.[184] Diagnostics can be divided into two distinct fields: (1) *imaging technology* and (2) *molecular diagnostics*.

Factoid

Despite the fact that diagnostic testing influences 70 percent of all healthcare decisions made, diagnostics makes up only 2 percent of Medicare spending.

"Medicare Needs to Get with the Times," The Burrill Report, *Burrill and Company, 2009.*

[184]Laurence C. Baker, et al., "Expanding Use of Imaging Technology and the Challenge of Measuring Value," *Health Affairs* 27, no. 6 (November/December 2008): 1468, 1477.

5.3.3.1 Imaging Technology *Medical imaging* is defined as a "non-invasive process used to obtain pictures of the internal anatomy or function of the anatomy using one of many different types of imaging equipment and media for creating the image."[185] Among the various imaging modalities, *Single Photon Emission Computed Tomography* (SPECT), *Magnetic Resonance Imaging* (MRI), and *Positron Emission Tomography* (PET) all offer *high sensitivity imaging*; however, each provides certain benefits for a given patient condition or specialty that the other procedures lack. For example, in cardiology, SPECT is the most widely available procedure and is the most extensively validated. PET is associated with the highest levels of diagnostic performance, while MRI offers a nonradiation alternative that maintains similar levels of accuracy.[186]

The use of diagnostic imaging has grown at a rate much greater than other physician services, likely due to advances in technology allowing for more efficient, effective, and safe procedures. As indicated by MedPAC in the June 2012 publication *A Data Book: Health Care Spending and the Medicare Program*, the number of CT and MRI scans, per 1,000 Medicare B *fee-for-service beneficiaries*, grew significantly between 2000 to 2009, with a slight decrease from 2009 to 2010.[187] The number of CT scans performed, on parts of the body other than the head, more than doubled between 2000

Medical Imaging

Noninvasive process used to obtain pictures of the internal anatomy or function of the anatomy using one of many different types of imaging equipment and media for creating the image.

"Medicare Part B Imaging Services: Rapid Spending Growth and Shift to Physician Offices Indicate Need for CMS to Consider Additional Management Practices," Government Accountability Office, June 2008, GAO-08-452.

[185] Government Accountability Office, "Medicare Part B Imaging Services: Rapid Spending Growth and Shift to Physician Offices Indicate Need for CMS to Consider Additional Management Practices," June 2008, GAO-08-452.

[186] Caroline Jaarsma, et al., "Diagnostic Performance of Noninvasive Myocardial Perfusion Imaging Using Single-Photon Emission Computed Tomography, Cardiac Magnetic Resonance, and Positron Emission Tomography Imaging for the Detection of Obstructive Coronary Artery Disease: A Meta Analysis," *Journal of the American College of Cardiology* 59, no. 19 (May 8, 2012): 1727.

[187] MedPAC "A Data Book: Health Care Spending and the Medicare Program," (June 2012), p. 112.

TABLE 5.5 Medicare Spending on Diagnostic Imaging in 2010

Procedure	Percent of Total Medicare Spending
Standard Imaging	21%
CT	20%
MRI	15%
Echocardiography	11%
Other Echography (ultrasound)	15%
Nuclear Medicine	8%
Imaging Procedures	5%
PET	4%

A Data Book: Health Care Spending and the Medicare Program, MedPAC (June 2012), p. 111.

and 2010, from 258 scans per 1,000 Medicare Part B beneficiaries in 2000 to 548 scans per 1,000 Medicare Part B beneficiaries in 2010. Similarly, the number of MRI scans performed, on parts of the body other than the brain, for Medicare Part B beneficiaries more than doubled during the same time period.[188] Corresponding with the increased use of diagnostic imaging, Medicare spending for these services has also increased; the allocation of Medicare spending for diagnostic imaging under the 2010 *Physician Fee Schedule* is set forth in Table 5.5.

Linear Accelerator (LINAC)

Delivers uniform doses of high-energy X-rays to the localized area of the patient's tumor, while sparing the surrounding normal tissue. It is the device most commonly used for EBT treatments for patients with cancer

"DOTmed Industry Sector Report: Linear Accelerators and Simulators," by Barbara Kram, DOTmed News*, November 19, 2008, http://www.dotmed.com/news/story/7013/ (accessed June 29, 2009).*

5.3.3.1.1 X-ray Many forms of imaging advancements have evolved from the basic *X-ray technology*, including, for example, *CT*, *MRI*, and *PET*, developed in 1895 by Wilhelm Conrad Roentgen, a German physicist who discovered *X-ray technology* and brought it to the United States soon thereafter in 1896. The X-ray process was quickly adopted by both the healthcare

[188] Ibid.

industry and the courts, and in 1903, the first X-ray device was placed in Hanover Hospital.[189] *X-rays* distribute high-energy electrons through a part of the body, which are absorbed at varying rates by different density tissues, and when they are stopped by a metal plate, the elections produce an image, known as a *radiograph*, of the thickest tissue, generally bone.[190] Although imaging technology has developed far beyond the original *tubes and coils*, the presence of this technology has persisted in the field of *diagnostic imaging*.

5.3.3.1.2 Computed Tomography (CT) *Computed tomography* (CT) technology has transformed both *diagnostic* and *interventional* medicine, as the quality of CT images, due to the *cross-sectional scanning* capabilities they afford, surpasses the *anatomical detail* of *competing imaging technologies*, such as X-ray.[191] CT produces *tomographic images* (slices) of a specific area of the body by using a computer to process many X-rays of the area to create a *cross-sectional image*, obtained by rotating the X-ray device around the patient's body in a process known as *CT scanning*.[192] The clearer images provided by CT are due, in part, to the *elimination of image superimposition outside the area of interest* and the *high-contrast resolution* used that can *differentiate* between *varying tissue densities*. In addition, CT appears to *expedite* and *improve* initial triage of patients on an *outpatient basis* and in the *emergency room*, allowing patients to either return home or be admitted for further evaluation.[193] Since its inception in 1970, use of CT technology has grown rapidly, and as of 2011, approximately 85.3 million scans were performed in the United States.[194]

In addition to *high-quality images*, CT can also be a *cost effective* alternative to several other imaging methods that are available. Furthermore,

CT Scanning

The process of making a computed tomography image.

"Computed Tomography (CT): Questions and Answers," National Cancer Institute, September 8, 2003.

CT scanning may be used *incrementally* with older, more invasive methods of diagnostics, for example, *catheter-based angiography*, lowering potential barriers to its implementation.[195] However, it should be noted that for some procedures, *substituting* older methods for *CT scanning* may produce net savings of more than $200 per procedure, not including increased (1) *efficiency*, (2) *productivity*, and (3) *patient satisfaction*.[196] The determination of the various cost efficiencies of such imaging technology is currently much in debate and awaiting further research and cost analysis.

The advent of *multidetector row computed tomography* (MDCT) technology has redefined imaging on the *molecular* and *cellular levels*, thereby enhancing patient management and care.[197] Through the evolution from the *4-slice CT scanner*, the *16-slice CT scanner*, and finally, the *64-slice CT scanner*, MDCT has raised the standard for *image quality* and *accuracy*, allowing for the production of *three-dimensional images*.[198]

Factoid

Italian radiologist Alessandro Vallebona first proposed a method to represent a single slice of the body on the radiographic film, known as tomography, in the early 1900s.

MULTIDETECTOR ROW CT ("MDCT")

MDCT has raised the standard for image quality and accuracy in identifying differences in patients. In addition to greater acuity, MDCT (namely, 64-slice technology) also operates at an increased speed over previously existing CT technology.

"CT Flexes Muscle in Coronary Disease Detection," by James Brice, Diagnosticimaging.com, November 2005, http://www.diagnosticimaging.com/showArticle.jhtml?articleID=174402602 (accessed July 14, 2006).

In addition to producing images with greater *acuity*, the *64-slice CT* also operates at an increased speed over previously existing CT technology. The average scanning time for the *64-slice scanner* was 313 seconds, which was 64 seconds faster than second-generation *16-slice scanners*.[199] A *64-slice CT scanner* can complete a scan in as little as eight to twelve (8 to 12) seconds, compared to a traditional CT scanner's time of 10 to 20 seconds.[200]

Factoid

The 64-Slice CT is the most popular CT technology in use, as it made cardiac and cerebral CT imaging possible.

"Nuclear Cardiology Adopts Hybrid and Dynamic Imaging," by David Berman, DiagnosticImaging.com, October 2006, http://www.diagnosticimaging.com/display/article/113619/1193342 (accessed February 10, 2009).

8, citing IMV, "Latest IMV CT Census Shows Slow-down in the Purchase of CT Technology," press release (March 20, 2008), http://www.imvinfo.com/user/documents/content_documents/nws_rad/MS_MRI_PressRelease.pdf (accessed October 10, 2012).

[199] James Brice, "CT Flexes Muscle in Coronary Disease Detection," Diagnostic imaging.com, November 2005, http://www.diagnosticimaging.com/showArticle.jhtml?articleID=174402602 (accessed July 14, 2006).

[200] Lisa Fratt, "State-of-the-Art Cardiac CT Prompts Better, Quicker, Diagnosis and Shorter Hospital Stays," *Cardiovascular Business* (March/April 2009): 22–24; Radiological Society of North America, "Cardiac CT for Calcium Scoring," American College of Radiology April 24, 2012, http://www.radiologyinfo.org/en/info.cfm?PG=ct_calscoring (accessed October 10, 2012).

Two of the most recent developments in *CT technology*, the *256-* and *320-detector row systems*, are collectively referred to as *dynamic volume CT*. *Dynamic volume CT* technology is capable of imaging an *entire organ* with *isotropic (uniform) resolution* in one rotation and as a complete volume. The *temporally uniform data* are then reconstructed as a *whole unit*, thereby reducing the chance of *artifacts* and *misregistrations* in the image caused by creating a *composite image*.[201] In addition to being *quicker* and *more accurate*, *dynamic volume CT* provides the benefit of exposing the patient to a significantly *lower dose of radiation* than both 64-slice imaging and the invasive diagnostic technologies. Similarly, *dynamic volume CT scanning* is sensitive enough in its high resolution to allow physicians to detect *subclinical problems*, facilitating *earlier diagnosis* and *treatment*.[202]

5.3.3.2 Magnetic Resonance Imaging (MRI) In contrast to X-ray and CT imaging, which use radioactive material, *magnetic resonance imaging* (MRI) uses powerful *magnetic fields*, *radio waves*, and often a *contrast solution* to produce *cross-sectional images* of *internal structures*, for example, organs, ligaments, and cartilage, that may be invisible to other imaging technologies. While MRIs do not expose patients to radioactive isotopes, the magnetic field created during a MRI procedure cannot be used on any patients with metal prosthetics.[203]

Functional MRI (fMRI), a combined technology using *Positron Emission Tomography* (PET) and the *MRI system*, enables physicians to *observe brain function* while patients perform *physical* and *mental tasks*.[204] fMRI is one of the most *prevalent methods of brain imaging* in today's market.[205] An estimated 30.2 million MRI procedures were performed in

2010, a significant growth from 26.6 million procedures conducted in 2006.[206]

While MRIs were previously used in circumstances in which a "*hidden*" trauma was indicated, for example, an injury to *softer tissue*, such as *ligaments*, that was previously missed by the *4-slice CT scan*, studies have shown that a *64-slice CT scan* can identify many of those injuries.[207]

5.3.3.2.1 "Fusion" Imaging: Nuclear Medicine and Combined Technologies *Nuclear imaging* uses trace quantities of *radiopharmaceuticals* that target specific organs, bones, or tissue being imaged to *noninvasively* provide information related to potential abnormalities, for example, differentiating a tumor from the surrounding swollen tissue.[208] The *radiopharmaceuticals* used are specific to the *target* organ, bones, or tissue in question. A *positron emission tomography* (PET), *single photon emission computed tomography* (SPECT), or a gamma camera detects the *radiopharmaceutical* and forms an image of the target region. Of note, the same imaging technology, using high enough doses of *radiopharmaceuticals*, may be used for treatment purposes in addition to diagnostic purposes.[209] While *nuclear imaging* can be time consuming, and image resolution quality may *not* be as high as with CT scans and MRIs, *nuclear imaging* does provide information about the given *abnormality's function*, for example, biological changes associated with the presence of a given disease, alongside its structure.[210]

The adoption of CT utilization in *conjunction* with *nuclear imaging* modalities has resulted in a *hybrid technology* known as *"fusion" imaging*

that combines *nuclear medicine cameras* with *CT detection methods*.[211] *PET-CT*, as well as *SPECT-CT* systems, have various qualities that may prove advantageous over the use of these modalities *independently*. By using a dual system (SPECT-CT or PET-CT), patients can undergo both procedures at once, resulting in *minimized error rates* and *clearer images*.[212] For some procedures, for example, *assessing metabolic status* of a given treatment, PET has been shown to be more effective than CT and MRI in terms of its ability to differentiate variations in images posttreatment.[213]

PET technology allows for substantially *higher sensitivity* than *single-photon imaging technologies* such as SPECT.[214] However, due to the longer *half-life* of *single photon emitters*, SPECT tracers last six hours, while PET tracers have only a 75 second half life. A longer half-life enables the use of a *wider observational time window*.[215] SPECT is much more *available*, is more *widely used*, and may currently be more *affordable* than PET-CT technology, for example, a SPECT camera can cost up to $200,000, while the PET-CT can cost up to $1.5 million; however, both of these imaging

PET technology allows for substantially higher sensitivity than single-photon imaging technologies such as the SPECT.

"PET versus SPECT: Strengths, Limitations, and Challenges," by Arman Rahmim and Habib Zaidi, Nuclear Medicine Communications *29 (2008): 193–207.*

modalities are *reimbursed* at approximately the same rate.[216] SPECT is subject to longer scan times and can produce *low-resolution images* that are prone to *artifacts* and *attenuation* (especially in larger patients).[217]

In 2007, the 15.9 million SPECT procedures that were performed significantly outpaced the 1.6 million PET-CT procedures performed.[218] While the number of SPECT procedures declined in 2010, the number of PET procedures increased 8.9 percent from 2009 to 2.1 million.[219] Further supported by the FDA approval of new clinical applications and improved reimbursement within cardiology specialties, PET market sales are projected to increase from $391.8 million in 2010 to $4.31 billion in 2018, as compared to SPECT market sales, which are only expected to increase from $758 million in 2010 to $1.68 billion in 2018.[220] Despite the described barriers, a

Factoid

PET-CT technology has been most incorporated in oncology practices, where budgets appropriately match the need.

"Great Expectations and the Saga of SPECT-CT," by Greg Freiherr, Diagnostic Imaging*, June 25, 2009, http://www.diagnosticimaging.com/display/article/113619/1425226?CID=rss (accessed June 29, 2009).*

[220]Ibid.

majority of the providers surveyed in a 2011 study projected that PET and *combined PET* technologies would eventually replace SPECT procedures altogether.[221]

5.3.3.2.2 Ultrasound *Ultrasound* technology continues to undergo extremely promising improvements, with *greater speed* and *enhanced quality* affording (1) *higher frequency*, (2) *better resolution*, and (3) *three-dimensional imaging*. This increase in ultrasound diagnostic use is fostering an array of possibilities, including (1) added *specificity* of results, (2) a *reduction* in the necessity of *biopsies*, and (3) more *standardized ultrasound* use.[222] While ultrasound technology has been developed in areas such as heart wall motion diagnostics and 3D/4D imaging for obstetrics and gynecology procedures, many radiologists have continued to use ultrasound for "*basic examinations only*."[223] However, advancements in ultrasound procedure guidance are both improving the efficiency and quality of ultrasound procedures that are performed as part of the *fusion imaging* guidance that is utilized during *interventional radiology* procedures.

The increased use of "*hybrid interventional suites*" in the cardiology arena may drive further demand and use of ultrasound equipment in *interventional radiology* procedures that combine the capabilities of a typical *operating room* with *imaging technology* such as *X-ray, CT, MRI,* and *ultrasound*.[224] Typically, patients suspected of having *carotid artery disease*, the most common cause of stroke in the United States, initially undergo an *ultrasound examination* of the carotid arteries before further diagnostic testing is performed.[225] In the past, a *catheter angiogram* of the carotid arteries, an invasive procedure that carries an increased risk of stroke and other complications, has been the traditional follow-up test to an *ultrasound*. However, *Computed Tomographic Angiography* (*CT angiography)* has emerged as a *less-expensive*, *safer*, *noninvasive procedure*, which has been shown to

accurately diagnose *carotid artery disease*.[226] While CT angiography use emerged in the late 1990s, it became a well-established diagnostic tool by the early 2000s, with the advent of high-speed CT technology.[227]

5.3.3.3 Molecular Diagnostics *Molecular diagnostics* traditionally involved the collection of a sample of a patient's tissue that was observed under a microscope to *screen for infections* (e.g., HIV, hepatitis, and tuberculosis) more accurately and effectively than traditional methods.[228] However, the capabilities of *molecular diagnostics* have evolved over time to include (1) *genetic disorder screening*, (2) *pre-implantation screening*, and (3) *cancer screening procedures*, thereby facilitating the transition toward *preventative healthcare*.[229] These advancements have changed the screening procedure to include both *tissue samples* and *genomic samples* isolated through *proteomics* and *DNA synthesis techniques*.[230]

The capabilities afforded by *molecular diagnostics* have relied on developments in (1) *polymerase chain reaction* (PCR)–based technology, (2) *electrochemical detection* of DNA, (3) *biochip technology*, (4) *nanotechnology*, and (5) *proteomic* technologies.[231] *Nanotechnology*, which may be understood as

MOLECULAR DIAGNOSTICS

The capabilities of molecular diagnostics have since evolved to include genetic disorder screening, preimplantation screening, and cancer screening procedures.

Biomarkers

An important tool for diagnosing and monitoring cancer; however, some critics believe biomarkers, as a clinical treatment process, were a failure.

"Proteomic Applications for the Early Detection of Cancer," by Julia D. Wulfkuble, Lance A. Liotta, and Emanuel F. Petricoin, Nature Reviews: Cancer 3 *(April 2003): 267; "Proteomic Retrenches," by Peter Mitchell,* Nature Biotechnology *28, no. 7 (July 2010): 665.*

the *engineering* of *body systems* on a *molecular level*, has been used in conjunction with the study of (1) *viruses*, (2) *biomarkers*, (3) *neural regeneration*, (4) *drug delivery membranes*, and other fields.[232] The ability to influence healthcare delivery through "highly integrated, miniaturized and smart micro-nano-bio-systems" is currently at the forefront of U.S. healthcare delivery, as it presents the capabilities to "enable the delivery of individualized health services with better access and outcomes at lower costs than previously deemed possible."[233]

Developments in these fields have driven both the advancement and the direction of molecular diagnostics to affect the molecular, nonmolecular, and in vitro diagnostic markets.[234] Advances in genetic engineering and enhancement and pharmacogenomics have led to a fusion of molecular diagnostics and therapeutic measures for specialized screening and treatment plans, which fusion is pivotal to personalized medicine.

Although the field of molecular diagnostics has grown beyond its original focus on screening for infectious disease, this function is still the fastest growing segment of the molecular diagnostics market, that is, 21 percent.[235] Currently,

[235] "Market Overview," in *Global Molecular Diagnostics Market and Future Forecast 2010–2014*, Renub Research, July 2011, p. 3.

the United States controls most of the global molecular diagnostics market, which is projected to reach $15 billion by 2014.[236] The potential profitability for suppliers within the personalized medicine market has led to increased transactional activity among molecular diagnostic companies, whereby large companies are diversifying, to maximize their presence in the personalized market, by purchasing specialized diagnostic entities, for example, in vitro diagnostic companies.[237] Following infectious disease screening, the second largest segment of the molecular diagnostics market is oncology testing.[238]

The field of *cancer diagnostics*, using *molecular technologie*s, has been influential in the transition to *personalized medicine*. *Cancer molecular diagnostics* (CMD) will most likely not, in the foreseeable future, replace traditional *pathological examinations*, but rather will serve to supplement and enhance these methods by employing them in conjunction with (1) *microarrays*, (2) *reverse transcriptase polymerase chain reaction* (RT-PCR), (3) *mass spectrometric proteomic analyses*, and (4) *protein chips*.[239] *CMD technology* will allow practitioners to (1) better *diagnose cancer*, (2) choose and develop *personalized treatment plans*, and (3) identify *predispositions* twice as quickly as other assays for only a fraction of the drug development costs.[240]

CMD TECHNOLOGY

Will allow practitioners to diagnose cancer, choose and develop personalized treatment plans, and identify predispositions twice as quickly as other assays and for only a fraction of the drug development costs.

[240] Ibid.

The identification of *medical predispositions* based on *genomic characteristics* is a relatively new growth market. In addition to the identification of *particular genes* that currently may be used to identify individuals who may be predisposed to certain cancers or diseases, *molecular diagnostics* can identify more than 1,900 *heritable disorders*. Although clinical laboratories are seeking to obtain a broader base for more diagnostics tests, a lack of standards between laboratories has led to a high level of variability and inconclusive results. Direct-to-consumer commercial "*testing kits*" have further diluted the standards for molecular diagnostics, creating concerns regarding the regulation of the field.[241]

Many *molecular diagnostic* technologies are not subject to the stringent compliance requirements set by the FDA for most *device technologies*. Rather, *the laboratory developed tests* (LDT) that encompass the many genetic diagnostic tests on the market are subject to FDA *discretional enforcement*, which is typically determined through the laboratory requirements prescribed in the *Clinical Laboratory Improvement Amendments of 1988*.[242] (See Chapter 3, "Regulatory Environment," for a further discussion of FDA regulations regarding *medical devices* and the *Clinical Laboratory Improvement Amendments of 1988*.)

5.3.4 Therapeutic Technology

The range of use for therapeutic technologies has grown substantially in the last century, and innovation in the field continues to lead to groundbreaking medical discoveries in the fields of *radiation therapy*, *minimally invasive surgery, transplant technologies, home infusion therapy, pain management*, and *molecular pharmacology*.

5.3.4.1 Radiation Therapy Much like *diagnostic imaging technology*, *radiation therapies* have been developed, adapted, and improved since the

discovery of the X-ray in 1895.[243] *Radiation therapy* uses high-energy light beams or charged particles to stunt the proliferation of cancer cells by damaging the DNA within the cell, thereby eliminating the cells' ability to divide or killing the cell.[244] However, radiation therapy also has the potential to damage healthy cells. Most side effects of radiation therapy are short term and are usually confined to the area being treated. Typically, treatments are administered on an *outpatient basis*, during the course of multiple sessions.[245] Approximately 50 to 60 percent of cancer patients use some form of radiation therapy at some point during their treatment.[246]

The development of *gamma knives* has increased the therapeutic capability, precision, and ease of use in which they deliver radiation therapy. These tools are used in the various modalities to deliver highly advanced therapy procedures, such *as intensity modulated radiation therapy* and *stereotactic radiosurgery*. In addition to executing treatment plans developed based on

Stereotactic Radiosurgery

This is a highly precise procedure involving the single, high-dose delivery of precisely targeted gamma-ray or X-ray beams, which is used in different parts of the body, but most frequently to treat brain tumors.

DOTmed Industry Sector Report: Linear Accelerators and Simulators, *by Barbara Kram,* DOTmed News, *November 19, 2008, http://www.dotmed.com/news/story/7013/ (accessed June 29, 2009).*

5.3.4.1.1 Intensity-Modulated Radiation Therapy *Intensity Modulated Radiation Therapy* (IMRT) is an advanced form of radiation therapy using *three-dimensional* (3D) imaging and treatment delivery. It differs from *3D conformal radiation therapy* (3D CRT), which uses linear accelerators to administer varying intensities of radiation without IMRT capabilities.[248] Alternately, IMRT treatments, custom-tailored using 3D CT images alongside computer-generated dose calculations, most effectively treat the *unique three-dimensional shape* of a tumor. This method allows for increased precision in the administration of high-dose radiation, while preserving the surrounding tissue.[249] Currently, CT scans are most commonly used for *IGRT*, such as *IMRT,* due to the technology being able to provide timely volumetric data.[250] Despite reported safety concerns related to certain procedures, for example, *nonmetastatic prostate cancer*, IMRT has been associated with *better patient outcomes* than other similar therapeutic radiation procedures.[251]

Recently, *Varian Medical Systems* introduced a new IMRT treatment technique, RapidArc, which delivers a radiation dose over a single rotation

360-degree rotation with treatments two to eight times faster than typical IMRT techniques.[253]

5.3.4.1.2 Proton Beam Treatment *Proton beam* treatment therapy allows physicians to specifically target the cancer without overexposing healthy tissues to the irradiation pattern and potentially damaging those organs as well. Because protons can *target the cancerous cells*, higher doses of radiation can be used to control and manage cancerous tumors, while minimally jeopardizing healthy tissue and organs. Accordingly, *proton beam therapy* has major advantages over standard or conventional radiation, as the energy distribution of protons emitted can be directed and placed in tissue volumes designated by the physician in a three-dimensional pattern for each beam, giving the physician greater precision and a greater degree of control over the amount of radiation that the patient is exposed to. As a result of this greater control, the oncologist can increase the dose to the *cancerous cells*, while reducing the dose to surrounding normal tissues, which may ultimately lead to fewer harmful side-effects, greater direct impact on the cancerous cells, and overall *increased cancer management.*[254] Of note is that the increased use of *direct-to-consumer advertising* related to *proton therapy* will likely lead to increased use of this technology, despite *clinical evidence* that *links* other radiation treatment alternatives, such as *IMRT*, contribute to better *patient outcomes* for some conditions, as compared to *proton therapy*.[255]

5.3.4.1.3 Stereotactic Procedures *Stereotactic radiotherapy* is a nonsurgical procedure involving the single, *high-dose delivery* of *targeted gamma-ray* or *X-ray beams* used to treat tumors and functional abnormalities in the brain.[256] Recently, advances in *stereotactic radiotherapy* allow for *a rapid fall off* in the amount of radiation a patient is exposed to, particularly to the *nontargeted surrounding tissue*, which makes *stereotactic radiosurgery* a particularly well-suited treatment for *brain metastases*, with *control rates* of 65 percent to 95 percent, and *adverse radiation rates* as low as 5 percent to 10 percent.[257] Frequently, stereotactic radiotherapy is administered in one session; however, physicians may recommend *fractionated stereotactic surgery* (treatments that are given over time), in circumstances where tumors are larger than could be treated in one session.[258]

Recently, *stereotactic radiotherapy* has been used to treat tumors located in areas other than the brain, in procedures referred to as *stereotactic body radiotherapy.* The most common sites for which *stereotactic body radiotherapy* is currently being used include (1) the *lungs*, (2) the *liver*, (3) the *abdomen*, (4) the *spine*, (5) the *prostate*, and (6) the *head and neck*.[259]

STEREOTACTIC RADIOSURGERY

This is actually a nonsurgical innovation that serves as an increasingly preferred alternative to invasive surgery for soft tissue tumors.

5.3.4.2 Minimally Invasive Surgery *Minimally invasive surgery procedures* typically lessen many of the risks traditionally associated with surgery through the use of several small incisions to guide fiberoptic cameras to the area(s) of interest.[260] Developments in *laparoscopic technologies* and an increasing demand for *minimally invasive surgery* are driving growth in the minimally invasive surgical procedures market, with advancements such as the creation of new and more precise *endomechanical devices* (small devices used for minimally invasive surgery) and *camera systems*.[261] Several product design platforms are being developed to meet this growing demand, including *robotic systems, flexible laparoscopy*, and *3D visualization systems*.[262] *Laparoscopy*, a form of minimally invasive surgery, involves the insertion of a slender tubular endoscope and other surgical instruments through the abdomen wall, allowing the practitioner direct internal visual navigation and control of the surgery.[263] *Laparoscopy* and other forms of *minimally invasive surgery* have evolved from continuous improvements in surgical technology to increase *ease-of-use, comfort*, and *accuracy*.

Medical device manufacturers are consistently designing new *minimally invasive surgery* products to make surgery less invasive for the patient, while still *improving precision* and *visualization for the surgeon*.[264]

Laparoscopy

Minimally invasive surgery that involves the insertion of a slender tubular endoscope through the abdomen wall. A laparoscopy involves the use of surgical instruments that the practitioner controls and fiberoptic technology for visual navigation.

AUTOMATED ENDOSCOPIC SYSTEM FOR OPTIMAL POSITIONING (AESOP)

This is the first laparoscopic camera holder.

"Robotic Assisted Laparoscopic Radical Prostatectomy: A Review of the Current State of Affairs," by V. R. Patel, M. F. Chammas Jr., and S. Shah, International Journal of Clinical Practice *61, no. 2 (February 2007): 309–314.*

However, the main barrier to expanding the scope of *minimally invasive surgery technologies* may be the *lack of awareness* of, and *training in*, advanced laparoscopic techniques by providers. To avoid the circumstance of manufacturers outpacing *efficient implementation* within the industry, in the development of new technologies manufacturers are focusing on their *ease of use*, in addition to the development of *innovative surgical techniques*.[265]

Recently, the availability of these newly developed *energy devices* has expanded the market for the utilization of *minimally invasive techniques* to include such devices as (1) *electrosurgical generators*, (2) *instruments*, (3) *accessories*, (4) and *thermal ligature systems*, which allow for more *accurate* and *less invasive* procedures by advancing *dissecting*, *cutting*, *coagulating*, and *ligature creation* surgical procedures.[266] In 2011, the *electrosurgical market* included approximately $1.1 billion in sales, which is expected to *increase* an average of 6.1 percent annually and reach approximately 1.37 billion by 2015.[267]

Radiation Therapies

Use high-energy light beams or charged particles to stunt tumor cell proliferation, thereby treating cancer.

Brachytherapy

Allows for treatment at higher doses of radiation to treat a smaller area in a shorter time by placing radiopharmaceuticals directly inside or next to the tumor. Brachytherapy can be temporary or permanent, with variable administration rates and doses.

"Brachytherapy," by Radiological Society of North America, RadiologyInfo, *June 10, 2009, http://www.radiologyinfo.org/en/info.cfm?PG=brachy (accessed June 26, 2009).*

5.3.4.2.1 Robotic-Assisted Surgery Of the various *minimally invasive surgery* technologies on the market, *surgical robots* may be best equipped to enable surgeons to perform complex open procedures with a minimally invasive approach.[268] The *da Vinci System*, developed by *Intuitive Surgical Inc.* in 1998 and approved by the FDA in 2000, revolutionized minimally invasive surgery by overcoming the limitations of both traditional surgical procedures and conventionally implemented noninvasive laparoscopic technology. A key feature of the *da Vinci System* is its *EndoWrist technology*, which allows the surgeon to fully rotate his or her hand, therefore giving the surgeon the capacity to reach around, beyond, or behind. The *EndoWrist* technology provides the surgeon with seven *degrees of freedom*, that is, the number of different rotations by the robot "*hand*."[269]

In its early development, *robotic-assisted surgery* performed with this technology was originally limited to *cardiac endoscopy*, but it has expanded

MINIMALLY INVASIVE PROCEDURES

Avoid many of the risks traditionally associated with surgical procedures through their use of several small incisions to guide fiberoptic cameras to areas that need treatment.

Degrees of Freedom

The number of possible rotations that can be made by a robotic "hand."

"Robotic Technology in Surgery: Past, Present, and Future," by David B. Camarillo, Thomas M. Krummel, and J. Kenneth Salisbury, American Journal of Surgery *(Supplement to October 2004): 2S–15S.*

The introduction of the *da Vinci System* represented a substantial progression in the field of *minimally invasive cardiac surgery*, including (1) *mitral valve repair*; (2) *transapical aortic valve implant*; (3) *CABG*; (4) *thoracic endografting*; (5) *repair of atrial fibrillation*; and (6) *robotic revascularization surgery*, that is, the "*DaVinci Revascularization on a Beating Heart*" procedure.[273] On approving the *da Vinci* robot for cardiac procedures, the FDA mandated training of all surgical teams and professionals intending to use the *daVinci* for cardiac procedures.[274] Surgeons who have pioneered the infusion of *robotic technology* into their cardiac programs believe that successful use of the *daVinci System* for cardiac procedures such as *beating heart revascularization* will be possible with the *right team of providers*; a *properly devised curriculum* targeted at surgeons, their teams, and other members of their departments; *multispecialty training*; and *patience*.[275]

In the last 20 years, the number of general surgical, gastrointestinal, gynecological, neurosurgical, orthopedic, pediatric, radiosurgical, and urological procedures that employ either robotically assisted or robotically controlled capabilities has grown steadily, for example, the use of robotic

[273] M. J. Mack, "Minimally Invasive and Robotic Surgery," *Journal of the American Medical Association* 285, no. 5 (2001): S488–S492; Mayo Clinic, "Robot-Assisted Surgery," 2009, http://www.mayoclinic.org/robotic-surgery/ (accessed April 6, 2009).

External Beam Radiation Therapy (EBT)

Involves the administration of high-energy X-ray beams to kill cancer cells and treat tumors. Often, some X-ray, ultrasound, or CT imaging is used prior to the delivery to ensure that the path of the beam will align with the target area.

"External Beam Therapy (EBT)," by Radiological Society of North America, RadiologyInfo*, June 10, 2009, http://www.radiologyinfo.org/en/info.cfm?PG=ebt (accessed June 26, 2009).*

procedures for radical prostatectomy increased from 1 percent in 2001 to more than 50 percent in 2009.[276]

While robotic surgery devices, such as the *da Vinci System,* are now common for *cardiac, urology, and gynecological procedures*, advancements in robotic-assisted surgery, especially in their visualization capacities, are now allowing these less-invasive techniques to be applied to more complicated surgeries, such as those of the spleen and the liver.[277] Initially, the *da Vinci System* was the only approved system on the market; however, in early 2009, *CUREXO Technology Corporation* announced FDA clearance of its robotic orthopedic surgical device, *ROBODOC*, for total hip arthroplasty.[278] Despite the availability of alternative robotic technologies, the *da Vinci System* has experienced *phenomenal growth* and nearly *complete market dominance*, with approximately 1,000 *da Vinci System* units used in hospitals nationwide as of August 2011.[279] In 2012, the company estimated that the *da Vinci System* would be used for 24 percent more procedures than

[276] Joan Trombetti, "Robotic Surgery," *DotMed News*, January 7, 2009, http://www.dotmed.com/news/story/7463 (accessed July 6, 2009); Laura Sigismund Leddy, et al., "Robotic Surgery: Applications and Cost Effectiveness," *Open Access Surgery* 3 (2010): 101.

[279] Carmen Phillips, "Tracking the Rise of Robotic Surgery for Prostate Cancer," National Cancer Institute, August 9, 2011, http://www.cancer.gov/ncicancerbulletin/080911/page4 (accessed July 18, 2012).

in 2011, a projection that appeared to be coming true, as the company saw an actual increase of 29 percent in the procedures performed with a *da Vinci System* between Q2 2011 and Q2 2012.[280]

5.3.4.2.2 Carotid Stenting as an Alternative to Cardiac Revascularization Treatment of *coronary artery disease* may be achieved through such procedures as *carotid stenting* or *revascularization*.[281] While *carotid stenting* (the process of inserting a mesh tube inside an artery to improve blood flow) and *cardiac revascularization* (a surgical procedure that places new blood vessels around existing blockages) appear to have *similar outcomes overall*, there is reported to be a higher risk of *stroke* during *stenting procedures*. In addition, *younger patients* appear to experience *better outcomes with stenting*, while *older patients* appear to experience *better outcomes with revascularization*.[282] Despite various studies purporting to identify the *preferable procedure* for a *given patient population*, there is still significant debate among surgeons regarding the *preferable procedure*, particularly in light of the fact that *revascularization* had historically been the *standard of care* for 50 years, while *stenting* has only become an *alternative* to *revascularization* within the last 20 years.[283]

5.3.4.2.3 Implantable Devices *Implantable devices* are also on the forefront of *minimally invasive surgery*, as new technologies related to monitoring chronic conditions, such as *diabetes* and *heart failure*, are expanding. One example is the *CardioFit* system. Similar to a pacemaker, the *CardioFit* system is a subcutaneous heart monitor that automatically reacts to changes in heart activity with *unidirectional stimulation* to the *vagus nerve*.[284] The device's safety and efficacy have been demonstrated, and *CardioFit* has already been approved in the European Union and is currently in FDA *Phase III clinical trials* in the United States.[285] Similar to *CardioFit*, the

Optimizer III Cardiac Contractility Modulation (CCM) *system* has an implantable mechanism that stimulates the heart muscle itself, rather than the nervous system, in order to ultimately "*train*" the heart to beat stronger.[286] The *Optimizer III* is also in FDA *Phase III clinical trials* and may be the first heart failure device of its kind to reach the commercial market.[287]

5.3.4.3 "Transplant" and "Replacement" Technologies Approximately 18 patients die each day *waiting* on a *transplant list* for organs to become available.[288] The *United Network for Organ Sharing* (UNOS), a private not-for-profit organization established in 1977, coordinates the U.S. organ *procurement* and *transplant* system, including *patient wait lists*, throughout 11 regional centers across the country.[289]

The first successful organ transplant was performed in 1954 with a human *kidney*, and subsequent *pancreas*, *liver*, *heart*, and *lung* transplants were successfully performed during the 1960s and the 1980s, in large part due to the development of *antirejection drugs* in recent decades.[290] As of 2010, the *kidney transplant wait list* was the most extensive, at 52,503 *active patients*, with the number of patients on the *wait list* having nearly doubled since 1998.[291] The number of patients on *transplant wait lists* for other organs is set forth in Table 5.6.

As of 2012, there are approximately 270 hospitals performing organ transplants in the United States.[292]

While survival rates following an organ transplant have improved for all types of transplant procedures, *kidney transplants* appear to continue to be the most successful, based on *graft survival rates,* that is, survival with a functioning transplanted organ. See Table 5.7.

A significant factor in determining the ultimate *success* and *longevity* of a transplanted organ is whether the donor was *living* or *deceased* at the time of *donation*, for example, donation from a *living donor* is associated with a *one-year survival rate* of 96.5 percent for kidney transplants, as compared to a *one-year survival rate* of 92 percent for kidney transplants involving a *deceased donor*. The incidence of organ rejection varies by type of organ, with the *lowest incidence of rejection* occurring for *kidney transplants* (10.8 percent), as compared to the *highest incidence of rejection* occurring for *intestinal transplants* (43.1 percent).[293]

Factoid

Cyclosporine, the first antirejection drug for organ transplants, was approved for commercial use.

Intestine	72.2%	50.6%

United States Organ Transplantation: OPTN & SRTR Annual Data Report 2010, United Network for Organ Sharing, Rockville, MD: Department of Health and Human Services, Health Resources and Services Administration, Healthcare Systems Bureau, Division of Transplantation, 2011, p. 8.

The number of organ donations has increased significantly in the last several decades. Since the 1970s, the *donor body standard* that was used was *brain death*; however, surgeons began using the *nonbeating heart donation standard* in the 1990s.[294]

5.3.4.3.1 Hip and Knee Transplants The market for *artificial hips* and knees appears to have been historically dominated by five companies: (1) *Biomet Inc.*, (2) *DePuy Orthopaedics Inc.*, (3) *Smith and Nephew PLC*, (4) *Stryker Corp*, and (5) *Zimmer Holdings Inc*. In recent years, the artificial knee and hip market began to shrink, due to several factors, including (1) the effects of the "*Great Recession*," (2) *downward pricing* pressure from hospitals, and (3) the resulting impact of a *"successful" 2009 qui tam action* against several device manufacturers in Texas.[295] In 2007, the Department of Justice (DOJ) settled criminal and civil investigations with the above five *hip and knee replacement companies*, which together made up 95 percent of the market at that time. In its *complaint*, the DOJ alleged that between 2002 and 2006, the companies *induced* hundreds of physicians to *exclusively use* a particular implant by entering into certain *consulting agreements* by which certain physicians were compensated in amounts up to hundreds of thousands of dollars

[294] John T. Potts and Roger Herman, *Non-Heart-Beating Organ Transplantation: Medical and Ethical Issues in Procurement* (Washington, DC: National Academy Press, 1997), pp. 1, 20–22.

Factoid

The da Vinci System revolutionized minimally invasive surgery by overcoming the limitations of both traditional surgical procedures and conventionally implemented non-invasive laparoscopic technology.

"Robotic Surgery," by Joan Trombetti, DotMed News, *January 7, 2009, http://www.dotmed.com/news/story/7463 (accessed July 6, 2009).*

per year, often undisclosed by the physicians to their patients and affiliated hospitals.[296] The companies agreed to 18 months of monitoring by the DOJ to ensure satisfactory compliance with new corporate procedures that would curtail industry use of *consulting agreements*. By the end of the 18-month monitoring period, the *knee and hip replacement industry* saw a 61 percent reduction in *consulting payments* made to physicians, that is, from $272 million to $105 million, and a 63 percent decrease (from 1,693 to 628) in the total number of physicians who received payments.[297] In total, the DOJ recovered $310 million in civil penalties from the settlements.[298] Significantly, the companies began publicly disclosing the names of all consultants and the amounts paid to them, a practice that is being adopted throughout the *pharmaceutica*l and *medical device industries*.[299]

These market disruptions have allowed for smaller companies to gain momentum within the $11 billion *hip and knee replacement industry*. New technologies have experienced the most success in the market, in particular, *robotically assisted procedures* that provide a greater level of accuracy for knee alignment. Since the 2006 release of MAKO Surgical's *RIO robotic system*, approximately 113 units have been sold and 13,000 procedures

[296] U.S. Department of Justice, "Five Companies in Hip and Knee Replacement Industry Avoid Prosecution by Agreeing to Compliance Rules and Monitoring," press release, September 27, 2007, pp. 2, 4, http://www.usdoj.gov/usao/nj/press/files/pdffiles/hips0927.rel.pdf (accessed October 15, 2012).

[299] Ibid., p. 4.

have been performed, resulting in MAKO obtaining a 12 percent share of the *$700 million U.S. knee transplant market*.[300]

5.3.4.3.2 Valve Replacements As surgical technology has advanced, surgeons are now better able to repair a patient's body, rather than replacing the failing organ, or part thereof, for example, the total number of *mitral valve repairs* versus the total number of *mitral value replacements* increased from 51 percent in 2000 to 69 percent in 2008. While *mitral valve replacements* have traditionally used *mechanical valve devices*, the use of *mechanical valves* has declined from 68 percent in 2000 to 37 percent in 2008, with *mitral valve tissue transplants* often being performed instead.[301] Similarly, in November 2011, the FDA approved the *Edwards Lifescience Sapien transcatheter heart valve*, which allows surgeons to replace *diseased aortic valves* without the need for open heart surgery, a procedure known as a *transcatheter aortic valve replacement* (*TAVR*). Subsequently, the FDA recommended *TAVR*'s use for *high-risk patients* in July 2012.[302] While *TAVR* has been approved in Europe since 2007, the *Edwards Lifescience transcatheter heart valve* is currently the only valve of its kind in the U.S. market, which is projected to drive the U.S. heart valve market to $1.5 billion by 2016.[303]

5.3.4.4 Home Health Infusion Technology *Infusion therapy* involves the administration of *medications, nutrients*, or other *solutions intravenously*, *subcutaneously*, *enterally*, or *epidurally*, that is, into the bloodstream, under the skin, into the digestive system, or into the membranes surrounding the spinal cord. Specific home infusion therapies include *anti-infectives, chemotherapy, pain management, parenteral and enteral nutrition, hydration therapy*, and *immunotherapy*.[304] The home infusion process requires the

drug itself, durable medical equipment (e.g., a pump or an IV pole), supplies (e.g., tubing), and often nurses to administer the treatment.

In June 2012, the *Medicare Payment Advisory Commission* (MedPAC) submitted its report to Congress regarding the feasibility of expanding Medicare to include *home-based infusion therapy*, in addition to infusion therapy performed in inpatient, outpatient, hospice, and *skilled nursing facility* settings.[305] Approximately 36,000 *Medicare Part B* beneficiaries and approximately 10,000 *Medicare Part D* beneficiaries received home infusion therapy in 2009. Medicare spending on home infusion therapy drugs, as well as the number of beneficiaries receiving these drugs, increased rapidly between 2006 and 2009, with the number of Part D enrollees receiving Part D–covered home infusion drugs increasing at a rate of 21 percent per year, as compared to a growth rate of 5 percent per year for the overall Part D population. In addition, Medicare fee for service spending for Part B–covered home infusion therapy drugs increased at an average rate of 17 percent

[305] Medicare Payment Advisory Commission, *Report to the Congress: Medicare and the Health Care Delivery System*, Washington, DC, June 2012, pp. 169–207.

Non-Parenteral Drug Delivery

A means of drug delivery where the distribution is through a means other than a digestive one.

"Biopharmaceutical Benchmarks 2006: The Rate of Biopharmaceutical Approvals Has Leveled Off, but Some Milestones Bode Well for the Future," by Gary Walsh, Nature Biotechnology *24, no. 7 (July 2006): 769–776.*

per year, as compared to an average growth rate of 6 percent in the number beneficiaries using Part B home infusion drugs.[306] *Home infusion antibiotics* covered by Part D accounted for the largest number of users of Medicare-covered home infusion drugs, followed by *immune globulin* and *alpha-1-proteniase inhibitor* drugs, and several drugs used to treat *rheumatoid arthritis*.[307] Similarly, antibiotics were the most common type of home infusion therapy drug covered by commercial insurers.[308]

According to *the Braff Group*, a healthcare M&A firm, *home infusion therapy* experienced a 60 percent increase in transactional market activity between 2010 and 2011.[309] With 16 deals in 2011 (11 of which had different buyers), the home infusion therapy market posted its highest transaction volume since 2008, according to *Braff*.[310]

5.3.5 Pain Management Technology

It is estimated that pain may perhaps be the most common reason that patients seek medical care, accounting for approximately half of all physician office visits in the United States. Some pain epidemiology studies appear to indicate that approximately 80 to 85 percent of persons over the age of 65 suffer significant health conditions that predispose them to pain.[311]

[311] Mary Thompson, "U.S. Pain Management Device Market: Catering to an Aging Population," *MedTech Insight* (August 2011): 42.

As the U.S. population continues to age, and chronic diseases, as well as surgical interventions, become more prevalent among this age group, appropriate pain management is likely to become an increasingly important focus of emerging technology developments. In response to this growing demand, it is reported that the combined U.S. sales of pain management devices totaled approximately $2.46 billion in 2010, with *neurostimulators* accounting for approximately 60 percent of sales, *external analgesia infusion pumps* accounting for approximately 26 percent of sales, and *implantable analgesia pumps* accounting for approximately 11 percent of sales.[312]

5.3.6 Molecular Pharmacology

Molecular pharmacology studies the interaction of drugs at a *cellular level* by translating *laboratory pharmacological findings* into *clinical pharmacological applications*—how *drug molecules interac*t with *protein receptors,* both on the surface of, and within, the cell. *Biopharmaceuticals* are *drugs* and *biologics* that interact with an organism via *genetic manipulation of foreign DNA*, while *biologics* are *therapeutic products* that are *developed using living sources*, such as *vaccines*, blood and blood products, and allergenic extracts and tissues.[313] The manufacturing of *biopharmaceuticals*, most specifically *vaccines, monoclonal antibodies, recombinant proteins*, and *stem cells*, relies heavily on the *cell culture market*.[314]

Biologics

Therapeutic products that are developed using living sources. Examples of biologics include: vaccines, blood and blood products, and allergenic extracts and tissues.

Biopharmaceuticals

A pharmaceutical product manufactured by biotechnology methods (involving live organisms or bioprocessing).

"What Is a Biopharmaceutical? Part 1: (Bio) Technology-Based Definitions," by Ronald A. Rader, BioExecutive International*, March 2005, p. 61.*

The FDA has approved drugs and *biologics* in eight categories of *biopharmaceuticals*: (1) *recombinant blood factors*, (2) *recombinant thrombolytics* and *anticoagulants*, (3) *recombinant hormones*, (4) *recombinant growth factors*, (5) *recombinant interferons and interleukins*, (6) *recombinant vaccines*, (7) *monoclonal antibody-based products*, and (8) *miscellaneous recombinant products*.[315] *Insulin* was the first *recombinant protein* to be approved and today remains the prototype for biopharmaceutical development. It was also among the first biopharmaceutical to undergo *molecular engineering,* a process that has since defined development and advancement in *biopharmaceuticals*, and generated $13.3 billion in sales in 2009 alone.[316] With both the incidence and the prevalence of diabetes on the rise, demand for such products is likely to continue to grow.

The Intramural Research Program (IRP) of the National Institutes of Health (NIH) encourages "bench-to-bedside" translational research and includes such programs as the Therapeutics for Rare and Neglected Diseases (TRND) Program, under the National Center for Advancing Translational

Sciences (NCATS); the Psychoactive Drug Screening Program, under the National Institute of Mental Health (NIMH); and the Laboratory of Molecular Pharmacology, under the National Cancer Institute's (NCI) Center for Cancer Research (CCR). The IRP has repositories for both natural and synthetic products and compounds and has access to the NCI-60, a databank of 60 cancer cell lines against which the NCI's Developmental Therapeutics Program screens hundreds of thousands of compounds.[317]

5.3.6.1 Proteomics A major trend in molecular medicine is *proteomics*. Derived from the words *proteins* and *genome*, *proteome* refers to all of the proteins produced "in one sample (e.g., tissue, organism, or cell culture) at a certain point in time."[318] *Proteomics* is similar to *genomics*, in that both can target specific areas of the genome for therapeutic benefit. While the *genome* rarely mutates, the *proteome* is dynamic and changes with every environmental signal within and outside of the cell.[319] The goal of research in this field of medical technology is not only to create a "*master list*" of all *potential gene protein iterations*, but also to *map* the *interconnection between proteins* as they respond to external stimuli.[320]

Therapeutic proteomic technology has seen developments with *innumerable implications* for correcting defective proteins or filling in a gap where

[320] Emanuel F. Petricoin, et al., "Clinical Proteomics: Translating Benchside Promise into Bedside Reality," *Nature Reviews: Drug Discovery* 1, no. 9 (September 2002): 683.

a protein is absent.[321] Several *protein kinase inhibitors* are currently in FDA clinical trials and have boosted proteomic research in *phosphorylation-triggered signaling*, known as "*phosphoproteomics*."[322] In addition, more accurate mass spectrometry techniques have allowed researchers to target cancer and tumor suppression proteins with more specificity.[323] Continued advances in this field are expected to support developments in *personalized medicine* technology, which are emerging particularly in the area of *oncology*, where specific therapies are being targeted to *genetically derived tumor types*. As a result, many *pharmaceutical* and *diagnostic companies* are entering the *personalized medicine* market at an accelerating pace.[324]

5.3.6.2 RNAi Therapeutics Other advances in *therapeutic genome technology* include *nucleic acid–based technologies,* which have clinical applications that involve both *deoxyribonucleic acid* (DNA) and *ribonucleic acid* (RNA). Advances in *DNA nanotechnology* have allowed for specifically targeted drug delivery, while advances in *RNA technology* have moved toward therapeutic "*interference*" with the genome. *RNA interference* (RNAi) is a natural cellular process where specific genes (e.g., a cancer gene) can be *targeted* and "*silenced*" so that they cannot *reproduce* and become *symptomatic*. Since its initial discovery in 1998, *RNAi* has become increasingly prevalent in the biomedical industry.[325]

Similar to RNAi, *microRNAs* (miRNA) are encoded within the genome and are anticipated to change therapeutic capabilities, due to the current theory that they regulate approximately one-third of the entire *human genome*.[326] As of 2012, 18 *RNAi therapeutic programs* are actively in *clinical trial stages*, involving almost 1,500 patients and healthy volunteers.[327]

However, *bevasiranib*, a drug to treat macular degeneration, was the only *RNAi therapeutic* to reach *FDA Phase III trials* before its FDA approval was halted due to lack of a *placebo test* group to compare efficacy data.[328] Significantly, there has been no report of high-incident side effects or any programs placed on "*clinical hold*" due to safety events throughout the clinical trial process for *RNAi therapeutics*.[329]

These *biopharmaceutical*s show tremendous promise in countless areas, the most notable of which include *anti-viral, Hepatitis C,* and *cancer treatment*, and were predicted to generate approximately $1 billion by 2015.[330] In addition, the number of biopharmaceuticals in general that are available for commercial use is continually growing, with 12 new products approved by the FDA in 2011.[331] However, the rate of FDA approval has slowed since 2006, with the *approval* of *new biological entities* (NBEs), stated as a percentage of *all new approvals,* decreasing from 24 percent between 2003 and 2006, to 21 percent between 2006 and 2010.[332]

5.4 CONCLUSION

> *Over the coming years, substantial new challenges will force legislators and regulators to make increasingly difficult distinctions. New products based on new technologies, most notably the emerging science of genetics, will proliferate. . . . Policy makers will have to weigh the promotion of innovation against the reduction of hazards in new ways, and the mix of policy and science will involve growing complexity. If history is a guide, our tolerance for risk will initially be high, but at the first sign of scandal, the legislative and regulatory reaction will be strong. Achieving the best regulatory balance will be a crucial task so that clinicians remain equipped with the safest and most effective medical technologies that science can provide.*
>
> —Robert I. Field, *Health Care Regulation in America: Complexity, Confrontation, and Compromise*

Current total spending on healthcare is 17.9 percent of GDP,[333] growing almost 1.6 percent faster than the nation's *per-capita output* in the last 25 years.[334] This growth is fueled by the *perpetual technological advancement*, *dynamic availability* of the most *accelerated technologies*, fear of potential *malpractice* suits, and efforts to procure *economic gain* that support the necessary supply factors to perpetuate this invincible expansion. The *Institute of Medicine* recently described this current "*paradox*" of U.S. healthcare delivery, stating:

> *As a result of improved scientific understanding, new treatments and interventions, and new diagnostic technologies, the U.S. healthcare care system now is characterized by more to do, more to know, and more to manage than any time in history. . . . The result of this paradox: advances in science and technology have improved the ability*

[333] Robert I. Field, *Health Care Regulation in America: Complexity, Confrontation, and Compromise* (New York: Oxford University Press, 2007), pp. 139–140; Centers for Medicare and Medicaid Services, "Table 1: National Health Expenditures Aggregate, Per Capita Amounts, Percent Distribution, and Average Annual Percent Change: Selected Calendar Years 1960–2010," in *National Health Expenditures Data*, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/tables.pdf (accessed June 25, 2012)

[334] Congressional Budget Office, *The 2012 Long-Term Budget Outlook*, June 2012, http://www.cbo.gov/sites/default/files/cbofiles/attachments/06-05-Long-Term_Budget_Outlook.pdf (accessed July 18, 2012), p. 45.

> *of the health care system to treat diseases, yet the sheer volume of new discoveries stresses the capabilities of the system to effectively generate and manage knowledge and apply it to regular care. These advances have occurred at the same time as, and sometimes have contributed to, challenges in health care quality and value.*[335]

In this *era of healthcare reform*, change is constantly on the horizon with increased emphasis on advancements and utilization of new technologies. *Diagnostic* and *therapeutic technologies* continue to emerge, replacing outdated techniques with less invasive, yet more expensive, alternatives. These technological advancements in the clinical treatment of patients will undoubtedly shape the future direction of patient care services in a *reimbursement environment* that *rewards providers* based on "*quality*" over "*quantity*." With growing importance placed on the *value metrics of patient care*, that is, "*highest quality at lowest costs*," an integrated *management information technology* system that includes data input by the patient, the provider, and the payor, may enhance the communication between these stakeholders and improve the *continuum of care*. As summarized by William Baumoll in *The Cost Disease: Why Computers Get Cheaper and Health Care Doesn't*:

> *Announcements of new information about diseases and new methods of diagnosis and treatment arrive with increasing frequency. . . . Some of these do provide cost savings, and many promise benefits that may justify their startling prices. All of them indicate that rapid and impressive change, and the costs this entails, are part of the evolving science of health-care delivery. The effectiveness, safety, and cost of these new medical techniques, however, are generally determined only after the new discoveries are already in use. Over time, many of these new techniques may prove inadequate. As this occurs and better approaches and procedures are recognized, doctors must be ready to abandon the methods that are no longer effective—especially those that come at great expense with little or no benefit to patients. . . .The introduction of incentives for physicians to discontinue costly procedures that have only marginal benefits may be another [means of reducing medical costs]. It may be necessary to subsidize or regulate the cost of expensive new medical*

[335] Mark Smith, et al., *Best Care at Lower Cost: The Path to Continuously Learning Health Care in America,* Institute of Medicine (Washington, DC: National Academics Press, 2012), p. S-4 (prepublication copy—uncorrected page proofs).

equipment, which may be used more often than is absolutely necessary by doctors who have no other means of recouping its cost . . . [and] to train future doctors to prefer diagnostic and treatment options that provide both cost savings and improved medical care to patients.[336]

CHAPTER 6

Healthcare Reform

6.1 OVERVIEW

In the last century, U.S. healthcare reform has historically been driven by complex, polar, and potentially conflicting sociopolitical, economic, demographic, and market factors, manifested by increased spending, a growing and aging population, workforce disruptions, increased prevalence and incidence of chronic and acute medical condition, and inefficient delivery and shortcomings in translating emerging technologies into the delivery of quality and affordable care. While the passage of President Barack Obama's signature healthcare reform initiatives (often referred to as "*Obamacare*"), through the March 23, 2010, enactment of the *Patient Protection and Affordable Care Act* and the March 25, 2010, passage of the *Health Care and Education Reconciliation Act of 2010* (hereinafter referred

to as the "ACA"), is a landmark event in U.S. healthcare reform, a multitude of unresolved issues and uncertainties remain.[1] However, the one certainty is that healthcare reform cannot, and should not, be viewed as a singular event, but rather as a long-standing process that will inevitably continue to be subject to various intervening economic circumstances, health variables, and sociopolitical scenarios at each stage.

The implementation of the ACA is an adaptive process, not only bound by the provisions contained in the actual text of the legislation, but also requiring direction by the promulgation of agency rules and regulations in the coming months and years. Furthermore, it is subject to factors beyond the legislative arena, including the level of the public's support and acceptance; the dynamic economic, political, and demographic landscape; the response of both private capital markets and employers; and the practical and operational implementation of the law by healthcare professionals and providers. The action (or inaction) of state governors, legislators, and attorneys general will also affect the ultimate application of many ACA provisions that must be implemented at the state, rather than the federal, level.

While the ACA sets the stage for a tumultuous *future* in U.S. healthcare delivery reform, the direction and ultimate consequence of that process are an extension of what preceded it. President Harry S. Truman once said, "The only thing new in the world is the history you don't know." An analogous concept is the economic principle that "the best indicator of what will happen in the future is the performance of the immediate past," which concept addresses the core foundation for financial valuation, that is, "all valuation is the expectation of future economic benefit." Accordingly, to possess the requisite background to forecast the future, the valuation professional requires an in-depth understanding of the historical development of the healthcare industry under the changing *reimbursement*, *regulatory*, *competitive*, and *technological* backdrop of reform.

6.2 INITIATIVES LEADING TO HEALTHCARE REFORM

The passage of the ACA in 2010 was the most recent episode in the long running saga of healthcare reform initiatives. Political and legislative initiatives related to U.S. healthcare reform date back to the early

[1] "Patient Protection and Affordable Care Act," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010); "Health Care and Education Reconciliation Act," *Pub. L.* 111-152, 124 Stat 1029 (March 25, 2010).

1900s.[2] (See Chapter 1, "The Chronology U.S. Healthcare Delivery: From Caduceus to Corporatization.") Health reform efforts continued through the late 1930s and 1940s with national initiatives and planning during the administration of President Franklin Delano Roosevelt (FDR), in support of the implementation of a national health insurance plan, for example, congressional passage of the *Social Security Act* in 1935, as well as the establishment of the *Department of Health and Human Services* (*HHS*) in 1939.[3] Later, in 1949, President Truman's attempt at passing the health reform program conceived by FDR was roundly defeated as a result of strong opposition and intense lobbying by the American Medical Association (AMA) and the American Hospital Association (AHA), which used "*Red Scare*" tactics of the time to equate national health insurance with a movement toward *Communism*.[4]

In 1965, U.S. healthcare reform reached another major milestone with the creation of the *Medicare* and *Medicaid* programs, providing funding for healthcare services to the elderly and the poor, which were signed into law by President Lyndon B. Johnson.[5] Following the passage of these landmark programs, U.S. healthcare expenditures began to increase throughout the 1970s, raising public and political concern over national health spending and significantly elevating cost-containment efforts, rather than the development of new national healthcare initiatives, as the main focus of lawmakers.[6]

The emphasis on cost-saving measures and the lack of support for sweeping new healthcare delivery models continued through the 1990s, despite

Factoid

The Health Insurance for the Aged and Disabled Act became law in August 1965 as part of President Lyndon B. Johnson's "Great Society" initiative and created Medicare.

Medicare Rules & Regulations: A Survival Guide to Policies, Procedures and Payment Reform *by Denise L. Knaus (Los Angeles: PMIC, 1998), p. 15.*

multiple efforts to address the fiscal implications of the rapid increases in healthcare expenditures during a period between 1980 and 1993 in which the healthcare portion of the GDP rose more than 50 percent.[7] Perhaps the most significant reform proposal initiated was the *Health Security Act of 1993* (HSA) led by First Lady Hillary Clinton and Ira Magazine, which would have established near-universal coverage and restructured the market for health insurance, but it failed to pass either house of Congress.[8]

THE HEALTH SECURITY ACT

The Health Security Act included provisions for universal coverage, regulations of the private insurance market, changes to healthcare financing through an employer mandate, cost control enforced by a national health board, and a transformed delivery system through managed care.

6.3 DRIVERS OF HEALTHCARE REFORM

The continued rise in healthcare expenditures, arguably at an unsustainable rate of increase following the failed 1990s reform efforts, served as one of several catalysts that precipitated the need for the most recent national healthcare reform initiatives. Other forces driving the urgency for passing some kind of national healthcare reform legislation include the increasing number of people who are uninsured or underinsured and unable to gain access to care, the growth and changing patient demographic of the aging baby-boomer population, declining reimbursement for physician services and provider manpower shortages, and increasing public awareness regarding quality of care issues and medical error rates, among others. These circumstances, together with the current economic recession, an unprecedented intensity in political discourse regarding U.S. government deficits and debt, and increasing political polarization and governance, especially related to an ardent renewal of asserting states' rights in opposing federal initiatives, have created a "*perfect storm,*" that may be able, for the first time, to fuel real changes to the current system of healthcare delivery in the United States.

6.3.1 Rising Healthcare Costs

In 2010, total national health expenditures (NHE) in the United States grew to $2.59 trillion, an approximate 3.93 percent increase from 2009.[9] Similarly, NHE for 2011 is estimated to be at approximately $2.7 trillion, an

HEALTHCARE SPENDING

Medicare, Medicaid, and Social Security account for nearly 40 percent of all government spending, with an expected rising percentage in the coming decades.

"The Great Recession and Government Failure," by Gary S. Becker, Wall Street Journal, *September 2, 2011, http://online.wsj.com/article/SB10001424053111904199404576536930606933332.html (accessed April 26, 2012).*

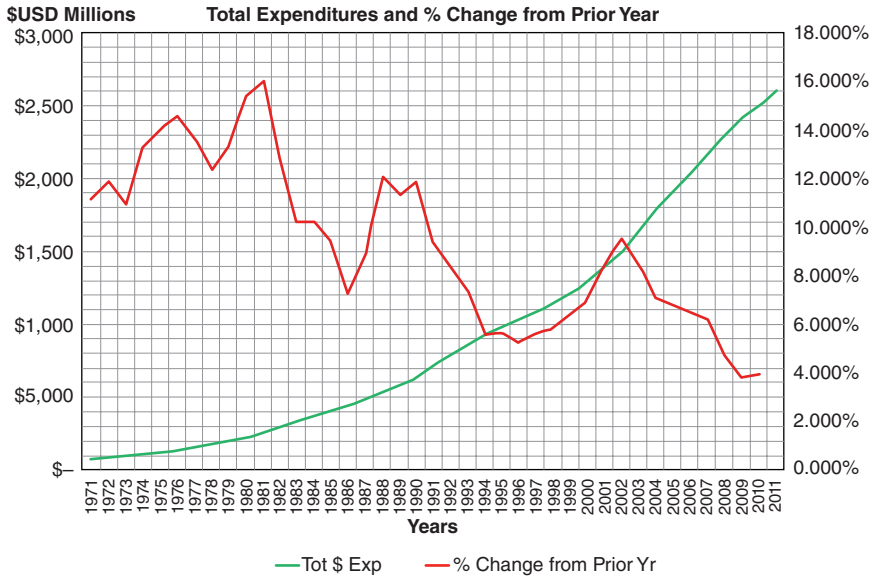

EXHIBIT 6.1 National Health Expenditures 1970–2010

"National Health Expenditures (NHE) Amounts by Type of Expenditure and Sources of Funds: Calendar Years 1970–2012," Centers for Medicare and Medicaid Services, January 2012, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/Proj (accessed August 30, 2012).

approximate 3.9 percent increase over the 2010 rate and just slightly higher than the historically low 2009 growth rate of 3.8 percent.[10] Despite the overall increase in NHE each year since 1970, this trend in the *decreasing rate* of growth in NHE is set forth in Exhibit 6.1.

Despite a growing demand for healthcare services, the patient population continues to experience financial strain when attempting to pay for healthcare services, with out-of-pocket spending for health services rising faster than the typical household income from 2001 to 2004.[11] From 2001 to 2006, the number of Americans indicating high financial burdens due to healthcare spending increased by approximately 1 percent per year, rising from 16.4 percent to 19.1 percent from 2004 to 2006 alone.[12] The financial stability of

Factoid

Failed efforts to reduce unemployment and stimulate the economy during the *Great Recession* led to nearly $1 trillion in government spending, causing the recession to grow and deepen.

"The Great Recession and Government Failure," by Gary S. Becker, Wall Street Journal, *September 2, 2011, http://online.wsj.com/article/SB10001424053111904199404576536930606933332.html (accessed April 26, 2012).*

the U.S. population has not improved in more recent years due to the *Great Recession* and is anticipated to remain unstable in the near future.[13]

6.3.2 Physician Manpower and Workforce Changes

Healthcare provider manpower shortages were also a contributing factor compelling recent healthcare reform initiatives. In 2010, the Association of American Medical Colleges (AAMC) approximated a shortage of 13,700 physicians across all specialties, 9,000 of whom provide primary care services. By 2020, the AAMC predicts this shortage will expand to 91,500 physicians, of which approximately half will be primary care providers.[14] This trend is driven by several factors, one of which is an aging baby boomer population, which is expected to increase the 65 and older population from 40.2 million in 2010 (when the first baby boomer turned 65) to 88.5 million in 2050, an increase from 13 percent to 20.2 percent of the total population.[15] In addition, the number of practicing physicians in the United States

is predicted to remain fairly stagnant during the next decade, due in part to physician lifestyle changes, which have resulted in a reduction of the total number of work hours, and the retirement of the current physician workforce, approximately 26.3 percent of whom were 60 years of age or older in 2010.[16] (See Section 4.3.4, "The Physician-Workforce Shortage: Demand Outpaces Supply," in Chapter 4, "Competition.") At the same time, the dynamic change and the versatility of providers as to scope of practice have been growing to accommodate the changing reimbursement, regulatory, competitive, and technological aspects of an evolving healthcare industry.[17] While the diversity of the shifting demographics of the healthcare workforce has presented significant challenges, it is instrumental to improving efficacy, quality of care, financial efficiency, patient satisfaction, workforce productivity, and professional satisfaction.[18] In order to capitalize on this

PHYSICIAN SHORTAGE AND THE FLEXNER REPORT

In 1910, the Flexner Report was released critiquing the over-supply and poor quality of students graduating from medical schools in North America and resulting in a movement toward higher premedical requirements and stricter admission standards.

Factoid

By 2020, it is estimated that the total number of physicians in the United States will reach 759,800, falling approximately 91,500 physicians short of projected demand.

"The Impact of Health Care Reform on the Future Supply and Demand for Physicians, Updated Projections through 2025," Association of American Medical Colleges, June 2010, https://www.aamc.org/download/158076/data/updated_projections_through_2025.pdf (accessed August 14, 2012).

potential, institutions must adopt models that strategically allocate physician and nonphysician manpower resources on the basis of scope and skill set, that is, "ensuring that the right care is provided by the right provider at the right time and place."[19]

6.3.3 Changing Patient Populations

The changing demographics of the patient population are another major catalyst driving healthcare reform. As mentioned earlier, the proportion of U.S. residents aged 65 or older is steadily increasing, expected to double by 2030, which circumstance is expected to have a significant effect on demand for healthcare services, due to the increased incidence and prevalence of disease and chronic conditions in the patient population over the age of 65.[20] The ethnicity of the U.S. patient population is also changing, with the 2010 census figures indicating an increasing degree of racial and ethnic diversity.[21] In 2012, for the first time in U.S. history, the number of minority births surpassed the number of Caucasian births.[22]

Further, it is estimated that by 2050, Caucasians will represent a minority faction of the U.S. population.[23] Changing ethnic demographics within the patient population may require a greater level of cultural competency among providers to prevent possible disparities in care, due to poor communication.[24] Disparities in access to care and differences in culture that have an impact on the provision of healthcare services will need to be identified in order to adjust the availability of adequately trained provider manpower to meet the healthcare needs of this growing segment of the U.S. population.[25]

6.3.4 Shifting Reimbursement Trends

There are major shifts taking place within the current healthcare reimbursement environment amid continuing controversy over physician reimbursement levels and the *Sustainable Growth Rate* (SGR) formula for determining the annual *Conversion Factor* (CF) under the *Medicare Physician Fee Schedule* (MPFS) (see Section 2.4.1, "Medicare," in Chapter 2, "Reimbursement Environment"). Every year since 2002, actual Medicare expenditures have exceeded target expenditures; however, congressional

Sustainable Growth Rate (SGR)

The SGR is the current mechanism for updating payment rates for physicians' services and has two key components: an expenditures target level (measured both annually and cumulatively) and a method for adjusting payment rates over time in an attempt to bring expenditures in line with the target level.

"Medicare's Physician Payment Rates and the Sustainable Growth Rate," Statement of Donald B. Marron before the Subcommittee on Health, Committee on Energy and Commerce, and U.S. House of Representatives, Congressional Budget Office, July 25, 2006, p. 1.

[25] Josiah Macy Jr. Foundation, "Ensuring an Effective Physician Workforce for the United States: Recommendations for Reforming Graduate Medical Education to Meet the Needs of the Public: The Second of Two Conferences—The Content and Format of GME," Conference Summary, Atlanta, GA, May 2011, pp. 2, 14.

action has suspended mandated cuts to payments for physician services every year. These continuous "*doc-fixes*" resulted in a widening gap between the cumulative spending and the cumulative target in each year the proposed cuts were overridden.[26] (See Table 2.8, "Annual Updates to the MPFS CF [CMS Final Rule v Congressional Action], 1997–2013.") Despite the continued debate, and support by many healthcare stakeholders (i.e., Medicare Payment Advisory Committee (MedPAC), the AMA, and the AHA) to repeal the SGR, to date, no legislation has been approved.[27]

At the same time that physicians have been facing decreasing reimbursement for their professional clinical services under traditional *fee-for-service* (*FFS*) reimbursement models, there has been a growing movement toward reimbursing providers based on alternative reimbursement structures that emphasize *value-based purchasing* (which shift a portion of the financial risk from the insurer to the provider), as opposed to FFS models, which have traditionally incentivized the volume of patients treated, in contrast to the value of care (i.e., quality of care per dollar spent), for example, *ACOs*, *Bundled Payments*, *Episode of Care* Reimbursement (see Chapter 2, "Reimbursement Environment"). This trend toward reimbursing providers under a "*value-based*" system has coincided with growing concerns by patients and the medical community regarding increasing medical error rates and the level of quality healthcare services provided to U.S. residents. As indicated in the 2012 issue of *Futurescan*, published by the Society of Healthcare Strategy and Market Development of the American Hospital Association,

> *The new value proposition will demand a totally different system of care. The physician-centric approach to episodic patient care,*

Fee-for-Service

A payment policy under which providers receive a fee for each service provided (e.g., an office visit, a test, a procedure, etc.).

The Advisor's Guide to Health Care: An Era of Reform, *by Robert James Cimasi (New York: American Institute of Certified Public Accountants, 2011), p. 279.*

which comes with costs the American society can no longer afford, will need to be replaced by a team-centric approach to population health management, which will require the close integration of hospitals, physicians, and other providers. Because the new model is being driven by the economics of 21st century America, it is going to "happen," independent of what occurs in the White House, Congress, the courts, or programs of the Centers for Medicare & Medicaid Services (CMS). It will not be possible for any hospital executive or board member to ignore or avoid such profound changes and challenges. But, it is possible for healthcare leaders to understand the changing environment and to manage those changes to the best of their ability, positioning their organizations, their communities, and their patients for a better future.[28]

COST OF SGR REPEAL

The *Congressional Budget Office* has estimated that the elimination of the SGR and freezing Medicare physician pay rates could cost as much as $376 billion over 10 years.

"Medicare's Payment to Physicians: The Budgetary Impact of Alternative Policies Relative to CBO's March 2012 Baseline," Congressional Budget Office, July 2012, http://www.cbo.gov/sites/default/files/cbofiles/attachments/43502-SGR%20Options2012.pdf (accessed September 17, 2012).

6.3.5 Demand for Quality Improvements

Patient concerns regarding the quality of healthcare delivered in the United States, despite the high costs associated with such healthcare services, were another significant driver of healthcare reform.[29] The average patient in the United States will typically spend as much as double the amount on a given healthcare service as that of a patient in a similarly developed country and yet will receive less efficient care of a lower quality.[30] For example, relative to other developed countries, the United States spends far more—more than 16 percent of its GDP—on healthcare, yet the United States is ranked very low in terms of health status, due to record-level access barriers and quality disparities.[31] "In the next five to ten years, healthcare costs will rise at a rate that cannot be supported by Medicare and Medicaid on a national level. The size of the baby boom generation aging into Medicare and the declining health of that population, bringing with it rising consumer expectations coupled with more complex health conditions, will create a major challenge for hospitals."[32]

Gross Domestic Product (GDP)

The total current market value of all goods and services produced domestically during a given period. It differs from Gross National Product (GNP) by excluding net income that residents earn abroad.

Such discrepancies in cost and quality outcomes, in conjunction with limited data on healthcare enterprises quality metrics, have resulted in increased demands for *transparency* and *accountability* in healthcare, two issues addressed in the 2010 reform legislation.

6.4 PATIENT PROTECTION AND AFFORDABLE CARE ACT (ACA)

Within the "*eye*" of the previously mentioned "*perfect storm*" and following many months of partisan controversy and political debate during President Obama's first term, Congress passed the ACA in March 2010.[33] While not achieving the objectives of those advocating for a universal coverage insurance program or a single payor system, the 2010 healthcare reform legislation did mark the beginning of a new era in the long march toward U.S. *healthcare reform* (see Chapter 1, "The Chronology of U.S. Healthcare Delivery: From Caduceus to Corporatization"), resulting in a changed paradigm for the way in which healthcare services are delivered and paid for in the United States. The reform's most recent initiatives have already had a significant impact on many aspects of the healthcare delivery system, including, for example, (1) increased regulatory scrutiny, aimed at combating fraud and abuse and antitrust violations; (2) health plan regulation; (3) addressing physician shortages; (4) access to, and quality of, care initiatives; and (5) increased attention to public health/wellness activities, among others.[34] The time line of the implementation of selected ACA provisions is illustrated in Exhibit 6.2.

March 23, 2010
President Obama signs Healthcare Reform Bill
H.R. 3950
H.R. 3962
Insurance
High-risk pool established;
No preexisting condition exclusion for children;
Health plans must provide minimum coverage;
Tax credits to small employers; and
Reinsurance program for medical loss ratio reporting.
Medicare
Rebates; and
Expand coverage.
Medicaid
Medicaid State Plan Amendment;
Increases drug rebate percentage to 23.1%; and
Increases noninnovator multiple source drug to 13%.
Tax Changes
Additional requirements on nonprofit hospitals and concurrent $50,000 fine; and
Limit deductibility of executive compensation.
September 2010
Dependent coverage for adult children to age 26.
2010
2011
Insurance
Voluntary insurance program for long term care.
Prevention/Wellness
Grants to small employers with wellness programs.
Medicare
50% discount from pharma manufacturers on brand name drugs;
10% bonus payment to primary care physicians and general surgeons in shortage areas; and
Prohibit higher cost sharing requirements for Medicare vs. free-for-service.
Medicaid
Prohibit federal payments for health care acquired conditions;
Permit enrollees with at least two chronic conditions; and
State balancing incentive program.
Quality Improvement
Increase funding to community health centers by $11 million.
2012
Medicare
Part D cost-sharing for full-benefit dual eligible beneficiaries equal cost-sharing for institutional care;
Allow ACOs share in cost savings;
Reduce Medicare payments;
Establish a hospital value-based purchasing; and
Reduce rebates for Medicare Advantage Plans Program.
Medicaid
Create new demonstration projects in Medicaid.
Quality Improvements
Require enhanced collection and reporting of data.
2013
Insurance
Create the Consumer Operated and Oriented Plan (CO-OP) program; and
Simplify health insurance administration by adopting a single set of operating rules.
Medicare
Begin phasing-in federal subsidies for brand-name prescriptions; and
Establish a national Medicare pilot program.
Medicaid
Increase Medicaid payments for primary care services.
Tax Changes
Increase the threshold for the itemized deduction for unreimbursed medical expenses;
Increase the Medicare Part A (hospital insurance) tax rate on wages;
Limit amount of contributions to a flexible spending account for medical expenses; and
Impose an excise tax.
2014
Employer Requirements
U.S. citizens and legal residents to have qualifying health coverage.
Insurance
American Health Benefit Exchanges and Small Business Health Options Program;
Reduce the out-of-pocket limits; and
Limit deductibles for health plans in the small group market.
Premium Subsidies
Provide refundable and advanceable premium credits and cost-sharing subsidies.
Medicare
Reduce the out-of-pocket amount that qualifies enrollee for catastrophic coverage;
Establish an Independent Payment Advisory Board; and
Reduce Medicare Disproportionate Share Hospital (DSH) payments.
Medicaid
Expand Medicaid.
Tax Changes
Impose fees on the health insurance sector.
2015 and beyond
Insurance
Permit states to form health care choice compacts and allow insurers to sell policies in any state participating in the compact.
Medicare
Reduce Medicare payments to certain hospitals for hospital-acquired conditions by 1%; and
Coverage gap eliminated by 2020.
Tax Changes
Impose an excise tax on insurers of employer-sponsored health plans with aggregate values that exceed $10,200.

6.4.1 Impact on Individuals

In a controversial provision referred to as the "*individual mandate,*" the ACA requires U.S. citizens and legal residents to maintain "*minimum essential coverage*," which may include government-sponsored programs, eligible employer-sponsored programs, plans in the individual market, grandfathered group health plans, as well as some other types of coverage. Individuals who fail to maintain this minimum essential coverage will be subject to the following excise tax penalty: $95 in 2014, $325 in 2015, and $695 in 2016 and beyond. This penalty is also applied in the event, however, that an individual's dependents do not maintain minimum essential coverage. Individuals who qualify for hardship or religious exemptions are excluded.[35] The ACA provides for refundable tax credits that eligible taxpayers may use to assist them in paying for individual and family plan premiums for health insurance purchased through a *State Health Benefit Exchange*. The requirements of, and concerns regarding, the establishment of state health insurance exchanges are discussed further below. Each individual enrolled in a plan offered through an *Exchange* will be required to report his or her income to the *Exchange*, on which basis of the information provided by the individual, the U.S. Treasury will pay a credit directly to the insurance plan in which the individual is enrolled. The individual will then pay the difference between the credit amount and the total premium charged.[36]

Factoid

On June, 28, 2012, the Supreme Court of the United States, in ruling on *National Federation of Independent Business v Sebelius* and *HHS v. Florida*, upheld the constitutionality of the *individual mandate*, deciding that the penalty for noncompliance fell within Congress's taxing power.

[36] Ibid.

Minimum Essential Coverage

Level of coverage that includes insurance offered in the individual market (such as qualified health plan enrolled in through an Affordable Insurance Exchange), an eligible employer-sponsored plan, or government-sponsored coverage such as Medicare, Medicaid, the Children's Health Insurance Program, TRICARE, or veteran's health.

"Requests for Comments on Reporting of Health Insurance Coverage," Internal Revenue Service, Notice 2012–32, http://www.irs.gov/pub/irs-drop/n-12–32.pdf (accessed September 18, 2012).

State Health Benefit Exchange

A state-established marketplace through which low- and moderate-income individuals and families and employees of small businesses will receive premium and cost-sharing subsidies in an effort to make private health insurance coverage more affordable.

"Establishing Health Insurance Exchanges: An Overview of State Efforts," Henry J. Kaiser Family Foundation, Focus on Health Reform, August 2012, http://www.kff.org/healthreform/upload/8213–2.pdf (accessed September 18, 2012).

6.4.2 Impact on Employers

All employer-related regulations related to ACA take effect January 1, 2014, and require that employers either offer affordable "*minimum essential coverage*" or pay an excise tax. An "*applicable large employer*" is defined as an employer who employs an average of at least 50 full-time employees during the preceding calendar year.[37] Employer-sponsored "*minimum essential coverage*" must be affordable, in that (1) the premium does not exceed 9.5 percent of the taxpayer's household income, and (2) the plan covers at least 60 percent of the total allowable costs of coverage.[38] If the

[37] "Patient Protection and Affordable Care Act, Sec. 4980H," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010), p. 254; "Shared Responsibility for Employers Regarding Health Coverage," 26 I.R.C. § 4980H(c)(2).

[38] "Refundable Credit for Coverage Under a Qualified Health Plan," 26 U.S.C. § 36(B)(c)(2)(C).

employer-sponsored plan is not deemed affordable, and an employee meets other income requirements, then the employee can be certified as having purchased health insurance through a state exchange with respect to which a "*premium tax credit*" or a cost-sharing reduction is allowed or paid to the employee.[39] An "*applicable large employer*" who *does not* offer *minimum essential coverage* for all of his or her full-time employees and has at least one full-time employee (FTE) who receives a premium tax credit will be assessed a fee in the amount of one-twelfth of $2,000 (approximately $166.67) per FTE, excluding the first 30 employees from the assessment.[40] If an applicable large employer *does* offer coverage but has at least one FTE receiving a premium tax credit who cannot afford the offered coverage, then the employer is subject to the lesser of (1) one-twelfth of $3,000 (approximately $250) for each employee receiving a premium tax credit who is given a government subsidy and purchases coverage through a *Health Insurance Exchange* or (2) one-twelfth of $2,000 for each FTE.[41]

The ACA also requires employers who offer coverage to their employees to provide *free choice vouchers* to their employees with incomes less than 400 percent of the *federal poverty level* (FPL), or whose premium exceeds 8 percent but is less than 9.8 percent of their income and who choose to enroll in a plan in the *Exchange*.[42] The voucher, in an amount equal to what the employer would have paid to provide coverage to the employee under the employer's plan, is used to offset the premium costs for the plan in which the employee is enrolled.[43] Employers with more than 200 employees were required to automatically enroll employees into health insurance plans

offered by the employer; however, employees could opt out of coverage.[44] The ACA's *free choice voucher* provisions, however, were repealed in 2011 by the *Department of Defense and the Full-Year Continuing Appropriations Act*, significantly reducing the number of persons covered.[45]

6.4.3 Impact on Insurers

Perhaps the most significant provisions of the ACA affecting health insurers are related to prohibiting health insurers from excluding individuals on the basis of a preexisting condition and *mandating* health insurance *coverage for dependent children.* Effective September 23, 2010, all health insurance plans (1) were prohibited from *excluding children under age 19* on the basis of a preexisting condition, (2) were required to provide *dependent coverag*e for children *up to age 26* for all individual and group policies, and (3) may not impose annual maximum benefit limits for "*essential benefits*," except those limits that may be permitted by regulations at a later date.[46] Effective January 1, 2014, group health plans are prohibited from excluding *any* patient on the basis of preexisting conditions.[47] In addition, plans that are self-funded must provide covered individuals with the option to seek

Wellness Programs

Wellness programs are plans offered to employees by employers that encourage healthier living habits, such as weight loss initiatives and assistance in quitting smoking.

external independent medical review of certain claims, such as claims that are denied based on a purported *lack of medical necessity.*[48] Further, insurance plans cannot require prior authorization or increased cost sharing for emergency services, even if those services are provided out-of-network, and are prohibited from discriminating in favor of highly compensated employees.[49] Group health plans are also allowed to increase incentives for *wellness program investments* from 20 percent to 30 percent of the cost of the insurance premium.[50]

In 2010, a temporary national high-risk pool was created to permit adults with preexisting conditions to obtain *subsidized coverage* that meets two criteria: (1) the payor's share of the costs is at least 65 percent of the total costs, and (2) the beneficiary's maximum out-of-pocket costs are capped at the current limit set for *high deductible health plans* (HDHPs), which are often associated with *health savings accounts* (HSAs).[51] (For more information on HSAs, see Section 2.5.2.4, "Health Savings Accounts [HSA]," in Chapter 2, "Reimbursement Environment.") This high-risk pool will be dissolved on January 1, 2014, when all insurers will be prohibited from excluding persons with preexisting conditions.[52] In addition, beginning in 2011, health plans were required to report the proportion of premium dollars spent on clinical services

Health Savings Accounts (HSAs)

Special accounts into which employers and employees both contribute, and from which the employee can draw funds to pay for health services. If the employer contributes, the value of those contributions is not taxable to the employee. Similarly, if the employee makes contributions, they count as "above-the-line" deductions.

and quality initiatives and to provide rebates to consumers for any amount spent that was less than *85 percent of premium dollars for large group plans* and *80 percent of premium dollars for individual and small group plans*.[53] In 2010, a process for reviewing increases in health plan premiums was established to require insurance companies to justify premium increases.[54]

It should be noted that the ACA provides special rules for *grandfathered health plans*, which is any group health plan or individual coverage that was effective on March 23, 2010, the date of the ACA's enactment. The ACA allows employers to maintain current levels of health insurance coverage for individuals who are already enrolled in plans, as well as for subsequently enrolled family members and new hires, provided that the plan allowed for dependent or family coverage on March 23, 2010. If those conditions are met, the grandfathered status of the plan will not be negated.[55] *Collectively bargained agreements* are grandfathered until the date on which the last of the collective bargaining agreements relating to the *grandfathered coverage* terminates.[56] Grandfathered plans are generally able to avoid many of the ACA's requirements pertaining to health insurers but are still subject to the following key provisions, as discussed earlier: (1) preexisting conditions, (2) dependent coverage, (3) elimination of coverage rescissions, (4) coverage limits, and (5) in 2014, excessive waiting periods.[57]

6.4.3.1 ACA's Impact on the Medicare Program In addition to those provisions of the ACA affecting all insurance providers (both public and private), the *Medicare Program* is required to (1) provide a productivity adjustment and reductions to *market-basket updates* for many providers; (2) make several concessions to e*xpand primary care*, coordinated care, and delivery system

reform; (3) support *quality initiatives*; (4) provide a rebate for Medicare Part D beneficiaries who are required to pay *out of pocket for prescription drug coverage* in 2010; (5) enforce provisions to continuously reduce the gap between generic and brand-name drugs by 2020; (6) add restrictions on revenue spending in 2014 for Medicare Advantage plans; and (7) update *disproportionate share payments (DSH*), among others.

6.4.3.2 ACA's Impact on the Medicaid Program Reform initiatives related to the *Medicaid Program* are being phased in between 2010 and 2014 and include several provisions related to (1) expanding enrollee eligibility, (2) prescription drug coverage, and (3) primary care and preventive services coverage, among others. In addition, Medicaid will be required to designate new matching payments for eligible individuals with increased Medicaid payment rates for primary care physicians. Specifically as related to Medicaid and the *Children's Health Insurance Program* (CHIP), healthcare reform provisions require states to maintain current income eligibility levels for children in Medicaid and CHIP until 2010 and extend funding levels for CHIP through 2015, with the CHIP benefit package and cost-sharing rules to continue under current laws. Beginning in 2015, states will be given the option to receive a 23 percent increase in the CHIP *match rate* up to a *cap of 100* percent. In addition, children who are eligible for CHIP but who are unable to enroll in the program, due to enrollment caps, will be eligible for tax credits.[58]

Following the invalidation by SCOTUS of the ACA provisions that mandated states to expand their Medicaid programs or lose all matching federal funds, states have been given the choice of whether to (1) *opt into the Medicaid expansion,* in exchange for significant federal assistance; or (2) *maintain their Medicaid programs' status quo* and deny access to potentially millions of poor and uninsured constituents. For states that *choose to participate*, the federal government will pay 100 percent of the costs of the expansion for three years, gradually scaling its matching funds down to 90 percent by 2020 and beyond.[59] (See Chapter 2, "Reimbursement Environment.") Beginning in 2017, states will become responsible for a percentage of the healthcare expenses for both adults who are newly eligible under the expansion and adults who are currently eligible under states' existing programs

[58]Kaiser Family Foundation, "Summary of New Health Reform Law," *Focus on Health Reform* (last modified April 8, 2010), p. 2.

[59]"Patient Protection and Affordable Care Act, Sec. 2001," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010), pp. 271–278.

and who, even in the absence of the expansion, will enroll in Medicaid as required by the ACA's individual mandate.[60] However, states stand to experience *significant financial gain* should they elect to expand their programs, in that the federal government would (1) pay a significantly higher percentage of the healthcare costs incurred by certain currently eligible adults; (2) provide coverage for poor and near-poor uninsured adults, which may decrease some of the non-Medicaid costs associated with these individuals, for example, mental health services and uncompensated care payments to hospitals; and (3) cause, through the economic/multiplier ripple effect, a significant additional amount of federal Medicaid funds to come into the state, thereby resulting in a substantial increase in the state's total economic activity, which would in turn generate revenue in the form of additional state income and sales taxes, as well as insurance premium and provider taxes where applicable.[61]

For example, in Missouri, the state would spend $431 million during the first five years of the expansion's implementation but would receive $8.4 billion in funding from the federal government in return.[62] Of further note, in 2011, Missouri spent almost $980 million in uncompensated care, and opting in to the expansion could lower that amount to $311 million, as well as reduce the $1.8 to $3.7 billion the state loses in economic productivity

Factoid

The *Congressional Budget Office* estimates that the Supreme Court's decision to strike down mandated Medicaid expansion in the ACA will reduce government health care spending by $84 billion from 2012 to 2022.

"Estimates for the Insurance Coverage Provisions of the Affordable Care Act Updated for the Recent Supreme Court Decision," Congressional Budget Office, July 2012, p. 2.

annually as a result of its citizens' healthcare needs going unmet.[63] Opting in to the *Medicaid Expansion* program in Missouri would mean expanding access to more than 300,000 Missourians, reducing the state's uninsured rate, stimulating the economy, and easing the burden that $1 billion in uncollected medical bills places on the state's hospitals each year.[64] Similarly, a study of the potential impact of the ACA's *Medicaid expansion*'s provisions in Nebraska estimated that the cost of expansion to the state would range from $140 to $168 million, but, in return, the state would receive $2.9 to $3.5 billion from the federal government through 2020, and the influx of federal funds would also generate a minimum of $700 million every year in new economic activity, which could potentially finance more than 10,000 jobs annually through 2020.[65] In contrast, forgoing the expansion could potentially cost Nebraska more than $1 billion in uncompensated care through 2019.[66]

Currently, 25 states remain undecided about whether to expand their Medicaid programs, 12 states and the District of Columbia have opted in, and 5 states have announced they will not expand their Medicaid programs (Florida, Louisiana, Mississippi, South Carolina, and Texas). Further, another five states appear unlikely to expand their programs: Iowa, Missouri, Nevada, New Jersey, and Nebraska.[67] While some states have offered specific reasons for their leanings, including the unwillingness to raise taxes

STATES OPTING IN TO MEDICAID EXPANSION

States choosing to expand their Medicaid coverage include Arkansas, California, Connecticut, Delaware, Hawaii, Illinois, Maryland, Massachusetts, Minnesota, Rhode Island, Vermont, and Washington.

"Where Each State Stands on ACA's Medicaid Expansion: A Roundup of What Each State's Leadership Has Said about Their Medicaid Plans," The Advisory Board, July 17, 2012, http://www.advisory.com/Daily-Briefing/2012/07/05/Where-each-state-stands-of-the-Medicaid-expansion (accessed August 23, 2012).

or the purported inability to fund other areas of need, such as education, other states have simply declined to participate, such as Texas, whose governor stated there was "no intention to implement so-called state exchanges or to expand Medicaid under Obamacare."[68]

Although the original mandated Medicaid expansion would have offered eligibility to more than half of the 41.2 million adults who lacked insurance as of 2010, the *Congressional Budget Office* (CBO) now predicts that 3 million fewer individuals will have insurance as a result of the Medicaid expansion being made optional.[69] In addition, those states that choose not to participate will cause a *higher per-person* cost to the federal government than if those individuals were covered by Medicaid, and many others will be left without coverage at all, due to ineligibility for Medicaid or private insurance subsidies.[70]

6.4.3.3 ACA's Establishment of Health Insurance Exchanges Under the ACA, states are required to have a state health insurance exchange (*Exchange*) in

[68] Ibid.

[69] Kaiser Commission on Medicaid and the Uninsured, "How Will the Medicaid Expansion for Adults Impact Eligibility and Coverage?" Washington, DC: Kaiser Family Foundation, July 2012, p. 3; Congressional Budget Office, "Estimates for the Insurance Coverage Provisions of the Affordable Care Act Updated for the Recent Supreme Court Decision," July 2012, p. 3.

[70] Congressional Budget Office, "Estimates for the Insurance Coverage Provisions of the Affordable Care Act Updated for the Recent Supreme Court Decision," July 2012, p. 4.

operation by January 1, 2014.[71] By providing a single place for consumers to (1) search for and *compare health plans*, (2) ask questions regarding coverage, (3) *check eligibility for programs* and tax credits, and (4) ultimately *enroll in a health plan*, the *Exchanges* are designed to both facilitate the *process of purchasing* health insurance and make it more affordable.[72] Though states may elect not to create these *Exchanges* and may allow the federal government to do so in their place, they must provide the secretary of HHS with a decision by January 1, 2013, regarding whether they will implement an independently designed *Exchange*.[73] In order to receive at least conditional approval of their respective exchanges by the January 1, 2013, deadline, states are encouraged to submit an "*Exchange Blueprint*" by November 16, 2012, which leaves little time for those states that deferred action pending the outcome of the SCOTUS June 2012 decision.[74]

AFFORDABLE INSURANCE EXCHANGES

A state health exchange can help an individual look for and compare private health plans. Individuals will be able to ask questions about coverage options and find their eligibility for health programs and state and federal tax credits.

[72] U.S. Department of Health and Human Services, "Key Features of the Law: Insurance Choices: Affordable Insurance Exchanges," January 25, 2012, http://www.healthcare.gov/law/features/choices/exchanges/index.html (accessed March 20, 2012).

[73] "Patient Protection and Affordable Care Act, Sec. 1321," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010), pp. 186187; Kaiser Family Foundation, "Health Reform Source: Implementation Timeline," 2012, http://healthreform.kff.org/Timeline.aspx (accessed March 20, 2012), p. 13.

[74] "Patient Protection and Affordable Care Act; Establishment of Exchanges and Qualified Health Plans; Exchange Standards for Employers," *Federal Register* 77, no. 59 (March 27, 2012): 18446; Center for Consumer Information and Insurance Oversight, "Draft Blueprint for Approval of Affordable State-Based and State Partnership Exchanges," Centers for Medicare and Medicaid Services, May 16, 2012, p. 4.

Published on March 27, 2012, the final rule regarding *health insurance exchanges* offers states significant flexibility in the design and operation of their *Exchanges* and combines the policies from two previously published *Notices of Proposed Rulemaking*, which provide states with more options through which to customize their *Exchanges* with respect to member eligibility, health plan participation, and the overall operation of the *Exchange*.[75] *Flexibility* is also a main focus in a state's operation of the *Small Business Health Options Programs* (*SHOPs*), which are programs that offer insurance options for small employers within state *Exchanges*.[76] Through SHOPs, employers will be able to choose the level of coverage they will offer to their employees, and states will be able to determine the size of the small group market participating in SHOPs.[77] In addition, small employers who purchase coverage through SHOPs may be eligible for a tax credit beginning in 2014.[78]

Small Business Health Option Programs (SHOPs)

Programs enacted as part of the ACA that are designed to assist qualified employers in the state who are small employers in facilitating the enrollment of their employees in qualified health plans offered in the small group market in the state.

Factoid

As of August 2012, 15 states and the District of Columbia have established state-based insurance exchanges, while 7 states have decided not to create a state exchange.

"Establishing Health Insurance Exchanges: An Overview of State Efforts," Henry J. Kaiser Family Foundation, Focus on Health Reform, *August 2012, http://www.kff.org/healthreform/upload/8213–2.pdf (September18, 2012).*

6.4.4 Impact on Providers

In addition to the ACA's impact on individuals, employers, and insurers, the 2010 healthcare reform legislation also has significant implications for healthcare providers. For example, *primary care physicians (including family medicine, internal medicine geriatrics and pediatric physician providers)* whose Medicare charges for office, nursing facility, and home visits make up at least 60 percent of their total Medicare charges will be eligible for a 10 percent bonus payment for services performed from 2011 through 2016.[79] In addition, general surgeons who conduct major procedures in a *designated health professional shortage* area will be eligible for a 10 percent bonus payment for these services from 2011 to 2016.[80] Medicare will also increase payment for psychotherapy services by 5 percent, and will extend Medicare

Designated Health Professional Shortage Area

Areas designated by the Health Resources and Services Administration (HRSA) as having shortages of primary medical care, dental, or mental health providers and may be geographic (a county or service area), demographic (a low-income population), or institutional (lacking a comprehensive health center, a federally qualified health center, or another public facility).

The Federal Poverty Level is issued each year in the *Federal Register* by the Department of Health and Human Services for administrative purposes, such as determining financial eligibility for certain federal programs.

"2012 HHS Poverty Guidelines," Department of Health and Human Services, http://aspe.hhs.gov/poverty/12poverty.shtml (accessed September 18, 2012).

incentive payments of 1 percent in 2011 and .5 percent from 2012 to 2014 for voluntary participation in *Medicare's Physician Quality Reporting Initiative* (*PQRI*).[81] Beginning in 2015, physician providers who do not successfully participate in the PQRI program will have their payments reduced by 1.5 percent in 2015 and by 2 percent in subsequent years.

As related to the Medicaid program, effective 2013, there will be *increased Medicaid payments for primary care physician services* for 2013 and 2014, with 100 percent federal funding.[82] Significantly, in 2014, states will have the option to participate in an expansion of Medicaid coverage to all non-Medicare eligible individuals under age 65 (i.e., children, pregnant women, parents, and adults without dependent children) with incomes up to 133 percent of the federal poverty level, based on a modified adjusted gross income, and Medicaid provides for enhanced federal matching funds for new eligible enrollees.[83] As discussed earlier, providers may realize additional revenues through the increased federal funding for these new enrollees and have less uncompensated care from these previously uninsured patients and increased state economic activity.

6.4.4.1 ACA's Establishment of Accountable Care Organizations The *Medicare Shared Savings Program* (*MSSP*) of the ACA, as discussed in Chapter 2, "Reimbursement Environment," and in Chapter 4, "Competition," provides for the creation of *Accountable Care Organizations* (ACOs), an organized network of providers who coordinate care in order to lower costs and increase quality to achieve financial incentives established through a contract with CMS. As one of the most commonly cited features of the ACA,

[81] Ibid.

[82] Kaiser Family Foundation, "Health Reform Implementation Timeline," *Focus on Health Reform* (last modified March 31, 2010), p. 3.

[83] Ibid., p. 4.

Accountable Care Organizations (ACOs)

ACOs are healthcare organizations in which a set of providers, usually physicians and hospitals, is held accountable under a contract with payor(s) for the cost and quality of care delivered to a specific local population.

"Can Accountable Care Organizations Improve the Value of Health Care by Solving the Cost and Quality Quandaries?" by Kelly Devers and Robert Berenson, Robert Wood Johnson Foundation, Urban Institute, October 2009, http://www.rwjf.org/files/research/acosummaryfinal.pdf (accessed January 19, 2012), p. 1.

ACOs have already taken effect in the federal market (under the *MSSP*), with similar entities being developed in the commercial market. It should be noted that there are also commercial ACOs being developed (see Chapter 4, "Competition").

With the issuance of the final rule regarding the establishment of ACOs on November 2, 2011, many organizations that had been considering ACO formation or that were already operating an ACO-like entity took steps to formally continue the development of those initiatives and implementation processes. The following month, CMS announced the names of 32 organizations that would participate in its *Pioneer ACO Model*, set to begin January 1, 2012.[84] In April 2012, 27 organizations were announced as participants in the MSSP, along with 5 participants for the Advanced

SUCCESS OF ACCOUNTABLE CARE ORGANIZATIONS

Despite the rapid growth in the number of federal ACOs, the success of the program is dependent on the clinical and management collaborations between healthcare providers within ACOs and whether ACOs can lower healthcare costs for both providers and payors through coordination of patient care.

Section 4.6.4.2, "Accountable Care Organizations (ACOs)," in Chapter 4, "Competition."

[84] "CMS Announces Pioneer ACO Participants," *American Hospital Association News*, December 19, 2011, http://www.ahanews.com/ahanews/jsp/display.jsp?domain=AHANEWS&dcrpath=AHANEWS/AHANewsNowArticle/data/ann_121911_ACOs (accessed July 21, 2012).

Payment ACO Model.[85] On July 1, 2012, another 89 organizations joined the MSSP, bringing the total number of federal ACOs to 154 and the total number of Medicare beneficiaries covered to 2.4 million.[86] Despite this rapid proliferation of ACOs across the country and general health policy support of the *accountable care* concept, the long-term feasibility and sustainability of the ACO model have not yet been demonstrated at this early juncture. A September 2012 study published in the *Journal of the American Medical Association* (*JAMA*) titled, "*Spending Differences Associated with the Medicare Physician Group Demonstration*" appeared to indicate that on average, per capita Medicare spending for seniors who were also covered by Medicaid (i.e., *dual eligible beneficiaries*) declined by approximately $532 annually for those seniors included in the five-year *Physician Group Demonstration accountable care* pilot.[87]

6.4.5 Fraud and Abuse Initiatives

Pursuing fraud and abuse of government healthcare payments has been a topic of heated debate in the healthcare industry, legislative and agency venues, and popular media for decades. In the last decade, the intensity of these discussions has been manifested by new regulatory initiatives. At the American Bar Association's 19th annual National Institute on Healthcare Fraud, OIG chief counsel Lewis Morris stated the OIG's intention to increase its monitoring of physician financial activities, including both physician referral and billing patterns.[88] The ABA's conference also included discussions of the recent expansion of the False Claims Act (FCA) and the *Fraud Enforcement and Recovery Act* (FERA).[89] FERA expanded the scope

of the *False Claims Act* by redefining the definition of "*knowingly*," thereby reducing the government's burden of proof and allowing for easier conviction for violation of the FCA.[90] One amendment to FERA, which was signed by President Obama on May 20, 2009, involved *civil investigative demands* (*CIDs*). CIDS are "*subpoenas to compel documents and testimony*" and had been subject to being approved by the attorney general.[91] The amendment to FERA allowed other top officials in the Department of Justice (DOJ) to also approve CIDs. Furthermore, the amendment requires that information obtained from a CID that is deemed necessary to an FCA investigation be shared with the *qui tam relator* (see Chapter 3, "The Regulatory Environment"). The amendment also expands the definition of "*official use*" to allow the government to use the information in communications with other government departments and with counsel for other parties.[92]

During the week of May 18, 2009, following the passage of the *Fraud Enforcement and Recovery Act* (*FERA*), newly appointed HHS secretary, Kathleen Sebelius, and the *Department of Justice* (*DOJ*) announced the creation of the *Healthcare Enforcement Action Team* (*HEAT*) and discussed the creation or expansion of several HHS antifraud programs. First, Sebelius announced the establishment of a new HHS initiative to focus on fraud prevention and elimination, named the *Healthcare Fraud Prevention and Enforcement Action Team* (HEAT), an anti-fraud group composed of both DOJ and HHS members and funded by allocations in President Obama's budget for increasing fraud prevention. HEAT has significantly increased regulatory scrutiny of provider arrangements, for example, additional site visits to *Durable Medical Equipment* (DME) providers to ensure that only Medicare-approved contractors are providing necessary services.[93]

HEAT OBJECTIVES

In addition to increasing the number of site visits, HEAT will work to increase Medicare compliance training for suppliers, improve data sharing between CMS and law enforcement officials, and strengthen overall program integrity activities.

"Sebelius: New Fraud Prevention Team Will Turn up HEAT," by Ben Amirault, Health Leaders Media, *May 21, 2009, http://www.healthleadersmedia.com/content/233446/topic/WS_HLM2_FIN/Sebelius-New-Fraud-Prevention-Team-will-Turn-up-Heat.html (accessed May 21, 2009).*

Sebelius also announced (1) the expansion of the *Medicare Fraud Strike Forces*, which had previously been focused in South Florida and Los Angeles, California, to also focus efforts on Detroit, Michigan, and Houston, Texas; (2) the expansion of government funding for (a) Medicare Integrity monitors to ensure compliance under Medicare Parts C and D, (b) s Medicaid provider audit program, (c) information-sharing among government organizations, (d) implementation of technology to assist in combating fraud, (e) training on Medicare compliance, and (f) the intent to roll out additional antifraud measures, as well as to create a website to track the progress of each of the above initiatives.[94]

The HHS and the OIG have striven to demonstrate and publicize that government expenditures on fraud investigation and prevention programs are prudent investments, touting that four dollars has been recovered for every one dollar spent.[95] The results also include the total number of cities

[94] Department of Health and Human Services, "Background: Turning up the HEAT to Stop Medicare and Medicaid Fraud," http://www.hhs.gov/stopmedicarefraud/background.html (accessed May 21, 2009); Ben Amirault, "Sebelius: New Fraud Prevention Team Will Turn Up HEAT," *HealthLeaders Media*, May 21, 2009, http://www.healthleadersmedia.com/content/233446/topic/WS_HLM2_FIN/Sebelius-New-Fraud-Prevention-Team-will-Turn-up-Heat.html (accessed May 21, 2009); Department of Health and Human Services, "Turning Up the HEAT to Stop Medicare and Medicaid Fraud," http://www.hhs.gov/stopmedicarefraud/ (accessed May 21, 2009).

[95] Ben Amirault, "Sebelius: New Fraud Prevention Team Will Turn Up HEAT," *HealthLeaders* Media, May 21, 2009, http://www.healthleadersmedia.com/content/233446/topic/WS_HLM2_FIN/Sebelius-New-Fraud-Prevention-Team-will-Turn-up-Heat.html (accessed May 21, 2009).

with strike force prosecution teams increased to nine in FY 2011, using advanced data analysis techniques to identify "emerging or migrating schemes as well as chronic fraud areas," for example, high-billing levels, that interagency teams target. Strike force operations, in FY 2011 alone, (1) "*charged a record number of 323 defendants who allegedly collectively billed the Medicare program more than $1 billion,* (2) *secured 172 guilty pleas,* (3) *convicted 26 defendants at trial, and (4) resulted in the sentencing of 175 defendants to prison, with an average sentence in of more than 47 months.*"[96] [Emphasis added.]

New fraud and abuse initiatives, most significantly various efforts to increase transparency and accountability among providers and payors, have been announced as the main focus of the Obama administration's 2010 ACA healthcare *reform legislation*, *including such projects as enhanced* screening and other enrollment requirements with a higher level of scrutiny for providers and suppliers applying to participate in Medicare, Medicaid, and CHIP "who may pose a higher risk of fraud or abuse . . . [which] includes licensure checks and site visits to confirm legitimacy and location." Also, the Affordable Care Act authorized (1) a new Automated Provider Screening (APS) system being launched in December 2011 "to support the Affordable Care Act's new requirements for risk-based provider enrollment . . . [using] existing information from public and private sources to automatically and continuously verify information submitted on a provider's Medicare enrollment application including licensure status . . . [and replacing] the time and resource-intensive process of manual review of the enrollment application"; (2) "the Secretary to impose a temporary moratorium on newly enrolling providers or suppliers of a particular type or in certain geographic areas if necessary to prevent or combat fraud, waste, and abuse; (3) "Increased Coordination of Fraud Prevention Efforts . . . among states, CMS, and its law enforcement partners at the OIG and DOJ . . . to suspend Medicare payments to providers or suppliers during the investigation of a credible allegation of fraud . . . [reversing] a long-standing Medicare practice of paying claims then attempting to recoup funds if the claim is found to be an error or fraudulent; and (4)[restricting] fraudulent providers and suppliers [from moving] easily from state to state or between Medicare and Medicaid by requiring all states to terminate anyone whose billing privileges have

[96]Department of Health and Human Services, "Turning Up the HEAT to Stop Medicare and Medicaid Fraud," http://www.hhs.gov/stopmedicarefraud/ (accessed May 21, 2009).

been revoked by Medicare or who has been terminated by another state Medicaid program for cause.[97]

It is clear from recent events that the passage and subsequent Supreme Court decision upholding the Obama administration's 2010 ACA healthcare reform legislation have created a significant impact on both the scope and the intensity of regulatory initiatives to both prosecute and prevent fraud and abuse in the healthcare industry. Given the fiscal and debt circumstances of the U.S. economy, it is unlikely that these efforts will subside any time soon (see Chapter 3, "Regulatory Environment").

6.5 PAYING FOR HEALTHCARE REFORM

Preliminary estimates regarding the cost of healthcare reform are anticipated to be at $820 billion, or more, during the 10-year period after its enactment, which may be funded in a variety of ways, including (1) reducing fraud and abuse within existing government health programs, (2) removing large subsidies to insurance companies, (3) increasing healthcare delivery efficiency through streamlining paperwork and coordinating care, and (4) through various taxes revenues obtained from individuals and companies.[98] The *Congressional Budget Office* (*CBO*) projects that the ACA will save $511 billion in medical spending and will produce a net reduction in the federal budget deficit by $143 billion from 2010 to 2019.[99] The various means established through the ACA legislation to fund its more expensive provisions are discussed later.

6.5.1 Tax Revenues

In addition to the already-mentioned sources to be used to help fund healthcare reform initiatives, other sources of funding for the ACA may

[97] "New Tools to Fight Fraud, Strengthen Federal and Private Health Programs, and Protect Consumer and Taxpayer Dollars," June 26, 2012, Healthcare.gov press release, http://www.healthcare.gov/news/factsheets/2011/03/fraud03152011a.html (accessed September 9, 2012).

[99] "The Congressional Budget Office Cost Estimate of H.R. 4872, Reconciliation Act of 2010," March 20, 2010, http://www.cbo.gov/doc.cfm?index=11379.

include (1) new annual fees paid by insurers, estimated to yield $60.1 billion from 2014 to 2019; (2) new annual fees paid by pharmaceutical manufacturers, which is estimated to raise $27 billion from 2013 to 2019; (3) a 2.9 percent excise tax on medical device manufacturers, which is estimated to rise $20 billion from 2013 to 2019; and (4) an excise tax on high-cost insurance plans, which will raise an estimated $32 billion from 2018 to 2019.[100]

6.5.2 Public Programs

Significant changes to Medicare alone are projected to result in net savings of $575 billion from 2010 to 2019.[101] Overpayments to Medicare managed care plans identified through increased fraud and abuse audits are projected to save more than $204 billion from 2010 to 2019.[102] In addition, Medicare payments to providers will be adjusted for improvements in quality and productivity under *value-based purchasing* initiatives, which will apply to payments made to inpatient hospitals, long-term care facilities, inpatient rehabilitation facilities, psychiatric hospitals and outpatient hospitals. The CBO projects that these payment adjustments will save $160 billion from 2010 to 2019, and that Medicare spending growth will slow from anticipated increases of 6.8 percent to 5.2 percent annually, extending the stability of the Medicare trust fund through 2026 and saving an estimated $397 billion from 2010 to 2019.[103]

CMS also estimates substantial savings in Medicare costs from certain ACA provisions to "(1) reduce Part A and Part B payment levels and adjust future 'market basket' payment updates for productivity improvements ($233 billion); (2) eliminate the Medicare improvement fund ($27 billion); (3) reduce disproportionate share hospital (DSH) payments ($50 billion); (4) reduce Medicare Advantage payment benchmarks and permanently extend the authority to adjust for coding intensity ($145 billion); (5) freeze the income thresholds for the Part B income-related premium for [nine]

Factoid

In CMS's first annual report to Congress detailing the findings of the Recovery Audit Contractor (RAC) program, California providers owed more than $6.6 million in Medicare overpayments for FY 2010—the most of any state.

Implementation of Recovery Auditing at the Centers for Medicare and Medicaid Services: FY 2010 Report to Congress As Required by Section 6411 of Affordable Care Act, *Centers for Medicare and Medicaid Services (2011).*

years ($8 billion); (6) implement an Independent Payment Advisory Board, together with strict Medicare expenditure growth rate targets ($24 billion); and (7) increas[e] the [Hospital Insurance (HI)] payroll tax rate by 0.9 percentage points for individuals with incomes above $200,000 and families above $250,000 ($63 billion)."[104]

6.6 FUTURE OF THE ACA

> *The search for a remedy to America's problems in health care has turned into a peculiarly arduous struggle—peculiar in its duration, its rancor, and its salience and centrality in national politics. Other democracies long ago resolved whether they have an obligation to provide care for the sick and protection against medical costs. For a century the United States has been fighting over that issue, and instead of subsiding, the disagreements have intensified and at times shaken the political arena. In their euphoria immediately after passage of the Affordable Care Act, its supporters believed they had achieved a historic breakthrough. But those who make history can never be sure what history will make of them. If the opponents of the law succeed, the triumph of the Obama years will turn into another chapter in a story of triumphant reaction.*[105]
>
> —Paul Starr

[104] Centers for Medicare and Medicaid Studies, "Estimated Financial Effects of the 'Patient Protection and Affordable Care Act,' as Amended," Office of the Actuary, April 22, 2010.

[105] Paul Starr, *Remedy and Reaction* (New Haven, CT: Yale University Press, 2012), pp. 279–280.

On June 28, 2012, the Supreme Court of the United States (SCOTUS), in a 5–4 decision, affirmed the constitutionality of the ACA (despite removing the requirement that states had to participate in the *Medicaid Expansion* program), ensuring that the ACA's provisions that had gone into effect to date would stand, and that the remaining provisions would be implemented as scheduled, for example, (1) expanding funding for fraud and abuse compliance and requiring physicians to identify potential Stark Law violations; (2) mandating that the aggregate cost of applicable employer-sponsored coverage be reported on Form W-2, beginning in 2011; (3) providing a federal tax credit to small businesses with 25 or fewer FTEs to offset the cost of insurance premiums (up to 35 percent); and (4) giving tax-exempt organizations a 25 percent (increasing to 35 percent in 2014) credit in the form of a refund.[106]

Yet despite the June 2012 SCOTUS decision, there is still a considerable level of uncertainty as to the ultimate impact of the ACA's implementation and whether the ACA will remain intact as it currently stands. For example, in its originally enacted form, the ACA included a provision that would have required states to opt in to a significant expansion (to include individuals with incomes up to 133 percent of the poverty line) of Medicaid beginning in 2014, in order to retain federal funding for all of their existing Medicaid programs.[107] By expanding their Medicaid programs to cover all non-Medicare eligible individuals, states would have received federal funding to cover 100 percent of the expansion's costs from 2014 to 2016, with federal funding being scaled down to 90 percent for 2020 and later years.[108] Through the use of both a "*stick*" and a "*carrot*," respectively, the ACA's Medicaid provisions were anticipated to expand access to more than

Sebelius*, Slip Opinion Nos. 11-393, 11-398 and, 11-400, 2012 BL 160004, 53 EBC 1513 (U.S. June 28, 2012); Amanda Cassidy, "Small Business Tax Credits. The Affordable Care Act Offers Incentives so That More of These Companies Will Help Provide Their Employees with Health Insurance," *Health Affairs: Health Policy Brief*, January 14, 2011; "The Patient Protection and Affordable Care Act," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010).

[107] Kaiser Family Foundation, "Summary of New Health Reform Law," April 21, 2010, http://www.kff.org/healthreform/upload/8061.pdf (accessed May 6, 2010); Jordan Rau and Julie Appleby, "Justices Uphold Individual Mandate, Set Limits on Medicaid Expansion," *Kaiser Health News*, June 28, 2012, http://www.kaiserhealthnews.org/stories/2012/june/28/supreme-court-upholds-individual-mandate.aspx (accessed July 21, 2012).

[108] Kaiser Family Foundation, "Summary of New Health Reform Law," April 21, 2010, http://www.kff.org/healthreform/upload/8061.pdf (accessed May 6, 2010).

17 million Americans.[109] However, in deciding the constitutionality of several challenged ACA provisions, SCOTUS removed the "*stick*," stating that the federal government could not compel the states to opt in to the Medicaid expansion by withholding federal funding for their existing Medicaid programs.[110] With only the "*carrot*" remaining, there is a significant amount of federal funding available to incentivize states; however, as mentioned in Chapter 1, "The Chronology of U.S. Healthcare Delivery," states now have the option of declining to participate in the Medicaid expansion and thus continue with their existing levels of Medicaid eligibility.

Since the enactment of the ACA in 2010, various members of Congress have staged at least 33 votes to repeal the legislation, albeit unsuccessfully.[111] In the aftermath of the SCOTUS decision that ultimately upheld the legislation, there are three potential political scenarios (resulting from the 2012 presidential and congressional elections) that could significantly alter the progression of the ACA: (1) a Republican president is elected, (2) a Republican majority controls the House and/or the Senate, and (3) both of the prior events occur. Any of these results could lead to the defunding, undercutting, amendment, or repeal of the ACA.

Despite any action a Republican president may take against the ACA, a full repeal would be unlikely, as there would be an insurmountable Democratic filibuster in the Senate.[112] However, the president, whether Democrat or Republican, will be able to exercise his extensive political leverage to attempt to both push his political agenda through Congress and create regulatory changes through HHS.[113] The ACA gives the president discretion in implementing many of its provisions, including employer contributions to *health savings accounts* (*HSAs*), *quality improvement measures* for providers who contract with private insurers, and *CO-OP insurer tax-exempt status*.[114]

[113] Ibid.

[114] Ibid., p. 9.

In the event of a Republican Senate majority, a full repeal of the ACA would also be unlikely, because even a Republican Congress would need to overcome a Democratic filibuster in the Senate. However, Congress could vote to reduce or cut the law's discretionary funding appropriations.[115] The ACA establishes its own budget authority within the law, so any attempt to defund its mandatory spending provisions would be impossible without a Senate super-majority (60 votes).[116] Despite the super-majority requirement, an amendment is not out of the realm of possibility, as funding for the *Prevention and Public Health Fund* (*PPHF*) has already been cut by $5 billion over 10 years by the *Middle Class Tax Relief and Job Creation Act of 2012*.[117] Discretionary spending provisions for programs such as *Pediatric Accountable Care Organizations* and *Rural Hospital Flexibility Grants*, inter alia, are at more risk of defunding, as they are subject to annual budget appropriations review.[118]

6.7 CONCLUSION: FUTURE OF U.S. HEALTHCARE DELIVERY IN AN ERA OF REFORM

The increased turmoil regarding continued threats to physician reimbursement under the *sustainable growth rate*; the increasing political storm surrounding the slow pace of economic recovery from the 2008 *Great Recession*, with the accompanying clamor for deficit reduction; the pressure to reduce Medicare spending; and the rising insurance premium costs for small businesses and families presented a "*perfect storm*" that set the initial stages for the ACA.[119] While the portending challenge of these looming demographic trends were clear even during previous attempts at healthcare reform, the U.S. electorate had yet to feel the full impact of the demographic time bomb related to the aging baby boomers in the U.S. population, with a higher incidence and prevalence of chronic disease and associated burgeoning healthcare costs.

Provider affiliations are likely to increase, due to the disproportionate number of physicians retiring, an inadequate supply of medical school graduates, and the expected continuing growth in patient utilization demand.[120]

Much of the implementation of the healthcare reform efforts going forward will depend on state government agency initiatives, legislative actions, and court rulings. Even with significant funding cuts, the healthcare industry has already adopted a new focus on quality, transparency, and lower costs. The initial drivers of healthcare reform remain and have already led to the development of commercial counterparts to several of the ACA provisions, including changing reimbursement methods emphasizing *bundled and episode of care payments*, *commercial ACOs*, and *federal transparency initiatives* as to pricing and quality.[121] While many healthcare industry stakeholders touted the ACA and the SCOTUS decision as a step forward, hospital and health system executives (proponents and critics of the ACA alike) have indicated that the SCOTUS decision has not changed their current strategic plans.[122]

The new paradigm regarding the delivery of healthcare in this era of reform is focused on the development of new models of cooperation and collaboration among a continuum of healthcare providers, in an enhanced pursuit of increasing the objectives of efficiency, quality, and access to care, while decreasing the acceleration in the rise in cost of providing healthcare services, such as through *Medical Homes*, *ACOs*, *Comanagement Arrangements, hospital/physician integration*, *and a myriad of other inter and intra provider relationships*. With the ACA's strong emphasis on quality, cost-effectiveness, and increased access, hospitals, physicians, and other providers will need to increase collaboration in order to achieve these objectives.

[120] American Medical Association, *Physician Characteristics and Distribution in the US 2010 Edition*, 2010, p. 458; "Table 201—Total and Active Physicians (MDs) and Physician-to Population Ratios, Selected Years: 1950–2000," in *Health Resources Statistics, 1965*, by the U.S. Department of Health, Education, and Welfare, National Center for Health Statistics, PHS Pub. No. 1509, 1966.

[121] PricewaterhouseCooper, "Implications of the US Supreme Court Ruling on Healthcare," Health Research Institute, July 2012, pp. 1, 4.

[122] Philip Betbeze, "CEOs: Now It's Time to Address Affordability," HealthLeaders, June 29, 2012, http://www.healthleadersmedia.com/print/LED-281811/CEOs-Now-Its-Time-to-Address-Affordability (accessed July 16, 2012); Scott Mace, "CIOs and CMIOs Speak Their Minds about the Supreme Court Decision," July 3, 2012, http://www.healthleadersmedia.com/print/TEC-281957/CIOs-and-CMIOs-Speak-Their-Minds-about-the-Supreme-Court-Decision (accessed July 16, 2012).

These new provider relationships and affiliations will necessarily present opportunities for valuation professionals to provide financial appraisal services related to (1) *transactional activities* as may be involved in *integration, affiliation, acquisition and divestiture* of the various provider enterprises (and interests therein), assets, and services; (2) the *value metrics* of *capital formation* related to the development and structure of *ACOs*, *joint ventures* and related *Provider Service Agreements*, *Comanagement Arrangements*, and other related ventures; and (3) financial feasibility analyses, including the development of forecasts, budgets, and income distribution plans related to these new integration initiatives.

In order to perform an effective valuation and execute the due diligence and analysis required for developing the observations, findings, conclusions, and opinions provided in a valuation report, the appraiser needs to possess an in-depth and robust understanding of the historical background from which the medical profession and the U.S. healthcare delivery system has evolved, as well as the current direction and *future trends* of healthcare reform efforts. Given the complexities, volatilities, and relatively esoteric nature of the industry, attaining the requisite command of this body of knowledge can best be achieved through the conceptual framework of the *Four Pillars of the Healthcare Industry*, that is, *reimbursement*, *regulatory*, *competition*, *and technology*, as these factors apply to the appraisal of *healthcare enterprises*, *assets*, *and services*.

About the Companion Website

This book includes a companion website, which can be found at http:// www .wiley.com/go/healthcarevaluation (password: cimasi234). The companion website contains five comprehensive bibliographies to serve as a useful reference of sources related to healthcare valuation on the topics of healthcare reform; regulatory pronouncements; economics; revenue and expense considerations; and general trends related to healthcare enterprises, assets, and services. Also included is a compendium of professional tools and practice aids, including over 50 sample valuation schedule templates; various process diagrams and flowcharts; engagement checklists; illustrative valuation methodology schematics; and detailed examples of tables of contents for various types of valuation reports.

Foreword

This comprehensive book traces the structure and economies of the healthcare system in the United States from its origins through the present day, as the foundation for the financial appraisal of healthcare enterprises, assets, and services.

It is based on exhaustive research and the 20-plus years of experience of Bob Cimasi's firm, Health Capital Consultants (its library holds over 50,000 books, papers, etc.). The book is heavily documented—the first chapter alone has more than 300 footnotes, and the second, more than 650!

While Bob is one of the most incisive authors covering the healthcare system, he is at the same time one of the system's harshest critics. For example, he makes reference to "the falling rank of U.S. health status as compared to other developed nations," and

> *The last two decades have seen the accelerated transformation of the U.S. healthcare professions into a service industry enterprise, whereby health services have been unitized, protocolized, and homogenized, in order to facilitate their sale in the market, just as if they were any other fungible market commodity, e.g., soybeans and pork bellies.*

Note his frequent use of italics for emphasis, so that the reader can almost hear him speaking.

His chapter on technology gets into the value drivers of management technology, as well as what we more conventionally think of as scientific technology. For example, he offers statistics on the rise in the incidence, complexity, and cost of both Electronic Health Records (EHRs) and the new version of the *International Statistical Classification of Diseases and Related Health Care Problems* (ICD). Originally established in 1893, ICD-10, scheduled to be implemented in 2014, will increase the number of procedure codes from 4,000 to 72,000 and diagnostic codes from 14,000 to 69,000.

Bob Cimasi introduces a lot of healthcare industry–specific acronyms, (e.g., ACA for Affordable Care Act) and defines each acronym the first time it is used, but most often not subsequently, so readers need to pay attention to the sidebars of acronyms and key terms included in each chapter (as well

as the Glossary found in Volume 2) so that they don't get lost in the sea of acronyms, which are seemingly endemic in healthcare.

As a layman with respect to healthcare, I was surprised and impressed with the recent developments in clinical technology, both diagnostic and treatment, that Bob summarizes in his extensive chapter on healthcare technology.

He liberally sprinkles illustrative tables, charts, and graphs where applicable throughout the text. These are often quite helpful to the reader to give more detail or a more lucid feeling for what the text is saying.

Prior to the chapters on the valuation of specific types of healthcare entities, there are three excellent general chapters on valuation in Volume 2, "Basic Valuation Tenets"; "Valuation Approaches, Methods, and Techniques"; and "Cost of Capital." These comprehensive chapters delve into more detail than I perceive the average reader may need to know, so I believe that the average reader can skip over some of the more esoteric parts of these chapters without losing the central essence of them, while the more advanced professional may seek to focus on this robust content.

The several chapters on the valuation of specific types of healthcare enterprises, services, and their various tangible and intangible assets demonstrate Bob's insightful knowledge of the healthcare industry and its components. For each major category of enterprises within the healthcare professions, he explains the nature, value drivers, and relevant trends of each subcategory, from hospitals to various types of clinical and nonclinical services.

For example, in the chapter on valuing inpatient enterprises, he points out that for hospitals, both capacity and occupancy rates are among the value drivers, and he provides a table of average occupancy rates by ownership category and size from 1975 through 2009. He gives a useful chart of other variables to consider and another convenient chart of sources of benchmarking data for these variables.

Readers should not delude themselves into believing that they will become instant experts in healthcare valuation. This is not a "how to" book. However, it provides both breadth and depth of detailed understanding into many specialties within the healthcare field, for both facilities and services. At this time of the greatest evolution in the history of healthcare valuation, it provides both exhaustively researched information and keen insight into value drivers and trends in most aspects of the healthcare field. It is a monumental contribution to the literature about the valuation of the healthcare industry and the medical profession.

Preface

The great thing in this world is not so much where we stand, as in what direction we are moving.

—Oliver Wendell Holmes

This year marks my thirtieth as a healthcare appraiser and the twentieth anniversary of Health Capital Consultants (HCC), the consulting firm I started in 1993. During that period, I've witnessed and experienced unprecedented change in both the healthcare industry and the valuation profession, as described in the following sections.

THE CHANGING HEALTHCARE INDUSTRY PARADIGM: THE CORPORATIZATION OF MEDICINE

The *corporatization* of medicine and the rise of *for-profit* healthcare have replaced the cottage industry of *Marcus Welby*–physician practices and the small community hospitals that were prevalent at the start of my career. The last three decades have seen the accelerated transformation of the medical professions into U.S. healthcare service *industry* enterprises, whereby healthcare services have been *unitized*, *protocolized*, and *homogenized*, in order to facilitate their *sale* in the market, just as if they were any other fungible market commodity, little differentiated from soybeans and pork bellies. This new healthcare delivery paradigm has accelerated alongside the *corporatization* of medicine, as demonstrated by the increase in large hospital systems; the retreat from private practice of medicine to employed physicians; and the consolidation of payors by large, for-profit health insurance firms.

CHANGES IN THE ENTERPRISES, ASSETS, AND SERVICES SUBJECT TO APPRAISAL AND SCOPE OF ENGAGEMENT

This changing paradigm has resulted in an evolving array in the types of *enterprises*, *assets*, and *services* that are subject to being appraised. As the complexities associated with healthcare transactions have increased

significantly, there has been a simultaneous increase in the opportunities available for the business valuation profession in scope and diversity arising from the growing demand for analysis related to both *Fair Market Value* and *commercial reasonableness* opinions for pending transactions. There will inevitably be fewer engagements focused on appraising solo and small group medical practices, as the healthcare industry consolidates, and greater numbers of physicians and other providers form larger organizations based on new emerging models of organizing the delivery of care.

These *emerging healthcare organizations* (EHOs) will continue to be driven by the need to develop new affiliations, capital structures, and governance configurations, in order to align the interests of patients/consumers with the various U.S. healthcare industry subsectors, including *inpatient* and *outpatient* providers; *payors* and *managed care entities*; and *suppliers* and *vendors*, in such a manner as to address the emergence of *value-based reimbursement* initiatives focused on both lowering costs and improving quality. These factors have necessarily also changed the scope of appraisal assignments, with an increasing volume of appraisals focused on property interests other than at the *total enterprise* level, and more emphasis on discrete property interests and services, as well as more focused attention on the *highest and best use* concept and the selection of the appropriate *premise of value*, that is, either *value in-use as a going concern* or *value in-exchange*. Given these complexities, the opportunities for additional collaboration among the various appraisal disciplines, such as business valuation, intangible assets and intellectual property, real estate, and machinery and equipment and personal property, have never been greater.

CAPITAL MARKET CHANGES: AVAILABILITY OF CAPITAL AND NEW FINANCIAL INSTRUMENTS

Changes in the capital markets related to both the availability of capital sources and the types of financial instruments used in financing healthcare transactions, particularly in recent years following the Great Recession, have transformed the way that healthcare providers, as well as the healthcare transactional marketplace, operate.[1] Neither healthcare enterprises nor the *capital markets* in which they operate, exist within a *vacuum*. Wide-ranging *factors* have an impact on the global and national economy and *reverberate* through markets, affecting the functioning of *capital markets* in healthcare,

[1] As with other industries, healthcare was dramatically affected during the difficult years following the collapse of the capital markets from 2007 through 2009.

as well as in other industries. The effects of the economic downturn of the Great Recession included a dramatic *retraction in the availability of capital*, as well as the *imposition of strict lending conditions* on those few credits that were being granted, even for stable and profitable healthcare enterprises.[2]

CHANGES IN THE VALUATION LITERATURE AND EDUCATION

The valuation profession has also progressed significantly during the last three decades. When I first began my appraisal education in the late 1970s, the availability of business valuation literature related to the appraisal of closely held enterprises was virtually nonexistent, with only a few seminal interdisciplinary valuation works, for example, Taussig's *Principles of Economics* (1918), Bonbright's *The Valuation of Property* (1937), and Babcock's *Appraisal Principles and Procedures* (1968), with most other authoritative texts relating only to real estate appraisal and corporate finance.[3] However, starting in the 1970s, several books began to address (albeit slowly) the appraisal of other closely held businesses and business interests.[4] During the next two decades, several additional texts related to appraising closely held business enterprises were published, including:

- **1977:** *How to Price a Business: A Special Report* by Raymond C. Miles;
- **1981:** *Valuing a Business* by Shannon Pratt;
- **1984:** *Basic Business Appraisal* by Raymond C. Miles; and
- **1987:** *Appraisal and Valuation: An Interdisciplinary Approach* by Richard Rickert.[5]

---

[2] Gary S. Becker, "The Great Recession and Government Failure," *Wall Street Journal*, September 2, 2011, http://online.wsj.com/article/SB10001424053111904199404576536930606933332.html (accessed April 26, 2012).

[3] F. W. Taussig, *Principles of Economics* (New York: Macmillan, 1918); James C. Bonbright, *The Valuation of Property* (New York: McGraw-Hill Book Company, 1937); Henry A. Babcock, *Appraisal Principles and Procedures* (Washington, DC: American Society of Appraisers, 1989).

[4] For example, McCarthy and Healy's *Valuing a Company*, published by John Wiley & Sons, in 1971, devoted just four pages to valuing professional practices and services companies.

[5] Raymond C. Miles, *How to Price a Business: A Special Report by Raymond C. Miles* (Englewood Cliffs, NJ: Institute for Business Planning, 1977); Shannon P. Pratt, DBA, CFA, CFP, ASA, *Valuing a Business* (Homewood, IL: Dow Jones-Irwin, 1981); Raymond C. Miles, *Basic Business Appraisal* (New York: John Wiley & Sons, 1984); Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach* (Washington, DC: American Society of Appraisers, 1987).

Beginning in the 1980s, the cannon of professional valuation literature related to appraising professional practices, including medical practices, began to emerge, including such titles as:

- **1980:** *How to Value Professional Practices* by Glenn Desmond;
- **1981:** *Valuing a Medical Practice* by the American Medical Association;
- **1986:** *Valuing Small Businesses and Professional Practices* by Shannon Pratt;
- **1987:** *New Trends in Dental Practice Valuation and Associateship Arrangements* by James Jackson and Roger Hill;
- **1988:** *Selling the Medical Practice* by Madeleine Pelner Cosman;
- **1989:** *Understanding the Valuation of Medical Practices* by James Unland;
- **1990:** *Valuing Professional Practices* by James Horvath; and,
- **1991:** *Financial Valuation of Your Practice* by Linda Ginsburg.[6]

Since that time, there has been a flurry of books and peer-reviewed journal articles, as well as academic research sources and industry newsletters, related to the various aspects of financial valuation, including the application of *cost of capital*, *tax affecting*, and *discounts for lack of marketability* to the valuation of closely held businesses and professional practices. Today, there are now excellent treatises and other authoritative texts and sources related to those aspects of financial valuation, as well as benchmarking and forecasting in both the transactional and litigation support arenas.

While healthcare financial appraisal literature has grown exponentially in the last 10 years, its very availability and the volume of information present a challenge to all professional consultants working at the forefront of this competitive healthcare industry. Simply stated, how do we find the

[6] Glenn M. Desmond, *How to Value Professional Practices* (Los Angeles: Valuation Press, 1980); *Valuing a Medical Practice* (Monroe, WI: American Medical Association, 1981); Shannon Pratt, DBA, CFA, CFP, ASA, *Valuing Small Businesses and Professional Practices* (Homewood, IL: Dow Jones-Irwin, 1986); James B. Jackson and Roger K. Hill, *New Trends in Dental Practice Valuation and Associateship Arrangements* (Chicago: Quintessence Publishing, 1987); Madeleine Pelner Cosman, *Selling the Medical Practice* (Tenafly, NJ: Bard Hall Press, 1988); James J. Unland, *Understanding the Valuation of Medical Practices* (Chicago: Health Capital Group, 1989); James L. Horvath, Ca, CBV, ASA, CCH, *Valuing Professional Practices* (Canadian Limited, 1990); Linda G. Ginsburg, *Financial Valuation of Your Practice* (Los Angeles: Practice Management Information Corporation, 1991).

time to sort through an accelerating ocean of information and data, select what is relevant, analyze it, and report it to our clients in a comprehensible, timely, and cost-effective manner? I addressed these challenges in my career by making a commitment to act on behalf of those providers who lacked the resources to adapt to change quickly enough to effectively compete in today's intensely competitive and dynamically turbulent market. Toward that end, the development of a disciplined healthcare finance and economics research staff and library resource was established as the focus of the core services that HCC delivers to its clients.

CHANGE IN VALUATION PROFESSION STANDARDS

Valuation standards and codes of ethics have also evolved during the last 30 years, concurrent with the development of professional business valuation designations by the American Society of Appraisers, the Institute of Business Appraisers, the National Association of Certified Valuators and Analysts, and the American Institute of Certified Public Accountants. The emergence of these various groups in promulgating standards has sometimes presented the appraisal community with conflicting valuation standards—perhaps due, in part, to changes in accounting concepts and procedures, for example, International Financial Reporting Standards (IFRS) versus Financial Accounting Standards Board (FASB) pronouncements.

More recently, the International Valuation Standards Council (IVSC) and other groups, building on the previous efforts of CLARENCE to develop the international glossary of business valuation terms, and the National Association Business Valuation Standards Council, which attempted to *harmonize* the standards of various appraisal organizations, have made efforts to consolidate professional standards. The issuance of judicial gatekeeping authority regarding expert witness testimony emanating from *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, decided by the U.S. Supreme Court in 1993, superseded the *Frye* (1923) standard in federal courts regarding the admissibility of *scientific* expert testimony, and in 1999, the *Kumho Tire v. Carmichael* case held that *Daubert*'s factors should be extended to apply to *nonscientific* expert testimony, thereby setting additional thresholds and standards for appraisers.[7]

[7] *Frye v. US,* 293 F. 1013 (D.C.C. 1923); *Daubert v. Merrell Dow Pharms., Inc.*, 509 U.S. 579 (1993); *Kumho Tire v. Carmichael*, 526 U.S. 137 (1999).

CHANGES IN REGULATORY SCRUTINY

During the last several years, there has been intensifying regulatory scrutiny related to the healthcare transactional marketplace regarding the potential for Anti-kickback, Stark, and other fraud and abuse violations involving Medicare and other government payors. Initiatives such as the Fraud Enforcement and Recovery Act (FERA), the Healthcare Fraud Prevention and Enforcement Action Team (HEAT), and the Medicare Fraud Strike Force have only been intensified with the passage of the 2010 Patient Protection and Affordable Care Act (ACA). A significant portion of this regulatory scrutiny has focused on the issues of Fair Market Value and *commercial reasonableness* related to the consideration being paid in transactions between tax-exempt hospital organizations to for-profit physician groups as part of the massive consolidation and integration initiatives currently being undertaken.

There has also been heightened regulatory scrutiny and the potential for severe penalties aimed at appraisers under Section 6695A of the Pension Protection and Affordable Care Act of 2006 for "substantial and gross valuation misstatements attributable to incorrect appraisals" that were "prepared by a person who prepared an appraisal of the value of property and who knew, or should reasonably have known, the appraisal would be used in connection with a return or claim for refund."[8]

CHANGES IN CLIENT EXPECTATIONS

Client expectations have also evolved, particularly as a result of technological advancements that have transformed the manner by which we communicate with our clients. The days of hanging wet copy fax pages on a clothesline to dry and using a 56K dial-up modem have been replaced with cell phones, e-mail, instant messaging, video teleconferencing, and secure *back offices* and *data rooms*. Each of these advances has come with an accompanying rise in client expectations and demands for access to appraisers, as well as a rise in the requirement for appraisers to be instantaneously accessible throughout the engagement. The way in which our financial models are developed and prepared has also evolved, largely due to the accessibility

[8] Substantial value is 150 percent or more than the amount determined to be correct (income tax); or the value is 65 percent or less than the amount determined to be correct (estate or gift tax). Gross value is 200 percent or more than the amount determined to be correct (income tax); or the value is 40 percent or less than the amount determined to be correct. "Substantial and gross valuation misstatements attributable to incorrect appraisals," Internal Revenue Code, 26 USC § 6695A.

of available data sources required for *due diligence* (particularly prevalent in the healthcare arena) that we receive electronically through databases and other data portals, as well as the exponential growth in the availability of healthcare financial and economic literature, and the input of academic theory, especially during the last 10 years.

HEALTHCARE INDUSTRY SPECIALIZATION

While the subject of industry specialization has been a point of contention for many years, in 1999, Chris Mercer (a valuation thought leader whom I greatly admire and respect), stated the issue succinctly as, "The basic question often boils down to: Should we hire an *industry expert* for this engagement, or is it preferable to hire a *valuation professional*?" Chris commented that "I believe I can say, based on many years of valuation experience, that *valuation expertise* combined with a broad base of industry experience, is a preferable experience set than purely industry expertise."[9] Based on my more than 30 years of healthcare valuation experience, I believe I can say that I both agree (in part) and disagree (in part) with Chris's comment.

I hold both valuation "generalists" and healthcare "industry specialists" in high regard; each group has contributed enormously to the advancement of the valuation profession. I would certainly agree that a strong base of general business knowledge and experience, as well as a thorough education in economic and financial principles, basic valuation tenets, appraisal methodology, and professional standards, are prerequisites to a successful appraisal engagement. However, given the complexities associated with understanding the value drivers that are often unique to the healthcare industry, the explosion of information and data available to appraisers, the heightened regulatory scrutiny, and the volatile dynamics of the new paradigm of healthcare reform, the valuation profession has necessarily evolved toward industry specialization. This is generally the result of the recognition that to be credible in performing a healthcare valuation, the appraiser also needs to possess an in-depth, informed understanding of the esoteric and complex attributes of the healthcare industry, which often appears to operate under a disparate, seemingly counterintuitive, framework of market economics (e.g., demand-driven, inelastic pricing).

The in-depth, robust knowledge required of a healthcare appraiser often can begin with a background of healthcare industry expertise, such

[9] Mercer Capital Management, Inc., "The 'Valuation Professional' vs. the 'Industry Expert,'" *E-Law Business Valuation Perspective Newsletter*, 1999-17 (December 15, 1999).

as in hospital financial management, but that experience alone is not sufficient without a thorough valuation education. Furthermore, credibility as an appraiser of healthcare interests requires a continuing commitment to keep abreast of the almost daily changes in national and regional economic conditions impacting the healthcare industry; payment and reform initiatives, reimbursement trends, regulatory and enforcement trends, the payor/delivery system mix, healthcare manpower and labor practices, supply-side dynamics, capital costs, emerging and declining models of healthcare organizations, and other issues related to the healthcare industry and transactional markets. For those valuation professionals who lack specific healthcare industry expertise, there has never been greater access to data and information related to the economic financial, and transactional areas of healthcare. Also, there is an increasing availability for both valuation education and professional development, as well as for obtaining a comprehensive understanding of the healthcare arena through healthcare associations and medical societies; online newsletters, journals, and health law and policy reporters; academic curricula; and courses, conferences, workshops, and symposiums, many of which are available through distance education, for example, audio conferences webinars.

There has long been a discernible pattern of consensus among healthcare industry clients to engage healthcare valuation specialists, at least for projects of any size or complexity. Recently, there also appears to be a growing acknowledgment in the valuation profession that industry specialization, in this case, with a professional focus on research and training specific to the healthcare industry, is warranted. Toward that end, on January 28, 2012, the Board of Governors of the American Society of Appraisers (ASA), "the oldest and only major appraisal organization representing all of the disciplines of appraisal specialists," passed a resolution establishing the "ASA Advanced Multidisciplinary Education in Healthcare Valuation" program as developed by the ASA Healthcare Special Interest Group (ASA HSIG) educational subcommittee.[10]

WHY I WROTE THIS BOOK

The healthcare industry is a vast and diverse part of the American economy that is undergoing a sustained and dramatic transformation. While the ultimate course that U.S. healthcare reform initiatives will follow is uncertain,

[10] "About US," American Society of Appraisers, www.appraisers.org/AboutUs/AboutUs.aspx (accessed April 22, 2013).

and there is still a quandary of unresolved issues posed by this *perfect storm*, one thing I know for certain is that whether one views it as a blessing or a curse, it is undeniable that there will be exponential growth in the demand for healthcare valuation professional services, and that the financial appraisal of healthcare enterprises, assets, and services will continue to grow in scope and complexity.[11]

In writing *Healthcare Valuation*, I focused, first and foremost, on the historical development of the U.S. healthcare industry and medical profession and the broad underlying market conditions and trends in which healthcare transactions and litigation take place, as well as the related basic tenets of financial economics in regard to the approaches and methods of healthcare valuation. The objective of this text is to gather and present the technical aspects of business valuation methodology relative to the financial appraisal of emerging healthcare organizations, within the context of the Four Pillars of the healthcare industry, that is, *reimbursement*, *regulatory*, *competition*, and *technology*.

This book is intended to *supplement*, not *supplant*, the existing cannon of professional valuation literature and builds on a solid foundation of authoritative texts, treatises, and research by professionals who have contributed greatly to that literature, as well as to the development of the business valuation profession, many of whom I am proud to call my friends and colleagues of many years and gratefully acknowledge as mentors. It is my hope that this book will augment what they have previously contributed.

Acknowledgments

The assistance and support of a number of my Health Capital Consultants (HCC) colleagues were instrumental to the development and publication of this book.

Todd A. Zigrang, MBA, MHA, FACHE, ASA, HCC President, and Anne P. Sharamitaro, Esq., HCC Executive Vice President and General Counsel, were central to the development of this project and greatly assisted by contributing to this work.

Other HCC colleagues who contributed significantly to this book include Vice President Matthew J. Wagner, MBA; Vice President John R. Chwarzinski, MSF, MAE; Senior Financial Analyst Jonathan T. Wixom; and Senior Financial Analyst Grant D. Heggie, MBA, MHA.

In addition, HCC's research and library staff, as well as members of HCC's consulting and administrative support team, were of great help.

Also, many thanks to our professional colleagues and clients who served as reviewers of, and commentators on, the various drafts of this work along the way, including Dr. Shannon Pratt, CFA, FASA, MCBA, ARM, ABAR, for his encouragement and inspiration over many years, as well as his comments on this text and his contribution of the Foreword; David Grauer, Esq., of Squire Sanders, LLP; Bob Morrison, ASA, BV/IA; Robert Schlegel, ASA, CBA, CCP, CDP, CISA, CSP; Richard M. Wise, FASA, MCBA, FCBV, FRICS, CVA, FCA, CPA, CA; Chris M. Mellen, ASA, MCBA, CVA, ABAR, CM&AA, MBA; Michael Gregory, ASA, AVA, PE; James B Lurie, ASA, CBA, CVA, BVAL; Howard Lewis, MS, GVA, AVA; Robert L. Wilson, Jr. Esq.; Lari B. Masten, MSA, CPA, ABV, CFF, CVA, ABAR; John Paglia, PhD, MBA; Dick Thorsen, CPA, CMEA, CVA; Morton Cohen, CPA; and, Tim Alexander, MLS, for their helpful review and commentary.

About the Author

Robert James Cimasi, MHA, ASA, FRICS, MCBA, AVA, CM&AA, serves as Chief Executive Officer of Health Capital Consultants (HCC), a nationally recognized healthcare financial and economic consulting firm headquartered in St. Louis, Missouri, serving clients in 49 states since 1993. Mr. Cimasi has more than 30 years of experience in serving clients, with a professional focus on the financial and economic aspects of healthcare service sector entities, including valuation consulting and capital formation services; healthcare industry transactions, including joint ventures, mergers, acquisitions, and divestitures; litigation support and expert testimony; and certificate-of-need and other regulatory and policy planning consulting.

Mr. Cimasi holds a Masters in Health Administration from the University of Maryland, as well as several professional designations: Accredited Senior Appraiser (ASA—American Society of Appraisers); Fellow—Royal Institute of Chartered Surveyors (FRICS—Royal Institute of Chartered Surveyors); Master Certified Business Appraiser (MCBA—Institute of Business Appraisers); Accredited Valuation Analyst (AVA—National Association of Certified Valuators and Analysts); and Certified Merger & Acquisition Advisor (CM&AA—Alliance of Merger & Acquisition Advisors). He has served as an expert witness on cases in numerous courts and has provided testimony before federal and state legislative committees. He is a nationally known speaker on healthcare industry topics and the author of several books, the latest of which include *Accountable Care Organizations: Value Metrics and Capital Formation* (Taylor & Francis, a division of CRC Press, 2013), *The Adviser's Guide to Healthcare*—Vols. I, II, and III (2010—AICPA), and *The U.S. Healthcare Certificate of Need Sourcebook* (2005—Beard Books). Mr. Cimasi is the author of numerous additional chapters in anthologies, books, and legal treatises, published articles in peer-reviewed and industry trade journals, and research papers and case studies, and he is often quoted by the healthcare industry press. In 2006, Mr. Cimasi was honored with the prestigious "Shannon Pratt Award in Business Valuation," conferred by the Institute of Business Appraisers. Mr. Cimasi serves on the Editorial Board of the Business Appraisals Practice of the Institute of Business Appraisers, of which he is a member of the College of Fellows. In 2011, he was named a Fellow of the Royal Institution of Chartered Surveyors (RICS).

Disclaimer

This work includes information regarding the basic characteristics of various statutes, regulations, and case law related to the healthcare industry. It is intended to provide only a general overview of these topics. The author has made every attempt to verify the completeness and accuracy of the information; however, neither the author nor the publisher can guarantee, in any way whatsoever, the applicability of the information found herein. Furthermore, this work is not intended as legal or tax advice or as a substitute for appropriate legal counsel.

Introduction

Whereof what's past is prologue; what to come, in yours and my discharge.

—William Shakespeare, *The Tempest*, Act 2, scene

It may be the "*perfect storm.*" The continued rise in healthcare expenditures, the increasing segment of the U.S. population that is uninsured or underinsured, the growth in demand for care from the changing patient demographic of the aging baby-boomer population, and declining reimbursement for physician services and provider manpower shortages are just a few of the several catalysts that are driving the *turbulent transactional marketplace* for healthcare *enterprises*, *assets*, and *services* in this new *era of reform*.

Those valuation analysts, whose healthcare engagements have been focused on appraising historically *traditional* provider organizations, for example, physicians in solo and small group practices, are seeing a decline in their client base as the healthcare industry consolidates, and greater numbers of providers form new and larger *emerging healthcare organizations* (EHOs). These EHOs are driven by the need to develop new affiliations, capital structures, and governance configurations, in order to align the interests of patients/consumers, as well as various U.S. healthcare industry subsectors, including *inpatient* and *outpatient* providers, *suppliers* and *vendors*, *payors*, and *managed care entities*, in such a manner as to address the emergence of *value-based reimbursement* initiatives, such as *Accountable Care Organizations*.

This book will address the key issues that the professional appraiser should consider when undertaking a healthcare valuation assignment, set within the conceptual construct of the "*Four Pillars*" of the U.S. healthcare delivery system.

THE FOUR PILLARS OF THE HEALTHCARE INDUSTRY

In developing an understanding of the forces and the stakeholders that have the potential to drive *healthcare markets*, it is useful to examine what *value*

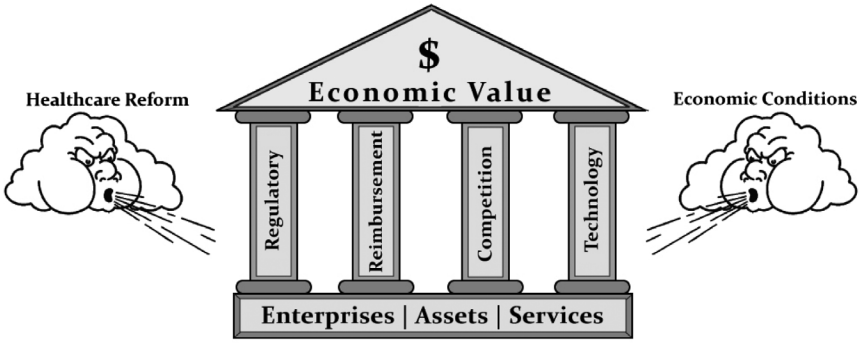

EXHIBIT I.1 The Four Pillars of the Healthcare Industry

may be attributable to healthcare *enterprises*, *assets*, and *services* as they relate to the four paramount market influences of the healthcare industry, that is, the *Four Pillars—reimbursement*, *regulatory*, *competition*, and *technology.* These four elements of the healthcare industry marketplace shape the dynamic by which providers and enterprises operate within the current transactional environment, while also serving as a conceptual framework for analyzing the *viability*, the *efficiency*, the *efficacy*, and, ultimately, the *value* that may be attributed to property interests, whether enterprises, assets, or services. Each of these *Four Pillars*, depicted in Exhibit I.1, will be further addressed in subsequent chapters.

STRUCTURE OF THIS TEXT

This text is meant to serve as both a *resource* and a *reference* and is focused on providing guidance in an era of reform related to the requisite research and analytical processes for both (1) the development of a supportable and replicable valuation conclusion and opinion in the financial appraisal of healthcare enterprises, assets, and services; and (2) the submission of a certified valuation report that is both comprehensive and credible. It is written for readers with a wide range of experience and professional focus, including healthcare industry C-suite executives; physicians and other clinical providers and their professional advisers, including attorneys, accountants, and consultants; banking, investment, and transactional advisors; and academics, researchers, and students, as well as other interested stakeholders.

This book is structured in two parts:

1. **Volume 1** consists of six chapters, beginning with a chronology of the U.S. healthcare delivery system, from the origins of medicine to the transformation of modern healthcare in the twentieth and twenty-first centuries (*Chapter 1*). *Chapters 2 through 5* explore the paramount influences of the *Four Pillars*, that is, *reimbursement*, *regulatory*, *competition*, and *technology*, as they apply to healthcare enterprises, assets, and services. *Chapter 6* provides an overview of the current healthcare environment in this new era of healthcare reform.
2. **Volume 2** consists of ten chapters, of which the first four provide a discussion of *basic valuation tenets* (*Chapter 7*), as well as a presentation of the generally accepted *valuation approaches*, *methods*, and *techniques* (*Chapter 8*), and the *costs/sources of capital* (*Chapter 9*), as these topics may be pertinent to healthcare valuation. *Chapter 10* sets forth the *planning* and *process* elements related to a healthcare valuation engagement. The next five chapters examine the following: the *value drivers* unique to each type of healthcare enterprise, asset, or service, as well as appropriate *valuation approaches*, *methodologies*, and *techniques* applicable to inpatient enterprises (*Chapter 11*), outpatient and ambulatory enterprises (*Chapter 12*), other healthcare-related enterprises (*Chapter 13*), tangible and intangible assets (*Chapter 14*), and healthcare services (*Chapter 15*). Finally, Chapter 16 provides the background and methodology regarding the regulatory threshold of *Commercial Reasonableness*.

READER TOOLS

This book will likely be used intermittently as a resource and a reference, in contrast to being read "cover to cover" in one sitting. Accordingly, to enhance the utility of this text as a navigable source for readers of various backgrounds, certain tools have been developed and appear throughout the text, including the following categories: *Key Concepts*, *Key Terms*, *Acronyms*, *Key Sources*, and *Factoids*. *Key Concepts* are the important *concepts* mentioned in the text that are significant to the healthcare valuation analysis. As an acknowledgment, *key concepts* are italicized in the text for emphasis and contrast. *Key Terms*, also italicized, refer to those significant words appearing in the text that may need to be defined for the reader and serve as a subset of the comprehensive *Glossary* that appears in Volume 2. *Acronyms*, formed by combining the initial letters or parts of a series of

words, are particularly prevalent in (and often the favorite pastime of) the healthcare industry and appear at the end of each chapter, as well as being included as part of the *Glossary*. *Key Sources* point to significant sources of data and information that are fundamental to the chapter content and serve as a subset of the comprehensive *Bibliography*, which is included in Volume 2. *Factoids* are brief, related facts of interest that are mentioned within the text. Also included are some concluding remarks and a brief epilogue.

A bedrock principle of financial valuation is that *economic value* is the *expectation* of *future economic benefit* to be derived from the *ownership* or *control of property.* The valuation analyst should, in keeping with the concept of the *principle of induction*, begin his forecast of the *future* with an in-depth understanding of the *past*, including the historical development of the U.S. healthcare delivery system within the context of the *Four Pillars*, the changing *reimbursement*, *regulatory*, *competitive*, and *technological* backdrop of an array of volatile, often complex market forces that make up the "*perfect storm*" within which the current U.S. healthcare transactional marketplace exists.[1] The first chapter of this text, "The Chronology of U.S. Healthcare Delivery: From Caduceus to Corporatization," begins the journey toward understanding the *financial appraisal of healthcare enterprises*, *assets*, and *services* in the *era of reform.*

[1]See Section 8.1.1.2.3.1, "Historical and Industry Trend Analysis," in Chapter 8, "Valuation Approaches and Methods."

CHAPTER 7

Basic Valuation Tenets

7.1 ECONOMIC PRINCIPLES

Underlying the arithmetic of it all, the application of the various approaches, methods, and techniques, as well as the rigors of the appraisal process, healthcare valuation is a discipline in the field of financial economics. Before proceeding with the subsequent chapters, which address the methodology and process of financial appraisal, this chapter reviews those economic principles and financial concepts that support the entire valuation endeavor, beginning with the principles of *scarcity* and *utility.*

7.1.1 Scarcity

> *"What each one of us can get is limited by time, by the incomes we earn, and by the prices we must pay. Everyone ends up with some unsatisfied wants. What we can get as a society is limited by our productive resources. These resources include the gifts of nature, human labor and ingenuity, and tools and equipment that we have produced.... Our inability to satisfy all our wants is called* ***scarcity****."*[1]

[1] Michael Parkin, *Economics* (Boston Pearson Addison Wesley, 2008), p. 2.

It has long been held that the first *principle of economics*, which gives rise to all questions of interest in economics, is the *principle of scarcity.* The practice of economics involves the analysis of the relationships between the *individual actors* and the *goods and services* available to them. Given the limited nature of resources, *rational economic actors* are forced to make decisions as to their choice of and consumption of the various goods and services within the economy. This decision making process is the primal question that economics seeks to answer. To wit:

> *The all-pervasive economic problem is that of* ***scarcity****. Not all desired things are available to individuals, the ultimate decision-making agents, when and as desired. Even if all desired physical commodities were present in unlimited quantities, we would not have enough* ***time*** *to enjoy them all.... It is the fact of scarcity that forces us to make economic decisions, that is, to organize our efforts for production and/or to engage in trade with a view toward obtaining desired objects.*[2]

Binger and Hoffman explain scarcity within the relationship of goods and time to enjoy them, positing that:

> *Every economy faces the problem of* ***scarcity:*** *individuals in an economy always wish to consume more goods and services than the economy is capable of producing. Even primitive societies, which appear to have limited wants, and frontier societies, which appear to have unlimited resources, face scarcity. In both of these examples, time is still a scarce resource and it must be carefully allocated between production of goods and consumption of leisure. Everyone would prefer to have the same amount of goods and more leisure, but that is not possible because leisure time must be given up to get produced goods.*[3]

However, the study of economics goes beyond simply describing how *economic actors* make decisions, it attempts to *prescribe* the *optimal strategy* that an economic actor *should* select. To assist in developing these *prescriptions*, economists use certain *simplifying assumptions* regarding the behavior of individuals, among which are the following: (1) individuals

---

[2] *Price Theory and Applications*, 3rd ed., by Jack Hirshleifer (Englewood Cliffs, NJ: Prentice-Hall, 1984), p. 16.

[3] Brian R. Binger and Elizabeth Hoffman, *Microeconomics with Calculus*, 2nd ed., (Boston: Addison Wesley Longman, 1998), p. 95.

would prefer more of a good to less, (2) individuals generally operate in a rational manner, and (3) individuals are capable of recognizing their preferences between separate bundles of goods, that is, individuals have *ordered* preferences of which they are aware. In addition, economists also posit certain mathematical principles regarding the properties of an individual's preferences (e.g., preferences are *complete*, *reflexive*, *transitive*, and *continuous*) that allow for the calculation of an optimal strategy. The combination of these simplifying assumptions, along with the scarcity of resources, and the assumption of *decreasing marginal utility* (discussed later) provides sufficient axioms to construct a framework for the economic decision-making process in which, mathematically, utility is maximized.

The reality of *scarcity* necessitates that *economic actors* make decisions regarding their consumption of various *goods* (and *services*). If resources were *unlimited*, individuals would not be faced with a conflict when choosing which bundle of goods to consume. There would be no restriction on an individual's consumption of as much of whichever goods he or she might prefer at any moment. To wit:

> *Scarcity is the present or anticipated supply of an item relative to the demand for it. In general, if demand is constant, the scarcity of the commodity makes it more valuable. Land, for example, is still generally abundant, but useful, desirable land is relatively scarce and, therefore, has greater value.* No object, including real property, can have value unless scarcity is coupled with utility. *Air, which has a high level of utility, has no definable economic value because it is abundant.*[4] *[Emphasis added]*

This *scarcity* of goods or services forces *economic actors* to differentiate between the items that they will choose to *consume* and those they choose

Factoid

Scarcity is the present or anticipated supply of an item relative to the demand for it. In general, if demand is constant, the scarcity of the commodity makes it more valuable.

The Appraisal of Real Estate, *10th ed. (Chicago: Appraisal Institute, 1992; orig. pub. 1951), pp. 24–25, 34.*

[4]Appraisal Institute, *The Appraisal of Real Estate, 10th ed.* (Chicago: Appraisal Institute, 1992; orig. pub. 1951), pp. 24–25, 34.

to *forgo*. An individual must consider the trade-offs between one bundle of goods and another. This process of decision making requires a methodology to discern, in a formal manner, between preferred outcomes and those that are less preferred. The principle of scarcity serves as the foundation of economic value to the extent that the scarce goods and services have usefulness, which is inexorably linked to the principle of utility as the foundation for economic value.

7.1.2 Utility Theory

As was noted earlier, economists assume that individuals can discern their relative preferences between goods. *Utility theory*, as developed in the economic literature, defines the criteria by which individuals determine their preferences.

> *In the modern theory, a utility index is simply a representation of a consumer's ordinal preferences. Economists model utility maximization mathematically because it is convenient to do so, but what they have in mind is not choosing the highest number but, rather, choosing the* ***most-preferred consumption bundle*** *allowed by a consumer's budget.*[5]

Utility is an abstract concept that encompasses not only the *satisfaction* that an individual enjoys from the ownership or use of a good, but also the satisfaction received from a *reduction in pain or discomfort*. For example, if an individual is relieved of an expense (an *avoidance of cost*), this would, on net, increase his or her stock of utility. In this sense, utility is a balance account. It is theoretically possible to capture a snapshot of

UTILITY THEORY

The formalized economic foundation for analyzing an individual's consumption patterns requiring individuals to consider their forward-looking expectation regarding the anticipated utility pay-off from the consumption of different bundles of goods.

[5] Brian R. Binger and Elizabeth Hoffman, *Microeconomics with Calculus*, 2nd ed., (Boston: Addison Wesley Longman, 1998), p. 109.

an individual's utility account by summing his or her current utility offset by the person's stock of sources of *disutility*, that is, pain or discomfort arising from, in financial terms, an added expense. However, due to the unique nature of individuals, it is not practically possible to universally quantify utility. The phenomenon of pain and pleasure will be experienced by each individual differently, even under similar circumstances, owing to the fact that each person will have unique sensitivities to both pain and pleasure. This fact limits the ability of utility to be generalized across individuals, in other words, there is no common metric that can be applied to all individuals to measure their utility. The following quote exemplifies this concept:

> *Since Utility is not observable, however, there is an extremely difficult measurement problem in constructing a set of cardinal utility indices for individuals. Each person* ***might*** *be able to construct an index reflecting personal preferences. However since person A cannot observe the utils person B enjoys and vice versa, there is no way to verify whether person A's utils have the same enjoyment value as person B's.*[6]

The uniqueness of the experience of utility eliminates the possibility of quantifying utility in an aggregated population. It does not, though, preclude the ranking of bundles of goods (including bundles made up of objects that reduce disutility); it only limits the ability to discuss, in a meaningful way, the magnitude of the utility impact of owning a particular bundle. The comparison of utility among individuals would be similar to measuring the length of an object in inches and comparing to another individual's measure in centimeters. No meaningful comparison can be made without the conversion to a common metric. Unfortunately, utility is experienced completely subjectively and lacks a verifiable objective measure.

Notwithstanding this limitation, the behavior of individuals can be analyzed within the framework of *utility* and *utility maximization*. It is not possible to precisely quantify the utility impact of the consumption of a particular bundle of goods or services, but judgments are still possible as to the relative preference of one bundle over another. An individual faced with a choice between two different *bundles of goods* and services will be able to *rank* the bundles which they find preferable (or they may also be *indifferent* between the two, that is, each bundle has an *equal impact on utility* and the individual would be *equally happy with either*).

[6] Ibid., p. 108.

Utility

An abstract concept that encompasses not only the satisfaction that an individual enjoys from the ownership or use of a good, but also the satisfaction received from a reduction in pain or discomfort.

7.1.2.1 The Principle of Substitution The fact that individuals are capable of comparing bundles of goods leads to the economic *Principle of Substitution*. The *Principle of Substitution* posits that what normally sets the limit of what would be paid for property is the cost of an *equally desirable substitute*, or one of *equal utility*. This principle is the basis for the decision as to whether to "*buy or build*" a product or a service.

> *Thus, the Principle of Substitution, a general prediction of economic exchange behavior, is valid because the behavior it predicts is based on at least implicit reasoning about the economic process. It is based on knowledge of economic causes and effect. It presupposes, then, another economic principle, that is, another general prediction, namely, that at a certain point, additional units of value expended will not create additional units of satisfaction. A unit of satisfaction created by an additional unit invested is a unit of marginal utility.*[7]

Often *utility* is confused with *wealth or income*. In fact, the *value of income or wealth* exists only insofar as it can be *quickly and easily converted* to *goods or services*, which ultimately provide *utility*. Increasing an individual's income may increase his or her *overall utility*, but only because in the future it can be exchanged for *goods or services* that will provide the

PRINCIPLE OF SUBSTITUTION

The price of a desired substitute, or one of equal utility, sets the ceiling of value for a particular good or service

[7]Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach*, American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987), pp. 9–10.

PRINCIPLE OF MARGINAL UTILITY

Additional units of satisfaction achieved from possession, use, or consumption of additional units of goods or property result finally in decreasing rates of satisfaction.

Appraisal and Valuation: An Interdisciplinary Approach, *Richard Rickert, American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987), p. 13.*

individual with utility. A utility-maximizing individual will seek to select from the universe of possible bundles of goods and services that allocation that generates the greatest possible utility for the individual. For an individual with *perfect information*, the process of utility maximization would simply entail comparing the possible combinations of goods and selecting the one that is most preferred.

7.1.2.2 Principle of Diminishing Returns As noted above, it is generally assumed that economic actors, *all things being equal*, will always prefer *more of a good to less*, meaning that for each additional unit of a good that is consumed, the individual's *total utility is increased*. The concept can be stated succinctly as *more is better.* Economists add one *corollary* to the previous statement, namely that while *utility increases* with each additional unit of a good consumed (referred to as *marginal utility*), it increases at a *decreasing rate*.

> *In contrast to total utility, marginal utility decreases as consumption increases. This is the key notion here. After a certain point, total and marginal utility are negatively correlated. This refers to the fact that additional units of satisfaction achieved from possession, use or consumption of additional units of goods or property result finally in decreasing rates of satisfaction.*[8]

Individuals have a desire for variety in the types of goods for consumption. If an individual were to have an abundance of a certain good, the addition of one more unit of that good would certainly increase his or her *overall utility*, but possibly to a lesser extent than if the individual were to receive

[8]Ibid., p. 13.

an additional unit of a good for which the individual had a lesser supply. The truth of this fact is evidenced by the *heterogeneity of the goods consumed* in the economy. With the narrow exception of certain goods (that is, those that are addictive), all goods will have the general concept of decreasing marginal utility, as stated in Bonbright, below:

> *Human wants for any one kind of commodity, they pointed out, are subject to a law of diminishing importance. Some wants for a particular commodity are urgent, other wants less so, and others still less. Therefore, when our supply of a commodity is limited, we assign the units of the supply to the satisfaction of the more important wants. The utility implied in the least important want, which we are in a position to satisfy with the given supply, is the marginal utility for that supply. It measures the importance of any one unit, since, if one unit of the supply were destroyed, only the least important want would go unsatisfied."*[9]

7.1.3 Expected Utility

The *utility maximization process* is complicated by the fact that *information is rarely if ever perfect*, decisions are *conditioned* on the *information set* that is available to the individual at the time the decision is made. The ability of the individual to *optimize* his or her *utility* will be limited by the person's access to *pertinent information*. The greater the similarity between the *information set available to the individual* and *complete information*, the more likely the individual will be to draw the *correct* (i.e., *utility maximizing*) conclusion. The fact is that *perfect forethought* is impossible; even after considering all deterministic factors, there would still exist random unpredictable events that may *materially alter the actual outcome*, as compared with the *expected outcome*.

7.1.3.1 Principle of Anticipation *Economic actors* thus make their decisions based on their *future expectations*. These *forward-looking expectations* form the foundation of value. As was noted earlier, the *source of value* for *money* (i.e., *income or wealth*) comes from its ability to be easily converted into a good in the future that provides the individual with *utility*. Therefore, the consideration of the purchase of a good is in actuality a comparison of the expected utility to be derived from the ownership of the good or

[9] James C. Bonbright, *The Valuation of Property: A Treatise on the Appraisal of Property for Different Legal Purposes*, vol. 1 (New York: McGraw-Hill, 1937), p. 94.

PRINCIPLE OF ANTICIPATION

A concept stating that the economic benefits of ownership of, or the contractual rights to control, the subject services to be performed under the contractual agreement are created from the expectation of those benefits or rights to be derived in the future; therefore, all economic value is forward looking.

Appraisal and Valuation: An Interdisciplinary Approach, *Richard Rickert, American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987).*

the service with the expected utility that could be derived from the conversion of the money to a good or a service in the future, that is, purchasing power. In addition, if the individual is faced with the dilemma of considering between the purchase of any number of goods and services, the forward expectations of utility to be derived from each good must be analyzed and the individual should select that bundle of goods and services that generates the greatest anticipated utility (including the choice not to purchase a bundle and to maintain the individual's purchasing power in the future). This analysis applies equally to the reverse situation, where an individual is considering disposing of a good currently owned, that is, converting a physical good into future purchasing power. It is the *differential in expected utility outcomes* that creates all *opportunities for trade* and the price at which a transaction occurs is commensurate with the expectations of both the purchaser and the seller's.

7.1.4 Forward-Looking Value and Discounting

It can be concluded, then, that all value is the *forward-looking expectation of utility* by the individual. This is often referred to as the *Principle of Anticipation*, which posits that the economic benefits of *ownership of*, or the *contractual rights to control*, the *bundle of goods* are created from the expectation of those benefits or rights to be derived in the *future*. Therefore, *all economic value is forward looking*.[10]

[10]Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach*, American Society of Appraisers, Washington, DC: International Valuation Sciences Institute, 1987).

Specifically, an *economic value* analysis should be focused on the economic benefits reasonably expected to be derived from the *use* or *utility* of the subject property *in the future,* bounded by the cost of an equally *desirable substitute*, or one of *equal utility,* for each of the elements of *economic benefit* (or *utility*) to be derived from the right to own or control the bundle of goods. It follows that a detailed examination of the attributes of the subject property must be undertaken, with each element of the attributes of the bundle of goods first *identified* as to their existence and then *classified* as to the specific factors and traits of each attribute that would exhibit the means by which they would reasonably be expected to provide *utility* to the owner of the bundle of goods going forward. It should be noted that this identification and classification of the subject property may be accomplished by considering the analogy of holding a bundle of twigs in your hand, where each twig represents a distinct element in the legal bundle of rights of ownership. This concept of a *legal bundle of rights* is important, due to the fact that control must be manifested in its ability to be enforced. In established societies, *legal protections, police powers, and the due process of law enforce the rights of ownership.* In societies where the due process of law does not exist, the establishment of utility arising from the ownership of a good may be *constrained* by the owner's ability to individually assert those *rights* at the point of a gun. For example, the assigning of *economic value* under circumstances of a *war-stricken environment* or in the presence of *civil strife*, the question arises, what is the value of the most *highly desirable source of utility*, where the *medium of exchange* is opium seeds or machine gun–wielding militants.

In the instance where an individual determines that the sum total of his or her *expected utility* arising from the *ownership of the good* is *less than* the expected *loss of utility* caused by the *reduction in his or her wealth*, the transaction would be foregone, and the individual would maintain his or her current level of wealth. If the reverse were true, and the individual anticipated that the sum of the expected future utility that would arise from the ownership of the good would *exceed* the reduction in utility from the loss of wealth, then the individual would proceed with the transaction and, on net, realize an overall *increase in utility.* As noted by Alfred Marshall,

> *We have already seen that the price which a person pays for a thing can never exceed, and seldom comes up to that which he would be willing to pay rather than go without it: so that the satisfaction which he gets from its purchase generally exceeds that which he give up in paying away its price; and thus derives from the purchase a surplus of satisfaction."*[11]

[11] Alfred Marshall, *Principles of Economics*, 8th ed. (New York: Cosimo, 2009), p. 103.

The *forward-looking nature of an individual's expectations* regarding the utility to be derived from the ownership of a good provides the environment that allows for the rise of *uncertainty* regarding the *ultimate outcome* of the utility transaction. As mentioned earlier, *random*, *unpredictable events* may intercede to alter the amount of utility actually realized by the individual, as compared with his or her expectations prior to the occurrence of the *random event*. When assessing the *future expected utility* from the ownership of a good, the individual will account for this *uncertainty* by *reducing the level of expected utility.*

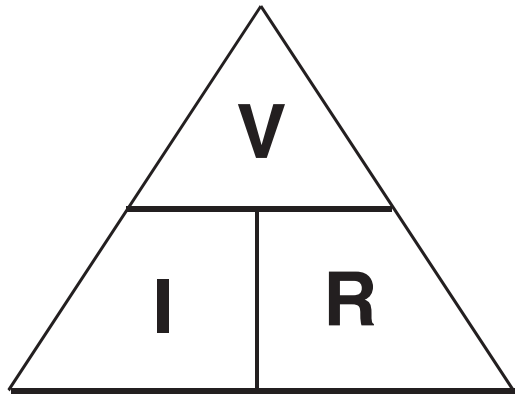
As an example, consider two goods that will generate an *equal level of utility*, one year in the future: (A) one with *complete certainty* (100 percent) of providing the anticipated benefit, and (B) one with a *50 percent probability* of providing the *anticipated benefit*. All other things being equal, the *probability-weighted expected utility* pay-off from derived from (A) would be greater than the probability-weighted expected pay-off attributable to (B). A *rational individual* would therefore be willing to convert a lesser amount of his or her current *purchasing power* (i.e., wealth) into the good with the *uncertain pay-off* (B), as compared to the good with the more certain pay-off (A), in other words, the value of the good at the date of the transaction would be *reduced*, due to the *uncertainty* of the *future expected utility.* This fact can be generalized into *the riskier the expected pay-off from a good, the lower the value of that good.*

7.1.4.1 Discounting The reduction in value caused by uncertainty is known as *discounting*. Future expected benefits are discounted to reflect the *relative uncertainty of actually receiving the benefit*. The following "*Value Pyramid*," illustrated in Exhibit 7.1, presents the process related to the valuation of goods, which can generally be discussed within the context of two distinct determinants: "*I*," the determination of the appropriate *Economic Income/Earnings/Net Benefit Stream* (expected utility) for the good, and "*R*," the development and selection of the appropriate *Risk Adjusted Required Rate of Return* (typically expressed as a discount rate, a capitalization rate, or a multiple), to apply to the net benefit stream selected.

The development of an applicable rate of discount is considered, in depth, in Chapter 9, "Costs and Sources of Capital."

Discounting

The reduction in value caused by uncertainty.



I = **Economic Benefit Stream, e.g., Income, Earnings, Cash Flow As defined by appraiser and appropriate to assignment**

R = **Risk Adjusted Required Rate of Return applicable to selected benefit stream, e.g., Discount Rate, Cap Rate, Multiple Valuation**

V = **Economic Value of the Enterprise**

EXHIBIT 7.1 The Value Pyramid

7.1.5 Summary

Scarcity of resources leads economic actors to make decisions that consider the *trade-off* between consumption of *various bundles of goods*. *Utility theory* is the *formalized economic foundation* for analyzing an individual's consumption patterns. *Utility theory* requires individuals to consider their *forward-looking expectation* regarding the *anticipated utility pay-off* from different *bundles of goods*. The *forward-looking expected utility pay-off* from ownership forms the *basis of value*. The economic concepts found in the *Principle of Substitution* and the *Principle of Utility* apply in the performance of a valuation analysis.

The *fundamental economic facts* or *economic behavior* that will occur under certain conditions form the basis of the *economic laws* of what will happen objectively in *economic situations*. Within this concept, it can be said that the dynamics as to how *economic value* is created may be understood within the context of the additional basic principles of the *Principle of Anticipation*, the *Principle of Substitution*, and the *Principle of Utility* as they relate to the economic benefits to be derived from the right to own or control the subject property under the contractual arrangement.[12] Both the

[12]Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach,* American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987).

Principle of Substitution and the *Principle of Anticipation* are premised on the existence of the *Principle of Utility*, accordingly the *Principle of Utility* is the primal concept of valuation. Thus, it has been said that this *Principle of Utility* may be stated as, *"An object can have no value unless it has utility."*[13] The interplay between scarcity and utility in the value proposition is addressed in Bonbright; to wit:

> *In short, the modern economist's distinction between utility and value is that the former term refers to the mere* capacity *of a thing to perform a useful service, whereas value refers to its importance* in view of that capacity. *The same idea has been put in other words by economic textbook writers who say that a thing, in order to have value, must have both utility and scarcity. If the article is deemed to be useless, people will not ordinarily value it at more than the cost of securing a duplicate—a cost which is negligible when the supply is plentiful.*[14] *[Emphasis added]*

Forward-looking expectations are subject to uncertainty, which individuals will mitigate through the process of discounting. The school of economists coming into prominence in the second half of the nineteenth century associated *value* with *utility*, that is, "The thing that gives value to a commodity they found, not in its costliness, but rather in its capability of satisfying a want—in other words, in its utility."[15]

7.2 FINANCIAL VALUATION CONCEPTS

Within the context of the *economic principles* described earlier, there are also several *financial valuation concepts* that should be understood at the outset of each valuation project. These concepts, within the context of the *economic principles* underlying the valuation process, form the foundation of a well-reasoned and defensible analysis.

7.2.1 Standard of Value

At the outset of each valuation engagement, it is critical to define appropriately (and have all parties agree to) the *standard of value* to be employed in

---

[13] F. W. Taussig, *Principles of Economics* (New York: MacMillan, 1918), p. 120.

[15] Ibid., p. 94.

STANDARDS OF VALUE

Various methods used to answer the question "*Value to whom?*" and outline the type of value to be determined, including Fair Market Value, Fair Value, Investment Value (Synergies), or Fundamental (Intrinsic) Value.

developing the valuation opinion. The *Standard of Value* defines the type of value to be determined and answers the question "*Value to whom*?" Several *Standards of Value* may be sought by the analyst, including (1) Fair Market Value, (2) Fair Value, (3) Investment Value (Synergies), and/or (4) Fundamental (Intrinsic) Value.

7.2.1.1 Fair Market Value The standard of *Fair Market Value* is defined as the *most probable price* that the *subject interest* should bring if *exposed for sale* on the *open market*, as of the *valuation date*, but exclusive of *any element of value arising from the accomplishment or expectation of the sale*. This standard of value assumes an anticipated *hypothetical transaction*, in which the buyer and the seller are each acting *prudently with a reasonable equivalence of knowledge, and that the price is not affected by any undue stimulus or coercion*.

Implicit in this definition are the following further assumptions:

1. The hypothetical transaction considered contemplates a *universe* of typical potential purchasers for the subject property and not a *specific* purchaser or a specific class of purchaser;
2. Buyer and seller are typically motivated;
3. Both parties are well informed and acting in their respective rational economic self-interests;
4. Both parties are professionally advised, and the hypothetical transaction is assumed to be closed with the typical legal protections in place,

Fair Market Value

The most probable price that the subject interest should bring if exposed for sale on the open market, as of the valuation date, but exclusive of any element of value arising from the accomplishment or expectation of the sale.

to safeguard the transfer of ownership of the legal bundle of rights that define and encompass the transacted property or interest;

5. A sufficiently reasonable amount of time is allowed for exposure in the open market;
6. A reasonable availability of transactional capital in the marketplace; and
7. Payment is made in cash or its equivalent.

As described by Dr. Shannon Pratt, *Fair Market Value* is:

> *the amount at which property would change hands between a willing seller and a willing buyer when neither is acting under compulsion and when both have reasonable knowledge of the relevant facts. . . . In most interpretations of fair market value, the willing buyer and willing seller are hypothetical persons dealing at arm's length, rather than any particular buyer or seller. In other words, a price would not be considered representative of fair market value if influenced by special motivations not characteristic of a typical buyer or seller. There is also general agreement that the definition implies that the parties have the ability as well as the willingness to buy or sell.* The market in this definition can be thought of as all the potential buyers and sellers of like businesses or practices."[16] *[Emphasis added]*

Inherent in each of the previous definitions of *Fair Market Value* is the concept, as stated by Justice Byron R. White, of "*The willing buyer—willing seller test of fair market value . . . nearly as old as the federal income, estate, and gifts taxes themselves*."[17]

Valuing of a healthcare-related enterprise, asset, or service requires additional assumption as to be considered in relation to the federal Stark Laws, anti-kickback statutes, and regulations related to tax-exempt organizations. For example,

1. The anticipated hypothetical transaction would be conducted in compliance with "*Stark I & II*" legislation, prohibiting physicians from making referrals for "*designated health services*" reimbursable under

[16] Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), pp. 41–42, citing the American Society of Appraisers, *Business Valuation Standards*, "Definitions."

[17] *United States v. Cartwright*, 411 U.S. 546, 551 (1973).

Factoid

A price would not be considered representative of fair market value if influenced by special motivations not characteristic of a typical buyer or seller.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), pp. 41–42, citing The American Society of Appraisers,* Business Valuation Standards, *"Definitions."*

Medicare to an enterprise with which the referring physician has a financial relationship.[18] "*Stark II*" defines "*fair market value*" as "*the value in arm's length transactions, consistent with the general market value. . . .*"[19] It is further assumed that the transaction falls within Stark II's specific exception for "*isolated financial transaction[s]*" when "*the amount of the remuneration under the employment . . . [(1)] is consistent with . . . fair market value of the services, . . . [(2)] is not determined in a manner that takes into account (directly or indirectly) the volume or value of any referrals by the referring physician, [(3)] . . . is provided pursuant to an agreement which would be commercially reasonable even if no referrals were made to the employer, . . . and [(4)] the transaction meets such other requirements as the Secretary [of HHS] may impose by regulation as needed to protect against program or patient abuse[;]*"[20]

2. The anticipated hypothetical transaction would be conducted in compliance with the federal Anti-Kickback Statute, making it illegal to knowingly pay or receive any remuneration in return for referrals.[21] The federal Anti-Kickback Statute requires the payment of "fair market value in arm's-length transactions and . . . [*that any compensation] is not determined in a manner that takes into account the volume or value of any referrals or business otherwise generated between the parties for which payment may be made in whole or in part under Medicare, Medicaid or other Federal health care programs*"[22] [emphasis added]; and

[18] 42 U.S.C.A. § 1395nn(a) (2006); Social Security Act § 1877(a) (2006).

[19] 42 U.S.C.A. § 1395nn(h)(3) (2006); Social Security Act § 1877(h)(3) (2006).

[20] 42 U.S.C.A. § 1395nn(e)(2)(B), (C), (6) (2006); Social Security Act § 1877(e)(2)(B), (C), (6) (2006).

[21] 42 U.S.C.A. § 1320a-7b(b) (2004).

[22] 42 CFR 1001.952(d)(5) (2004).

3. Related to the previous, the following definitions of terms apply: "*In an excess benefit transaction, the general rule for the valuation of property, including the right to use property, is fair market value.*"[23] "*A disqualified person [regarding any transaction,] is any person who was in a position to exercise substantial influence over the affairs of the applicable tax-exempt organization at any time during [a five-year period ending on the date of the transaction].*"[24] "*An excess benefit transaction is a transaction in which an economic benefit is provided by an applicable tax-exempt organization, directly or indirectly, to or for the use of a disqualified person, and the value of the economic benefit provided by the organization exceeds the value of the consideration received by the organization.*"[25]

7.2.1.1.1 Requirement for Fair Market Value in the Healthcare Industry The *increasing government scrutiny* of the *business activities* of healthcare providers over the last quarter century has led to tightened restrictions and increased regulatory enforcement, with both *civil and criminal penalties*, related to such areas as *Fraud and Abuse*, *anti-kickback*, *self-referral*, and *tax-exempt status*. It should be noted that many types of *business arrangements*, which would be regarded as *typical motivations* inherent in *commercial relationships* between parties in *other industries*, are perceived as exhibiting the potential for a *significant risk of fraud* in the *healthcare industry.* For example, *referral relationships* that would be both *lawful and expected* in other *financial industries* may violate both federal and state *anti-kickback and/or self-referral laws* when they are found to exist between healthcare providers. Changes in the scope and nature of *Medicare Fraud and Abuse enforcement*, as it relates to *physician self-referral laws*, has turned the *transactional market* for provider entities that provide "*designated health services*" (DHS) into an area of *significant uncertainty*, thereby resulting in a *greater perception of risk* of the valuation of these enterprises.

This current heightened regulatory environment for the healthcare industry affects the type of data required, the methodology employed, and the entire process of developing and reporting a valuation opinion related to healthcare entities, for example, enhanced diligence in maintaining appraiser work files, and clearly defining the important relationship between the appraiser and healthcare legal counsel. See Chapter 3, "Regulatory Environment," for an in-depth discussion of the healthcare industry's regulatory environment.

7.2.1.2 Fair Value Distinct from the valuation standard of *Fair Market Value* is the standard of *Fair Value* for financial reporting purposes, as well as from the context of *Fair Value* in the state statutes and case law. *Fair Value* for financial reporting, as required by generally accepted accounting principles and the Securities Exchange Commission, has been defined by the *Financial Accounting Standards Board* (FASB) Statement No. 157 (ASC 820 as of 2009), as "the price that would be received to sell an asset or paid to transfer a liability (an exit price) in an orderly transaction between market participants at the measurement date."[26]

Fair Value

The price that would be received to sell an asset or paid to transfer a liability (an exit price) in an orderly transaction between market participants at the measurement date.

"Statement of Financial Accounting No, 157: Fair Value Measurements," Financial Accounting Standards Board, September 2006, p. 2.

According to Dr. Pratt, FASB Statement No. 157 also expands the distinction between *Fair Value* and *Fair Market Value:*

> *The Board agreed that the measurement objective encompassed in the definition of fair value used for financial reporting purposes is generally*

[26] Statement No. 157 was issued by FASB on September 15, 2006, and is effective for financial statements issued for fiscal years beginning after November 15, 2007. Financial Accounting Standards Board, "News Release: 09/15/06," September 15, 2006, http://www.fasb.org/news/nr091506.shtml&pf=true (accessed May 11, 2012); Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 46; PricewaterhouseCoopers, *FASB Accounting Standards Codification Quick Reference Guide*, 2009; Financial Accounting Standards Board, "Statement of Financial Accounting No. 157: Fair Value Measurements," September 2006, p. 2.

> *consistent with similar definitions of fair value used for valuation purposes. For example, the definition of fair market value in Internal Revenue Service Ruling 59–60 (the legal standard of value in many valuation situations) refers to "the price at which property would change hands between a willing buyer and a willing seller when the former is not under any compulsion to buy and the latter is not under any compulsion to sell, both parties having reasonable knowledge of relevant facts." However, their Board observed that the definition of fair market value relates principally interpretive case law, developed in the context of tax regulation. Because such interpretive case law, in the context of financial reporting, may not be relevant,* the Board chose not to adopt the definition of fair market value, *and its interpretive case law,* for financial reporting purposes.[27] *[Emphasis added]*

Also, note that the term "*price,*" as mentioned in both the FASB definition and Pratt's discussion is referring to the *exit* price, not the *entry* price ("*the price that would be paid to acquire the asset or to assume the liability*").[28] The definition implies a transaction in an ideal market, as the "'*market' referred to in this definition is 'the market in which the reporting entity would transact for the asset or liability, that is, the principal or most advantageous market for the asset or liability.*'"[29] If an active market exists on the date of valuation, the ***market price*** may be at *Fair Value*.[30] To quantify *Fair Value*, FASB has identified three hierarchies of measurement (the highest level of which is to be used in the accounting exercise) as follows:

> *Level 1 (highest-priority) inputs are quoted prices in active markets for identical assets or liabilities.*
>
> *Level 2 inputs are those other than quoted prices included within Level 1 that are directly or indirectly observable.*
>
> *Level 3 inputs are unobservable inputs that reflect assumptions about what market participants would use in their pricing analyses."*[31]

[30] Ibid.

[31] Ibid., pp. 1006–1007; Financial Accounting Standards Board, "Statement of Financial Accounting No. 157: Fair Value Measurements," September 2006, pp. 9–12.

THREE HIERARCHIES OF MEASUREMENT TO QUANTIFY FAIR VALUE

Level 1 (highest-priority) inputs are quoted prices in active markets for identical assets or liabilities, Level 2 inputs are those other than quoted prices included within Level 1 that are directly or indirectly observable, and Level 3 inputs are unobservable inputs that reflect assumptions about what market participants would use in their pricing analyses.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), pp. 1006–1007; "Statement of Financial Accounting No, 157: Fair Value Measurements", Financial Accounting Standards Board, September 2006, pp. 9–12.*

Many states have adopted the *Universal Business Corporation Act*, which defines *Fair Value* as "*the value of the shares immediately before the effectuation of the corporate action to which the dissenter objects, excluding any appreciation or depreciation in anticipation of the corporate action unless exclusion would be inequitable.*"[32] The definition of *Fair Value*, under these state laws, is also applicable to situations of dissenting stockholders' appraisal rights, whereby a minority stockholder has the right to have his or her shares appraised and receive *Fair Value* in cash during a corporation merger, a sellout, or another major action.[33] The corporate state law definition of *Fair Value* is distinct from the accounting contrivance of *Fair Value* set forth earlier in this section, as well as from the standard of *Fair Market Value*.

7.2.1.3 Investment Value (Synergies) In contrast to the standard of *Fair Market Value*, the standard of *Investment Value* may be defined as "the specific value of an investment to a particular investor or class of investors based on individual investment requirements; distinguished from *market value*, which is impersonal and detached"[34] [emphasis added]. There may

[32]Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 45, citing Oregon Revised Statues, Section 60.551(4), 2009.

[33]Ibid.

[34]Ibid., p. 43, citing *The Dictionary of Real Estate Appraisal*, 4th ed. (Chicago: Chicago Appraisal Institute, 2002), p. 152.

Investment Value

The specific value of an investment to a particular investor or class of investors based on individual investment requirements, distinguished from market value, which is impersonal and detached.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), p. 43, citing,* The Dictionary of Real Estate Appraisal, *4th ed. (Chicago: Chicago Appraisal Institute, 2002), p. 152.*

be many valid reasons for the *Investment Value* of the subject interest to a given owner or prospective owner to differ from the *Fair Market Value* of that same subject interest, including such reasons as "(1) Differences in estimates of future earning power, (2) Differences in perception of the degree of risk and the required rate of return, (3) Differences in financing costs and tax status, and (4) Synergies with other operations owned or controlled."[35]

7.2.1.4 Fundamental (Intrinsic) Value The valuation standards of *Fair Market Value*, *Fair Value*, and *Investment Value*, are distinct from the concept of *Fundamental (or Intrinsic) Value*, in that it "represents an analytical judgment of value based on the perceived characteristics inherent in the investment, not tempered by characteristics peculiar to any one investor, but rather tempered by how these perceived characteristics are interpreted by one analyst versus another."[36] In describing the distinctions between the various standards of value, Dr. Pratt has noted that the "concept of intrinsic value cannot be entirely divorced from the concept of fair market value, since the actions of buyers and sellers based on their specific perceptions of intrinsic value eventually lead to the general consensus market value and to the constant and dynamic changes in market value over time."[37]

[35] Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 43.

[36] Ibid., p. 44.

[37] Ibid., p. 45.

Factoid

The concept of intrinsic value cannot be entirely divorced from the concept of fair market value, since the actions of buyers and sellers, based on their specific perceptions of intrinsic value, eventually lead to the general consensus market value and to the constant and dynamic changes in market value over time.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), p. 45.*

Fundamental (Intrinsic) Value

A representation of an analytical judgment of value based on the perceived characteristics inherent in the investment, not tempered by characteristics peculiar to any one investor, but rather tempered by how these perceived characteristics are interpreted by one analyst versus another.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), p. 44.*

7.2.2 Premise of Value

In addition to identifying the standard of value to be used in the valuation engagement, it is imperative that the premise of value, in other words, an assumption further defining the standard of value to be used and under which a valuation is conducted, also be determined at the outset of the valuation engagement. The premise of value defines the hypothetical terms of the sale, that is, "the most likely set of transactional circumstances that may be applicable to the subject valuation; e.g., going concern, liquidation," and answers the question—value under what further defining circumstances?[38] The selection of the premise of value can have a significant effect on its application in the valuation process. Two general concepts relate to the consideration and selection of the premise of value: "*Value in Use*" and "*Value in Exchange*."

[38] Richard Rickert, "The Principles and Concepts of Valuation: Theory of Utility and Value, Value Influences, and Value Concepts," in *Appraisal and Valuation: An Interdisciplinary Approach*, vol. 1 (Washington, DC: American Society of Appraisers, 1987), pp. 6–7.

PREMISE OF VALUE

The Premise of Value defines the hypothetical terms of the sale, that is, "the most likely set of transactional circumstances that may be applicable to the subject valuation; for example, going concern, liquidation," and answers the question—Value under what further defining circumstances?

Appraisal and Valuation: An Interdisciplinary Approach, *by Richard Rickert, American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987), pp. 6–7.*

7.2.2.1 Value in Use *Value in use* is the premise of value that assumes that the assets will continue to be used as part of an ongoing business enterprise, producing profits as a benefit of ownership *of a going concern.* As defined by Pratt: "Value as a going concern" is "value in continued use, as a mass assemblage of income-producing assets, and as a going-concern business enterprise."[39] It should be noted that to support a valuation premise of *value in use as a going concern*, that premise would require a reasonable likelihood that the subject enterprise would produce, in the reasonably foreseeable future, sufficient net margin to generate an economic cash flow to support the value of the investment represented by the tangible assets used to generate the revenue stream of the provider enterprise.

It should be noted that the basic concept of *Value in Use* is that all economic values are derived from some form of economic *usefulness*, also termed *utility*, as discussed in Section 7.1.2, "Utility Theory." The interplay of concepts, as they relate to the consideration and selection of either *Value in Use* or *Value in Exchange* as the premise of value lies in the fact that "*All economic values*

VALUE IN USE

The premise of value that assumes that the assets will continue to be used as part of an ongoing business enterprise, producing profits as a benefit of ownership of a going concern.

[39] Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 47.

VALUE AS A GOING CONCERN

Value in continued use, as a mass assemblage of income-producing assets, and as a going-concern business enterprise.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), p. 47.*

are variations of value-in-use; in some cases, the *use* is for *exchange of properties* or the rights to properties.... A person who owns or has *control of a property but does not use or consume it* can use it *to exchange for something else. Value created by exchange is thus ultimately a form of use value*"[40] [emphasis added]. Therefore, all *economic values* are variations of *Value in Use*.[41]

7.2.2.2 Highest and Best Use As discussed earlier, in the event that a business enterprise fails to produce sufficient evidence to indicate a reasonable likelihood that it would, as a going concern enterprise, in the reasonably foreseeable future, be able to generate *sufficient economic benefit* to support the *invested capital* used to generate the *revenue stream* of the enterprise, the valuation premise of *Value-in-Use as a Going Concern* cannot be supported, and the adoption of the *Value in Exchange* premise of value is indicated.

PRINCIPLE OF HIGHEST AND BEST USE

That use among possible alternatives which is legally permissible, socially acceptable, physically possible, and financially feasible, resulting in the highest economic return.

"The Principles and Concepts of Valuation: Theory of Utility and Value, Value Influences, and Value Concepts," by Richard Rickert, Appraisal and Valuation: An Interdisciplinary Approach *(Washington, DC: American Society of Appraisers, 1987), p. 55.*

[40] Richard Rickert, "The Principles and Concepts of Valuation: Theory of Utility and Value, Value Influences, and Value Concepts," in *Appraisal and Valuation: An Interdisciplinary Approach* (Washington, DC: American Society of Appraisers, 1987), p. 7.

[41] Ibid., pp. 6–7.

It should be emphasized that the decision to use the *Value in Exchange* premise of value, instead of the *Value in Use as a Going Concern* premise of value, does not preclude the existence of economic *Fair Market Value* attributable to intangible assets. Intangible assets may well exist and hold significant economic *Fair Market Value* under the *Value in Exchange* premise, based on the principle of *Highest and Best Use*, which "holds that this use is that use among possible alternatives which is legally permissible, socially acceptable, physically possible, and financially feasible, resulting in the highest economic return."[42]

Pratt points out that the concept of *Highest and Best Use* drives a selection of the valuation premise, which may apply under *Fair Market Value*:

> *Each of these alternative premises of value may apply under the same standard, or definition, of value. For example, the fair market value standard calls for a "willing buyer" and a "willing seller." Yet, these willing buyers and sellers have to make an informed economic decision as to how they will transact with each other with regard to the subject business. In other words, is the subject business worth more to the buyer and the seller as a going concern that will continue to operate as such, or as a collection of individual assets to be put to separate uses? In either case, the buyer and seller are still "willing." And, in both cases,* they have concluded a set of transactional circumstances that will maximize the value of the collective assets of the subject business enterprise.[43] *[Emphasis added]*

Dr. Pratt goes on to explain that

> *[t]ypically, in a controlling interest valuation, the selection of the appropriate premise of value is a function of the* highest and best use *of the collective assets of the subject business enterprise. The decision regarding the appropriate premise of value is usually made by the appraiser, based upon experience, judgment and analysis.*"[44]

Reilly and Schweihs echo Dr. Pratt's comments in reference to intangible assets, stating that

> *"[t]he selection of the appropriate premise of value may be dictated by the* highest and best use *of the subject intangible asset. The*

[42] Ibid., p. 55.

[43] Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 48.

[44] Ibid.

highest and best use of an intangible asset is typically defined as the reasonably probable and legal use of the intangible asset that is physically possible, appropriately supported, financially feasible, and results in the highest use."[45] *[Emphasis added]*

7.2.2.3 Value in Exchange It should be noted that in the absence of a reasonable expectancy of sufficient economic cash flow to support the value of the investment represented by the tangible assets used to generate the revenue stream of the enterprise, the highest and best use, as discussed above, of the assets may be, and the valuator must select a premise of value of "Value-in-exchange as an orderly disposition of a mass assemblage of assets, in place." This premise of value does not include current use in the production of net economic cash flow and will not include consideration of the assets as a going-concern business enterprise. As stated in Zukin:

The underlying asset approach can be done on either a net liquidation basis or by using the value of the underlying assets in continued use. *The former basis is normally applicable when there is a distinct possibility that the business is worth more "dead" than "alive." . . . Value in use is the appropriate starting point for an analysis of a going business enterprise's fixed assets. However, the values reported on this basis must be tested to show that the income stream justifies the values reported. When that situation exists, value in use on an unadjusted basis is appropriate. When the net profits are not sufficient to justify the values reported, a downward adjustment to these values in use must be made. Ultimately, the underlying asset approach must consider the net profits or cash flow of a business when expressing an opinion of value other than liquidation value.* It is important that the income or benefit stream justify the values of the fixed assets in order to properly employ this approach."[46] *[Emphasis added]*

The three levels of *value in exchange*, as noted by Dr. Pratt, are:

1. "**Value as an assemblage of assets.** *Value in place, as part of a mass assemblage of assets, but not in current use in the production of income, and not as a going-concern business enterprise."* *[Emphasis added]*

[45] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw Hill, 1999), p. 62.

[46] James H. Zukin, ed., *Financial Valuation: Businesses and Business Interests* (New York: Maxwell MacMillan, 1990), pp. 42–44.

VALUE IN EXCHANGE

An orderly disposition of a mass assemblage of assets, in place, which does not include current use in the production of net economic cash flow and will not include consideration of the assets as a going-concern business enterprise.

2. "**Value as an orderly disposition.** *Value in exchange, on a piecemeal basis (not part of a mass assemblage of assets), as part of an orderly disposition; this premise contemplates that all of the assets of the business enterprise will be sold individually, and that they will enjoy normal exposure to their appropriate secondary market.*" *[Emphasis added]*
3. "**Value as a forced liquidation.** *Value in exchange, on a piecemeal basis (not part of a mass assemblage of assets), as part of a forced liquidation; this premise contemplates that the assets of the business enterprise will be sold individually and that they will experience less than normal exposure to their appropriate secondary market.*"[47] *[Emphasis added]*

The level of value selected will have an impact on the results of the value calculations. For example, the costs of liquidation should be considered in the value estimate when using the *value as a forced liquidation* premise of value. Shortening the investment time horizon may have a deleterious effect on the valuation of the subject enterprise, as it presents a restriction on the available pool of buyers and investors and the level of ownership, as required under the standard of Fair Market Value.

7.2.3 Level of Interest

Of further importance in the development of a valuation model related to a specified asset or bundle of assets is to consider the *level of interest* to be acquired. The *level of interest* indicates the amount of control that a purchaser in the transaction is acquiring. As such, the *level of interest* can be divided into three general classifications: (1) Minority Interest, (2) Control Interest, and (3) Neither a Minority nor a Control Interest.

[47] Shannon Pratt, "Defining the Assignment," in *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), pp. 47–48.

THREE GENERAL CLASSIFICATIONS OF LEVEL OF INTEREST

(1) Minority interest, (2) control interest, and (3) neither a minority nor a control interest.

The selection of a particular *level of interest* and the associated *level of value* will have an impact on the determination of the adjustment that must be made to the calculation results of the valuation analyst.

7.2.3.1 Minority Interest A *minority interest* reflects an ownership interest that lacks the aspects of control necessary to direct the economic and financial strategies employed by the firm. Typically, anything less than a 50 percent interest in a firm would be considered a *minority position*, although more complicated organizational structures (i.e., multiple owners with variable interests) or organizational agreements that confer significant authority on owners with less than a majority position may deviate from the general 50 percent interest rule. A thorough review of the structure of the organization is warranted to ensure that the most appropriate *level of interest* is applied to the transaction.

Minority Interest

An ownership interest that lacks the aspects of control necessary to direct the economic and financial strategies employed by the firm, that is, anything less than a majority interest in a firm.

7.2.3.2 Control Interest The converse of the *minority interest* is a *control interest*. According to Christopher Mercer in *The Integrated Theory of Business Valuation*, the control level of value can be further subdivided as follows:

> *There is a growing understanding that there are at least two conceptual levels of value above the marketable minority level:*
>
> ***Financial Control.*** *The first level describes what a financial buyer is able (and perhaps willing) to pay for control of a business. Financial buyers acquire companies based on their ability to*

extract reasonable (to them) rates of return through the acquisition of companies, often on a leveraged basis.

Strategic Control. *The second control level is referred to as the strategic, or synergistic, level of value. Strategic buyers can (and do) pay more for companies than financial buyers do because they expect to realize synergies from acquisitions (e.g., perhaps through eliminating duplicate expenses or achieving cross-selling benefits) that increase future cash flows.*[48]

Control Interest

An ownership interest with the authority to alter the strategic financial and economic operations and goals of the firm.

Due to the nature of the regulatory environment within which healthcare entities operate, which requires valuations to be conducted under the valuation standard of *fair market value*, a standard that requires the indicated value to be exclusive of any element of value arising from the accomplishment or expectation of the sale (i.e., *synergistic gains*). Therefore the valuation analyst seeking to determine the *fair market value* of an enterprise under a *control level of interest* must consider only *financial buyers* when determining the appropriate premium/discount related to control to apply. Premiums and discounts are discussed in depth in Chapter 8, "Valuation Approaches and Methods."

7.2.3.3 Neither a Minority nor a Control Interest The third possible interest that may be transacted is an *equal proportion* of the equity ownership. In this ownership structure, the *level of interest* being transferred is neither a minority nor a control position. This position falls into a category between pure control and pure minority. The owners of this level of interest will, by virtue of their equality position, maintain some measure of control, above and beyond that of a simple minority holder, if only insofar as the equity holder can force negotiations by withholding their support. This *level of interest* is identifiable and can be valued using industry standard techniques.

In summary, it is imperative that the valuation consultant consider the *level of interest* under consideration before embarking on the valuation

[48] Z. Christopher Mercer, *The Integrated Theory of Business Valuation* (Memphis: Peabody Publishing, 2004), p. 92.

process. As suggested by the empirical evidence, the typical investor in a healthcare enterprise would be willing to pay more for the expanded bundle of legal rights that accompany a *control position*, as compared to a *minority position*. It is also important for the valuation consultant to understand the *level of interest* indicated by the particular methodology used in determining the value of the subject firm. For example, an indication of value derived from publicly traded equity shares would indicate a *minority interest*, as a single share of a publicly traded firm typically affords the owner minimal influence over the operation of the firm. If the valuation analyst was attempting to determine a *control level of value*, the indication of value would need to be adjusted to reflect the *premium* that would be paid over a *minority interest* for a *control position*. See Chapter 8, "Valuation Approaches and Methods," for a detailed discussion of discounts and premiums typically used in valuations.

7.2.4 Marketability Basis

In addition to the *premise of value* and the *level of interest*, a valuation analyst should also consider the relative marketability of the interest being transferred. Marketability, also known as *liquidity*, refers to the ability to convert the interest in the firm into cash or its equivalent. Typically, the more *liquid* an asset, that is, the more easily it is converted to cash, the greater the indication of value. Assets that are *less marketable* will require a *greater amount of time and effort*, as well as, direct outlays of cash to consummate a transaction (i.e. *transaction costs*). If the purchaser anticipates the difficultly in transacting the assets at the end of his or her investment horizon, then the buyer will demand a lower price for the assets in question to compensate him or her for the extra expense that will be realized to exit the investment. Therefore, *less marketable* assets will transact at a *lower price* than more readily *marketable assets*. This price differential is referred to in the valuation literature as a *discount for lack of marketability* (*DLOM*).

This discount is similar to the *control premium*, in that it is only required to convert an indication of value into the desired *marketability basis*. A valuation analyst using *publicly traded equity shares* (i.e., *highly liquid*) to value a closely held enterprise would apply the *DLOM* to arrive at

Discount for Lack of Marketability

The reduction in price demanded by investors as compensation for the perceived difficulty in converting an asset into cash or its equivalents, relative to a similar, more easily converted asset.

TWO CLASSIFICATIONS OF MARKETABILITY BASIS

(1) Freely traded, and (2) closely held.

the desired indication of value. Conversely, if a valuation analyst were using transactions in *closely held equity* to determine a *freely traded level of value*, the valuation analyst would be warranted in applying a *premium* to the indicated value to reflect the extra *liquidity* present in the interest actually being transferred. It is important that the valuation analyst understand the *marketability basis* on which the indication of value is to be based and the *marketability basis* arrived at from the methodology selected. The DLOM is discussed, in depth, in Chapter 8, "Valuation Approaches and Methods."

7.2.5 Valuation Date

Another parameter used in the development of a valuation model that can have a significant impact on the indication of value and that should be settled on early in the process of developing a valuation model is the *valuation date*. A valuation is a snapshot of a moment in the history of a firm. It expresses the *forward-looking expectations* related to the future performance of the firm based up the *information set* available "*as of*" the *valuation date*. Information that was not *known or knowable* as of the *valuation date* should not be considered in developing the indication of value. For example, changes in the competitive environment in which an enterprise operates, while known at the time the valuation model is being developed, but completely unanticipated as of the agreed-on *valuation date*, should not be considered in developing a valuation model. The goal of the *valuation date* is to identify specifically the value of a firm on a particular day. Value is a moving target, and indications of value can vary significantly with the arrival of new information. By restricting the information set to the information that was available as of a specific date, the valuation analyst can report the indication of value that would most probably be reported on the given *valuation date*.

Valuation Date

The date specified for when an indication of value will be reported. The valuation date limits the information available to the analyst to that which would have been available prior to the valuation date.

The selection of the *valuation date* will reflect the particular use of the report, as well as the preference of the client. The selection of a *valuation date* is oftentimes driven by the availability of the data necessary to support the indication of value. After consideration of the above, the valuation analyst should select an appropriate *valuation date* and clearly convey that date to the client to ensure there is no misunderstanding as to the indication of value that will be delivered.

7.3 CONCLUSION

A firm foundation in the *basic valuation tenets* will assist the valuation analyst in the development of the valuation model requisite for the assignment. The more complicated the *valuation assignment,* the more essential it is that the valuation analyst has a solid understanding of the *economic principles* that underlie *valuation theory.* All valuation projects will be unique exercises in the application of these *economic principles.* Complex valuation challenges can often be addressed by analyzing each of the discrete constituent elements, with reference to the *applicable theoretical concepts* derived from established economic principles, which are identical to the value pyramid (see Section 7.1.5, "Summary").

Regardless of whether the analyst is attempting to value an *exotic imbedded real option in a multistage transaction* or trying to determine the value of a simple enterprise, asset, or service, the foundational theory is identical: (1) identify the expected economic benefit that will accrue to the owner of the property; and (2) apply a risk-adjusted required rate of return to discount those anticipated economic benefits at an *appropriately adjusted discount rate*, which accounts for the *perceived risk* associated with the *uncertainty* of actually attaining the *economic benefit*. By using this method, the valuation analyst should be able to reduce even the most complex valuation engagements to a *tractable analytical exercise.*

Excess Capacity

The actual output of a firm, industry, or economy is below the rate at which all resources are fully employed.

The American Dictionary of Economics, *by Douglas A. L. Auld, Graham Bannock, R. E. Baxter, and Ray Rees (New York: Facts on File, 1983).*

Factoid

Alfred Marshall, considered one of the founders of economics, was born in England in 1842. In *Principles of Economics,* first published in 1980, he emphasized that the price and output of a good are dependent on its supply and demand. Marshall died in 1924.

CHAPTER 8

Valuation Approaches and Methods

At the outset, it should be noted that financial appraisal, and healthcare valuation in particular, is not a Zen exercise—*the journey is not the destination*. The explicit, specific definition of the *twigs in the legal bundle of rights* that make up the property interest(s) to be appraised is a sine qua non requirement. This first step and the subsequent steps in the *appraisal assignment planning* and *development process* are addressed in Chapter 10, "Planning and Process for Healthcare Valuation Engagements."

However, even the most carefully planned and flawlessly executed valuation engagement process will fail in the absence of the appropriate selection and application of valuation methodology that is in conformance with professional standards and, generally, has been (1) accepted in the valuation profession, (2) set forth in the canon of authoritative professional literature, and (3) accepted in the courts.

In subsequent chapters, the financial appraisal of specific categories of healthcare enterprises, assets, and services will be discussed in some detail. This chapter addresses the *methodology* of healthcare valuation as it applies to those respective property interests, as well as two other related assignments often performed by healthcare valuation professionals, that is, *commercial reasonableness opinions* and *purchase price allocations*.

8.1 VALUATION METHODOLOGY

There are numerous generally accepted valuation approaches, methods, and techniques (*methodology*) for the financial appraisal of healthcare enterprises, assets, and services. The choice of *methodology* depends primarily on the purpose of the valuation report and the specific characteristics of the type of property interest being appraised and the interest in that property. The objective and purpose of the valuation engagement, the standard of value, the premise of value, and the availability and reliability of data must all be considered by the valuator in the selection of applicable approaches and methods. The three (3) general classifications of valuation approaches are the "*Income Approach*," the "*Market Approach*," and the "*Asset/Cost Approach*," within each of which are several methods and techniques available for consideration, as discussed further on.

8.1.1 Income Approach

Income approach–based methods measure the present value of anticipated future economic benefits that will accrue to the owner of the subject entity. Economic benefits of ownership have several potential measures: cash flow, net income, net operating income, or dividend payouts. In addition to estimating the future economic benefits of ownership of the subject entity, an appropriate discount rate (as discussed next), risk-adjusted for the subject entity, by which the benefits are discounted, must also be developed.

There are several methods that may be considered under the income approach, which are discussed in the next sections.

Discount

The percentage or dollar amount below the net asset value at which an entity is sold.

Dictionary of Health Economics and Finance, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2007), p. 113.*

8.1.1.1 Total Invested Capital vs. Equity Valuation At the outset, the valuation analyst should determine whether the desired indication of value to be determined is the value of the *Total Invested Capital* of the enterprise (i.e., *debt free*) or the value of the equity of the enterprise (i.e., *net of debt*). As discussed later, cash flow is frequently used as the measure of net economic benefit flowing to the owners of the subject enterprise. The calculation of the net economic benefit stream (i.e., cash flow) to be capitalized using the income approaches will be defined by which value indication is selected. To arrive at the value of total invested capital, the valuation analyst should use the *free cash flow to the firm*, which includes cash flow to both the equity and the debt holders of the subject enterprise. Equity valuation, conversely, is determined by using the *free cash flow to equity*, which (as implied by *net of debt*) considers only that cash flow that would flow to the equity holders of the enterprise and excludes that cash flow accruing to the debt holders of the enterprise (names debt).

8.1.1.2 Discounted Net Cash Flow Method The *discounted net cash flow method* estimates the present value of the "*normalized*" expected cash flow distributable to the owners of the subject entity for a determined projection period, with a residual or "*terminal*" value ascribed to all expected cash flow beyond the projection period. While the calculation of the terminal period value, which is identical to the *single period capitalization method* (discussed later), remains sensitive to the stability of future cash flow, at least for the projection period this methodology allows for greater flexibility in the expectations related to the economic benefit flowing to the owners within the projection period, permitting the valuation analyst to tailor his or her expectations to future trends for the short and medium terms.

The valuation analyst, in applying the *discounted net cash flow methodology*, must project the most probable revenue stream to be generated by the subject property, as well as the economic operational and capital expense burdens necessary to generate that revenue. The net economic benefit flowing to the owners of the subject property is then calculated as the revenue

SINGLE PERIOD CAPITALIZATION METHOD

A method that estimates the present value of the subject entity by capitalizing, at a rate appropriate to the subject entity, into perpetuity the expected economic benefit of a single year.

less both of the economic expense burdens. The net economic benefit will be forecasted for each of the distinct postacquisition periods, as well as for the terminal period, and these forecasted benefits will then be discounted and aggregated to arrive at an indication of value as of a specified valuation date.

8.1.1.2.1 Normalizing Adjustments Often, the financial statements of a healthcare enterprise are prepared to reflect the specific circumstances of its operations, as well as the enterprise's tax posture. One purpose of making *normalizing* adjustments is to recast the historical *accounting* statements of the healthcare entity to reflect the true economic status of the healthcare enterprise, in regard to the monetary and financial benefits of ownership, by adjusting certain revenues and/or expenses. The resulting recast statements should reflect an *economic*, rather than a *tax-driven* or operational, perspective of the healthcare entity. Further, nonrecurring or extraordinary expenses should be adjusted to reflect the most probable expectation of normalized expenses required to support the revenue stream of the subject entity. These adjusted statements form the underlying income/earnings basis for calculations used in the several income approach–based methods, including the *Discounted Net Cash Flow Method*.

Among other possible normalizing adjustments that the valuation analyst should consider are:

1. Adjustment of the subject entity's owner compensation;
2. Adjustment of amounts to be paid under contracts between the subject entity and any related parties;
3. The conversion of operating leases to capital leases, as required by IRS regulations.

8.1.1.2.1.1 Owner's Compensation It is often the case that compensation to be paid to the physician owners of a healthcare entity reflects an optimized tax strategy, in contrast to strictly economic considerations. In an

effort to minimize their exposure to federal, state, and local taxes, owner physicians may alter their salaries. The total amount that might be distributed to the subject enterprise's owner physicians may consist of two elements: (1) the compensation to be paid to the owner physicians for their provision of clinical and nonclinical services, and (2) their compensation for the investment in the subject enterprise.

The regulatory environment in which the healthcare industry operates requires the valuation analyst to seek the *fair market value* of the subject enterprise by considering the most probable price at which the subject enterprise would transact, given a *universe of typical purchasers/investors*, which would not be restricted only to owner physicians. The typical investor instead would not necessarily consider the historical stated physician owner compensation for his or her clinical and nonclinical services as indicative of the *fair market value* for those services and would not reflect the anticipated compensation that would have to be paid by the typical investor to attain those same services from other nonowner physicians, because the compensation may be:

1. Below *fair market value*, because of the owner's decision to retain earnings within the enterprise to fund strategic growth or to distribute as profits; or
2. Above *fair market value*, because they include the profit from sources other than the clinical and nonclinical services provided by the owner physicians.

Therefore, the residual income calculated using the historical compensation amounts may *not* reflect the expected net economic benefit that would

Fair Market Value

The value in arm's-length transactions, consistent with general market value, without taking into account any ability between parties to refer business to one another.

"Fair Market Value," in "Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships: Final Rule with Comment Period," Federal Register *66, no. 3 (January 4, 2001): 944; "Fair Market Value," in "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II): Interim Final Rule with Comment Period,"* Federal Register *69, no. 59 (March 26, 2004): 16107.*

accrue to the universe of typical buyers/investors in the subject enterprise. The valuation analyst should review the historical compensation paid to the owner physicians (by comparison to industry-indicated benchmarks, as discussed later) and adjust the compensation (if necessary) to reflect the anticipated economic cost burden that would be necessary to support the revenue of the subject enterprise, and exclusive of any of the profits that might accrue to the owners of the subject enterprise.

8.1.1.2.1.2 Related Party Contracts Payments made between the subject enterprise and any other enterprise with common ownership to the subject enterprise should be reviewed to ensure they are at *fair market value*, that is, they represent an *arm's length bona-fide transaction.* An example would be a group of physician owners of a medical practice also owning a real estate holding company that leases medical office space to the medical practice. The payments made between these two commonly owned enterprises may be selected so as to minimize the tax exposure of the enterprises. The *typical investor* in the medical practice, therefore, would not anticipate that those historical (*tax optimized*) payments would continue or would not, in any event, pay more than the *fair market value* for the services to be provided under the contract. The *typical investor* would, in contrast, anticipate his or her expense burden to reflect the economic *fair market value* of the services to be provided under the related party contract. Therefore, the valuation analyst should carefully review all contracts between the subject enterprise and any other enterprises with common ownership to ensure that the payments are reflective of the *fair market value* of the provided services.

8.1.1.2.1.3 Operating versus Capital Leases Another adjustment that the valuation analyst should consider is the treatment of leases. In response to the increased use of *off balance sheet* financing by various enterprises, the accounting profession (as well as the IRS) has heightened its *scrutiny* of these practices. One type of *off balance sheet* financing seen within the healthcare enterprise is the use of *operating leases* (also referred to as "*true*" leases) to finance equipment purchases. *Operating leases* can be used as an alternative to *traditional financ*ing of purchased equipment. The *operating lease* expense is reflected in the *income statement* of the subject enterprise. *Purchased equipment*, in contrast, is reflected on the *balance sheet* of the subject enterprise (included in the fixed assets owned by the enterprise) and is *depreciated* over its *economic useful life* (which is reflected in the periodic income statement). The benefit to the enterprise of using an *operating lease* (as opposed to purchasing the equipment outright) is that the purchase price can be allocated across multiple periods, and any liability (such as an equipment loan) that would be associated with an equipment purchase will not appear on the enterprises balance sheet, thus the reference to *off*

balance sheet financing. The enterprise's ability to "*hide*" liabilities by not reporting these liabilities on its balance sheet prompted both the *Financial Accounting Standards Board* (FASB) and the IRS to issue new regulations regarding the appropriate use of operating leases, as opposed to using a *capital* lease, which treats the leased assets in a similar manner to purchased assets (i.e., included on the balance sheet both as an asset and a liability).

Very briefly, *Accounting Standard Codification* (ASC) 840 states that a lease will be considered an *operating lease* (usage agreement) unless *one or more* of the following four criteria are met. If any of the following applies, the lease is then treated as a capital *lease* (purchase/sale agreement):

1. The lease automatically transfers ownership of the property to the lessee by the end of the lease.
2. The lease contains a bargain purchase option.
3. The lease term equals 75 percent or more of the *estimated economic life* of the property. (Note: *Economic life* is defined as the period of actual usefulness of an asset. Economic life refers to the period beyond which it is cheaper to replace or scrap an asset than to continue maintaining it—not to be confused with depreciable life.)
4. The present value of the minimum lease payments at the beginning of the lease term equals or *exceeds* 90 percent of the *fair market value* of the property.[1]

The leading IRS pronouncement on what constitutes a "*true*" lease in the equipment leasing context is Revenue Ruling 55 540, 1955–2 C.B. 39, which, although issued in 1955, still represents the position of the IRS. In this ruling, the IRS states that whether an agreement, which in form is a lease, is in substance a conditional sales contract depends on the intent of the parties as evidenced by the provisions of the agreement, read in light of the facts and circumstances existing at the time the agreement was executed.[2] In ascertaining such intent, no single test, or any special combination of texts, is absolutely determinative.

Section 3.02 of the ruling provides that in making the determination of the intent of the parties under the facts and circumstances, "it is necessary to determine whether by virtue of the agreement, the lessee has acquired, or will acquire, title to any equity in the property."[3]

---

[1] "Recognition," Financial Accounting Standards Board, Accounting Standard Code 840-10-25, 2010, formerly codified as FASB 13.

[2] Rev. Rul. 55-540 (IRS RRU), 1955-2 C.B. 39, 1955.

[3] Ibid.

Section 4.01 lists a number of conditions that tend to show the existence of a sale, rather than a lease. The ruling states that a lease will be treated as a conditional sale for federal income tax purposes if "*one or more of the following conditions are present:*

a. Portions of the periodic payments are made specifically applicable to an equity to be acquired by the lessee. . . [.[4]]
b. The lessee will acquire title upon the payment of a stated amount of 'rentals' which under the contract he is required to make. . . [.[5]]
c. The total amount which the lessee is required to pay for a relatively short period of use constitutes an inordinately large proportion of the total sum required to be paid to secure the transfer of the title. . . [.[6]]
d. The agreed 'rental' payments materially exceed the current fair rental value. This may be indicative that the payment includes an element other than compensation for the use of property. . . [.[7]]
e. The property may be acquired under a purchase option at a price which is nominal in relation to the value of the property at the time when the option may be exercised, as determined at the time of entering into the original agreement, or which is a relatively small amount when compared with the total payments which are required to be made. . . [.[8]]
f. Some portion of the periodic payments is specifically designated as interest or is otherwise readily recognizable as the equivalent of interest."[9]

Revenue Ruling 55–541, 1955–2 C.B. 19, a companion ruling to Revenue Ruling 55–540, discusses a situation where an asset was leased for substantially its entire useful life. The ruling states that the absence of an agreement to pass title is not indicative that the agreement was a lease and, in that situation, equitable ownership had passed. Therefore, it is essential that the lease is for a period that is not substantially the entire useful life of the asset.[10]

[10] Rev. Rul. 55-541 (IRS RRU), 1955-2 C.B. 19, 1955, in accordance with Rev. Rul. 60-122 (IRS RRU), 1960-1 C.B. 56, 1960.

In Revenue Ruling 68–590, 1968–2 C.B. 66, the IRS set forth the terms of a *financing lease* between a political subdivision and a user for a project constructed through the issuance of industrial development bonds. Under this lease, the political subdivision agreed to "*lease*" the project to the corporation for an initial term of 20 years, which was substantially shorter than the useful life of the project. The corporation assumed an unconditional obligation to make *periodic payments*, called "*basic rental*," during the *initial term* in amounts sufficient to cover the payment of the *interest on and principal of the bonds*. The *basic rental* was adjustable to take into consideration any excess of net proceeds from the sale of the bonds over the cost of the project and certain other contingencies. The corporation was given *options* to renew for terms, which, when added to the initial term, aggregated *99 years*. The *basic rent* during the renewal periods was *nominal*. The corporation was also given an option to purchase the project for a *nominal amount* at the *end of the lease term*, or earlier on *prepayment of basic rental*. The corporation also agreed to pay, as *additional rent*, all fees and expenses of a trustee incurred under a "*Trust Indenture*"; all utility charges, taxes, assessments, and casualty and liability insurance premiums; and any other expenses or charges related to the use, operation, maintenance, occupancy, and upkeep of the project. The IRS held that the corporation had all of the burdens and benefits of ownership under this arrangement, and, in effect, the corporation was treated as the owner of the project for federal income tax purposes.[11]

In Revenue Proceedings 2001–28, 2001–19 I.R.B. 1156, 2001–1 C.B. 1156, 2001, and 2001–29, 2001–19 I.R.B. 1160, 2001–1 C.B. 1160, 2001, the IRS has published guidelines that must be satisfied in order to receive an advanced private ruling on the determination of whether a "*leveraged lease*" is a "*true lease*" for federal income tax purposes.[12] Generally, a leveraged lease occurs

[11] Rev. Rul. 68-590 (IRS RRU), 1968-2 C.B. 66, 1968.

[12] Rev. Proc. 2001-28 (IRS RPR), 2001-19 I.R.B. 1156, 2001-1 C.B. 1156, 2001, superseded Rev. Proc. 75-21 (IRS RPR), 1975-1 C.B. 715, 1975 and Rev. Proc. 76-30 (IRS RPR), 1976-2 C.B. 647, while Rev. Proc. 2001-29 (IRS RPR), 2001-19 I.R.B. 1160, 2001-1 C.B. 1160, 2001, superseded Rev. Proc. 79-48 (IRS RPR), 1979-2 C.B. 529, 1979 and Rev. Proc. 75-28 (IRS RPR), 1975-1 C.B. 752, 1975. Both in 2001. A leveraged lease involves three parties—a lessor, a lessee, and a lender to the lessor. In general, these leases are net leases, the lease term covers a substantial part of the useful life of the leased property, and the lessee's payments to the lessor are sufficient to discharge the lessor's payments to the lender. Depending on the facts and circumstances, such a transaction might be treated as a lease or a sale for tax purposes. "News on the Tax Front," Small Business Taxes & Management, June 15, 2011, http://www.smbiz.com/sbw2061.html (accessed January 18, 2013).

when the lessor-owner has borrowed the funds to purchase the equipment. Presumably, if the contemplated leasing company will not be borrowing the funds in order to purchase the property it will lease, these requirements need not be met. Nevertheless, if such requirements can be met, strong evidence would exist that the "*lease*" is a "*true lease*." These revenue procedures require the lessor to have, incur, and maintain a minimum investment of 20 percent of the cost of the property. In addition, the revenue procedures provide for a further requirement that at least 20 percent of the original price of the property be equal to the fair market value of the property at the end of the lease term.[13] In effect, the revenue procedures quantify, in an analogous situation, the requirement of the minimum residual value at the end of the lease term that is required in Revenue Ruling 55–540.

Also, these revenue procedures require (i) that any renewal options should be at *fair rental value* and that any purchase options should be at fair market value, (ii) that the equipment be capable of removal from the lessee's premises, and (iii) that any maintenance and repairs performed by the lessee not be such that they constitute an improvement or addition to the property. Further, no part of the cost of the property should be furnished by the lessee. If the lessor-leasing company borrows the funds to acquire the property, the lessee may not guarantee any such indebtedness. Also, the lessor should be able to demonstrate, through a formula set forth in the revenue procedures, what it expects to receive as a profit, apart from the value of the tax benefits obtained from the transaction.[14]

In summary, Revenue Ruling 55–540 contains the IRS's most complete statement on whether a lease of equipment will be treated as a "true" lease or a conditional sales agreement. In the ruling it was stated that the IRS will look at the intent of the parties at the time the agreement was executed to determine the proper characterization of the transaction. Generally, an intent to enter into a conditional sale agreement will be found to be present if (a) portions of the rental payments are made specifically applicable to an equity acquired by the lessee, (b) the lessee will acquire a title automatically after certain payments have been made, (c) the rental payments are a disproportionately large amount in relation to the sum necessary to complete the sale, (d) the rental payments are above fair rental value, (e) the title can

[13] "Rulings, Leveraged Leasing Transactions, Rev. Proc. 2001-28 (IRS RPR), 2001-19 I.R.B. 1156, 2001-1 C.B. 1156, 2001, p. 2; further explained in "Rulings; Leveraged Leasing Transactions Information and Representations," Rev. Proc. 2001-29 (IRS RPR), 2001-19 I.R.B. 1160, 2001-1 C.B. 1160, 2001, pp. 2–5.

[14] "Rulings, Leveraged Leasing Transactions, Rev. Proc. 2001-28 (IRS RPR), 2001-19 I.R.B. 1156, 2001-1 C.B. 1156, 2001, pp. 3–5.

be acquired at a nominal option price, or (f) some portion of the rental payments are identifiable as interest.[15]

In addition to Revenue Ruling 55–540, the IRS has announced, in a series of revenue procedures starting with Revenue Proceedings 75–21, more specific guidelines under which it would answer ruling requests in an analogous context, leverage leasing transactions. In general, "*[u]nless other facts and circumstances indicate a contrary intent*," the IRS will not rule that a lessor in a leveraged lease transaction is to be treated as the owner of the property in question unless (a) the lessor has incurred and maintains a minimal investment equal to 20 percent of the cost of the property, (b) the lessee has no right to purchase except at fair market value, (c) no part of the cost of the property is furnished by the lessee, (d) the lessee has not lent to the lessor or guaranteed any indebtedness of the lessor, and (e) the lessor must demonstrate that it expects to receive a profit on the transaction, other than the benefits received solely from the tax treatment.[16]

The valuation analyst should review the leases of the subject enterprise to determine if any lease currently treated as a "*true*" or operating lease should instead be converted to a capital lease. Interpretations of various IRS rulings and accounting standards (summarized from the above) suggest that a lease transaction should meet the following criteria to qualify as a "*true (operating) lease*":

1. At the beginning of the lease term, the leased asset must have a projected fair market value at the expiration of the lease term of an amount greater than or equal to 20 percent of the value of the leased asset at the inception of the lease, excluding from consideration the effect of inflation and/or deflation and any cost to the lessor for removal.
2. The leased asset is projected to have the longer of (1) at least 20 percent of its expected normal useful life (the life projected at the inception of the lease) remaining at the end of the base term, or (2) a remaining normal useful life of at least one year at the end of the base lease term.

[16] Rev. Proc. 75-21 (IRS RPR), 1975-1 C.B. 715, 1975 Superseded by "Rulings, Leveraged Leasing Transactions, Rev. Proc. 2001-28 (IRS RPR), 2001-19 I.R.B. 1156, 2001-1 C.B. 1156, 2001, p. 2. (Quote still remains in 2001 guidance). "Bond Practice: Requirements for a 'Trust Lease' for Exclusion from Treatment as a Capital Expenditure," James P. Monacell, February 19, 2002, http://www.sgrlaw.com/resources/briefings/bond_practice/453/ (accessed January 18, 2013).

3. The lessee cannot have a right to purchase or renew the leased asset for a price that is less than its fair market value.
4. The lessor cannot have a right to force the lessee to purchase the leased asset at a fixed price.
5. The lessor must have a minimum unconditional equity "*at risk*" investment equal to at least 20 percent of the value of the leased asset at all times during the lease term. This can be done in a number of ways: with cash, with other consideration, or by personally assuming the obligation to buy the equipment.
6. The lessee must not furnish any part of the purchase price of the leased asset or have loaned or guaranteed any indebtedness created in connection with the acquisition of the leased asset by the lessor.
7. The lessor must show that the lease transaction was entered into for profit, apart from any tax benefits resulting from the transaction. Total lease payments that the lessee is obligated to pay over the lease term, when added to the equipment's estimated residual value, have to be greater than the amount of money that the lessor is obligated to pay out for the equipment, such as debt service and equity investment, including any related direct equity financing costs.
8. The present value of the lease payments cannot exceed 90 percent of the *Fair Market Value* (purchase price) of the equipment.[17]

The international convergence of accounting standards, as expressed by the *International Accounting Standards Board* (IASB) and FASB, are driving changes in the method of accounting for leases. In a June 13, 2012, press release, Hans Hoogervorst, chairman of the IASB, stated, "The boards have reached agreement on a proposed approach to put leases over one year on the balance sheet."[18] As noted in the *Investor Spotlight: Potential Changes to Lessee Accounting* (published by the IASB on December 14, 2012), under the proposed method, the accounting for finance (capital) leases would remain unchanged; however, operating leases over 12 months would be required to be recognized as an asset and a liability on a discounted basis.[19]

This change in the accounting standards will eliminate a large portion of operating leases requiring adjustment to capital leases.

8.1.1.2.2 Controlling Adjustments Similar to, but distinct from, the normalizing adjustments noted above are controlling adjustments. As discussed in Chapter 7, "Basic Valuation Tenets," depending on the particular facts and circumstances related to the valuation, the valuation analyst may be seeking either a *minority* or a *control* interest in the subject enterprise. In the event that the valuation analyst determines that the indication of value sought by the analyst is on a control basis, then adjustment should be made in the application of the *income-based approaches*.

Typically, the valuation analyst seeking an indication of value of an enterprise on a control basis will adjust the anticipated cash flow generated by the subject enterprise to reflect the net economic benefit arising from the aspects of control enjoyed by the prospective purchaser. For example, the valuation analyst may adjust the historical subject enterprise expense structure to reflect the industry-indicated average expense structure to reflect the ability of a control purchaser to direct the operation of the subject enterprise and the expectation that the indicated industry expense structure would represent the most probable level of operational efficiency that would be expected of a similar enterprise. Another economic variable commonly adjusted by a valuation analyst seeking a value indication on a control basis is the capital structure. A control purchaser would be capable of altering the mix of equity and debt finance within the enterprise. The typical adjustment to the capital structure assumes that the typical universe of purchasers/investors in the subject enterprise would use a capital structure similar to the industry, that is, the industry-indicated benchmark capital structure would be the most likely capital structure employed going forward.

For the valuation analyst seeking an indication of value on a minority (noncontrol) basis, these adjustments would not be necessary, the assumption being that a minority ownership interest would not include the authority to alter the strategic operation of the subject enterprise. Therefore, the cash flow used in an *income-based approach* should be matched to the level of interest being sought by the valuation, that is, a control level of interest will be reflected in cash flow adjusted to represent the benefits of control.

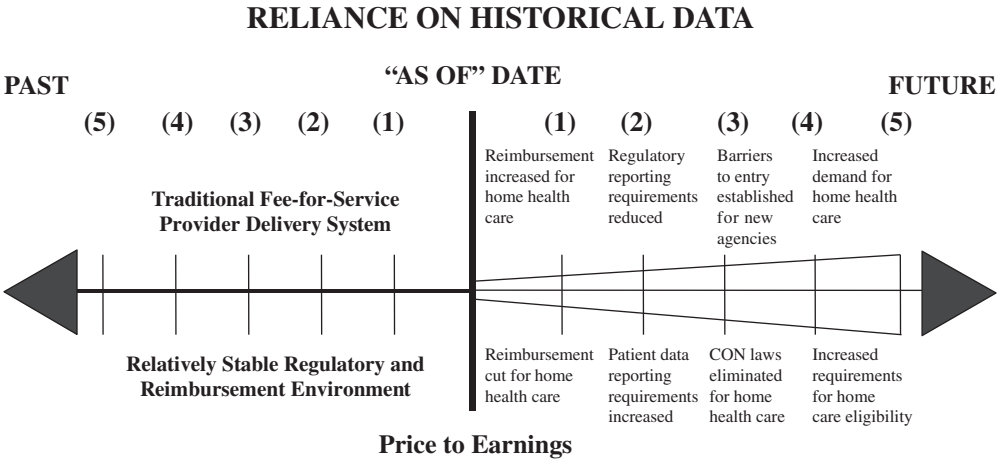
8.1.1.2.3 Forecasting Among the tasks that must be accomplished to apply the *discounted net cash flow* methodology is the forecasting of the revenue generated by the subject property, as well as the economic operating and capital expense burden necessary to generate the anticipated revenue. As described in the discussion of the *Principle of Anticipation* (see Chapter 7, "Basic Valuation Tenets") the valuation analyst should always be

cognizant of the basic valuation tenet that "*All value is forward looking*." The "*forward-looking*" analyst necessarily performs a predictive function. As the "*future*," at the time of the valuation, cannot be known with absolute certainty, the valuation consultant must make predictions regarding the future financial performance of the enterprise, asset, or service being appraised. Income-based methods, particularly, require the analyst to predict variables (such as revenue, operational costs, and capital costs) to project the anticipated economic benefit that will accrue to the owners of the asset.

The goal of the analyst should be to select the most appropriate forecasting technique (i.e., the technique that minimizes the variance of the predicted value from what is eventually the actually measured value of the metric), given the information that is available at the time that the prediction is made. Several techniques are available to assist the consultant in his or her forecasting function, including an analysis of the historical trends of the entity under consideration, as well as more sophisticated statistical techniques (e.g., the analytical techniques used in determining the conditional mean) aimed at quantifying the tendencies of the subject entity. While complex statistical analyses can inform an analyst's opinion regarding the future performance of an entity, these analyses should always be tempered with a "*real world*" assessment of the plausibility of the results. It is the role of the valuation analyst to interpret the results of any mathematical analysis, including describing and reporting those results in a meaningful way for the end users of the information.

8.1.1.2.3.1 Historical and Industry Trend Analysis Forecasting is vital to the income approach. Many forecasting techniques are available to the valuation analyst in determining the most probable economic benefit accruing to the owners of a particular asset. The available techniques vary significantly with regard to complexity and applicability. Forecasting in the social sciences is a continuously evolving subject, with new techniques developing at a steady pace. A brief synopsis of some of the often-used techniques employed throughout the social sciences to derive projections is set forth below. The selection of any one technique will rely on the nature of the projection being made, the ability of the analyst developing the projection, and the availability of data related to the process being projected. The valuation analyst should consider using as many techniques as possible when developing his or her projections for the valuation model.

Traditional healthcare valuation methodologies have relied on the analysis of historical accounting (after applying normalizing adjustments) and other data as predictive of future performance and value. The turbulent status of the healthcare industry during the last three decades has introduced intervening events and circumstances that may have a dramatic effect on the



Q: HOW USEFUL IS THE PAST IN DETERMINING VALUE?

EXHIBIT 8.1 Roadmap of Historical Performance

revenue or benefit stream of the subject entity. In that event, the "*road map of historical performance*" becomes less predictive of future performance. An example of how events may change the prediction of future performance is set forth in Exhibit 8.1.

The extent to which historical trends may be relied on is an important decision within the boundaries of the concept of the *principle of induction*, which posits that

> *The broad, underlying central principle in forecasting is the PRINCIPAL OF INDUCTION. Stated simply, this is the assumption that the future will be like the past. Existing statistical data on a subject are presumed to show trends—patterns from the past—that will continue in the future. We assume that the various factors recorded and analyzed statistically acted collectively, that is together. We also assume that the pattern of their interactions is not going to change unpredictably; thus, past trends as seen will continue in the future.*[20]

In addition to reviewing the historical performance of the subject entity, the valuation analyst should consider the *historical trends* within

[20] Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach*, American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987), p. 26.

the healthcare industry as a whole, as well as within the industry sector, the specialty and subspecialty of the enterprise being appraised, to provide a foundation to support predictions based on either the subject entity–specific historical trends or otherwise. For example, it would be difficult to project a specific entity's revenue growth in excess of the industry and/or specialty norms for an extended period of time. These kinds of divergent growth patterns are rarely observed empirically and most likely represent a misspecification of the prediction model. However, if the predicted value is based on *sound reasoning* and a *well-articulated logic*, it may be appropriate to use a projection that is not in conformance with the industry benchmarks. These compelling reasons may be subject entity-specific and rely on the reasoned judgment of the valuation analyst. An example would be in the instance where a particular specialty has experienced a change in anticipated reimbursement due to the impact of *bundled payments*. Using past historical growth, without consideration of the structural change in the revenue generation process, may be inappropriate. Because the past is not a perfect predictor, the analyst may choose to diverge from the historical subject entity or industry trends. It is incumbent on the valuation consultant to readily identify the reasons and to clearly articulate the logic that leads the analyst to consider either the historical or industry trends as poor predictors of future performance for the subject entity.

8.1.1.2.3.2 Historical Average (Unconditional Mean) Much time has been spent, in both an academic as well as an applied context, on determining the best way to forecast financial performance. Economics, finance, and mathematics have all been concerned with developing a model to express the *most probable* expected value for a random variable. Research in the field of statistics has long held that given a population of random variables, with a given distribution, the most probable value for any single instance of the random variable will be expressed by some measure of central tendency.

In determining the expected path for certain types of random input in a valuation model, a valuation consultant will often use the historical average as the best prediction of future performance. It is important here to note the differences between *measures of level*, *measure of change*, and *measure*

Factoid

Typically, historical data available to a consultant extends back only two to three years prior to the valuation. Such small sample sizes create difficulties in identifying outliers, and the consultant should seek to conserve as much information as possible.

MEASURES OF LEVEL

An indicator of the stock measure of a variable.

of relative change. The characteristic of each of the measures may have an impact on the projection of that quantity. Levels indicate the stock measure of a variable, for example, fourth quarter 2011 Gross Domestic Product (GDP) was estimated at a level of $15,321 billion.[21] A measure of change, conversely, would reflect a flow, for example, the level of unemployment in November 2008, increased (changed) by 461,000 (from a level 10,083,000 in October 2008 to a level of 10,544,000 in November 2008).[22] And the *relative measure of change* includes percentage change (i.e., the change in level divided by the magnitude of the level), for example, the level of unemployment increased by approximately 4.5 percent from October 2008 to November 2008 (461,000 divided by 10,083,000 equals approximately 4.5 percent). Each measure has its use, and the valuation consultant should be aware of the measure being used to correctly interpret the historical trend and to correctly project the financial variable under consideration.

MEASURE OF CHANGE

A reflection of a flow.

MEASURE OF RELATIVE CHANGE

An indication in the change in level divided by the magnitude of the level.

[21] Bureau of Economic Analysis, "Table 1.1.5 Gross Domestic Product," November 29, 2012, http://www.bea.gov/iTable/iTable.cfm?ReqID=9&step=1 (accessed December 12, 2012). It should be noted that GDP figures are subject to revision and may be changed at a later date.

[22] Bureau of Labor Statistics, "Labor Force Statistics from the Current Population Survey," December 13, 2012, www.bls.gov/cgi-bin/surveymost (accessed December 14, 2012).

One measure of central tendency that can be used in the projection of a random variable is the *arithmetic mean*, that is, the average value, calculated using the following equation:[23]

$$\frac{1}{n}\sum_{i=1}^{n} X_i$$

where: X_i = the ith data point
n = the sample size

Arithmetic Mean

The average value of historical data used as a measure of central tendency.

Given a sample from a random population, the arithmetic mean can often be the best estimate of the value of a new iteration drawn from the population. The valuation analyst seeking a measure of central tendency for a variable that reflects a level measure or a measure of change should consider using the arithmetic mean of the data set as an indication of the most probable value for any single member of the data set.

Alternatively, the valuation analyst may choose to use the *geometric mean* as the selected measure of central tendency, which may be more appropriate when calculating the average rate of change (such as growth rates). Geometric means can be calculated using the following equation:[24]

$$G = (X_1 \times X_2 \times \cdots \times X_n)^{1/n}$$

where: G = the geometric mean
n = the sample size

The geometric mean of an annual growth rate is often referred to as the *compound annual growth rate* (*CAGR*) and is commonly used to calculate

[23] Mark L. Berenson, David M. Levine, and Timothy C. Krehbiel, *Business Statistics: Concepts and Applications* (Upper Saddle River, NJ: Pearson Prentice Hall, 2003), p. 88.

[24] Thomas Hill and Pawel Lewicki, *Statistics: Methods and Applications* (Tulsa, OK: StatSoft, 2006), p. 626; Sidney Siegel, *Nonparametric Statistics: For the Behavioral Sciences* (New York: McGraw-Hill, 1956), p. 30.

annual returns for various financial and economic variables. A valuation analyst seeking to find a measure of central tendency for a measure of relative change (such as a growth rate) should select the geometric mean of the data set as the expected value for a random draw from the population of data.

Another measure of central tendency available to the valuation analyst is the *harmonic mean*, which is calculated using the following equation:[25]

$$H = n \times \frac{1}{\sum_{i=1}^{n} \frac{1}{X_i}}$$

where: H = the harmonic mean
n = the sample size

And the harmonic mean can be characterized as:

> *a special type of weighted mean in which an observation's weight is inversely proportional to its magnitude. The harmonic mean is a relatively specialized concept of the mean that is appropriate when averaging ratios ("amount per unit").*[26]

While the harmonic mean is less widely applied than the arithmetic and geometric means, it tends to limit the impact of very large values (i.e., *outliers*) contained in the data set. Outliers are data points within the data set that appear to be significantly different from the rest of constituent data points and can sometimes be attributed to measurement errors in the reported data or to specific aspects of the individual member of the population that tend to be unique to that member. It is important to identify those data points that may be outliers and to determine the nature of the outliers. Outliers, either those resulting from reporting errors or those resulting from a unique member of the data, may have limited predictive value. By using the harmonic mean, the valuation analyst can restrict the impact of outliers on his or her measure of central tendency.

---

[25] Thomas Hill and Pawel Lewicki, *Statistics: Methods and Applications* (Tulsa, OK: StatSoft, 2006), p. 623; Sidney Siegel, *Nonparametric Statistics: For the Behavioral Sciences* (New York: McGraw-Hill, 1956), p. 30.

[26] Richard A. DeFusco, Dennis W. McLeavey, Jerald E. Pinto, and David E. Runkle, *Quantitative Methods for Investment Analysis*, 2nd ed. (Baltimore: United Book Press, 2004), p. 120.

Median of the Historical Data

A measure of central tendency that establishes the value of a data set with an equal number of greater and lesser values within the data set and that is resistant to the effects of outliers.

An alternative to the mean (arithmetic, geometric, or harmonic) that valuation consultants may consider using is the *median* of the historical data set. To calculate the median, the valuation analyst must first order the set by magnitude (either increasing or decreasing in value). Once the set has been ordered, then the analyst can determine the median by:

> *When the **n** [the sample size] is odd, the median is the value of the item that is in the middle.*
> *When **n** is even, the median is the mean of the two items that are nearest to the middle.*[27]

The median, which seeks the balance point between the upper and lower ends of the distribution of a variable, will be resistant to the impact of outliers, as the magnitude of the upper (and lower) end of the distribution is not used in determining the median value. The arithmetic mean, conversely, may be significantly biased by the presence of an outlier.

The problem of outliers can be dealt with in yet another manner. The valuation analyst may consider using a *trimmed mean* as the measure of central tendency for the data set. The trimmed mean is calculated in the same manner as the arithmetic mean, except that certain extreme values are eliminated from the data set prior to calculation. For example, the analyst may identify several individual data points as possible outliers. The valuator would then calculate the arithmetic mean of the data set, excluding those possible outliers. Or the valuator may restrict, from the start, the data set by removing the top 5 percent of values and the lowest 5 percent of values within the data set and recalculating the arithmetic average over the remaining values. The valuation analyst should be cautious in trimming a data set. Under certain circumstances, such as a nonsymmetric distribution for the sample set, the trimmed mean will likely be biased and not represent a true measure of central tendency.

---

[27] John E. Freund and Richard Manning Smith, *Statistics: A First Course* (Englewood Cliffs, NJ: Prentice-Hall, 1986), p. 49.

Outliers

Data points included within the data set that appear to be significantly different from the other members.

A valuation analyst who suspects that there may be outliers in the data may opt to use the harmonic mean, the median, or the trimmed mean, as opposed to the arithmetic or geometric means. Several statistical tests (e.g., Grubb's test) have been developed to assist in the identification of outliers, but none have sufficient statistical power to definitively identify outliers.[28] It is therefore left to the subjective consideration of the valuation consultant to appropriately identify outliers within the data and develop forecasts that adjust for the outlier effects. It should only be after careful consideration that any data points are restricted from an analysis. Typically, in the valuation arena, historical data extends for only two to three years prior to the valuation. With such small sample sizes, identifying outliers will be difficult, and the consultant should seek to conserve as much information as possible.

The arithmetic mean, the trimmed mean, and the median are all considered unconditional measures of central tendency, that is, the future expected value is determined without consideration of any other outside variables or the historical path of the variable of concern. The expected value does not change in response to changes in other correlated outside variables (sometimes referred to as *state variables* or *exogenous variables*) or in the time trend of the variable of concern (also called the *endogenous* variable).

The analysis of trends, which involve random variables that evolve over time (also known as *time series analysis*), can be more complicated than the relatively simple calculation of the arithmetic, geometric, and harmonic means. Trends, which change over time, are subject to random shocks in any single measurement period, that is, any single *innovation* of the time series may have nonsystematic factors (unanticipated) that divert the data series from its otherwise stable long-term growth path. If these shocks are truly

Trimmed Mean

An arithmetic mean with certain extreme values eliminated from the data set prior to calculation.

[28] Frank E. Grubbs, "Procedures for Detecting Outlying Observations in Samples," *Technometrics* 11, no. 1 (February 1969): 1–21.

Factoid

The law of large numbers is a probability theorem that states that the variability in sample proportion decreases as the size of the sample increases.

Statistics: A New Approach, *by W. Allen Wallis and Harry V. Roberts (Glencoe, IL: The Free Press, 1956), p. 121.*

random, then by averaging several past values of the variable and applying the "*law of large numbers*," these random effects should cancel out, resulting in an average value that accurately reflects the most probable expected value for the variable under consideration.

8.1.1.2.3.3 Conditional Mean Predictive models that "*condition*" their expected value based on the time path of the endogenous variable and/or the level (or changes) in certain exogenous variables are called *condition mean models*. They rely on the relatively more complex statistical technique of time series regression analysis. This technique seeks to identify the mathematical equation that "*best fits*" the historical data. A time series regression model seeks the functional form that minimizes the deviations of the actual historical data from the value predicted by the equation. Many statistical software packages, including Microsoft Excel, have the capability of performing regression analysis. It is left to the valuation analyst to select the appropriate software package to use in performing the time series regression analysis. Caution should be taken, as inferences drawn from incorrectly specified, or otherwise erroneously conceived, time series regression models may lead the valuator to incorrect conclusions. It is recommended that a valuator have a clear understanding of time series regression techniques before including these methods in a valuation.

Conditional Mean

Predictive models that condition their expected value based on the time path of the endogenous variable and/or the level (or changes) in certain exogenous variables.

8.1.1.2.3.4 Coincident Indicators The first methodology for analyzing time series data is a "C*oincident Indicators"* model, which functionalizes a relationship between the particular innovations of a dependent variable with

Revenue

The product of price and quantity.

the measurements of a set of independent exogenous variables that occur simultaneously with the innovations of the dependent variable.[29] A model defined in this manner posits a correlation between the independent exogenous variables and the dependent variable of interest. Using standard regression techniques, coefficient estimates for each of the included exogenous variables can be estimated. The dependent variable can then be forecasted using projected values for the exogenous variables. For example, a model could be estimated with the level of operating expenses for a hospital enterprise expressed as a function of the level of revenue. To project operating expenses, in this example, the valuation analyst would input the projected revenue for the enterprise into the estimated function, and the resulting value would be an estimate of the expected level of operating expense for the enterprise *conditioned* on the projected level of revenue. Because considerations of these variables are coincident, there is a need for readily available expectations related to the independent exogenous variables (revenue from the example), which may impose a significant restriction on which variable can be used. Relying on revenue as the *independent* variable makes the fundamental accuracy of the forecasted operational cost dependent on the efficacy of the revenue forecast. In addition, the use of anticipated values for the explanatory variables introduces an increased uncertainty regarding the forecasts that is difficult, if not impossible, to measure.

8.1.1.2.3.5 Leading Indicators To address the shortcomings of using a *coincident indicator model*, the valuation analyst may consider using a *leading indicator model*. This model is similar to the coincident indicator model, except that the independent exogenous variables are *lagged* one or more time periods behind the most recent *innovation* of the *dependent variable*. The theoretical relationship advanced by this model is that the dependent variable varies in response to changes in the values of the set of included exogenous variables, that is, these independent exogenous variables *lead* the dependent variable. Once the regression coefficients for the model have been estimated,

[29] Both coincident and leading indicator models are seen predominantly in the business cycle economic literature, although they may be applied to any time series data that includes contemporaneous exogenous independent variables. See James H. Stock and Mark W. Watson, "New Indexes of Coincident and Leading Economic Indicators," *NBER Macroeconomics Annual 1989* (Boston: MIT Press, 1989), pp. 351–409.

the valuation analyst can project the value in the next period based on the currently measured levels of the independent exogenous variables. A model of this type conditions its projection based on the set of information available at the lagged one period time, as opposed to the coincident model, which conditions expectations on all information available up to the most recent time period. Restricting the information set to the lagged time period will necessarily limit the predictive power of these types of models. The estimated statistical relationships identified in these models will, often times, be less clear than with coincident models. The choice between coincident and leading indicator models should be based upon a consideration of the strength of the relationship in the leading indicator model in comparison to the availability and reliability of the forecasts for the independent exogenous variables.

8.1.1.2.3.6 Autoregressive Models A second class of time series models that can be utilized for forecasting purposes **consists of** *autoregressive models*.[30] *Auto regression* (AR) is a more sophisticated form of extrapolation that uses historical trends in a time series data set to project the expected path that the variable will follow in the future. The significant difference from the indicator models (coincident and leading) discussed earlier is that the explanatory variables used in the time series analysis include (and may be restricted to) the historical values of the dependent variable. The generalized form of the AR model is:

$$Y_t = \alpha + \beta_1 \times Y_{t-1} + \beta_2 \times Y_{t-2} + \cdots + \beta_i \times Y_{t-i}$$

where: t = the time period of the innovation
i = the number of periods lagged
β = the coefficient (or *weighting*) for the lagged innovation
α = the long run average value for the time series

AUTOREGRESSIVE MODEL

A sophisticated form of extrapolation that uses historical trends in a time series data set to project the expected path that the variable will follow in the future.

[30] For a more in-depth discussion of techniques used in performing time series analysis, please see Walter Enders, *Applied Econometrics Time Series* (Hoboken, NJ: John Wiley & Sons, 2004).

For example, it would be fair for a valuation analyst to assume that physician productivity follows a *mean reverting process*, that is, the productivity varies around a long-term average level of output. Based on this assumption and with a sufficient amount of data, the valuation analyst could *fit* an AR model that reflects this assumed *data generating process*. This *fitted* model could then be used to *extrapolate forward* the anticipated *dynamics* of physician productivity.

8.1.1.2.3.6.1 Simple Autoregression A simple autoregression model analyzes the relationship between a time series variable and the lagged values (possibly lagged multiple time periods) of itself (i.e., the same time series), including an error term that is assumed to be random.[31] It is based on the belief that the past behavior of a variable is indicative of the future expected value of that variable. This technique is similar to, but distinct from, the concept of the *Principle of Induction*, as described earlier by Rickert. A key assumption for autoregressive models is that the process generating the time series variable is constant through time. Were there to be a significant shift in an exogenous factor (often referred to as a *structural* or *regime change*), the future path of the variable may not follow from the historical fluctuations of the variable. Stated another way, as a result of a *structural shift*, the assumed random error term may no longer be truly random, that is, there may be some further information encoded in the error term that can be manipulated to produce more accurate forecasts. In this sense, autoregressive models are a momentum model; the variable will continue along is historical path (following its momentum, except for unpredictable random shocks), unless acted on by an outside force. It is important for the valuation analyst to consider the possible impact of structural changes on the forecasts generated by simple auto regressive models.

SIMPLE AUTOREGRESSION

An analysis of the relationship between a time series variable and the lagged values (possibly lagged multiple time periods) of the variable.

[31]The *error term* refers to the random unanticipated and nonsystematic shocks that drive the variability in the dependent variable, also referred to as "white noise," as borrowed from communications theory; it reflects the interference of the information contained in the "signal" caused by the error term.

8.1.1.2.3.6.2 Autoregression with Exogenous Variables One technique that can be used to avoid forecast errors due to exogenous factors is to include not only lags of the dependent variable in the forecast model, but also lagged (or possibly coincident) values of the exogenous factors believed to be significant in the determination of the path of the dependent variable. This provides the flexibility in the model to reflect the changing environment in which the dependent variable operates. This added flexibility comes at a cost, though, requiring additional time to determine which exogenous factors to include, and then the collection of the data related to those exogenous factors, as well as the greater computational power required to calculate the dependent variable's sensitivity to changes in the exogenous variables. The generalized AR with exogenous variables model is:

$$Y_t = \alpha + \beta_{y-1} \times Y_{t-1} + \beta_{y-2} \times Y_{t-2} + \cdots + \beta_{y-i} \times Y_{t-1} + \beta_{z-1} \times X_{t-1} + \beta_{z-2} \times X_{t-2} + \cdots + \beta_{x-I} \times Y_{t-i}$$

where: t = the time period of the innovation
i = the number of periods lagged
X = the time series of the exogenous variable(s)
β = the coefficient (or *weighting*) for the lagged innovation
α = the long run average value for the time series

Forecasting the growth rate in operating expenses for a healthcare enterprise by using the historical trend in operating expenses, along with the historical growth rate of the consumer price index (i.e., inflation), would be an example of a model using the AR with exogenous variables framework.

Forecasting is an import ingredient in the financial analysis of healthcare enterprises. The range of potential methodologies extends from simple averaging to complicated autoregressive models. The preceding sections represent only an introduction to the complex discipline of statistical forecasting. The valuation analyst is encouraged to explore, in detail, the intricacies of statistical forecasting before selecting any one method to project values. In addition, the valuation analyst should consider whether the possible improvement resulting from using a complex forecast method is outweighed by the cost of extended time required to estimate the more complicated forecast model and to interpret the model's results for the end user. This cost/benefit analysis may be key in determining the most appropriate forecasting technique to be used. For example, for a small physician practice or outpatient clinic, these techniques may not be necessary, but for a large healthcare system with multiple specialties and service lines, these more complex

techniques may be appropriate, in reference to both the cost/benefit analysis and a consideration of the nature of the engagement.

8.1.1.3 Revenue Forecasts The natural starting point for forecasting the net economic benefit that will accrue to the owners of an asset under an income approach is to project the expected revenue that will be generated by the asset in the future. Forecasting of revenue begins by understanding the underlying factors that make up the revenue stream of the asset, that is, revenue is the product of *price* and *quantity*. The forecasting of revenue should therefore proceed by projecting the (1) quantity of the product or service that will be sold in the future, and (2) the most probable price at which that product or service will transact. A reasonable revenue forecast can be obtained through a careful consideration of both of these constituent factors and through the application of the forecasting techniques described earlier.

The foundation of revenue generation lies with the constituent types of input (i.e., *capital*, *labor*, *technology,* and *natural resources*) that underlie the productive process. The expectation of future revenue should be tempered with an understanding of the enterprise's current stock of capital, labor, technology, and natural resources that can be used in the production of revenue. The combination of these economic inputs circumscribes the available *capacity* for the enterprise. A valuation analyst's projection should always be mindful of the limits that are placed on the output levels attainable by the subject enterprise owing to the available capacity of the enterprise. Should a valuation analyst wish to project revenue that outstrips current capacity, a further economic expense burden must also be forecast, to account for the investment in the necessary economic input to support that growth, that is, the extra labor, capital, technology, and/or natural resources required to support the extra capacity needed to generate the projected revenue. For example, patient throughput in an ambulatory surgery center is restricted by the availability of the operating room and the capacity of the preoperative and postoperative facilities. The projection of procedure volumes that exceed this capacity would not be feasible, without also simultaneously projecting an increase in the economic cost burdens (i.e., an increased use of *capital, labor, technology*, and/or *natural resources*).

The volatility underlying the structural changes in the healthcare industry (within the context of the *Four Pillars*, as described in Chapters 2 through 5) requires the analyst to also consider the fundamental factors affecting the subject entity's future operation, rather than solely relying on historical trends.

Regulatory, technological, reimbursement, and competitive changes in the healthcare industry indicate a likelihood that the *past trends* may be less influenced by the *Principle of Induction* (as noted previously by Rickert) and therefore less informative as to the future performance of the subject entity

than would be the case in a more stable industry. While these concerns may be mitigated by using the advanced statistical analysis techniques described in this chapter, such as an *auto regressive with exogenous variables model*, the availability of data for any given assignment may limit these options for the valuation analyst. The fundamental analysis of the underlying value drivers (i.e., the *four pillars*), in addition to applying the *Principle of Induction*, is therefore necessary in formulating sound economic and financial forecasts for the subject entity. An example of the application of the revenue forecasts method can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.3.1 Economic Trends Historically, the healthcare services market has exhibited a supply/demand profile contrary to that of the general economy; that is, healthcare has been characterized as having *supply-driven demand* with inelastic pricing attributes, in other words, demand is unaffected by changes in consumer income or healthcare pricing (see Section 4.3, "Supply and Demand in Healthcare," in Chapter 4, "Competition"). The healthcare market has been characterized as *supply driven* with *inelastic demand*, that is, demand is unaffected by changes in consumer income or healthcare *pricing*. The ability of the market to provide *controls on price and quality* is inhibited by factors that can be expressed in three general categories: (1) the nature of health, which creates an *unpredictable*, *urgent*, and "*infinite*" level of demand for healthcare services; (2) the ubiquitous involvement of insurance, private and governmental, as an intermediary in the purchase of healthcare interferes with consumer motivations and consequently their choice of providers and services; and (3) the difficulties in measuring healthcare quality and beneficial outcomes (both of quantifying and qualifying) and the lack of information on the relative costs of healthcare providers and services also inhibits consumer selection, further removing incentives to providers to improve quality and lower costs. A market with demand of this type creates the circumstance where only supply and the ability to pay limit the use of health services.[32]

In addition to these three general categories, there are numerous other factors that should be considered by the valuation analyst, including the following:

1. Patients don't purchase services directly from providers;
2. Patients don't compare prices between providers;
3. The government is the largest purchaser of healthcare;

[32] Robert James Cimasi, "But for the Purported Wrongful Act: The Analysis & Valuation of Healthcare Commercial Damages in a Changing Reimbursement & Regulatory Environment," National Association for Forensic Economics, Eastern Economic Association, Annual Conference 2003, New York, February 22, 2003, p. 49.

4. Private purchasers often lack market power;
5. Patients, purchasers, and providers lack information;
6. Many providers have monopoly or near monopoly power (yet antitrust laws prevent some potentially beneficial integration);
7. Providers are rewarded for increasing costs;
8. Capital investments are overly subsidized;
9. Certificate of need, regulation, and licensing laws are an entry barrier to competing and substitute providers and services; and
10. Exit barriers protect low-quality providers.[33]

However, as a result of more recent trends toward *consumer-driven healthcare* (see Chapter 4, "Competition") and *value-based reimbursement initiatives* (see Chapter 2, "Reimbursement Environment"), the demand for healthcare services has become increasingly elastic, for example, as a consequence of tightened family budgets and higher out-of-pocket expenses. As stated by Stanford University economics professor Alan Enthoven,

> *A seller faces inelastic demand if the seller can increase revenue by raising price, and elastic demand if the seller increases revenue by reducing price. For there to be an incentive for health plans to cut price, demand must be so elastic that the additional revenue gained exceeds the additional cost of serving more subscribers. Managed competition is about creating such price elasticity.*[34]

This trend toward greater elasticity results in reimbursement for healthcare services being reactive to the broader trends experienced throughout the economy.

> *The effects of economic shifts include changes in the demand for (or access to) health care, but also organizations' and practitioners' own financial status. Reports from markets across the United States are describing a sort of perfect storm: falling revenues due to decreased demand for less non-urgent or elective care, more patients unable to pay their medical bills, significant losses in investment income,*

---

[34] Alan C. Enthoven, "The History and Principles of Managed Competition," *Health Affairs* 12, Supp. no. 1 (1993): 32, citing Alan C. Enthoven, "Why 'Competition' in Health Care Has Failed: What Would It Take to Make It Work?" The 1992 Clemens Lecture, St. John's University, Collegeville, MN, September 17, 1992.

less charitable giving, and cuts in health care funding by states and localities.[35]

Accordingly, in considering the projection of future reimbursement for a healthcare enterprise, the valuation analyst should be increasingly aware of movements in the wider economy. The trends in supply and demand for healthcare services, described earlier, are increasingly related to the trends in the economy as a whole. A valuation analyst considering the projection of revenue should be aware of the movements in the wider economy. Supply and demand for the services provided by the subject enterprise may have an effect on its level of revenue. Increasing unemployment rates and decreasing national income amounts have been manifested into an adverse impact on both the demand and the consumer's ability to pay for healthcare services. Individuals who find themselves unexpectedly unemployed and whose health insurance coverage was tied to their employment will either decrease their demand for healthcare services or delay their payments for healthcare services, which, if part of a broader economic trend, could exhibit a significant impact on the healthcare industry as a whole.[36]

Economic trends may also have an impact on the supply of healthcare services. For example, the evaporation of liquidity within the capital markets, along with the reduction in charitable giving associated with the *Great Recession*, placed significant restraints on healthcare entities' ability to gain access to the capital necessary to maintain their current facilities and to acquire the technology necessary to maintain their competitive advantage within the marketplace. The impact of this restraint may lead to decreased revenue, which may require *down-sizing* to accommodate constrained budgets. This reduction in services (either through down-sizing or bankruptcy) may result in a limitation on the supply of healthcare services available in a given market service area.

In light of these considerations, the valuation analyst should establish a solid understanding of the economic environment in which the subject entity operates, as well as an understanding of the expected trends within the general economy. Several metrics are available, from private and public sources, to assist the valuation analyst in determining the economic environment, including:

1. The growth rate in Gross Domestic Product (GDP);
2. Consumer spending and inflation;

[35] Jill Bernstein, "Impact of the Economy on Health Care," Robert Woods Johnson Foundation, Issue Brief, August 2009, p. 4.

[36] Ibid., p. 3.

3. Business and manufacturing activity;
4. Industrial production and capacity utilization;
5. Trends in the financial markets;
6. Housing starts and building permits;
7. Unemployment; and
8. Interest rates.

These economic variables (and others) should be explicitly referenced and the relationship between them and the anticipated revenue carefully analyzed in the development of the valuation analyst's forecast of revenue. Macroeconomic trends may not be specifically quantifiable in the assessment of revenue trends. They do, however, provide a context through which the analyst can consider the microeconomic trends specific to the healthcare industry and the specific subject enterprise being considered. The analyst should attempt to justify any incongruence between the macroeconomic trends suggested earlier and the microeconomic trends being considered for the specific subject enterprise being up for consideration.

8.1.1.3.2 Medicare and Third-Party Payor Trends In addition to performing an economic trend analysis, the valuation analyst should also consider the third-party payors who will be responsible for making the projected payments that make up the forecasted revenue stream. Reimbursement yield trends for third-party payors will directly affect the revenue received by the healthcare entity. While currently increasing, the amount of healthcare cost in the United States that is paid for *out of pocket* by the individual receiving the service is still significantly less than that paid by third-party payors. Healthcare reimbursement is, to the greatest degree, a combination of payments from governmental agencies (e.g., Medicare and Medicaid) and commercial payors (e.g., private insurance companies). The key to forecasting the future expected level of revenue for a healthcare entity is to understand the contracting and payment methodologies employed and anticipated for the third-party payors. Methods and trends related to private and governmental reimbursement for healthcare services are discussed in depth in Chapter 2, "Reimbursement Environment."

8.1.1.3.3 Healthcare Industry Trends A robust understanding of the trends within the healthcare industry will be useful in determining the expected growth rate in revenues. These trends may be considered within the context of the concept of the *four pillars of healthcare enterprises,* as discussed in the Introduction, as well as *Reimbursement* (Chapter 2), *Regulatory* (Chapter 3), *Competition* (Chapter 4), and *Technology* (Chapter 5). These *four pillars* of the healthcare market serve as a conceptual construct through which to view

and by which to analyze the forces and stakeholders of the healthcare industry and to provide a framework for analyzing the viability, efficiency, and productivity of healthcare enterprises, assets, and services. The valuation analyst should be informed by the *four pillars* in developing their forecasts of revenue and revenue growth. These fundamental analyses of the underlying economic drivers underpinning development within the healthcare industry provide the theoretical foundation that supports the quantitative assessments, as described later, used in the analyst's projections.

8.1.1.3.4 Specialty Trends The next step in the analysis required in performing the revenue projections necessary to develop a valuation is to review and assess the trends within the specific industry sector, specialty, and sub specialty of the subject entity. The valuation analyst should be aware of the specialty trends for the subject enterprise and make projections that are informed by their expectations in reference to the *four pillars*.

8.1.1.3.5 Procedure Volume

8.1.1.3.5.1 Individual Units of Productivity There are several pertinent measures of productivity in the health care industry from which the valuation analyst can select when projecting the future quantity of goods and services to be provided, as one of the elemental bases of forecasting revenue, including:

1. The volume of procedures to be performed;
2. The amount of total *relative value units* (RVU) generated;
3. The total *work relative value units* (wRVU) produced by a provider or a group of providers;
4. *ASA units* for anesthesiology procedures; or
5. *Patient Bed Days* for skilled nursing facilities.

In addition, these procedural volume measures are further classified by reference to the type of procedure performed. These classifications will be specific to specific type of enterprise being valued and include the following:

1. *Current Procedural Terminology* (CPT) codes for physician services;
2. *Ambulatory Procedure Codes* (APC) for Ambulatory Surgery Centers; and
3. *Diagnosis Related Group* (DRG) for inpatient hospital procedures.

The particular measure selected will be determined by (1) the availability of the data, and (2) the type of entity or service being appraised (see Chapters 11, "Inpatient Enterprises," and 12, "The Valuation of Outpatient Enterprises," for measures of productivity applicable to the various types of healthcare enterprises).

The valuation analyst should be familiar with the source of (e.g., the *Federal Register* or CPT Schedule), the foundation of, and the application of each of the productivity measures, as well as their idiosyncrasies and historical evolution, in assessing the impact on the valuation process. In the years following the passage of the legislation creating both Medicare and Medicaid in the 1960s, procedure volume alone was used for reimbursement on the basis of the "*customary, prevailing, and reasonable*" rate. While this may have provided a viable measure of productivity/output, its inability to differentiate between complex procedures (i.e., those requiring greater quantities of economic input) and simple procedures (i.e., those requiring fewer types of economic input) led to the development of the *resource based relative value system* (as discussed in Chapter 2, "Reimbursement Environment") as the basis of the Medicare fee schedule implemented between 1992 and 1996. The aggregated RVU measure of output, in contrast, reflects not only the volume of the output produced, but also the intensity of the resource demands required to produce that output. Large government payors, such as Medicare and Medicaid, calculate reimbursement for physician services based on the RVU productivity of the enterprise. RVU measures of output have the further advantage of being comparable across specialties. The development of the RVU measures has been evolving over time and is a hotly contested ongoing process. This may make the *intertemporal* comparison of RVU productivity less informative than if it were a time invariant measure, but it is still a superior metric to the simple comparison procedure volumes. The superiority of this metric arises from the RVU output measure encoding additional information regarding the resources required across a mixture of complex and simple procedures, and ultimately the corresponding economic operating and capital expense burden that needs to be determined and then applied against revenue to arrive at the net economic benefit.

Depending on the particular circumstances of the valuation assignment, for example, the absence of RVU metric data, it may be more feasible to collect information related to a particular enterprise's output using several alternative productivity measures that may be available. It is important that the valuation analyst clearly understand the application of the specific measure selected to avoid errors during the projection process. It is of further importance that the valuation analyst endeavor to identify and classify the sources of output for the subject enterprise and match the revenue to a particular source of productivity, for example, diagnostic imaging, pharmacy services, or physical therapy services, which may be included in the enterprise's aggregate revenue but would require separate and distinct forecasting—as to volume, reimbursement yield, and the corresponding operating and capital expense levels.

8.1.1.3.5.2 Market Demand/Utilization Growth The next step in the revenue projection process is to determine the most probable level of output that can be expected for the subject enterprise. Increases in output may be attributable to either an increase in the size of the market service area in which the goods or services are transacted or an increase in the enterprise's market share, that is, increased output can be the result of the "*pie*" getting bigger for everyone or it can be the result of the individual firm's "*slice of pie*" getting larger relative to the other enterprises within the market service area.

Projected increases in output volume due to growth in market share (i.e., *a larger slice of the pie*) should be based on an analysis of the enterprise's ability to compete within the market service area. For healthcare entities, growth in market share is typically achieved through either more successful use of the excess capacity (e.g., operating rooms or patient bedrooms) of the enterprise or through the expansion (either organically or through mergers and acquisitions) of the equipment/facilities and/or physician workforce used in the provision of medical services. A healthcare enterprise may also realize increased output volume if it is able to take advantage of a reduction in the level or types of services offered by a competitor. If the valuation analyst determines that as of the agreed-on valuation date for the valuation, it was *known or knowable* that the subject enterprise had the resource (both financial and managerial) and that the utilization demand for its services is sustainable, then the valuation analyst should consider including an appropriate increase in the anticipated production for the subject enterprise to reflect the expected increase in market share. This projection should be supportable by market research and should not be speculative. For example, the estimation of procedure volume for newly hired physicians may be less certain because of the lack of historical productivity patterns, in which case, the valuation analyst should consider benchmarking to industry norms. There are several sources of information available to the valuation analyst

BENCHMARKING TO INDUSTRY NORMS

A benchmarking technique that compares data from the entity to survey data from other entities within the same industry sector and subsector.

"Benchmarking: A General Reading for Management Practitioners," by Sik Wah Fong, Eddie W. L. Cheng, and Danny C. K. Ho, Management Decision *36, no. 6 (1998): 410.*

in determining the most likely output for a new physician, including the industry-indicated average output for physicians within the same specialty, the historical productivity of the existing physicians within the practice, the ratio of physicians to population for the new physician's specialty in the market service area, as compared with the ratio of physicians to population for the new physician's specialty nationally, and the economic, demographic, and physician specialty trends within the market service area.

As was noted earlier, increases in output growth can also be the result of increases in the size of the market service area. Changes, or anticipated changes, in the market service area population are the most useful metrics in determining the most probable growth rate of patients within the market service area. The valuation analyst should review the population trends within the market service area, as well as any anticipated demographic trends, to determine the most probable growth in procedure volume attributable to the increase in the size of the market service area. In addition, the analyst should consider only the particular demographic segment that is served by the specific enterprise or asset being valued. For example, the growth rate in the over-65 population within the market service area would not provide useful information relative to the anticipated growth in the market service area for pediatric services. Instead, the analyst should be more concerned with the expected growth in population under the age of 17, that is, the likely population to be served by pediatricians.

Several external factors may also impact the valuation analyst's expectations for growth in the market service area for a particular healthcare enterprise. Technological advancements may render some enterprises obsolete (or may compete directly with more traditional services), reducing the anticipated growth rate in output volume for the enterprise, regardless of the changes in the population. Also, the incidence and prevalence of the disorders served by the subject entity will affect the expected output volume for an enterprise. Changes in the demographic mix within the market service area may impact the incidence and prevalence of certain diseases, indicating a change to the expected output volume for the subject enterprise beyond simply population growth. The valuation analyst should carefully consider all factors that may affect his or her output volume projections. Simply relying on statistical measures, without a nuanced understanding of the local environment, will lead to erroneous projections and an inaccurate assessment of value.

A further consideration for the valuation analyst is the difference between long-term and short-term projections. Recent fluctuations in economic and demographic variables may indicate a short-term disequilibrium that will return to the long-run trend over time, or they may indicate a structural shift in the relationship, foreshadowing a long-term change in the

historical pattern. The valuation analyst should investigate the recent trends in population dynamics for the market service area to ensure that the output volume forecasts are sustainable, both in the short term and in the long term. Income-based methods project the economic benefits of ownership of a healthcare enterprise into perpetuity; output volume growth expectations that conform to short-term trends may be less tenable when considered over longer time frames, and adjustments to the selected long-term output volume growth rate may be warranted.

To review the methodology described earlier, the projection of output volume for a healthcare enterprise begins with determining the appropriate output measure to be used, given the specific interest being appraised and the availability of data and information. Once the valuation analyst has selected the output measure to be used, the next step is to analyze the two sources of changes in output volume: (1) changes in the size of the market service area, and (2) changes in the subject entity's market share. Growth in output volume will result from the combination of these two factors. The valuation consultant should include the explicit assumptions related to both of these factors underlying his or her output volume growth projections. A thorough review of external factors that may lead to deviations between the expected population growth rates and output volume growth rates should also be conducted, as well as a consideration of the likelihood of the persistence of the recent trends in comparison with the longer-term trends.

8.1.1.3.6 Reimbursement Output volume growth is only half of the revenue growth story. Reimbursement for the goods and services provided also impacts the revenue projections. As was noted previously, revenue is the product of quantity sold (*output volume*) and price (*reimbursement*). An analysis of the trends in reimbursement is therefore necessary to appropriately project revenue. Reimbursement trends will be sensitive to the specific procedure being performed or service being provided. It is advisable for the valuation analyst to consider reimbursement based on the particular procedure type appropriate to the particular interest being appraised and the available information (e.g., CPT coded procedures in a physician practice setting or DRG coded procedures for an inpatient hospital setting), to account for variations in the trends for each procedure type. For example, the reimbursement trends for a multispecialty physician practice might be disaggregated to the individual specialty level, and reimbursement trends by specialty may be projected.

Each reimbursement projection should be based on the valuation analyst's review of (1) the historical trends in reimbursement for the subject entity, (2) the economic trends within the market service area for the subject

entity, (3) the Medicare and third-party payor trends, and (4) the trends specific to the medical specialties provided by the subject enterprise.

8.1.1.3.6.1 Historical Trends A natural starting place for analyzing a particular healthcare enterprise or service's reimbursement trends is its recent historical performance. In the previous section, the first step in projecting output volume growth was the determination of an appropriate measure of output. This selected metric should then be used as the basis for projecting reimbursement, that is, the historical revenue for the subject enterprise should be scaled to the level of historical output. For example, historical revenue for a freestanding diagnostic imaging center could be reviewed on a per-procedure (or whichever output measure was selected) basis. As was stated earlier, revenue is the product of price and quantity; therefore, revenue divided by quantity equals price. This methodology provides the valuation analyst with information related to the historical reimbursement that is actually realized by the subject enterprise, for each procedure type. The valuation analyst can observe the historical trend in reimbursement for the subject enterprise by reviewing data from several years. The valuation analyst should consider the historical changes (e.g., the *percentage of change*) in reimbursement for the subject entity over as long a period as is practicable, given the data available. A three- to five-year look-back is generally considered desirable but may not be feasible, depending on the specific subject enterprise being considered.

8.1.1.3.6.2 Industry and Specialty Trends As was noted earlier, the forecasting of revenue should be grounded in the economic trends within the industry and specialty of the subject entity. The agency of the federal government tasked with managing federal expenditures on healthcare is the Centers for Medicare and Medicaid Services (CMS). CMS, as well as the many stakeholders in the healthcare industry, expend significant effort in determining the appropriate reimbursement rate to be paid to providers of medical services. The complexity of the reimbursement structure used by CMS is discussed in detail in Chapter 2, "Reimbursement Environment." The trend historically has been that private insurers' reimbursement rate changes will tend to correlate with changes in CMS reimbursement rates. Oftentimes, managed care contracts between providers and insurance companies will specifically indicate that reimbursement for procedures will be based on a stipulated percentage above the Medicare reimbursement rate for the same procedure. Therefore, the growth rates in reimbursement for both Medicare and private insurers will be similar, and the analyst can reasonably project the changes in reimbursement for *all payors* by projecting the expected growth in Medicare reimbursement. This greatly simplifies the task of reimbursement projection, as government agencies such as

CMS are held to a higher standard of transparency than traditional third-party payors, and therefore routinely make updated cost and reimbursement data available publicly. By analyzing this data, the valuation analyst can, at least for the short run, project revenue growth. If possible, the analyst should attempt to obtain specific information regarding the details of the managed care contracts that are in effect for the subject enterprise, to assess the likelihood that non-Medicare reimbursement trends might diverge significantly from the anticipated Medicare trends and to assess the probable magnitude of that divergence. The analyst should also be careful to include only data and information that would have been available "*as of*" the agreed-on analysis's valuation date. Data and information that would not have been available "*as of*" the valuation date should be strictly ignored to arrive at an expectation of value specific to the selected valuation date.

The valuation analyst can rely on the percentage of change in Medicare reimbursement for the specific mix of procedures performed by the subject entity as the basis for his or her short-run expectation regarding the growth in reimbursement from all payors. Long-run projections should instead be based on an assessment of the long-term historical trend in Medicare reimbursement (to the extent that the subject enterprise's reimbursement tracks Medicare reimbursement) for the mix of procedures performed by the subject entity. Short-run fluctuations in reimbursement should not be projected into the long term. It is likely that reimbursement growth rates tend to exhibit mean reverting behavior in the long run, that is, short-run shifts gradually dissipate, returning to their long-run trend rate. A smoothed historical trend provides the best indication of the expected path of future reimbursement for the subject entity beyond the first postacquisition year. The valuation analyst should project growth in reimbursement for the first postacquisition year at the anticipated change in Medicare reimbursement for the year following the valuation date, and for the postacquisition years beyond the first year the analyst should project reimbursement growth to gradually approach the long-term historical trend.

To summarize, the revenue projections are the result of two factors: procedure volumes and reimbursement. Revenue projection should proceed by independently assessing the analyst's expectations regarding each of these factors. Both procedure volume and reimbursement forecasts should be based on a fundamental analysis of the economic drivers affecting the subject entity. This analysis should include national, state, and local economic and demographic trends, industry-specific trends, and specialty-specific trends. All projections should be grounded in these economic fundamentals to avoid overly optimistic/pessimistic projections and to provide a reality check on the strictly quantitative methods.

8.1.1.4 Forecasting the Economic Cost Burden As stated above, the foundation of revenue generation lies with the economic input that underlies the productive process. While forecasting the changes in revenue, as described earlier, it is equally important to project the expenses related to the economic input necessary to generate the revenue, including both the (1) economic operating expenses and (2) economic capital costs. An example of the application of the economic operating cost burden method can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.4.1 Economic Operating Cost Burden There are two general types of operating expenses: (1) fixed expenses and (2) variable expenses. Fixed expenses are those expenses that do not vary with the productivity of the subject enterprise. These expenses are a fixed amount, regardless of the level of revenue the subject enterprise has produced. Variable expenses, conversely, are those expenses that will vary with the output of the subject enterprise. For example, a nuclear imaging procedure requires the use of a radioisotope. Therefore, the use of the radioisotope (or the expense related to the use of the isotope) is directly correlated with the number of nuclear imaging procedures performed (the revenue generated by the procedure), in other words, an increase in the volume of procedures performed will lead to an increase in the expected expense. A third type of expense would be a hybrid expense; these expenses have elements of both a fixed expense and a variable expense. An example might be rent expense, which would be fixed for a given level of output but may need to be increased to facilitate a greater level of output. The term of the projection period should be considered in determining whether an expense is a fixed expense or a variable expense. Over a long enough projection period, all expenses will become variable expenses.

8.1.1.4.1.1 Historical Expenses Often, the most accurate predictor of future performance is the performance in the immediate past. It is in the immediate past that the projection of the economic operating expense burden begins. Each expense of the subject enterprise needs to be properly identified and quantified (and possibly normalized) before being classified as either fixed or variable.

8.1.1.4.1.2 Fixed Expenses There can be many types of fixed expenses, but the most common are expenses that are contractually agreed on, such as a real estate or equipment lease agreement. Expenses such as these may be projected forward by simply assuming that the contract will be enforced and that the subject enterprise will pay the specific expense as outlined in the contract. The term of the contract must be a consideration, in that if the contract related to the fixed expense terminates prior to the end of the projection period, then the fixed expense will need to be projected separately for (1) the term of the contract, and (2) the projection period beyond the

term of the contract. This second period of the expense projection may be a simple continuation of the contract projection, or it may remain a fixed expense but incorporate an escalator such as expected inflation. It may also need to be normalized (i.e., the contracted expense was not needed or was above/below market value, etc.) and may even need to be reclassified as a variable expense during the latter period.

8.1.1.4.1.3 Variable Expenses Variable expenses are those expenses that are incurred during the productive process and can include such expenses as cost of goods sold and supplies. The greater the production (i.e., output) that the subject enterprise generates, the greater variable expenses that are incurred. There are two general methods of projecting these variable expenses forward:

1. Indexed directly to the growth in revenue; and
2. Indexed directly to the growth in procedure volume, with an additional inflation escalator included.

When indexed directly to revenue, it is implied that the inflation rate for the variable expense is exactly equal to the growth in reimbursement for the revenue of the subject enterprise. As was noted earlier, growth in reimbursement consists of (1) growth in procedure volume, and (2) growth in reimbursement yield. Since variable expenses, by definition, grow at the same growth rate as procedure volume, the difference between the revenue growth rate and the procedure volume growth rate must be the growth rate in reimbursement yield; therefore, using the revenue growth rate as the growth rate for variable expenses implicitly includes expected changes in reimbursement yield as the inflation factor for the expenses. It has the further impact of forcing the variable expense to remain at a constant percentage of revenue, which may or may not be desirable. In contrast, changes in variable expenses can be grown at the same rate as procedure volume and subsequently increases by a generalized inflation rate, to reflect the expected nominal price changes in the given expense. This method may be used to reflect the expectation that growth in reimbursement yield may not accurately reflect the expected growth in expenses. Depending on the projected growth rate in revenue, as compared with the expected growth rate in the expense, this technique may lead to a deterioration or an improvement in the projected margin for the subject enterprise.

8.1.1.4.1.4 Hybrid Expenses There are also expenses that exhibit characteristics of both fixed expenses and variable expenses. Expense related to employment is one example. There is not a one-to-one relationship between growth in revenue and growth in staff expenses. Employees can become more productive but earn the same salary. Similarly, their productivity may

remain the same, but they receive a cost of living increase to their salary. This would imply a fixed expense profile to staff expenses. However, growth in procedure volume may, in time, exceed the capacity of the current staff. At this point, additional staff will have to be added as the revenue grows. Similarly, some employees may be 1099 contractors who are paid on a per unit basis. This would imply a variable expense to staff expenses. A determination must be made as to the relative weighting of fixed versus variable for many expenses. Once made, the expenses may be projected forward using the combination of the growth profiles of fixed expenses and variable expenses based on these weightings.

8.1.1.4.2 Industry Benchmarks As has been noted previously, all analyst projections should be grounded in a basis of reality. The valuation analyst should compare the expense projections for the subject property to established industry benchmarks to ensure that the projections are conceivable for the subject property. For example, a valuation analyst should carefully consider projections that include operating margins that are significantly greater than those realized by suitable comparison companies and reported in industry expense surveys. While expectations of relatively large margins can be justified over the short run, the projection into perpetuity (as required by the *Discounted Net Cash Flow Methodology*) may be unreasonable. A valuation analyst should be skeptical of long-term divergences from industry norms. Benchmarking is discussed at more length in Section 8.3, "Risk Assessment."

8.1.1.4.3 Economic Capital Cost Projections In addition to the operating expenses necessary for the generation of the projected revenue, the valuation analyst must also project the *capital expense burden* that will be required to support the projected revenue stream of the subject enterprise. Capital includes the economic input used in the generation of the subject enterprise's revenue, but which is not consumed in the productive process. Examples include tangible personal property, equipment, and real property *owned* by the subject enterprise. The capital expense burden for *leased* property and equipment would be reflected in the lease expense related to these types of input and would be projected as part of the operational expenses.

8.1.1.4.3.1 Capital Expenditures All healthcare enterprises require some investment in physical capital to maintain their operation. This *investment* in physical capital represents the *economic capital expense burden* for the entity and is commonly referred to as *capital expenditures*. Capital expenditures represent cash outflow from the operations of the subject property and would otherwise be available to the owners of the subject property,

that is, before paying out profits to the owners, the entity may invest in new physical capital. As such, it represents a decrement, albeit necessary, to the economic benefit accruing to the owners of the subject property and must therefore be accounted for in the calculation of an indicated value, which, as noted in Chapter 7, "Basic Valuation Tenets," is based on the anticipated future benefits accruing to the owners of the subject enterprise. An example of the application of the economic capital cost projections can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.4.3.2 Sustainable Growth: Capital Expenditures and Depreciation[37] Depreciation, as it is commonly understood, is an accounting convention. Accounting depreciation of physical capital provides a tax shield benefit to the owners of the subject property, that is, taxable income is reduced according to the amount of accounting depreciation realized by the enterprise. Underlying this accounting convention is an important economic principle related to the physical depreciation of capital.

Physical capital, such as equipment and machinery, is consumed slowly during the productive process. Over time, physical capital will wear down and require maintenance or become obsolete and require replacement. The economic concept of depreciation includes that portion of an entity's physical capital that is consumed during a given period in the production of output (and thereby revenue). A portion of the capital expenditures of an enterprise therefore is the replacement and maintenance of the existing stock of physical capital. In the absence of efficiency gains from technological advancement, the subject entity will require an equivalent level of physical capital to produce revenue in the future as was used in the past. Therefore, the rate of economic depreciation of the physical capital will set a floor on the capital expenditures of the subject entity. The subject entity will need to, at the very least, replace that portion of the physical capital that has economically depreciated during a given period. This minimum level of capital expenditures can be called the *steady state* rate of capital expenditures (or investment), as it is the amount of investment necessary to maintain the *current* level of physical capital necessary to support the *current* level of revenue. No level of capital expenditures below the *steady state* rate can be sustained without a corresponding decline in revenue (or increase in the technical efficiency of the capital employed). If the valuation analyst is projecting revenue growth in the future, a rate in excess of the *steady state* rate

[37]The analysis in this section is adapted from macroeconomic growth theory, as expressed in Robert Solow's endogenous growth theory. See Robert M. Solow, "A Contribution to the Theory of Economic Growth," *The Quarterly Journal of Economics* 70, no. 1 (February 1956): 65–94.

would be necessary to *build up* the stock of physical capital to the level necessary to support those new, higher revenues.

The projection of capital expenditures in a valuation is often correlated with the growth in revenue without consideration of the effect on the stock of physical capital. The valuation analyst should compare the rate of economic depreciation (which may be approximated by accounting depreciation) to the rate of capital expenditures. If the rate of depreciation outpaces the rate of capital expenditures, then the stock of physical capital will be declining throughout the projection period. This can only be the case if (1) there exist increases in efficiency from technological advancement, or (2) the valuation analyst projects decreases in revenue. The random arrival of technological advancement defies prediction, and any claims to the nature and magnitude of efficiency gains from an unproven technology should be viewed skeptically by the valuation analyst. Otherwise, a decreasing stock of physical capital is only possible for an enterprising contracting in the type and/or amount of services provided (and therefore revenue).

If the valuation analyst (as often occurs) projects *real* growth in revenue, as opposed to *nominal* growth attributable to *inflationary factors*, then the projected rate of capital expenditures must exceed the anticipated rate of economic depreciation to provide the excess stock of physical capital to support the new revenue. The valuation analyst should be aware of the balancing act that is necessary to project a logically consistent rate of capital expenditures, in light of the anticipated economic depreciation of the subject enterprise's physical capital.

8.1.1.5 Pro-Forma Income Statements After the valuation analyst has completed the forecasting of the economic benefits and economic costs anticipated for the given enterprise, the next step in the valuation process is to apply these projections in the production of a pro-forma income statement for the enterprise, including distinct projections of revenue and operating expenses for each discrete period within the projection period, as well as a final projection for the terminal period. The revenue and operating expense projections calculated, as shown earlier, will be displayed along with the calculated *net income* (i.e., the difference between the revenue projection and the projected expenses) from which the subject enterprise's anticipated *cash flow* will be calculated.

8.1.1.5.1 Tax Affecting Income When valuing a pass-through entity, such as a partnership or an S-corporation, using an income approach–based method, valuation experts have asserted and recent academic research has supported that any variance in the tax benefit between C-corporations and

pass-through entities is reduced or eliminated.[38] Accordingly, under these circumstances, the income stream of the subject entity *should* be tax-affected using the corporate federal and state tax rates.

As set forth by tax court judge David Laro, within the text of *Business Valuation and Federal Taxes*:

a. *Some empirical studies of C and S corporation transactions in the marketplace* do not support the notion that S corporations are worth more than C corporations*; in fact, they point to the opposite conclusion. However, given the complexity of the corporate transaction structuring, not everyone agrees that this evidence is conclusive. [Emphasis added]*
b. *A 100 percent ownership interest in an S corporation* does not necessarily come with a bundle of rights and obligations attached to it any more than does a 100 percent ownership interest in a C corporation. *This is distinctly different than a minority interest in an S corporation or a C corporation. [Emphasis added]*
c. The controlling shareholder can mimic the favorable tax characteristics of an S corporation *(i.e., avoid the double-taxation disadvantage of C corporation dividends by paying additional salary). [Emphasis added]*
d. Buyers will not pay for an election that they can make themselves for free*, unless it has some value to them. Grabowski points out that in some instances, buyers will pay a premium for the possible benefits that come with an old-and-cold S corporation.*[39]

[38]The findings of the Mattson, Shannon, and Upton study indicate that the size of the transaction makes a difference in the deal structure, and, at the very least, it indicates that the enjoyment of the benefits of a §338(h)(10) election is not universal. Michael Mattson, Donald Shannon, and David Upton, "Empirical Research Concludes S Corporation Values the Same as C Corporations," *Business Valuation Library*, BVUpdate (November/December 2002). A study conducted by Vinso concluded that it becomes apparent that the appraiser should consider that C-corporation transactional data may produce the same or different results than S-corporation transaction data, but for wholly different reasons than the avoidance of the dividend tax. Joseph D. Vinso, "Distributions and Entity Form: Do They Make Any Difference in Value?" *Valuation Strategies* 7, no. 1 (2003): 12. A study by Phillips found that stock sales of S-corporations and C-corporations were priced similarly, and asset sales of S-corporations and C-corporations were priced similarly. John R. Phillips, "S-Corp or C-Corp? M&A Deal Prices Look Alike," *Business Valuation Library Update*, BVUpdate (March 2004).

[39]David Laro and Shannon P. Pratt, *Business Valuations and Federal Taxes*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2011), pp. 109–110.

An old-and-cold S corporation is not subject to the built-in gains tax, as would be a C corporation for which a new S corporation election is made. If there is any chance that a sale of the business could occur during the next ten years, that difference is important. Further, no buyer of less-than-absolute controlling interest in a C corporation can make an S corporation election unilaterally; any such election requires unanimous election of all shareholders. If an investor buys controlling interest (albeit not 100 percent) of a C corporation, that investor cannot force an S corporation election upon the other shareholders. [Emphasis added]

e. S corporations logically make distributions of funds necessary to support taxes on corporate earnings. This is no different from a C corporation*; in either case, the money is gone and no longer available for corporate investment and growth. [Emphasis added]*
f. *If valuing a controlling interest, the experts generally agree that there may be* no difference in value between S corporations and C corporations. *Logically, the experts' consensus is* that C corporation valuation methods may be used for valuing controlling ownership interests in S corporations.[40] *[Emphasis added]*

However, in recent tax court opinions, the court has ruled that S corporation earnings should *not* be tax affected under certain facts and circumstances. The majority of these cases involved transactions of minority interests.[41] However, in one case, *Estate of William G. Adams, Jr. v. Commissioner*, the valuation was of a 61.59 percent *controlling interest*. Tax court judge David Laro, within the text of "*Business Valuation and Federal Taxes,*" summarizes the case as follows:

In Adams, involving a 61.59 percent controlling interest, the court followed the analysis in Gross, and emphasized the importance of matching the tax characteristics of the net cash flow and capitalization rates, either "before corporate tax or after corporate tax.[42] *[Emphasis added]*

[42] David Laro and Shannon P. Pratt, *Business Valuations and Federal Taxes*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2011), p. 103. Laro and Pratt cite *Estate of William G. Adams, Jr. v. Commissioner*, T.C. Memo. 2002-80 at 86.

> *It should be noted that the pool of likely willing buyers for the controlling interest in the S corporation would most likely have been individuals who would be able to continue the S corporation election.* If the pool of likely willing buyers had been large corporations who could not continue the S corporation election and would not pay for its benefits, that fact should have been developed in the case.[43] *[Emphasis added]*

Under the standard of *Fair Market Value*, the valuation analyst must consider the most probable universe of hypothetical purchasers for the subject property. If this pool of likely investors is significantly composed of taxable entities or, in the alternative, exempt entities that, in lieu of taxes, have a regulatory mandate to provide charitable services, then it would be reasonable for the valuation analyst to conclude that the earnings forecasted for the subject property would be subject to federal and state income taxes. In the event that the valuation analyst concludes that the subject entity's income should be tax affected, the analyst should ensure that the given tax rate for the particular geographic location within which the asset is located is used. In addition, the analyst should include any tax shield benefits (such as the deduction of depreciation expense) available to the subject property. An example of the application of pro-forma income statements can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.6 Projected Cash Flow After taxes affecting the income of the subject property, the valuation analyst should construct a projected statement of cash flow showing the projected net income (after taxes, if necessary) of the subject entity, as calculated earlier in this chapter, for each of the distinct projection periods, as well as the terminal period. This projected statement of cash flow will represent the expected net economic benefit available to the owners of the subject property in each period. The net income (after taxes, if applicable) will be adjusted to reflect the cash flow impact of (1) working capital requirements, (2) capital expenditures, (3) depreciation, and (4) changes in interest-bearing debt. An example of the application of the projected cash flow can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.6.1 Working Capital Requirements The valuation analyst must consider the working capital requirements for the subject enterprise. Any increases in working capital will be funded out of the entity's cash flow, and, therefore, to calculate the net cash flow available to the owners of the subject property, the valuation analyst must deduct from the subject

[43] David Laro and Shannon P. Pratt, *Business Valuations and Federal Taxes*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2011), p. 103.

property's net income (after taxes, if applicable) any anticipated increases in working capital requirements for the subject enterprise. Alternatively, any decreases in working capital requirements will generate cash that will be available to the owners of the subject property, as profits, and should be added to the net income (after taxes, if applicable) of the subject property.

Note that in some instances, the scope of the valuation engagement may call for the *exclusion of certain working capital items*, for example, *cash* and/or *accounts receivable*. In this event, the valuation analyst could either remove its consideration from the calculation of historical working capital of the operations of the subject enterprise, which is used as a base in determining the increase/decrease in working capital investment for cash flow projections when performing a valuation analysis using an *Income Approach*–based valuation method, or the valuation analyst could subtract the economic value of the specified working capital items from the calculated value of the subject enterprise in its entirety, which would have been calculated based on the historical working capital without any exclusions. It should be noted that reducing the historical working capital creates an increase in the amount of working capital investment needed to fund operations of the subject enterprise in the future—resulting in a decrease in cash flow in the period that the increased working capital investment is made.

8.1.1.6.2 Capital Expenditures As discussed earlier, the analyst must project the anticipated capital expenditures necessary to support the projected revenue. These capital expenditures are financed from the existing cash flow of the subject property and would accrue to the owners of the enterprise had they not been expended in the maintenance of the existing capital and the investment in new physical capital. As such, these expected expenditures must be deducted from the net income (after taxes, if applicable) of the subject property to calculate the net economic benefit that is expected to accrue to the owners of the subject property.

8.1.1.6.3 Depreciation As was also noted earlier, based on the level of physical capital anticipated for the subject property, there is a corresponding level of depreciation (i.e., consumption of that physical capital in the production of revenue). This consumption reflects the capital cost burden to produce the revenue. Due to the fact that the capital expenditures already include the expense to maintain and replace the existing physical capital, the inclusion of the depreciation expense (which was deducted from income previously for tax purposes) would amount to double-counting the capital expense. Therefore, any depreciation amounts should be added back to the net income (after taxes, if applicable) of the subject entity in determining the anticipated net economic benefit accruing to the owners of the subject property in each period. An example of the application of economic capital cost projections can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.6.4 Changes in Interest-Bearing Debt For valuations with the aim of deriving the value of the total invested capital of the enterprise, changes (i.e., the addition of new debt and the deduction of repayment of debt principal) should not be considered. The cash flow capitalized to arrive at the value of total invested capital represents the cash flow accruing to all owners (debt and equity) of the enterprise and is therefore not affected by the particular mix of debt and equity within the firm. Alternatively, should the valuation analyst be seeking an indication of the equity value of the enterprise, a consideration of the changes in the level of debt held by the company is warranted. Repayments of principal on the outstanding debt of the enterprise should be deducted from the cash flow of the firm. In addition, the net income should be increased by the amount of any new debt issued during the period.

The schedule of projected cash flow, which will be discounted in calculating the final indication of value, should reflect the level of value the analyst is seeking with regard to the valuation assignment. Should the valuation analyst be seeking an indication of the value of the total invested capital in the subject enterprise (composed of both equity and debt holders), then the cash flow used should include those amounts that will accrue to the holders of both equity and debt (referred to as the "*debt free*" technique). This technique determines the cash flow that would accrue to the owners in the absence of debt, although the calculated weighted average cost of capital will reflect the tax benefits inherent in the utilization of debt. Therefore, the net economic benefit flowing to the owners of the subject asset should include interest expense, which is typically removed from operating income before the application of taxes. Also, because this method attempts to arrive at the cash flow available to *all* owners of the subject enterprise, the cash flow impacts of changes to the level of interest-bearing debt are excluded, because these changes represent only a reformulation of the relative use of debt and equity in the subject enterprise's capital structure and not a change in cash flow. The calculation of the net cash flow to total invested capital is summarized as follows:

Revenue	
Operating Expenses	(–)
Capital Expenditures	(–)
Depreciation	(+)
Changes in Working Capital	(+/–)
Cash Flow (Total Invested Capital)	

If, conversely, the analyst is seeking an indication of value to the equity holders of the subject enterprise, the analyst should adjust the cash flow to

reflect only those that would be available to the subject enterprise's equity holders. The cash flow to equity is calculated similarly to the cash flow to total invested capital, with the exception that the impact of the inclusion of debt in the capital structure, for example, *interest expense*, is included. Interest expense, which was excluded from the expenses in the free cash flow to total invested capital method, is included in the expenses to equity holders. The payments made to debt holders would not be available for distribution to the equity holders. Also, changes to the level of interest-bearing debt are included in the cash flow that could be available for distribution to equity holders or available for the subject enterprise to invest that cash flow in new equipment, in other words, a capital investment. Alternatively, the subject enterprise could finance the equipment purchases with debt capital, thereby increasing the amount of cash flow available for distribution to the equity holders. As the cash flow to equity is calculated by subtracting capital expenditures from operating income, if those capital expenditures were financed by debt, they would not be reflected in the cash flow calculation. Accordingly, the available cash flow to the equity holders should be adjusted to reflect the amount of increase in the level of interest-bearing debt infused into the capital structure. If, conversely, the subject enterprise were to decrease the level of interest-bearing debt in the capital structure, then the amount of the reduction in principle should be subtracted from the cash flow available for distribution to the equity holders of the subject enterprise. The following equation summarizes the calculation of the cash flow available to the equity holders of the subject enterprise:

Revenue	
Operating Expenses	(–)
Capital Expenditures	(–)
Depreciation	(+)
Interest Expense	(–)
Changes in Level of Interest Bearing Debt	(+/–)
Changes in Level of Working Capital	(+/–)
Cash Flow (Equity)	

8.1.1.7 The Discounted Net Cash Flow Method After the analyst has calculated the selected level of cash flow, projected for the discrete periods of the projection period, the analyst then discounts these types of cash flow to arrive at the present value equivalent of the anticipated cash flow as of the valuation date. See Chapter 9, "Costs and Sources of Capital," for a discussion of the calculation of the appropriate rate of discount for the cash flow of the subject property.

An example application of the discounted net cash flow method can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.7.1 The Discrete Projection Period Typically, a valuation analyst will discount future cash flow using the *mid-period discounting convention*. This mid-period discounting convention is applied by assuming that the anticipated cash flow will be received by the owners of the subject property evenly throughout each distinct period. The mid-period convention is applied by assuming that the cash flow arrives at the midpoint of the projection period. For example, a cash flow projected for the next year will be discounted as if the entirety of the cash flow were received in the middle of the year, that is, year 1's cash flow is discounted at 0.5 years, year 2's cash flow at 1.5 years, and so forth.

One exception to the use of the mid-period convention is the case of an enterprise with highly seasonal revenues, that is, revenue generation is concentrated in a specific period. In this case, where the cash flow is not assumed to be evenly disbursed over the course of the year, the cash flow should be discounted relative to its chronological proximity to the valuation date, which may represent any portion of the calendar year. For example, if the valuation date is January 1, and the most significant portion of the anticipated cash flow is anticipated to be received in September, the valuation analyst would discount the first year's cash flow at .75 years (equal to 9 months divided by 12 months in a year), the year 2 cash flow would be discounted at 1.75, and so forth, for each of the discrete projection periods. This selection of discounting periods more accurately reflects the timing, and therefore the value, of the expected cash flow and may have significant and material impact on the indication of value, depending on the magnitude of the cash flow being discounted.

The aggregate value of the discounted (using the mid-period convention, if appropriate) anticipated cash flow from each of the discrete future periods being projected represents the value on the valuation date of the future cash flow that is available for distribution to the owners of the subject property.

8.1.1.7.2 Terminal Period Calculation Assuming that the utility of the property is anticipated to extend beyond the final discrete period of the projection, the net free cash flow available to the owners during a "*terminal*" or "*residual*" period should be developed, representing the *benefits of ownership* that would accrue to the owners of the enterprise being valued beyond the final period of the discrete periods of the projection.

It is important for the valuator to consider various aspects of the enterprise being valued relating to what a *prospective purchaser* (in a hypothetical transaction required by the standard of *fair market value*) would be *willing to pay*, as "*incremental benefit*," for the economic benefit produced by the established, ongoing enterprise during any period subsequent to the

period necessary to create the *hypothetical startup* alternative. The benefit stream produced should be considered in concluding that the continuity of the enterprise as related to the terminal/residual value estimate is reasonable. In addition, such considerations may include (1) the expected sustainability of the revenue stream; (2) the expected increase in utilization demand, as well as market scope; and (3) the competitive environment.

The analyst should determine the appropriate cash flow that is anticipated to continue forward into perpetuity and that will be capitalized to arrive at the value of the most probable residual cash flow for the enterprise. The projection of the terminal period cash flow into perpetuity requires the valuation analyst to make certain adjustments to the final projected cash flow for the discrete projection period. Under the concept of the "*Gordon Growth Model*," the *net cash flow* from the final period of the projection is *"grown"* by a selected long-term growth rate.[44] This terminal cash flow is then *capitalized*, and the resulting indicated value is then *discounted back* to *present value* (using the appropriate risk-adjusted discount rate) at the valuation date to account for the value of all "*residual*" cash flow from the end of the discrete projection period and into perpetuity.

The sum of the various types of *Discounted Net Cash Flow* from the discrete projection period is then summed with the *discounted capitalized value of the terminal/residual period*, to calculate an estimate of the *value* of the enterprise, before application on any discounts and premiums, as discussed later.

Typically, the valuation analyst will make the assumption that capital expenditures will be equal to depreciation (i.e., the *steady state rate*) during the terminal period. If capital expenditure were projected to exceed depreciation throughout the terminal period into perpetuity, the subject property would have unbounded growth and would eventually consume the entire economy. Alternatively, if depreciation were in excess of capital expenditures, the entirety of the enterprise's physical capital would, over time, be consumed, and the enterprise would lack the necessary capital to support the projected cash flow. By equating the level of depreciation and capital expenditures, the size of the enterprise will, throughout the terminal period, remain at a constant level (*steady state*) equal to its size at the end of the projection period.

In addition, it is further assumed that the level of *interest-bearing debt* for the firm will remain constant throughout the projection period, that

[44] Robert Reilly and Robert Schweihs, *The Handbook of Advanced Business Valuation* (New York: McGraw-Hill, 2000), p. 480; the Gordon Growth Model is similar to the single period capitalization method described later.

is, *new debt* is added at a rate that just offsets the amount of *debt repaid* during the period. Therefore, the terminal period cash flow is equal to the net income (after taxes, if applicable) of the subject entity plus/minus the anticipated changes in working capital, as shown in the following equation:

Revenue	
Operating Expenses	(–)
Changes in Working Capital	(+/–)
Cash Flow (CF_n, adjusted)	

The valuation analyst will then subtract the long-term anticipated growth rate for the enterprise from the discount rate selected for the subject property.[45] The result is the *capitalization rate* that will be applied to the *terminal period cash flow* to arrive at the value of all future cash flow for the subject property, as of the *end of the projection period*. This amount must then be further discounted, using the mid-period discounting convention, back to the valuation date to arrive at its present value equivalent as of that date, that is, if the end of the discrete projection period is five years after the valuation date, the calculated terminal period cash flow must be discounted 4.5 years to arrive at the value as of the valuation date. The formula for calculating the terminal period cash flow is described next:

$$\text{TPCF} = \frac{CF_n(1+g)(1+R)^{0.5}}{(R-g)}$$

where: CF_n = the adjusted cash flow in the last discrete projection period
g = the long-term anticipated growth rate for the subject enterprise
R = the risk-adjusted discount rate
n = the number of discrete projection periods
TPCF = Terminal Period Cash Flow (as of the end of the discrete projection period)

An example of the application of a terminal period calculation can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.1.7.3 Final Indication of Value The valuation analyst's final indication of value (before application of the necessary discounts and premiums, as discussed in Section 8.4, "Discounts and Premiums") will equal the sum of the present value equivalent cash flow from each of the discrete periods of

[45] See Exhibit 7.2 in Chapter 7, "Basic Valuation Tenets," for the algebraic derivation of the capitalization formula.

the projection period added to the present value equivalent of the *terminal period cash flow* (before the application of the necessary discounts and premiums), as shown in the following equation:

$$\text{Final Indication of Value} = \frac{CF_1}{(1+R)^{0.5}} + \frac{CF_2}{(1+R)^{1.5}} + \cdots + \frac{CF_n}{(1+R)^{n-0.5}} + \frac{\text{TPCF}}{(1+R)^{n-0.5}}$$

where: CF_n = the expected cash flow in period n
R = the risk adjusted discount rate
TPCF = the calculated terminal period cash flow
n = the number of discrete projection periods

8.1.1.8 Single Period Capitalization Method The *Single Period Capitalization Method* estimates the value of the future expected economic benefit accruing to the owners of the property based on the economic benefit received from a single, *normalized* period. This method is most readily applied to property where long-term stability in the economic benefit flowing to the owners of the enterprise/asset is anticipated. If it can be assumed that the enterprise will generate the same economic benefit (or an economic benefit with a known stable growth rate) in perpetuity, then the property can be appraised by the application of a single calculation method, using (1) a normalized net economic benefit amount as a proxy for the future anticipated benefit stream into perpetuity, and (2) the risk-adjusted required rate of return, which may be expressed as a single risk-adjusted capitalization rate (see Exhibit 8.2).

The measure of economic benefit to be capitalized in this methodology is typically a cash flow measure, representing the available cash produced by the entity in excess of the operating and capital expenses. In effect, the *Single Period Capitalization Method* is a "shorthand" technique (as shown by the algebraic derivation of the Single Period Income Capitalization Method in Exhibit 8.2), which applies the discounting process to the stream of future economic benefits of ownership of the defined property interest being appraised in a condensed, single calculation, in contrast to the multi-period, multi-calculation process of the Discounted Cash Flow (DCF) method, discussed earlier.

Note that the particular cash flow to be capitalized will be dependent on the value indication the analyst is seeking. Since the single period cash flow method is a restricted form of the *discounted net cash flow method*, the cash flow should be calculated in the same manner as the cash flow for the terminal period of the *discounted net cash flow method*. (See Section 8.1.1.2, "Discounted Net Cash Flow Method," for further discussion on the calculation of cash flow to be discounted.)

EXHIBIT 8.2 Single Period Income Capitalization Method

SINGLE PERIOD INCOME CAPITALIZATION METHOD OF VALUATION
– ALGEBRAIC DERIVATION –

The basic "*Discounting Formula*" states that V_0 is the *Present Value* of the sum of all the earnings (E_n) that can be reasonably expected to be generated in the future, until period n, where n approaches infinity (∞), discounted at the rate of k.

$$V_0 = \sum_{n=1}^{\infty} \frac{E_n}{(1+k)^n} = \sum_{n=1}^{\infty} \frac{E_0(1+g)^n}{(1+k)^n}$$

where: V_0 = Present Value
E_n = Earnings for year n
k = Discount Rate
g = Growth Rate
n = Period n

The "*long-form*" of this expression is (see the following assumptions):

$$V_0 = \frac{E_1}{(1+k)} + \frac{E_2}{(1+k)^2} + \frac{E_3}{(1+k)^3} + \cdots + \frac{E_n}{(1+k)^n} \tag{1}$$

Which can be rewritten as:

$$V_0 = \frac{E_1}{(1+k)} + \frac{E_1(1+g)}{(1+k)^2} + \frac{E_1(1+g)^2}{(1+k)^3} + \cdots + \frac{E_1(1+g)^{n-1}}{(1+k)^n} \tag{2}$$

Multiplying both sides of Equation (2) by $\frac{(1+k)}{(1+g)}$ yields:

$$\frac{(1+k)}{(1+g)}V_0 = \frac{E_1(1+k)}{(1+k)(1+g)} + \frac{E_1(1+g)(1+k)}{(1+k)^2(1+g)} + \frac{E_1(1+k)(1+g)^2}{(1+k)^3(1+g)} + \cdots + \frac{E_1(1+k)(1+g)^{n-1}}{(1+k)^n(1+g)} \tag{3}$$

Simplifying Equation (3) by eliminating like terms, we arrive at:

$$\frac{(1+k)}{(1+g)}V_0 = \frac{E_1}{(1+g)} + \frac{E_1}{(1+k)} + \frac{E_1(1+g)}{(1+k)^2} + \frac{E_1(1+g)^2}{(1+k)^3} + \cdots + \frac{E_1(1+g)^{n-1}}{(1+k)^n} \tag{4}$$

Subtracting Equation (2) from Equation (4) yields:

$$\frac{(1+k)}{(1+g)}V_0 - V_0 = \frac{E_1}{(1+g)} \tag{5}$$

Multiplying both sides of Equation (5) by $(1 + g)$, yields:

$$\begin{aligned}(1+k)V_0 - (1+g)V_0 &= E_1\\ V_0 + kV_0 - V_0 - gV_0 &= E_1\\ kV_0 - gV_0 &= E_1\\ V_0(k-g) &= E_1\\ V_0 &= \frac{E_1}{(k-g)} \qquad (6)\end{aligned}$$

THEREFORE:

$$V_0 = \sum_{n=1}^{\infty} \frac{E_n}{(1+k)^n} = \frac{E_1}{(k-g)} \qquad (7)$$

ASSUMPTIONS:

1. g, k are constant
2. $k > g$ (if $k < g$, the V_0 will be infinitely large)
3. n approaches ∞

CONCLUSION:

The use of a *capitalization rate* (cap rate) within the *single period capitatlization method* (SPCM) of the *income approach* is a derivative of the income based *discounted net cash flow* (*DCF*) *method*. The SPCM places more restrictions on the underlying assumptions than the DCF, including the assumption of a *constant* growth rate in *perpetuity* for the *net economic benefit* accruing to the owners of the property. The *algebraic derivation* of the SPCM demonstrates that an earning stream, less growth at the rate of g, to infinity (∞) is reflected in V_0. This method, while perhaps convenient to employ (requiring only a single calculation) may be subject to challenge based upon its reliance on a single, constant rate of growth in perpetuity—a condition not often found within the healthcare industry given the volatile nature of the *Four Pillars of Health Care Valuation* (i.e., Regulatory, Reimbursement, Competition, and Technology).

To determine the indication of value (either equity or total invested capital) from this method, the analyst should then capitalize the calculated cash flow at an appropriate capitalization rate. The analyst can use the methods described in Chapter 9, "Costs and Sources of Capital," to determine the appropriate *discount rate* for the subject enterprise. This discount rate can then be translated into a capitalization rate by removing the expected long-term growth rate, that is, the *discount rate* less the *long-term growth rate* equals the capitalization rate.

The Single Period Capitalization rate is, in fact, only an application of the inverse Price to Earnings Multiple, as shown in the following proof.

Let: E = Earnings (Income, Cash Flow, etc.)
SPCR = Single Period Capitalization Rate

P = Price (Market Value)

$\frac{E}{P}$ = Price to Earnings Multiple

Proof:

1. $\frac{E}{SPCR} = P$ Single Period Capitalization Formula
2. $\frac{1}{E} \times \frac{E}{SPCR} = P \times \frac{1}{E}$ Multiply Both Sides of the Equation by $\frac{1}{E}$
3. $\frac{1}{SPCR} = \frac{P}{E}$ Cancel Like Terms
4. $SPCR = \frac{E}{P}$

The final indication of value, prior to the application of any discounts or premiums as discussed later, will then be calculated as:

$$\frac{\text{Single Period Cash Flow}}{\text{Capitalization Rate}}$$

It is often useful to explain the relationship between the single period capitalization method, which may be a less known concept to healthcare providers, as the inverse of a market multiple (i.e., price to revenue, as described in the next section, "Market Approaches"), with which they are more familiar. Hospital C-suite executives and physicians are typically aware of and understand the *P/E ratios* for the stock holdings in their personal portfolios and regularly track them from sources such as the *Wall Street Journal*. A *proof* demonstrating that the Single Period Capitalization Method is equivalent to a P/E multiplier with which the executives and physicians are more comfortable is shown in Exhibit 8.2.

As was noted, the *single period capitalization method* is best suited to enterprises with stable long-term cash flow and the expectation of a stable risk-adjusted required rate of return. The volatility experienced with regard to healthcare reimbursement, as well as the rapidly changing competitive markets and technological advances and the continual change in regulatory oversight, would tend to indicate an environment in which the single period capitalization method may not be valid. The valuation analyst should consider that the use of other methodologies may be less restrictive in relation expectations of stability. An example of the application of the single period capitalization method can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.2 Market Approaches

Market approach–based methods are premised on the foundation that actual transactions of similar entities provide guidance to value. The *efficient market hypothesis* posits that prices derived from well-functioning publicly traded markets are reflective of all pertinent information available to the participants in the market, that is, a price derived from market transactions represents the market consensus present value of the expected future economic benefit to be received from ownership of the asset by a typical investor.

In the absence of properly functioning markets, this becomes less true. For the market price to be indicative of the typical investor, the market participants must be free from coercion or undue pressure to consummate a transaction. Further, markets must have sufficient liquidity (i.e., there are relatively many buyers and sellers active in the market) to allow for the price determination process to unfold; also, a properly functioning market will allow sufficient time for buyers and sellers to locate one another and negotiate an acceptable price. There is also an assumption of a reasonable equivalence of knowledge between the buyer and the seller regarding the asset and the nature of the prospective transaction. To the extent that markets fail to achieve these criteria, the resulting market prices will be less informative and may fail to reflect the actual anticipated economic benefit accruing to the owners of the asset.

Market prices are empirical information, the validity and efficacy of which rely on the manner and quality of its recording, collection, and reporting. As was noted earlier, market efficiency implies that the market prices fairly reflect the consensus expected benefit of the typical purchaser of an asset. If, for a particular purchaser, the price is determined to be *too high*, this indicates that the expected benefit that *purchaser* expects to derive from an asset is less than the benefit expected to be derived by the *typical purchaser*, that is, the average market participant is capable of extracting greater utility from the asset than the particular purchaser in this example.

This price system directs the allocation of scarce assets to those who can produce the greatest amount of expected benefit, as they would be

MARKET APPROACH

A method premised on the foundation that actual transactions of entities similar to the subject entity provide an indication to its value.

willing to pay the greatest price for the asset. Market theory therefore suggests that prices derived from properly functioning markets are reflective of the anticipated economic benefit that would accrue to the typical owner of the asset. When there is a relatively efficient and unrestricted secondary market for comparable properties, and that market accurately represents the activities of a representative number of willing buyers and willing sellers, the market approach valuation methods using data directly from the market may provide the best evidence as to the value of the subject property.

Two commonly used market methods include (1) the Guideline Transaction/Merger and Acquisition Method, and (2) the guideline public company method. Both of these similar methods are described next.

8.1.2.1 Guideline Transaction/Merger and Acquisition Method When there is a relatively efficient and unrestricted secondary market for comparable properties, and that market accurately represents the activities of a representative number of willing buyers and willing sellers (i.e., *efficient markets*, as discussed earlier), the *market* may be most determinative of the value of the subject property. The *Principle of Substitution* (as discussed in Chapter 7, "Basic Valuation Tenets") states that the cost of an equally desirable substitute, or one of equal utility, tends to set the ceiling of value, In other words, it is the maximum that a knowledgeable buyer would be willing to pay for a property. Substitutes, while imperfect, must be used, since there are no two companies/practices that are exactly identical. Homogeneous (*the same in type, size, structure, quality, etc., i.e., similar; uniform*) companies and transactions should be researched to use as guidelines to value for the subject company.

PRINCIPLE OF SUBSTITUTION

The price of a desired substitute, or one of equal utility, sets the ceiling of value for a particular good or service.

The application of the Guideline Transaction/Merger and Acquisition Method is as follows:

1. Select the appropriate look-back period prior to the valuation date from which to select transactions (i.e., select a look-back period in which economic and industry conditions are similar to those at the valuation date);

2. Identify transactions in which the target company is similar to the subject enterprise (e.g., same specialty, services, etc.);
3. Obtain data regarding the transactions (e.g., transaction consideration/price, transaction terms, target practice's financial information, number of physicians, services provided, geographic location, interest in the target company acquired, etc.);
4. Select appropriate transactions to use in the methodology based on similarity to subject practice and sufficiency of data and information related to the transaction;
5. Adjust transaction price for noncash terms of the deal. Implicit in the definition of Fair Market Value is "payment is made in cash or its equivalent." Therefore, if any of the transaction consideration in the guideline transactions was paid in company stock, management or consulting agreements, earnouts and/or notes, the transaction price may require an adjustment to reflect cash value;
6. Calculate appropriate valuation ratios. The valuator must determine whether the ratios derive an equity level of value (e.g., Price/EBT or Price/Earnings) or an invested capital/asset level of value (e.g., MVIC/Revenue or MVIC/EBITDA);
7. Analyze the data for several statistical measures of central tendency, for example, mean, median, high, low, upper quartile, and lower quartile. The valuator may also consider the relationship of the ratios to other characteristics of the target companies (e.g., perform a regression analysis between the MVIC/Revenue ratio and the target companies' profitability);
8. Choose the appropriate ratio to apply to the subject enterprise's proper benefit stream (e.g., multiply the subject practice's net revenue to the chosen MVIC/Revenue ratio);
9. Decide the appropriate weight of consideration to be given to each valuation technique, if multiple techniques are used (e.g., MVIC/Revenue and MVIC/EBITDA). The valuator should consider the nature of the universe of typical purchasers of enterprises similar to the subject enterprise, that is, are potential investors or hypothetical acquirers of the subject practice most likely be "*horizontal consolidators*" (i.e., companies whose motivations are to increase revenue within currently offered product lines and would affect their own expense structure to the acquired revenue stream) or "*vertical integrators*" (i.e., companies whose motivations are to add new product lines that are not currently offered);
10. Adjust for any assets or liabilities included or excluded in the subject practice valuation but included/excluded in the guideline transactions; and

11. Apply any premiums and/or discounts (see below), if appropriate, to reach the level of value as set forth in the valuation engagement.

Gathering data on comparable transactions has historically been problematic, due to the limited reporting of information, inaccuracies, and inconsistencies in the transactional data submitted, and an insufficient level of detail regarding the characteristics of assets in the transactions reported, which limits the ability to test their homogeneity or comparability to the subject enterprise.

However, there are a growing number of resources for transactional data, with several focused on the various sectors of the healthcare industry, including those in Exhibit 8.3. However, the number of recent reported professional practice transactions with specific enough information as to deal terms, that is, price to earnings, price to revenue, payor mix, and so on, presents an ongoing challenge, as there are fewer publicly traded companies involved in these transactions reporting useful information available to the valuation analyst. The following describes the principles and practical details related to the use of market data in market valuation methods.

The process and technique for identifying direct market comparable transactions to consider in applying the Guideline Transaction/Merger and Acquisition Method is displayed in Exhibit 8.3.

8.1.2.1.1 Restrictions of the Guideline Transaction/Merger and Acquisition Method When guideline companies are not fully identical to the subject entity, the appraiser can use a technique of "*abstraction*," that is, adjustments to make the comparison possible. This technique involves identifying the chief features, factors, and amenities of similar companies from the database of completed transactions and then determining the extent to which the differences affect the prices of the guideline transactions. Points of comparison that may be used to make quantitative adjustments to the market transactional data include the:

1. Date of each transaction;
2. Assets tangible/intangible that each company owns/uses;
3. Location and market scope of each company;
4. Age and life cycle (business cycle) of each company;
5. Financial and management condition of the company at the time of sale;
6. Regulatory environment imposed on each company; and
7. Special financing or other terms regarding each transaction.

Once a set of transactions has been identified and their financial ratios calculated, there may appear to be "*outliers*" that have transaction ratios

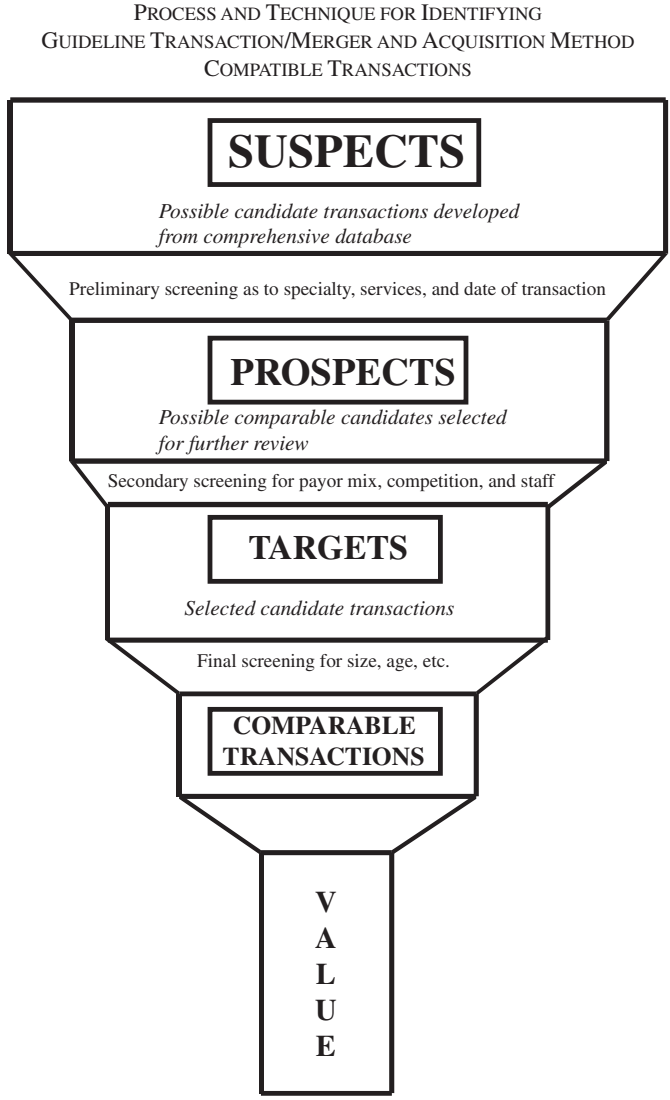

EXHIBIT 8.3 Process Flow Model for Guideline Transaction/Merger and Acquisition Method

(e.g., price to revenue, price to earnings, etc.) varying significantly from the norm, as illustrated in Exhibit 8.4. These outliers are often removed from consideration as potentially misrepresentative transactions. However, transactions should be selected for analysis based on comparability to the subject entity, not on how close their transaction ratios are to the norm.

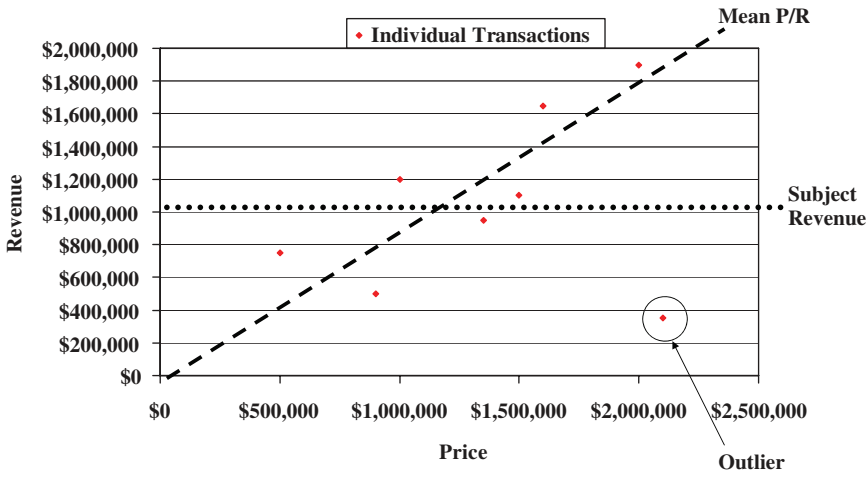

EXHIBIT 8.4 Hypothetical Transaction Scatterplot

Many causes for outliers may warrant exclusion. Characteristics of medical practices that should be examined for comparability include:

1. Payor mix;
2. Staffing depth and quality;
3. Service mix—type of services rendered;
4. Nature and sustainability;
5. Site of service (hospital, nursing home, office, etc.);
6. Geographical location/proximity to hospital;
7. Status of practice with value-based purchasing/episodes of care initiative (e.g., *medical home* and *accountable care organizations*);
8. Competition;
9. Call coverage;
10. Development of new treatment protocols;
11. Covenants not to compete;
12. Office system and management sophistication;
13. Years in practice;
14. Growth trend/potential;
15. Profitability;
16. Patient age mix;
17. Collections/accounts receivable;
18. Doctor to patient ratio for catchment area;

19. Ease of entry (e.g., Certificate of Need restrictions) and local/regional regulatory environment (e.g., corporate practice of medicine and scope of practice); and
20. Extent of technology adoption (e.g., electronic medical records).

Only after a thorough evaluation of the comparability of market transactions should outliers be excluded, and the basis of their exclusion needs to be explained to avoid the appearance that transactions were "*cherry picked*," resulting in bias.

In addition, the use of a limited database of transactions may be misleading if it is not statistically representative of the overall market. The valuation analyst may still perform the analysis, due to the limited sample size of the transactions reported or available to the researcher, but, in general, the smaller the sample size of the included transactions, the less certain the calculated result.

Another potential limitation of the Guideline Transaction/Merger and Acquisition Method is that it may be difficult to determine the degree of comparability necessary to assure that the financial ratios derived from the transactions examined are predictive of value for the subject entity. For example, reported transactions for companies under the same Standard Industrial Classification (SIC) code may not be homogenous for medical practices, which share SIC 8011 with ambulatory surgical centers (ASCs), with which they are certainly not comparable. Primary care practices, specialty surgical practices, and ASCs have all historically traded at different transaction ratios.

The valuation analyst should also be aware that unreported transactions may be driving the perception of value within a specific industry or market. Within a specific industry or market, it is not unusual for buyers and sellers to rely on so-called *rules of thumb*, which arise from their purported knowledge of unreported transactions and which speculative indications of value lie somewhere between a *SWAG* (*Scientific Wild A** Guess*) *Method* and a shot in the dark. In considering the selection and application of the Guideline Transaction/Merger and Acquisition Method, perhaps the most applicable axiom to keep in mind is that "*The plural of anecdote is not data.*"

While market approach–based methods, such as the Guideline Transaction/Merger and Acquisition Method are conceptually desirable, there may be significant impediments to their use in enterprises. As stated by Dr. Shannon Pratt,

> *The opportunities to go awry in the implementation of the market approach are legion. Sometimes the toughest ones to spot are the errors of omission, such as failure to consider the full population of potentially useful guideline companies, failure to make certain adjustments, or failure to use all of the best data available to support*

> *certain adjustments, such as reasonable compensation, or a discount for lack of marketability. Some of the most common errors are:… failure to analyze and adjust guideline company data;…applying multiples to inconsistently defined data;…failure to account for excess or deficient cash;…using an "asset plus" rule when a company's returns are not adequate to support the assets employed;… not applying proper discounts and premiums or not adequately supporting the amounts of the discounts or premiums applied.*[46]

An example of the application of a guideline transaction, the merger and acquisition method, can be found online at http://www.wiley.com/go/healthcarevaluation.

8.1.2.1.2 Guideline Public Company Method The Guideline Public Company Method is based on the theory that an indication of value of the subject entity can be derived through the valuation multiples of the freely traded, minority interest–registered shares of publicly traded companies. This method assumes that pricing relationships, based on past measurements of these selected transactional ratios of comparable minority equity shares in healthcare entities, can provide useful and relevant indications of investor expectations and, accordingly, useful indications of value for the subject entity, even though the subject entity may be privately held.

The application of the guideline public company method is as follows:

1. Identify a set of guidelines for publicly traded companies that is sufficiently similar to the subject entity to be useful in this analysis;
2. Calculate the Market Value of Invested Capital (MVIC) for each of the publicly traded companies (MVIC equals the market value of common and preferred equity outstanding plus the value of short-term and long-term debt outstanding);
3. Calculate the appropriate ratios for each of the publicly traded comparable companies (e.g., "*MVIC/Revenue*" or "*MVIC/EBITDA*");
4. Adjust ratios for differences in transactions and companies involved (see following equation); and
5. Apply ratios to the appropriate measure of benefit of the subject entity.

An example of the application of the guideline public company method can be found online at http://www.wiley.com/go/healthcarevaluation.

Smaller companies often have more business and financial risk than larger companies do and tend to have lower pricing multiples than larger

[46] Shannon Pratt, *The Market Approach to Valuing Businesses*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2006), p. 273.

companies.[47] Therefore, using the above equations (i.e., "*MVIC/Revenue*" and "*MVIC/EBITDA*"), as well as data from larger publicly traded companies, to derive pricing multiples can distort the indications of value of smaller companies (if not appropriately adjusted) when these multiples are used (multiplied by the subject enterprise's appropriate economic benefit stream) to develop indications of value of the subject practice. When necessary, the valuation multiples may be adjusted to reflect size disparities that may exist between the subject enterprise and the comparable publicly traded companies.

One of the size adjustment techniques that may be used involves the measurement of differences in the historical equity returns of smaller companies as compared to larger companies (measured by market value of equity) from data compiled and reported by credible sources (for example, the *Stocks, Bonds, Bills and Inflation Yearbook, Valuation Edition* [*SBBI*]). The following equations may be used to adjust both the "*MVIC/Revenue*" and "*MVIC/EBITDA*" multiples to reflect size disparities previously discussed:[48]

$$\text{Adjusted}\frac{\text{MVIC}}{\text{Revenue}}\text{Multiple} = \frac{1}{\frac{1}{\text{UnadjustedMultiple}}}\text{VariantFactor}\left(\%\frac{\text{Equity}}{\text{MVIC}}\right)\times\text{SizePremium}$$

$$\text{Adjusted}\frac{\text{MVIC}}{\text{EBITDA}}\text{Multiple} = \frac{1}{\frac{1}{\text{UnadjustedMultiple}}+\left(\%\frac{\text{Equity}}{\text{MVIC}}\right)\times\text{SizePremium}}$$

where: Unadjusted Multiple = Multiple derived from guideline public company data

$\%\frac{\text{Equity}}{\text{MVIC}}$ = Market Value of Equity of the guideline public company divided by Market Value of Total Invested Capital of the guideline public company

[47] James R. Hitchner, *Financial Valuation, Applications and Models*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2006), p. 311.

[48] Ibid., pp. 310–315; and "Adjusting Multiples from Guideline Public Companies," Teleconference Presentation, August 31, 2006, Business Valuation Resources, LLC, 2006, Exhibit 8.

Size Premium = Difference between the arithmetic mean of returns of the guideline public company size decile compared to the subject enterprise size decile as reported by "*Morningstar*"

Variant Factor = Net Revenue of the guideline public company divided by EBITDA of the guideline public company

An example of an application of the guideline public company method can be found online at http://www.wiley.com/go/healthcarevaluation.

Several measures of central tendency, that is, mean, median, high, low, and the upper and lower quartiles, may be calculated and used to analyze the generated adjusted multiples in order to determine the optimal means of comparing the publicly traded market transactions of the guideline companies' shares to a hypothetical transaction involving the subject enterprise. Multiple other considerations may factor into this analysis, such as (1) a comparison of the subject enterprise's operations to those of the guideline public companies; (2) the stability of the physicians and providers of the subject enterprise; (3) the practice infrastructure and dynamic (e.g., as a department within a larger practice or a "*stand-alone*" entity, as well as any other arrangements, affiliations, or contracts); and (4) risk related to the probability of achieving management's projections used by this valuation.

The guideline public company method will also suffer from similar drawbacks as the Guideline Transaction/Merger and Acquisition Method, for example, the lack of a sufficient number of comparable guideline companies and the difficulty in determining the existence of possible outliers within the data set.

Also, there is a growing school of thought within the valuation community that the use of indicators from publicly traded stocks may not be reflective of the market for *closely held enterprises*, such as physician practices, outpatient centers, and other closely held healthcare enterprises, which may have unique drivers underlying their capital markets. Rob Slee, a well-known proponent of this concept and the author of *Private Capital Market*, has stated,

> *Private Companies, particularly those with annual sales of $5 million to $350 million, have unique capital market needs.... The private capital markets are a complex interacting network of discrete exchanges rather than a unified structure. They differ greatly from the unified structure of public markets. For example, institutionalization in the public markets is developed more than in the private markets. In the public market, the players are licenses, highly regulated, and larger in size, and they tend to offer a wide*

> *range of financial services. In the private market, there is a host of smaller transfer players who provide discrete services. While these services are largely unregulated, the Securities and Exchange Commission and various state authorities provide some regulation.*[49]

This evolving attention to distinction between public transactions and private transactions is reflected in the work Professor John K. Paglia at the Center for Applied Research at Pepperdine University's Graziadio School of Business, which provides an Annual Capital Market Report that

> *tracks the private cost of capital and benchmarks, both the current climate and projected outlook, across multiple market segments for lending, investing and acquiring capital.*[50]

In the healthcare industry this concept may not be as large a concern, due to the tendency of companies and the investors who invest in them to traverse back and forth from privately held to publicly traded, such as HCA Healthcare. In selecting which market approach–based methods to employ (if any), the valuation analyst should balance consideration of the sufficiency, validity, and efficacy of the available transactional data reported, as well as the applicability of such indications of value as may be determined to arise out of observations from such distinct sources as historical transactional data of privately held companies and historical transactions of minority equity interests in publicly traded companies.

8.1.3 Asset/Cost Approach-Based Methods

Asset/cost approach–based methods seek an indication of value by determining the cost of reproducing or replacing an asset. This approach is sometimes used in healthcare appraisal when the entity has little or no net economic benefit stream to be valued and/or in a circumstance where the entity is not being considered the basis of a *going concern*. It is often also used for the valuation of healthcare intangible assets, where there may be significant regulatory risk related to anti-kickback and Stark statutes in employing an income approach–based method.

ASSET/COST-BASED APPROACH

A method seeking an indication of value by determining the cost of reproducing or replacing an asset, commonly used when the entity has little value beyond the tangible assets or in the event that the entity is not a going concern.

There are several methods that may be used under the asset/cost–based approach, including (1) Adjusted Net Asset Method, (2) Liquidation Value Method, and (3) Excess Earnings Method.

8.1.3.1 Adjusted Net Asset Method The *adjusted net asset value method*, also known as the *asset accumulation method*, estimates the value of the total *invested capital* of an enterprise by identifying, distinguishing, disaggregating, and summing the Fair Market Value of both *tangible* and *intangible* component assets. Once the assets to be included in the transaction have been identified, the valuation analyst must separately and distinctly value each. For example, a typical physician transaction may include *tangible personal property* (e.g., furniture, fixtures, and equipment), real property (e.g., buildings), and intangible assets (e.g., procedures and protocols, trained and assembled physician and nonphysician workforces, and custody rights to patient medical records). It is the responsibility of the valuation analyst to clearly identify those assets, both tangible and intangible, that will be included in the transaction and subject to valuation. The final opinion of value issued by the analyst will be the summation of the value of each of the individually and distinctly identified and appraised tangible and intangible assets. For a further discussion of the appraisal various tangible and intangible assets of healthcare enterprises, see Chapter 14, "The Valuation of Tangible and Intangible Assets."

ADJUSTED NET ASSET METHOD

A method that estimates the value of the total invested capital of an entity by determining the sum of the fair market value of each of its discrete assets.

8.1.3.2 Liquidation Value Method *Liquidation value methods*, either by orderly or forced disposition, estimate the value of an enterprise by determining the present value of the net proceeds from liquidating the company's assets and paying off liabilities. The "*orderly*" method is used to describe a situation in which the sell-off process is conducted in an organized and systematic fashion within a reasonable time horizon directed by the seller. In this scenario, a lesser degree of urgency exists, in contrast to *the* "*forced*" *method*, where the seller no longer is in a position that affords him or her the opportunity to proceed at the seller's own discretion toward liquidation, with (all, or the majority of) the assets being sold at approximately the same time in at the same relatively quick time period—often at auction. Generally, the *orderly liquidation value* method will yield a value greater than the value that may be determined under the *forced liquidation value method*.

LIQUIDATION VALUE METHOD

A method that estimates the value of an entity by determining the present value of the net proceeds from liquidating the company's assets and paying off liabilities.

8.1.3.3 Excess Earnings Method The excess earnings method, also called the "Treasury Method" or the "*IRS Formula Method*," based on Revenue Ruling 68–609, does not neatly fit into any of the three approaches. This method is considered by many valuators to be a "hybrid" method, combining elements of the asset/cost approach with elements of income approach methods.

This method first values the intangible assets of the subject entity using a residual technique, whereby a portion of the benefit stream (e.g., net free cash flow or net income) is, first, attributed to a return on net tangible assets using a market-derived cost of capital for similar tangible assets; second,

EXCESS EARNINGS METHOD

A "hybrid" method, combining elements of the asset/cost based approach with elements of income approach methods, establishing the value of an entity's tangible and intangible assets, arriving at an estimate of the overall asset value for the subject entity as a going concern.

an appropriate portion of the benefit stream is attributed to the fair market value of the replacement cost of services provided by the owner as "owner compensation"; and finally, the dollar amount of the benefit that remains after the deduction of these two amounts (the "residual") is then presumed to be attributable to the intangible assets. This amount of the benefit stream, which has been determined to be attributable to the intangible assets of the subject entity, is then capitalized using a risk-adjusted equity rate of return, and the resulting indicated value of the intangible assets is then combined with (added to) the value of the tangible assets of the subject entity to arrive at an estimate of the overall asset value for the subject entity as a going concern. An example of the application of the excess earnings method can be found online at http://www.wiley.com/go/healthcarevaluation.

8.2 ALTERNATIVE VALUATION TECHNIQUES

At times, due to the nature of the asset or service being valued, the valuation analyst may need to rely on *alternative techniques*, which do not neatly fit into any of the above approaches, to arrive at a value indication. As noted in Chapter 7, "Basic Valuation Tenets," the fundamental analytical technique common to all valuation is the determination and capitalization of the expected future benefit to be gained from the ownership of the property being valued. The application of this fundamental strategy remains effective even in the event the analyst relies on an *alternative valuation technique*. The following list of techniques is not intended to be exhaustive; instead, it is meant to represent a class of techniques that do not fit neatly into any single approach classification. The analyst should be prepared to be confronted with seemingly esoteric or exotic assets (or business relationships) whose valuation requires innovative techniques. The competent valuation analyst need not avoid combining valuation approaches, methods, and techniques as necessary to complete the valuation, so long as they can remain true to the fundamental economic concepts expressed in Chapter 7, "Basic Valuation Tenets."

8.2.1 Certainty Equivalent Valuation

One alternative valuation technique that can be used by the valuation analyst is the concept of Certainty Equivalent Valuation (CEV). As has been noted previously, the future is uncertain. Valuation is concerned with projecting the most probable economic benefit that will accrue to the owners of an asset. There exists any number of possible outcomes related to the economic benefit that is *actually realized* from owning an asset. More traditional valuation approaches deal with these uncertain outcomes by

CERTAINTY EQUIVALENT VALUATION

Establishes the smallest certain cash flow an entity would be willing to exchange for a cash flow with risk.

Valuation Using the Certainty Equivalent Approach, *Simon Frasier University, http://www.sfu.ca/~awv/413/413l5.pdf (accessed December 5, 2012).*

forecasting the most probable outcome and discounting that outcome by a risk-adjusted required rate of return, often a discount rate, which reflects that the more uncertain the outcome, the greater the perception of risk and the greater the discounting. This concept is developed in detail in Chapter 9, "Costs and Sources of Capital."

An alternative strategy that may be employed in developing an indication of value is to assign a probability to each possible outcome, with the condition that the probabilities must sum to one. This restriction implies that one of the events must occur and no other event not included in the set is allowed to occur. The measure of economic benefit for each outcome is then multiplied by its corresponding probability. The probability-weighted economic benefits of all of the possible outcomes are then summed to determine the most probable expected economic benefit. To arrive at the value on a specific date, the most probable expected economic benefit must be discounted back from the date of the outcome to the valuation date. Due to the fact that all of the uncertainty involved in the possible outcomes has been accounted for in the probability weighting, the analyst need only discount the cash flow by the appropriate risk-free rate. The value indication derived after the discounting of the most probable expected benefit would represent the *actuarially fair* value of the asset, that is, the investor would be indifferent between purchasing the asset at the calculated price and investing the same amount in a risk-free asset.

One limitation of the CEV is that it may not be possible to support and document the basis upon which the valuator has assigned the probabilities to each possible outcome. Also, the number of possible outcomes may be too numerous or the assignment of particular probabilities may lack sufficient empirical support as a valid foundation for their selection. While the logic underlying CEV can apply to any situation, it is the practical application of the CEV concept that leads to difficulties. CEV should only be used in a situation where the analyst has (1) a clearly defined set of possible outcomes, (2) a sound methodology for assigning probabilities to the possible outcomes, (3) reliable information related to the measurement of the economic benefit that results from each possible outcome, and (4) the possible

outcomes are discrete, mutually exclusive events. An example of the application of the certainty equivalent valuation to value a covenant not to compete can be found online at http://www.wiley.com/go/healthcarevaluation.

8.2.2 Monte Carlo Simulation Analysis

A closely related technique to the CEV is Monte Carlo Simulation Analysis (MCSA). Monte Carlo simulations are similar to the CEV method, in that they attempt to determine the likelihood of possible outcomes. MCSA harnesses the ability of computers to quickly complete repetitive tasks. The basic structure of an MCSA model is to randomly determine, in an informed manner, those factors that affect the economic benefit accruing to the owners of an asset. Then, from those randomly determined factors, the analyst determines the economic benefit that would accrue. This process is repeated a large amount of times (typically, 100,000 or more), with each iteration having the underlying factors driving the value of the economic benefit randomly calculated. After completing the iterations, the analyst then averages the value of the calculated economic benefits, which represent the most probable economic benefit that the owner of the asset would expect. Then, similar to the CEV technique, the analyst would discount the expected benefit back to the valuation date, using the appropriate risk-free rate. Unlike the CEV method, instead of determining the economic benefit associated with each possible outcome, the analyst must determine the appropriate probability distributions to apply to the underlying factors that drive the economic benefit realized from the ownership of the asset. The selected probability distribution (e.g., normal, uniform, t-student, etc.) will shape the values of the randomly selected underlying factors that affect the economic benefit that accrues to the owner of an asset. Care should be given to the selection to ensure that it conforms to the reality of the process that determines the possible outcomes.

As an example, consider revenue from a healthcare entity, which as discussed earlier is most often the product of output and reimbursement per unit

MONTE CARLO SIMULATION ANALYSIS

A simulation used for sampling random outcomes of a stochastic process, such as a stock price.

Options, Futures, and Other Derivatives*, 7th ed., by John C. Hull (Upper Saddle River, NJ: Pearson Prentice Hall, 2009), p. 267.*

of output. These can be considered the underlying random factors that drive revenue. Therefore, to apply an MCSA technique to revenue projection, the analyst would assume a probability distribution for both the procedure volume and the reimbursement. One such selection could be to assume that both variables are *log normally distributed*, that is, that the percentage of change in the variables is normally distributed with a mean equal to the long-run trend and variance equal to the historically observed variance. The analyst would then select (more precisely, the computer program used for the MCSA would select) randomly a value for the growth rates in output and reimbursement from a population with mean/variance parameters as defined above. A single iteration would then be the last period reimbursement increased by the randomly selected growth rate times the last period output increased by the randomly selected growth rate for the output. This process would be repeated X times (where X is a sufficiently large number). The result would be X possible revenue outcomes, the average of which would be the most probable (given the distributional assumptions above) revenue. A similar process could be undertaken to project X possible economic expense burdens necessary to support the X different revenue amounts already calculated. The analyst could then calculate the difference between these two projections as the residual income that would accrue to the owner of the asset. This residual amount could then be averaged and discounted to arrive at the value, as of the valuation date, of the right to ownership of the asset.

MCSA is limited by the amount of historical data available to parameterize the underlying random factors affecting value. With a small data set, the variability of the underlying random factors may be too large to provide an expectation without a wide margin for error, and it may be more appropriate to use an analytical method, such as those described earlier. Another limitation to MCSA is the necessity to assign a particular probability distribution to the underlying factors. This requires making assumptions regarding the nature of the data-generating process that produces each of the random underlying factors. The analyst should be careful to select a

Factoid

The Monte Carlo Simulation was coined by John von Neumann, Stanislaw Ulam, and Nicholas Metropolis and was named after a casino in Las Vegas, Nevada, where Ulam's uncle would often gamble.

"The Beginning of the Monte Carlo Method," by N. Metropolis, Las Alamos Science*, Special Issue, 1987, p. 127.*

distribution that is sensible for the given underlying variable. For example, a normally distributed random variable can (with a nonzero probability) take on any value, from negative infinity to positive infinity. Reimbursement, conversely, cannot be below zero (and in all practical applications cannot be zero). Therefore, assigning a normal distribution to reimbursement would be inappropriate, so an alternative (such as the log normal distribution assumed earlier) should be selected. The last limitation of MCSA is that it requires a significant level of programming ability to properly apply the methodology. Some user-friendly additions to familiar software packages (such as the Crystal Ball add-in for Microsoft Excel) have been developed, but caution is advised in using *black-box* programs without understanding the particular limitations of the software utilized. Inadvertent errors may occur if the output from these programs is not sufficiently understood by the valuation analyst.

8.2.3 Economic Value-Added Analysis

Economic value-added analysis is a useful tool for developing executive compensation structures, particularly bonuses. It is premised on the belief that the compensation received by an executive should be scaled to the magnitude of the increase in economic value he or she provides. It is similar to the *excess earnings method* described earlier. The analysis is performed at the beginning of the compensation period (e.g., the beginning of the calendar year) by the analyst calculating the profit of the firm after consideration of the necessary compensation to be paid to the owners of the assets (both tangible and intangible) and excluding any compensation to the executive. The analyst would repeat this calculation at the end of the compensation

ECONOMIC VALUE ADDED ANALYSIS

A measure of progress of value creation, relying on the principles that (1) a company is profitable when returned earnings on capital exceed opportunity costs of capital; and (2) wealth is created from positive net present value investments.

"What's Wrong with the Economic Value Added?" by Sergei Vailievich Cheremushkin, Social Science Research Network, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1120917 (accessed December 5, 2012).

DISCOUNTED NET CASH FLOW METHOD

A method that estimates the present value of "normalized" expected cash flow distributable to the owners of the subject entity for a determined projection period, with a residual or "terminal" value ascribed to all expected cash flow beyond the projection period.

period as well. The difference between these two amounts would be the economic value added by the executive. Compensation, or bonuses, then would be tied to the amount of economic value the executive was capable of producing. This compensation structure provides the benefit of aligning the executive's incentives with those of the owners of the firm. The executive's compensation would be dependent on increasing the economic value added to the enterprise, which necessarily increases the value of the enterprise to the owners, as contrast to more traditional compensation structures that may result in a misalignment of interest between the executive and the firm's owners.

8.2.4 Real Option Analysis

A valuation analyst may be confronted with a particular engagement that involves the appraisal of an asset that is best accomplished using a *real option method*. *Real options* exist when the value of the assets making up an enterprise do not capture all of the *strategic value* of the ability to control those assets. Real options reflect the *flexibility* available to the owner of the enterprise to engage in activities, such as the expansion or abandonment of a project. Typical valuation methodology may require that the management of a firm be committed to a particular strategy with the exception of all others. A typical discounted cash flow method may not capture the value inherent in the option for a hospital to open a new location or service line for the provision of services. In that case, real *option analysis* (ROA) provides a framework through which the valuation analyst can consider the value of the imbedded real option, that is, to expand or not to expand. The analysis is performed similar to the valuation of financial options, either through numerical methods (i.e., simulations) or analytical methods (i.e., Black Scholes equation). The valuation of real options is a complex and varied subject. The nature of the ROA topic exceeds the scope of this text and is discussed by many alternative sources (see *Key Sources*).

REAL OPTION ANALYSIS

A method for assigning a dollar value for structuring a project to include information on where exit points should exist in the project's time line and that of having the option to exit at those points.

"Real Option Analysis: Improving Project Selection in Healthcare Settings," by David K. Wyant, Journal of Healthcare Information Management *23, no. 1 (Winter 2009): 59.*

8.2.5 Net Present Value Analysis

In addition to providing valuation services related to transactions within the healthcare industry, a consultant may be asked to perform an analysis related to the feasibility of a project. Typically, corporate finance departments considering strategic projects will use a *Net Present Value* (NPV) analysis to evaluate the likelihood of success for a project. The NPV of an investment project is the discounted value of the differences over time between monetary costs and benefits in each period.[51] For healthcare enterprises seeking to determine the viability of a strategic option, the NPV analysis provides a financial investment basis for determining whether to proceed with the anticipated project or reject it. Healthcare enterprises may employ an NPV analysis to evaluate a project's potential impact on the enterprise's financial profile, as well as on its needs for total available capital and allocation decisions related to utilization of existing capital.[52] These healthcare enterprises should seek to determine whether the additions to net cash flow generated from the anticipated project over the lifetime of that project will be greater than the initial *start-up* and the ongoing *maintenance costs* of the project after consideration of the enterprise's cost of capital, as well as the probability of obtaining both a return on and a return of investment capital.

The NPV analysis is undertaken in an identical manner to the traditional discounted net cash flow methodology. The analyst will forecast revenue, along with the associated operating and capital expense burdens necessary to support those revenues, and calculate the residual income that would accrue

[51] Anthony J. Culyer, *The Dictionary of Health Economics*, 2nd ed. (Northampton, MA: Edward Elgar Publishing, 2010), p. 347.

NET PRESENT VALUE ANALYSIS

An approach to valuing a potential capital investment project by finding the present value of its expected future incremental cash flow.

Options, Futures, and Other Derivatives*, 7th ed., by John C. Hull (Upper Saddle River, NJ: Pearson Prentice Hall, 2009), p. 745.*

to the investors in the project. This residual cash flow is then discounted to the initiation date of the project at an appropriate risk-adjusted discount rate (see Chapter 9, "Costs and Sources of Capital," for a discussion of the calculation of discount rates). The result of this discounting process would be the cash equivalent value of the anticipated future residual cash flow of the project over the life of the project. To determine the NPV of the project, the analyst then subtracts the initial start-up capital investment needed at initiation to fund the project. If the NPV of the project is greater than zero (i.e., the present value of the future expected cash flow is greater than the initial investment) then the value of the enterprise as a whole would be positively affected by proceeding with the project. Alternatively, should the NPV of the project be negative, the enterprise would expect to reduce its overall value by proceeding with the project (i.e., by expending more to invest in the project than the sum total of the cash flow it will produce over its lifetime). NPV analysis not only provides a straightforward method to determine the feasibility of a project, it is also useful in making decisions between possible mutually exclusive projects. The NPV of a project represents the expected increase in enterprise value that will result from the investment in the project; therefore, when deciding between multiple projects, the analyst should recommend the project with the greatest marginal impact on the enterprise's value, that is the project with the greatest NPV.

With the advent of accountable care organizations, as promulgated under the accountable care act (commonly known as "*Obamacare*"), a growing number of healthcare organizations are using NPV analysis to assess their participation in the emerging healthcare organizations. A detailed analysis of the application of NPV for accountable care organizations can be found in the book titled *Accountable Care Organization: Value Metrics and Capital Formation*, published in 2013 by Taylor and Francis.[53]

[53] Robert James Cimasi, *Accountable Care Organizations: Value Metrics and Capital Formation* (Boca Raton, FL: Taylor and Francis Group, 2013).

8.2.6 With and Without Analysis

A *with and without* analysis, also known as a *but for,* or a *before and after* analysis, is a technique that employs a *hypothetical condition* in the determination of value. The foundation of the technique lies in calculating an indication of value, using the methods described earlier, under a specified set of *explicit assumptions*, then repeating the valuation exercise under a *new* subset of assumption, that is, *with and without* the inclusion of certain of the assumptions. This technique is commonly applied in the valuation of damages in the litigation support arena, where it may be referred to as a *but for* analysis in reference to the indicated value *but for* the purported wrongful action of the defendant. Charles Wilhoite, ASA of Willamette Management Associates, describes this method, referring to it as the *before and after damages method*, as:

> *The before-and-after method is based on the premise that economic damages can be estimated by comparing:*
>
> 1. *actual profits realized by the plaintiff company during the damages period with*
> 2. *projected profits for the plaintiff company assuming no wrongful acts had been committed*
>
> *In essence, the difference between the projected profits (before the alleged wrongful acts and assuming the continuation of pre-damage operating results) and the actual performance (after the alleged wrongful acts) represents the economic damages.*[54]

This method can also be useful in determining value in nonlitigation contexts. A *with and without* analysis can be employed to determine the magnitude of a *key person* discount, as described in Section 8.4.5, "Key Person Discounts"). The valuation analyst can calculate the value of an enterprise, including the appropriate revenues and expenses associated with the *key person* (the initial set of assumptions) and then recalculate the value in the absence of the *key person* (the secondary set of assumptions). The value difference between the two cases, the *with and without*, would equal the anticipated enterprise value impact of the loss of the *key person*. Valuation analysts using a *with and without* analysis should clearly

[54] Charles A. Wilhoite, "Lightning Strikes Twice, MRI Associates Wins Big Again: Halloween Verdict Proves to Be Frightening to Regional Health System," *Insights* (Spring 2012): 88–93.

Key Person Discounts

A reduction in the ownership value of an entity, due to the actual or real loss of an owner or a key person.

Dictionary of Health Economics and Finance, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2007), p. 208.*

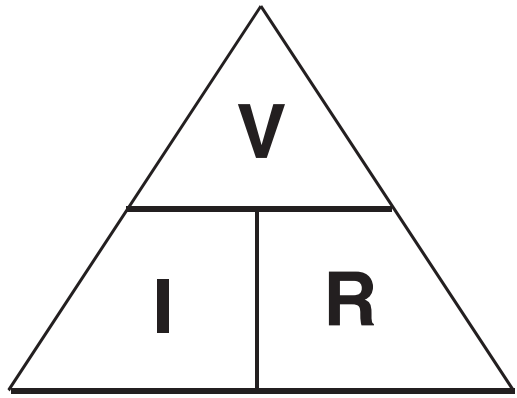
state the assumptions utilized in each case, the change in assumptions from the initial case to the secondary case, and the reason for the difference. It should also be noted that changing numerous assumptions, from one case to the next, may not be equivalent to the aggregation of the same changes individually, that is, two concurrent changes may have an impact on the magnitude of each other that would not be reflected in a *piecewise* (one by one) analysis of the sole impact of each.

8.3 RISK ASSESSMENT

The paramount concern for the valuation analyst, using any of the methods described earlier, is to accurately and precisely determine the risk factors involved in his or her projections related to the future expected benefit that will accrue to the owners of the subject property. A visual illustration of this risk-benefit relationship is depicted in Exhibit 8.5.

When assessing the amount of risk associated with the given healthcare enterprise being valued (component "*R*" of the value pyramid), it is important for the valuator to keep the following items in mind:

1. Since uncertainty breeds the perception of risk, under which circumstances a higher rate of return is demanded by potential purchasers, even high-quality, risk-averse, stable growth, highly profitable, and eminently transferable professional practices may have the potential to be "*tar-brushed*" by the perception of overall market uncertainty, as well as risk related to the particular subject enterprise's industry sector.
2. Other market motivating factors often drive transactional pricing multiples, for example, investors' fear of being shut out of their ability to legally maintain or sell their investment represents an undue stimulus or special motivation and synergy that may drive the deal, resulting in prices below or above value.



I = **Economic Benefit Stream, e.g., Income, Earnings, Cash Flow**
As defined by appraiser and appropriate to assignment

R = **Risk Adjusted Required Rate of Return applicable to selected benefit stream, e.g., Discount Rate, Cap Rate, Multiple Valuation**

V = **Economic Value of the Enterprise**

EXHIBIT 8.5 The Value Pyramid
Source: © Health Capital Consultants

3. The selection of risk-adjusted rates to capitalize an earnings or benefit stream into value requires more than just a cursory analysis of underlying data related to market systematic risk, as a nonsystematic, subject enterprise risk adjustment may also be appropriate.

The valuator should be aware that the assessment of risk by investors is related to both the actualities and (perhaps more substantially) the perceptions of the market and related to external economic, demographic, and industry conditions, as well as to aspects of the specific subject professional practice and the prospective transaction.

As discussed earlier, it is important to first analyze and reach a supportable conclusion as to the risk and return for a specific type of investment that is characteristic of the specific dynamics of the market in which it operates at any point in time before selecting a discount/capitalization rate.

It should be kept in mind that while this estimate of investor-perceived risk may necessarily be based, to some degree, on the judgment of the valuation consultant, which may be subjective in nature, objective methods and techniques are available and should be employed to the extent possible to

arrive at a valid and supportable discount/capitalization rate. The assessment of risk is inexorably related to, and should be based on, an informed consideration by a qualified analyst familiar with the healthcare industry subsector within which the subject entity operates and who may properly assess the most *probable* expectations and perceptions of a universe of typical buyers, sellers, owners, and investors as to the future performance of the subject enterprise, as well as expected material changes in the substantive value drivers.

In the final analysis, the assessment of risk must be carefully correlated to an informed, realistic, and unsparing assessment of current "*buyers'/sellers' perceptions in the market.*"

8.3.1 Financial and Operational Benchmarking

Financial operations are a significant source of risk for many healthcare enterprises. The valuation analyst should carefully consider both the financial performance and the economic condition of the subject enterprise when determining the level of risk involved in investing in the enterprise.

There are many factors that determine the relative attributes of success or failure of a healthcare enterprise in the current dynamic regulatory, reimbursement, and competitive environment. Perhaps one of the most important of these factors is the degree to which management is able to react to changes by making timely, informed decisions regarding the operational direction and financial performance of the organization. Among the most useful management tools available to achieve this objective is that of *benchmarking*, a well-established and long-accepted process of financial analysis that can assist managers and their professional advisers in developing a comprehensive understanding of the operating performance and financial status of their healthcare enterprise.

Benchmarking techniques can also be used to illustrate the degree to which an enterprise varies from comparable healthcare industry norms, as well as to provide vital information regarding trends in the internal operational performance and financial status of the subject enterprise. The successful application of benchmarking will generally reveal both favorable and unfavorable areas of a business's operations, which may then require further examination to determine causality and planning for their remediation. In this manner, the process of benchmarking often assists not only in identifying the existence of nonstandard performance and anomalies in costs, levels of productivity, and financial ratios, but also in discovering their underlying causes. Once the driving factors for aberration from the norm are determined, they should be further investigated and assessed as to the potential weaknesses and risk factors, as well as the potential strengths they pose for the enterprise going forward. While this benchmarking process is

essential for internal managers seeking to adjust business methods to optimize performance, it is also an invaluable tool for valuators and financial analysts in forecasting the most probable future performance of the subject enterprise.

Healthcare valuation analysts often use benchmarking to help assess the subject entity–specific (nonsystematic) risk by identifying and quantifying its relative strengths and weaknesses, compared to normative data from similar entities in its specific industry. Common methods of applying benchmarking analyses to the valuation process include:

1. Adjusting operating expenses and capital items, as well as capital structure to industry norms (when valuing a *control* position);
2. Adjusting the indication of a discount rate or cost of equity derived from the market (subject entity specific risk premium);
3. Selecting the appropriate financial multiples or ratios (e.g., price/earnings, price/revenue, price/EBITDA); and
4. Selecting appropriate discounts and premiums based on the level of value sought (e.g., discount for lack of marketability, control premium, minority discount).

Prior to performing a benchmark analysis, the valuation analyst will find it useful to *common size* the data in order to account for intertemporal differences in scope and scale that may skew the calculated results.[55] Common size refers to expressing the historical financial metrics as a percentage or a ratio of some measure. Methods of common-sizing include expressing items on income and expense statements in terms of

1. Percentage of revenue;
2. Per unit produced—for example, Relative Value Unit;
3. Per provider—for example, physician;
4. Per capacity measurement—for example, per square foot; or
5. Other standard units of comparison.

Successful financial and operational benchmarking can be divided into two categories:

1. Internal Subject Entity Benchmarking
2. External Benchmarking

[55] "Common Size Financial Statements," NetMBA.com (2007), http://www.netmba.com/finance/statements/common-size/ (accessed August 13, 2009), p. 3.

8.3.1.1 Internal Benchmarking

8.3.1.1.1 Internal Subject Entity Benchmarking *Internal subject entity benchmarking* compares the current or most recently reported performance of an enterprise or a property to its past performance, a process that involves the normalization of data (see the earlier discussion regarding normalization in Section 8.1.1.2, "Discounted Net Cash Flow Method") regarding the subject entity's historical operating performance and financial status and the comparison of that past data with the current data related to the subject entity. The adjustment of past data may be necessary to allow for a similar basis on which to make comparisons, by avoiding the complications of accounting/reporting measurement differences that have arisen over time within the entity, or anomalies, that is, extraordinary and nonrecurring events. *Internal subject entity benchmarkin*g examines the performance, over the course of time, of the subject entity for the purpose of identifying changes in performance within the entity and to provide a basis for projecting future performance over time. Recalling the *Principle of Induction*'s premise that the future is likely to be like the past (see Section 8.1.1.2.3.1, "Historical and Industry Trend Analysis"), *Internal subject entity benchmarking* can assist the valuation analyst, from a risk perspective, by highlighting changes in the historical operations of the subject entity and suggesting those trends that may require further investigation in determining the likelihood of the subject entity's ability to achieve the financial and operational targets projected within the valuation.

8.3.1.2 External Benchmarking

External benchmarking refers to the comparison of the subject enterprise or property to various benchmark metrics derived from data sources outside of the subject entity. *External Benchmarking* can be divided further into two categories: (1) *Benchmarking to Industry Norms* and (2) *Economic Benchmarking*.

8.3.1.2.1 Benchmarking to Industry Norms *Benchmarking to industry norms* compares data from the subject entity or property to normative survey data from other entities within the same industry sector and subsector.[56] This method of benchmarking provides the basis for the comparison of the *operational performance* and *financial condition* of the subject entity to that of similar entities, for the purpose of identifying its relative *strengths*, *weaknesses*, and *related measures of investment risk*.

[56] See Sik Wah Fong, Eddie W. L. Cheng, and Danny C. K. Ho, "Benchmarking: A General Reading for Management Practitioners," *Management Decision* 36, no. 6 (1998): 410.

The process of *benchmarking* against industry averages or norms will typically involve the following steps:

1. *Identification* and *selection* of appropriate surveys to use as benchmarks, that is, to compare with data from the *subject entity* of interest. This involves, in part, answering the question, "*In which survey would this organization most likely be included?*"
2. If appropriate, *recategorization* and *adjustment* of the subject entity's *revenue* and *expense* accounts to optimize data compatibility with the selected survey's structure and definitions (e.g., common sizing).
3. *Calculation* and *articulation* of observed differences of the subject entity from the industry averages and norms, expressed in terms of variance in ratios, dollar unit amounts, or percentages of variation.

Benchmark analysis, both internal and external, requires the *comparison* of metrics related to *operational performance* and *financial conditions* of the subject entity. These metrics reflect the *relative efficiency* of the subject entity as compared with its own historical performance, as well as its performance relative to the industry subsector in which it operates. Several of the metrics that may be used in the *benchmarking process* are described in the following sections.

8.3.1.3 Clinical Benchmarking Metrics *Clinical benchmarking* was initially a subset of industry benchmarking. Today, *clinical benchmarking* addresses several aspects of clinical care, including the continuous development and maintenance of quality health care; how best practices supports the attainment of targeted patient-focused outcomes; the compilation of all

CLINICAL BENCHMARKING

A benchmarking technique that is typically used with the expectation that a given organization is aiming to improve the quality of clinical care, obtain and/or maintain a particular standard of excellence, or increase the number of practices or processes that are founded in evidence-based practice.

"Sharing the Evidence: Clinical Practice Benchmarking to Improve Continuously the Quality of Care," by Judith Ellis, Journal of Advanced Nursing *32, no. 1 (2000): 216–218.*

generally accepted, evidenced-based benchmarks for best practices; evaluating the involvement of practitioners and multidisciplinary effort across levels of care in benchmarking activities; and the dissemination of best practices.[57]

Clinical benchmarking is typically used with the expectation that a given organization is aiming to improve the quality of clinical care and patient outcomes, obtain and/or maintain a particular standard of excellence, or increase the number of practices or processes that are founded in *evidence-based practice*.[58] The impact of successful clinical benchmarking often results in the continued utilization of a *best practice* approach to management, as well as the *innovative progression* in quality of care. Typically, the application of benchmark analysis is directly dependent on a practitioner's respective buy-in to the benchmarking process.[59] In light of the dynamic changes regarding the movement from traditional *fee-for-service* to *value-based reimbursement* (VBR), the valuation analyst should inquire as to the status of this within the subject entity and assess the impact on *qualitative value drivers*, for example, *depth of management*, that might provide support for the subject entity's ability to survive and prosper in the new *quality/value-driven* reimbursement environment. As this is a relatively new, and perhaps unfamiliar, consideration in valuing healthcare provider enterprises, the next sections are intended to provide a brief primer on *quality metrics* as increasingly important *value drivers*, requiring the analytical attention of the valuator.

As those *clinical benchmarking practices* being adopted are typically similar to those used for industry *financial benchmarking*, valuation analysts may wish to apply many of the same types of performance indicators, notwithstanding that they may have to be adopted to *clinical practices*, in contrast to industry or *business-related processes*. The applicability of a given metric is dependent on the *needs of the organization* and the *fit of the proposed benchmarking study* to those needs, as well as the *risk attended to the cost of the benchmarking*; in addition, the result may be *misinterpreted*, leading to a *lack of credibility* with providers.[60] A few of the more

[59] Ibid., p. 220.

[60] The challenges associated with benchmarking include who establishes the benchmark, how the data is reported, and does the data take into account statistical noise that may be seen as distorting the credibility of the message delivered? Thomas P. Miller, Troyen A. Brennan, and Arnold Millstein, "How Can We Make More Progress in Measuring Physicians' Performance to Improve the Value of Care," *Health Affairs* 28, no. 5 (September/October 2009): 1429.

commonly used benchmarking indicators, for example, *clinical resource utilization* and types of *quality indicators*, are discussed in more detail in the following sections.

8.3.1.3.1 Measuring Clinical Resource Utilization *Clinical resource utilization*, a topic that is becoming increasingly important with the acceleration in healthcare quality initiatives, includes concerns regarding the amount of resources used by a healthcare entity and the impact of *resource utilization* practices on quality of care.[61] The importance of measuring and benchmarking utilization rates is reflected in current and proposed legislation regarding physician payments, for example, *value-based purchasing initiatives*.[62] Due to recent concern over increasing imaging expenditures, some governmental organizations, such as the *Congressional Budget Office* (*CBO*), have proposed increasing the use of machines for imaging services as one type of cost-reduction initiative.[63]

Inpatient *Diagnostic Related Groups* (*DRGs*) are considered helpful benchmarks for utilization rates and can be collected from standard claim forms for physician payment (see Chapter 2, "Reimbursement Environment," for a discussion of DRGs and other clinical metrics).[64] In addition, because submission of DRGs is regulated by the *Health Care Industry Association*'s (*HCIA*) *International Classification of Clinical Services* (*ICCS*) coding system, hospital-specific codes are converted to a universal system, standardizing patient-level data from different hospitals for easy comparison.[65] Additional useful benchmarking indicators for measuring clinical resource utilization include average measurements for *length of stay (ALOS or LOS)*; *pharmaceutical units* or *pharmacy cost*; *laboratory units/cost*; *imaging units/cost*; and *average routine charges*, for example, room and board costs per case/day, total ancillary costs, operating room costs, anesthesia costs, and medical/surgical supply costs, which are often designated as ratios (i.e., per case or per day).[66]

8.3.1.3.2 Measuring Quality The topic of whether healthcare reform would improve the quality of care and the price of services has been among one of the more pressing concerns voiced by providers and patients for the last few decades.[67] With an increased focus on improving quality of care, while, at the same time, decreasing healthcare costs and expenditures, as well as the attempt to balance the interests of patients, physicians, *and* payors, healthcare reform has posed an almost intractable challenge. Quantifying the quality of care is perceived to be difficult, due, in part, to the variability in how providers define and perceive the concept of "*quality.*" As a result of this misalignment, there exist a variety of conflicting methods by which to establish healthcare *quality metrics*. Quality indicators have been established in three general categories: (1) *institutional quality indicators*, (2) *service quality indicators*, and (3) *clinical quality indicators*.

Institutional quality indicators are benchmarking metrics used to determine how well a provider adheres to regulatory standards set by accreditation agencies, associations, and other regulatory bodies.[68] Although institutional quality is traditionally determined by measuring outcomes, several organizations continue to use measures of compliance to quantify adherence to regulatory measures.[69] Examples of organizations requiring hospital compliance with quality targets include (1) the *Joint Commission*; the *College of American Pathologists* (*CAP*) for laboratory operations; (2) the *Occupational Safety and Health Administration* (*OSHA*) for workplace safety; and (3) the *National Council for Quality Assessment* (*NCQA*), which measures the quality of health plans.[70]

Methods of collecting data on quality vary by hospital, health system, or state. For example, some states require hospitals to fill out "*hospital scorecards*," which may be used to measure a range of performance indicators, from *clinical outcomes* of various specialties (e.g., in obstetrics: Cesarean delivery rates, postdelivery complication rates), to *hospital throughput data* (e.g. number of cases, ALOS).[71] This data may be used in a variety of ways at the discretion of the provider, for example, consumer marketing of services or obtaining additional Health Maintenance Organization (HMO) contracts.[72]

Factoid

The American Medical Group Association (AMGA) provides three different annual quality surveys that allow participating organization to compare their data to industry peers across the nation. These include (1) the Patient Satisfaction Benchmarking Program, (2) the Provider Satisfaction Benchmarking Program, and (3) the Employee Satisfaction and Engagement Benchmarking Program.

"Benchmarking," American Medical Group Association, http://www.amga.org/Research/benchmarking_research.asp (accessed September 15, 2009).

Service quality indicators are used to measure *patient satisfaction* regarding the healthcare services they received from providers.[73] In some ways, this is the most direct method to gauge performance and the success of an organization's customer service goals. Although many organizations tailor satisfaction surveys to the particular services provided, data may not be comparable across organizations. Regular assessment of *patient satisfaction* may be useful for improving long-term quality outcomes of a healthcare enterprise, but it is often impractical as a short-term or immediate outcome measure, due to the variable time interval between survey collection and implementation of desired changes.[74] See the sidebars for several sources of data regarding healthcare quality that are published annually by the *American Medical Group Association* (*AMGA*): (1) *Patient Satisfaction Benchmarking Program*; (2) *Provider Satisfaction Benchmarking Program*; and (3) *Employee Satisfaction and Engagement Benchmarking Program*.[75]

There exist several hundred *Clinical Quality Indicators*, which may be useful in measuring *clinical outcomes* from patient treatments. Three general categories of indicators commonly used are:

1. *Generic indicators*, for example, morbidity and mortality or readmission, which are measures based on a rate of occurrence within the patient population.

[73] Ibid., p. 50.

[74] Ibid., pp. 50–51.

[75] American Medical Group Association, "Benchmarking," http://www.amga.org/Research/benchmarking_research.asp (accessed September 15, 2009).

2. *Disease-specific indicators,* which are used to classify patients with regard to either a specific diagnosis or procedure (with varying degrees of specificity), for example, the number of patients undergoing an elective surgery.
3. *Functional indicators*, which are outcomes used as a proxy for patient quality of life or overall population health and may include, for example, patient functional performance following a procedure.[76]

Clinical quality indicators are examples of measuring *output quality*, that is, the determination of whether the quality standard was met as a result clinical care or treatment.[77] With the rise of *accountable care* (as detailed in Chapter 6, "Healthcare Reform"), the ability of healthcare enterprises to generate revenue will be increasingly linked to the clinical and quality measures discussed earlier. The assessment of risk for a given healthcare enterprise necessitates an analysis of the clinical and quality metrics of the subject entity in comparison with industry norms.

8.3.1.4 Ratio Analysis *Financial ratio analysis* calculates ratios of various aspects of the *operational performance* and *financial conditions* as illustrative of the financial status of the subject entity. These ratios are evaluated in terms of their comparison to generally established industry norms and are often expressed as ranges of positive or negative trends for the subject industry, in comparison to the industry sub-sector. For example, a *current ratio* (as described next) of less than 1.0 for the entity might be considered "*suspect*," in indication of inadequate resources to meet current obligations, when compared to ratios derived from survey data from the comparable industry subsector.

FINANCIAL RATIO ANALYSIS

A benchmarking technique in which ratios are typically calculated as measurements of various financial and operational characteristics that illustrate the financial status of the entity.

[76] HFMA, "Financial and Clinical Benchmarking: The Strategic Use of Data," HCIA, 1997, p. 57

[77] Arthur G. Tweet and Karol Gavin-Marciano, "The Guide to Benchmarking in Healthcare: Practical Lessons from the Field," *Quality Resources* (1998): 25.

Liquidity Ratios

Ratios that measure the ability of an organization to meet cash obligations as they become due, that is, to support operational goals.

Common types of financial indicators that are measured by ratio analysis include:

1. *Liquidity ratios* measure the ability of an organization to meet cash obligations as they become due, that is, to support operational goals. Ratios above the industry mean generally indicate that the organization is in an advantageous position to better support immediate goals. The *current ratio*, which quantifies the relationship between assets and liabilities, is an indicator of an organization's ability to meet short-term obligations. Managers use this measure to determine how quickly assets are converted into cash.
2. *Activity ratios*, also called *efficiency ratios*, indicate how efficiently the organization uses its resources or assets, including cash, accounts receivable, salaries, inventory, property, the plant, and equipment. Lower ratios may indicate an inefficient use of resources and assets.
3. *Leverage ratios*, measured as the ratio of long-term debt to net fixed assets, are used to illustrate the proportion of funds, or capital, provided by shareholders (owners) and creditors to aid analysts in assessing the appropriateness of an organization's current level of debt. When this ratio falls equal to or below the industry norm, the organization is typically not considered to be at significant risk.
4. *Profitability*: Indicates the overall net effect of managerial efficiency of the enterprise. To determine the profitability of the enterprise for benchmarking purposes, the analyst should first review and make adjustments to the owner(s) compensation, if appropriate. Adjustments for the market value of the "*replacement cost*" of the professional services provided by the owner are particularly important in the valuation of professional medical practices for the purpose of arriving at an "*economic level*" of profit.

Activity Ratios

Ratios that indicate how efficiently the organization uses its resources or assets, including cash, accounts receivable, salaries, inventory, property, the plant, and equipment.

Leverage Ratios

Ratios used to illustrate the proportion of funds, or capital, provided by shareholders (owners) and creditors to aid analysts in assessing the appropriateness of an organization's current level of debt.

Profitability

An indication of the overall net effect of managerial efficiency of the enterprise.

Exhibit 8.6 displays some of the commonly used ratios in each of the above categories:

The valuation analyst should be aware that the financial ratios discussed here are illustrative, but not exhaustive, of those available. The selection of the appropriate ratio(s) to consider will be largely driven by the facts and circumstances specific to the subject enterprise being valued, for example, a key metric within the health insurance industry subsector is the *medical loss ratio*, which is not likely to be applicable in other industry subsectors.[78] The valuation analyst should endeavor to include as many industry-specific *benchmarking metrics* available to generate the fullest, most robust picture of the subject enterprise's *financial performance* and *economic status*, as related to its industry subsector.

In addition, the selection of financial ratios for analysis and comparison of the enterprise's performance requires careful attention to the homogeneity of the available benchmarking data sample. Benchmarking of intra-organizational data typically proves to be less variable across several different measurement periods. However, the use of data from *external* enterprises for comparison may introduce variation in measurement methodology and procedure. In the latter case, the use of a standard chart of accounts for the subject enterprise, or recasting the subject enterprise's data to a standard format that matches the organization of the benchmark sample data, can effectively facilitate an appropriate comparison of the subject enterprise's *operating performance* and *financial status* to *industry normative* survey data.

[78]The Medical Loss Ratio is the relationship of medical insurance premiums paid out for claims. David Edward Marcinko and Hope Rachel Hetico, eds., *Dictionary of Health Insurance and Managed Care* (New York: Springer, 2006), p. 181.

EXHIBIT 8.6 Commonly Used Financial Ratios

Ratio	Formula
Profitability Ratios	
Operating Profit Margin	$\frac{\text{Operating Profit}}{\text{Net Revenue}}$
EBITDA Margin	$\frac{EBITDA}{\text{Net Revenue}}$
Liquidity Ratios	
Current Ratio	$\frac{\text{Total Current Assets}}{\text{Total Current Liabilities}}$
Working Capital to Revenue	$\frac{\text{Working Capital}}{\text{Net Revenue}}$
Working Capital (excluding current portion of Interest Bearing Debt) to Revenue	$\frac{\text{Working Capital} - \text{Current Portion of Interest Bearing Debt}}{\text{Net Revenue}}$
Activity Ratios	
Days in Accounts Receivable	$\frac{\frac{\text{Accounts Receivable}}{\text{Net Revenue}}}{365}$
Net Property & Equipment to Net Revenue	$\frac{\text{Property and Equipment (net)}}{\text{Net Revenue}}$
Total Asset Trunover	$\frac{\text{Net Revenue}}{\text{Total Assets}}$
Leverage Ratios	
Debt Ratio	$\frac{\text{Total Liabilities}}{\text{Total Assets}}$
Interest Bearing Debt to Book Value of Total Capitalizaion	$\frac{\text{Interest Bearing Debt}}{(\text{Interest Bearing Debt} + \text{Net Worth/Equity})}$
Interest Bearing Debt to Market Value of Total Capitalizaion	$\frac{\text{Interest Bearing Debt}}{(\text{Interest Bearing Debt} + \text{Market Value of Equity})}$

HISTORICAL SUBJECT BENCHMARKING

A benchmarking technique that compares the current or most recently reported performance of an entity to its past performance, a process that involves the adjustment and comparison of past data with current data.

Healthcare *industry normative* survey data of this type, for the purposes of benchmarking, may be obtained from several publicly available, or proprietary, sources, enabling the analyst to compare detailed financial, operational, and clinical performance to similar peer group data. It is important to ensure that the survey data is as current as possible, and it should be noted that delays of a year or more in the publication of survey data are not uncommon. In the healthcare industry's rapidly changing reimbursement and regulatory environment, where year-to-year changes may be significant and material, mismatching data from different years due to the delay in availability may result in shortcomings as to the efficacy and validity of the benchmark analysis and the valuation process. An example of the application of measuring quality can be found online at http://www.wiley.com/go/healthcarevaluation.

8.3.1.5 Economic Benchmarking Generally speaking, *economic benchmarking* may be used as a *research technique* to understanding market forces. More specifically, *economic benchmarking* is a comparison of *business operation efficiency* based on economic principles, or as it is affected by the characteristics of a particular market.[79] One study hypothesized that economic benchmarking can be used to (1) improve the average performance of a given entity within the marketplace; (2) improve the performance of poorly performing organizations, more than others above a certain threshold of performance; or (3) reduce the gaps in performance between organizations.[80]

The *client base* and *earnings* of a healthcare enterprise are associated, in some degree, with the demographics of the area in which the enterprise operates. For example, the value of an existing physician medical practice

ECONOMIC BENCHMARKING

A benchmarking technique that compares that business operation efficiency based on economic principles, or as it affects a particular market.

"Economic Benchmarking and Its Applications," by Virendra Ajodhia, Konstantin Petrov, and Gian Carlo Scarsi, KEMA Consultants, p. 1.

with an established patient population would typically be negatively affected by high population growth and turnover rates, which circumstances would make it easier for a new *competitive market entrant* medical practice to establish itself and become equally profitable.[81] In contrast, the value of an existing practice may increase with a stable, steadily growing population base, as a rising population rate may act to promote economic growth and increase the pricing of services within a typical market.[82]

The age distribution of a given *market service area*'s (MSA) patient population is an important factor in assessing utilization demand for certain medical specialties and subspecialties. Today, the aging population of baby boomers has increased demand for certain specialties, such as practitioners of cardiology, geriatric medicine, ophthalmology, and orthopedics. In contrast, a younger population base will typically be more reliant on, and therefore raise the demand for, practitioners of pediatrics, obstetrics, family medicine, and neonatology.

Economic benchmarking provides a guideline by which consultants can compare the efficiency, needs of, and demands on healthcare organizations, while accounting for market forces. This form of benchmarking is generally used to provide basic information as to where a given enterprise stands with regard to its *effectiveness* and/or *efficiency* within the competitive MSA in which it operates.[83] This information provides a foundation for further subject entity–specific analysis for the purpose of benchmarking the subject entity's relative riskiness as related to (1) *operational and clinical performance*, (2) *financial status*, (3) *efficiency*, and (4) *function in the marketplace*.

Factoid

The Gross National Product (GNP) is the broadest indicator of economic growth, with current-dollar GNP measuring the market value of goods and services produced, and constant-dollar GNP (or Real GNP) measuring the quantity of economic output.

Guide to Economic Indicators, *by Norman Frumkin (Armonk, NY: M. E. Sharpe, 1990), p. 114.*

8.3.1.5.1 Economic Benchmarking Indicators and Sources There are a variety of national, regional, and local sources that provide some of the more common economic indicators, which include (1) *unemployment*, (2) *labor statistics*, (3) *inflation*, (4) *new housing starts*, (5) *household income*, (6) *inflation rates*, (7) *interest rates*, (8) *Gross National Product* (GNP), (9) the *Composite Index of Leading Economic Indicators*, (10) *return rates for government securities*, and (11) *financial market data and indexes*, among others. (See the sidebars for several sources of general economic data.)

In addition to using both *internal* and *external* benchmark comparisons in developing the *assessment of risk*, the valuation analyst should consider the subject entity's operation within the context of the *four pillars*, that is, (1) *regulations*, (2) *reimbursement*, (3) *competition*, and (4) *technology*, as discussed later.

8.3.2 Regulatory Risk

Perhaps arising from the *corporatization* and the rapid growth of *government financing* of the ever-changing U.S. healthcare delivery system, the regulatory environment in which healthcare enterprises and providers operate has become significantly more *complex* and *intense* in its *scrutiny*. This circumstance presents the potential for severe penalties, civil and criminal, related to entering into transactions and arrangements that may subsequently be found to be legally impermissible. With the passage of the 2010 Patient Protection and Affordable Care Act (ACA—aka *Obamacare*), and the government's assertion to eliminate fraud as an avenue to help finance reform, providers are facing additional attention focused on increased regulation and strict prosecution of *fraud and abuse* violations. Despite the June 2012 U.S. Supreme Court decision upholding the constitutionality of

the ACA, and the related implementation of the act, issues related to the regulation of healthcare enterprises, assets, and services on both a federal and a state level are yet to be resolved. Regardless of how these issues are ultimately decided, the sweeping nature of the ACA will continue to drive ongoing changes in the structure, operation, and financing of many healthcare provider enterprises. See Chapter 6, "Healthcare Reform," for an in-depth discussion of the ACA, as well as other trends related to healthcare reform.

With this ever-changing regulatory environment, the ability to accurately project the future performance of a healthcare entity is diminished, as the level of uncertainty related to *healthcare business and capital structures*, *operations*, and *current marketing plans* increases. As such, this level of uncertainty may increase the perceived risk of an investment in a healthcare entity. The valuation analyst should carefully research the perception of this uncertainty, and the resulting perceived risk, by monitoring the healthcare regulatory changes and the market's reaction to them. Note that the investor's perception of risk is often more important than what the risk may actually be (see the earlier discussion on the impact of the *perception of risk*).

The healthcare industry represents one of the largest sources of expenditures by the federal government and as a result is one of the most heavily regulated U.S. industries (as discussed in Chapter 3, "Regulatory Environment"). The potential for *fraud and abuse* claims adds to the uncertainty of achieving the forecast net economic benefits accruing to the owners of a healthcare entity, thereby increasing the perceived risk and demand for a higher *risk-adjusted rate of return* for a potential investor. The valuation analyst should, in performing his or her assessment of risk, include an analysis of the potential effects of regulatory oversight, resulting in diminished profitability for the enterprise.

8.3.3 Reimbursement Risk

As Medicare is often a significant source of revenue for a healthcare entity, annual changes in the method by which Medicare reimburses providers can, concomitantly, significantly affect the perceived level of risk related to the *forecasted financial performance* of a healthcare enterprise. Initially, with Medicare's conversion to the prospective payment system, projection of payment for services rendered provided a relative certainty, for example, service X is reimbursed by Medicare with Payment Y, with little or no adjustment. Further, commercial payors typically index their payments for services rendered to the rate established by the Medicare PPS, which similarly provides a level of certainty in the commercial market. On a day-to-day basis, this provides tremendous certainty.

Note that although Congress changes Medicare reimbursement rates on an annual basis, this constitutes, to some degree, a *predictable change*, which is not a driver of *uncertainty. Unpredictable change* drives *uncertainty.* However, Congress has, on many occasions, reversed an announced change in reimbursement for Medicare's prospective payment systems, often to the benefit of the healthcare providers, which unpredictable change is then often mirrored by many commercial payors, in turn driving tremendous uncertainty and perception of risk in the healthcare industry. This uncertainty regarding reimbursement under the prospective payment systems is only compounded by the unease associated with the accelerating shift from fee for service payments to VBR. In performing a *risk assessment*, the healthcare valuation analyst should be aware of this uncertainty and how it relates to investor perception of risk and demand for higher *rates of return.* Chapter 2, "Reimbursement Environment," discusses payor trends within the healthcare industry in detail.

8.3.4 Competitive Risk

In recent years, *consumer-driven healthcare* has increased, due to the shift away from *defined benefits* to *defined contributions* of premium coverage plans, where more of the responsibility for premium payment is placed directly on the insured patients. The resulting economic pressures from this new paradigm have been accompanied by greater *direct-to-consumer advertising* by both providers and pharmaceutical companies.[84] Competition within the healthcare industry, driven by the growth of *consumer-driven healthcare*, is complicated by those unique characteristics of the healthcare industry that hinder the traditional notion of economic behavior. For example, as the relationship between *price* and *quality of care* is generally defined by providers, rather than by consumers, patients are less equipped to make informed healthcare purchase decisions, in comparison to other nonhealthcare–related markets. A more in-depth discussion of the unique competitive characteristics of the healthcare industry, as well as the barriers to new market entrants, is set forth in Chapter 4, "Competition."

Despite these *barriers to entry* in the healthcare marketplace, the competition among healthcare entities can become intense as these entities endeavor to add new services or expand to new markets. The development of ACOs (as discussed in Chapter 6, "Healthcare Reform") reduces the

[84] Marc-Andre Gagnon and Joel Lexchin, "The Cost of Pushing Pills: A New Estimate of Pharmaceutical Promotion Expenditures in the United States," *Public Library of Science* 5, no. 1 (January 2008): 0032.

total number of competitors in a given market and serves a consolidating role within the healthcare industry. Relative to nonhealthcare industries, this nontraditional economic behavior and industry consolidation serve to increase perceptions of risk, while heavy regulation of operations (which also serves as a *barrier to entry*) tends to decrease perception of risk. The valuation analyst should carefully review the competition within the specific MSA in which the healthcare enterprise being valued operates, and determine the likelihood of changes to the firms making up the likely competitors of the enterprise.

8.3.5 Technological Risk

In this era of healthcare reform, change is constantly on the horizon, with increased emphasis on advancements and utilization of new technologies. The United States exhibits an intensive technologically focused style in the practice of medicine and delivery of healthcare services that is unparalleled elsewhere. Technology-driven medicine is perceived as a source of professional prestige, with society generally favoring the application by providers of even more advanced medical technologies. These technological advancements in the clinical treatment of patients will undoubtedly shape the future direction of patient care services in a reimbursement environment that rewards providers based on "*quality*" over "*quantity.*"

The continual turnover in technology required within the healthcare industry continues to lend a *predictable* level of technological change that, while not specific with respect to the type of new technology, is constant in its effect on the delivery of healthcare services. The additional risk for healthcare entities is not only the *change in technology* (which may render some providers obsolete) within the industry, but is also the inability to foresee the arrival of new technologies for a subject entity's specific MSA, as well as the demand for capital to fund its acquisition, implementation, and operation. The old adage "*No Bucks, No Buck Rogers*" is particularly pertinent to this capital adequacy risk factor. Accordingly, the valuation analyst should be aware of the technological trends within the particular industry sector and subsector, as well as the particular specialty and subspecialty of the subject entity.

8.4 DISCOUNTS AND PREMIUMS

With each method used, certain adjustments should be considered based on the specific requirements of each engagement and the inherent indication of value (i.e., the "*level of value*") that results from each method. There are

Blockage Discount

A price concession that will typically be accepted by a controlling interest holder of a freely traded company when selling a large block of stock at one time.

DISCOUNT FOR LACK OF MARKETABILITY

A discount applicable to the value of a controlling interest in a closely held company, due to the inherent illiquidity of the investment, which may include the explicit and implicit costs incurred in developing the market, assessing the viability of the business interest, and those costs associated with preparing the business for a potential transaction.

several different premiums and discounts that may be appropriate to consider in performing a valuation of a healthcare enterprise, for example, *Discount for Lack of Marketability*, *Key-Person Discount*, *Blockage Discount*, *Minority Discount*, *Control Premium*, *Blockage Premium*, and so on. Application of these discounts and premiums requires a thorough understanding of the specific facts and circumstances of the valuation assignment, as well as of the legal bundle of rights that make up the property interest being appraised. For example, if the scope of the engagement requires the valuator to determine the fair market value of a 100 percent *controlling* interest in a private (*closely held*) business, indications of value derived from methods that result in a *freely traded* level of value (e.g., the *Guideline Public Company Method,* described earlier) may warrant the application of a premium to reflect the prerogatives of control inherent to the 100 percent controlling interest being appraised, which elements of control are absent from the analysis of minority interest level shares in publicly traded companies.

8.4.1 Discount for Lack of Marketability

Discounts for lack of marketability are meant to reflect two circumstances that affect the monetization of property: (1) liquidity (or lack thereof), which typically refers to the ability of the seller to convert his or her investment into cash, with certainty as to the amount and timing of the proceeds; and (2) level of marketability of a business interest, which refers to the relative transactional costs of monetizing an interest in a closely held enterprise, in contrast to the transactional cost of a property interest where

there exists a previously established market for the specific business interest being sold (e.g., publicly traded shares that are bought and sold on a stock exchange enjoy a high level of marketability, in contrast to shares in the same company that may have certain restraints in regard to being traded on the exchange). As noted by Professor Abbot,

> *Since the adoption of definitions for marketability (capability and ease of transfer or salability) and liquidity (ability to readily convert an asset into cash* ***without significant loss of principal****), it is important to parse this discount based on the source of impairment. Marketability denotes the legal ability to sell or transfer ownership. A public, registered, and unrestricted security is fully marketable, while a public, registered, but restricted security (subject to Rule 144) is less marketable and a private, unregistered interest is least marketable (most impaired).*[85]

There are inherent risks relative to the liquidity associated with ownership of controlling interests in both *closely held* and *freely traded* companies, in contrast to ownership of minority interests in freely traded companies. Owners of entire companies (public or private) or minority interests in private companies lack the ability to simply contact a buyer or a broker to sell their interest instantaneously and receive the proceeds within days, in contrast to investors in the public stock market, who have the ability to sell their *freely traded* minority interest in a company within minutes and receive cash proceeds in a matter of days.

Further, as pointed out in Shannon Pratt's *Valuing a Business*, the controlling interest holder in a *closely held* company would have the ability to liquidate his or her interest only by either (1) consummating a public offering of the controlling block of stock or (2) selling his or her interest in

Risk

Uncertainty, or the assignment of outcomes and their associated probabilities of occurring.

Dictionary of Health Economics and Finance, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2007), p. 316.*

[85] Ashok Abbot, "Discount for Lack of Liquidity: Understanding and Interpreting Option Models," *Business Valuation Review* 28, no. 3 (Fall 2009).

a private transaction.[86] The transactional considerations that a controlling owner may incur, should this individual wish to divest of his or her ownership interest, include the following:

1. *Uncertain time horizon to complete the offering or sale.*
2. *Cost to prepare for and execute the offering or sale.*
3. *Risk concerning eventual sale price.*
4. *Noncash and deferred transaction proceeds.*
5. *Inability to hypothecate.*[87]

The controlling interest holder of a *freely traded* company would typically have to accept some level of price concession in order to sell a large block of stock at once, referred to as a *blockage discount*, which also occurs for large blocks of minority interests, as discussed next.[88]

Thus, a discount may be applicable to the value of a controlling interest in a *closely held* company, due to the inherent illiquidity of the investment, which may include the explicit and implicit costs incurred in developing the market, assessing the viability of the business interest, and those transactional costs associated with preparing the business for a potential transaction. Such a discount is commonly referred to as a "*discount for lack of marketability*."

Much of the empirical research supporting the notion of a *private company discount*, that is, a *discount for lack of marketability* for controlling interests in *closely held* companies, centers on the difference in acquisition multiples of public and private companies.[89] However, it is the view of some in the valuation profession that there is no conceptual basis for applying a *discount for lack of marketability* to a controlling interest.[90] These analysts point to a study conducted by *John Phillips* and *Neill Freeman*, published in the *Business Valuation Review* in September 1995, that attributes the indicated discounts resulting from the *Mergerstat Review Study* of P/E ratios of

acquisitions of public and private companies to differences in size, industry, and profitability.[91]

Other observers of the differences in the acquisition multiples between public and private companies have hypothesized the following reasons for the variance:

1. **Exposure to the market**, that is, publicly traded companies are listed in multiple news outlets and their audited financial data is available to the public; the lack of this market exposure for private companies requires more resources to be spent finding possible acquisition targets and obtaining information necessary to assess a proper bid price.
2. **Quality of financial information**, that is, more extensive financial reporting requirements for publicly traded companies, in contrast to private companies, may lead to information asymmetries between buyers and sellers of private companies, resulting in an increased perception of riskiness for investors in private companies, compared to investors in publicly traded companies; it should be noted that even though publicly traded companies may still be able to "mask" certain information about the company through questionable accounting practices, it is assumed that private companies, operating under less stringent reporting requirements, would have a greater ability to manipulate their accounting data.
3. **Size effect**, in other words, similar to the argument set forth in the Phillips and Freeman study, the private company data set typically consists of smaller companies, as compared to the public company data set, and smaller firms are typically riskier than larger firms, as most empirical studies on the matter have shown; hence, the more risky the firm, the higher the return that would be required by a typical investor, and therefore the lower the indicated value result.[92]

Empirical studies performed more recently regarding the difference in acquisition multiples between public and private companies include the

[91] See reference to John R. Phillips and Neill W. Freeman, "Do Privately-Held Controlling Interests Sell for Less?" *Business Valuation Review* 14, no. 3 (September 1995): 102–113, in Chris Mercer, *Quantifying Marketability Discounts* (Memphis, TN: Peabody Publishing, 1997), pp. 340–341.

[92] Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely-Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 444.

Koeplin, Sarin, and Shapiro Study and the *Officer Study.*[93] These studies indicate the existence of a *private company discount*, even after controlling for industry and size, when making comparisons of the valuation multiples. However, the results of these most recent studies vary substantially, depending on the valuation multiple chosen for the analysis. The *Koeplin et al. study* reported that the comparison of Enterprise Value/Sales multiples derived from acquisitions of public and private companies did not provide an indication of the existence of a *private company discount*; however, the comparison *of Enterprise Value/EBITDA* multiples indicated an 18 percent discount, and the comparison of *Enterprise Value/EBIT* multiples yielded a 30 percent discount. The *Officer Study* had similar variability in the results.

In addition to the liquidity risks inherent in controlling interests (of both *closely held* and *freely traded* enterprises), there exist inherent risks relative to the liquidity of investments in *closely held* minority interests that are not relevant to the investment in freely *traded* minority shares. This *closely held minority interest liquidity risk* is distinctly different from that of the *controlling interest liquidity risk*, mentioned earlier, and typically is observed using the variance in specific types of minority interest shares.

Over the years, there have been several empirical studies performed attempting to quantify a *discount for lack of marketability* related to ownership of *closely held* minority interests in contrast to *freely traded* minority interests. These studies can be classified into two categories: (1) transactions involving restricted stock of publicly traded companies and (2) studies involving pre- and post-initial public offerings (IPO).

8.4.1.1 Restricted Stock Studies Publicly traded companies may sell unregistered securities by means of a *private placement*. These "*restricted*" stocks are very similar to the shares of stock of the same company that are publicly traded in the market, except that the owners of the restricted stocks are prohibited from selling for a designated period of time (e.g., six months, one year, or two years). Purchasers of restricted stock typically require a discount from the price of the publicly traded shares, to reflect the risk associated with holding such an illiquid investment.

[93] John Koeplin, Atulya Sarin, and Alan Shapiro, "The Private Company Discount," *Bank of America Journal of Applied Corporate Finance* 12, no. 4 (Winter 2000): 94–101; Micah Officer, "The Price of Corporate Liquidity: Acquisition Discounts for Unlisted Targets," *Journal of Financial Economics* 83 (2007): 571–598.

Restricted Stock

Publicly traded stocks are prohibited from trading for a designated period of time (e.g., six months, one year, or two years).

Table 8.1 summarizes the results of several of the empirical studies performed on the discounts given to restricted stocks.

The arithmetic mean of these studies results in approximately a 28 percent discount of the price for restricted stocks of public companies. It should be noted that since 1997, when the *SEC Rule 144* requiring a two-year "*holding period*" before restricted stocks could be freely traded was reduced to one year, there has been only one restricted stock study performed. This study, by *Columbia Financial Advisors* (set forth in Line 13 in Table 8.1), found an average discount for lack of marketability of only 13 percent.

8.4.1.2 Pre-IPO Studies Two of the significant studies relating to the discounts of the price of private transactions and their subsequent IPOs

TABLE 8.1 Summary of Restricted Stock Studies

	Published Empirical Study	Years Covered by the Study	Number of Transactions	Average Discount
1	SEC Overall Avg.	1966–69	398	25.80%

TABLE 8.2 Summary of Emory Studies (Adjusted 2002)

Study Date	No. of Qualifying Transactions	Mean Discount	Median Discount
1980–1981	12	59%	68%
1985–1986	19	43%	43%
1987–1989	21	38%	43%
1989–1990	17	46%	40%
1990–1992	30	34%	33%
1992–1993	49	45%	43%
1994–1995	45	45%	47%
1995–1997	84	43%	41%
1997–2000	266	50%	52%
Total of All Transactions (1980–2000)	543	46%	47%

"Underlying Data in Excel Spreadsheet for 1980–2000 Pre-IPO Discount Studies, as adjusted October 10, 2002," http://www.emoryco.com/attach/1980_2000_Underlying_Data.xls (accessed December 30, 2008).

were considered: (1) *Emory Studies* and (2) *Willamette Management Associates Studies*.

These empirical studies measured the difference in price of arm's-length transactions involving private companies and the price of their stock at a subsequent IPO.

8.4.1.2.1 Emory Studies (also known as the Baird & Co. Studies) John D. Emory Sr., F. R. Dengel III, and John D. Emory Jr., of Emory Business Advisors, have conducted nine studies between the years 1980 and 2000, using the prospectuses of companies at their IPO that had a prior transaction within five months prior to the IPO. In 2002, after a further review of the transactions, the authors of the study eliminated all transactions that possibly could have been outside the time frame of the nine studies, as well as corrected other minor errors that had occurred over the years.[94] The adjusted results of the Emory Studies are summarized in Table 8.2.

The average of the nine studies by Emory and colleagues resulted in an average discount for lack of marketability of 46 percent and a median discount of 47 percent. It should be noted that the 1997–2000 study was a specialized study of 266 transactions involving "*dot-com*" only stocks.

[94] John Emory Sr., F. R. Dengel III, and John Emory Jr., "Discounts for Lack of Marketability Emory Pre-IPO Discount Studies 1980–2000 as adjusted October 10, 2002," *Business Valuation Review* (December 2002): 190.

8.4.1.2.2 Willamette Management Associates Studies *Willamette* Management Associates (WMA) has conducted an annual study from 1975 through 2000 of completed IPOs, similar to the Baird Studies, to determine a discount for lack of marketability. The results of WMA's studies are summarized in Table 8.3.

TABLE 8.3 Summary of WMA Studies

Time Period	Number of Companies Analyzed	Number of Transactions Analyzed	Standard Mean Discount	Trimmed Mean Discount*	Median Discount
1975–78	17	31	34.00%	43.40%	52.50%
1979	9	17	55.60%	56.80%	62.70%
1980–82	58	113	48.00%	51.90%	56.50%
1983	85	214	50.10%	55.20%	60.70%
1984	20	33	43.20%	52.90%	73.10%
1985	18	25	41.30%	47.30%	42.60%
1986	47	74	38.50%	44.70%	47.40%
1987	25	40	36.90%	44.90%	43.80%

TABLE 8.4 Koeplin, Sarin, and Shapiro Study

Descriptive Statistics	Private Firms[1]	Public Firms[2]
Net Sales (in millions)	$56.30	$91.20
Assets	$40.60	$60.10
	Private Company Discount[3]	
Enterprise Value/EBIT	30%	
Enterprise Value/EBITDA	18%	
Enterprise Value to Sales	<1%[4]	

"The Private Company Discount," by John Koeplin, Atulya Sarin, and Alan Shapiro, *Bank of America Journal of Applied Corporate Finance* 12, no. 4 (Winter 2000): 94–101.
[1]Median of 84 closely held companies acquired.
[2]Median of 84 matched public companies acquired.
[3]Based on median multiples for domestic acquisitions.
[4]Difference not statistically significant.

The average and median of the trimmed data of WMA's studies resulted in a discount for lack of marketability of 42.2 percent and 44.7 percent, respectively.

8.4.1.3 Acquisition Multiples Studies

8.4.1.3.1 Koeplin, Sarin, and Shapiro In 2000, the *Bank of America Journal of Applied Corporate Finance* published a study conducted by John Koeplin, Atulya Sarin, and Alan Shapiro titled "The Private Company Discount," referred to as the *Koeplin, Sarin and Shapiro Study.*[95] This study reviewed matched pairs (within a similar sector) of private and public company acquisitions between 1984 and 1998. Table 8.4 shows descriptive statistics related to the relative size of the private and public firms within the study, as well as the implied discount derived from the median of the selected transaction multiples.

8.4.1.3.2 Officer Study In 2007, the *Journal of Financial Economics* published a study conducted by Micah Officer, titled "The Price of Corporate Liquidity: Acquisition Discounts for Unlisted Targets," referred to

[95]Koeplin is now an associate professor at the University of San Francisco; Sarin is now a professor at Santa Clara University; Shapiro is now a professor at the University of Southern California.

TABLE 8.5 Officer Study

Descriptive Statistics	Private Firms[1]	Unlisted Subsidiaries[2]	Public Firms[3]
Assets (in millions)	$52.50	$255.20	$292.60
	Private Company Discounts		
	Private Firms[4]	Unlisted Subsidiaries[5]	
Enterprise Value/EBITDA	17%	27%	
Enterprise Value/Sales	18%	30%	
Average Acquisition Discount	17%	28%	

"The Price of Corporate Liquidity: Acquisition Discounts for Unlisted Targets," by Micah Officer, *Journal of Financial Economics* 83 (2007): 571–598.
[1]Median of 417 closely held companies acquired.
[2]Median of 416 unlisted subsidiaries acquired.
[3]Median of 4,206 public firms acquired.
[4]Based on average difference in multiples (price paid for equity to book value of equity, price paid for equity to earnings, enterprise value to EBITDA, and enterprise value to sales) paid for private firms and comparable public firms (difference in arithmetic average of multiples).
[5]Based on average difference in multiples (price paid for equity, price paid for equity to earnings, enterprise value to EBITDA and enterprise value to sales) paid for unlisted subsidiaries and comparable public firms (difference in arithmetic average of multiples).

as the *Officer Study.*[96] This study compares acquisition multiples paid for (1) "*stand alone*" private companies or (2) unlisted subsidiaries of publicly traded companies to an industry- and size-matched comparable acquisition of a publicly traded company. Table 8.5 shows the relative size of each category based on total assets, as well as the average *private company discount* for the "stand alone" private firms (17 percent) and the unlisted subsidiaries (28 percent).

8.4.1.3.3 Mergerstat Review Study Each year, "Mergerstat Review" conducts a study to examine the variance of price to earnings (P/E) ratios of transactions involving the acquisition of public companies vs. transactions involving the acquisition of private companies. Transactions during the last eleven years were summarized and analyzed.

[96]He is now an associate professor of finance at Loyola Marymount University.

TABLE 8.6 P/E Ratios—Transactions Involving Public Companies and Private Companies

Year	Median P/E Offered: Acquisitions of Public Companies	Base	Median P/E Offered: Acquisitions of Private Companies	Base	Calculated Discount
2000	18	379	16	130	11.11%
2001	16.7	261	15.3	80	8.38%
2002	19.7	161	16.6	83	15.74%
2003	21.2	198	19.4	107	8.49%
2004	22.6	188	19	108	15.93%
2005	24.4	230	16.9	127	30.74%
2006	23.7	294	21.4	65	9.70%
2007	24.9	300	21.6	64	13.25%
2008	22.1	130	10.6	51	52.04%
2009	18.1	98	18.4	22	–1.66%
2010	20.9	162	9.3	21	55.50%
2011	21.3	139	14.9	77	30.05%
Mean					20.77%
Median					14.49%
Weighted Mean (by base number of transactions)					18.65%

Compiled from data on the Median P/E Offered: Public vs. Private from "Mergerstat Review," FactSet Mergerstat, LLC, Santa Monica, CA, 2008 (p. 20) and 2012 (p. 21).

The results of the Mergerstat Review analysis are lower than those of the other two studies—the average resulting in a *discount for lack of marketability* of 20.77 percent, with a median of 14.49 percent and a weighted average (by number of private transactions) of 18.65 percent. A comparison of median P/E ratios for public and private acquisitions is set forth in Table 8.6.

8.4.1.4 Selection of a Discount for Lack of Marketability In the June 19, 1995, ruling in *Mandelbaum v. Commissioner*, U.S. tax court judge David Laro outlined several factors that should be considered when determining the appropriate discount for lack of marketability to be applied to a particular valuation assignment. The methodology employed by Judge Laro includes adjustments to the results of the various discount studies based on these so-called *Mandelbaum Factors*, which have been recognized as contributing

TABLE 8.7 Factors Affecting the Discount for Lack of Marketability

Factor	Direction of Effect	Impact of Effect
Private vs. Public Sales of Stock	Increase	Moderate
Financial Statement Analysis	Increase	Smaller
Company's Dividend Policy	Increase	Smaller
Nature of the SUBJECT ENTITY, Its History, Position in the Marketplace, and Its Economic Outlook	Decrease	Moderate
Management	Decrease	Moderate
Control	Decrease	Larger
Restrictions on Transfer of Ownership	Increase	Smaller
Holding Period	Decrease	Smaller
Redemption Policy	Decrease	Smaller
Transaction Costs	Increase	Larger

factors relating to the *discount for lack of marketability* and are set forth in Table 8.7.[97]

Historically, it has been believed that the amount of market exposure for publicly traded companies lent investor comfort, due to the greater transparency in disclosure requirements, although with the scandals and defalcations in capital markets over the last decade, some analysts may find the claimed transparency to be illusory at best. Nonetheless, the level of resources required to be expended by the buyer in performing requisite due diligence in assessing a potential transaction, as well as the costs incurred by the seller in preparing the business for sale (e.g., accounting costs, legal costs, appraisals, management time, and brokering fees), should be considered in determining the amount of discount applicable.[98] Many analysts still believe there is a significant disparity as to these costs between public and private company transactions.

In the development of a *discount for lack of marketability*, consideration should be given to those specific facts and circumstances related to the

[97] *Mandelbaum v. Commissioner*, T.C. Memo. 1995-255.

[98] S. P. Pratt, *Business Valuation Discounts and Premiums*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2009), pp. 204–206.

unique healthcare regulatory environment, which is typically more intense and robust than in other industries. The potential for regulatory scrutiny and the associated public concern may tend to limit the pool of potential investors for a given enterprise.

A recent illustration of the risk of limiting a potential pool of investors occurred when *Mercy Health System*, a *tax-exempt* Catholic health system, attempted to sell one of its hospitals, St. Joseph's, located in Hot Springs, Arkansas, to a *for-profit* competing hospital, which resulted in picketing, community unrest, and scrutiny by the Vatican.[99] The public nature of the criticism received by Mercy is ongoing and may limit its acquisition plans going forward, due to concerns related to its standing and position within the community, particularly in regard to its tax-exempt standing.

Another example of those marketability concerns unique to healthcare would be the recent legislation that eliminated the *whole hospital exception* to the Stark Law.[100] The *whole hospital exception* allowed a physician to have an ownership interest in a hospital (not in a subdivision of the hospital) if the physician was authorized to perform services at the hospital.[101] Similar to potential effects of negative public opinion, regulations that limit physician ownership may act to limit the potential investor/buyer pool and decrease the number of joint ventures between physicians and hospitals.[102] Specifically, increased regulation affecting physician investment results in physician providers having limited access to capital, thereby being relegated to cope with aging plants and equipment and a decreased ability to attract, recruit, and retain quality physicians, with a resulting loss of market share, revenue, and profit.[103]

---

[99] Jim Doyle, "Is Mercy Health Abandoning Catholic Mission in Hot Springs?" *St. Louis Post-Dispatch*, October 21, 2012, http://www.stltoday.com/business/local/is-mercy-health-abandoning-catholic-mission-in-hot-springs/article_44b46620-a3b7-57bd-9612-5d0b3942baf3.html (accessed January 21, 2013).

[100] The whole hospital exception was severely limited, and effectively eliminated, under section §6001 of the ACA, which bans future physician-owned hospitals from forming and also limits the expansion of existing facilities. "Patient Protection and Affordable Care Act," *Pub. L.* 111-148, 124 Stat 684 (March 23, 2010).

[101] "Prohibition against Any Federal Interference," 42 U.S.C. 1395(d)(3) (May 18, 2008).

[102] Robert James Cimasi, "Whistling Past the Graveyard: The Impact of Regulation of Healthcare Valuation," *Valuation Strategies* (September/October 2008): 19, 43.

[103] "Capital Financing: Financial and Operating Metrics Analysis," prepared for the Illinois Health Facilities Planning Board by the Governors State University Health Administration Program, September 2004, p. 8.

Moreover, multiple commentators have argued that self-referral regulations have led to the exclusion of physicians as major investors in new "*health market initiatives*," thereby reducing the investor pool in healthcare markets in which physicians seek to have an ownership interest.[104] A limitation on the number of potential investors such as this may affect the value of such enterprises by discounting their value for a perceived lack of marketability.[105] For more information on the Stark Law, see Section 3.3.2, "Stark Law," in Chapter 3, "Regulatory Environment," and for more information of the effects of the limiting of the whole hospital exception under the ACA, see Section 4.5.4, "Physician-Owned Healthcare Facilities," in Chapter 4, "Competition."

In addition to the concerns noted previously, the *gauntlet* of regulatory oversight and public scrutiny surrounding transactions within the healthcare industry may have a *chilling effect* on potential participants in the market for healthcare enterprises and may also affect the *liquidity*, that is, the time necessary to convert an investment into cash, of healthcare enterprises. For example, consider the illustrative case of a nonprofit tax-exempt managed care organization attempting to divest itself of a Medicaid managed care service line. A transaction of this nature may include approval from state insurance regulators, department of health and senior services, and other state regulatory agencies, as well as being subject to public and legislative hearing and antitrust approval regarding the qualifications of the potential purchasers, and may include a review of:

1. The sufficiency not only of the financial, but also the management capital of the purchasers; and
2. The ethical and legal standing of the purchasing organization.

This level of oversight requires management time and expertise to direct the acquisition process, as well as direct outlays of funds to comply with the regulatory requirements. In addition to the direct costs involved with regulatory compliance, the oversight from nongovernmental advocacy groups may create a great deal of public contentiousness that may pose a significant public relations risk to a potential purchaser's other businesses and brands.

---

[104] Paul Larson and Deryl Gulliford, "Stark Regulations and Health Care in Rural America," American Academy of Medical Administrators, http://www.aameda.org/MemberServices/Exec/Articles/winter05/StarkandRuralHealthCare.pdf (accessed June 2, 2008).

[105] Robert James Cimasi, "The Valuation of Physician-Owned Hospitals in a Changing Reimbursement and Regulatory Environment," *Pulse* (Physician Hospitals of America) (Winter 2007/2008): 15.

These added costs specific to the healthcare industry, both direct and reputational, will tend to:

1. Limit the pool of potential purchasers and investors willing to accept the consequences of participating in the transactional market for healthcare enterprises; and
2. Diminish the prices offered as potential purchasers attempt to defray these costs.

These considerations related to the regulatory and public environment should be included when developing a *discount for lack of marketability* in the healthcare industry.

8.4.2 Control Premium/Discount for Lack of Control

A control premium is an increase to the pro rata share of the value of the business that reflects the impact on value inherent in the management and financial power that can be exercised by the holders of a control interest of the business, usually the majority holders. Conversely, a *discount for lack of control* (*DLOC*) is the reduction from the pro rata share of the value of the business that reflects the impact on value of the absence or diminution of control that can be exercised by the minority equity holders of the entity being appraised. The mathematical relationship between the control premium and the DLOC can be expressed by the following formula:[106]

$$\text{Discount for Lack of Control} = 1 - \frac{1}{(1 + \textit{Control Premium})}$$

When attempting to quantify the appropriate *discount for lack of control* to be applied to the indicated level of value, the specific conditions and factors related to the healthcare industry, subsector, specialty, and subspecialty of the subject enterprise, as well as the mix of the type of buyer of entities similar to the subject enterprise who would be typical in the universe of buyers, sellers, owners, and investors for the subject enterprise when considering the hypothetical transaction, which is inherent in the standard of *fair market value*. Further considerations, which would include whether this pool of investors consists of *strategic vs. financial buyers*, *long- versus short-time horizon investors*, and *industry insiders versus speculators*, should be considered when analyzing the results and determining the pertinence and application of the empirical studies described next.

[106] Shannon P. Pratt, *Business Valuation: Discounts and Premiums* (New York: John Wiley & Sons, 2001), p. 19.

There are several empirical studies available that attempt to quantify control premiums. Two such studies are:

1. **Mergerstat Review**—An annual series study of the premium paid by investors for controlling interest in public traded stock.[107]
2. **Control Premium Study**—A quarterly series study that compiles control premiums of publicly traded stocks by attempting to eliminate the possible distortion caused by speculation of a deal.[108]

In determining the appropriate control premium for a healthcare-related enterprise, the valuation analyst may use the "*Mergerstat Review*" studies of control premiums paid in several healthcare transactions (SIC code 80). An example of these studies from 1995 to 2011 is presented in Table 8.8.

The analysis of the "*Mergerstat Review*" studies indicated an *arithmetic mean control premium* of 34.30 percent, a *median control premium* of 32.20 percent, and a *weighted arithmetic mean control premium* of 36.41 percent (weighted by the number of transactions considered in each period analyzed), based on data from 1995–2011.

Similarly, a valuation analyst may also use the "*Control Premium Study*," which reports control premiums paid in healthcare transactions (SIC Code 80) as well, set forth in Table 8.9.

The analysis of the "*Control Premium Study*" indicated an *arithmetic mean control premium* of 44.69 percent, a *median control premium* of 35.95 percent, and a *weighted arithmetic mean control premium* of 37.65 percent (weighted by the number of transactions considered in each period analyzed), based on data from 1998 to 2011.

Consideration of the application of a *discount for lack of control* should take into account studies published in the valuation profession literature, including those of *Eric Nath* and *M. Mark Lee,* which present the argument that a *discount for lack of control* should be applied only based on facts and circumstances that indicate that a typical acquirer would reasonably believe that it can create sufficient added economic benefits so that the acquisition value of a company will exceed its market value.[109] In the circumstance that in a specific industry within which

Compilation of data on Mean of Control Premiums in SIC Code 80 (Health Services) from "Mergerstat Review," FactSet Mergerstat, LLC, Santa Monica, CA, 2000 (p. 79), 2004 (p. 79), 2008 (p. 79), and 2012 (p. 81).

[1]Mean of all transactions weighted by base number of transactions considered.

*Excludes one transaction with a Control Premium of 4900%. It should be noted that no transactions were reported for SIC Code 80 in 2003.

exist no market conditions that would create these benefits in a manner large enough to justify the payment of a premium, then the expectation that a universe of typical investors would agree to the application of such a control premium may be in doubt. The healthcare industry, which operates under strict governmental oversight, may lack sufficient managerial autonomy to warrant a premium for control, that is, the ownership's flexibility to direct the management of the enterprise may be limited by the regulatory environment inherent in the healthcare industry.

8.4.3 SEAM Equation

As noted earlier, in Section 8.1.1.5.1.1, "Tax Affecting Income," recent academic research suggests that the income projections for the subject enterprise should be tax affected, as the *income-based approaches* use a "build-up" method to develop an equity discount rate derived from empirical market transactional data of publicly traded C-corporation minority equity securities. The indicated value derived from the selected methodology may result in a publicly traded C-corporation equivalent level of value.

Should the valuation analyst determine that the valuation assignment requires an indication of value on an S-corporation basis, then an

INCOME-BASED APPROACH

A method measuring the present value of anticipated future economic benefits that will accrue to the owner of the subject entity, such as cash flow, net income, net operating income, or dividend payouts.

adjustment may be required to modify the C-corporation equivalent level of value derived from the selected methodology to the S-corporation (pass-through company) level of value.

A model developed by Dan Van Vleet, ASA, is referred to as "*The S Corporation Equity Adjustment Multiple*" method (SEAM equation) and has met with increasing acceptance in the valuation profession. The SEAM method, as described in detail next, relies on two (2) premises:

1. That there are substantial differences in the treatment of income taxes with S-corporations and C-corporations and with their respective shareholders; and
2. That capital markets, at least over the long term, are efficient.

The SEAM method, which should be applied only to *equity capital*, because the benefit in higher returns from electing *S-corporation tax filing status* accrues only to the *equity portion* of capital and not to *debt*, which is an integral part of total invested capital, provides an estimate of the percentage premium that a hypothetical investor would be willing to pay for obtaining the returns from an S-corporation share in the place of an otherwise identical C-corporation share, calculated by dividing the incremental net economic benefit of being an S-corporation shareholder, rather than a C-corporation shareholder, by the net economic benefit of being a C-corporation shareholder.[110] The model is therefore appropriately applied only to a *noncontrolling interest* in an S-corporation, where empirical market data of publicly traded C-corporation equity securities is used to estimate the value of the S-corporation shares.[111]

[110] Daniel R. Van Vleet, "The S Corporation Economic Adjustment Model," *Business Valuation Review* 23, no. 3 (September 2004): 167–180.

[111] Shannon Pratt and David Laro, *Business Valuation and Taxes: Procedure, Law and Perspective* (Hoboken, NJ: John Wiley & Sons, 2005), pp. 127–130.

The SEAM equation is based on the following assumptions:

1. The pass-through "organizational form of the entity being appraised will continue in perpetuity."
2. "Investors are indifferent between cash investment returns and unrealized capital gains," which results in the S-corporation paying out 100 percent of its earnings as distributions.
3. "Investors in C corporations recognize capital gains taxes when incurred."
4. "Buyers are willing to pay sellers for the S corporation income tax benefits."
5. "Beneficial aspects of current income tax law regarding S corporations and other pass-through tax entities relevant to C corporations will continue in perpetuity."
6. The subject pass-through tax entity "will continue to be a profitable enterprise in perpetuity."[112]

"*The S-Corporation Economic Adjustment*" (SEA) is based on equations that model the net economic benefits to (1) C-corporation shareholders (NEB_c) and (2) pass-through entity shareholders (NEB_s). The NEB_c equation consists of two principle components:

1. Net cash received by shareholders from dividends after the payment of
   a. Income taxes at the entity level;
   b. Income taxes on dividends at the shareholder level; and
2. Net capital appreciation of the equity security after recognition of capital gains taxes at the shareholder level.

Accordingly, the SEAM equation is used to provide an estimate of the percentage premium an investor would be willing to pay for a share of a pass-through entity, in contrast to that of an otherwise identical C-corporation share. The premium is calculated by dividing in the incremental net economic benefit of being a pass-through entity shareholder by the net economic benefit of being a C-corporation shareholder. This percentage is then added to 1 to calculate a multiple that may be used to adjust the indicated equity value of a pass-through taxable entity when empirical studies/analyses derived from market data are used as the basis of the estimate of value of C-corporations. The basic SEAM equation is as follows:

[112] Daniel R. Van Vleet, "The S Corporation Economic Adjustment Model," *Business Valuation Review* 23, no. 3 (September 2004): 167–180.

$$\text{SEAM} = 1 + \frac{t_c + t_{cg} - t_i - t_c t_{cg} + D_p t_d - D_p t_{cg} - D_p t_c t_d + D_p t_c t_{cg}}{1 - t_c - t_{cg} + t_c t_{cg} - D_p t_d + D_p t_{cg} + D_p t_c t_d - D_p t_c t_{cg}}$$

where: t_c = C-corporation effective tax rate
t_{cg} = Capital gains tax rate
t_i = Individual ordinary income tax rate
D_p = Dividend payout ratio
t_d = Income tax on dividends

The multiple, calculated as described, would then be applied to the indicated value resulting from the *discounted net*. An example of the application of SEAM equations can be found online at http://www.wiley.com/go/healthcarevaluation.

8.4.4 Blockage Discounts

Blockage discounts typically refer to the price concession that must be given by a seller in order to sell a large block of publicly traded stock in a short period of time (assuming the size of the block is larger than the existing market demand). While there does not currently exist a reliable empirical methodology for quantifying an exact discount for blockage, the amount should be based on the facts and circumstances of the engagement, which would typically include factors such as the size of the block to be traded, the volume of existing bids, and so on.[113]

8.4.5 Key Person Discounts

Some enterprises, especially in the healthcare industry related to professional medical practices, are highly reliant on a single individual or a small group of key individuals for the continuity of the successful operation of the enterprise. The perceived probability of the risk that some exigency or adverse circumstance could befall the continued participation of this key individual and in turn affect the level of economic benefit generated by the enterprise is encompassed in the *key person discount*. Factors to be considered in determining the existence of the key person discount include the key individual's

1. Relationships with Patient/Customers, including charisma or "*bedside manner*," and reputation or standing in the community;

[113] S. P. Pratt, *Business Valuation: Discounts and Premiums*, 2nd ed. (Hoboken, NJ: John Wiley & Sons, 2009), pp. 134–144.

2. Employee Loyalty; and
3. Advanced Clinical Training and Technical Abilities, for example, board certifications and collegiality, that is, the ability to develop beneficial professional and referral relationships.

Over the years, several studies have been performed in an attempt to quantify the appropriate key person discount, with inconclusive results.[114] One such study by James Larson and Jeffrey Wright, published in the *Business Valuation Review*, analyzed the publicly traded companies before and after the announcement of the departure of key individuals and indicated that

> *When the discount [key person discount] is deemed appropriate, the order of magnitude is generally a decrement of 4–6% in* equity value. *[Emphasis added]*[115]

Even though a specific percentage discount has yet to be established, the use of a *with and without* method (as described in Section 8.2.6, "With and Without Analysis") may be appropriate in determining an indication of the discount that should be applied.

An important issue to consider when determining the level of key person discount to apply is that the majority of small business enterprises are reliant on a key person or persons, and if a "*size premium*" is included in the determination of the risk-adjusted required rate of return, it may include the significant portion of the circumstantial elements that would lead to the application of a *key person discount*.[116]

In addition, specific regulation within the healthcare industry restricts the consideration of the volume of referrals in the determination of value. The valuation analyst should be cautious by ensuring that the application of a *key person discount* does not imply that the decrement to value of the enterprise encompassed by the *key person discount* is related to a decrease in the volume of referrals from nonexempt sources or that the unadjusted

value of the enterprise includes payment for the generation of referrals from outside sources, that is, those not specifically allowed under the *group practice exception*. See Chapter 3, "Regulatory Environment," for a fuller discussion of the regulations specific to the healthcare industry.

8.5 RELATED VALUATION ASSIGNMENTS

8.5.1 Commercial Reasonableness

Regulatory oversight within the healthcare industry requires that many transactions adhere to both the concept of the proposed transaction meeting, the threshold requirement of being within a range of *fair market value*, and the concept of a second requirement that the proposed transaction also meets the distinct, but related, threshold known as *commercial reasonableness*, in order to be deemed legally permissible. Valuation professionals are often engaged to develop and render an opinion as to the *commercial reasonableness* of a given transaction, in part or overall, as an additional deliverable of the valuation engagement.

The Department of Health and Human Services (HHS) has defined the term "*commercially reasonable*" as an arrangement that appears to be "*a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals.*"[117] The Stark II, Phase II, commentary suggests that "an arrangement will be considered 'commercially reasonable' in the absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential DHS referrals."[118]

Further guidance as to the definition of *commercial reasonableness* appears in the commentary published by the 2006 American Law Institute, which states that

> *Each financial and contractual connection between hospitals and physicians should be scrutinized to ensure that goods or services changing hands are being provided at fair market value, and at*

[117] "Medicare and Medicaid Programs; Physician's Referrals to Health Care Entities with Which They Have Financial Relationships: Proposed Rule," *Federal Register* 63, no. 6 (January 9, 1998): 1700.

[118] "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II): Interim Final Rule with Comment Period," *Federal Register* 69, no. 59 (March 26, 2004): 16107.

> *a level no more than necessary for the business purposes of the arrangement.*[119]

To determine whether the subject transaction is within the range of *commercial reasonableness*, the valuation analyst should consider whether the parties entering into the transaction are exhibiting *sound business judgment* in light of the enterprise's *size*, the *number of patients* treated, and the *medical needs* of those patients.[120] Among the several factors to be considered within the context of *commercial reasonableness* of the subject transaction is whether the purchasing entity could have obtained the same services from a *nonreferral* physician at a cheaper rate or under more favorable terms.[121]

Significantly, it is important that the purchaser not "(i) provide physicians with items or services for free or less than fair market value, (ii) relieve physicians of financial obligations they would otherwise incur, or (iii) inflate compensation paid to physicians for items or services."[122]

There are several methods available to the valuation analyst to ascertain the *commercial reasonableness* of the subject transaction(s). One such method is to develop a *post-transaction feasibility model*, which indicates *a payback period* (both a *return on* and *return of*) for the investment to be made in the overall transaction(s), including any and all consideration that transfers from the buyer to the seller for any and all elements of the acquisition(s) of going-concern enterprises and service lines, tangible and intangible assets, and services, as well as any lease arrangements, which may make up the subject overall transaction(s).

As noted earlier, for the subject transaction to be considered *commercially reasonable*, it must be "a sensible, prudent business agreement . . . *even in the absence of any potential referrals*" [emphasis added].[123] In performing the *post-transaction payback period feasibility analysis*, the valuation analyst creates a long-term pro-forma projected statement of cash

flow (see Section 8.1.1.6, "Projected Cash Flow"), including all elements of the transaction(s) under consideration. This cash flow is then aggregated to determine the number of periods necessary to *recoup* the initial investment, including all financing costs, of the assets purchased in the subject transaction(s). If the valuation analyst determines that the required *payback* period is of a duration similar to the investment horizon expected by the universe of typical investors in assets similar to the subject transaction, then the valuation analyst may deem the transaction to be *commercially reasonable*, in that it is probable that given the available information, a similar investor would endeavor to participate in the proposed transaction(s).

Additional guidance in developing the *commercial reasonableness* threshold, as it pertains to the *Stark Law*, can be found in the more detailed analysis proposed by the government's expert in the 2004 *U.S. v. SCCI Hospital Houston* case (as discussed in Chapter 3, "Regulatory Environment").[124] The government's financial expert in that case stated that *commercial reasonableness* depended on the agreement being "*essential to the functioning of the hospital*" and further emphasized that there had to be "*sound business reasons for paying medical director fees to referring physicians.*"[125]

Further, the government's expert analyzed several factors in assessing the *commercial reasonableness* of the compensation, including:

1. The size of the hospital, number of patients, and patient acuity levels needs;
2. The quality of activities and involvement of medical staff in need of medical direction;
3. The number of regular committees and meetings that required physician involvement; and
4. The quality of hospital management and interdisciplinary coordination of patient services.[126]

This *feasibility* analysis component of the commercial reasonableness study should include consideration of the *broad strategic goals* and *stated*

---

[124] *United States ex rel. Darryl L. Kaczmarczyk, et al. v. SCCI Health Services Corp.*, Civ. No. H-99-1031 (S.D. Tex. April 12, 2004).

[125] *Fair Market Valuation Report—United States v. SCCI*, in *US ex rel. Kaczmarczyk, et al v. SCCI Hospital Ventures, Inc.*, Civ. No. H-99-1031 (July 12, 2005), p. 6; Lewis Lefko, "Fair Market Value in Health Care Transactions," Haynes and Boone, LLP, July 20, 2007, http://www.worldservicesgroup.com/publications.asp?action=article&artid=2086 (accessed September 18, 2008).

[126] *Fair Market Valuation Report—United States v. SCCI*, in *United States ex rel. Kaczmarczyk, et al. v. SCCI Hospital Ventures, Inc.*, Civ. No. H-99-1031, (July 12, 2005), p. 6.

mission of the organization. Often, purchasers within the healthcare industry include *charitable organizations*, that is, entities that are required to be organized and operated exclusively for exempt purposes, including charitable purposes, which in this instance includes relief of the poor, the distressed, or the underprivileged.[127]

In addition, as stated in Revenue Ruling 69–545:

> *In the general law of charity, the promotion of health is considered to be a charitable purpose. […] A nonprofit organization whose purpose and activity are providing hospital care is promoting health and may, therefore, qualify as organized and operated in furtherance of a charitable purpose.*[128]

The threshold for *commercial reasonableness* within the context of a *tax-exempt* charitable organization may differ from that of a *for-profit* organization. As implied by the name, *for-profit* organizations are typically motivated to seek financial profit, that is, revenues in excess of the capital and operating expense burdens of the enterprise. *Tax-exempt* charitable organizations, conversely, have *stated missions* and are required by the IRS regulations to provide a *community benefit*, as noted earlier. The accomplishment of this charitable mission may result in these enterprises sustaining financial losses, with the expectation of the goals of the charitable mission, for example, care of indigent patients, providing a *social benefit* that exceeds the anticipated financial losses. In the *commercial reasonableness* context, this implies that for *tax-exempt* charitable organizations it may be *commercially reasonable* to consider to some degree some elements of transactions that fail to meet the *feasibility* criteria described earlier and that may result in ongoing *financial losses*, so long as these transactions are in documented furtherance of their charitable mission. An example of how this circumstance is manifested is the case where a health system may be required to provide finance payments for some period of time to cover losses associated with incorporating a medical practice into an *integrated healthcare system* for the *long-term benefit* of the community it serves. The *nature, scope,* and *reason* for the *support payments* should be *well documented* and considered within the context of the health system's commitment to provide a *continuum of quality care* to the *market service area*.

[128]IRS Revenue Ruling 69-545, 1969-2 C.B. 117.

8.5.2 Purchase Price Allocation

Another valuation assignment that may be requested of the analyst is a *purchase price allocation*. Financial reporting standards and IRS tax regulations require that the purchasing organizations account for the assets transferred during a business combination. Under the FASB ASC 805, formerly known as *Statement of Financial Accounting Standards* (SFAS) 141(r), business combinations must be accounted for using the "*acquisition method*" for the purposes of financial reporting. The *acquisition method* requires that the reporting entity must provide the following:

1. Identify the acquirer;
2. Determine the acquisition date;
3. Recognize and measure the identifiable assets acquired, the liabilities assumed, and any noncontrolling interest in the acquiree; and
4. Recognize and measure goodwill or a gain from a bargain purchase.

Of interest in the *purchase price allocation process* are steps 3 and 4, *the recognition and measurement of the identifiable assets acquired* and the *recognition a measurement of goodwill*. If it were assumed that the prospective transaction were to occur under the premise of *value in use as a going concern*, and if it were further assumed that the valuation methodology used was the *discounted net cash flow* (DCF) method, the resulting value indication would represent the *discounted expected future economic benefit* that would accrue to the owners of all of the assets (*tangible and intangible*) into *perpetuity*. As such, the value of the *discrete assets* that make up the *subject entity* would be included in *the single value indication* resulting from the *DCF analysis*.

Allocation of the purchase price, as required in step 3 of ASC-805, would then be accomplished by first determining the *fair value* of each of the *identifiable* assets included in the transaction. *Fair value* is defined by FASB, under ASC 820, as:

> *the price at which an orderly transaction to sell the asset or to transfer the liability would take place between market participants at the measurement date under current market conditions.*[129]

Assuming the underlying transaction for which the allocation is being undertaken was conducted in the absence of coercion or intentional

[129] "Fair Value Measurement," FASB ASC 820-10-05-1B (May 2011), formerly SFAS 157, para. 5.

misrepresentation, then the price paid by the acquirer for the subject entity can be, for financial reporting purposes, considered *fair value*.

The purchase price allocation process then becomes an exercise in identifying and measuring the specific assets (*both tangible and intangible*) and assigning a portion of the purchase price to each. The identification and measurement of *tangible assets* is straightforward. Many techniques exist for the appraisal of real estate and other fixed assets (see Chapter 14, "The Valuation of Tangible and Intangible Assets," for a full discussion of techniques for valuing tangible assets). Application of the most suitable valuation method, given the characteristics of the particular subject entity, results in the amount of the purchase price to be allocated to the tangible personal property of the subject entity.

The residual amount that remains after the deduction of the value of the tangible personal property represents the expected economic benefit that would accrue to the owners of the subject entity from the subject entity's *intangible* assets. According to ASC 805, for an intangible asset to be identifiable it must:

> *(1) [be] separable, that is, capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, identifiable asset, or liability, regardless of whether the entity intend to do so; or, (2) Arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity of from other rights and obligations.*[130]

Given the FASB standards expressed earlier, the remainder of the purchase price allocation process consists of identifying and discretely valuing the individual intangible assets included in the transaction. After the value of the *identifiable intangible asset* has been deducted from the purchase price (along with the previously determined *tangible asset* value), any residual unallocated purchase price amount remaining will be classified as *goodwill* and will represent the value of the intangible assets that fail to meet the criteria for *identification*.

As an example, in the transfer of ownership in a physician practice, the typical identifiable intangible assets include the following:

1. The custodial rights to patient medical records;
2. Employment agreements;
3. Noncompete covenants;

[130] Citing (SFAS 141(R)), para. 3k (December 2007), which was recodifyed as "Business Combinations" (FASB ASC 805).

4. Favorable lease interest;
5. Certificate of need (if required);
6. Trademarks, trade names, and other marketing-related intangible assets;
7. Internet domain names and telephone numbers;
8. Technology related intangibles, such as unique techniques or processes; and
9. Any intellectual property related intangibles, such as patents or trade secrets.

To the extent that within a given transaction any of these *identifiable* intangible assets exist, they can be separately valued and deducted from what would otherwise be considered goodwill. It should be noted that in addition to the above *identifiable* intangible assets, a physician practice will typically include an intangible asset composed of the physician and nonphysician trained and assembled workforces. FASB has determined that while the *trained and assembled workforce* intangible asset exists, it is not *identifiable* (as defined earlier) and therefore cannot be separately valued from the practice goodwill for financial reporting purposes. During the last decade, there have been numerous books, chapters, and journal articles, as well as webinar presentations and conferences, devoted to the valuation activities related to purchase price allocations for financial reporting. A list of these resources can be found in the bibliography of valuation literature in the appendices of this book.

In addition to, and distinct from, allocating the purchase price for financial reporting purposes, the valuation analyst may also be asked to allocate the purchase price for tax purposes. The Internal Revenue Service (IRS) requires both the *buyer and seller* in a business transaction to file *form 8594, Asset Acquisition Statement*, which reports the *sale/purchase* of a group of assets that *constitute a business* to attach to their respective income tax returns. Completion of Form 8594 requires both the purchaser and the seller to allocate the purchase price across seven asset classes defined as follows:

1. **Class I assets**—"Cash and general deposit accounts (including savings and checking accounts), other than certificates of deposit held in banks, savings and loan associations, and other depository institutions."
2. **Class II assets**—"Actively traded personal property within the meaning of section 1092(d)(1) and Regulations section 1.1092(d)-1 (determined without regard to section 1092(d)(3)). In addition, Class II assets include certificates of deposit and foreign currency even if they are not actively traded personal property. Class II assets do not include stock of target affiliates, whether or not actively traded, other than actively

traded stock described in section 1504(a)(4). Examples of Class II assets include U.S. government securities and publicly traded stock.

3. **Class III assets**—"Assets that the tax payer marks-to-market at least annually for federal income tax purposes and debt instruments (including accounts receivable). However, class III assets do not include:
   - Debt instruments issued by persons related at the beginning of the day following the acquisition date to the target under section 267 (b) or 707;
   - Contingent debt instruments subject to Regulations sections 1.1275–4 and 1.483–4, or section 988, unless the instrument is subject to the non-contingent bond method of Regulations section 1.1275–4(b) or is described in Regulations section 1.988–2(b)(2)(i)(B)(2); and
   - Debt instruments convertible into stock of the issuer or other property."
4. **Class IV assets**—"Stock in trade of the taxpayer or other property of a kind that would properly be included in inventory of the taxpayer if on hand at the close of the taxable year, or property held by the taxpayer primarily for sale to customers in the ordinary course of its trade or business."
5. **Class V assets**—"All assets other than Class I, II, III, IV, VI, and VII assets. **Note**. Furniture and fixtures, buildings, land, vehicles, and equipment, which constitute all or part of a trade or business, are generally Class V assets."
6. **Class VI assets**—"All section 197 intangibles (as defined in section 197) except goodwill and going concern value. Section 197 intangibles include:
   - Workforce in Place;
   - Business books and records, operating systems, or any other information base, process, design, pattern, know-how, formula, or similar item;
   - Any customer-based intangible;
   - Any supplier-based intangible;
   - Any license, permit, or other right granted by a government unit;
   - Any covenant not to compete entered into in connection with the acquisition of an interest in a trade or a business; and,
   - Any franchise, trademark, or trade name."

The term "section 197 intangible" does not include any of the following:

- An interest in a corporation, partnership, trust, or estate;
- Interest under certain financial contracts;
- Interests in land;
- Certain computer software;

Certain separately acquired interest in films, sound recordings, video tapes, books, or other similar property;
Interest under leases of tangible property;
Certain separately acquired rights to receive tangible property or services;
Certain separately acquired interest in patents or copyrights;
Interest under indebtedness;
Professional sports franchises acquired before October 23, 2004; and,
Certain transactions costs."

7. **Class VII assets—**"Goodwill and going concern value (whether or not the goodwill or going concern value qualifies as a section 197 intangible)."[131]

Section 197(d)(1) of the *Internal Revenue Code* (IRC) further defines the section 197 *intangibles* as including the following:

(A) goodwill,
(B) going concern value,
(C) any of the following:
(i) workforce in place including its composition and terms and conditions (contractual or otherwise) of its employment,
(ii) business books and records, operating systems, or any other information base (including lists or other information with respect to current or prospective customers),
(iii) any patent, copyright, formula, process, design, pattern, knowhow, format, or other similar item;
(iv) any customer-based intangible,
(v) any supplier-based intangible, and
(vi) any other similar item,
(D) any license, permit, or other right granted by a governmental unit or an agency or instrumentality thereof,
(E) any covenant not to compete (or other arrangement to the extent such arrangement has substantially the same effect as a covenant not to compete) entered into in connection with an acquisition (directly or indirectly) of an interest in a trade or business or substantial portion thereof, and
(F) any franchise, trademark, or trade name.[132]

---

[131] Instruction for Form 8594 (Rev. December 2008), Department of Treasury, Internal Revenue Service.

[132] Internal Revenue Code, Section 197, Amortization of Goodwill and Certain Other Intangibles.

Section 197 goes on to define *customer-based intangibles* as:

> *(i) composition of market,*
> *(ii) market share, and*
> *(iii) any other value resulting from future provision of goods or services pursuant to relationships (contractual or otherwise) in the ordinary course of business with customers.*[133]

And section 197 further defines supplier-based intangibles as "any value resulting from future acquisitions of goods or services pursuant to relationships (contractual or otherwise) in the ordinary course of business with supplier of goods or services to be used or sold by the taxpayer."[134]

If the value of the enterprise being purchased is calculated based on a *going concern* premise of value, the individual distinct assets (Class I–VII) will not be distinctly valued, but instead will be valued as part of the entirety of the practice. The role of the consultant, then, is to allocate a portion of the purchase price to the tangible and intangible assets for completion of Form 8594, as well as provide a basis for the *depreciation* of the *tangible assets* and *amortization* of the *intangible assets*. It should be noted that in completing the IRS Form 8594, the value of any *physician and nonphysician trained and assembled workforces* may be allocated separately from goodwill, in contrast to the treatment of the *trained and assembled workforce* as required by ASC 805 for financial reporting.

The identification and valuation of *separately identifiable intangible assets*, as *distinct from goodwill*, is necessary to correctly produce postacquisition financial statements that accurately reflect the assets held by the acquiring firm and is governed by ASC 805. In addition, for tax reporting purposes, it is also necessary to assign value to certain of the intangible assets acquired to complete the required IRS Form 8594 and to provide a basis for the amortization of the intangible assets. Accepting an engagement to complete a purchase price allocation requires the valuation analyst to determine whether the allocation should be completed for financial reporting and/or tax reporting purposes regarding the treatment of intangible assets; these types of reports are distinct and most often significantly dissimilar in their definition, selection of methodology, and underlying assumptions. For further discussion of intangible assets, see Chapter 14, "The Valuation of Tangible and Intangible Assets."

[134] Ibid.

8.6 CONCLUSION

The valuation analyst has available numerous and diverse *approaches*, *methods*, and *techniques* (*methodology*) to use in developing a financial appraisal of healthcare *enterprises, assets,* and *services*. The choice of approach(es) or method(s) depends primarily on the *purpose* of the valuation report, the specific characteristics of the type of property interest being appraised, and the level of value and interest in that property. The *objective and purpose* of the valuation engagement, the *standard of value*, the *premise of value*, and *the availability and reliability of data* must all be considered by the valuator, as well as the specific nature of the engagement being undertaken, all of which will act to inform the valuation analyst as to the *methodology* to apply.

Standards of appraisal practice require the valuation analyst to consider the use of multiple approaches, methods, and techniques in arriving at his or her final indication of value. The convergence of multiple methods tends to lend credence to the calculated results, although the lack of agreement does not necessarily imply that any one approach, method, or technique is incorrect. The divergence of results does, however, suggest further investigation by the valuation analyst to determine the source of the variance in value indications.

In the application of the various methods described earlier, the valuation analyst should always be aware of the foundational economic principles set forth in Chapter 7, "Basic Valuation Tenets." The approaches, methods, and techniques discussed in this chapter are all based on the financial and economic underpinnings of value. Confusion and misapplication of valuation *methodology* can occur if those underlying concepts are not understood and adhered to.
