CHAPTER 9

Costs and Sources of Capital

Regardless of which of the income-based methodologies is used in the valuation process, a key parameter that must be determined is the appropriate *risk-adjusted rate of return* used to discount the *future expected economic benefits* accruing to the owners of the entity/asset under analysis. All income-based approaches attempt to express these future economic benefits, such as *cash flow* or *cost detriments*, in *present day* (as of the date of the valuation) terms. Specifically, the current owners of capital will expect compensation for postponing their enjoyment of their *ownership of capital*, as well as compensation to reflect the relative *uncertainty* of actually receiving those future benefits. These two concepts are central to understanding the cost of capital faced by healthcare entities.

9.1 HEALTHCARE FINANCING OPTIONS

Financing can be achieved through (1) *debt*, (2) *equity*, or (3) *internally generated surpluses* from revenue. Healthcare financing includes various *financial instruments* from short-term financing, taxable long-term financing, and tax-exempt bond financing to private and public equity markets. Choosing the *optimal* combination of each of the sources of capital depends on the size and makeup of the organization and what types of financing are required, as well as the *tax posture* of the borrower enterprise.

Throughout the healthcare industry's history, financing has come from various sources, including "philanthropic donations, public grants, tax-subsidized operating surpluses, and investments from nonprofit organizations based in other industries."[1] Different capital financing options are available to healthcare entities, depending on whether the organization is a *for-profit* or a *nonprofit* entity. For example, publicly traded equity markets allow *for-profit* healthcare organizations to gain access to large sums of capital based on the fluctuating value of their equity, either through an *initial public offer* (IPO) or through a *secondary equity offering* (SEO) for companies already traded in public markets.[2] The capital accumulated through sales of equity may be used by the company to finance future growth opportunities or to repay existing debt.

Both *for-profit* and *nonprofit* healthcare organizations seek capital financing from these various sources, although each entity displays unique financing characteristics that reflect its respective mission. For example, *nonprofit* entities rely more heavily on philanthropy, donations, government grants or savings from tax-exempt status, and traditional sources of debt capital.[3] *For-profit* healthcare entities, in contrast, tend to rely on a combination of "*equity capital and debt*" as financing sources. However, due to regulatory limitations, *nonprofit* healthcare organizations are ineligible to participate in public equity markets.[4] Rather, these entities typically raise capital by (1) using *tax-exempt bonds* to finance their operations, strategic initiatives, and other capital-related needs; (2) relying on *charitable donations* from both individuals and organizations as an alternative method of financing; and (3) leveraging significant flows of *cash deposits* into favorable financing terms from lender institutions, both on an interim basis and for a more permanent lending relationship. In addition, both *for-profit* and *nonprofit* organizations may enter *private capital markets*, through *venture capital* investors and *buyout funds*, as well as private *REITs* and *conduit lending structures*, which allow organizations to gain access to equity capital without subjecting the entity to overly burdensome regulations and the accompanying reporting requirements of the public equity market.

Initial Public Offer (IPO)

The first time a business, which was previously a privately held firm, issues publicly traded shares of stock.

Secondary Equity Offering (SEO)

Shares of stock that are purchased from publicly traded firms.

Cash Flows

Reported net income of a corporation plus amounts charged off for depreciation, depletion, amortization, and extraordinary charges to reserve accounts for the particular year under consideration.

Dictionary of Health Economics and Finance, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2007), p. 63*.

9.1.1 History of Healthcare Financing

Capital finance is an integral component of a healthcare organization's long-term financial sustainability. Traditionally structured finance for *solo practitioners* and *small to medium physician group practices* was secured through personal and family equity, as well as debt capital through local *commercial lenders* using their practice's *cash deposits* as leverage and pledging their *accounts receivable*, their *tangible personal property* (e.g., furniture and fixtures) and their *real property* as *collateral*, often supplemented by *personal guarantees* as recourse to the *lender.*[5] As the healthcare industry has evolved, so have the sources of capital for small to medium medical providers, as well as for large healthcare organizations, including *asset based lending* (e.g., *AR financing)* and *cash flow lending*, based on historical performance and the borrower's demonstrated ability to repay.

Typically, 50 percent of a healthcare organization's assets have been financed with equity, the remainder being financed by debt. However, this ratio differs among the various types of healthcare delivery entities (i.e., hospitals, outpatient clinic, ambulatory providers, skilled nursing facilities, long-term care facilities, and so on).[6]

In addition to the underwriting concerns of capital providers, healthcare lenders are influenced by three additional areas: (1) the *low margins* and *high costs* of healthcare services, (2) the volatility of government policy and the "*regulatory uncertainty*" of the healthcare industry, and (3) the

Essentials of Health Care Finance, *4th ed., by William O. Cleverly (Gaithersburg, MD: Aspen Publishers, 1997) p. 370.*

persistent *perception of risk* as to the ultimate impact on investors captive to the current *healthcare reform initiatives*.

9.1.2 Sources of Financing

Contemporary healthcare organizations have a multitude of borrowing options, including (1) *bond financing*, (2) *commercial lending*, (3) *mezzanine (or subordinated) lending*, (4) *equity*, (5) *sale-leaseback*, and (6) *seller "take back" financing*.[7]

The valuation analyst should carefully consider the availability of the sources of financing that could be used, as well as the costs and fit regarding the investment time horizon of the universe of typical borrowers in determining the appropriate cost of capital. Valuation analysts should also be aware of trends emerging from the healthcare industry that may have an impact on an entity's access to capital. A fact mentioned in a recent article by noted healthcare attorney Peter Pavarini related to the impact of healthcare reform and the recent U.S. Supreme Court ruling in regard to the Patient Protection and Affordable Care Act (ACA):

> *In general, capital will be more available to investment-grade hospitals and health systems and continuing care retirement communities. As health reform progresses, credit ratings may be more difficult to maintain given the anticipated decline in hospital volumes which should result in thinner profit margins. In addition to an organization's credit profile, credit-rating agencies will look at quality factor[s], such as outcomes, much more closely than they have in the past.*[8]

BOND FINANCING

A method of debt financing in which an investment bank underwrites the issuance of a bond and auctions it in the market. The required return is inferred from the price information provided by actual transactions in that specific debt offering.

Valuation professionals should be aware of the changing market conditions and how these changes may affect both the access to and the cost of capital to the borrower.

9.1.2.1 Debt Financing Healthcare entities use debt financing to meet their immediate objectives, as well as to pursue their extended goals in sustaining the continued viability of the organization. *Long-term debt* financing for healthcare organizations represents any debt that is repaid over a period of time that *extends beyond a single year* and can be drawn from various sources, including "private and municipal bond markets [. . .] loans, capital leases, mortgage or real estate financing, participation in real estate investment trusts, taxable bonds, notes, [. . .] certificates of participation, and tax-exempt bonds."[9]

However, the financial composition of long-term debt often differs for *nonprofit* and *for-profit* healthcare entities. Historically, *nonprofit* health systems have relied on "[p]ublic issues of long-term tax-exempt debt," which "remain the largest source of low cost capital financing for most nonprofit hospitals and health systems."[10] A recent national examination of *nonprofit* hospital systems found that approximately 95 percent of the long-term debt of hospitals and health systems consists of *tax-exempt debt.*[11] *For-profit* systems typically carry significantly higher percentages of long-term debt

LONG-TERM DEBT FINANCING

Any debt that is repaid over a period of time that extends beyond a single year and can be drawn from various sources.

Healthcare Capital Finance in Good and Challenging Times, *by David A. Lips (Washington, DC: American Health Lawyers Association, 2009), 7.*

compared to *nonprofit* organizations. In addition, long-term debt financing typically increases correspondingly with the size of the healthcare system.[12]

9.1.2.1.1 Public Bond Markets Due to the underwriting costs, *bond financing* is usually efficacious only for large healthcare organizations. A *bond issue* typically involves the underwriting of the bond issuance by an investment bank, often referred to as "*floating*" the bond. The bond issue is then auctioned to the market and the required return is inferred from the price information provided by actual transactions in that specific debt offering. The magnitude of the fees associated with the issue of a *bond flotation* often render small- and medium-size bond issues, based on the total value of the issue, impractical.

Bond Issue

The underwriting of the bond issuance by an investment bank, often referred to as "floating" the bond, which is then auctioned to the market and the required return is inferred from the price information provided by actual transactions in that specific debt offering.

[12] William O. Cleverley and Jane Baserman, "Patterns of Financing for the Largest Hospital Systems in the United States," *Journal of Healthcare Management* 50, no. 6 (November 2005): 362.

9.1.2.1.2 Commercial Lending The narrow profit margins and high operating costs of some healthcare enterprises, as well as the lack of specific knowledge of the healthcare industry leading to uninformed assessments of risk, have in the past often made traditional lenders reluctant to enter the arena of healthcare financing. This is an issue of particular concern to a growing transactional market within the healthcare industry because hospitals and other healthcare entities may be more reliant on credit than other industries are. Capital expenditures play an increasingly important role in hospitals' sustainability, as both facilities and equipment are necessary to attract sufficient physicians and the patients they treat to establish a healthcare provider as a viable investment. The unique financial needs of healthcare organizations require lenders who understand the intricacies and metrics of healthcare operational performance and capital expenditures. The presence of former healthcare industry managers, who understand a healthcare organization's functions and needs, within a financial institution is an integral part of how a healthcare enterprise should choose a financing partner. In addition to the financial capital, these lenders may also provide the *management capital* and an impetus toward enhancing efficiency and cost-cutting initiatives for healthcare borrowers.[13]

9.1.2.1.3 Mezzanine Lending *Mezzanine lending*, also called *subordinated lending*, refers to the issue of a class of debt that in the event of default, and liquidation of the firm's assets, will be paid only after the *senior debt holders* have been compensated. Since mezzanine debt still retains its seniority over common equity, it fills the *middle ground* in a firm's capital structure between equity and senior debt, and, consequently, the cost of mezzanine debt falls between the typical interest rate paid for senior debt and the required

MEZZANINE (OR SUBORDINATED) LENDING

A method of debt financing that refers to the issue of a class of debt that in the event of default, and liquidation of the firm's assets, will only be paid after the senior debt holders have been compensated. It fills the middle ground in a firm's capital structure between equity and senior debt and consequently the cost of mezzanine debt falls between the typical interest rate paid for senior debt and the required rate of return demanded by the equity holders.

[13] Dan Morse, "Looking Outside: Using External Capital Sources to Overcome Budget Constraints," GE Healthcare Financial Services, http://www.gehealthcarefinance.com/includes/OurSolutions/montgomery.pdf (accessed January 5, 2012).

rate of return demanded by the equity holders. The fact that the use of mezzanine debt increases the debt maintenance payments for the firm and thereby increases the probability of default by the borrowing firm, along with the fact that mezzanine debt holders will have seniority in payments in the event of default, both tend to increase the riskiness of an equity investment in the firm using mezzanine debt and will tend to increase the required return demanded by the equity investors.

9.1.2.2 Equity Financing

9.1.2.2.1 Internal Financing Internally financed projects are funded from the reserves or cash flow of the organization, that is, cash flow that would otherwise be available for distribution to the organization's investors, which may be defined as owners within *for-profit* enterprises or the community within *nonprofit* enterprises. In that sense, *reinvestment* of *current earnings* is a form of *equity financing*. Based on the underlying assumption that it is the fiduciary responsibility of the healthcare entity's management to reinvest earnings only in projects that are expected to return at least the *equity holders' required rate of return*, the cost of equity for an internally financed project should be, at a minimum, equal to the investors' required rate of return. However, it should be noted that the "*equity holders required rate of return*" for *nonprofit* enterprises may well be defined (at least in part) as being encapsulated in the mission of the institution to serve its community benefit—a "*social return.*" When this concept runs afoul of the well-worn healthcare aphorism "*No Margin, No Mission*," controversy as to the objectives and expectations for internal financing is assured to ensue.

> **"NO MARGIN, NO MISSION"**
>
> Without sufficient net and operating margins, healthcare enterprises will not have the means with which to fulfill their mission of providing healthcare.

9.1.2.2.2 Public Equity Markets Alternatively, large *for-profit* healthcare entities can issue publicly traded shares, either through an initial public offering (IPO) for firms that are currently privately held or through secondary equity offerings (SEO) for firms whose equity is already traded publicly. The capital raised from publicly traded equity markets has a required rate of return equal to the return on equity of the already outstanding shares of stock existing as of the offering date. This is due to the *dilution effect* of the ownership interest of the current shareholders. These equity holders will

accept this *dilution effect* only if they anticipate that the cash raised from the equity sale will return a greater amount than if the firm did not undertake the new investment that required the stock issue to raise the capital.

9.1.2.2.3 Private Equity *Private equity* refers to any *nonpublic source* of equity. Firms engaged in private equity include *investment banks*, *hedge funds* and firms whose sole purpose is to seek investment opportunities in private companies. Private equity investment necessarily includes diminished control for original equity holders of the firm, which may be subject to the risk of divergent strategic goals between the original equity investors and the private equity investors. Private equity investors typically seek high return opportunities (and consequently have higher risk tolerances); however, they may be less patient for returns than traditional equity holders in the event that cash flow is delayed and may be more inclined to dismantle a less liquid organization to extract the value of its assets.

Private Equity

Any nonpublic source of equity.

9.1.2.2.4 Venture Capital Healthcare entities might alternatively seek equity financing through select *venture capital* sources. *Venture capital* is a subset of private equity that focuses on smaller emerging companies. In addition to their capital investment, venture capitalists provide their expertise in developing strategies to transition smaller private companies in the *early stages* of their development into more mature corporations. This *mentorship process* is often as valuable to the firm as the actual equity investment and differentiates venture capital firms from the rest of private equity.

Venture Capital

A subset of private equity financing that focuses on smaller emerging companies.

9.1.2.3 Alternative Financing Options In addition to the more traditional forms of finance noted earlier, there are several alternative options available to healthcare entities to meet their capital needs.

9.1.2.3.1 REIT Financing *Real Estate Investment Trusts* (*REITs*) are investment vehicles by which to invest in a wider portfolio of real estate assets

Real Estate Investment Trusts (REITs)

A method of financing which involves investment in a wider portfolio of real estate assets than simply acquiring a single property (typically real property). The owner of the premises may obtain REIT financing by agreeing to sell their real estate assets to the trust and subsequently leasing back the property, thereby acquiring cash to invest in its core healthcare functions.

than simply acquiring a single property. In the healthcare industry, REIT investment is typically in real property, land and buildings, used by healthcare entities in the provision of medical services (e.g., medical office buildings, hospitals, medical office parks, outpatient ambulatory centers, long-term care facilities, and others). REIT financing involves healthcare entities that already own their premises and agree to sell their real estate assets to the trust and subsequently lease back the property. This provides the benefit of an injection of cash into the lessee that can be used to invest in the core functions of that healthcare entity, to pay down debt, or to invest in other enterprises and initiatives, as well as provide the trust with rental income for a specified period of time as a return on the investment.[14] Some REIT arrangements may also confer additional tax benefits.

9.1.2.3.2 Joint Financing Another form of financing available to health care entities is *joint financing*. Joint financing involves two or more entities agreeing to joint develop a project/asset to the benefit of both investors. For example, two medical office buildings jointly developing, building, and owning a parking structure for the benefit of both buildings. The benefits of

JOINT FINANCING

A method of financing in which two or more entities agree to joint develop a project/asset to the benefit of both investors, with the benefit of reduced financial burden and more diverse risk allocation to each entity.

[14] Jeffrey H. Cooper, "Real Estate Monetization: An Attractive Source of Hospital Capital," *Health Care Financial Management* (July 2012): 102–104.

joint financing are that it reduces the financial burden to each of the individual participants and allocates the risk among multiple entities.

9.1.2.3.3 Charitable Financing *Charitable financing* is used particularly by *nonprofit* entities. While *charitable donations* do not have an explicit capital cost, there is a cost for solicitation and obtaining the donations. Instead, charitable donations are premised on the expectation that the donation will provide a return to the wider society within which the entity operates. To the extent that an entity fails to meet the benefit expected by the person or the foundation donating the funds, it may find future charitable financing difficult to achieve. The calculation of a social discount rate is not easily achieved and falls under the purview of *welfare finance*. Charitable benefactors have alternative options for allocating their scarce donative capital. The expected return from these alternative investments will tend to set the floor for the required return for charitable donations, as the charitable donation could have been invested in the alternative and provided funds that could then be used for the preferred charitable purposes of the benefactor. Therefore, the *social benefit* derived from a charitable donation should at least equal the risk-adjusted rate of return for a similar enterprise. (Note the discussion of "*Social Return*," earlier.)

In addition to *donations* that directly finance operations, many healthcare ventures (particularly *nonprofit* entities) rely on a *stream of income* generated by returns from the investment of a *charitable endowment*. Instead of directly applying donated funds to the enterprise's operation budget, the funds are deposited in a charitable trust that invests the funds in various instruments with the goal of maintaining the endowment's principles' as well as providing a benefit stream that can be used in achieving stated goals of the institutions. The alternative use of these funds is *reinvestment* within the *charitable trust*, in which case the *required rate of return* should be the expected return on investment for the charitable trust, which presumably would be the required rate of return for a prudent investor within the risk profile permitted under the terms of the endowment or trust.

9.1.2.3.4 Capital Leases and Off Balance Sheet Financing *Capital leases* are another option available to healthcare ventures seeking to obtain financing. Typically, *capital leases* are used to finance, over time, large capital expenditures (e.g., MRI systems, X-ray systems, or radiation therapy equipment). While *capital leasing* has some similarities to traditional *commercial lending*, there are some important benefits that may make the use of capital leases more attractive to healthcare entities, such as (1) they capture the depreciation tax shield benefit of ownership without a significant down payment or personal guarantee; (2) they possibly receive more favorable terms

from industry specialist leasing firms, with greater institutional knowledge of healthcare; and (3) they receive expert technical and administrative advice particular to the leased asset.[15]

A distinction should be drawn between capital leases and operating ("*true*") leases. Operating leases, in contrast to capital leases, are treated as an operating expense and are reflected in the subject entity's income statement as a recurring expense and are often referred to as "*off balance sheet*" financing. An asset leased under a capital lease should be "*capitalized*" and stated on the subject entity's fixed asset list and balance sheet and depreciated over the economic useful life of the asset; a "*true*" (or operating) lease should not.

There are, however, certain aspects of true leases subject to IRS scrutiny. In particular, Revenue Ruling 55 540, 1955–2 C.B. 39 defines a "*true*" lease (i.e., operating) in the equipment leasing context. In this ruling, the IRS stated that

> *The determination of whether an agreement, which in form is a lease, is in substance a conditional sales contract depends upon the intent of the parties as evidenced by the provisions of the agreement, read in light of the facts and circumstances existing at the time the agreement was executed. In ascertaining such intent no single test, or any special combination of tests, is absolutely determinative.*

Interpretations of various IRS rulings and accounting standards suggest that a lease transaction should meet the following criteria to qualify as a "*true lease*" (operating):

1. At the beginning of the lease term, the leased asset must have a projected fair market value at the expiration of the lease term of an amount greater than or equal to 20 percent of the value of the leased asset at the inception of the lease, excluding from consideration the effect of inflation and/or deflation and any cost to the lessor for removal.
2. The leased asset is projected to have the longer of (1) at least 20 percent of its expected normal useful life (the life projected at the inception of the lease) remaining at the end of the base term, or (2) a remaining normal useful life of at least one year at the end of the base lease term.
3. The lessee cannot have a right to purchase or renew the leased asset for a price that is less than its fair market value.[15]

[15] Richard Contino, *The Complete Equipment Leasing Handbook* (New York: Amacom, 2002).

4. The lessor cannot force the lessee to purchase the leased asset at a fixed price.
5. The lessor must have a minimum unconditional equity "at risk" investment equal to at least 20 percent of the value of the leased asset at all times during the lease term. This can be done in a number of ways: with cash, with other consideration, or by personally assuming the obligation to buy the equipment.
6. The lessee must not furnish any part of the purchase price of the leased asset or have loaned or guaranteed any indebtedness created in connection with the acquisition of the leased asset by the lessor.
7. The lessor must show the lease transaction was entered into for profit, apart from any tax benefits resulting from the transaction. Total lease payments that the lessee is obligated to pay over the lease term, when added to the equipment's estimated residual value, have to be greater than the amount of money that the lessor is obligated to pay out for the equipment, such as debt service and equity investment, including any related direct equity financing costs.[16]
8. The present value of the lease payments cannot exceed 90 percent of the Fair Market Value (purchase price) of the equipment.[17]

As construed here, an operating lease should not be considered a *source of capital*. In a *true* lease, the ownership of the asset is retained by the leasing firm. In a *capital lease*, ownership of the asset is transferred to the "*lessee*," and the lease payments are, in effect, *structured payments* for the asset, similar to traditional *loan payments*.

For the purposes of the valuation process, it is important to correctly identify leases as either operating or capital, to assist the valuation consultant in accurately projecting the expected expense burden of the subject entity. In addition, a firm's use of *capital* versus *operating leases* affects the entity's *capital structure*. As is discussed later, the firm's capital structure is a key determinant of the cost of capital. It is incumbent on the valuation consultant to correctly construe the financial position of the subject entity relative to its use of capital and operating leases, to appropriately determine the firm's *capital cost*.

It should be noted that among the current trends in the accounting industry is a movement toward a reconciliation of the accounting standards as expressed by the *Financial Accounting Standards Board* (*FASB*) with the

[16] Internal Revenue Service, "IRS Revenue Ruling 55-540," 1955; Internal Revenue Service, "IRS Revenue Procedure 2001-28," May 7, 2001.

[17] Financial Accounting Standards Board, "Statement of Financial Accounting Standards No. 13," Norwalk, Connecticut, November 1976, p. 49.

Factoid

A business's capital structure is a key determinant of the cost of capital.

Factoid

The Hill-Burton Act was one of the first instances of significant federal funding—and regulation—of the healthcare industry, financial assistance to over 4,200 hospitals, nearly 60 percent of all U.S. hospitals.

Special Analyses: Budget of the United States Government: Fiscal Year 1978, *United States Office of Management and Budget (Washington, DC: Government Printing Office, 1978), p. 215.*

standards promulgated by *the International Accounting Standards Board* (*IASB*). Lease accounting is among the issues to be reconciled during the integration process. Most experts believe that the process will eventually conclude with FASB, and therefore the United States, accepting the *international lease accounting standards*, which *do not allow* for *operating leases*, favoring instead a *capital lease treatment* for all equipment leases.[18] As noted earlier, the conversion of a subject entity's leases to *capital leases* will have an impact on its capital structure and therefore its *cost of capital* as well.

9.1.2.3.5 Government Grants and Programs Federal, state, and local governments are also a significant source of *financial capital* for the healthcare industry. The benefits of a hospital venture to the community in which that entity operates extend beyond the *private investors/owners of the enterprise*. Many communities realize direct, as well as indirect, benefits from healthcare entities. These benefits may encourage governments, at all levels, to assist these enterprises in obtaining sufficient financing to fund their capital and operating budgets.

Toward that end, many governmental agencies have historically developed programs to support endeavors in the healthcare industry. For example, the *Hospital Survey and Construction Act of 1946* (commonly known as the *Hill-Burton Act*) was landmark legislation that provided for federally funded health policy planning and direct federal investment in

[18] Financial Accounting Standards Board, "Exposure Draft: Proposed Accounting Standards Update," August 17, 2010, pp. 1, 3.

hospital construction.[19] (See Chapter 1, "The Chronology of U.S. Healthcare Delivery: From Caduceus to Corporatization," for a discussion of the history surrounding the *Hill-Burton Act*.)

Currently and in the future, these programs will typically be designed to further a particular deficiency in care delivery, as identified by a governmental agency, such as (1) critical access hospital grants supporting hospitals designated as critical access in underserved areas; (2) the HITECH act, which provides funding to assist healthcare enterprises in the adoption of electronic health records (EHR); and (3) funding for post-9/11 emergency preparedness and response capabilities. Valuation analysts should be aware of these alternative sources of financial capital, as well as their availability to the different types of healthcare ventures.

The costs associated with governmental sources of capital may not be recognized as direct financial expenditures. Instead, government assistance may come with an inherent, but not explicit, regulatory burden. Healthcare entities seeking governmental funding may find themselves, as a condition of receiving the funding, required to meet new reporting and/or oversight requirements. For example, as a condition of receiving funding under the HITECH act, healthcare providers are required to prove "*meaningful use*," that is, to receive the funding providers must meet several benchmark standards that indicate not only that they have purchased the required EHR, but that they are also making efficient use of it.[20] The cost burden of this oversight, both through the collection and reporting of data and the costs of meeting the required standards, while not directly reflected in the distinct accounting of the capital cost for these funds, is instead reflected in a greater operating expense burden for the entity and the resultant decrease in the available cash flow. A valuation analyst, considering the inclusion of governmental sources of capital, should carefully consider the costs and sources of payments associated with obtaining these funds to accurately estimate the future economic benefit arising from this form of capital.

9.2 COST OF CAPITAL

A key component of the income-based valuation approaches is the determination of the appropriate *discount rate* to apply to the *expected future economic*

[19] Andrew B. Dunham, *Health and Politics: The Impact of Certificate of Need Regulation* (Chicago: National Center for Health Service Research, 1981), p. 141.

[20] Jonathon P. Tomes, "Avoiding the Trap in the HITECH Act's Incentive Timeframe for Implementing the EHR," *Journal of Health Care Finance* 37, no. 1 (Fall 2010): 91–100.

benefit to be derived from the ownership of the subject entity. This discount rate is most commonly referred to as the *Cost of Capital*. The concept of the *Cost of Capital* can be viewed from two alternative perspectives: (1) the *Cost of Capital* is the *expected expense that an entity will incur* in obtaining the necessary capital financing to fund an investment, or (2) it can be understood as a reflection of the uncertainty pertaining to an *investor's expectation of realizing the projected cash flow* associated with the asset(s) being acquired.

These two concepts are not unrelated. *Investors' risk perceptions* strongly influence the required rate of return necessary to induce investors to allocate a portion of their scarce capital toward a particular project, and these risk perceptions should be swayed by the expectations as to the probability of actually realizing those returns. *Economic and financial theory*, as well as *empirical evidence*, suggests that there exists a strong connection between the *uncertainties* related to the future expected economic benefit of an investment and the *required return* an investor demands. Economic actors (e.g., investors) are assumed to operate in their own best interest within boundaries of *rational economic behavior*, which requires that *greater risk* be rewarded with *greater return.* Toward that end, *rational investors* will assess the relative riskiness (relative to other alternative investment opportunities) and determine the appropriate level of compensation that will be required to allay their fears related to the achievement of the anticipated cash flow. All things being equal, a riskier (i.e., less likely) future cash flow will be discounted at a higher rate to account for the discomfort experienced by the investor related to the likelihood of his or her investment achieving the anticipated future cash flow.

All value is *forward looking* and is therefore subject to *uncertainty and risk*. To assess the value of an asset, an appraiser must accurately forecast the *expected future economic benefit* that will accrue to the owner of that asset, as well as appropriately determine the *likelihood* of actually achieving those anticipated gains. The concept of the *Cost of Capital*, from the *investor's perspective*, is the excess compensation required to render the investor, at a minimum, to a state of indifference between investing in the risky asset and an alternative *risk-free* asset, in other words, a future economic benefit known, with *certainty.* That is, the investor must be compensated not only for the *postponement* of the utility derived from the consumption of the capital that is invested (i.e., the *time value of money*), but also for the *likelihood* of reduced or nonexistent returns from the investment project. The excess return required over the *risk-free* rate of return is referred to as the *risk premium*. Accordingly, the *Cost of Capital* can be considered, in general terms, to be composed of a *risk-free portion* and a *risk premium*. Projects with *greater certainty* regarding the anticipated future economic benefits pose a *lower risk* to

investors and will have a lower risk premium and a lower required rate of return.

From the perspective of the *entity seeking funds* for investment in a project, the *Cost of Capital* can be viewed in the more traditional sense of a *cost*. As noted earlier, capital financing requires that the providers of capital receive a return on their investment. To a firm seeking capital, this can be thought of as the *hurdle* rate. If a project under consideration is not expected to generate sufficient cash flow to provide capital investors with both a *return on* and *return of* their initial investment, then the project should be forgone, in favor of projects with more favorable cash flow expectations or lower capital costs.

Yet in a larger sense, the *Cost of Capital* is the *mechanism* through which the economy enforces the *efficient allocation of scarce resources* to their highest and best use. As a decision *criterion*, the *Cost of Capital* provides information to *economic actors* on the *relative merits* of a project. The individual actors within the economy do not require information regarding every possible use of the scarce capital available in the market; they require knowledge only of the *market* price of capital. So long as the project's anticipated cash flow provides an excess return above the *Cost of Capital*, then the project should be undertaken.

Further, in deciding between two competing projects, the project hat provides the greatest risk-adjusted return would be preferred because it generates the *greatest expected excess cash flow* to the entity after consideration of the cost of the capital employed as a function of the riskiness of the project and the time value of money related to the project's time horizon. This process ensures that capital is directed to those projects with the greatest possible return, that is, the projects with the largest expected future economic benefits are selected, and those projects that provide lesser benefits are avoided. Free market philosophies consider that this is best accomplished through the *price mechanism* without the need for overt direction. The concept asserts, as its basis, that a self-organizing system of socially efficient capital allocation naturally emerges from *rational economic actors* seeking *individually beneficial outcomes*. This concept is commonly referred

Cost of Capital

A key component of the income based valuation approaches is the determination of the appropriate discount rate to apply to the expected future economic benefit to be derived from the ownership of the subject entity.

COST OF CAPITAL

The concept of the cost of capital can be viewed from two alternative perspectives: (1) the cost of capital is the expected expense that an entity will incur in obtaining the necessary capital financing to fund an investment, or (2) it can be understood as a reflection of the uncertainty pertaining to an investor's expectation of realizing the projected cash flows associated with the asset(s) being acquired.

"THEOREM OF THE INVISIBLE HAND"

Given a number of ideal conditions, optimizing behavior on the part of individuals and firms under pure competition leads to an efficient (Pareto-optimal) social outcome.

Price Theory and Applications, *by Jack Hirshleifer (Englewood Cliffs, NJ: Prentice-Hall, 1984), p. 479.*

to as the "*Theorem of the Invisible Hand*" (in reference to the famous Adam Smith quote) and can be summarized as:

> *Given a number of ideal conditions, optimizing behavior on the part of individuals and firms under pure competition leads to an efficient (Pareto-optimal) social outcome.*[21]

9.2.1 Estimating the Cost of Capital

As noted earlier, the *capital structure* of a healthcare entity typically consists of both equity and debt. Each of these *sources of capital* has unique properties that affect the expected cost that a firm would incur when gaining

[21] Hirshleifer states that the "One allocation of goods in an economy is said to be 'Pareto—Preferred,' in comparison with another, if in the first arrangement all parties concerned are at least as well off and one or more of the parties is actually better off than in the second." Pareto-optimal in this sense would be the *arrangement* whereby the maximum utility for all parties is attained, without the reduction of utility for any party. Jack Hirshleifer, *Price Theory and Applications* (Englewood Cliffs, NJ: Prentice-Hall, 1984), p. 479.

Weighted Average Cost of Capital

A blend of the cost of an enterprise's various capital components, including the cost of debt capital and the cost of equity capital of the enterprise, representing the expected return demanded by the blend of both debt and equity investors in the subject entity, and the capital cost to the entity for financing future projects.

WEIGHTED AVERAGE COST OF CAPITAL (WACC)

WACC reflects the relative use of equity and debt in the capital structure of the particular entity under analysis, based mostly on (1) the cost of debt, (2) the cost of equity, and (3) the anticipated capital structure for the subject entity.

access to and using these *capital sources*. To appraise the financial value of a healthcare entity, the most probable cost burden that would be expected by a *typical investor* in the subject entity should be considered. The estimation of the costs related to financing an investment is encapsulated in the concept of the *Weighted Average Cost of Capital* (WACC), which reflects the relative use of equity and debt in the capital structure of the particular entity under analysis. The important types of input into the development of the WACC are (1) the *Cost of Debt*, (2) the *Cost of Equity*, and (3) the anticipated capital structure for the subject entity.

9.2.1.1 Cost of Debt Healthcare enterprises have multiple options available to them in seeking debt financing. The selection of the *type* of *debt financing* will have an impact on the *expected cost of debt*. Deriving the cost of debt is generally a relatively straightforward exercise for a given enterprise. Lenders, in all classes of debt, will expect both a *return of* and a *return on* their initial investment. The size and form of these returns will largely be determined by the *type of debt* that is obtained. Traditional commercial bank lenders will typically expect a return of the principle amount loaned (*return of*), as well as an interest payment (*return on*) on an agreed-on loan repayment schedule. While the terms of the loan may be variable, all debt financing is similar, in that the lenders will expect compensation, above the *risk-free rate*, for providing the loaned funds; to the extent that the *return of* is perceived to be of higher risk, the lenders will demand a greater *return*

on as compensation for assuming this greater risk. Therefore, projection of the expected *cost of debt* necessarily involves an assessment of the relative riskiness of the borrowing enterprise.

The valuation analyst can rely on either the *historical subject entity cost of debt* (i.e., the interest rate on outstanding debt) or a *market-derived expected cost of debt*. Of note is that in using *historical interest expense* as a *proxy* for the *expected cost of debt* attention is required to the timing of the historical debt investment. *Historical interest expense* is based on the level of debt in the firm *at the time the loan was made* and is based on the *prevailing market interest rate at that time*. As of the *date of valuation*, the debt level of the firm may be *significantly different* than *at the time the existing debt was obtained*. Higher debt levels, in general, imply a *greater perceived risk* of borrower default and therefore demand a higher interest rate to compensate the lender for assuming this *greater perceived risk*. To the extent that the level of debt for the subject entity has changed, affecting the lender's perception of the borrower's liquidity and solvency, then the anticipated cost of debt will typically be adjusted upward. The valuation consultant should consider using the historical cost of debt only when it is reasonable to assume that the *level of debt* at the time the subject entity obtained the debt financing is *similar* to the *expected debt levels in the future*.

Alternatively, the valuation analyst can look to the market for similar enterprises that provide insight to the valuation analyst in determining an appropriate cost of capital. One *market-based method* to estimate cost of debt is to collect *current yield rates* for publicly traded, fixed-income securities (i.e., corporate bonds) with similar *risk profiles* (e.g., within the same industry or subindustry) as the subject entity. A *composite cost of debt* can be created by calculating the *weighted average* of the *collected yield rates*, with greater weight applied to those yields derived from market comparable instruments that have greater similarity to the subject entity.

Another *market-based method* for determining an appropriate *cost of debt* is to assess the quality of the hypothetical debt issued by the subject entity and apply a *risk premium* over the prevailing *risk-free rate* in accordance with the valuation consultant's risk assessment. The risk assessment can be performed by using several metrics to discern the subject entity's likelihood of default. A method proposed by Aswath Damodaran at New York University's Stern School of Business is:

> *estimat[e] the cost of debt . . . by us[ing] the*
>
> *interest coverage ratios of these firms to estimate 'synthetic ratings,' and then us[ing]*

the default spreads on these ratings [over the risk free rate] to arrive at the costs of debt.

To allow for the fact that private firms tend to be smaller and riskier than most publicly traded firms, we would use the relationship between interest coverage ratios and ratings for a subset of smaller, publicly traded firms.[22]

The advantage of *market-based methods* is that, assuming relatively *efficient markets*, the *market-derived cost of debt* should reflect all elements of pertinent information (e.g., the impact of *constrained capital markets*) available at the time of the valuation. It may be necessary, though, to further adjust the market-based calculated *cost of debt* to reflect *idiosyncrasies* particular to the given subject entity, such as *poor credit history* or *high leverage*, as compared to industry norms.

9.2.1.2 Cost of Equity Several methodologies have been developed to estimate the *cost of equity* for an enterprise. Selection of the appraisal methodology to employ will rely primarily on the availability of data related to the specific entity being valued. Among the methods commonly used to estimate *equity capital costs* are (1) the *Build-up Method*, (2) the *Capital Asset Pricing Method* (*CAPM*), and (3) *Arbitrage Pricing Theory* (*APT*) methods.

Factoid

Arbitrage Pricing Theory methods are divided into two different types: (1) macroeconomic models, explaining required rates of return based on macroeconomic variables; and (2) microeconomic models, which look to variables specific to the subject entity.

Capital Asset Pricing Method

A technique that defines the riskiness of an investment relative to the overall riskiness of the market, resulting in the assumption that all things being equal, investors will require greater compensation for greater risk.

[22] Aswath Damodaran, "Valuing Private Firms," New York University, http://pages.stern.edu/~adomar/ (accessed on September 18, 2012).

9.2.1.2.1 Build-Up Method

9.2.1.2.1.1 Risk-Free Rate The starting point for developing an appropriate discount rate is the *alternative investment opportunities* in *risk-free* or *relatively risk-free investments*. The interest rate of U.S. government securities is often considered to be a close *substitute* or *proxy* for a *risk-free rate* (e.g., 20-year Treasury bond rate as of the *date of the valuation*).

9.2.1.2.1.2 Investment Alternative (Equity Risk Premium) This adjustment reflects the extra return, or *premium*, realized on the historical public stock market indices (e.g., the New York Stock Exchange [NYSE], Standard and Poor's 500 [S&P 500], and the Dow Jones Industrial Average [DJIA]) that is typically available to an equity investor in large company stocks in excess of the return on a risk-free investment. Morningstar, which acquired the Ibbotson Company, has since 1926 studied and estimated the historical realized *Equity Risk Premium* (*ERP*) associated with the risk of investment in common stock in relation to various government bonds in its *Stocks, Bonds, Bills and Inflation Yearbook* (SBBI).[23]

Various valuation publications (e.g., Grabowski and King) have compared the expected growth in *Gross Domestic Product* (*GDP*), *earnings*, or *dividends* with *realized returns* reported by sources such as Morningstar, noting that "investors could not have expected as large an ERP as the equity premiums actually realized."[24] In light of these published studies, it may be appropriate to adjust downward a historical realized ERP to estimate a forward-looking ERP.[25]

9.2.1.2.1.3 Industry Risk Premium This adjustment applies a measurement of the relative risk of the healthcare industry (SIC code 80) against the market index as a whole by the addition of an industry risk premium to the selected *risk-free rate* and *ERP* from the "*build-up*" method. Morningstar has developed an *industry premium methodology* from tracking the *returns* and *related betas* (which are measurements of relative volatility)

---

[23] Morningstar, as described on its corporate website, http://corporate.morningstar.com/US/asp/subject.aspx?xmlfile=177.xml (accessed September 20, 2012), "*is a leading provider of independent investment research in North America, Europe, Australia, and Asia. [They] . . . offer an extensive line of products and services for individuals, financial advisors, and institutions.*" SBBI is published annually, quarterly and for recent years has been available online.

[24] Roger J. Grabowski and David W. King, "Equity Risk Premium: What Valuation Consultants Need to Know about Recent Research: 2005 Update," *Valuation Strategies* (September/October 2005): 10.

[25] Ibid.

of companies in a number of industries in its annually published *Stocks, Bonds, Bills and Inflation Valuation Yearbook* (SBBI).

9.2.1.2.1.4 Size Risk Premium The *build-up* of the *risk-free rate*, the *equity risk premium*, and *industry risk premium* provides a combined estimate of the *indicated return required* by investors in large company stocks in the healthcare industry. Morningstar measures the additional return *of small company stocks* over the *stock market index* as a whole. *Anomalies* have been noted in the returns of *small companies* in comparison to *larger companies* (famously by Eugene Fama and Kenneth French, as discussed further later). *Smaller companies* tend to produce *greater statistically significant returns* than *larger companies* when controlling for *risk factors* other than *size*. This indicates that participants in equity markets perceive extra *risk* for investing in companies based on their size. Morningstar provides estimates of the *historical size premium* based on *company market capitalization levels* divided into 10 "*deciles*."

9.2.1.2.1.5 Subject Entity Specific Risk Premium The combination of the *four elements* discussed earlier (i.e., the *risk-free rate*, the *ERP*, the *industry risk premium*, and the *size risk premium*) estimates returns based on the *market's expectation* of *systematic risk* from *freely traded equities* not subject to the *liquidity* and *risk* concerns of *small private companies*.

The subject entity-specific risk premium provides an adjustment for the nonsystematic risk and is somewhat more *subjective* than the other elements in the *build-up* method, in that it reflects the valuation consultant's *informed*, if less *empirical*, assessment of the various risk factors that are *inherent and specific to the subject entity.* Additional *risk factors*, specific to a subject healthcare enterprise, include, but are not limited to, (1) *operational performance* (as evidenced by benchmarking), (2) *market/competition*, (3) *technological obsolescence*, (4) *uncertainty* related to *reimbursement* from *government* and *managed care providers*, (5) *provider and staff stability*, (6) *access to capital*, (7) *risk* related to *key persons* or *key suppliers*, (8) *depth of management*, and (9) *geographic distribution.*

HEALTHCARE ENTERPRISE RISK FACTORS

Risk factors include operational performance, market/competition, technological obsolescence, uncertainty related to reimbursement from government and managed care providers, provider and staff stability, access to capital, risk related to key persons or key suppliers, depth of management, and geographic distribution.

Butler-Pinkerton Method

A valuation calculator that attempts to measure total cost of equity and public company specific risk.

"The Butler Pinkerton Model: Empirical Support for Company-Specific Risk," by Peter J. Butler and Keith A. Pinkerton, Value Examiner*, May/June 2003.*

9.2.1.2.1.6 Attempts at Standardization of Selected Risk Premia Research challenges related to determining the appropriate discount rate/cost of equity include (1) finding research to support the quantification of *subject healthcare practice–specific risk premiums*, (2) obtaining *size premium data* for small companies, and (3) determining *industry risk adjustments* for certain professional practice industry subsectors.

Among several efforts within the valuation profession, over the years, a calculator has been released using the *Butler-Pinkerton method* to measure *total cost of equity* and *public company–specific risk*.[26] It provides empirical benchmarks for selecting the correct subject entity–specific risk premium for the subject enterprise, mixing subjective and objective techniques. The calculator can only be used to calculate implicit volatilities exactly matching the private company's total cost of equities (TCOE). An example of the use of the build-up method to determine the cost of equity can be found online at http://www.wiley.com/go/healthcarevaluation.com.

9.2.1.2.2 Capital Asset Pricing Model (CAPM) An alternative to the *build-up method* for estimating the *cost of equity* to be used in the income approaches is the Capital Asset Pricing Method (CAPM). The CAPM technique defines the *riskiness* of an investment relative to the *overall riskiness* of the *market*, that is, the *expected return* from a *well-diversified portfolio of assets*. Underlying this technique is the assumption that all things being equal, investors will require *greater compensation* for *greater risk*. The first step in calculating the *cost of equity* using the CAPM method is to estimate the *beta*, that is, the *relative variability* of the returns for the subject entity in comparison to the market. *Beta is* often considered to be a measure of volatility.

9.2.1.2.2.1 Beta Estimation Beta estimation is a *regression technique*. It measures the *marginal sensitivity* of the selected publicly traded entity's

[26]The calculator was created by Keith Pinkerton and Peter Butler based on the Butler-Pinkerton model and is available on the Business Valuation Resource website, http://www.bvmarketdata.com/defaulttextonly.asp?f=bpmintro.

returns to changes in the *returns* of the *market as a whole*, or a *suitable proxy* for the *market*. The steps for estimating the *beta* of a publicly traded entity are as follows:

1. Collect *historical return data* for the *selected publicly traded stock* and the *market proxy* (e.g., the DJIA or the S&P 500) for an appropriate time frame (e.g., the most recent three- to five-year period preceding the "as of " date of the valuation);
2. Calculate the *excess return* of the selected publicly traded stock's (equal to the *historical returns minus* the *prevailing risk-free rate*);
3. Calculate the *excess return* of the *market* (equal to the *historical market return* less the then, as of the valuation date, *prevailing risk-free rate*);
4. Calculate the *variance* of the *historical excess returns* for the *market proxy*;
5. Calculate the *covariance* between the selected publicly traded stock's excess returns and the market proxy's excess returns; and
6. *Beta* is defined as the ratio of covariance, calculated in step (3), and the market variance, calculated in step (2).

For *closely held firms*, similar to many enterprises typically encountered in the healthcare industry, *betas* can only be estimated *indirectly*, due to the lack of *historical time series information* related to the value of the privately held company's equity. To overcome this deficiency in data for privately held companies, valuators will typically use a *publicly traded company proxy* (or a *portfolio* of *publicly traded companies*) from the same industry as the subject entity being appraised in the calculation of *beta*. Once the *proxy* has been identified, the process outlined in steps 1 through 6 is completed using the *proxy* in place of the subject entity.

The ultimate goal of the *CAPM technique* is to quantify the extent to which the subject entity's equity returns vary in comparison to the *market*. Equity returns that exhibit greater variability than the market will result in a *beta* greater than unity, those with lesser variability than the *market* will have a *beta* less than unity, and an equity *beta* equal to one implies variation in excess returns on par with the *market*.

Once the relationship between the returns of the subject entity (or its proxy) has been estimated, then a reasonable cost of equity can be estimated according to the following equation:

(The current Risk-Free Rate)
+ (The estimated beta × Long-Run Expected Excess Return of the Market)
Cost of equity

Beta Estimation

A regression technique that measures the marginal sensitivity of the selected publicly traded entity's returns to changes in the returns of the market as a whole, or a suitable proxy for the market.

The *cost of equity* calculated in this manner can then be used to determine the appropriate *Weighted Average Cost of Capital* (WACC), as discussed later.

9.2.1.2.3 Arbitrage Pricing Theory (APT) One of the greatest strength of the CAPM method is its simplicity. It is easily calculated from data that is generally available. While the results of the *CAPM method* provide reasonable expectations, at least theoretically, for the *anticipated cost of capital* required by the market, the empirical record is less clear regarding its *efficacy*. In an attempt to address this shortcoming, the *Arbitrage Pricing Theory* (*APT*) *method* has been proposed as an alternative method to estimate the cost of capital.

The main criticism leveled against the CAPM method is that *future expected returns to equity* are affected by more *factors* than *market risk*. The APT method attempts to overcome this criticism by estimating the *cost of capital*, while considering *multiple sources of risk* in addition to *market risk*. The CAPM methodology estimates the *cost of equity* based solely on market risk. The APT method alternatively estimates the cost of equity relative to *a series of factors*. It is the responsibility of the valuator to determine which factors are important in determining the *cost of capital* particular to the subject entity being analyzed.

The name *arbitrage* pricing theory refers to the argument that if factors in addition to the systematic market risk are significant in determining the *expected return of equity*, then to eliminate the *arbitrage opportunity* (an assumption typical in finance and economic theory) the market must already price these *factors* into the subject entity's *cost of equity*.[27] If, instead, the *cost of equity* for the subject entity did not reflect the impact of these factors, then *careful analysis of these factors* would provide *market participants* with an opportunity to generate a *risk-free return* on the

[27] *Arbitrage*, as defined in Frank Fabozzi, Franco Modigliani, Frank Jones, and Michael Ferri (*Foundations of Financial Markets and Institutions* [Upper Saddle River, NJ: Prentice Hall, 2002]), is "the act of taking advantage of a difference in price and/or return of an asset that is traded in more than one market"; in the APT setting, this refers to the *arbitrageurs'* ability to more accurately price capital than the CAPM model, giving them the ability to use this information to earn a risk-free return.

prospective investment. To the extent that a *risk-free opportunity exists*, it should be exploited by so-called *arbitrageurs* until the *cost of equity* for the investment aligns with these *more nuanced expectations*.

APT models can be broadly divided into two different types: (1) *macroeconomic models* and (2) *microeconomic models*. *Macroeconomic models* seek to explain *required rates of return* based on *macroeconomic variables*. Examples of *variables* that could be included in a *macroeconomic model* are changes in *anticipated inflation*, *expected growth rate in gross domestic productions*, the *expected national employment level*, or *trends in consumption spending* and *disposable income*. In contrast, *microeconomic models*, sometimes referred to as *fundamental factor models*, look to variables specific to the subject entity, such as "*Industry Membership, price-earnings ratio, book value-to-price ratio, size, and financial leverage.*"[28] A popular example of a *fundamental factor model* is the *Fama-French three factor model*, which uses *market returns*, *size*, and the *book-to-price ratio* as the determining *factors* in estimating the *cost of capital*.[29]

After the valuator has determined the appropriate set of variables to include in the model, the APT method proceeds by estimating (using an *ordinary least squares regression methodology*) the *factor weighting* of each of the included *variables* using *historical returns* for the subject entity, as well as the *historical values* for the *included factors*. The *expected cost of equity* can then be estimated by applying the *weightings* determined earlier to the *forecasted values* for the included *variables*, as shown in the following equation:

$$Cost\ of\ Equity = a + w_1 * F_1 + \cdots w_i * F_i$$

where: a = the *regression constant*, interpreted as the *unconditional average return*
w_i = the *weighting* for factor (i)
F_i = the *forecasted value* of factor (i)

Calculation of the individual weightings for the multiple included factors in the APT model requires *more complicated techniques* for estimation than the single factor CAPM model. This may account for its more limited use. In addition, empirical evidence is *inconclusive* as to the effectiveness

[28] Richard Defusco, et al., *Quantitative Methods for Investment Analysis* (Baltimore: United Book Press, 2004), p. 649.

[29] As developed by Kenneth French, Ph.D., at Dartmouth University and Eugene Fama, Ph.D., at the Booth School of Business at the University of Chicago.

of various *APT models*, although this is may be partially explained by the requirement to *specifically tailor* the included *factors* to the subject entity, making *broad empirical tests* difficult to perform.[30] It should be noted that the *build-up* method, as described earlier, is consistent with the APT method using *market returns*, *size*, and *industry factors*. Further, the *subject entity–specific risk premium* can be interpreted as a *composite factor*, accounting for *various fundamental factors* as determined by the valuator.

In determining the appropriate method to use in estimating the *expected cost of equity* for a particular engagement, the valuator should balance the *relative merits* of the different methodologies outlined above with the *complexity* of the model and the *available data*. The nature of the specific entity to be valued will help direct the valuator toward a method for estimating the cost of equity. *Small, closely held entities* may lack sufficiently similar publicly traded companies to make the CAPM and APT methods feasible. Under those circumstances, it may be more appropriate to use the *build-up* method. But for larger entities, such as ambulatory surgery centers, large outpatient clinics, or hospitals, the CAPM or the APT may be more attractive.

9.2.1.3 Capital Structure A healthcare organization's *capital structure* is sensitive to *market conditions* and its *short- and long-term goals* for expansion in a changing healthcare environment. An organization's *capital structure decision* is how it plans to finance *daily operations*, as well as how it plans to finance *growth* within the organization. *Capital structure* generally consists of both *short- and long-term debt*, and *common* and *preferred stocks/equities*. It should only be finalized once the organization's goals are clearly defined, and when the time line for financing its needs is known. Organizations seek the *optimal ratio* between *debt* and *equity financing* by which to derive the *maximum benefit* for *stakeholders* of the organization, that is, the *community* (which benefits from a tax-exempt organization) or the s*hareholders* in an investor-owned organization.[31] As is noted in a 2008 article in the *Journal of Health Care Finance*:

> *Capital investment by hospitals is needed to ensure enough capacity to meet the health care needs of a growing population, provide*

[30] Frank Fabozzi, Franco Modigliani, Frank Jones, and Michael Ferri, *Foundations of Financial Markets and Institutions* (Upper Saddle River, NJ: Prentice Hall, 2002), pp. 258–259.

[31] Kenneth H. Marks, et al., *The Handbook of Financing Growth* (Hoboken, NJ: John Wiley & Sons, 2005), pp. 22–23.

> *access to new treatment technologies, and support information technology that can improve patient safety and quality of care. Failure to keep up with plant maintenance or advances in medical technology affects a hospital's ability to attract and maintain physicians and to provide a broad range of services. Similarly, low investment in property, plant, and equipment has been associated with below average quality, inefficient operations, loss of market share, and declines in access to financial capital.*[32]

An important consideration for the valuation analyst is whether the level of *capital expenditures* projected for the analysis is sufficient to support its *revenue projection*. Over short time frames, healthcare entities may experience *efficiency gains* that allow for *greater productivity* without a related *increase in costs*. However, over the long run, once the *efficiency gains* have been fully exploited, increases in output will require *increasing the use of capital investments*. A valuation analyst should be cognizant of this fact, and *revenue projections* should be tempered by the enterprise's ability to access capital, as well as the impact of increasing capital investment on the enterprise's capital structure and thereby its cost of capital.

The theory of capital structure is often viewed as "a unique mix of debt and equity that minimizes the overall cost of financing assets."[33] Historically, the capital structure ratios of *nonprofit* health entities were relatively consistent, while *for-profit* healthcare organizations' ratios tended to reflect *sensitivity* to *market conditions*.[34] *Debt-to-equity ratio* trends for publicly traded hospitals are set forth in Table 9.1.

2011	64.04	58.46	179.28	142.19

Ibbotson SBBI: 2012 Valuation Yearbook—Median Data for SIC Code 806: Hospitals (Chicago: Morningstar, 2001–2011). Historical data accessed at http://ccrc.morningstar.com/IndSearch.aspx# (accessed April 25, 2012).

An illustration of this information is set forth in Exhibit 9.1.

Of note is that the *debt-to-equity ratio* tends to differ between *for-profit* and *nonprofit* hospitals, due to varying *access* to *equity markets*.[35] There is recent evidence that the *depressed hospital capital structure* in the 2009/2010 period recovered as hospitals were able to access *different sources of capital* to improve *weak capital structures* encountered during the *Great Recession*.[36] This improvement suggests a pattern that may represent a widening in the access to capital for healthcare entities.

Healthcare valuators should be aware of the *broader trends* within the *market*, including *debt utilization*, the *types and sources of financial capital*, and *overall industry trends*, in determining the appropriate *risk-adjusted discount rate* to use in the income approaches as described in

[35] Ibid., p. 43.

According to a 2010 survey conducted by the Healthcare Financial Management Association 40 percent of respondents experienced challenges related to capital funding and 22 percent experienced increases in the cost of capital in the wake of the financial turmoil referred to as the Great Recession.

"Hospitals Response to Difficult Economic Times," May 2010, Healthcare Financial Management Association, Healthcare Financial Pulse.

Factoid

A January 2009 study by the American Hospital Association found that 53 percent of responding hospitals considered the unavailability of "usual sources of capital" as a very important factor in their decision to postpone capital projects.

"Report on the Capital Crisis: Impact on Hospitals," American Hospital Association, January 2009, p. 5.

The Great Recession

An 18-month global economic recession lasting from December 2007 to July 2009, in which industrial production fell 16 percent in the United States.

"Did the 'Great Recession' Live Up to the Name?" by David Wessel, Wall Street Journal, *April 8, 2010.*

CAPITAL STRUCTURE DECISION

How a healthcare enterprise plans to finance daily operations, as well as how it plans to finance growth within the organization.

CREDIT BUBBLE

An extended period of historically low interest rates during the late 1990s and early to mid-2000s, subsequently leading to the mid-2000s housing bubble and late 2000 Great Recession.

9.2.1.3.1 Collapse of Capital Market Liquidity Neither healthcare entities nor the *capital markets* they operate in exist within a *vacuum*, and their *access to capital* is affected by *trends* in the *broader economy.* Wide-ranging *factors* that have an impact on the world economy can *reverberate* through markets, affecting the functioning of *capital markets* in the healthcare industry, as well as other industries. A review of the recent history of *global capital market turmoil* and the *interconnectedness* of *worldwide financial markets* is useful in understanding its impact on the healthcare industry.

Historical developments in *international finance*, as well as the *financial innovations* and *political motivations* that predated *the housing boom* and *subsequent economic decline*, make up the roots of the *Great Recession*, which can be traced back to the *housing bubble* in the U.S. *domestic real estate market* during the early and mid-2000s.[38] It was driven by *several factors*, but perhaps most important, the *extended period of historically low interest rates* during the late 1990s and early to mid-2000s. This *credit bubble*, of cheap and easy access to loanable funds, increased demand for housing, which in turn pushed housing prices higher. The effects of the resulting economic downturn reverberated throughout the economy, including the healthcare industry, with the dramatic *retraction in the availability of capital* and the *imposition of strict lending conditions* on those few credits that were being granted.

Increased *capital costs* for healthcare entities can be traced to the increased *perception of risk* by lenders and investors. In light of the recent *uncertainty* related to healthcare reform and the *availability of funding for healthcare services*, *risk-averse investors*, both *equity* and *debt*, demanded *higher returns* to offset the *added risk* assumed by investment in some sectors of the healthcare industry.

In addition to enhanced *risk perceptions* of potential investors, healthcare entities may find financing through *traditional bank lending* and bond markets *constrained* as well. As a result of the financial crisis, investors' *flight to quality*, defined as their tendency to shift capital allocations to *less risky assets* (i.e., from *equity* to *bonds*) during periods of *financial distress*, has *depressed* interest rates. Investors have been adjusting their portfolios by increasing their bond holdings and reducing their equity holdings. This *rebalancing* of portfolios has increased the *supply of loanable funds* and held *borrowing costs low.* Federal Reserve *oversight* and *international banking standards* have led many banks to increase their *holdings of reserves*

[38] Gary S. Becker, "The Great Recession and Government Failure," *Wall Street Journal*, September 2, 2011, http://online.wsj.com/article/SB10001424053111904199404576536930606933332.html (accessed April 26, 2012).

and trim their portfolios of *riskier loan assets*. In addition, to *hedge* against default risks, many banks have increased the burden of *loan covenants* on *new debt*, thereby increasing the *implicit borrowing costs* through *draconian lending policies* with *strict capital reserve* and *cash flow requirements*, even while maintaining lower *explicit interest costs*. A January 2009 study by the American Hospital Association found that 53 percent of responding hospitals considered the unavailability of "*usual sources of capital*" as a very important factor in their decision to postpone capital projects.[39] The report also stated that 73 percent of respondents indicated that access to capital from "banks [and] financial services companies" was at least somewhat harder, with 33 percent characterizing it as significantly harder or that they have no access.[40] Similar trends were noted in the market for taxable and nontaxable bonds.

These trends accentuate the increasingly challenging nature of appraising the value of a healthcare enterprise in volatile capital markets. Aside from enterprise-level concerns, broader macroeconomic events may dramatically affect demand expectations and access to capital. The valuation analysis of a healthcare enterprise should be grounded in the consideration of not just general economic and industry trends but also an understanding of the impact of seemingly unrelated economic events that can infect the healthcare industry by means of interconnected financial capital markets. The value equation for many healthcare enterprises relies significantly on management's ability to effectively assess and mitigate these risks in designing a beneficial capital structure and gaining access to the requisite capital to cost-effectively support current and future operations, as well as finance growth.

9.2.1.3.2 Methods for Projecting Capital Structure The *cost of capital*, and thereby *enterprise value*, is particularly sensitive to the projected capital structure for the subject entity. Small changes in *capital structure*, when projected into *perpetuity*, may have *dramatic impacts* on the valuation analyst's *final opinion of value*. The valuation analyst should have a *firm empirical and analytical foundation* to support his or her *capital structure projections*. In forecasting the *future capital structure* of a healthcare enterprise, the valuation analyst can rely on two methods: (1) the *industry-indicated benchmark debt-to-equity ratio* (such as the Ibbotson's data noted in Table 9.1) or (2) the *historical ratio of debt to equity for the subject entity.*

---

[39] American Hospital Association, "*Report on the Capital Crisis: Impact on Hospitals*," January 2009, p. 5.

[40] Ibid., p. 8.

The method selected by the valuation analyst will, in large part, be determined by the *level of value* being appraised. The industry-indicated benchmark method is most appropriate when applied to a *control* position (i.e., a *majority ownership* position with the ability to influence *operations* and *capital planning*). Implicit assumptions in the *industry-indicated benchmark method* are that the new owner will have the ability to change the capital structure of the subject entity and will choose to select a ratio of debt to equity similar to the most probable ratio that would be selected by the industry. These assumptions are based on the desired *level of value* for the client and the *most probable expected capital structure* that would be used by the *universe of typical purchasers/investors* in the *fair market value* of *the hypothetical transaction* of the subject entity. The *industry benchmark average capital structure* for similar enterprises, which is composed of *many owners and operators* within the healthcare industry, is a *strong indication* of the *industry's preferred capital structure*. Therefore, it is appropriate to apply the *industry benchmark debt-to-equity ratio* when the valuation analyst is seeking a *control level of value*.

Alternatively, if the valuation analyst is seeking not a *control level of value* but a *minority level of value*, it can no longer be assumed that the typical universe of buyers/investors would be capable of altering the capital structure of the subject entity. In this situation, it is more appropriate to apply the historical debt-to-equity ratio for the subject entity. The difficulty in applying the historical levels of debt and equity is determining the *market* value of equity. Debt value is assumed to be booked at its *market* price. Equity, conversely, is not booked at its *fair market value*, which, in fact, is the goal of the valuation exercise. This leads to a *circular argument*, where the *discount rate* is necessary to determine the *value of the equity*, which is, in turn, needed to determine the *discount rate*. To close this circle, the valuation analyst may use an *iterative method* to determine the *internally consistent capital structure*, given the resulting *value of the equity* derived. Steps for the *iterative method* are as follows:

1. Select an assumed capital structure;
2. Determine the value of equity under the assumed capital structure;
3. Calculate the ratio of debt to total capital, given the value of equity determined in step (2);
4. If the debt-to-total capital ratio calculated in step 3 is not equal to the assumed capital structure in step 1, then select a new assumed capital structure; and
5. Repeat steps 1 through 4 until the assumed capital structure in step 1 equals the resulting capital structure in step 4.

By repetitively applying these steps, the valuation analyst can focus in on an appropriate *assumed capital structure* that is consistent with the end result of the valuation.

The *projected capital structure*, using either *the industry benchmark method* or the *iterative method*, can then be used to determine the *weighted average cost of capital* (*WACC*), which represents the *average cost of capital financing*, given a *particular capital structure*, which should be applied to the subject entity's *projected cash flow.*

9.2.1.4 Weighted Average Cost of Capital (WACC) The *discount rate/cost of equity* is typically applied when determining the *present value* of *future economic benefits* in deriving the *equity value* of the enterprise being appraised (equity = assets minus liabilities), on a "*net-of-debt*" basis. When applying an *income approach method* to value the assets of the enterprise, that is, on a "*debt-free*" basis (assets = equity + liabilities), the valuator would typically use a *weighted average cost of capital* (*WACC*) as the expected rate of return on the investment. The WACC is a blend of the cost of an enterprise's various capital components, including the *cost of debt capital* and the *cost of equity capital* of the enterprise.

The WACC is calculated by the formula:

$$\text{WACC} = (k_e * W_e) + (k_d[1 - t] * W_d)$$

where: k_e = Cost of Equity
W_e = Weight of Equity
k_d = Cost of Debt
t = Effective Tax Rate
W_d = Weight of Debt

The WACC, as calculated here, represents the *expected return* demanded by the blend of both *debt and equity investors* in the subject entity; it also represents the *capital cost* to the entity for financing *future projects* (assuming similar *risk parameters*). An example of the application of the weighted average cost of capital can be found online at http://www.wiley.com/go/healthcarevaluation.com.

9.3 CONCLUSION

At any given point in time, healthcare enterprises have a variety of available *financing options*. The *availability of capital* will have a *strong influence* on the *cost of capital* to healthcare ventures. The *capital costs* borne by

healthcare entities will be, in large part, determined by the *mix of financing sources used* for a given project and each of those sources' particular cost. It is important for the valuation consultant to understand that *capital markets* are in a constant *state of flux*, responding to the arrival of new information on *a moment-by-moment basis*. The analysis of *capital cost* for a borrower depends not only on the *corporate governance* and *capital structure* of the firm, but also on the nature of the prevailing *broader macroeconomic trends*. In addition, *capital cost* concerns are *inextricably* linked to the particular *enterprise*, *service*, or *asset* being valued, See Chapter 11, "Inpatient Enterprises," Chapter 12, "The Valuation of Outpatient Enterprises," Chapter 14, "The Valuation of Tangible and Intangible Assets," and Chapter 15, "Healthcare Services," for discussions specific to each entity related to their *costs and sources of capital*.

Capital markets are more intertwined than ever, both across industries and internationally. As has been recently seen, *political* and *social turmoil internationally* can translate into dramatic changes in *domestic returns to equity and debt*. The *rapid expansion* and *growing reliance* on *new technologies* in the *delivery of healthcare* will drive *demand for capital* within the healthcare industry, as healthcare providers, in response those *changing technologies*, *demographics*, and *utilization demand*, seek to upgrade their *facilities*, their *capital equipment,* and their *operational processes*. A thorough understanding of the impact of (1) *the current macroeconomic climate*, (2) the *microeconomic structure of a particular borrower*, and (3) the *financial and economic environment within the healthcare industry* is *instrumental* in determining the appropriate cost of capital to employ in the valuation process.

CHAPTER 10

Planning and Process for Healthcare Valuation Engagements

Knowing is not enough; we must apply. Willing is not enough; we must do.

—Johann Wolfgang von Goethe

Perhaps the most important activity among the several determinants of success for a healthcare valuation engagement is that of *project planning* and establishing a *disciplined process* for developing the valuation conclusion and opinion, as well as preparing and submitting the valuation report. The aphorism of the "*6 Ps*," that is, "*proper prior planning prevents poor performance*," suggests that "*form before function*" should serve as the guiding principle in undertaking a new valuation engagement.

The uniquely broad scope of management concerns, the often limited span of control, and the complex governance structure of their organizations frequently prevent the direct involvement of healthcare C-suite executives in the valuation process, which is often relegated to mid-level management. Accordingly, inherent in the deliverables of most healthcare valuation engagements is the expectation that the valuation professional will *coordinate* and drive the project forward in a *timely* and *efficient manner*. This includes conducting the *due diligence* and *data gathering process* across *multiple facilities, departmental management teams, service line stakeholders*, and other *constituencies*, as well as coordinating with both *general counsel* and *outside legal counsel*. A dedication to the *discipline of planning* and *process* is essential to meeting client expectations regarding the valuation analyst's ability to make the "*trains run on time*." Toward that end, this chapter addresses the specific steps in the planning and execution of a healthcare valuation assignment.

10.1 DEFINING THE ENGAGEMENT

Before the first spreadsheet is opened, several preliminary steps in the valuation engagement process need to be undertaken and resolved. Inevitably, the failure to complete these first steps will, at best, result in a costly waste of man hours spent correcting avoidable errors, and at worst, be manifested as a flawed analysis and a less-than-accurate valuation conclusion and opinion.

10.1.1 Identifying the Parties to the Engagement, Conducting an Appropriate Conflict Search, and Maintaining Privilege

At the earliest possible moment, preferably following the initial phone call, e-mail, or other communication requesting the valuation engagement, the valuation professional should elicit the names and other necessary identifying

information of all parties related to the subject transaction, including any parties holding an *ownership interest, sellers, buyers, lenders*, and their professional advisors, for example, *attorneys, accountants, appraisers*, and *transactional consultants*, as well as the relationships among each of the parties involved in the prospective transaction, and the property being appraised or the assignment at hand. In the event that the appraisal assignment is for *litigation* purposes, identifying information as to all *plaintiffs*, *defendants*, their *respective attorneys*, and the *officer of the court* (*e.g., the judge*) in the *court venue* to which the valuation analyst's report will be submitted should be requested. On receipt of this information, the valuation professional should perform an immediate and thorough *conflict search* to ensure that any potential *conflict of interest* be *affirmatively disclosed* to the client and/or the client's legal counsel, prior to acceptance of the assignment. The regulatory and competitive environment in healthcare is such that when addressing the potential for a *conflict of interest*, the healthcare valuation analyst should be expected to be like *Caesar's wife—not only above reproach, but beyond suspicion*. In the event that the valuation analyst has participated in a previous project that involved one or more of the parties or property interests related to the new engagement, it is the valuation analyst's duty to disclose this information to his or her client, and a decision needs to be arrived at by the client regarding whether to acknowledge and waive any *concern* or *potential claim* of *conflic*t or *privileg*e related to that circumstance.

Appraisal Report

The development and preparation of a certified opinion of value related to a given property interest.

Appraisal Consulting

The development and reporting of a recommendation, analysis, or opinion to solve a problem.

Appraisal Review

The development and reporting of an opinion regarding the quality of an appraisal report.

THREE BASIC CONSIDERATIONS OF VALUATION ASSIGNMENTS

(1) Select the level of valuation service that you need for your specific assignment; (2) match the deliverables of the valuation assignment to the specific purpose, objective, use, and any other special requirements of your project; and (3) make sure the assignment product is "scalable and upgradeable."

Factoid

Valuation reports are issued to communicate the value estimate and may be a variety of types, including oral reports, letters, narratives, and comprehensive reports.

In those instances where the buyer *and* the seller in a transaction, or both parties in a *dispute resolution* (mediation, arbitration, or litigation), agree to *jointly engage* the valuation professional, it is essential that both parties be concisely identified as, *singularly and severally*, the "*client*" for the engagement, and that their *respective responsibilities*, for example, providing documents and information or the responsibility for paying fees and expenses, be clearly established and explicitly set forth in the written terms of the engagement agreement.

In light of the time demands resulting from the limited availability and access to healthcare, it is helpful for *C-suite* executives and their legal counsel, when obtaining disclosure of the identities of the related parties, to gather, at the start of the assignment, the complete contact information, for example, name of firm, mailing address, business phone, direct line, cell phone, e-mail address, of each of the parties, as well as the names and contact information for their assistants and schedulers, the optimal time to reach them, and a determination as to their inclusion/exclusion on the *vetting list* for e-mail communications, correspondence, and conference calls.

10.1.2 Establishing and Maintaining Attorney-Client Privilege

In the current regulatory environment, healthcare valuation analysts are often engaged by outside legal counsel representing the healthcare provider as the valuation analyst's client, in contrast to the healthcare valuation

analyst entering into an engagement agreement directly with the healthcare provider. This may be done for several reasons, including (1) establishing a means by which *attorney-client privilege* might be maintained to protect confidential conversations, e-mail communications, correspondence and documents shared between the valuation analyst and client; (2) providing for direct involvement by the client's healthcare legal counsel in determinations related to regulatory risk and/or the *legal permissibility* of certain property interests being appraised; and (3) maintaining *confidentiality* with third parties related to the subject enterprise, for example, *employees, vendors, lenders* and *patients/customers*. Accordingly, it is typically a best practice for the valuation professional to inquire, at the outset of discussions related to the engagement, whether the "*client*" for the engagement should be the outside legal counsel for the owner of the property interest being appraised. In the event that the decision is made that the client for the engagement should be outside legal counsel, the engagement agreement should specify to which party the valuation analyst's invoices for professional fees and expenses should be sent, which party has the responsibility to pay them, and which party or parties are bound by other contract terms, for example, *indemnification*, *nonsolicitation* of the valuation analyst's staff, and *legal venue*.

Another consideration in maintaining *attorney-client privilege* is to label all *drafts*, work papers, e-mail or correspondence, and other documents and work product as being "*prepared at the request of counsel—subject to attorney-client privilege.*" In addition, to maintain *attorney-client privilege*, all conversations regarding subject matter that may potentially relate to regulatory issues should be conducted *only* with the participation of legal counsel. The legal issues related to *attorney-client privilege* continue to develop over the years, and the valuation analyst should seek guidance regarding this from the client's counsel as to those issues at the outset of the engagement.

CONFLICTS OF INTEREST

A set of circumstances that creates a risk that professional judgment or actions regarding a primary interest will be unduly influenced by a secondary interest.

"Understanding Financial Conflicts of Interest," by Dennis F. Thompson, New England Journal of Medicine *329, no. 8 (August 19, 1993).*

10.1.3 Executing a Confidentiality/Nondisclosure Agreement

Often, prospective clients and/or their legal counsel will request that valuation professionals execute a *confidentiality* and/or *nondisclosure agreement* prior to receiving specific information related to the prospective engagement that would be requisite to performing a conflict search, establishing the nature of the assignment, and agreeing on the scope of deliverables and preliminary budget for executing the engagement. While this is most often not unexpected and should typically be accommodated promptly, the valuation professional should review any such agreement provided by the prospective client to ensure that the terms of the agreement are not so *overly broad* as to *unreasonably restrict* the valuation analyst from doing future work for other parties in a *market service area*, in the event that the valuation analyst is not engaged for that particular assignment. In addition, it is important that the nondisclosure agreement does not prevent the valuation analyst from including certain information in the report that is required in the development of a conclusion or an opinion of value. In the alternative, certain information may be redacted, as agreed to by the client, from the report, so long as it is noted what information is redacted and the information is maintained in the valuation analyst's work file.[1]

General Research

General industry research and information relative to the general economic and demographic trends; competition; general healthcare industry trends; specialty trends; and managed care environment, specific to the subject property interest.

Specific Research

Data specific to, and obtained from, the sources at each subject enterprise. Specific research may include, but is not limited to, financial statements, tax returns, productivity reports, supplies inventory, accounts receivable schedules, fixed asset schedules, prior valuation or consulting reports, budgets and projections, and documentation on transactions involving the subject entity.

[1] Uniform Standards of Professional Appraisal Practice: 2012–2013 Edition, "Confidentiality" section of the "Ethics Rules."

Normalized Earnings Amount

The single dollar amount, derived from the adjusted earning of the subject entity over a number of years, that best represents the earnings capacity of the subject entity, based on the historical performance.

WORK PLAN ELEMENTS

(1) Appraisal staff assignment and (2) identify project milestones.

INHERENT RISK FACTORS

(1) Years in operation, (2) competition, (3) ease of entry in market, (4) growth trend/potential, (5) profitability/efficiency, (6) collections A/R, (7) spectrum of specialties, (8) lease price/terms, and (9) regulatory/malpractice environment.

Factoid

Once all the necessary data to perform an engagement is presented to the valuation consultant, an engagement is typically completed with two to four weeks, depending on the availability of the client and the management of the subject entity to answer follow-up questions and to provide clarification of the data presented to the valuation consultant.

10.1.4 Identify Parties Who May View and Discuss Draft and Final Report

In accordance with *professional standards*, the valuation analyst's report may only be shared with the client who has engaged the valuation analyst. Typically, the engagement agreement for a valuation project will include language similar to the following:

> *Possession of any REPORT or a copy thereof does not carry with it the right of publication or distribution. It may not be used, in whole or in part, by anyone except the CLIENT for whom the REPORT*

VALUATION REPORT STRUCTURE

(1) The client and intended users, (2) the intended use of the appraisal, (3) definition of entity and asset being appraised, (4) standard and premise of value and purpose of appraisal, (5) effective date of the appraisal, (6) description of operation, and (7) subject entity description.

STEPS IN PREPARING THE VALUATION ENGAGEMENT

(1) Prepare preliminary draft narrative report, (2) prepare a final discussion draft, (3) perform a detailed review, (4) obtain an independent internal review, (5) tick-and-tie report, (6) discuss the engagement findings and the final report draft, (7) determine that all review points and open items have been addressed and revisions made as appropriate, (8) conduct a quality review, (9) prepare and bind the final report, (10) sign and apply embossed certification seal, and (11) submit the final bound certified report to client.

was prepared, or conveyed to any third party without the previous express written consent of the VALUATION ANALYST.

However, it is not unusual that the valuation analyst will be requested to provide a copy of his or her work product to parties other than the client. Accordingly, to avoid any possible misunderstanding, or violation of standards or the valuation analyst's duties to the client, the identities of any and all parties with whom the valuation analyst and client may share or discuss the work product (including draft reports, as well as the final valuation report) should be decided in advance with the client and included as a *specific written disclosure* in the terms of the engagement agreement.

10.1.5 Establishing and Maintaining Valuator Independence

At the outset of each engagement, the valuation professional should disclose to the client the *various steps in the process* of developing the *valuation conclusions*, and rendering the certified *valuation opinion*, as well as specifying the format of the valuation analyst's report. It is important to *affirmatively*

communicate to the client that the conditions of the assignment, as related to the valuation analyst *maintaining independence*, will be strictly adhered to throughout the project. Included in this essential discussion should be the explanation that while the valuation analyst may share with the client or other authorized parties to the valuation assignment certain preliminary draft schedules and work papers, as well as, on specified occasions, certain sections of a draft report, this action, if undertaken, will be *only* for the purpose of the valuation analyst soliciting the assistance of these parties in avoiding any *inadvertent factual errors of omission or commission* arising from the valuation analyst's interpretation of data and information supplied by the client. Any such action on the part of the valuation analyst does not give license to the client to engage the valuation analyst in a debate regarding the valuation analyst's *conclusion(s)* or *opinion*.

At the end of the day, the valuation analyst's principal product is the *credibility* of the analyses, *conclusions*, and *opinion* being rendered. Participation in discussions related to the valuation analyst's *cognitive decisions* and professional judgments are the exclusive province of the valuation professional and must be carefully *controlled*, confined to educating the client as to the *methodology* and *assumptions* employed, and conducted in a manner that would *not* lead to a debate as to the valuation opinion. Any leniency or forbearance on the part of the valuation analyst in insisting that this condition be adhered to throughout the engagement may be misconstrued as flexibility on the valuation analyst's part that would detract from the *independence* of his or her opinion and thereby damage the *credibility* of the valuation.

10.1.6 Identify the Objective, Purpose, and Use of the Appraisal

An essential element of each valuation engagement is to clearly establish, through discussions with the client, the *objective*, *purpose*, and *use* of the appraisal prior to beginning the assignment. A statement of the *objective* of the report establishes what the valuation analyst has been engaged to seek, that is, the type (*standard) of value* being sought, the *specified property interest being appraised*, and the valuation "*as of*" date at which the indication of value will be stated. Typically, the engagement agreement for a valuation project will include language as to the *objective* of the appraisal similar to the following:

> *The objective of this REPORT is to provide an estimate of the Fair Market Value (as defined below) as of the VALUATION DATE of the SUBJECT INTEREST.*

The *purpose* of the valuation engagement should also be concisely stated so as to identify the *reason* that the appraisal is being sought, while a statement of the *use* of the report should describe the *specific manner* in which, and toward what end, the valuation report will be *employed*. Typically, the engagement agreement for a valuation project will also include language as to the *purpose* and *use* of the appraisal, similar to the following:

> *The purpose and specific use of this REPORT is to assist CLIENT management and legal counsel in its advisement of CLIENT's board of directors as to its consideration of a prospective transaction of the SUBJECT INTEREST.*

The *purpose* and *use* of the appraisal should include specific reference to whether the property being appraised is (1) subject to an *anticipated transaction*, (2) for an *allocation of purchase price* of a specific transaction into the *various classifications of tangible and intangible assets* (particularly specifying if the allocation is for the purposes of financial reporting or transaction accounting), or (3) whether the appraisal report is being prepared to *support the expert testimony* of the valuation analyst in court.

These first steps in *defining the valuation assignment*, that is, *identifying the parties* to the engagement; conducting an *appropriate conflict search*; executing a *confidentiality/nondisclosure agreement*; identifying the parties who may view the *draft* and the *final valuation report*; establishing and maintaining the *valuation analyst's independence*; and identifying the *objective*, *purpose*, and *use* of the appraisal are steadfast elements, not typically subject to modification once they have been determined and agreed to between the client and the valuation analyst. However, there are some elements of the healthcare financial valuation process that, while needing to be preliminarily established at the outset of the engagement, may require modification during the course of developing the valuation analysis, as will be discussed later in this chapter.

10.1.7 Identify the Scope of the Valuation Assignment

The valuation analyst has the obligation to disclose to the client sufficient information as to *the scope of work* to be performed in order to allow the intended users of the appraisal to understand the *scope of work* performed so that they may rely on the assignment results. Sufficient information includes disclosure of the research and analyses performed and might also include disclosure of research and analyses *not* performed.

Under the 2012 Uniform Standards of Professional Appraisal Practice and Advisory Opinions (USPAP), Scope of Work Rule, it is noted that

For each appraisal, appraisal review, and appraisal consulting assignment, an appraiser must:

1. *Identify the problem to be solved;*
2. *Determine and perform the scope of work necessary to develop credible assignment results; and,*
3. *Disclose the scope of work in the report.*

An appraiser must properly identify the problem to be solved in order to determine the appropriate scope of work. The appraiser must be prepared to demonstrate that the scope of work is sufficient to produce credible assignment results.

Comment: Scope of work includes, but is not limited to:

1. *The extent to which the property is identified;*
2. *The extent to which tangible property is inspected;*
3. *The type and extent of data researched; and*
4. *The type and extent of analyses applied to arrive at opinions or conclusions.*[2]

An acceptable *scope of work* should include such research and analyses that are sufficient to produce *credible conclusions* and *opinions* and that reflect the expectations of *typical readers* of *reports* for *similar assignments*, as well as the scope of work that *professional peers* would perform for a *similar assignment*. It should be noted that the determination of the scope of work in a given assignment is an *ongoing process*, *subject to revision*

Factoid

The Scope of Work Rule was established in the 2006 edition of USPAP, to combat the notion that each scope of work decision should be a one-size-fits-all solution.

"Understanding the Scope of Work Rule and Advisory Opinion 32," by Kenneth L. Joyner, International Association of Assessing Officers, http://www.iaao.org/uploads/joyner1.pdf (accessed December 6, 2012).

[2]"Scope of Work Rule," Uniform Standards of Professional Appraisal Practice, 2012–2013 Edition, Appraisal Standards Board, Appraisal Foundation, Effective January 1, 2012, p. U-13.

Factoid

A consultant's choice of valuation methodology depends primarily on the purpose of the valuation report, the availability of data for each method selected for the engagement, and the specific characteristics of the subject entity.

and reconsideration should additional information or conditions that would affect the assignment be discovered during the course of *due diligence* and analysis. The decision to exclude any steps in, or information obtained through, the *due diligence process*, as well as a decision not to perform any relevant valuation methodology, must be *disclosed*, *explained*, and *supported*. In the event that during the valuation assignment, circumstances arise that limit the valuation analyst's ability to maintain an acceptable scope of practice, for example, access to data and information is denied, the valuation analyst must consider whether the scope of the assignment can be modified, perhaps through the use of *extraordinary assumptions*, and still produce a *credible* valuation conclusion of opinion. Should that not be achievable, the valuation analyst should *withdraw* from the engagement.

10.1.8 Define the Property to Be Appraised

The valuation analyst should *define* the property to be appraised by specifically *determining* and *describing* the *legal bundle of rights* included in *the property interest being appraised*, including the *amount* and *type* of *control prerogatives* being sought. For example, the engagement may call for the valuation of (1) the *total invested capital* (i.e., consideration of all sources of capital, both *equity* and *debt*) of the subject enterprise; (2) *equity* (i.e., *assets-liability = debt*) of the subject enterprise; or (3) *certain assets* of the subject enterprise, any which of these may be done at various *levels of value*. An example of the application of defining the property to be appraised can be found online at http://www.wiley.com/go/healthcareevaluation.com. Note that a transaction may also include certain *services* to be provided by the staff of the subject enterprise, for example, acquiring *physician professional clinical services* and *executive/administrative services* that may not require the same type of *discounts* and *premium*s typically applied to the valuation of *enterprises* or *assets*. An example of the application of defining the property to be appraised can be found online at http://www.wiley.com/go/healthcarevaluation.

The appropriate indication of value for a subject enterprise is directly influenced by the "*level of value*" derived from the various *approaches*, *methods*, and *techniques* employed for the valuation assignment. These "*levels of*

value" can be explained as the *continuum* along which the *prerogatives of control* of the organization, as well as the *liquidity of the investment*, may span.

Control prerogatives include those rights that give the *holder* the ability to perform the following: (1) make changes to the *capital structure* of an organization; (2) implement new *strategic* and *operating objectives*, for example, develop new products or services, expand into new markets, divest of existing service lines, and so forth; (3) change *vendors and/or suppliers*; (4) amend/change the *Bylaws* or *Articles of Incorporation* of the organization, for example, expand/contract the voting requirements required to pass certain initiatives, change the voting rights of certain classes of ownership shares, establish committees, and so on; (5) set *management/executive compensation* policies; (6) change *operational management* of the organization; (7) change the *Board of Directors* of the organization; (8) implement and negotiate *mergers and acquisitions* of the organization; (9) register the company's *financial securities for public sale*, such as an IPO or additional offerings; (10) *declare dividends* and *share buybacks*; and (11) any other right implemented by those in control of the organization.[3]

Intuitively, a property interest that includes control prerogatives should warrant a *premium* above a similar property interest that lacks prerogatives of control. However, the amount of discount applicable to a *minority interest*, which lacks *prerogatives of control*, would most likely not be the same percentage in each and every circumstance. Rather, as alluded to earlier, the appropriate level of *discount for lack of control* (DLOC) should be based on the specific facts and circumstances of the subject property that give rise to the *elements of control*, which would create a *range or continuum of applicable discounts*. For example, the level of control of an enterprise is often misconstrued to be based on the ownership percentage of the property interest being appraised; however, due to elements of the *organizational governance* of the enterprise, for example, a block of ownership interest, the existence of a "swing vote" position, and certain takeover or "*coattail*" protections, minority interests may possess certain elements of control.[4]

Furthermore, the appropriate DLOC chosen should be applied to the corresponding appropriate level of value existing at the outset of the engagement. For example, some within the valuation community have expressed their view that using *pricing multiples of minority interests* in *public companies* results in an indication of value at a *minority interest level*, and that no further DLOC is warranted should the valuation engagement require the appraisal of a *minority interest* in a closely held firm. These same proponents would espouse that a *control premium*, or *acquisition premium*, may

[3]Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely-Held Companies,* 5th ed. (New York: McGraw-Hill, 2008), p. 385.

[4]Ibid., pp. 398–399.

be applicable to the indication of value derived from pricing multiples of minority interests in public companies when the valuation engagement calls for the appraisal of a *control interest* in a closely held firm. Others within the valuation community propose that pricing multiples of minority interests in public companies reflect the same price that a *control position* in the public company would demand and criticize the use of *control premiums* when using the *pricing multiples* of *minority interests* in *public companies* to derive an indication of value for a *control interest*. These critics suggest that if *minority interests* in *publicly traded companies* did not trade at their *control price,* these companies would be bought out, and they point to the relatively small number of publicly traded companies taken private in a given period of time to support their viewpoint that this has not been the case. Furthermore, these critics would suggest that in the event that the appraised interest is at a minority level, a DLOC should be applied to *indications of value* derived from *pricing multiples of publicly traded minority interests*, which are assumed to reflect the *control level* of value.

Another notable aspect of the *levels of value debate* is the idea that *minority interest holders in publicly traded companies* may not be as *price sensitive* to having prerogatives of control, since they would be able to divest their shares with a higher degree of ease in contrast to the holder of a *closely held minority interest*. This viewpoint suggests that *liquidity* is the only difference between *publicly traded minority interests* and *closely held minority interests*, as well as their assumption that *control premiums* based on shares of *publicly traded minority interests* may be lower than those demanded by investors in *closely held entities*. In addition, the valuation analyst should be aware of whether the subject enterprise is *closely held,* in contrast to being *freely traded*, which may have an impact on the *type* and *amount* of *discounts/premiums* that are applicable to certain *valuation methods* and *techniques*. For additional information regarding the DLOC, see Section 8.4.2, "Control Premium/Discount for Lack of Control."

10.1.9 Identify Any Conditions or Restrictions of the Appraisal Assignment

Any *condition* or *restrictions* that *qualify* the *conclusion(s)* and *opinion of value* should be identified, defined, and disclosed at the start of the valuation assignment. This may include *laws and regulations*, *jurisdictional exceptions*, *extraordinary assumptions*, *hypothetical conditions*, *restriction on the availability of data*, and other conditions that may affect the scope of work. *Laws* include *constitutions*, *legislative* and *court-made* law, *administrative rules*, and *ordinances*. *Regulations* include *rules or orders* having *legal force*, issued by an *administrative agency*. There are essentially three

methods by which laws are manifested in order to have *legal force*, that is, (1) *statutory*—federal and state legislation and ordinances; (2) *regulatory*—administrative and agency rules or orders; and (3) legal precedent—judicial directives, orders, and established case law. *Hypothetical conditions* may be defined as "an assumption contrary to that which currently exists but, for the purposes of a valuation, has been assumed to be that which would typically be expected by the universe of typical purchasers." This would apply, for example, if the ancillary services and technical component service line(s) of a medical practice were to be considered as an independent, separate, and stand-alone going-concern enterprise, which is contrary to present fact but assumed for the valuation project. *Extraordinary assumptions* relate to the adjustment of past data, which may be necessary to allow for a similar basis on which to make comparisons and avoid the complications of accounting/reporting measurement differences that have arisen over time within the entity, or anomalies. For example, *nonrecurring events*, such as nonrecurring or extraordinary expenses related to a onetime legal settlement or transaction, should be adjusted to reflect the most probable expectation of normalized economic operating expenses required to support the revenue stream of the subject enterprise.

10.1.10 Valuation "As of Date": Effective Date of the Valuation Analyst's Opinions and Conclusions

At the outset of the assignment, it is imperative that the valuation analyst receive confirmation of the valuation "*as of*" date, the date of which is based on several factors: (1) the most proximate to the anticipated transaction date; (2) the most recent accounting period for which reliable data is available; and (3) statutes, regulations, or court rules that establish the date to which the valuation conclusion and opinion apply.

10.1.11 Standard of Value to be Used in the Appraisal

Of particular importance in performing a healthcare valuation engagement is the determination of the *standard of value* to be used, which answers the question "*Value to whom?"*(see Section 7.2.1, "Standard of Value," in Chapter 7, "Basic Valuation Tenets"). Typical *standards of value* sought in a valuation engagement include:

1. Fair Market Value (see Section 7.2.1.1, "Fair Market Value");
2. Fair Value (see Section 7.2.1.2, "Fair Value");
3. Investment Value (see Section 7.2.1.3, "Investment Value [Synergies])"; and
4. Intrinsic Value (see Section 7.2.1.4, "Fundamental [Intrinsic] Value").

It should be noted that healthcare related valuations typically *require* that the *standard* of *Fair Market Value* be used (see Section 7.2.1.1.1, "Requirement for Fair Market Value in the Healthcare Industry," and Section 3.3.3.7, "Fair Market Value as Defined by Fraud and Abuse Laws").

10.1.12 Premise of Value to Be Utilized in the Appraisal

In addition to the *standard of value*, it is important that the *premise of value*—which answers the question "Value under what further circumstances?"—be established at the outset of a valuation engagement. The two typical categorizations of the *premise of value* are (1) *Value in Use* (see Section 7.2.2.1, "Value in Use") and (2) *Value in Exchange* (see Section 7.2.2.3, "Value in Exchange"), and are set forth in Exhibit 10.1. Note that

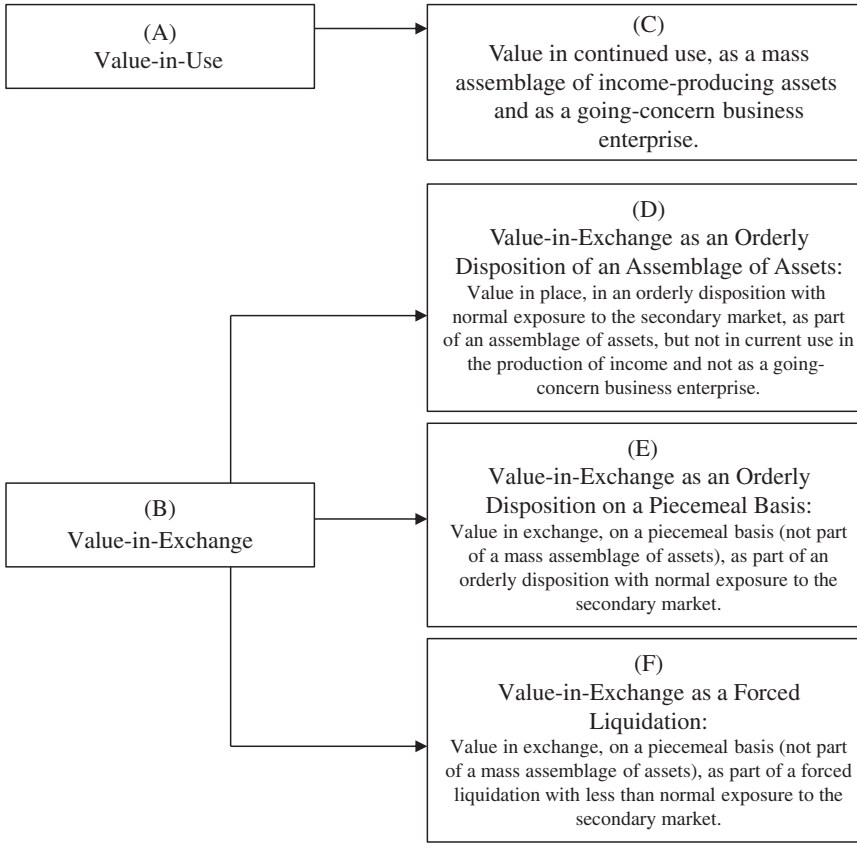

EXHIBIT 10.1 Premise of Value Categories
Source: © Health Capital Consultants

the premise of value of *Value in Exchange* is further defined, based on the following three subcategories: *value as an assemblage of assets*, *value as an orderly disposition*, and *value as a forced liquidation.*

10.1.13 Obtain Preliminary Legal/Organizational and Transaction Documents

At the *outset of the engagement*, the valuation analyst should strive to obtain, as a preliminary first step, as many of the *legal/organizational* and *transactional documents* as are available. Examples of these documents are set forth in Table 10.1.

10.1.14 Development of Preliminary Summary of Relationships/Transaction Schematics

Based on the preliminary *legal/organizational* and *transaction* documents and information received related to the engagement, the valuation analyst

TABLE 10.1 Legal/Organizational and Transactional Documents

Legal/Organizational Documents	Transactional Documents
Articles of Incorporation, LLC Formation Agreements, Partnership Certifications, Certificates of Trust, etc.	Asset Purchase Agreements
By-Laws, Operating Agreements, Trust Agreements	Stock Purchase Agreement
Shareholder Agreements, Member Agreements, Partnership Agreements, etc.	Bill of Sale
Pertinent Executive Meeting Minutes	Asset Contribution Agreement
Existing Employment Agreements and Curricula Vitae for Key Personnel	Buy-Sell Agreement
Real Property Lease Agreements	Standstill Agreements
Personal Property Lease Agreements	Nondisclosure and Confidentiality Agreement
Existing Buy-Sell Agreements	Letters of Intent
Existing Consulting or Management Services Agreements	Transaction Term Sheets
Loan Agreements	Proposed Employment Agreements
Related Party Vendor/Supplier Agreements	Proposed Lease Agreements
Third-Party Payor Agreements	Proposed Compensation Plan Details

should develop a preliminary "*Summary of Relationships*" and/or "*Summary of the Transaction*" schematic, which accurately depicts the "*Flow of Funds*" between *all* parties to the subject transaction in order to specifically and explicitly identify them and avoid any *inadvertent factual errors of omission or commission*. See Chapter 14, "The Valuation of Tangible and Intangible Assets," for a sample illustration of a "*Summary of Relationship"* diagram and Chapter 15, "Healthcare Services," for a sample illustration of a "*Flow of Funds*" diagram set within the context of a physician group practice compensation/income distribution arrangement. This first step serves as the foundation for then developing a secondary request for documents and information.

10.1.15 Prepare and Submit Document and Information Request

The *document and information request* for the engagement should set forth the *internal data of the subject enterprise* that will be relied on by the valuation analyst in performing the requisite due diligence related to developing a conclusion and opinion of value regarding the subject property interest. Typically, this *data-gathering process* takes place in three distinct steps: (1) the *preliminary and supplemental document and information requests*, (2) the *management interview/questionnaire*, and (3) the subject enterprise *site visit*. The *preliminary document and information request* includes those items that support the *subject-specific internal research* related to the subject enterprise, asset, or service. This is most often an *iterative process,* similar to *peeling back layers on a head of cabbage*, and the valuation analyst's review of the initial information received then leads to the development and submission of a *supplemental* request for additional documents and clarifying information. The *iterative* nature of this *process* and the importance of client cooperation in providing the information requisite for due diligence should be communicated to management of the subject enterprise at the outset of the engagement to properly manage expectations regarding the data-gathering process.

These steps in the data-collection process for the *transactional arena* are mirrored in the *discovery* process for *litigation support engagements*. The valuation analyst will make an official request for the *production of documents* to be provided by the opposing party in a legal dispute through the client's legal representation. In addition, analogous to the *questionnaire/survey instrument* in the *transactional valuation arena*, in performing a *litigation support engagement*, the valuation analyst may prepare *interrogatories*, that is, questions to be posed by the client's legal counsel to be answered by the opposition to assist the valuation analyst in the completion of the valuation

TABLE 10.2 Typical Steps in the Data Gathering Process

Transaction Engagements	Litigation Support Engagements
Preliminary Document and Information Request	Request for Production of Documents
Questionnaire/Survey Instrument	Interrogatories
Management Interview/Site Visit	Deposition Testimony

engagement. The valuation analyst may also, as part of a *litigation support engagement*, be called on to provide *expert witness testimony* based on the findings contained within his or her valuation report at a deposition, where the opposing legal counsel will be allowed to cross-examine the valuation analyst regarding his or her conclusions and opinions contained within the valuation report. Table 10.2 shows the relationship between the data-gathering process for engagements involving transactions and those involving litigation support.

As the requested documents and information are gathered, an *engagement-specific database* may be useful to *appropriately* account for the data in a manner that adequately *identifies*, *classifies*, and *stores* it, so that it may be *timely* and *efficiently retrieved* for use (*ICSR*). This *ICSR Process* is described in Exhibit 10.2.

10.1.15.1 Method of Data Transmittal: E-mail, Confidential Back Office/Data Sharing Room, Fax, Mail In addition to e-mail, fax, and hard copy document transmittal, one of the most effective and efficient methods of data transmittal and communicating with the client is through the utilization of a web-based, encrypted "*Back Office*" for the engagement. This is achieved by providing certain individuals, as may be specified by the client, with confidential usernames and passwords to access a specified, confidential file room on the valuation analyst's web server, i.e., "*Back Office.*" This allows users to upload requested documents and information, at their convenience, as well as to review the valuation analyst's *confidential work product* related to the engagement, without such draft documents and information being sent by e-mail or otherwise distributed.

10.1.15.2 Maintaining Data Status Tracking Summaries The timeframe required to complete any engagement is highly dependent on the client's ability to gain *access to*, *gather*, and *submit* the requested data related to the subject enterprise, asset, or service being appraised to the valuation analyst in a *timely* and *efficient* manner. Accordingly, the valuation analyst must

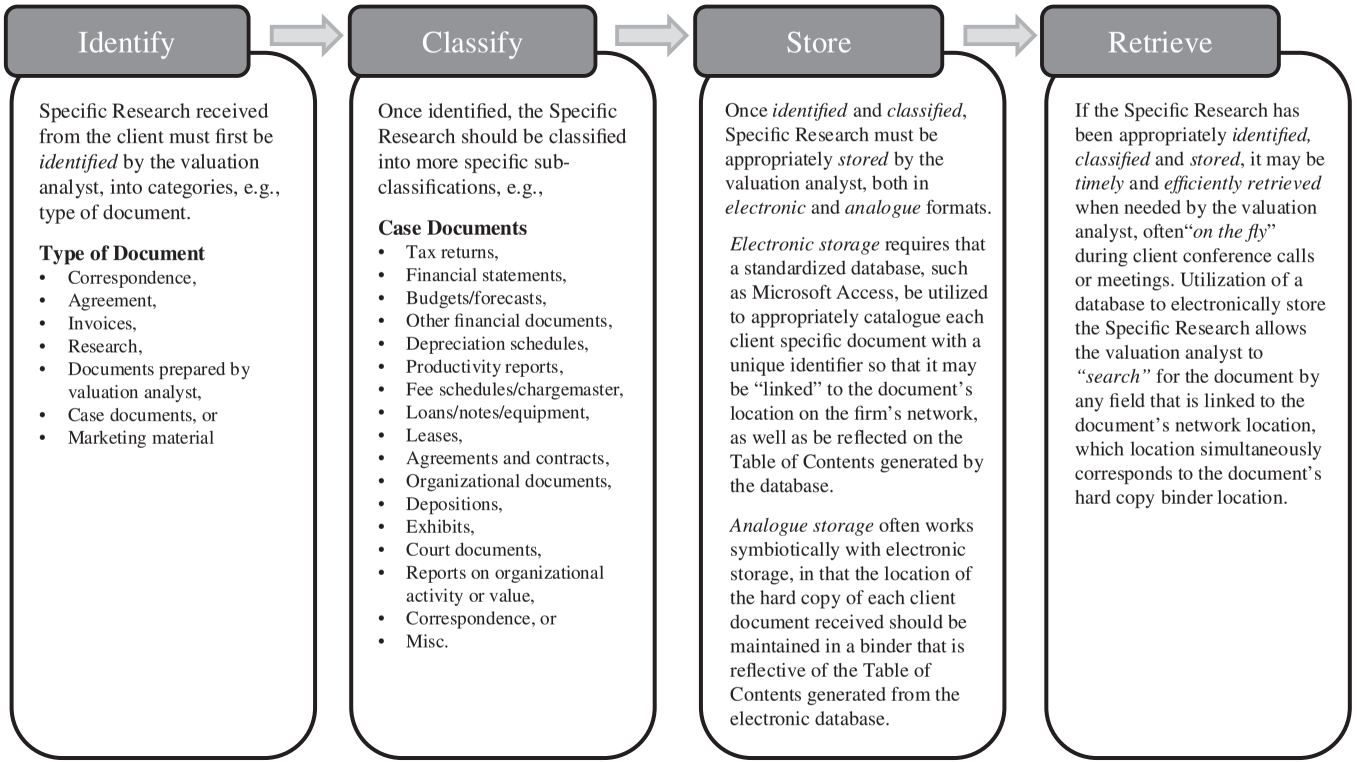

EXHIBIT 10.2 The ICSR Process
Source: © Health Capital Consultants

maintain an accurate *Data Status Tracking Summary*, which provides a contemporaneous "*log*" of those documents and data sets that

1. Have been requested, the date they were requested, and from whom they were requested;
2. Have been received, the date they were received, and from whom they were received; and
3. Have been requested and are still outstanding, will be essential to moving forward the data-gathering process in adherence to the set timetable for the engagement.

10.1.15.2.1 Date for Site Visit, Management Interview, and Report Delivery In addition to the valuation analyst receiving the requested documents and information from the client in a timely manner, it is essential that *milestone chronologies* that set forth the key steps for completion of the engagement be established in order to ensure adherence to the project timetable. These *milestones* include dates for the site visit; management interview; review of the draft report, for the purpose of the client identifying any inadvertent factual errors of omission or commission; and final report delivery. *Effectively communicating* the status of the project to the client avoids any potential misunderstandings, unexpected delays, misplaced client expectations, or other exigencies that may act to weaken client confidence in the valuation analyst's work product or, ultimately, the credibility of the valuation analyst's report.

10.1.16 Budget Required for Completion of the Engagement

The *preliminary budget estimate* for the engagement is typically established at the outset of the engagement, based on initial conversations between the client and the valuation analyst and their preliminary assessment as to the scope of the engagement. The valuation analyst and the client should consider building some flexibility into the budget, due to *exigencies* that may arise during the course of the engagement beyond the control of the valuation analyst, for example, change in the *scope of deliverables* or *premise of value* and unforeseen difficulties in getting the requested data that would require additional time and expense to perform the engagement.

One technique that both preserves the requirement that the valuation analyst be paid for the professional services and expenses to requisite for completing the assignment according to professional standards, and assures that the project costs would not be subject to the valuation analyst "*running the meter*," is set forth as:

> *Should VALUATION ANALYST determine at any time during the engagement that the requirements of the engagement will cause*

VALUATION ANALYST's professional fees to exceed the estimate by more than ten percent (10%), VALUATION ANALYST will so inform CLIENT and obtain CLIENT's permission to proceed.

10.1.17 Draft the Engagement Agreement

Once the *conflict search* has been performed, the *scope of services* has been defined, and the *preliminary budget estimate* has been determined, the *Valuation Engagement Agreement* may be drafted. In addition to reiterating the "*purpose*" and "*use*" of the valuation assignment, considerations not otherwise set forth in the *Valuation Engagement Agreement*, for example, the scope and limitations of the engagement, as well as the relationship of the valuation analyst to the client, should be included. An example of these types of provisions follows:

NATURE OF ENGAGEMENT *Except as otherwise provided herein, nothing contained in this AGREEMENT shall create any relationship of agency, partnership, employment, or joint venture between VALUATION ANALYST and CLIENT. VALUATION ANALYST and CLIENT are independent contractors and neither shall exercise control over the performance of the other hereunder. VALUATION ANALYST does not provide legal or tax advice. VALUATION ANALYST is not required to provide litigation support, give expert witness testimony or attendance in court by reason of this engagement. Should such additional services be requested by CLIENT, mutually satisfactory arrangements must be made prior to such appearance or provision of services. VALUATION ANALYST does not practice law and has not rendered any legal opinions or determinations in this engagement. The indications of value expressed within this REPORT are necessarily applicable only to the type, standard, and premise of value stated within the REPORT, and then only based upon the referenced definition of that type, standard, and premise of value. VALUATION ANALYST hereby disclaims any implied or explicit representation of the future performance or earnings of the SUBJECT ENTERPRISE to any current or future holder of an ownership interest.*

The terms of every valuation engagement should accurately and fairly reflect the *needs*, *fit*, and *risk parameters* for both parties to the

agreement, that is, the valuation analyst and the client. This should include a realistic assessment as to the input required from each party to achieve a successful project outcome. Among these factors and considerations that should be incorporated into the written engagement agreement are the following:

1. *C-suite healthcare executives* and *legal counsel* may not fully comprehend the complexity and need for communication with the valuation analyst;
2. The absence of this cooperation by the client and his or her legal counsel in the process of data gathering, due diligence, and decisions related to the scope and premise of value may make the completion of the assignment impossible; and
3. The ability of the appraiser to adhere to the agreed-on timetables and budgets depends on the valuation analyst not being forced to expend significant amounts of time connecting with the client and legal counsel for conference calls and other communications.

Here is an example of the language to use to establish in advance of the commencement of the valuation assignment the commitment to cooperate:

> ***COMMITMENT TO COOPERATE:*** *CLIENT acknowledges its intent to cooperate seriously and in good faith with VALUATION ANALYST pursuant to achieving the successful conclusion of the engagement. CLIENT will promptly provide CONSULTANT with the specific, general, financial, and technical information requested by VALUATION ANALYST necessary to facilitate the assignment. CLIENT agrees to: accept or return calls from CONSULTANT promptly; assist CONSULTANT in evaluating the reports presented by VALUATION ANALYST to CLIENT; respond on a timely basis to requests for conference calls, scheduling of meetings, and interviews.*

The *valuation engagement agreement* should clearly state the arrangements made and agreed to for the payment of the "*Professional Fees*" and expenses to the appraiser for the engagement, including the *amount* and *nature* of any required *retainer* (e.g., *nonrefundable* or *refundable* and under what circumstances it will be refunded), as well as the *hourly rate* for each individual performing services for the project. The treatment of any *additional expenses*, for example, any third-party *real estate* or *tangible personal property* (FF&E) appraisals that may be required and the *payment*

terms for them, should be clearly established in the engagement agreement. An example of the language for provisions of this type follows:

PROFESSIONAL FEES:

CLIENT agrees to pay CONSULTANT professional fees for this engagement as follows:

(a) ***RETAINER:*** *A nonrefundable retainer in the amount of _____ DOLLARS ($____,000.00) due and payable upon execution of this AGREEMENT. The retainer amount will be applied to CLIENT's account upon issuance of the final invoice(s) submitted by CONSULTANT to CLIENT;*

(b) ***HOURLY RATE:*** *CONSULTANT will invoice CLIENT for CONSULTANT'S time spent on behalf of CLIENT during this engagement at CONSULTANT'S hourly rates as listed on the SCHEDULE OF PROFESSIONAL FEES, which is attached hereto and incorporated herein. Based upon initial conversations between CLIENT and CONSULTANT and their preliminary assessment as to the scope of the engagement, it is estimated that the required professional fees to complete the engagement should not exceed _____ DOLLARS ($_____.00). Should CONSULTANT determine at any time during the engagement that the requirements of the engagement will cause CONSULTANT'S professional fees to exceed the estimate by more than ten percent (10%), CONSULTANT will so inform CLIENT and obtain CLIENT'S permission to proceed;*

(c) ***ADDITIONAL EXPENSES:*** *CONSULTANT will invoice CLIENT for agreed upon expenses incurred including real estate appraisals or appraisal updates, tangible personal property appraisals, travel, computer/research data, and miscellaneous expenses at CONSULTANT'S cost;*

(d) ***PAYMENT TERMS:*** *All fees and expenses billed under this AGREEMENT are due and payable upon receipt of invoice, unless a written extension has been provided by CONSULTANT. CONSULTANT reserves the right to defer rendering further services until payment is received for services rendered and invoiced. A fee of one and one-half percent (1½%) per month will be charged to CLIENT by CONSULTANT on all balances due after TEN (10) days past due. CLIENT agrees that it will pay any collection*

fees and reasonable attorney's fees incurred by CONSULTANT in collecting past due amounts owed under this AGREEMENT.

The valuation analyst may need to gain access to *sensitive client information* in the performance of a valuation assignment. To assuage any client concerns regarding the sharing of private information, the *Valuation Engagement Agreement* will typically include a confidentiality clause that limits the valuation analyst's ability to distribute information regarding the client's operating performance and financial status. An example of this confidentiality language is illustrated next:

CONFIDENTIAL INFORMATION: *During CONSULTANT'S engagement under this AGREEMENT, information regarding the professional, personal, and financial information may be shared by CLIENT and CONSULTANT (the "CONFIDENTIAL INFORMATION"). During the term of this AGREEMENT and thereafter, CONSULTANT and CLIENT shall hold such CONFIDENTIAL INFORMATION in the strictest confidence as fiduciaries, and shall not, voluntarily or involuntarily, sell, transfer, publish, disclose, display or otherwise make available to any third party any portion of the CONFIDENTIAL INFORMATION or related materials without the express written consent of the other party. CONSULTANT and CLIENT shall use their best efforts to protect the CONFIDENTIAL INFORMATION consistent with the manner in which they protect their most confidential business information.*

10.1.18 Identify the Project Team for the Engagement

The valuation firm will need to select and disclose to the client those analysts, researchers, and project manager(s) who will be committed to working in tandem with the client and its representatives to promptly establish scheduling and reporting objectives; efficiently gather the required data; clarify necessary information; analyze issues; as well as help the client understand the background and reasons for the valuation firm's efforts related to market research and the valuation process, as a whole, throughout the investigative and reporting stages of the engagement (PROJECT TEAM). The PROJECT TEAM should employ a project management structure for the development and implementation of the engagement that efficiently deploys internal resources, client management and such other consultants as the client may retain, audit and tax counsel, and strategic planning/organizational consultants in an interactive, time-efficient, cost-effective, and coordinated manner.

The PROJECT TEAM should be structured in a manner that will provide an experienced senior-level (perhaps a principal) analyst to lead the

PROJECT TEAM. The healthcare industry environment of constant change requires the skills of seasoned, certified professional business valuators, financial analysts, researchers, and technicians who have the experience and technical skills to competently, consistently, cost-effectively, and in a timely manner respond to client needs.

Consequently, the PROJECT TEAM should be based on a team of professionals who:

1. Have actual, hands-on experience as valuation consultants, financial analysts, intermediaries, and researchers in the healthcare industry;
2. Are experienced process technicians in these areas of valuation, analysis, transactions, and research;
3. Understand the healthcare transactional markets as they affect value;
4. Understand the culture and mechanisms that define the relationships between the various organizations that make up today's healthcare delivery systems, that is, physicians, hospitals, skilled nursing facilities sub-acute care services, ambulatory/outpatient centers, ancillary services, home health, patients, payors, and the community at large;
5. Understand the organizational, operational, and noneconomic issues pertinent to the management of healthcare systems, hospitals, and skilled nursing facility in specific;
6. Demonstrate expertise in legal aspects and programmatic and business operations of healthcare systems;
7. Are familiar with private and public funding streams, regulations, and mechanisms;
8. Understand state of the art development of structure and governance of healthcare system networks, both in design and in implementation; and
9. Inspire confidence that the valuation process has been accomplished in a manner that develops an atmosphere of integrity, trust, and corporation.

In addition to selecting and disclosing the PROJECT TEAM to the client, the valuation analyst should also establish a *vetting list* identifying all of the contact information for all external parties related to the project and specifying which *types* and *nature* of communications, for example, conference call schedules, review of documents, and so on, may and should be shared with each of them, making certain to obtain the e-mail address, firm name and address, direct phone line, cell phone, and optimal times of availability for each contact and his or her assistant (if applicable). Note that the party responsible for gathering the data may not be the client who retained the valuation analyst but may be any number of subject entity personnel or outside entities, for example, billing and accounting companies, attorneys, or tax counsel. Having this information available is often critical to the ensuring the "*success*" of the engagement.

10.2 DEVELOPING THE VALUATION OPINION

Even though preliminary work to establish relationships and determine requisite documents and information may have already begun, the valuation engagement "officially" begins when the signed Engagement Agreement is received from the client (often the legal counsel of one of the parties to the transaction).

10.2.1 Conducting Appropriate Due Diligence

Conducting a level of due diligence appropriate to the scope of a given assignment is critical to the development of the valuation opinion. First and foremost, the appraiser serves in the role of proxy for the *universe of typical investors and* buyers inherent in the requisite hypothetical transaction of the *fair market value* standard, See Chapter 3, "Regulatory Environment," for a more in-depth discussion of *fair market value*. Due diligence may be defined as:

> *A prospective buyer's or broker's investigation and analysis of a target company, a piece of property, or a newly issued security.*[5]

There are two distinct classes of information generally required for due diligence related to healthcare valuation: (1) *general research* and (2) *specific research*. *General research* typically consists of information and data related to *national and regional healthcare industry trends*, *reimbursement trends*, *competitive marketplace assessments*, *medical industry specialty and technological trends*, *transactional data*, and *investment risk/return data*, as well as other research not specifically related to, or obtained from, the subject enterprise, asset, or service being appraised. General research is obtained for the purpose of providing a context within which the analyst considers the *specific research* and information gathered.

S*pecific research* is related to information specific to the historical *operational performance* and *financial condition* of the subject enterprise, asset, or service, as well as the *pertinent clinical related data*. Specific research is typically obtained from the client or the appropriate contact designated by the client.

10.2.1.1 General Research *General research* may be obtained from a variety of sources, including:

1. Books and monographs;
2. Journals and periodicals;

[5] Bryan A. Gardner, ed., *Black's Law Dictionary*, 9th ed. (St. Paul, MN: Thomson Reuters, 2009), p. 523.

3. Government agencies;
4. Proprietary data aggregators and portals;
5. Professional societies and trade associations;
6. Conferences and webinars;
7. Online databases; and
8. Academic and industry "*think tanks*" and research foundations.

While the process of obtaining *general research* provides valuation analysts with an adequate grasp of the body of knowledge applicable to a particular property interest being appraised, it is the efficacy of the valuation analyst's subsequent application of generally accepted analytical methods to that data that determines the successful outcome of the assignment. The *technical tools that* the valuation analyst needs to employ to provide clients with the *observations*, *findings*, *conclusions*, and *opinions* that are to be deliverable under a particular engagement involve the *synthesis* of a substantial amount of *data* that may be pertinent to the valuation assignment, as well as the *appropriate analysis*, *calculations*, and *considerations* of the *various types and forms of that data*. Among the *technical tools* available to analysts is the *benchmarking* process, that is, a comparison of *specific research data* from the subject property interest to *industry-indicated benchmark norms*, and may include the performance of a *simple variance analysis* on a single characteristic, such as a patient outcome metric related to "*readmission within 30 days of discharge*," or may be comprehensive in scope, including the comparison of numerous *clinical*, *operational*, and *financial metrics*.

Benchmarking is used to establish an understanding of the *operational and clinical performance* and the *financial status* of a healthcare enterprise. Benchmarking techniques can also be used to illustrate the degree to which an organization *diverges* from *comparable healthcare industry norms*, as well as providing vital information regarding trends within the organization's *internal operational performance* and *financial status*. For example, benchmarking in the healthcare services sector serves several *purposes*:

1. Offers insight into the enterprise and practitioner performance as it relates to the rest of the market (e.g., allowing organizations to find where they "*rank*" among competitors, and as a means for *continuous quality improvement* [CQI]);
2. Objectively evaluates performance indicators on the enterprise and practitioner levels;
3. Indicates variability, extreme outliers, and prospects;
4. Identifies areas that require further attention and possible remediation (e.g., redistributing resources and staff and increasing operating room [OR] utilization);

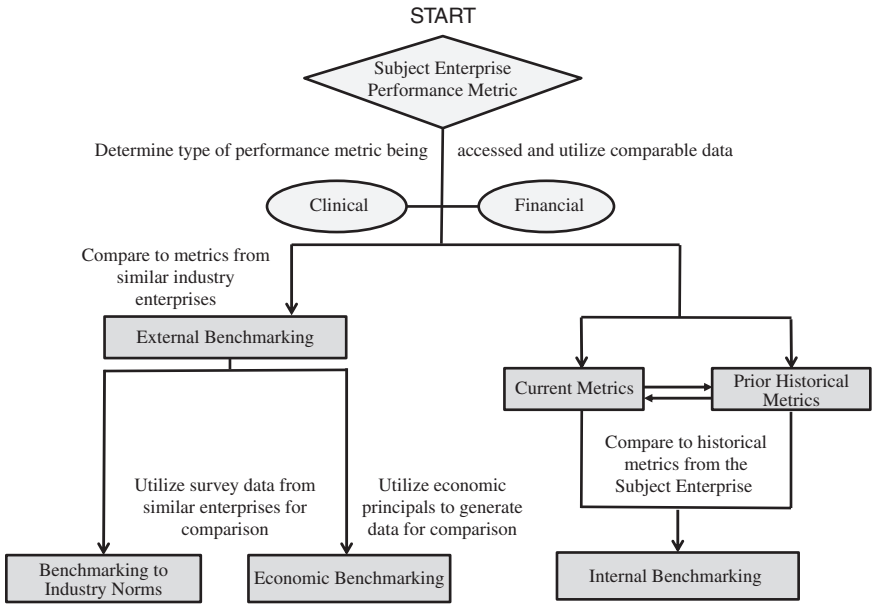

EXHIBIT 10.3 Variations in the Benchmarking Process
Source: © Health Capital Consultants

5. Promotes quality and efficiency improvement (e.g., improving average length of stay [ALOS] and other clinical efficiency measures); and
6. Provides enterprises with a *value-metric system* to determine if they comply with legal standards for *fair market value* and *commercial reasonableness*.[6]

An illustration of the benchmarking process is set forth in Exhibit 10.3 and is also described in more depth in Section 8.3.1, "Financial and Operational Benchmarking," in Chapter 8, "Valuation Approaches and Methods."

[6]Paul M. Schyve, MD, "The Joint Commission's Perspective," in Stephen C. Schoenbaum, MD, MPH, *Measuring Clinical Care: A Guide for Physician Executives* (Tampa, FL: American College of Physician Executives, 1995), p. 57; Aspen Health Law and Compliance Center, "The Physician Compensation Plan As an Instrument of Cultural Change," in Daniel K. Zismer, *Physician Compensation Arrangements* (Gaithersburg, MD: Aspen Publication, 1999), pp. 108–115; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies FACMPE* (Englewood, CO: Medical Group Management Association, 2006), pp. 110–111; Healthcare Financial Management Association, "Financial and Clinical Benchmarking: The Strategic Use of Data" (Baltimore: HCIA, 1997), pp. 76–77.

For more information on the *key sources of benchmarking data* related to the appraisal of *enterprise*, *assets* and *services*, see Chapter 11, "Inpatient Enterprises," Chapter 12, "The Valuation of Outpatient Enterprises," Chapter 13, "Other Healthcare-Related Enterprises," Chapter 14, "The Valuation of Tangible and Intangible Assets," and Chapter 15, "Healthcare Services," as well as the *Key Sources* in these chapters.

10.2.1.2 Subject Enterprise–Specific Research In contrast to *general research*, *specific research* is information and data that is directly related to, or obtained from, the *subject enterprise*, *asset*, *or service* being valued. Specific research will often consist primarily of those documents received by the valuation analyst through the *information and data gathering process* (or *discovery process*, in the case of *litigation support engagements*) including, but not limited to, those *preliminary legal/organizational* and *transactional documents* set forth in Table 10.1 in Section 10.1.13, "Obtain Preliminary Legal/Organizational and Transaction Documents."

On the valuation professional's review and analyses of the preliminary documents and information provided, a supplemental request for documents and information should be developed, including the items set forth in Table 10.3.

TABLE 10.3 Typical Supplemental Document and Information Request

Financial statements (including Income and Expense Statements and Balance Sheets) for the last five full years, plus updates to the most recent quarter, or the month prior to the date of the valuation.
General ledger, of detailed transactions, for the twelve-month period following the "as of" date.
Tax returns (including detailed attachments and supplemental information) for the last five full years.
Fee schedules for the subject enterprise's current "as of" date of valuation, reflecting standard fee, Medicare fee, and other prenegotiated fixed fee for service or managed care fees.
Aged schedule of accounts receivable with payor detail for the period ending of each of the last five years and as of the date of the valuation.
Accounts payable with creditor detail for the period ending of each of the last five years and as of the date of the valuation.
Detailed inventory of medical equipment and office equipment (including furniture and fixtures) in use in the subject enterprise as of the date of valuation, with the date and cost of acquisition. Detailed depreciation schedules should be included from tax returns or accountants' records to verify the schedule.

TABLE 10.3 (*continued*)

Estimate of the number of days of each category of supplies on hand (categorized by medical supplies, lab supplies, and office supplies) as of the date of valuation.
Count of active patient charts that have experienced activity within the last 1½ to 2 years prior to the date of valuation. Also, an estimate of the total patient charts with the subject enterprise as of the date of valuation.
A CPT coded schedule of the number and type of major and minor procedures by payor, performed in the subject enterprise for each of the last five years and as of the most recent quarter, or the month prior to the date of the valuation. Please provide this information by provider and site of service.
A list of physicians and providers in the subject enterprise as of the date of valuation, including their productivity at the subject enterprise for each of the last five years and as of the most recent quarter, or the month prior to the date of the valuation (number of procedures, types of procedures, site[s] of service, charges, collections, etc.) and a Curriculum Vitae. Please also provide a list of former physicians and providers, including the dates of service at the subject enterprise.
A description and list of referral sources (including productivity, i.e., number of procedures and charges) as of the date of valuation.
Copy of all agreements or proposals for past transactions involving the transfer of an equity or ownership interest in the subject enterprise, prior to the date of valuation.
Any prior valuation reports, investment banking or venture capital, or other financial analyses that have been performed related to the subject enterprise since inception.
List of any insurance, Medicaid/Medicare, and/or third-party payor audits that have been performed or are pending for the subject enterprise, with date and outcome.
Summary and description of privileges at hospitals where staff privileges are held and the scheduling arrangement.
Copy of Declaration Page (cover page) of malpractice insurance.
A list of all patents and intellectual property rights owned by the subject enterprise.
Patient location/zip code distribution report (sorted by location/zip code).
Copies of all managed care contracts in use in the subject enterprise (or a summary of duration, reimbursement scenarios, etc.)
A copy of the organizational chart for the subject enterprise.
Roster of staff (including non-MD providers), indicating the type of employment (i.e., W-2 or Independent Contractor status), salary, title, duties, and years of service for the subject enterprise.
Copy of any practice protocols, operation manuals, employee policies, and procedure manuals in use for the subject enterprise.
Copies of all licenses, certifications, accreditations, permits, and other regulatory approvals, including, if applicable, Certificates of Need (CON).

(*continued*)

TABLE 10.3 Typical Supplemental Document and Information Request (*continued*)

Information on management information systems, including all software for accounting, coding, billing, reporting, patient records, and so forth, with the name of the manufacturer, product, modules, options, and so on, as well as the version, release, and update numbers.
Provide a summary and copies of documents related to any pending litigation in which the subject enterprise is presently involved.
Copy of any operating or capital budgets or forecasted statements prepared for the subject enterprise.
A description of the provider income distribution plan in place at the practice, including any periodic calculations.
Addresses, office hours, and physician and provider staffing for the main office and the satellite offices.
A description of all sites of services (fixed and/or mobile).
A description of the call/coverage rotation schedule (if applicable).
Marketing materials (e.g., brochures, description of commercials, website, etc.).
Floor plan or layout of each of the office locations.

An example of the application of subject entity specific research can be found online at http://www.wiley.com/go/healthcarevaluation. Additional subject-specific information may also be obtained through the *site visit/management interview*; an illustration of the types of information that may be collected during the *site visit/management interview* is set forth in Table 10.4.

As part of the requisite due diligence associated with a specific engagement, the valuation analyst should conduct independent research, specific to the subject enterprise, to supplement any information provided by the subject entity, in line with the old Russian proverb "*trust but verify.*"[7] For example, the valuation analyst may conduct a *Uniform Commercial Code* (UCC) search to determine if the subject enterprise has any undisclosed outstanding liabilities or whether the subject enterprise leases, rather than owns, its tangible personal property, that is, furniture, fixtures, and equipment. Similarly, a search for filings related to the subject enterprise with the Office of the Secretary of State in which the subject enterprise operates should

[7]Attributed to Vladimir Lenin and popularized by U.S. president Ronald Reagan. See President Reagan's "Remarks on Signing the Intermediate-Range Nuclear Forces Treaty," December 8, 1987, http://www.reagan.utexas.edu/archives/speeches/1987/120887c.htm (accessed February 18, 2013).

TABLE 10.4 Types of Subject Specific Information: Site Visit/Management Interview

History and Background Information	Managed Care Environment
Premise/Location/Building Description	Hospital Privileges and Facilities
Transition to Electronic Medical Records	Referral Sources and Patterns
Quality of Staff and Depth of Management	Strength of Financial Management and Credit Collections Policy
Competitive Trend Analysis	Operational Efficiency Assessment
Patient Base Trends	Future Plans, e.g., Growth, Transition to Value Based Reimbursement, etc.

be performed to identify pertinent information related to the actual legal organization of the subject enterprise, as well as performing a brief search of online legal databases, such as Public Access to Court Electronic Records for federal litigation and state litigation databases, such as Case.net in Missouri, to reveal any past and ongoing litigation involving the subject property interest, including shareholder disputes, commercial damages and liabilities, and malpractice cases.[8] Further information related to the subject enterprise, asset, or service, which might not have been disclosed, may be gleaned from state licensing and certifying agencies and disciplinary boards and may have an impact on the reputation, as well as the *clinical* and *operational performance* and *financial status* of the subject enterprise. It should be noted that *subsequent events*, that is, events that would *not* have been *known or knowable* as of the *valuation date*, but that may also have a deleterious effect on the value indication for the subject property, must be disclosed, within the valuation report, to the client. However, these *subsequent events* do not have an impact on the valuation opinion as of the valuation date and may require a decision by the client whether an updated valuation report, that is, with a valuation date after the *subsequent events*, should be undertaken.

The valuation analyst should also restate and adjust the subject enterprise–*specific* financial data received to (1) facilitate *industry benchmark comparisons* of the specific line item allocations of the subject entity's financial statements to comparable industry indicated benchmark norms for those line items and (2) reflect the *true economic operating performance* and *financial status* of the subject enterprise. Accordingly, the valuation analyst should carefully consider restating certain line items related to the revenue and expenses of the subject entity, for example, owner compensation and

[8] See http://www.pacer.gov; also see https://www.courts.mo.gov/casenet/base/welcome.do.

benefits, discretionary expenses not required to support the projected revenue of the subject enterprise, and extraordinary nonoperating income and expenses. Likewise, the valuation analyst should consider restating certain of the assets and liabilities of the subject entity, for example, removing nonoperating assets; adjusting tangible personal property (i.e., furniture, fixtures, and equipment) from book value to *economic fair market value*; and removing those assets excluded from the property interest being appraised, such as accounts receivable and cash.

Furthermore, the valuation analyst should consider restating the *cash and cost-based balance sheet* of the subject enterprise to include the *economic value* of all of the assets included in the property interest being appraised, such as:

1. Supplies;
2. Accounts receivable (if included); and
3. Those assets financed through operating leases that have been capitalized.

Similarly, the subject enterprise's balance sheet should be adjusted to account for those liabilities that exist but that were not included on the subject enterprise's balance sheet, for example, *capitalized lease obligations* and *accounts payable*. Typically, normalizing/control adjustments, such as adjustment of operating expense, capital items, and capital structure to industry norms, are made to the projected cash flow of the subject enterprise, as well as adjustments to the subject entity's *risk-adjusted required rate of return*. See Chapter 8, "Valuation Approaches and Methods," for a discussion of adjustments to the subject enterprise's historical financial statements.

10.2.2 Preparing the Analysis

10.2.2.1 Consideration and Selection of Valuation Approach(es), Method(s), and Technique(s) to Be Utilized Each valuation engagement should include consideration given of each of the three approaches to value, that is, the *Income Approach*, the *Market Approach*, and the *Cost Approach*.[9] The determination of applicable valuation *approaches*, *methods*, and *techniques* will depend primarily on:

1. The *purpose* of the valuation report;
2. The *objective* and *purpose* of the valuation engagement;

[9]Ian Ratner, Grant Stein, and John Weitnauer, *Business Valuation and Bankruptcy* (Hoboken, NJ: John Wiley & Sons, 2009), p. 26.

3. The *Standard of Value*;
4. The *Premise of Value*;
5. The *specific characteristics* of the subject property interest; and
6. The *availability* of *reliable data*.

As previously discussed in Section 7.2.2.1, "Value in Use," in Chapter 7, "Basic Valuation Tenets," *income approach–based methods* are typically premised on the ability of the enterprise to produce *sufficient net cash flow* in the *reasonably foreseeable future*. In the absence of the ability of the enterprise to generate an economic cash flow sufficient to support the value of the investment represented by the tangible and intangible assets used to generate its revenue stream, consideration should be given to changing the premise of value *as a going concern* to a *value in exchange* premise, for example, as *an orderly disposition of an assemblage of the assets in place*. For example, many *professional physician practice enterprises* do not produce a *positive net economic cash flow* once the value of the *physician compensation expense burden* is adjusted to reflect *Fair Market Value* for those services provided. This circumstance may indicate that the use of an *income approach–based valuation method* for appraisal of the entity, in its entirety, as a *going-concern enterprise* may not represent the *highest and best* use of the capital invested in the enterprise.

Basic steps in preparing the valuation analysis are set forth in Table 10.5. A more detailed discussion of the selection of appropriate valuation approaches and methodologies may be found in Chapter 8, "Valuation Approaches and Methods."

In order to avoid any *inadvertent factual errors of omission or commission*, the valuation analyst should consider submitting, for review of the management of the subject enterprise, those items of the appraiser's work product reflecting information related to the subject entity's *historical operational performance and financial status*, for example, historical financial statements, provider productivity calculations, payor mix determinations, staff rosters, and financial allocations between service lines. The valuation analyst should typically not submit for management review those schedules and work papers that reflect conclusions or opinions related to *operational* and/or *financial projections*, development of *risk-adjusted required rates of returns*, or determination of the type and amount of *discounts and premiums* to be applied. These elements of the analysis reflect the professional and independent judgment of the analyst, who must strive at all times to maintain that independence and objective perspective, when providing conclusions or opinions of value, which opinion should not be subject to debate.

After the historical data related to the subject enterprise has been verified for accuracy, and the analysis has been fully developed, the valuation

TABLE 10.5 Basic Steps in Applying Valuation Approaches and Methods

Calculate the Indication of Value using Market Comparable Data and Historical Subject Enterprise Performance Metrics	Chapter 8, "Valuation Approaches and Methods"	Section 8.1.2, "Market Approaches"
Apply Any Necessary Premiums and Discounts	Chapter 8, "Valuation Approaches and Methods"	Section 8.4, "Discounts and Premiums"
Asset/Cost Approach–Based Methods	**Applicable Chapter Reference**	**Applicable Section Reference**
Identify Assets to Be Included (Both Tangible and Intangible)	Chapter 8, "Valuation Approaches and Methods"	Section 8.1.3, "Asset/Cost Approach–Based Methods"
Collect Historical Cost, Date of Acquisition, and Asset Condition Information Related to the Included Assets	Chapter 14, "The Valuation of Tangible and Intangible Assets"	Section 14.2.2.1.3, "Asset/Cost Approach for Valuing Tangible Personal Property"
Collect Data Regarding Industry Trends in Asset Costs (i.e., Marshall & Swift)	Chapter 14, "The Valuation of Tangible and Intangible Assets"	Section 14.4.1.3, "Cost Approach for Valuing Tangible Personal Property"
Calculate Current Value of Included Assets	Chapter 8, "Valuation Approaches and Methods"	Section 8.1.3, "Asset/Cost Approach–Based Methods"
Apply Any Necessary Premiums and Discounts	Chapter 8, "Valuation Approaches and Methods"	Section 8.4, "Discounts and Premiums"

analyst should review the results of each valuation method employed to ensure the sensibility and credibility of the results, a process commonly referred to as "*reasonableness testing*" (in slang terms often referred to as a "*smell test*"; however, this author does not subscribe to the efficacy of olfactory metrics). Elements to consider when performing a "*reasonableness test*" may include:

1. Recheck the logic and math used in each valuation method;
2. Compare various ratios of the company being valued to those of other companies;
3. Test the reasonableness of the value from a buyer's perspective by computing a payback period; and
4. Test the reasonableness from an adversary perspective.[10]

The selection of a particular "*reasonableness test*" to employ will be largely driven by the specific *facts* and *circumstances* surrounding the valuation engagement, including the *availability* of *data* and *information*, as well as the *purpose* and *use* of the appraisal. Once the "*reasonableness test*" has been completed for each of the methods employed, the indicated results are typically reconciled, correlated, and synthesized to derive the *final conclusion and opinion of value*, which results should then be subject to a further "*reasonableness test*."

10.2.2.2 Reconciliation, Correlation, and Synthesis of Approaches and Methods to Arrive at the Valuator's Final Conclusion of Value In order to reconcile the results derived from the valuation approaches, methods, and techniques used in the analysis, the valuation analyst should consider the significant elements of the analysis, including but not necessarily limited to, (1) comparability of data from normative industry benchmark sources to the subject enterprise, (2) the extent to which the indicated result from a specific method is based on future or past industry trends, and (3) reliability of the input to the method. Exhibit 10.4 sets forth an illustrative example of the weighting of each method employed.

While no specific or prescribed *mathematical model* may be substituted for the *informed*, *professional judgment* of the valuation analyst, a recapitulation of the *indicated value results* of each method employed and a

[10] Jay E. Fishman, Shannon P. Pratt, J. Clifford Griffith, and D. Keith Wilson, *Guide to Business Valuations*, Vol. 2 (Fort Worth, TX: Practitioners Publishing Company), p. 805.25.

EXHIBIT 10.4 Reconciliation, Correlation, and Synthesis of Approaches and Methods

Method	Value Indication	Weight	Indicated Results
Discounted Cash Flow Method	$3,258,578	80%	$2,606,862
Guideline Public Company Method	$3,409,407	10%	$340,941
Merged and Acquired Company Method	$3,953,770	10%	$395,377
Final Opinion of Fair Market Value of Subject Interest			$3,343,180
Final Opinion of Fair Market Value of Subject Interest (Rounded)			**$3,300,000**

summary discussion of the *weight of consideration* accorded by the valuation analyst in *correlating* each method as contributing to the *final conclusion of value* should be provided *only* for the purpose of illustrating, in a *clear and simple manner*, the valuation professional's *analysis* and *judgment* in arriving at the *final conclusion and opinion of value*, so that it might be better understood by the client.

In order to arrive at a *reconciliation* of these *indicated values* and an *overall final conclusion of value* for the *property interest*, the valuation analyst should carefully consider each method performed in terms of its *application* and the *quantity* and *quality* of the available data. Each method should then be accorded a weight of consideration, based on the valuation analyst's degree of confidence in the *appropriateness* and *accuracy* of each method, the *sufficiency* and *validity* of the data available for the method, and the *pertinence* to the circumstances of the engagement. An example of this reconciliation, correlation, and synthesis process is illustrated in Exhibit 10.4.

It should be noted that in some instances, it may be appropriate to present a range of value in contrast to a point estimate. In which case, the *boundaries* of the *range of value* may be set by the *minimum* and *maximum indications of value* derived from the methods employed.

10.2.3 Developing the Valuation Report

Following this first step of the healthcare valuation process, that is, development of the appraisal analysis, the *observations*, *findings*, *conclusions*, and *opinions* need to be presented, under Uniform Standards of Professional

Appraisal Practice (USPAP) standards, to the client in a manner that achieves the following:

> *Each written or oral appraisal report for an interest in a business enterprise or intangible asset must:*
>
> 1. *Clearly and accurately set forth the appraisal in a manner that will not be misleading;*
> 2. *Contain sufficient information to enable the intended user(s) to understand the report; and*
> 3. *Clearly and accurately disclose all assumptions, extraordinary assumptions, hypothetical conditions, and limiting conditions used in the assignment.*[11]

This second step in the healthcare valuation process, that is, *developing the valuation report*, is equally as important as the appraisal analysis itself.

10.2.3.1 Identify the Level of Report Required under the Uniform Standards of Professional Appraisal Practice The first step in developing the valuation report is to determine the level of detail required under USPAP, based on the range and scope of the assignment, as discussed in Section 10.1.7, "Identify the Scope of the Valuation Assignment."

10.2.3.2 Identify the Method of Report Transmittal The final report may be delivered to the client through several methods, that is, *hard copy*, *oral*, or, increasingly, clients are requesting that the final report be delivered *electronically.* Should the client request an electronic copy of a report that has been issued in hard copy, it is important that the electronic copy be a facsimile of the hard copy, that is, an exact duplicate of the hard copy. As such, this does not represent a second issuance of a report with a separate date of the report.

10.2.3.3 Prepare an Index of the Report The final report should be prepared in a disciplined, thorough manner with a systemic plan and not in an ad hoc manner. Toward that end, the valuation analyst should prepare a detailed *Index* or *Table of Contents* for the report, which identifies each of the elements of the report. See Table 10.6 for representative items typically included in the table of contents for a valuation report.

A more detailed illustration of a *Table of Contents* for a healthcare engagement can be found online at http://www.wiley.com/go/healthcarevaluation.

[11] USPAP 2012—2013 Edition, published by the Appraisal Foundation, p. U-75.

TABLE 10.6 Typical Items Included in the Table of Contents/Index of a Valuation Report

Transmittal Letter
Section 1: Description of the valuation assignment.
Section 2: History, background, and description of the subject enterprise.
Section 3: Economic and demographic conditions within which the valuation was considered.
Section 4: Condition and trends for the general healthcare industry.
Section 5: Conditions and trends for the subject enterprise's specialty.
Section 6: Financial data of the subject enterprise, including the recasting of historical accounting data and benchmarking to industry norms.
Section 7: Valuation approaches, methods, and techniques related to this valuation, including the development of the risk-adjusted required rate of return and applications of the methods used.
Section 8: Statement of the appraiser's findings, opinions, and conclusions.
Section 9: Certification of the appraiser.
List of Tables
List of Exhibits
Schedules

10.2.3.4 Prepare Schedules, Narrative, and Appendices to Be Included in the Report

Once a preliminary table of contents for the report has been created, the valuation analyst can begin producing the appropriate schedules, narrative, and appendices related to the applicable valuation approaches, methods, and techniques selected for the engagement. Typically, the valuation analyst should begin the project by drafting the narrative section, which sets forth a description of the assignment, as well as the section that describes the history and background of the subject enterprise, prior to the development of financial models. In addition, the sections of the narrative that set forth the current and projected industry trends are a necessary input to any projections included in the financial models and therefore would need to be created at the outset of the engagement as well.

10.2.3.5 "Tick-and-Tie" and Quality Review Process

Of utmost importance to the preparation of the final report is the "*tick-and-tie*" and *quality review* process, a process that generally involves three steps: (1) "*tick and tie*" of

Tick and Tie

A correction of any errors in a report's narrative, schedules, or appendices.

Quality Review

The final review of a valuation report, checking for errors in the assemblage of the final reports, including printing errors, page layout errors, and quality assurance of the materials utilized.

the valuation schedules, (2) "*tick and tie*" of the valuation report narrative, and (3) *quality review* of the final report, either "*hard copy*" or *electronic*.

Once the *final conclusion of value* has been determined, an independent review of the accuracy, validity, and reasonableness of the indicated results should be performed. "*Tick and tie*" is jargon for the process of (1) verifying an amount (by placing a "*tick*" mark next to it), and (2) matching or balancing one amount to another ("*tie*" out). The objectives of this review should be to:

1. Verify the accuracy of the input;
2. Confirm that the valuation methods employed were used correctly;
3. Make certain that all backup documentation is appropriately referenced and stored; and
4. Ensure that the work product developed conforms to applicable valuation standards, including the requirement that the output derived from the valuation methods employed is replicable.

See Exhibit 10.5 for an illustrative example of a checklist that may be used in performing the "*tick and tie*" of the *valuation report schedules*:

It should be noted that most valuation engagements are an *iterative process* that may change as the engagement moves forward. Every *iteration* of the financial model should be subject to the "*tick and tie" process* prior to being submitted for review by the client.

Similarly, the narrative sections of the valuation report should be subjected to an independent review by a new "*set of eyes*," that is, a competent and trusted colleague who did not participate in drafting the narrative. The independent review should assist the valuation analyst in avoiding (1) errors in grammar, syntax, and spelling; (2) failures in logic, non sequiturs, and/or inconsistent statements; and (3) redundancies, lack of clarity, and other common editorial shortcomings and errors.

EXHIBIT 10.5 Schedules Tick-and-Tie Checklist

Checked By:	**Project Name:**
Date Reviewed:	**Project Agreement Number:**
Subject Interest (e.g., Total Invested Capital, Equity, Distinct Assets, etc.):	**Standard of Value:**
Level of Value: (e.g., minority, control, neither) [if applicable]:	**Premise of Value:**
Document File Path and File Name:	**Schedule Name and Number:**

Tick-and-Tie Checklist	Completed	Notes
General		
Ensure That the Appropriate Approaches, Methods, and/or Techniques Have Been Selected.		
Ensure That the Selected Approaches, Methods, and/or Techniques Are Correctly Applied and Result in the Desired Indication of Value.		
Perform a *"Reasonableness Test"* on All Calculated Results.		

(*continued*)

EXHIBIT 10.5 Schedules Tick-and-Tie Checklist (*continued*)

Tick-and-Tie Checklist	Completed	Notes
Worksheet Headers/Footers		
Filename and File Path—Footer (Draft Version Only)		
Schedule Author's Initials—Footer (Draft Version Only)		
Subject Entity Name—Footer		
Copyright Symbol with Valuation Firm's Name—Footer		
Column and Row Headings		
Column Headings and Row Numbers in Sequential Order		
Check Consistency and Order of Time Periods		
Check for Definitions of All Acronyms Utilized, e.g., TTM (Trailing 12 Months)		
Data Validity		
Ensure That All Facts and/or Assertions Are Supported by Sources Contained within the Appraiser's Work File.		
Confirm All Values Included in the Schedule Against the Appropriate Document in the Appraisers Workfile, i.e., *"Tick"* the Schedule.		
Check the Validity of All Connections between Schedules to Ensure Proper Links, i.e., *"Tie"* the Schedule.		
Check for Conclusory Statements without Sufficient Support, e.g., Nonsequiturs.		
Check for Use of Appropriate Data and Information, e.g., ASC Benchmarking Is Not Appropriate for a Cardiology Practice.		

Footnotes
Check for Spelling, Grammar, and Sense.
Ensure All "*Named Terms,*" e.g., SUBJECT ENTITY or CLIENT, Are Used Consistently.
Ensure All Sources Reference the Correct Document in the Appraiser's Workfile.
Confirm Footnote Number References Correct Cell in Schedule.
Formulas
Check for Calculation Errors.
Ensure All Complex Calculations Are Clearly Presented, i.e., the Calculations Are Replicable.
Ensure That the Correct Formula Is Utilized and Ensure the Calculation Result Is a Sensible Conclusion.
Ensure That All Formulas Reference the Correct Cells for Calculations.
Discounts and Premiums
Ensure That the Indicated Value (Including the Application of Any Discounts or Premiums) Results in the Desired Level of Value, i.e., Minority or Control Interest.
Ensure That the Selected Discount and/or Premium Is Supported by Empirical Evidence That Is Contained within the Appraiser's Workfile.

Exhibit 10.6 provides an illustration of those items that might typically be included in a *narrative review checklist*.

Once the schedules have been appropriately "*tick-and-tied*" and the narrative of the report has been subject to a *"tick-and-tie" review*, the final step in the valuation report development process is to "*quality review*" the final report to ensure:

1. That the *Table of Contents/Index* accurately reflects each section of the narrative report, as well as the page number on which each narrative section begins;
2. The *accuracy* of the *headers and footers* for each page, including the *project name* and the *client name*;
3. That formatting is consistent throughout the schedules and the report narrative, including font type, font size, and spreadsheet borders.
4. The *orientation* of both the *pages* and the *images* (e.g., map of the market service area) contained on each page is correct;
5. All pages are *numbered* and *intact*;
6. All pages have *appropriate margins* and are without "*widows and orphans*," *extraneous spaces*, *lines*, or *characters*; and
7. All pages are printed on the *correct paper type* and are free from *smudges* and *ink blurs*.

After the *final hard copy report* has been *quality reviewed* and *any and all errors* have been corrected, the report is ready to be *bound*. Each report should be made uniquely identifiable, perhaps by adding a document number, to maintain an accurate accounting of the total number of *original*, *bound*, *hard copy reports* that have been issued and who has received them. To ensure that *client confidentiality* is maintained, the cover of the report (and the packaging in which it is transmitted) should be stamped "*CONFIDENTIAL*." The valuation analyst should also confirm that the report has been received by the *appropriate party* on receipt of the delivery notice from the postal or courier service used. It should be noted that the quality review process is equally as important for *electronic versions* of the final valuation report. All of the quality concerns discussed earlier should be addressed, regardless of the *medium of transmission* for the report. An example of the application of the "tick-and-tie" and quality review process can be found online at http://www.wiley.com/go/healthcarevaluation.

10.2.3.6 Sign and Seal the Report for Transmittal to the Client The final step in preparing the report is for the valuation analyst to "*sign and seal*" the report with his or her *certification*. In the event that the final report is submitted electronically, the valuation analyst must nevertheless sign the report, either through insertion of an electronic signature or by scanning the certification page containing the valuation analyst's original signature for inclusion in the

EXHIBIT 10.6 Report Narrative Review Checklist

Conclusion clearly stated and matches other sections (e.g., Section 1, Summary Conclusion, Section 7, and Results)		
Section 9: Certification of Valuator		
Confirm appropriate certifications and team members included		

electronic report. In addition, the electronic final report should be password protected, requiring the client to use a password to "*open*" the electronic file that contains the report; this step helps prevent the contents of the report from being inadvertently disclosed. It should also be separately password protected, that is, not using the same password, to prevent changes from being made to the document without the analyst's knowledge.

10.2.4 Post-Engagement and Record Retention

Once the final report has been issued, and the engagement has concluded, the importance of a *timely* filing of the appraiser's work file containing all of the valuation analyst's work papers cannot be overemphasized. Accordingly, as with the appropriate "*ICSR*" of specific and external research related to the engagement, the valuation analyst must make certain that each document to be contained in the appraiser's work file is *identified ("I")*, *classified ("C")*, and *appropriately stored ("S")* so that it can be *retrieved ("R") in a timely and efficient manner,* in the event that it needs to be referenced in the future. Furthermore, the valuation analyst must ensure that his work file is maintained and stored in a manner that is consistent with a predetermined document retention policy. This policy should be developed and implemented to ensure that the appraiser's work file is maintained in accordance with the requirements mandated under professional valuation standards, as well as those requirements of law and regulation, for example, rules of the court, healthcare regulatory specifications, taxing authority regulation, and the requirements of the appraiser's professional liability insurance policy. Often an outside law firm is retained to ensure that the valuation firm's document retention policy is in compliance with these concerns. See Exhibit 10.7 for an illustrative example of a valuation analyst's document retention policy.

POST-ENGAGEMENT REVIEW

An evaluation of the appraiser's and the staff's performance during the engagement and of the quality of final work product.

RECORDS RETENTION

The safekeeping of all work papers, data sources, and other engagement-related documents for potential future uses or disputes.

10.3 CONCLUSION

As discussed throughout this chapter, in order to survive the risk inherent in undertaking a healthcare valuation assignment, the development and observance of a well-thought-out plan and discipline of process are required. This discipline of this process involves:

1. Concisely identifying the property being appraised, the parties to the transaction, and the scope of the engagement, as well as the purpose and use of the appraisal report;
2. Establishing and maintaining confidentiality, attorney-client privilege, and the appraiser's independence;
3. Providing strict oversight of the project, including maintaining tracking summaries and budgets;
4. Conducting the appropriate due diligence to minimize the risk to the client, as well as to the appraiser;
5. Providing a thorough and complete analysis of the property interest being appraised, including consideration of all applicable approaches, methods and techniques; and
6. Developing clear and concise appraisal report that sets forth, in a clear and concise manner, all of the relevant information required by professional standards, including but not limited to the purpose and use of the appraisal report; any contingent and limiting conditions; the valuation approaches, methods and techniques considered and used; and the appraiser's findings, opinions, and conclusions.

Recall that the appraiser's role is that of serving as a *proxy* for a *universe of typical investors* or *buyers*. The goal of each valuation report is ultimately to demonstrate and establish both the competence of the appraiser and the credibility of the appraiser's opinion. These goals can best be achieved by a strict adherence to a well-conceived plan, as well as a disciplined, consistently monitored, and appropriately documented valuation process for the healthcare valuation engagement.

CHAPTER 11

Inpatient Enterprises

Hospitals in the United States have always been intimately engaged with their communities. From Benjamin Franklin starting Pennsylvania Hospital to shipbuilder Jean Louis leaving his fortune to create Charity Hospital in New Orleans to Mother Joseph establishing hospitals throughout the Pacific Northwest, leaders have known that hospitals are essential to the well-being of the community.[1]

—Connie J. Evashwick and Eileen L. Barsi

[1] Connie J. Evashwick and Eileen L. Barsi, "Community Connections: An Expanding Hospital Role Includes Community Well-Being," *Futurescan 2012*, Society for Healthcare Strategy and Market Development of the American Hospital Association (2012), p. 26.

Hospitals and their inpatient-related services have had a significantly changing role during the long history of their existence as part of the U.S. healthcare delivery system. As the provision of inpatient healthcare services has evolved in the United States, due to *technological advances* and the *corporatization of healthcare*, inpatient enterprises have had to adapt to *changing market conditions*. The acceleration of the growth of hospitals focused on inpatient care in the decades subsequent to the passage of the *Hill Burton Act of 1946* were followed by a pronounced shift in setting from the provision of *inpatient care* to *outpatient care*. In response to burgeoning hospital admissions, as well as increasing *financial pressures* to control spiraling costs, the prospective payment system (PPS) in the early 1980s has forced inpatient enterprises to adapt to these market forces in order to remain viable in the dynamic healthcare competitive landscape.[2]

This chapter focuses on the two major classifications of inpatient facilities: (1) *hospitals* (classified into several categories and subcategories, as set forth in Table 11.1) and (2) *long-term care enterprises* (classified into several categories and subcategories, as set forth in Table 11.22). This text will also describe the market for these types of enterprises, as well as the particular *value drivers* that may be attributed to each, and the *typical valuation approaches, methodologies, and techniques for valuing these enterprises*.

Prospective Payment System (PPS)

A system used by Medicare to pay medical providers, hospitals, and clinics a set amount of money per diagnostic related group (DRG).

Dictionary of Health Economics and Finance, *by David Edward Marcinko (New York: Springer, 2007), p. 293.*

Hospitals

Institutions where the sick or injured are given medical or surgical care.

Merriam-Webster's Collegiate Dictionary, *10th ed. (Springfield, MA: Merriam–Webster, 1999).*

[2] See Chapter 1, "The Chronology of U.S. Healthcare Delivery."

11.1 HOSPITALS

Hospitals may be described, in the most basic sense, as "*institutions where the sick or injured are given medical or surgical care*" and are typically classified by several categories: (1) *duration of patient stay*, for example, short-term or long-term; (2) *types of conditions treated*, such as acute or chronic care; (3) *tax status*, for example, tax-exempt or for-profit; (4) *service line*, such as general or specialty; and (5) *location*, that is, urban or rural.[3]

The hospital sector generated $850 billion in annual GDP in 2011, representing the single *largest expenditure for healthcare in the United States* and accounting for 31.5 percent of all healthcare spending.[4] While hospitals may provide *outpatient services* or own/participate in *outpatient enterprises*, e.g., (1) *pharmacy departments*, (2) *medical practices*, (3) *ambulatory surgery centers*, and (4) *diagnostic imaging centers*, this chapter focuses on the *inpatient services* provided at hospitals, which may be categorized as set forth in Table 11.1.

In addition, hospitals may be *owned* by several different types of entities, as set forth in Exhibit 11.1.

Centers for Medicare and Medicaid Services (CMS)

An agency within the U.S. Department of Health and Human Services responsible for the administration of Medicare, Medicaid, and other programs.

"Centers for Medicare and Medicaid Services- CMS," U.S. Department of Health and Human Services, 2011, http://www.healthfinder.gov/orgs/HR0033.htm (accessed May 25, 2012).

[3] *Merriam-Webster's Collegiate Dictionary*, 10th ed. (Springfield, MA: Merriam-Webster, 1999); MedPAC, "Chapter 5: Defining Long-Term Care Hospitals," in *Report to the Congress: New Approaches in Medicare*, June 2004; "Long-Term Acute Care Hospitals," American Hospital Association, 2012, http://www.aha.org/advocacy-issues/postacute/ltach/index.shtml (accessed April 25, 2012).

[4] "Table 2: National Health Expenditures; Aggregate and Per Capita Amounts, Annual Percent Change and Percent Distribution, by Type of Expenditure: Selected Calendar Years 1960–2011," in *National Healthcare Expenditure Tables*, Centers for Medicare and Medicaid Services, 2012.

TABLE 11.1 Classification of Hospitals

	Acute Care		Chronic Care				
	Short-Term	Long-Term	Sub-Acute	Long-Term			
Type of Inpatient Services and Enterprises	Inpatient care received for serious injuries that require treatment options less than 25 days	Inpatient care received for serious injuries that require treatment options more than 25 days	Comprehensive inpatient care for acute illness or injury to treat an underlying long-term condition. Typically between acute and long-term chronic care	Care provided for both medical and nonmedical needs for patients whose chronic condition or demographic requires care for long periods of time	Facility Description	Size of the Market (in billions)	Number of Facilities in United States
All Hospitals	X	X	X	NA	"… institutions where the sick or injured are given medical or surgical care."	785.7[1]	5754[2]
Short-Term Acute Care Hospital	X	NA	NA	NA	Has facilities, medical staff, and all necessary personnel to provide diagnosis, care, and treatment of a wide range of acute conditions, including injuries.		4985[2]

For-Profit Hospital	X	NA	NA	NA	Provide "*... a full range of ... health care services in the most cost-effective way possible*" to maximize wealth for their shareholders.	1013[2]
Not-for-Profit Hospital	X	NA	NA	NA	Primary mission is to "*improve health and access to care in the communities they serve.*"	2904[2]
Secular Hospital	X	NA	NA	NA	Nonprofit hospitals not affiliated with a sect, or group, of the population.	2483[3]
Sectarian Hospital	X	NA	NA	NA	Are hospitals not affiliated with a particular religious sect or group.	483[3]
Academic Hospital	X	NA	NA	NA	Those institutions that include allopathic or osteopathic medical schools or one or more other health professional schools or programs.	940[3]

(*continued*)

TABLE 11.1 Classification of Hospitals (*continued*)

	Acute Care		Chronic Care				
	Short-Term	Long-Term	Sub-Acute	Long-Term			
Rural Hospital	X	NA	NA	NA	Rural hospitals are those hospitals located outside of a Census Bureau metropolitan statistical area and often serve their communities as the only source of care.	NA	1987[2]
Critical Access	X	NA	NA	NA	Limited service hospitals located in remote rural areas.	NA	1327[4]
Sole Community Hospital	X				A hospital located at least 35 miles from another like hospital.	NA	450[5]
Public or Governmental Hospital	X	NA	NA	NA	A governmental hospital is owned by either the federal or state government that provides for the location in which it resides.	NA	1068[2]

Specialty Hospital	X	NA	NA	NA	A hospital that is primarily or exclusively engaged in the care and treatment of one of the following: (1) patients with a cardiac condition; (2) patients with an orthopedic condition; (3) patients receiving a surgical procedure; or (4) any other specialized category of patient (or case that the secretary designates as inconsistent with the purpose of permitting physician ownership and investment interests in a hospital under this section.	$30.69[(6)]	500[7]
Children's Hospital	X	NA	NA	NA	Offers traditional healthcare services to children, in addition to promoting public health by pioneering new vaccines and treatments for common conditions.	$5.05[6]	51[8]
Women's Hospital	X	NA	NA	NA	Women's hospitals are frequently established and owned by physicians and focus on delivery of surgical, orthopedic, spinal, or cardiac services.	$1.12[6]	9[8]

(*continued*)

TABLE 11.1 Classification of Hospitals (*continued*)

	Acute Care		Chronic Care				
	Short-Term	Long-Term	Sub-Acute	Long-Term			
Surgical Hospital	X	NA	NA	NA	Surgical hospitals are frequently established and owned by physicians and focus on delivery of surgical, orthopedic, spinal, or cardiac services.	$4.11[6] (cardiac and orthopedic)	74[8]
Psychiatric Hospital	X	NA	NA	NA	Inpatient facilities with medical staff trained to provide diagnostic, medical treatment, and monitoring care to mentally ill or substance-abusing patients.	$20.40[6]	435[2]
Long-Term Acute Care Hospital		X	NA	NA	A hospital that has an average inpatient length of stay of greater than 25 days.	$14.59[6]	111[2]

Miller and Kelli Washington (Loganville, GA: Richard K. Miller & Associates, 2011), p. 204. 8. *Hospital Statistics: 2012 Edition* (Chicago: American Hospital Association, 2012), p. 8.

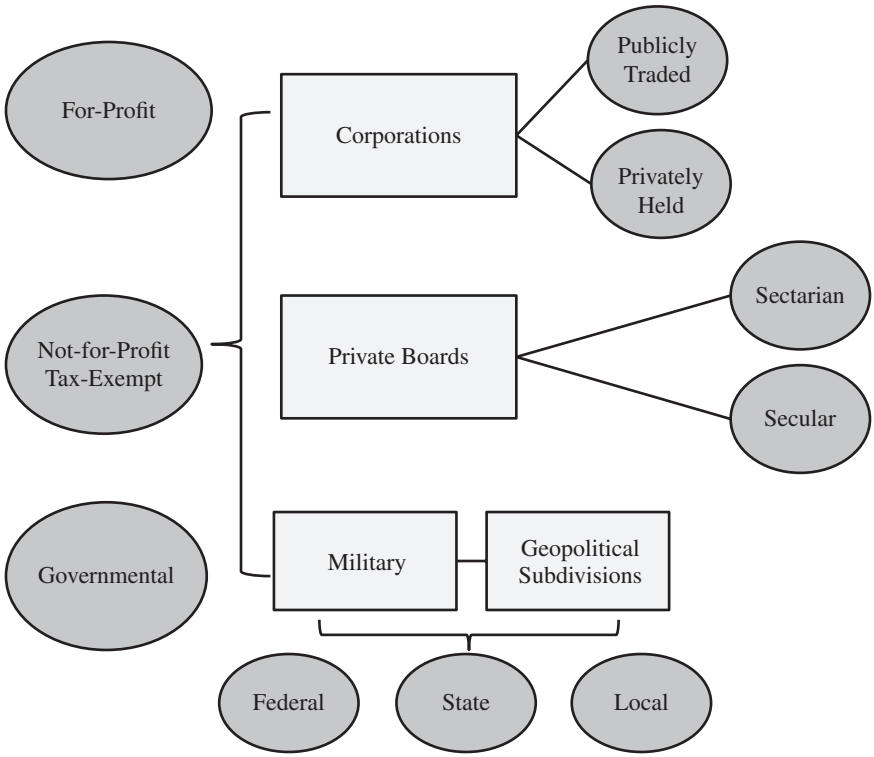

EXHIBIT 11.1 Types of Hospital Ownership[5]

Each of the classifications may be owned by one or more of the types of organizations depicted in Exhibit 11.1.

11.1.1 Short-Term Acute Care Hospitals

Acute healthcare services may be defined as involving the treatment of patients suffering from *severe episodes of illness* due to *trauma* or *disease*. Accordingly, "an acute hospital is defined as a short-term hospital that has facilities, medical staff and all necessary personnel to provide diagnosis, care and treatment of a wide range of acute conditions, including injuries."[6]

[5]The ACA created many restrictions on physician-owned hospitals, but, to date, they still exist. These restrictions are discussed in Chapter 3, "Regulatory Environment," and Chapter 13, "The Valuation of Other Healthcare-Related Enterprises."

[6]"Hospitals Today," Connecticut Office of Health Care Access Website, http://www.ohca.state.ct.us/Publications/Hospital%20Study/HospToday.pdf (accessed October 15, 2002).

For-profit acute care hospitals are owned by *investors*, and accordingly, their *operating objective* is to offer high-quality care, while maximizing the monetary return to their investors. As of 2012, there were 1,013 *for-profit acute care hospit*als in the United States.[7] The largest *for-profit national hospital chain* in the United States, *Hospital Corporation of America* (HCA), was founded in 1968 and owned 163 *hospitals* and 110 *freestanding surgery centers* as of 2012.[8] The success of HCA has resulted in significant *profits for investors*; however, *margin-oriented business practices* also appear to have prompted claims that *patient care may suffer*, due to HCA's *cost-cutting strategies*.[9] In contrast, *not-for-profit acute care hospitals* are typically owned by private exempt organizations or the geopolitical subdivision in which they operate. These not-for-profit hospitals must meet the regulatory requirements set forth in Section 501(c)(3) of the IRS code for *tax-exempt*

COMMERCIAL REASONABLENESS

An agreement between a healthcare organization and a physician should be "commercially reasonable," such that the agreement "appears to be a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals." CMS noted in 2004 that this standard introduced an "unwarranted subjective element" into the test for commercial reasonableness and redefined the standard as follows: "if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician (or family member or group practice) of similar scope and specialty, even if there were no potential DHS referrals."

"Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," Federal Register *69, no. 59 (March 26, 2004): 16093.*

[9] Julie Creswell and Reed Abelson, "A Giant Hospital Chain Is Blazing a Profit Trail," *New York Times*, August 14, 2012.

organizations, in addition to reporting their operating activities by filing an IRS Form 990, as discussed in Chapter 3, "Regulatory Environment." As of 2012, there were 2,904 *not-for-profit acute care hospitals* in the United States, nearly double the number of *for-profit acute care hospitals*.[10]

Sectarian acute care hospitals are those *not-for-profit hospitals* affiliated with a particular *religious sect* or *group*, for example, *Catholic*, *Baptist*, *Jewish*, or *Adventist Churches*, and may be required to conform to a specific set of *religious doctrines*.[11] Officers of a *sectarian acute care hospital* may require the approval of a *church leadership*, for example, a local bishop, before making significant financial or policy decisions.[12] In contrast, *secular acute care hospitals* are those *not-for-profit acute care hospitals* that are *not* affiliated with a specific *religious sect* or *group* but that instead focus on a particular aspect of *charitable healthcare services*, for example, *community health*, *teaching*, or *research*.[13]

Academic health centers (AHC), also known as *academic medical centers* (AMC), are those acute care hospital institutions that include *allopathic medical schools*, *osteopathic medical schools*, and/or one or more other *health professional schools* or *programs*, for example, *nursing*, *public*

Factoid

While outpatient surgery centers and specialty hospitals compete with short-term acute care hospitals, the short-term acute care hospitals deal more frequently with patients who have more complicated conditions.

Factoid

AHCs represent 14.8 percent of all Medicare discharges.

"Section 6: Acute Inpatient Services for Short-Term Hospitals and Specialty Psychiatric Facilities," in A Data Book: Health Care Spending and the Medicare Program, *MedPAC, June 2012, p. 64.*

Factoid

AHCs account for 55 percent of all uncompensated care.

"Teaching Hospitals: Their Impact on Patients and the Future Health Care Workforce," in TrendWatch, *American Hospital Association, September 2009, p. 2.*

health, or *pharmacy*. These institutions typically have a unique mission that includes (1) *clinical services*, (2) *research*, and (3) *teaching*. Funding for AHCs is often tied to the *budgets* of their affiliated educational institutions. AHCs typically have *lower margins* than other *nonacademic health systems*, due, in part, to *higher operating expenses*, for example, *higher wages*, *capital for research*, and higher *exposure to Medicaid populations*.[14]

11.1.2 Rural Hospitals

Rural acute care hospitals are those hospitals located outside of a *metropolitan statistical area,* as defined by the U.S. *Census Bureau*, which often serve their communities as the sole or primary *source of care*.[15] As of 2012,

[14] Sandra Kim and Susan Benz, "The Changing Academic Medical Center/University Relationship," Treasury Institute for Higher Education, pp. 2, 3, 4.

[15] A "geographic entit[y] defined by the Office of Management and Budget (OMB) for use by Federal statistical agencies in collecting, tabulating, and publishing Federal statistics . . . [with] a core urban area of 50,000 or more population." "Metropolitan and Micropolitan Statistical Areas Main," United States Census Bureau, http://www.census.gov/population/metro/ (accessed December 27, 2012); "IRS Exempt Organizations Hospital Compliance Project Final Report," Internal Revenue Service, February 1, 2012, p. 3; "Small or Rural Hospitals," American Hospital Association, p. 1.

Factoid

The Census Bureau projects that the portion of the American population over age 65 will increase from 39 million in 2010 to more than 69 million in 2030. The most rapidly growing broad age group is projected to be the 85-year-old and older population, doubling its current size by 2025 and increasing fivefold by 2050.

"Changing Demographics: Implications for Physicians, Nurses, and Other Health Workers," Health Resources and Services Administration, 2003, pp. 7–8.

approximately 90 percent of *rural acute care hospitals* were designated as either (1) *critical access hospitals* (CAH), 59 percent; (2) *sole community hospitals* (SCH), 17 percent; (3) *rural Medicare-dependent hospitals* (MDH), 9 percent; or (4) *rural referral centers*, 5 percent.[16] As of 2011, there were approximately 2,000 *rural acute care community hospitals* in the United States, providing care to approximately 72 million individuals.[17] Approximately 97 percent of *rural acute care hospitals* have fewer than 200 beds; 84 percent of *rural acute care hospitals* have fewer than 100 beds; 64 percent of *rural acute care hospitals* have fewer than 50 beds; and 47 percent of *rural acute care hospitals* have fewer than 25 beds.[18] While the number of *rural acute care hospitals* has declined slightly since the early 1990s, as urban areas have grown, "*swallowing up*" existing *rural acute care hospitals*, the prevalence of *rural acute care hospitals* has remained largely unchanged since 2004.[19]

With average occupancy rates of 49 percent, *rural acute care hospitals* had an *average profit margin* of 5.5 percent in 2010, lower than the 6.4 percent profit margin experienced by hospitals overall.[20] However, during

[16] "Section 6: Acute Inpatient Services for Short-term Hospitals and Specialty Psychiatric Facilities," in *A Data Book: Health Care Spending and the Medicare Program*, MedPAC, June 2012, p. 64; Medicare Payment Advisory Commission, "Critical Access Hospitals Payment Basics," *Payment Basics*, September 2012, p. 2.

[18] Ibid.

[19] American Hospital Association, "Organizational Trends," *Trendwatch Chartbook 2012*, 2012.

[20] "Section 6: Acute Inpatient Services in Short-Term Hospitals and Specialty Psychiatric Facilities," in *A Data Book: Health Care Spending and the Medicare Program*, MedPAC, June 2012, pp. 71, 77, 78.

Factoid

On average, for-profit short-term acute care hospitals earn a 0.1 percent profit margin on their Medicare patients.

Medicare Payment Policy: Report to the Congress, *MedPAC, Washington, DC: March 2012.*

Factoid

On average, not-for-profit hospitals earned a –5.7 percent profit margin on Medicare patients.

Medicare Payment Policy: Report to the Congress, *MedPAC, Washington, DC, March 2012, p. 58.*

the last decade, the *average profit margin* for *rural acute care hospitals* has varied between 2.4 percent and 6.0 percent, which is similar to the range for hospitals overall, that is, 1.8 percent to 6.4 percent.[21]

Critical Access Hospitals (CAHs) are *limited service hospitals* located in *remote rural areas*; they operate up to 15 beds for *general acute care* and up to an additional 10 *swing beds*, for a *total capacity* of 25 beds.[22] Although

TELEMEDICINE

The transfer of electronic medical data (high-resolution images, sounds, live video, and patient records) from one location to another, in order to enhance the quality and efficiency of patient comfort and care.

"Telemedicine 101: A Brief History of Telemedicine," by Nancy Brown, Telemedicine Information Exchange, American Telemedicine Association, http://tie.telemed.org, May 30, 1995.

[21] Ibid., pp. 77, 78.

[22] Kathleen Dalton et al., "Choosing to Convert to Critical Access Hospital Status," *Health Care Financing Review* 25, no. 1 (Fall 2003): 115.

TELEHEALTH

Closely related to telemedicine, the term is used to describe the broader definition of remote healthcare that does not always involve clinical services, although the two terms are often used interchangeably.

"Telemedicine Defined?" American Telemedicine Association, http://www.@americantelemed.org/i4a/pagees/index.cfm?pageid=3333 (accessed June 30, 2009).

CAHs represented 59 percent of all rural hospitals in 2012, they received only 30 percent of the Medicare payments made to rural hospitals during the same time period, in contrast to *Sole Community Hospitals* (SCHs), which represented 17 percent of all rural hospitals in 2012 and which received 31 percent of the total Medicare payments made to all *rural hospitals*.[23]

CAH status was established in 1997, when the *Balanced Budget Act of 1997* merged the *Rural Primary Care Hospital* (RPCH) *program* and the *Medical Assistance Facility* (MAF) *Demonstration* to create the *Medicare Rural Hospital Flexibility Program* (*Flex Program*), which provides states with the opportunity to establish a state *Medicare Rural Hospital Flexibility Program*, under which a state must designate "at least 1 facility in the State … as a critical access hospital."[24] Administered by CMS, the *Flex Program* awards certain grants to states in order to improve *rural health systems*.[25] As of September 2011, only five states, (1) *Connecticut*, (2) *Delaware*, (3) *Maryland*, (4) *New Jersey*, and (5) *Rhode Island*, did *not* have a *Flex Program* in place or any CAHs.[26]

Factoid

Rural hospitals had an average profit margin of 5.5 percent in 2010.

"Section 6: Acute Inpatient Services for Short-term Hospitals and Specialty Psychiatric Facilities," in A Data Book: Health Care Spending and the Medicare Program, *MedPAC, June 2012, p. 78.*

As amended under the *Medicare Prescription Drug, Modernization, and Improvement Act of 2003* (MMA 2003), hospitals, including *academic hospitals*, currently participating in the Medicare program must meet each of the following criteria to be classified as CAHs under Medicare:[27]

1. The hospital must be located in a state with an established *Medicare Rural Flexibility Program*.
2. The hospital must be located in a rural location or be defined as rural under a special Medicare provision.
3. The hospital must be compliant with the specific conditions of participation (CoP) established under the Medicare program for CAH.[28]
4. The hospital must be located more than a 35-mile drive from another hospital or CAH (15 miles in a mountainous area), unless designated by the state as a "*necessary provider*" prior to January 1, 2006.
5. The hospital must offer round-the-clock emergency care services.
6. The hospital must have no more than 25 beds (15 acute beds and 10 swing beds with SNF level care).
7. The hospital must have an average *length of stay* (LOS) of less than 96 hours.[29]

Length of Stay (LOS)

The number of consecutive days a patient is hospitalized.

Dictionary of Health Insurance and Managed Care, *by David Marcinko (New York: Springer, 2006), p. 168.*

[27] "Medicare Prescription Drug, Modernization and Improvement Act of 2003," *Pub. L.* 108-173 117 Stat 2266 (December 8, 2003)

[28] The CoP for CAH are set forth in 42 CFR, Part 485, subpart F.

[29] Centers for Medicare and Medicaid Services, "Critical Access Hospital: Rural Health Fact Sheet Series," January 2012, p. 2.

In addition, hospitals participating in Medicare that ceased operating after November 29, 1989, or health clinics that were previously a hospital before being downsized, may also be eligible for CAH status, as long as they meet the CoP for CAH.[30]

While obtaining CAH status is voluntary, there may exist certain *reimbursement advantages* for those hospitals with higher than expected *costs*, due to their *case mix* and *wage levels*.[31] A 2003 study of CAHs revealed that (1) they provided fewer *specialty services*; (2) were more dependent on *swing bed patients* for sustaining revenue than larger rural hospitals; and (3) had *higher than average Medicare costs per case*, relative to other low-volume providers.[32] A later 2009 study of CAHs indicated that three years after converting to CAH status, CAHs typically experienced 9.78 percent *higher revenues* and 5.43 percent *higher operating margins* than they had received prior to the hospital's conversion.[33] However, despite the apparent increase in margins that follows a hospital's conversion to CAH status, a survey of CAHs by the *Rural Policy Research Institute* identified four primary reasons why an eligible hospital may choose *not* seek to obtain CAH status: (1) the hospital may have incurred *negative financial impacts*; (2) the hospital may have to close certain *units*, in order to meet the mandated bed limit requirements established by CMS; (3) the hospital has an *average length of stay* (ALOS)

Capitation

A reimbursement system in which providers are paid a set amount up front for each patient they treat (i.e., a "per head" basis).

Bundled Payment: AHA Research Synthesis Report, *by American Hospital Association Committee on Research (May 2010), p. 3.*

[33] Pengxiang Li, John Schneider, and Marcia Ward, "Converting to Critical Access Status: How Does it Affect Rural Hospitals' Financial Performance?" *Inquiry* 46, no. 1 (Spring 2009): 52–53.

CAPITATION

Capitation is a prepaid reimbursement method that pays a provider a set price for providing medical services to a defined population for a defined set of services, regardless of service utilization. Providers must manage the financial risk of providing adequate care by calculating the expected volume of referrals, the average cost, and their ability to control utilization.

The Complete Capitation Handbook: How to Design and Implement At-Risk Contracts for Behavioral Healthcare, *by Gayle L. Zieman (Tiburon, CA: CentraLink Publications, 1995), pp. 30, 294.*

beyond the CMS limits for CAHs; and (4) the community is opposed to the hospital obtaining CAH status.[34]

As of June 30, 2012, there were 1,327 CAHs in the United States, the majority of which were located in the center of the United States.[35] See Table 11.2 for a breakdown of those states with the largest number of operating CAHs.

A *sole community hospital* (SCH) is a *short-term acute care hospital* participating in the *Inpatient Prospective Payment System* (IPPS) program that meets one of the following four criteria:

1. The hospital is located at least 35 miles from another *like hospital*, where a "*like hospital*" is defined as any hospital that also participates in the *IPPS*; provides short-term, acute care; is not paid under any other Medicare prospective payment system; and does not qualify as a CAH (discussed earlier).[36]
2. The hospital is located between 25 to 35 miles from other *like hospitals* and no more than 25 percent of the hospital's *inpatients* or Medicare *beneficiaries* are admitted to other *like hospitals* in a 35-mile radius area,

[34] Rural Policy Research Institute, "Chapter 6—Small Rural Hospitals That Have Chosen Not to Convert to CAH Status," http://www.rupri.org/rhfp-track/year2/chapter6.html (accessed March 22, 2005).

24	Louisiana	27	49	New Jersey	0
25	Oregon	25	50	Rhode Island	0

"Number of Critical Access Hospitals per State," Flex Monitoring Team, September 30, 2012, http://www.flexmonitoring.org/documents/StateCounts_CAH+DPU_09_30_12.xls (accessed December 3, 2012).

Factoid

An urban hospital participating in the IPPS program may be reclassified as a rural hospital and qualify as an SCH, if it meets all of the SCH criteria except being located in a rural area.

"Special Treatment: Hospitals Located in Urban Areas and That Apply for Reclassification as Rural," 42 CFR § 412.103(a)(3) (October 1, 2009).

or, if larger, in the hospital's service area. (Of note is that rural hospitals may qualify as SCHs if they have fewer than 50 beds and w*ould be able* to meet the 25 percent *inpatient criteria*, if not for the *unavailability of specialized services* and patients seeking these services elsewhere.)[37]

3. The hospital is located between 15 and 25 miles from other *like hospitals*, but those hospitals are *inaccessible* for at least 30 days for two out of three years, due to local topography or severe weather.[38]
4. The hospital is at least 45 minutes of travel time from the nearest *like hospital*, either due to *speed limits*, *typical weather*, or *distance*.[39]

Similar to an SCH, a *Rural Medicare-Dependent Hospital* (MDH) is a rural hospital that operates fewer than 100 beds and has at least 60 percent of its patient population attributed to Medicare but does not meet the requirements to be classified as an SCH.[40]

11.1.3 Government Hospitals

The primary function of *governmental hospitals* is to ensure that the *medical needs of the community* are met, regardless of the hospital's profitability or the patient's ability to pay.[41] *State governmental hospitals* are government hospitals owned by the state in which they are located, while *county governmental hospitals* are owned by the county in which they are located,

TABLE 11.3 Decline of State and Local Government-Owned Hospitals (*continued*)

Year	Number of Government Hospitals	Change in Government Hospitals	% Change in Government Hospitals
2008	1,105	(6)	–0.54%
2009	1,092	(13)	–1.18%
2010	1,068	(24)	–2.20%
Average Annual Change		(20)	–1.42%
Total Change		(693)	–39.35%

AHA Hospital Statistics: 2012 Edition, American Hospital Association, 2012, p. 7.

and *municipal governmental hospitals* are owned by the municipality in which they are located.

As set forth in Table 11.3, the number of state and local government-owned hospitals has shown a 39.35 percent decrease, which is an average of 1.42 percent per annum between 1975 and 2010.[42]

11.1.4 Specialty Hospitals

The term "*specialty hospital*" is defined in the *Prescription Drug and Medicare Improvement Act of 2003* as "a hospital that is primarily or exclusively engaged in the care and treatment of one of the following:

> *(i) patients with a cardiac condition;*
> *(ii) patients with an orthopedic condition;*
> *(iii) patients receiving a surgical procedure; or*
> *(iv) any other specialized category of patients or cases that the Secretary designates as inconsistent with the purpose of permitting physician ownership and investment interests in a hospital under this section."*[43]

The *specialized category of patients* often characterizing the patient population of a particular specialty hospital may include, but is not limited to, (1) *children*, (2) *women*, and (3) *psychiatric patients*.

[42] American Hospital Association, *AHA Hospital Statistics: 2012 Edition*, 2012, p. 7.

[43] "Clarifications to Certain Exceptions to Medicare Limits on Physician Referrals," excerpted from "Prescription Drug and Medicare Improvement Act of 2003," U.S. Senate, S.1 §453(a)(7).

The AHA broadly defines niche providers to include "heart hospitals, orthopedic hospitals, surgical hospitals, ASCs, cancer hospitals and centers, dialysis clinics, pain centers, imaging centers, mammography centers, and a host of other narrowly focused providers."[44] The AHA does not include other types of specialty and niche services, such trauma and intensive care, which require extensive specialization and are provided solely within the traditional inpatient hospital setting. The definition of "*niche provider*" changes, depending on who is attempting to classify providers within the broad range of *limited service providers*. The definition may be broad and may include surgical hospitals, ASCs, specialty hospitals, and virtually all providers that provide a specialized service outside of a hospital setting. Alternatively, the definition may be narrow and may include only providers treating patients with either a cardiac or an orthopedic condition or those performing surgical procedures.

It should be noted that facilities characterized as "*surgical hospitals*" are, in fact, licensed as general acute care hospitals. Their licensed status requires that they provide a varying range of services, which may limit their ability to truly focus on the surgical specialty they have selected as their objective. Because of these difficulties, surgical hospitals resist clear definition. This ambiguity has in turn led to misconceptions about their objectives, the benefits, their role in the communities they serve, and their appropriate place in the continuum of healthcare delivery in the United States.

In its 2003 report on specialty hospitals, the GAO defined a surgical hospital as a private, short-term acute care hospital where "two-thirds

Artificial hip demand is expected to increase 174 percent, while artificial knees will skyrocket by 673 percent.

"Government Transparency Mandates Improve Hospital Orthopedics Supply Chain," by Scott Crandall, Healthcare Cost Containment, Healthcare Financial Management Association, August 2009 Web Exclusive, http://www.hfma.org/Publications/Newsletters/Healthcare-Cost-Containment/Archives/2008/August/Government-Transparency-Mandates-Improve-Hospital-Orthopedics-Supply-Chain/ (accessed November 8, 2012).

[44] American Hospital Association, "Promises Under Pressure," www.hospitalconnect.com/aha/annual_meeting/content/03mtgpaper_Niche.pdf (accessed February 27, 2005).

Factoid

Short-term acute care hospitals offer the largest range of services of any health care enterprise.

AHA Hospital Statistics, *American Hospital Association, 2011, pp. 155–169.*

Factoid

In general, surgical hospitals are "focused factories" that are able to "achieve higher quality, greater efficiency, and lower costs" than general short-term acute care hospitals.

"Specialty Hospitals, Ambulatory Surgery Centers, and General Hospitals: Charting a Wise Public Policy Course," by David Shactman, Health Affairs *24, no. 3 (May/June 2005): 868.*

or more of its inpatient claims were for surgical diagnosis-related group (DRGs)," excluding:

1. Government-owned hospitals;
2. Hospitals where the majority of inpatient claims were for MDCs that related to rehabilitation, psychiatry, alcohol and drug treatment, children, or newborns; and
3. Hospitals with fewer than 10 claims per bed per year.

The *Breaux Amendment* provides yet another definition of specialty hospitals that is inconsistent with the GAO's definition of surgical hospitals: *"[T]he term 'specialty hospital' means a hospital that is primarily or exclusively engaged in the care and treatment of one of the following*:

(**i**) patients with a cardiac condition;
(**ii**) patients with an orthopedic condition;
(**iii**) patients receiving a surgical procedure; or
(**iv**) any other specialized category of patients or cases that the Secretary designates as inconsistent with the purpose of permitting physician ownership and investment interests in a hospital under this section."

For the purposes of evaluating the attack on specialty and niche providers, this term may be broadly defined to include any healthcare provider who

Factoid

Physicians in Fresno opened the first modern surgical hospital in the United States in 1988 by adding beds to their existing ASC. This facility, Fresno Surgery Center, is still in operation today, now operating as a fully licensed hospital.

"Inside the First Surgical Hospital," Outpatient Surgery, *www.outpatientsurgery.net/builders/2003/first_surgical_hospital.php (accessed October 3, 2003).*

provides a specialized level of care and/or medical treatment outside of a traditional inpatient hospital setting. Specialty and niche providers focus on a group of conditions or diseases and often offer a "multidisciplinary" approach, where specialists and related paraprofessionals treat patients in a facility specifically designed for and dedicated to the treatment of those conditions. Such providers include ASCs, which perform surgical procedures on an outpatient basis, as well as surgical and specialty hospitals and all healthcare providers possibly affected by attempts to prohibit physician investment in facilities and medical equipment. A broad, inclusive definition of specialty and niche providers is also necessary because nontraditional healthcare providers increasingly compete with traditional healthcare providers.[45]

As of 2011, there were approximately 200 freestanding *children's hospitals* in the United States, serving approximately 12 percent of *all hospitalized children* and training approximately 25 percent of U.S. pediatricians.[46]

Physician Hospital Organization (PHO)

Organizations that unite a hospital or a group of hospitals and a physician organization through a contractual relationship for the purpose of contracting with managed care organizations.

The Managed Health Care Handbook*, 3rd ed., edited by Peter R. Kongstvedt (Gaithersburg, MD: Aspen Publishers, 1996), p. 999.*

In addition to offering *traditional healthcare services* to children, *children's hospitals* are often the pioneers of new vaccines and treatments for childhood conditions, such as asthma, and may serve as a resource for *public health education*, *injury prevention*, and *access to appropriate healthcare* for children and their families.[47]

Specialty *women's hospitals* focus on providing the *continuum of care* for women during the course of an *entire lifetime*, including (1) *chronic care*, e.g., cancer, obesity, and other age-associated diseases; (2) *preventive and primary care*, e.g., gynecological exams and cancer screening; and (3) *acute care*, for example, childbirth.[48] As of 2012, there were only nine *specialty hospitals* in the United States that focused solely on *women's care*.[49]

Psychiatric hospitals are inpatient facilities with medical staff trained to provide (1) *diagnostic services*, (2) *medical treatment*, and (3) *monitoring* to *mentally ill* or *substance-abusing* patients.[50] The range of *behavioral health services* offered at *psychiatric hospitals* are often categorized by the *type of patient or patient condition* being treated, e.g., (1) *geropsychiatric*, (2) *general adult*, (3) *substance abuse*, and (4) *adolescent*. As of 2012, there were 435 *specialty hospitals* in the United States that solely focused on providing *psychiatric care,* thereby representing the *largest* classification group of specialty hospitals.[51]

Factoid

In 2011, the United States spent more than $100 billion to treat mental disorders and another $12 billion to treat drug and alcohol abuse.

Patient Protection and Affordable Care Act (ACA)

Landmark U.S. healthcare reform legislation passed on March 23, 2010.

"Patient Protection and Affordable Care Act," Pub. L. *111–148 (March 23, 2010).*

Surgical hospitals are commonly considered a *hybrid* of *general acute care hospitals* and *ambulatory surgery centers* (ASCs).[52] These hospitals are frequently *established* and *owned* by *physicians* and focus on the delivery of *surgical*, *orthopedic*, *spinal*, or *cardiac* services.[53] The first *modern surgical hospital* in the United States, Fresno Surgery Center, was converted from an ASC in 1988 after a California bill was passed allowing ASCs to add an additional 20 beds to their surgery centers for an extended stay up to 72 hours.[54] The various types of *surgical hospitals* in the United States are set forth in Table 11.4.

Of note is that a significant lobbying and advocacy campaign by the AHA and FHA culminated in the 2010 healthcare reform legislation, composed of the *Patient Protection and Affordable Care Act* (ACA) and the *Health Care and Education Reconciliation Act of 2010*, that placed significant restrictions on the growth and development of *physician-owned hospitals*, including *specialty hospitals*, as discussed in detail in Section 3.3.2, "Stark Law," in Chapter 3, "Regulatory Environment."[55]

11.1.5 Long-Term Acute Care Hospitals

Medicare defines *Long-Term Acute Care Hospitals* (LTCHs) as "*a hospital which has an average inpatient length of stay (as determined by the Secretary*

[52] "Inside the First Surgical Hospital," *Outpatient Surgery*, 2003, www.outpatientsurgery.net/builders/2003/first_surgical_hospital.php (accessed August 30, 2011); Office of Inspector General, "Physician-Owned Specialty Hospitals' Ability to Manage Medical Emergencies," Department of Health and Human Services, January 2008, p. 13.

of Health and Human Services [the Secretary]) of greater than 25 days."[56] LTCHs can be either *freestanding* or exist within an *acute hospital facility.* LTCHs within an existing hospital are typically smaller in size than a *freestanding LTCH*, averaging 36 beds, in comparison to an average of 111 beds in *freestanding LTCHs*. As of 2009, there were 432 *long-term care hospitals* in the United States.[57]

Long-Term Care Hospital

A Medicare term for a hospital whose average length of stay (LOS) is more than 25 days and is not otherwise a mental health or rehabilitation hospital.

Dictionary of Health Insurance and Managed Care, *by David Marcinko (New York: Springer, 2006), p. 171.*

[56] Centers for Medicare and Medicaid Services, "Medicare Proposes Payment Changes for Long-Term Care Hospitals for Rate Year 2006," January 28, 2005, http://www.cms.hhs.gov/apps/media/press/release.asp?Counter=1339 (accessed June 5, 2006).

[57] American Hospital Association, "Maximizing the Value of Post-Acute Care," *TrendWatch*, November 2010, p. 1.

*LTCH*s located within *short-term acute care hospitals* are required to have their own separate *governing body*, *chief financial officer*, *chief medical officer*, and *medical staff*.[58] In addition, LTCHs located within *short-term acute care hospitals* must either (1) perform basic functions *independently* of the affiliated *short-term acute care hospital*, (2) incur no more than 15 percent of the *total inpatient operating costs* for the related *short-term acute care hospital*, or (3) receive at least *75 percent of their patients from sources other than the affiliated short-term acute care hospital*.[59] The passage of the *Medicare, Medicaid, and SCHIP Extension Act of 2007* had imposed a moratorium on new *LTCH* facilities, which restricted expansion and new market entrants until it expired on December 29, 2012.[60]

LTCHs play a vital role in the *continuum of care*, in that they provide care to patients who are too ill for *skilled nursing facilities* but who no longer need short-term acute care.[61] LTCH patients typically require *medically complex* and *coordinated services* from various types of providers, including *nurses*, *therapists*, and *physicians specializing* in (1) *occupational medicine*, (2) *physical and rehabilitative medicine*, (3) *radiology*, and (4) *internal medicine*. In addition, an LTCH requires *technicians and paraprofessionals* for such services as (1) *lab sciences and phlebotomy*, (2) *pharmacy*, (3) *dietetics*, (4) *billing and coding*, (5) *nursing aids*, (6) *respiratory care*, (7) *radiology and imaging*, and (8) *supply chain management*.

Factoid

The number of LTCHs located within acute hospitals has grown at almost three times the rate of long-term care hospitals in general.

[61] MedPAC, "Chapter 5: Defining Long-Term Care Hospitals," in *Report to the Congress: New Approaches in Medicare*, June 2004, p. 125.

Factoid

LTCHs lower readmissions to short-term acute care hospitals by 26 percent per episode of care.

"Chapter 5: Defining Long-Term Care Hospitals," in Report to the Congress: New Approaches in Medicare, *MedPAC, June 2004, p. 127.*

11.1.6 Current and Future Trends: Regulatory, Reimbursement, Competition, and Technology

11.1.6.1 Regulatory All hospitals are subject to numerous *federal*, *state*, and *local regulations,* including *licensure*, *certification*, and *accreditation* requirements. All 50 states require hospitals to be licensed and typically require a hospital to maintain an organized governing board, medical and nursing staff, and administration staff, as well as minimum services (e.g., radiology, pharmacy, laboratory, and emergency services).[62] Other facility and equipment standards also require sufficient levels of safety, sanitation and infection control, and record management and retention.[63] In order to maintain *licensure*, facilities may need to meet certain building requirements, as well as comply with limits on the number of beds allowed in a given facility.[64]

Durable Medical Equipment (DME)

Durable medical equipment (DME) is medical equipment designed to improve the quality of life of patients with illnesses or injuries and must be able to withstand repeated use, must primarily serve a medical purpose, and, generally, must not be useful to a person lacking an injury or illness.

"Durable Medical Equipment Payment System," MedPAC, October 2011, http://www.medpac.gov/documents/MedPAC_Payment_Basics_11_DME.pdf (accessed November 5, 2012).

[63] Ibid., p. 62.

[64] "Excluded Hospital Units: Common Requirements," 42 CFR 412.25, Centers for Medicare and Medicaid Services.

The Joint Commission on Accreditation of Healthcare Organizations (*Joint Commission*) is the largest and most prestigious private accrediting agency for hospitals in the United States, including psychiatric hospitals. *The Joint Commission* is an *independent*, *not-for-profit organization* that maintains standards for *clinical*, *administrative*, and *organizational performance*. JCAHO conducts on-site reviews of the *quality* and *safety of care* for accreditation and renewals every three years for more than 19,000 healthcare organizations.[65] Most states require hospitals to participate in Medicare as a *condition of licensure*, which required *certification* through CMS and *accreditation* by a national accrediting agency, for example, the Joint Commission.[66] (See Section 3.8.1.2, "Medicare and Medicaid Certification," in Chapter 3, "Regulatory Environment.")

In addition to those regulatory requirements that are mandated for all hospitals, *government-owned hospitals* are subject to all of the regulatory requirements and restrictions of other governmental organizations.[67] The degree to which a given government's electoral and political process influences hospital operations depends on the governance structure of the hospital board.[68]

Factoid

TJC conducts on-site reviews of the quality and safety of care for accreditation and renewals every three years for more than 19,000 healthcare organizations.

[67]Nancy Kane, et al., "Strained Local and State Government Finances among Current Realities That Threaten Public Hospitals' Profitability," *Health Affairs* 31, no. 8 (August 13, 2012): 1680–1681.

[68]Ibid., p. 1682.

Factoid

The three main hospital accrediting bodies with CMS "*deeming status*" are the Joint Commission, the American Osteopathic Association, and Det Norske Veritas Healthcare.

"Medicare and Medicaid Programs; Approval of the Application by the Joint Commission for Continued Deeming Authority for Hospitals," Federal Register *74, no. 227 (November 27, 2009): 62334; "Medicare and Medicaid Programs; Application of the American Osteopathic Association for Continued Deeming Authority for Hospitals,"* Federal Register *74, no. 166 (August 28, 2009): 44370; "Medicare and Medicaid Programs; Continued Approval of Det Norske Veritas Healthcare's (DNVHC's) Hospital Accreditation Program,"* Federal Register *77, no. 165 (August 24, 2012): 51537.*

Government-owned hospitals can be directly governed by either (1) *elected officials or their appointees* or (2) *independent boards*.[69]

In addition to the various *fraud and abuse* restrictions that may be applicable to all hospitals, for example, the Stark Law's prohibition against self-referrals for *designated health services*, the "exception" to the self-referral prohibition for rural hospitals under *Stark II* is of significant note. This *exception* to the *ownership or investment prohibition* against referrals for *designated health services* (DHS) of Medicare patients to an entity in which the physician has an ownership or investment interest applies to rural hospitals, provided that *substantially all* of the services (i.e., a continued level of 75 percent or more) are furnished to individuals residing in a *rural area*.[70]

Factoid

Approximately 72 million individuals, 23 percent of the U.S. population, are living in rural areas.

See Chapter 3, "Regulatory Environment," for a general discussion of *Fraud and Abuse* provisions applicable to hospital enterprises.

11.1.6.2 Reimbursement Hospitals are reimbursed by Medicare for inpatient services on an *inclusive per diem* or *per case basis*, using Medicare's *diagnostic related group (DRG)* payment system under the IPPS.[71] In contrast, commercial payors may reimburse hospitals under a variety of reimbursement methods (despite typically being based on Medicare payment methodologies and rates), as set forth in Table 11.5.

IPPS payments are determined according to the "operating and capital costs that efficient facilities are expected to incur in furnishing covered inpatient services."[72] IPPS payments are calculated by applying a series of *adjustments* to two separate *base payments*, that is, (1) the *capital base payment rate* and (2) the *operating base payment rate*, each of which is set as a *prospectively determined federal payment rate per discharge*. These *federal*

[71]The inclusive nature of Medicare's inpatient hospital benefits is that coverage for Medicare beneficiaries under the IPPS includes those outpatient services rendered within three days prior to admission for the inpatient stay being billed. This is known as the 72-hour rule. Medicare Payment Advisory Commission, "Hospital Acute Inpatient Services Payment System," *Payment Basics*, October 2012, pp. 2–3.

[72]Centers for Medicare and Medicaid Services, "Acute Care Hospital Inpatient Prospective Payment System," Payment System Fact Sheet Series, February 2012, p. 3.

payment rates are adjusted based on three factors: (1) the *patient's condition* and *related treatment strategy* (see *DRG Relative Weight* in the equation later in this chapter); (2) the *market conditions in the facility's geographic location,* based on the *area wage index*; and (3) *policy adjustments for qualifying hospitals* (see IME payment and *disproportionate share hospital* (DSH) payment adjustments).[73] This equation is illustrated in Exhibit 11.2.

Capital payments are intended to cover the costs associated with *depreciation*, *interest*, *rent*, and *property-related insurance* and *taxes*, while *operating payments* are intended to cover *labor* and *supply costs*.[74]

The per discharge standard *federal rates* are each updated on an annual basis. "CMS determines the standard Federal rate by adjusting the [past year's] national average cost per discharge by a factor so that estimated aggregate payments based on the standard Federal rate adjusted by the payment adjustments described in § 412.312(b) equal estimated aggregate payments based solely on the national average cost per discharge."[75] The *Capital Standard Federal Payment Rates* from 1999 to 2013 are set forth in Table 11.6.

In addition, the *National Adjusted Operating Standardized Amounts* from 1999 to 2013 for both *large urban areas* and *other areas* are set forth in Table 11.7.

In addition to the *policy adjustments* available to all hospitals, for example, IME and DSH, as discussed earlier, academic health centers (AHCs) are *explicitly* reimbursed by Medicare above and beyond the *payment rate* designated for the *clinical services* they provide through two different payment adjustments: (1) *indirect medical education* and (2) *direct graduate medical education.*[76] *Indirect medical education* is designed to reimburse AHCs for the *higher cost* of providing patient care at an AHC, due, in part, to the costs of using innovative, advanced technologies, and is calculated as an *add-on figure* to an AHC's DRG payment.[77] In contrast, *direct graduate medical education* is designed to reimburse AHCs for the *costs directly associated*

with educating residents, including, but not limited to, (1) *resident salary*, (2) *resident benefits*, (3) *overhead*, and (4) *supervision of residents*.[80]

In addition, the IPPS includes an *outlier adjustment* for *extraordinarily high cost services* and "*pass-through*" payments for *new technologies*.[81] (See Chapter 2, "Reimbursement Environment.")

While a discussion of those *value drivers* pertinent to hospital outpatient departments will be provided in Chapter 12, "The Valuation of Outpatient Enterprises," the basic methodology by which hospital outpatient departments are reimbursed is discussed within this section, due to the interrelationship between *inpatient* and *outpatient services* provided by an overall hospital enterprise. Medicare payments for *outpatient services* are based on the *Hospital Outpatient Prospective Payment System* (HOPPS), under which o*utpatient payments* are determined by *Ambulatory Payment Classifications* (APCs), a reimbursement system implemented by CMS on August 1, 2000.[82] CMS groups outpatient procedures into approximately 750 distinct APCs, based on a set of *relative weights*. Similar to the IPPS, the HOPPS reimbursement methodology also includes a *conversion factor* and an *adjustment for geographic* differences in input prices. For a full discussion of the implementation and current methodology used for the HOPPS, see Section 2.4.1.3.1.2, "Hospital Outpatient Reimbursement," in Chapter 2, "Reimbursement Environment."

The 750 APC groups are based on services and items that are *clinically similar* and *use comparable resources*. Each APC is "*bundled*," meaning it encompasses both the *primary service* being classified and many *services integral to the provision of the primary service*. Like the IPPS, reimbursement under the HOPPS is intended to cover the hospital's *operating* and *capital* costs and is determined by multiplying the *relative weight* for the APC by a conversion factor.[83] Every year, the APC groupings and their *relative weights* are

Value

The present worth of all the rights to future benefits arising from ownership of the thing valued (i.e., the expectation of future benefit).

Dictionary of Health Insurance and Managed Care, *by David Marcinko (New York: Springer, 2006), p. 293.*

[80] American Hospital Association, "Teaching Hospitals: Their Impact on Patients and the Future Health Care Workforce," *TrendWatch*, September 2009, p. 3.

AMBULATORY PAYMENT CLASSIFICATION (APC)

A system for Medicare reimbursement to acute care facilities for outpatient services (e.g., HOPPS), launched by CMS on August 1, 2000.

"Success with APCs," Healthcare Financial Management *(September 2002): 68.*

reviewed by the *Ambulatory Payment Classification Groups Advisory Panel*, which advises CMS on updates to relative weights given to each group.[84] Beginning July 1, 2010, the *market basket update* for both *inpatient* and *outpatient* hospital services started being reduced by (1) 0.25 percent for FY 2010–2011, (2) 0.1 percent for FY 2012–2013, (3) 0.3 percent for FY 2014, (4) 0.2 percent for FY 2015–2016, and (5) 0.75 percent for FY 2017–2019.[85]

Of note is that the conversion factor for IPPS and HOPPS is *directly* associated with the *sustainable growth rate* (SGR) formula, which has been a topic of heated debate in recent years, as related to its calculation. For further discussion of the implementation and current methodology used for the HOPPS and the SGR, see Chapter 2, "Reimbursement Environment."

The two subclassifications of *rural hospitals*, that is, (1) *critical access hospitals* (CAH) and (2) *sole community hospitals* (SCH), are each reimbursed by Medicare using methods different from other hospitals. CAHs are reimbursed using a *cost-plus based method* for (1) *professional services*, (2) *outpatient services*, (3) *inpatient services*, and (4) *swing-bed services*. Under this method, payments to CAHs are determined as a *percentage* of the *hospital's predicted reasonable costs*, as set forth in its submitted *Medicare Cost Report*, plus a *markup* of 1 percent.[86] These percentages are set forth in Table 11.8.

TABLE 11.8 CAH Reimbursement Payments by Type of Service as a Percentage of Their Medicare Cost Report

Type of Service	Percent of Cost
Inpatient Care	101.0%
Swing-Bed Care	17.2%
Professional Services under the "*standard payment method*"	Lesser of (1) 80% of the 101% reasonable costs for CAH services, which is up to 100% of reasonable costs for CAH; or (2) 101% of the reasonable cost in furnishing CAH services less the applicable Part B deductible and coinsurance amount.
Professional Services under the "*optional payment method*"	Sum of (1) the lesser of 80% of 100% of the reasonable cost of the CAH in furnishing CAH services or 101% of the outpatient services less applicable Part B deductible and coinsurance amounts; and (2) 115% of the allowable amount, after applicable deductions, under the Medicare Physician Fee Schedule for professional services. Payment for nonpractitioner professional services is 115% of 85% of the allowable amount under the Medicare Physician Fee Schedule.
Outpatient Care	Lesser of (1) 80% of the 101% reasonable costs in providing the service; or (2) 101% of reasonable cost for providing the service less applicable Part B deductible and co-insurance amounts.

Market Basket

A varied combination of health care products, goods, and services.

Dictionary of Health Economics and Finance*, by David Edward Marcinko (New York: Springer, 2007), p. 225.*

In contrast, *sole community hospitals* (SCH) are reimbursed by Medicare at the maximum of the following:

1. The current IPPS payment for the hospital;
2. The updated hospital-specific rate based on fiscal year 1982 costs per discharge;

3. The updated hospital-specific rate based on fiscal year 1987 costs per discharge;
4. The updated hospital-specific rate based on fiscal year 1996 costs per discharge; or
5. The updated hospital-specific rate based on fiscal year 2006 costs per discharge.[87]

Market Basket Index

An index of the annual change in the prices of goods and services providers used to produce health or other goods and services. There are separate market baskets for prospective payment systems (PPSs), hospital operating input and capital input, skilled nursing facilities (SNFs), and outpatient services and facilities.

Dictionary of Health Economics and Finance, *by David Edward Marcinko (New York: Springer, 2007), p. 225.*

Likewise, *rural Medicare-dependent hospitals* (MDH) are reimbursed in a similar manner to an SCH; however, these enterprises are also eligible for a PPS rate weighted 25 percent from the current PPS rate and 75 percent from an individual MDH's historical costs.[88] Of note is that the *Medicare Dependent Hospital Program*, which allowed for the blended reimbursement methodology described earlier, expired in September 2012, and while there is legislation in Congress to extend the program until

October 1, 2013, to date, MDH's are currently reimbursed at the prevailing PPS rate.[89]

In an attempt to alleviate financial pressures from recent *Medicare reimbursement reductions* and a *higher proportion of uninsured patients* receiving care at *rural hospitals*, several programs have been established to *optimize reimbursement* for these providers, for example, the ACA expanded the definition of "*low-volume hospital"* for FY 2011 and 2012, increasing the number of *rural hospitals* eligible for payment adjustments under Medicare's PPS.[90] In addition, the ACA, as modified by the *Medicare and Medicaid Extenders Act of 2010*, extended many of the temporary provisions that had been enacted prior to the ACA, including (1) the *outpatient hold harmless provision* for small rural hospitals, which was set to expire in 2010; (2) *reasonable cost payments for clinical diagnostic lab services* for select rural hospitals, which was

Factoid

The ACA expanded the definition of "low-volume hospital" for FY 2011 and 2012, increasing the number of rural hospitals eligible for payment adjustments under Medicare's PPS.

set to expire July 1, 2011; and (3) the *Medicare-Dependent Hospital program*.[91]

Since October 2002, LTCHs have been reimbursed by Medicare under a PPS and have received reimbursement based on the M*edicare severity long-term care diagnosis related groups* (MS–LTC–DRG) since 2008.[92] The MS–LTC–DRGs are updated *annually* by CMS, and as of 2013, there were 751 MS–LTC–DRG classifications.[93] In 2010, Medicare spent approximately $5.2 billion on reimbursements to LTCH.[94] While LTCHs are typically one of the

[91]The outpatient hold harmless provision provided additional payments under the OPPS to rural hospitals with fewer than 100 beds and SCHs and was extended through 2011. This provision was further extended through December 31, 2012, under the Temporary Payroll Tax Cut Continuation Act of 2011. Centers for Medicare and Medicaid Services, "October 2012 Update of the Hospital Outpatient Prospective Payment System (OPPS)," MLN Matters Number: MM8031, August 24, 2012, p. 4. The Medicare reasonable cost payments for clinical diagnostic lab services reimburse hospitals with fewer than 50 beds based on reasonable costs for clinical diagnostic laboratory services, in contrast to the typical fee schedule reimbursement method, and was extended through July 1, 2012. The Medicare-Dependent Hospital program allows MDH's to be reimbursed through a blend of 25 percent PPS rate and 75 percent historical costs and was extended through October 2012. However, in May and June of 2012, the Rural Hospital Access Act of 2012 was introduced to Congress (H.R. 5943 and S. 2620). As of the publication of this book, this act had not been enacted. If passed, this legislation would extend the program until October 1, 2013. "Rural Hospital Access Act of 2012," H.R. 5943, 112th Congress (June 8, 2012); "Rural Hospital Access Act of 2012," S. 2620, 112th Congress (May 7, 2012). [94]MedPAC, "Long-Term Care Hospital Services," in *Report to the Congress: New Approaches in Medicare*, March 2012, p. 257.

most *expensive* options for *post-acute care*, they also tend to treat the most *medically complex patients*, for example, those patients requiring *prolonged mechanical ventilation* or who are experiencing *multiple organ failure*.[95]

A significant trend in reimbursement for healthcare services, including those provided by hospital enterprises, is the implementation of *episode of care payment*s, which refers to a *single reimbursement payment* made to providers for at least a portion of the medical services provided within a *particular course of treatment*. *Episode of care payment* models are designed to lower the overall *cost of care* and promote the shift away from *volume-based reimbursement* to *value-based reimbursement*. Two models of *episode of care payments* have gained popularity in recent years: (1) *bundled payments* (*episodes of care* as defined by a series of services) and *value-based purchasing* (*episodes of care* as defined by a population, either patients or providers).[96]

Bundled payments include the *combining*, or *bundling* of, multiple *related procedures or diagnoses* into *one reimbursement payment* for the entirety of a single *episode of care*.[97] *Bundled payments* share the *financial risk* between the *payer* and *provider*, that is, if the *cost of care* for a certain treatment exceeds the *bundled payment received*, healthcare providers *absorb the loss*; however, if a portion of the *bundled payment* remains after treatment, *providers keep the savings*.[98] Of note, the scope of the various bundled payments models is broad and may range from covering a *single acute episode* (e.g., stenting) to payment *for all services* involved in *managing a patient's heart disease* for an entire year.[99] For more information on the bundled payment initiatives through CMS, see Section 2.7.1.1.1, "Bundled Payments," in Chapter 2, "Reimbursement Environment."

In addition, the *Hospital Value-Based Purchasing Program* is one of the various implementations of *value-based purchasing* (VBP) by CMS. VBP encompasses any model of *provider payments* that links *reimbursement* or *incentive bonus payments* to the *quality* and the *cost of care* that a provider can achieve for a *defined patient population*. Most often, these *rewards* are offered to providers who meet (1) established standards for *patient health outcomes* and (2) set *percentage reductions* in actual *patient*

expenditures.[100] For more information on the most recent value-based purchasing initiatives through CMS that may affect hospital reimbursement, see Section 2.7.1.1.2, "Value-Based Purchasing," in Chapter 2, "Reimbursement Environment."

11.1.6.3 Competition Competition between *short-term acute care hospitals* and *specialty and surgical hospitals* grew rapidly over the decades of the 1990s and the 2000s as the number of *specialty and surgical hospitals* has increased, and the perception that reimbursement rates for *specialty procedures*, particularly *surgical procedures*, are relatively *profitable* in comparison to other services. This margin differential has led to (often unsubstantiated) claims that *specialty hospitals* strive to treat only the most *profitable patients*, leaving the *less profitable patients* for *general short-term acute hospitals*, a practice referred to as "*cream-skimming*" or "*cherry picking*."[101] It should be noted that while *outpatient surgery centers* and *specialty hospitals* compete with *short-term acute care hospitals*, their patient populations do not always overlap, as *short-term acute care hospitals* more frequently care for patients with *complicated conditions* and *comorbidity factors* than specialty hospitals do.[102]

Factoid

Specialty and surgical hospitals are licensed in all states as general acute care hospitals.

[102] Medicare Payment Advisory Commission, *Report to the Congress: Medicare Payment Policy*, Washington, DC, MedPAC, March 2012, p. 74.

The ACA strictly *limits* the ability of *physician-owned hospitals* (POHs) to *expand* and *develop* by (1) prohibiting the *addition of new beds and surgical units* and (2) prohibiting physicians from *increasing their percentage of ownership* in a hospital, which effectively *eliminates the whole-hospital exception under Stark* and essentially *prohibits* the opening of *new* POHs after 2011. Some commentators have suggested that the prohibition against POH expansion will damage the value of or ultimately entirely *eliminate* this type of healthcare provider entity from the market.[103] However, those POHs that have *grandfathered status* may still be able to compete with other inpatient hospital enterprises.[104] See Chapter 3, "Regulatory Environment," for more information on the *Stark Law* and the *Whole Hospital Exception*.

FAIR MARKET VALUE

The policy, under current law, that physicians must be compensated at fair market value for the services they provide.

Hilgers and Sidney Welch, "Physicians Post-PPACA: Not Going Bust at the Healthcare Buffet (Part 1 of 2)," *Physician News Digest*, March 15, 2012, http://www.physiciansnews.com/2012/03/15/physicians-post-ppaca-not-going-bust-at-the-healthcare-buffet-part-1-of-2/ (accessed November 3, 2012).

[104] POHs in operation, or in the process of expansion, prior to March 23, 2010, may continue their operations under the whole hospital exception; however, the circumstances under which they may expand is significantly limited to when the POH (1) is located in a county with a population growth rate of at least 150 percent of the state's population growth over the last 5 years, (2) has a Medicaid inpatient admission percentage of at least the average of all hospitals in the county, (3) is located in a state with below-national-average bed capacity, or (4) has a bed occupancy rate greater than the state average. Furthermore, any expansion is subject to an application process through HHS. "Patient Protection and Affordable Care Act, Sec. 6001," *Pub. L.* 111-148, 124 Stat 684-689 (March 23, 2010), as amended by "Health Care and Education Reconciliation Act, Sec. 1106," *Pub. L.* 111-152, 124 Stat 1049-1050 (March 30, 2010).

LTCHs compete with both *short-term acute care hospitals* and *skilled nursing facilities* (discussed later).[105] In 2006, of all of the Medicare *intensive care unit* (ICU) patients receiving mechanical ventilation, 16 percent received treatment from an LTCH, while 46 percent received treatment at a *skilled nursing facility.*[106] LTCHs are typically significantly more *expensive* than *skilled nursing facilities*, due, in part, to the *types and levels of services offered*, which generally cost 3 to 12 times more than when performed at a *skilled nursing facility.*[107] Additionally, LTCHs have been shown to reduce the *length of stay* required in *short-term acute care hospitals* by an average of seven days and lower readmissions to *short-term acute care hospitals* by 26 percent per *episode of care*.[108]

Skilled Nursing Facility (SNF)

An institution that has a transfer agreement with one or more hospitals to provide 24-hour skilled nursing and rehabilitative care on an inpatient basis.

Dictionary of Health Insurance and Managed Care*, by David Marcinko (New York: Springer, 2006), p. 267.*

Factoid

Skilled nursing facilities account for the largest portion (43%) of long-term care Medicaid expenditures.

A Report on Shortfalls in Medicaid Funding for Nursing Home Care*, American Health Care Association, December 15, 2011.*

[107] MedPAC, "Chapter 5: Defining Long-Term Care Hospitals," in *Report to the Congress: New Approaches in Medicare*, June 2004, p. 122.

[108] Ibid., pp. 125, 127.

11.1.6.4 Technology Technological advances continue to have a significant impact on hospitals, including (1) *reducing recovery times and improving quality of care through minimally invasive technologies*, (2) *coordinating care and improving quality through an increased utilization of electronic health records* (EHR) *and computerized prescription order entry* (CPOE), and (3) allowing an *increasing number of procedures to be performed in an outpatient setting.*[109]

Although EHR implementation by hospitals is progressing at a relatively *slow rate*, it has continued to increase steadily since 2003.[110] The benefits of EHR have been shown to improve quality by (1) *increasing adherence to guidelines*, (2) *enhancing disease surveillance*, and (3) *decreasing medication errors relative to primary and secondary care.*[111] In addition,

ELECTRONIC HEALTH RECORDS (EHR)

A longitudinal collection of electronic health information about individual patients and populations.

T. D. Gunter and N. P. Terry, "The Emergence of National Electronic Health Record Architectures in the United States and Australia: Models, Costs and Questions," Journal of Medical Internet Research *(2005), http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1550638/ (accessed May 24, 2012).*

Factoid

The first electronic health record (EHR) was adopted in the 1960s.

"Electronic Health Records Overview," National Institutes of Health: National Center for Research Resources, April 2006, p. 2.

[111] Basit Chaudhry, et al., "Systematic Review: Impact of Health Information Technology on Quality, Efficiency, and Costs of Medical Care," *Annals of Internal Medicine* (May 16, 2006): 742–752, http://www.annals.org/content/144/10/742.full (accessed July 15, 2010).

COMPUTERIZED PHYSICIAN ORDER ENTRY (CPOE)

An electronic system that allows physicians and providers to electronically order laboratory, pharmacy, and radiology services.

"Electronic Health Records Overview," by the National Institute of Health, National Center for Research Resources, April 2006, p. 7.

Factoid

More than one million serious medication errors occur every year in the United States.

"Fact Sheet: Computerized Physician Order Entry," by the Leapfrog Group, March 3, 2009; "To Err Is Human: Building a Safer Health System," *by Institute of Medicine, November 1999, p. 1.*

CPOE, a technology often included within an EHR system, has been shown to minimize error by reducing the *inefficiencies* and *ambiguities* associated with *hand-written orders.*[112]

Healthcare technology is more than just medical devices, pharmaceuticals, hardware, and software. It is, first and foremost, how disease is acknowledged and perceived, affecting how the therapy protocols developed

HEALTH INFORMATION TECHNOLOGY (HIT)

Associated with improving "the health of individuals and the performance of providers, yielding improved quality, cost savings, and greater engagement by patients in their own healthcare.

"The Benefits of Health Information Technology: A Review of the Recent Literature Shows Predominantly Positive Results," by Melinda Beeuwkes Buntin, Health Affairs *30, no. 3 (March 2011): 464.*

[112] Oregon Health and Science University, "Welcome to CPOE.org," http://www.ohsu.edu/academic/dmice/research/cpoe/index.php (accessed June 22, 2009).

for its treatment are implemented. The various types of medical technologies are discussed in greater detail in Chapter 5, "Technology."

11.1.7 Value Drivers of Hospitals

As noted in Chapter 7, "Basic Valuation Tenets," the *value* of a healthcare enterprise is based on the enterprise's ability to generate an anticipated *net economic benefit* in the future, in excess of the *economic operating* and *economic capital expense* burdens required to produce the revenue stream of the enterprise, to those that own an interest in that benefit or the rights to control it. Some of the *value drivers* identified for healthcare inpatient enterprises are (1) *Scope of Services*, (2) *Capacity*, (3) *Revenue Stream*, (4) *Payor Mix*, (5) *Operating Expense*, (6) *Capital Structure*, (7) *Suppliers*, (8) *Market Rivalries and Competitors*, and (9) *Subject Entity Non-Systematic Risk*, as discussed further later.

11.1.7.1 Scope of Services *Value* can be created for a hospital by *diversifying the range of services provided*. At any given time, a specific service will be subject to certain *supply* and *demand* conditions. For example, the *demand for*, and *revenue generated* from, a *particular* surgical service may be *adversely affected* by the introduction of a new *noninvasive treatment* that is *preferable* to patients. By expanding the *scope of services* provided and *diversifying the sources* of revenue for an inpatient enterprise, the *risks* specific to a *particular* service may potentially be mitigated, and the *aggregate revenue* produced by the enterprise will have enhanced stability. This improved stability may reduce the perception of uncertainty by potential investors and may provide *value* gains through lowered *capital costs*.

Expanding the *scope of services* provided may also provide a hospital with *economies of scope*, that is, *fixed costs* may be spread across various *service lines*. In addition, certain *synergies* may be allocated across *service lines*, as well as the *spill-over benefits* of housing several different specialties within the same organization. *General hospitals* may be capable of *cross-subsidizing* less profitable *service lines* by using the excess returns generated by a more profitable service line. These effects have the potential to act *in concert* to allow the subject enterprise to operate with a lower *economic cost burden*, thereby increasing the *value* that may be attributed to that enterprise. It should be noted that hospitals may also face *diseconomies of scale* and *scope*, as governmental regulations require certain minimum levels of *standby capacity* to meet exigencies that may arise during emergency situations.[113]

[113] MedPAC, *Medicare Payment Policy: Report to the Congress*, Washington, DC, March 2012, p. 74.

Homogeneous Enterprise

An enterprise that is similar or uniform in structure and quality to a subject enterprise.

"Homogeneous," Merriam-Webster Dictionary, *2012, http://www.merriam-webster.com/dictionary/homogeneous (accessed October 4, 2012).*

Factoid

Hospitals are required to maintain standby capacity for handling emergencies and to comply with government regulations.

Medicare Payment Policy: Report to the Congress, *MedPAC (Washington, DC, March 2012), p. 74.*

See Table 11.9 for a description of the range of services provided by U.S. hospitals.

It should be noted that many of the hospital services described in Table 11.9 are offered on an *outpatient basis*, for example, *hospital-based outpatient care center services* (71 percent of hospitals) and *outpatient surgery services* (80.2 percent), as discussed further in Chapter 12, "The Valuation of Outpatient Enterprises."

Approximately 64 percent of admissions to *for-profit, short-term, acute care hospitals* followed a visit to the *emergency department*, while 67 percent of *not-for-profit short-term acute care hospitals* inpatient admissions were preceded by a visit to the *emergency department.*[114] A 2012 MedPAC report found that the number of *points of contact* controlled by a single organization along the *continuum of care* correlated with the *profitability of a hospital* or a *health system* because the hospital or healthcare system had *firsthand knowledge* of its capabilities and was able to match its capabilities with the needs of the patient.[115] In light of this correlation, hospitals have been expanding their *outpatient services* during the last decade, with *outpatient spending* rising from 16 percent

[114] "Section 6: Acute Inpatient Services in Short-Term Hospitals and Specialty Psychiatric Facilities," in *A Data Book: Health Care Spending and the Medicare Program*, MedPAC, June 2012, p. 69.

Physical Rehabilitation Inpatient Care Units	15.4%		

"AHA Hospital Statistics," American Hospital Association, 2011, pp. 155–169.

Factoid

Sixty-four percent of all for-profit, short-term, acute care hospital admissions followed a visit to the emergency department.

"Section 6: Acute Inpatient Services in Short-Term Hospitals and Specialty Psychiatric Facilities" in "A Data Book: Health Care Spending and the Medicare Program," MedPAC, June 2012, p. 69.

of all hospital spending in 1999 to 20 percent of all hospital spending in 2010.[116]

A February 2012 report by the *Internal Revenue Service* (IRS), titled *IRS Exempt Organizations Hospital Compliance Project: Final Report*, suggested that *not-for-profit hospitals* spend approximately 9 percent of their revenues on *community benefit* activities, including, but not limited to, (1) *research*, (2) *education*, and (3) *free medical care*.[117] The IRS report provided the following distribution of those activities making up a *not-for-profit hospital's community benefit* activities: (1) *uncompensated care* (56 percent), (2) *medical training* (23 percent), (3) *medical research* (15 percent), and (4) *community programs* (6 percent).[118] The IRS report added that *not-for-profit hospitals* located in *low insurance coverage areas* spent, on average, 11.1 percent of revenue on *community benefit* activities, while *not-for-profit hospitals* located in *high insurance areas* spent approximately 7.2 percent of revenue on *community benefit* activities.[119] The study also found that CAHs provided the *lowest* level of *community benefit* of any s*hort-term acute care hospital* and typically did not provide *medical education* or *training*.[120]

Sectarian not-for-profit hospitals may decline to offer certain services on the basis of their *religious doctrine*; for example, the services provided

[116] "Section 6: Acute Inpatient Services in Short-Term Hospitals and Specialty Psychiatric Facilities," in *A Data Book: Health Care Spending and the Medicare Program*, MedPAC, June 2012, p. 63.

[117] Stephanie Strom, "IRS Study Tries to Assess If Hospitals Earn Tax Breaks," *New York Times*, February 13, 2009.

Factoid

Not-for-profit hospitals spend about 9 percent of their revenues on community benefit activities.

"IRS Study Tries to Assess If Hospitals Earn Tax Breaks," by Stephanie Strom, New York Times*, February 13, 2009.*

by *Catholic hospitals* must be in compliance with the *Ethical and Religious Directives for Health Care Services*, promulgated by the *United States Conference of Catholic Bishops*, a list of directives specifying what procedures *are* and *are not* allowed to be performed in a Catholic hospital.[121] Limitations on the *scope of services* provided at these facilities have the potential to limit their *market reach*, as patients may seek treatment from a *secular hospital* located in the same market service area.

While many *government hospitals* are licensed to provide all of the same services as those available at other *short-term acute care hospitals*, in an attempt to fulfill the medical needs of low-income residents that may otherwise go unmet, the *scope of services* provided by these institutions often includes "*unprofitable procedures*," for example, *regional trauma* and *inpatient mental health services*.[122] Certain service lines are typically more profitable than others, due, in part, to (1) *the stability of reimbursement payments for the procedures provided within the service line*, (2*) the insurance status or health status of those patients who generally use the services*, and (3) *whether the service line is able to operate as a loss leader in the market*, that is, services reimbursed for less than it costs to provide them in order to improve patient volumes in other, more profitable, services. For example, a *cardiology service line* typically has a higher reimbursement yield than an *emergency room*

[121] "Hospital Mergers: The Hidden Crisis," Religious Pro-Choice Americans Speak Out, 2012, http://www.rcrc.org/pdf/Hospital_Mergers.pdf (accessed August 21, 2012); Susan Berke Fogel and Lourdes A. Rivera, "Saving Roe Is Not Enough: When Religion Controls Healthcare," *Fordham Urban Law Journal* 31, no. 3 (2003): 732; United States Conference of Catholic Bishops, *Ethical and Religious Directives for Catholic Health Care Services*, 5th ed., November 17, 2009, http://www.usccb.org/issues-and-action/human-life-and-dignity/health-care/upload/Ethical-Religious-Directives-Catholic-Health-Care-Services-fifth-edition-2009.pdf (accessed November 20, 2012).

[122] Nancy Kane, et al., "Strained Local and State Government Finances among Current Realities That Threaten Public Hospitals' Profitability," *Health Affairs* 31, no. 8 (August 13, 2012): 1680.

Factoid

Not-for-profit, short-term, acute care hospitals outnumber for-profit hospitals almost 3 to 1 (2,904 hospitals to 1,013).

"Fast Facts on US Hospitals," American Hospital Association, January 3, 2012, p. 2.

department, which may provide services to a higher proportion of uninsured patients.[123] As noted earlier, *emergency room departments* also account for a large portion of admissions, including highly profitable cardiology patients. Accordingly, the losses in the *emergency room department* may be *cross-subsidized* by the profits from potentially increased *cardiology admissions*.

In contrast, *political pressure* from elected officials to provide those services that may benefit certain constituencies could have the potential to influence *government short-term acute care hospitals* to offer services that fail to enhance the *social benefit* typically provided by *government hospital* operations.[124] One study found that prior to the *Great Recession*, those public hospitals *directly governed by elected officials* were more profitable than *independent safety net hospitals*.[125]

Compared to the *comprehensive services* approach taken by *general acute care hospitals*, some hospitals offer *specialized services* to better

Factoid

Government hospitals represent 12.3 percent of all Medicaid discharges.

"Section 6: Acute Inpatient Services for Short-Term Hospitals and Specialty Psychiatric Facilities," in A Data Book: Health Care Spending and the Medicare Program*, MedPAC, June 2012, p. 64.*

[123] Health and Human Services, "New Data Say Uninsured Account for Nearly One-Fifth of Emergency Room Visits," news release, July 15, 2009, http://www.hhs.gov/news/press/2009pres/07/20090715b.html (accessed February 5, 2013).

[124] Nancy Kane, et al., "Strained Local and State Government Finances among Current Realities That Threaten Public Hospitals' Profitability," *Health Affairs* 31, no. 8 (August 13, 2012): 1680.

[125] Ibid., 1686.

capture *gains of specialization* and realize *cost reductions* by *efficiently using certain resources*. *Children's hospitals*, *academic health centers*, and *long-term care hospitals* all focus of providing *specialized services*. For example, *children's hospitals* are increasingly being used by other hospitals as a resource for *treating* and *protecting* abused children, offering (1) *advocacy*, (2) *public health education*, (3) *injury prevention*, and (4) *access to care*.[126] In addition to providing *clinical services*, children's hospitals train the majority of *pediatricians* and *pediatric specialists* in the United States.[127]

Due to their unique focus on training *physicians*, *nurses*, and other *allied health professionals*, AHCs typically offer more specialized and *medically intense* services than do other *short-term acute care hospitals*.[128] For example, a 2009 survey indicated that

1. 58 percent of AHCs *have certified neonatal intensive care units*, while only 13 percent of *nonteaching hospitals* include the same *in-house department*;
2. AHCs treat approximately 96 percent of the *burn victims* in the United States and approximately 91 percent of the *pediatric intensive care patients* in the United States;
3. 66 percent of AHCs offer *geriatric services*, whereas only 35 percent of *nonacademic hospitals* provide the same services;
4. 63 percent of AHCs provide services related to the treatment of AIDS, as compared to 16 percent of *nonacademic hospitals*; and
5. 35 percent of all AHCs offer *substance abuse outpatient services*, as compared to only 9 percent of *nonacademic hospitals*.[129]

TABLE 11.10 Characteristics of the Patients and Services Present at an LTCH

Patient Conditions	Services Offered
Respiratory disorders	Skilled nursing
Brain injury	Physical, occupational, and recreational therapy
Major multiple traumas	Respiratory therapy
Infections	Speech therapy
Wound care	Radiology and lab services
Related conditions	Pharmacy

"Maximizing the Value of Post-Acute Care," in *TrendWatch*, American Hospital Association, November 2010, p. 2.

In addition, AHCs tend to treat a significant percentage of the uninsured population, serving as a key *healthcare safety net provider.*[130]

As mentioned earlier, LTCHs typically provide clinical services to *medically complex patients*, for a variety of primary care services, as set forth in Table 11.10.

Factoid

Profit margins at AHC averaged 5.3 percent in 2010.

"Section 6: Acute Inpatient Services for Short-term Hospitals and Specialty Psychiatric Facilities," in A Data Book: Health Care Spending and the Medicare Program, *MedPAC, June 2012, p. 79.*

11.1.7.2 Capacity The *capacity* of a particular hospital may be defined as the availability of those *resources* needed to treat the *patient volume* and manage the *throughput* of patient care. The *sufficiency* of a particular inpatient enterprise's *resources* may be examined by comparing measures of *capacity.* The valuation analyst should include a capacity analysis as part of the performance of his or her valuation due diligence and revenue projection.

A commonly used measurement of hospital *capacity* is *occupancy rate*, that is, the *actual utilization of inpatient beds* over a specific period of time (i.e., utilized hospital bed days ÷ available hospital bed days). Typically, higher occupancy rates suggest that a hospital's available beds are being

[130] American Hospital Association, "Teaching Hospitals: Their Impact on Patients and the Future Health Care Workforce," *TrendWatch*, September 2009, p. 2.

TABLE 11.11 Occupancy Rate by Ownership, 1975 to 2009

500 Beds or More	80.9%	82.1%	77.3%	71.4%	72.2%	74.9%	74.0%

Health, United States, 2011: With Special Feature on Socioeconomic Status and Health, Centers for Disease Control and Prevention, (Hyattsville, MD: National Center for Health Statistics, 2012), p. 357.

used efficiently. In addition, *increased occupancy rates* are generally associated with *higher profits* for hospitals, where *incremental revenues* related to increased *bed days* typically exceed *incremental costs*. *Occupancy rates* may be improved by either (1) *increasing admissions* or (2) *reducing the number of staffed beds*.[131] The average *occupancy rates* during the last 30 years for various types of hospital enterprises are set forth in Table 11.11.

The scope of a *capacity* assessment may focus on the entirety of hospital services or may be limited to a specific department or service line, for example, *available OR time*. *Focused capacity* assessments allow hospitals to monitor and improve the efficiency of various departments or service

[131] Ingenix, *Almanac of Hospital Financial and Operating Indicators: A Comprehensive Benchmark of the Nation's Hospitals* OptumInsight, 2012, p. 211.

lines.[132] For a discussion of how capacity may affect a valuation analysis, see Section 8.1.1.3.5.2, "Market Demand/Utilization Growth," in Chapter 8, "Valuation Approaches and Methods."

11.1.7.3 Revenue Stream The *revenue* generated by a hospital is largely dependent on the *volume* of services provided and is driven by the *reimbursement yield* for those services, which varies based on (1) the *type of service being billed for*, and (2) the *type of payor supplying the reimbursement*. Typically, the reimbursement yield for a given service is based on the reimbursement rate for the diagnostic related group (DRG) related to that service. As discussed in Section 2.4.1.3, "Reimbursement and Billing," in Chapter 2, "Reimbursement Environment," hospitals are reimbursed under the IPPS based on an *average*, *qualified*, *predetermined* amount for each patient treated with a similar diagnosis, as defined by a specific DRG. Each DRG payment is *prospectively* assigned based on the *anticipated capital* and *operating costs* associated with treating a given condition and is also adjusted for certain *geographic factors* and *patient characteristics*, for example, outlier payments, *treatments involving new technologies*, and *DSH* and *IME adjustments*.[133] An example of the application of the revenue stream can be found online at http://www.wiley.com/go/healthcarevaluation.

The *revenue* generated from *patient volumes* may also be affected for hospitals where a large percentage of the care is provided to the *uninsured* (particularly in community hospitals). Other considerations when assessing hospital revenue include recent initiatives to shift reimbursement toward *value-based purchasing methodologies*. In addition to affecting the revenue generated by patient care, these new reimbursement models, for example, the *hospital value-based purchasing program*, *bundled payments*, and other epi*sode of care–based reimbursement models*, may also change the unit of productivity used to measure and project revenues for a particular hospital enterprise.

The projection of revenue for the subject hospital enterprise should include a consideration of some of the following variables set forth in Table 11.12 (each of these variables is discussed in detail further on).

Revenue for the hospital industry is expected to increase an average of 4 percent annually from 2012 to 2017.[134] An example of an application

TABLE 11.12 Variables to Consider for Hospital Revenue Projections

Type of Variable	Examples Found in Hospitals
Changes in the Regulatory Environment	New Licensing Restrictions; Changes to CON Laws; Moratoriums of Facilities
Changes in Reimbursement Yield	Changes in Per Diem Rates; Changes in DRGs; Changes in CPT Codes; Changes to Conversion Factor
Changes in the Competitive Environment	Changes in Skilled Nursing Facility Services; Change in Ambulatory Centers; Changes in Surgical and Specialty Hospitals
Changes in Technology	EHR; Minimally Invasive Surgery; Improvements to Medical Devices; New Pharmaceutical Products
Changes in Demand for Services	Shifts in Population Demographics; Growth in Population; Increase in Market Service Area Wages; Improvements in Transportation; Changes in Employment; Changes in Population; Changes in Demographics
Changes in Rivalry and Market Share	Opening/Closing of Rival Hospitals; Acquisitions by Rival Hospitals; Changes in ER Department Size
Changes in Payor Mix	Changes in Out of Pocket Expenses; Changes to Medicare Rates; Changes in Commercial Payor Coverage

of the revenue stream can be found online at http://www.wiley.com/go/healthcarevaluation.

11.1.7.4 Payor Mix In addition to the ability to *negotiate* more *favorable contracts* in low competition markets, hospitals that *employ physicians* are often capable of *negotiating higher reimbursement rates* from private payors, typically resulting in anywhere from a 5 percent to a 40 percent increase over hospitals that do *not employ physicians*.[135] Each type of hospital has specific historical trends related to its *payor mix* (which directly affect revenue) and therefore has its own expectations regarding revenue. The payor mix generally attributed to short-term acute care hospitals is set forth in Table 11.13.

As the two primary payors for *short-term acute care hospitals*, Medicare and Medicaid discharges have a significant impact on the overall revenues and resulting margins for all hospital types. The percentage of discharges

[135] Anna Mathews, "Hospitals Raise Fees after Buying Physician Practices," *Wall Street Journal*, August 27, 2012.

TABLE 11.13 Payor Mix for Short-Term Acute Care Hospitals

Payor	Percent of Mix
Medicare	40.9%
Medicaid	17.2%
Private Insurance	16.5%
HMOs and PPOs	14.0%
Self-Pay	4.9%
Workers' Compensation	20.0%

National Hospital Discharge Survey 2009, Centers for Disease Control and Prevention, http://www.cdc.gov/nchs/data/nhds/6expectedsoruce/2009expec6_numberprincipal.pdf (accessed December 6, 2012).

attributable to Medicare and Medicaid patients by hospital type is set forth in Table 11.14.

Although declining reimbursement trends during the last decade have resulted in most *short-term acute care hospitals* experiencing negative margins from treating Medicare patients, as indicated in Table 11.14, Medicare margins overall have increased since 2008, as illustrated in Exhibit 11.3.

Further, these negative trends are somewhat skewed, as in 2010 when 25 percent of hospitals experienced Medicare margins of 4.6 percent or higher, while another 25 percent experienced margins below –15.8 percent.[136]

The nature of the patient base in a given *market service area* is significantly dependent on the *geographic location* and associated *demographics*. Of the 41 million *uninsured individuals* in the United States, approximately 20 percent live in *rural areas* and are, on average, *older*, *poorer*, and *less healthy* than those living in urban areas, which may likely have a significant impact on the *patient populations*, *payor mix*, and *associated revenue streams* of *rural community hospitals*.[137] In 2010, *sole community hospitals* (SCHs) received $5.147 billion (4.63 percent of all Medicare inpatient payments) for inpatient services.[138] In addition,

Although these margins include payments and costs for acute inpatient, outpatient, skilled nursing, home health, and inpatient specialty.

EXHIBIT 11.3 Overall Medicare Margins for All Enterprises, 1999–2010
"Section 6: Acute Inpatient Services for Short-Term Hospitals and Specialty Psychiatric Facilities," in *A Data Book: Health Care Spending and the Medicare Program*, Medicare Payment Advisory Commission, June 2012, p. 75.

following the 2008 *Great Recession*, the payor mix for SCHs shifted from *higher-paying private insurers* to *lower-paying Medicaid* and *self-pay* patients.[139]

In contrast to other hospital types, *government short-term acute care hospitals* receive 35 percent of their revenues, not from payors, but instead in the form of subsidies from their government owners, which are frequently received as *lump sum* payments, regardless of the *quantity* or the *quality* of care provided.[140] Under the ACA, a 75 percent reduction in Medicare DSH payments is set for 2014, which, if actually implemented, will likely have a

[139] Scott Clay and Peter Bruton, "Outlook for Independent Community Hospitals: Uncertain," *HFM Magazine*, November 2012, http://www.hfma.org/Templates/Print.aspx?id=34677 (accessed November 8, 2012).

Sole Community Hospital (SCH)

Short-term acute care hospitals that are located at least 35 miles from like hospitals in rural areas, located 25 miles from other similar hospitals, and have fewer than 25 percent of their patients admitted to similar hospitals and have fewer than 50 beds, or are at least 45 minutes from the nearest like hospital.

"Sole Community Hospital—Rural Health Fact Sheet Series," Centers for Medicare and Medicaid Services, November 2011, p. 1.

negative impact on *government short-term acute care hospitals*, which realize approximately 12 percent of their revenue from DSH payments.[141]

Government short-term acute care hospitals are typically *safety net hospitals* and provide services to a disproportionately higher number of Medicaid patients and charity care patients than do other *not-for-profit* and *for-profit hospitals*.'[142] Accordingly, *government-owned hospitals* received $15.46 billion (13.92 percent of all 2010 Medicaid inpatient payments) for inpatient services in 2010.[143] In addition, *government hospitals* are generally more likely than *for-profit* and *other not-for-profit short-term acute care hospitals* to provide services to *uninsured patients*.[144]

Safety-Net Hospital

A hospital, often an academic hospital, that provides care to low-income, uninsured, or vulnerable patient populations.

"Hospitals Today," Connecticut Office of Health Care Access Website, http://www.ohca.state.ct.us/Publications/Hospital%20Study/HospToday.pdf (accessed October 15, 2002).

Similar to *government hospitals*, AHCs often serve as *safety-net hospitals* for a given market service area, providing care to *low-income*, *uninsured*, or *vulnerable patient populations*.[145] In 2008, AHCs accounted for 55 percent of all *uncompensated care* and 50 percent of all *Medicaid hospitalizations*.[146]

As indicated in Table 11.14, *academic health centers* (AHCs) typically have higher *margins* from Medicare patients than do other *short-term acute care hospitals*, due, in part to the *medical education* and DSH payments received from the federal government.[147] In 2010, AHCs received approximately $25.23 billion (22.72 percent of all 2010 Medicare inpatient

Short-Term Acute Care Hospital

A short-term hospital that has facilities, medical staff, and all necessary personnel to provide diagnosis, care, and treatment of a wide range of acute conditions, including injuries.

[147] MedPAC, *Medicare Payment Policy: Report to the Congress*, Washington, DC, March 2012, p. 58.

Specialty Hospital

A hospital that limits its focus and scope of services to provide treatment for a single medical specialty or cluster of specialties (e.g., surgical, pediatric, or women's care).

Dictionary of Health Economics and Finance, *by David Edward Marcinko (New York: Springer, 2007), pp. 338–339.*

payments) as reimbursement for Medicare inpatient services provided to Medicare beneficiaries.

A 2012 study published in *Health Affairs* indicated that *cardiac hospitals* have a larger proportion of commercial payor patients and fewer Medicaid and uninsured patient as compared with *general short-term acute care hospitals.*[148] In contrast to other *specialty hospitals*, services to Medicaid patients composed 54 percent of all inpatient services rendered in *children's hospitals* as of 2009 and accounted for 53 percent of all inpatient days.[149]

Typically, the two *dominate payors* for *rural hospitals* are (1) *private payors*, which cover 40 percent to 44 percent of *rural hospital* patients, and (2) *Medicare,* which covers 33 percent to 45 percent of *rural hospital* patients.[150] In addition, Medicaid typically covers 13 percent to 15 percent of *rural hospital* patients, with 7 percent or less of *rural hospital* patients

[148]Liam O'Neill and Arthur J. Hartz, "Lower Mortality Rates at Cardiac Specialty Hospitals Traceable to Healthier Patients and to Doctors Performing More Procedures," *Health Affairs* 31, no. 4 (April 2012): 810.

[149]American Academy of Pediatrics, "Medicaid Facts United States," Children's Hospital Association, September 2012, http://www.childrenshospitals.net/AM/Template.cfm?Section=Public_Policy8&Template=/CM/ContentDisplay.cfm&ContentID=1869 (accessed November 20, 2012); National Association of Children's Hospitals and Related Institutions, "Glance @ Analytics—June 2009," June 2009, http://www.childrenshospitals.net/AM/Template.cfm?Section=Utilization_and_Financial_Report&TEMPLATE=/CM/ContentDisplay.cfm&CONTENTID=46251 (accessed October 19, 2012).

being uninsured.[151] A subset of rural hospitals, CAHs typically receive their revenue from three primary sources: (1) *private payors* (38 percent), (2) *Medicare* (36 percent), and (3) *Medicaid* (13 percent).[152] In 2010, CAHs received $8 billion in total payments from Medicare.[153]

11.1.7.5 Operating Expense *Human resource expenses* (i.e., salaries, wages, and benefits) are typically the largest *expense incurred* in providing hospital services.[154] As indicated in Table 11.15, the median *compensation per discharge cost* is nearly three times greater than the *cost of supplies per discharge*.

Value may be created through improved *operational performance* by realizing *economies of scale* that may be available in the healthcare industry, that is, as firm size *increases*, the *fixed cost burden* for the provision of medical services on a per unit of productivity basis most often *declines*. This is evidenced by the fact that *not-for-profit hospitals*, with revenue greater than $500 million, have an *average profit margin* of 5.5 percent, while smaller *not-for-profit hospitals* with revenue under $25 million report *profit margins* of only 3.3 percent.[155] This reflects the fact that larger hospitals are capable of distributing their *fixed cost expenses* over a larger patient base, thereby lowering their *per-patient cost burden* and increasing their *operating profit margins*. In contrast to *not-for-profit hospitals*, profit margins at AHCs averaged 5.3 percent in 2010 and have varied between –0.4 percent and 5.3 percent from 1999 to 2010 and may be affected by the revenue enhancements provided by Medicare, as discussed earlier.[156]

[4] Inpatient Professional Liability Expense ÷ Total Inpatient Discharges.

Physician Preference Items (PPI)

Expensive medical devices, such as orthopedic implants, heart valves, bone products, balloons, and wires.

"Supply and Inventory Terms Defined," Healthcare Financial Management Association, http://www.hfma.org/Templates/Print.aspx?id=2856 (accessed November 8, 2012).

Factoid

Physician Preference Items (PPIs) are defined as "expensive medical devices, such as orthopedic implants, heart valves, bone products, balloons, and wires".

"Supply and Inventory Terms Defined," Healthcare Financial Management Association, http://www.hfma.org/Templates/Print.aspx?id=2856 (accessed November 8, 2012).

Inpatient revenues are typically generated from *prospectively assigned DRG payments*; therefore, the ability of a hospital to reduce cost is among the most significant factors in maximizing hospital profits. There are several methods through which a hospital may choose to manage or reduce costs, for example: (1) *improvements to the quality of care to reduce readmissions*, (2) *reductions in the LOS required for a given condition*, (3) "*right sizing*" *staffing levels*, (4) *maintaining appropriate levels of supplies*, (5) *enhancement of communication between physicians and other providers*, and (6) *outsourcing services*, for example, cafeteria or janitorial services.

The *projected economic operating and economic capital expense burdens* necessary to support the projected *revenue stream* for the subject hospital enterprise may be affected by some of the variables set forth in Table 11.16.

The valuation analyst should typically project *capital* and *operating expense burdens* based on (1) *historical trends*, (2) *industry benchmarking*, and (3) any anticipated interactions with the variables described in Table 11.12 and Table 11.16.

TABLE 11.16 Variables to Consider for Hospital Expense Projections

Type of Variable	Examples Affecting Hospitals
Changes in the Regulatory Environment	Changes to Safety Protocols; Changes in Licensing Requirements; Ownership Restrictions
Changes in the Reimbursement Environment	Changes in Covered Services; Changes in Hospital Status (e.g., CAH, etc.)
Changes in the Competitive Environment	Changes to Surgical Hospitals; Changes to Ambulatory Surgery Centers; Changes to Services by Skilled Nursing Facilities; Talent Poaching
Changes in Technology	Acquisition of New Technology; Rapid Obsolescence of Existing Equipment
Changes in Demand for Services	Changes in Capital Expenditures to Meet Demand Shifts; Expansion of Inpatient Beds; Changes in Swing Beds
Changes in Rivalry and Market Share	Changes in Awareness of Services; Joint-PR Efforts; Changes in Employed Physicians
Changes in Suppliers	Just in Time (JIT) Inventories; Group Purchasing Organizations (GPOs); Ability to Obtain from Other Hospital Departments

Benchmark

Derived from similar processes or services in an industry, competitors, or internal organization in order to set a level of care as a goal to be attained.

Glossary of Terms Commonly Used in Health Care, *AcademyHealth, 2004 Edition.*

11.1.7.6 Capital Structure The mix between the use of *equity* and *debt financing* within a hospital can have a significant *value* impact by altering the *capital expense burden* for the hospital. *Debt financing*, generally speaking, has a lower *cost burden* than *equity financing*. This affects the *value* of the enterprise by lowering the overall *capital cost burden* incurred by the enterprise in the provision of *medical services*, that is, it reduces the costs necessary to produce the *net economic benefit* accruing to the owners of the hospital. In addition, the utilization of debt in a hospital's capital structure may provide *preferential tax treatment* relative to the use of *equity financing*. The interest paid on outstanding *debt* offsets the hospital's *taxable income,* thereby reducing its *tax burden*. In contrast, *equity financing* has *no* such *preferential treatment*. With an increase in *debt financing* relative to *equity financing* comes an increased probability of *bankruptcy* and the associated *financial distress costs*. The greater *riskiness* associated with increased *debt* utilization is reflected in a higher *cost of equity*, that is, equity holders will demand *greater compensation* to *offset* the additional *risk*. The *optimal capital structure* for a given organization is, accordingly, the capital structure that *maximizes the value* of the enterprise considering these contending influences.

For-profit short-term acute care hospitals typically have *debt-to-asset* ratios (i.e., the *book value* of the *liabilities* of the subject enterprise divided

EQUITY

Ownership interest of common and preferred shareholders in a corporation. Also, total assets minus total liabilities, or net worth.

Corporate Finance, *4th ed., by Stephen Ross, Randolph Westerfield, and Jeffrey Jaffe (Toronto, Ont.: McGraw-Hill Ryerson, 2005), p. 943.*

CAPITAL STRUCTURE

The mix of the various debt and equity capital maintained by a firm. Also called financial structure. The composition of a corporation's securities used to finance its investment activities; the relative proportions of short-term debt, long-term debt, and owners' equity.

Corporate Finance, *4th ed., by Stephen Ross, Randolph Westerfield, and Jeffrey Jaffe (Toronto, Ont.: McGraw-Hill Ryerson, 2005), p. 939.*

by the *book value* of the *assets* of the subject enterprise) that range between 30 percent and 55 percent, depending on the specific hospital's *ownership*, *stability of income*, *pricing power*, *charity care*, *size*, *affiliation*, *after-tax cost of debt*, *age*, and *location.*[157] In general, *larger hospitals* have *higher debt-to-asset ratios.*[158]

Not-for-profit, short-term, acute care hospitals face similar trade-offs between lower *cost debt* and higher *cost equity*, due to the costs of attracting new donations, as well as their *inability* to access the *equity capital markets.*[159] *Not-for-profit, short-term, acute care hospitals* typically have *debt-to-asset ratios* of about 30 percent, which can vary based on *revenue*,

DEBT

A loan agreement that is a liability on the firm; an obligation to repay a specified amount at a particular time.

Corporate Finance, *4th ed., by Stephen Ross, Randolph Westerfield, and Jeffrey Jaffe (Toronto, Ont.: McGraw-Hill Ryerson, 2005), p. 941.*

[167] Jonathan Gruber, "Chapter 7: Public Goods," in *Public Finance and Public Policy*, 2nd ed. (New York: Worth Publishers, 2007), p. 178.

the *actual healthcare services* received by patients are both *rival*, that is, the consumption of the healthcare services reduces the amount of service that can be provided to others, and *excludable*, in other words, the consumption of healthcare services precludes others from using the exact same service. Accordingly, the production of a *public good* cannot be obtained through the mere consumption of *healthcare services*.[168] Therefore, the need for *government hospitals* arises only when the *marginal demand for public health* exceeds the *marginal demand for private healthcare services*.[169] Under this theory, the government should supply *public hospitals* only when the *cost* of providing *public hospitals* is *lower* than the *cost* of providing *private healthcare services*.[170]

Within this *public health* and *private healthcare service* environment, the valuation analyst must determine whether a *government hospital* produces the *optimal level of public health*. When a *government hospital* produces a *suboptimal level of public health*, the valuation analyst would anticipate a sale of the hospital to a *nongovernmental entity.* Thus, the pool of typical *buyers*, *sellers*, *owners*, and *investors* would select an *optimal capital structure* most similar to that of *private entities*. However, in the event that the *government hospital* does produce an *optimal level of public health*, the determination of *optimal capital structure* becomes less clear.

Like *private hospitals*, *government hospitals* should seek the cheapest sources of funding for its assets.[171] However, unlike *private hospitals*, *government hospitals* do not have an *explicit cost of equity*, as in the case of *for-profit hospitals*, or an *implicit cost of equity*, as in the case of *not-for-profit hospitals*.[172] Rather, the government's equivalent to the *cost of equity* is the *cost of social utility*, as determined by the

---

[168] Ibid.

[169] In cases where the marginal demand for public health is less than the marginal demand for private healthcare services, the marginal demand for private healthcare services will produce a level of public health greater than the marginal demand for public health. Jonathan Gruber, "Chapter 7: Public Goods," in *Public Finance and Public Policy*, 2nd ed. (New York: Worth Publishers, 2007), p. 183.

[170] In cases where private suppliers can produce a level of public health greater at a lower price, the government would be better off contracting with private suppliers to provide public health services (e.g., Medicare, Medicaid, TriCare, etc.); Jonathan Gruber, "Chapter 7: Public Goods," in *Public Finance and Public Policy*, 2nd ed. (New York: Worth Publishers, 2007), p. 183.

[171] Jonathan Gruber, "Chapter 8: Cost-Benefit Analysis," in *Public Finance and Public Policy*, 2nd ed. (New York: Worth Publishers, 2007), p. 207.

[172] Ibid.

citizens over whom the government presides.[173] The amount of government expenditures on healthcare must be balanced by two factors: (1) the *tax revenue* the government collects today and (2) the *debt* the government issues today to cover any budget short-falls.[174] The *intertemporal balance* of government *spending* and *taxing*, where *social utility* is maximized, produces the *optimal capital structure* for that government hospital, which is the *expected social return* on the government tax receipts, that is, the amount of public health generated by the hospital. If this social return is deemed insufficient, hospitals may affect changes in *tax policy* through their elected officials or the ballot box.[175] The cost associated with financing this optimal point is the government's *cost of capital*.[176] It should also be noted that the level of *debt financing* associated with this point is only the difference between *taxes collected today* and *taxes collected in the future*.[177] Thus, the government's *cost of capital* is at a minimum equivalent to that of the area over which it governs, on a pretax basis.[178]

Within this context, *government hospitals* are a *consumption choice* by the government. Thus, the capital structure of the government hospital will vary, based on (1) *the optimal level of public health for a given citizenry*, (2) *the government's alternative consumption choices for maximizing social utility*, (3) *the expected tax collections from future generations*, (4) *the optimal level of social utility for a given citizenry*, (5) *the alternative investment choices available to the individual citizenry*, and (6) *the taxation preferences of the citizenry.* Of note is that there is not an agreed-on *universal optimal capital structure* for *government hospitals*.

Psychiatric hospitals experience *lower levels of capital intensity* than do *short-term acute care hospitals*, due, in part, to their *lack of a need for expensive medical equipment*, as well as their ability to dedicate a significant portion of space to *direct patient care*.[179] Accordingly, *psychiatric hospitals*

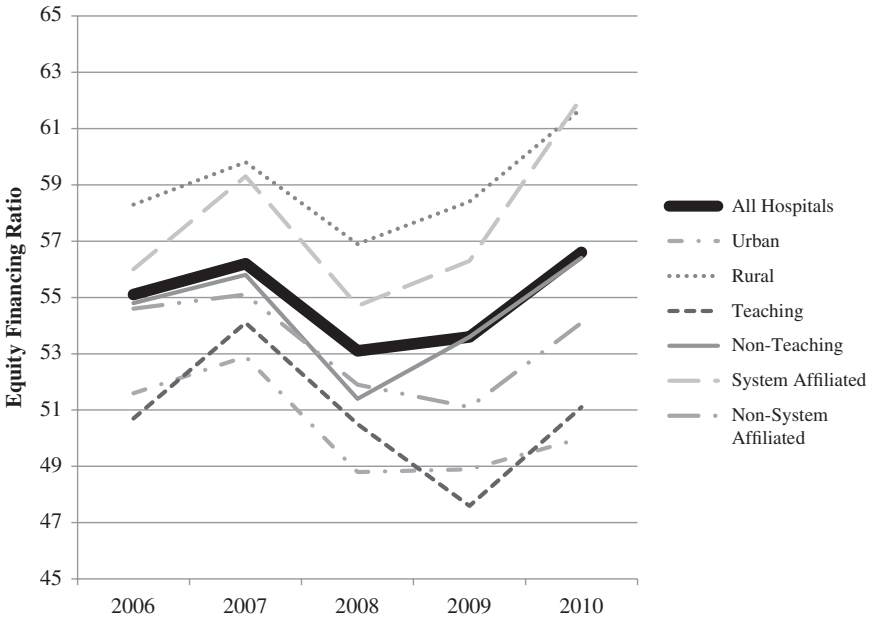

EXHIBIT 11.4 Equity Financing Ratios for Hospitals, by Type, 2006 to 2010
Almanac of Hospital Financial and Operating Indicators: A Comprehensive Benchmark of the Nation's Hospitals, Ingenix, OptumInsight, 2012, p. 58.

typically have between 28 percent and 50 percent of the *book value* of their assets financed through *debt.*[180]

There are several means of equity financing commonly used by hospitals: (1) *foundations*, (2) *endowments*, (3) *restricted funds*, and (4) *permanently restricted funds*. For more information of the types of equity financing available, see Section 9.1.2.2, "Equity Financing," in Chapter 9, "Costs and Sources of Capital." In 2010, the average *equity financing ratio* for hospitals increased, due, in part, to the fact that more hospitals are choosing to *finance* capital projects with *debt* in response to the historically low interest rates experienced in the period.[181] The change in *equity financing* by hospitals over the last five years is illustrated in Exhibit 11.4.

TABLE 11.17 Leverage Ratios for Hospitals (SIC 806)

	2011	2012
Debt/Market Value Equity	109.99%	207.54%
Liquidity	1.73%	1.49%
Cost of Debt	7.02%	7.23%
Cost of Equity	11.72%	13.33%

Ibbotson Cost of Capital Data is available only for SIC 8011 for 2010; all other capital analysis will contain a four-year trend from 2009 to 2012. *Ibbotson Cost of Capital Yearbook* (Chicago: Morningstar, editions 2012, 2011, 2010, and 2009).

For illustration purposes, various ratios available for describing the *capital structure* of hospitals, which operate within SIC Code 806, are presented in Table 11.17.

11.1.7.7 Suppliers While in the past *labor costs* made up the largest segment of a *hospital's operating budget*, *supply costs* are projected to quickly increase in their significance as a result of (1) *increased cost for distribution*, *lower inventories of distribution channels* and (2) *fewer on-time deliveries*.[182] Significantly, hospitals have begun focusing on areas with the most potential for *reducing supply costs*, such as *consumable commodities* that encompass a broad range of supply types, from *low-cost* (e.g., bandages, gauze, syringes, sutures) to *high-end* (e.g., implants, pharmaceuticals, surgical instruments) commodities. In a 2012 survey by *Modern Healthcare*, almost 80 percent of providers surveyed stated that their *strategic plan formally included reducing supply costs*.[183]

Supplier

A provider of healthcare services, other than a practitioner, that is permitted to bill under Medicare Part B, including for DME, prosthetics, orthotics, X-ray, and so on.

Dictionary of Health Insurance and Managed Care, *by David Marcinko (New York: Springer, 2006), p. 278.*

In 2011, 251 *new drug shortages* were reported, 73 percent of which were injectables.[184] This represented a *significant increase* from the 110 *drug shortages* reported in 2008, of which 35 percent were injectables.[185] Many of these *finalized supply shortages* were due to *raw material shortages*, *discontinuations*, and *production capacity issues*.[186] As of June 2011, *drug rationing* affected 99.5 percent of all hospitals, with 82 percent reporting *delayed treatment*, 69 percent reporting *less effective treatment*, 63 percent reporting *no treatment*, and 35 percent reporting *adverse outcomes*.[187] The four *drug categories* experiencing the *worst shortages* are (1) *chemotherapy*, (2) *antibiotics*, (3) *emergency drugs*, and (4) *anesthesia/sedation*; the shortages may particularly affect *children's hospitals,* due to the fact that these enterprises often use a disproportionate amount of *injectable drugs*, including *pain medication*, *parenteral nutrition* (used in *neonatal intensive care units*), and 80 percent of drugs that treat *acute lymphoblastic leukemia*, the most common form of *pediatric cancer.*[188] The valuation analyst should consider the impact of future pharmaceutical shortages on a subject enterprise's ability to continue to provide its historical *scope of services* and maintain its historical revenue levels.

A recent trend toward smaller *bulk units* and *just-in-time* (JIT) distribution may result in many hospitals maintaining only *minimal stock levels* of

---

[184]The Food and Drug Administration (FDA) defines a drug shortage as occurring when "the total supply of all versions of the approved product available at the user level will not meet the current demand [and] a registered alternative manufacturer will not meet the current and/or projected demands for the potentially medically necessary use(s)." U.S. Food & Drug Administration, "Frequently Asked Questions about Drug Shortages," http://www.fda.gov/Drugs/DrugSafety/DrugShortages/ucm050796.htm#q1 (accessed November 20, 2012).

certain supplies, which may also translate into *lower storage requirements* and better *alignment of inventory with clinical demand.*[189] However, these methods necessitate *accurate real-time information* being communicated between the *point of use* (i.e., at the hospital unit, not the storage room) and the *distributor.*[190] Any disruption or inefficiencies in communication may have major consequences, in terms of both *hospital finances* and *clinical outcomes.*[191] In addition, JIT inventory management is reliant on stable distribution channels through which input is transported. Any interruption in the flow of goods and services from the distributor to the subject enterprise may result in costly delays and lost opportunities for the subject enterprise. The logistics infrastructure of the United States is among the best in the world, but unforeseen events have in the past created disruptions in the free flow of goods and services within the U.S. economy, as was evidenced by the nationwide shut-down of air traffic following the attacks on September 11, 2001. The valuation analyst should consider the strategic risk associated with JIT inventory policies when assessing the value of an inpatient enterprise.

Adverse Drug Event (ADE)

An injury caused by drugs, typically in the form of an allergic reaction or adverse physiological responses to a certain combination of medications. Preventable ADEs are injuries that are caused by human error.

Factoid

One adverse drug event (ADE) adds, on average, $2,000 to the cost of hospitalization.

"Leapfrog Hospital Survey Results," by the Leapfrog Group, 2008, p. 3.

JUST-IN-TIME (JIT)

An inventory replenishment method that relies on accurate real-time usage data to "pull" and replace supplies, leading to minimal stock on hand, more frequent orders of smaller quantities, and lower operating costs.

Dictionary of Health Economics and Finance*, by David Edward Marcinko (New York: Springer, 2007), pp. 205–206.*

11.1.7.8 Cost Reduction Methods One relevant method of reducing hospital supply chain costs may be through the use of *group purchasing organizations* (GPOs), which are defined as *groups of providers*, often including hospitals, that use their *consolidated purchasing* power as *leverage* to negotiate discounts for supplies from *vendors*.[192] GPOs have been a mechanism for *controlling supply costs*, particularly for smaller hospitals that are able to take advantage of a large hospital's leveraging abilities.[193]

When selecting a GPO, approximately 84 percent of providers surveyed by *Modern Healthcare* for the *2012 Survey of Executive Opinions on Supply Chain Issues* cited the ability to *control the prices of consumables* as "*very important*," yet in 2012, only 25 percent of providers surveyed were *satisfied* or thought GPOs were effective in controlling

[192] "Supply and Inventory Terms Defined," Healthcare Financial Management Association, http://www.hfma.org/Temp lates/Print.aspx?id=2856 (accessed November 8, 2012).

[193] Scott Crandall, "Government Transparency Mandates Improve Hospital Orthopedics Supply Chain," *Healthcare Cost Containment*, Healthcare Financial Management Association, August 2009 Web Exclusive, http://www.hfma.org/Publications/Newsletters/Healthcare-Cost-Containment/Archives/2008/August/Government-Transparency-Mandates-Improve-Hospital-Orthopedics-Supply-Chain/ (accessed November 8, 2012).

Group Purchasing Organization (GPO)

An organization that leverages the buying power of a group of healthcare organizations to obtain contracted discounts from vendors.

"Supply and Inventory Terms Defined," Healthcare Financial Management Association, http://www.hfma.org/Templates/Print.aspx?id=2856 (accessed November 8, 2012).

prices.[194] Despite these beliefs, approximately 53 percent of those providers surveyed planned to *increase* their utilization of GPO contracts, while only 12 percent either did not belong to a GPO or planned to *decrease* their use of GPOs.[195] A further discussion of GPOs is provided in Chapter 13, "The Valuation of Other Healthcare-Related Enterprises."

In addition to *leverage* from group purchasing activities, new technologies are being used by providers to report implementation of efficiency metrics in the supply chain. One example is the utilization of *radio-frequency identification* (RFID), which allows *supply managers* to track *inventory* from the *manufacturer* to the *patient*. RFID embeds supply items with *radio-emitting tags* to track real-time location of inventory, allowing for a reduction in *shrinkage due to theft or damage*, as well as the ability to *locate supplies faster during shortages or emergencies*. RFID tags also track

Factoid

When selecting a GPO, approximately 84 percent of providers surveyed by *Modern Healthcare* cite the ability to control the prices of consumables as "very important," yet only 25 percent are satisfied in this regard or think GPOs are effective in doing so.

"Supply-Side Economics," by Jaimy Lee, Modern Healthcare*, August 18, 2012, http://www.modernhealthcare.com/article/20120818/MAGAZINE/308189932 (accessed November 26, 2012).*

[194] Jaimy Lee, "Supply-Side Economics," *Modern Healthcare* (August 18, 2012), http://www.modernhealthcare.com/article/20120818/MAGAZINE/308189932 (accessed November 26, 2012).

[195] Ibid.

supplies by *expiration date*, which optimizes *first-in, first-out protocols* and prevents stagnation and supply waste. RFID networks can also use "*smart dust*," which is *particle-size digitized sensors* that are able to detect *light*, *humidity*, and other *conditions* that may be important for inventories requiring *special storage and handling*.[196]

Another method of potentially reducing supply costs is through the *full integration* of the *supply chain*. A *materials management information systems* (MIMS) may be linked to *point-of-use interfaces* to allow for *real-time inventory monitoring* and *automatic notification* of replenishment needs. Such systems can identify underutilized equipment and supplies, which may provide and present opportunities to lower inventory carrying costs. An example is the performance of the Mayo Clinic, which successfully reduced its *supply spending* by 3 percent in 2010 through implementation of a *supply information management system* to manage inventory and gather usage data.[197]

Although a hospital generally keeps 6,000 to 8,000 *stock-keeping units* (SKUs) on hand at a given time, it may "*own*" up to 35,000 SKUs "*end to end*."[198] Typically, hospitals only measure inventory for (1) *perioperative services*, (2) *pharmacy*, and (3) *materials management* and do not take into account inventory held by their *vendors*, *wholesalers*, or *consignors* or the costs associated with *shipping* and *shrinkage* during transport. Hospitals may attempt to counter rising costs by assessing the *total costs of ownership* (TCO) for each supplier, which examine the total cost of supplies, for example, *acquisition*, *ownership*, and *post-ownership*, including "value analysis; freight and distribution costs; timeliness of delivery; inventory carrying

Supply Chain

A complex and dynamic system through which information and supplies flow upstream and downstream between manufacturers, distributors, purchasers, providers, and consumers.

Factoid

A hospital typically keeps 6,000 to 8,000 stock-keeping units (SKUs) on hand at a given time.

"Not Your Father's Supply Chain," by Michael Darling and Sandy Wise, Materials Management in Health Care *19, no. 4 (April 2010): 1.*

PRODUCT STANDARDIZATION

The practice of purchasing large quantities of an item or brand from one or two vendors in order to obtain discounted rates.

"Supply and Inventory Terms Defined," Healthcare Financial Management Association, http://www.hfma.org/Templates/Print.aspx?id=2856 (accessed November 8, 2012).

TOTAL COST OF OWNERSHIP (TCO)

An integration of the costs of acquisition, ownership, and post-ownership, including "value analysis; freight and distribution costs; timeliness of delivery; inventory carrying costs and risks; technology cycles; order fulfillment costs; quality and defect rates; customer service; volatility of end-user demand; cash flow; warranty costs; and, environmental costs."

"Do You Know Your Supply Chain Cost Drivers?" by Vicki L. Smith-Daniels, Healthcare Cost Containment, Healthcare Financial Management Association *(October 2008), Web Exclusive, http://www.hfma.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=3716 (accessed November 8, 2012).*

costs and risks; technology cycles; order fulfillment costs; quality and defect rates; customer service; volatility of end-user demand; cash flow; warranty costs; and, environmental costs."[199]

[199]Vicki L. Smith-Daniels, "Do You Know Your Supply Chain Cost Drivers?" *Healthcare Cost Containment*, Healthcare Financial Management Association, October 2008 Web Exclusive, http://www.hfma.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=3716 (accessed November 8, 2012).

While most providers tend to focus on internal aspects of *supply chain management*, enterprises may also consider *risk mitigation* further up the *global supply chain*. In 2012, 73 percent of businesses reported a *supply chain disruption*, with the top three causes being (1) *unplanned IT outages*, (2) *adverse weather*, and (3) *service failures by outsourcers*.[200] Various exigencies, for example, the attacks of September 11, 2001, and the 2011 Japanese tsunamis, may disrupt the hospital supply chain and affect input prices and hospital populations, with a resulting impact on the value of the hospital enterprise.

11.1.7.9 Market Rivalries and Competitors *Geographic location* (i.e., *region*, *state*, or *metropolitan area*), as well as the *proximity to other medical services* (including both *competitors* and *complements*), may significantly affect the *revenue-generating capability* of a hospital enterprise.[201]

Market rivalries among hospitals may include competition for (1) *patients*, (2) *managed care contracts*, (3) *direct employer benefit plan contracts*, and (4) certain *scarce resources* that may be used in the provision of medical services, for example, technicians and paraprofessionals. In addition, the competition for *patients* and *managed care contracts* by hospitals often affects the *revenue-generating* capabilities of the hospital, that is, as the number of *competing* hospitals increases within a given *market service area*, hospitals may be forced to make concessions relative to the *charges* submitted to certain payors. In a market with several hospitals (or "*substitute enterprises*" that provide similar services), managed care companies and patients may demand *lower prices* for the services provided. It is typical in a high competition industry for enterprises to realize narrower profit margins than in less competitive markets, which may have a significant negative impact on the *value* of a hospital.

Certificate of Need (CON)

The formal justification of capital expenditures from a governmental healthcare agency, especially for a new specialty hospital, outpatient center, medical clinic, and so forth.

Dictionary of Health Economics and Finance, *by David Edward Marcinko (New York: Springer, 2007), p. 66.*

[200] Business Continuity Institute, "Service Failures by Outsourcers Reach Top Three Causes of Supply Chain Disruption," press release, November 7, 2012, http://www.thebci.org/index.php?option=com_content&view=article&id=343&Itemid=414 (accessed November 26, 2012).

[201] Sophia Snyder, "Hospitals in the US," IBIS World, May 2012.

CAPITAL EXPENDITURES

The cash outflows a firm incurs to acquire long-lived assets, both tangible (e.g., buildings, equipment, furniture, and fixtures) and intangible (e.g., computer software, patents, work product).

Financial Accounting: A Valuation Emphasis, *by John S. Hughes, Frances L. Ayres, and Robert E. Hoskin (Hoboken, NJ: John Wiley & Sons, 2005), pp. 274, 536.*

There are also *legislated barriers to market entry* that inpatient facilities must often address, including state *certificate of need* (CON) laws, *licensure requirements*, *zoning*, and *environmental requirements*, all discussed in more detail in Chapter 3, "Regulatory Environment."

In addition, hospitals compete over *physician* and *nonphysician provider services*, a *scarce resource* used in the production of medical services. High demand for these types of *input* can often result in *increased costs* and *decreased profits for hospitals*. Conversely, in low-competition markets, an excess supply of physician services may result in *greater bargaining leverage* and *reduced cost burdens* for hospitals.

The U.S. healthcare delivery system is facing what is perhaps its greatest challenge in the expected demand for increased health services from the aging of the *baby-boomer* generation. The passage of the ACA in March 2010, which requires increased insurance coverage for specified individuals meeting indicated income thresholds in 2014, will also likely increase patient demand for *hospital inpatient* and *outpatient services* in the coming years.

During the last decade, rising healthcare costs and the increasing number of uninsured patients have had a greater negative impact on *publicly owned hospitals* (with margins that, on average, merely break even), as compared to *privately owned hospitals* (with margins near 5 percent). Due to these financial burdens, many public hospitals have closed or converted to private ownership, thereby decreasing the prevalence of public hospitals from one in every four hospitals in 1999 to one in every five hospitals in 2010.[202] The ACA, which will reduce the current levels of Medicaid DSH

[202]Laurie E. Felland and Lucy Stark, "Local Public Hospitals: Changing with the Times," Center for Studying Health System Change, Research Brief, No. 25, November 2012, p. 2.

payments by 50 percent between 2014 and 2020, presents a particular concern for *public hospitals*, despite certain provisions allowing for the possibility of serving a smaller uninsured population.[203] Although revenue growth has been positive, the overall rate of growth for *not-for-profit hospitals* has decreased since 2008, due to (1) reductions in patient volumes, (2) changes in reimbursements, and (3) governmental pressures to lower costs.[204]

In light of this, the 1990s witnessed an enormous *consolidation* in the healthcare industry overall, in particular within the hospital industry. While the number of transactions decreased during the early 2000s, they have increased during the last decade as the healthcare industry has, once again, begun a period of *consolidating*. Table 11.18 provides the number of hospital transactions from 1997 to 2012.

Further evidence of this consolidation can be seen in the growing number of hospitals operating within health systems, which has steadily risen

Hospital Corporation of America, Inc.	4.5%
Community Health Systems	1.7%
Tenet Healthcare	1.2%
Health Management Associates	0.8%
LifePoint Hospital	0.5%
Universal Health Services	0.5%

"Hospitals in the US," by Sophia Snyder, IBIS World, May 2012.

during the last decade, from approximately 2,550 in 2000 to approximately 2,950 in 2010.[205]

The *hospital* market segment is highly fragmented, with the top six hospital chains accounting for approximately 9 percent of the total industry revenue, as illustrated in Table 11.19.

The hospital industry is dominated by the *not-for-profit* sector. The number of *not-for-profit short-term acute care hospitals* (2,904 hospitals) is nearly three times the number of *for-profit hospitals* (1,013 hospitals).[206]

Competition between *long-term acute care hospitals* (LTCHs) has historically been *weak*, although it has *intensified* due to the 12 percent *compound annual growth* in the number of LTCHs from 1993 to 2003.[207] However, the growth in LTCHs slowed to 4.75 percent from 2004 to 2010, due, in great part, to the moratorium on the development of new LTCHs (see Chapter 3, "Regulatory Environment").[208] Despite this growth, LTCHs are not present in every market, and a total of only

412 exist across the country.[209] However, with the expiration of the moratorium on December 29, 2012, many observers believe that growth in LTCHs may resume at the rapid pace seen during the 1993 to 2003 period.[210]

From January 1, 2010, to June 30, 2012, 80 percent of the LTCH enterprise transactions were acquisitions by *regional players* and *for-profit enterprises*, as set forth in Table 11.20.[211]

Specialty hospitals have seen dynamic changes in the period from the end of 2010, when there were approximately 500 *specialty hospitals* in the

United States.[212] Due to the passage of the ACA and provisions implementing regulatory restrictions on *physician ownership* of hospital enterprises (see Chapter 3, "Regulatory Environment"), some physician owners have *cancelled plans to expand* and subsequently *sold their shares* in facilities that were under construction at the end of 2010.

As indicated in Table 11.21, the typical *acquirers* of *surgical hospitals* between January 1, 2011, and June 30, 2012, were *for-profit, short-term, acute care hospitals* (56 percent of transactions) and *not-for-profit, short-term, acute care hospitals* (44 percent of transactions).[213] Approximately

[212] Richard K. Miller and Kelli Washington, *The 2011 Healthcare Business Market Research Handbook* (Loganville, GA: Richard K. Miller & Associates, 2011), p. 204.

[213] Author's compilation from *The Health Care M&A Report*, Irving Levin Associates, Norwalk, CT (First Quarter 2011; Second Quarter 2011; Third Quarter 2011; Fourth Quarter 2011; First Quarter 2012; and Second Quarter 2012).

66 percent of *surgical hospital* transactions between January 1, 2011, and June 30, 2012, involved acquisition by a *local hospital* serving a *single community*, while 33 percent of *surgical hospital* transactions involved acquisition by a *national hospital chain*.[214]

11.1.7.10 Subject Entity Nonsystematic Risk A *discount rate*, at which the *expected future stream of net economic benefit* is *discounted to present value*, is selected by the valuation analyst to represent the *expected risk-adjusted rate of return* a typical investor would require to invest in the subject property interest being *valued*, given the *systematic risk* of the market, as well as the *unsystematic risk of the subject enterprise*. See Chapter 8, "Valuation Approaches and Methods," for further discussion of *discounts and premiums*.

A technique commonly used in the determination of the discount rate for the valuation of small, closely held companies is a type of "*build-up*" method. It is based on several r*isk and return conditions*, that when totaled, result in an estimate of the *rate of return* that an equity investor would most likely *require to invest* in the inpatient enterprise. The *risk and return conditions* considered may include (1) *a risk-free rate*, (2) *an investment alternative (equity risk premium)*, (3) *a healthcare industry risk premium*, (4) *a small public company risk premium*, and (5) *an enterprise-specific risk premium*. For definitions of these risk/return factors, see Chapter 8, "Valuation Approaches and Methods."

The nonsystematic *subject entity–specific risk premium* may be perceived as somewhat more *subjective*, in that it reflects a valuator's informed assessment of the various risk factors that are inherent and specific to the subject enterprise being valued. Additional risk factors, specific to the interest in the hospital enterprise, and their impact on the selected discount rate, may include risk elements related to:

1. *The enterprise's operational and financial performance, compared to the industry*;
2. *Consideration of the uncertainty regarding the government's and other third-party managed care organizations' reimbursement of services*;
3. *Competitive forces within the enterprise's market service area*;
4. *Consideration of risk related to the projected expense structure of the enterprise*, that is, likelihood an acquirer of a control interest in the

[214] Author's compilation from *The Health Care M&A Report*, Irving Levin Associates, Norwalk, CT (First Quarter 2011; Second Quarter 2011; Third Quarter 2011; Fourth Quarter 2011; First Quarter 2012; and Second Quarter 2012).

enterprise can change the expense structure to a level equal to industry benchmarks;
5. *Operational performance*, as compared to the *industry benchmarks*, for example, *higher readmissions*, *lower mortality*, and *higher asset turnover*;
6. *Medical staff relations*;
7. *Diversity of referral base*; and
8. *Scope of services offered*.

11.2 LONG-TERM CARE

Long-term care enterprises may be classified as (1) *skilled nursing facilities*, (2) *assisted living facilities*, and (3) *congregate care facilities*, as set forth in Table 11.22.

Congregate Care

A combination of "private living quarters with centralized dining services, shared living spaces, and access to social and recreational activities," as well as "transportation services, personal care services, rehabilitative services, spiritual programs, and other support services," but the facilities are not licensed to provide healthcare services

"Congregate Care," RetirementHomes.com, 2012, http://www.retirementhomes.com/homes/congregate_care.html (accessed August 11, 2012); "About Retirement Care Communities," by Thomas Day, National Care Planning Council, http://www.longtermcarelink.net/eldercare/retirement_care_communities.htm#independent (accessed November 17, 2012), p. 21.

Assisted Living

A type of living arrangement in which meals, shelter, transportation, and the activities of daily living are provided either in-home or in a centralized location.

Dictionary of Health Insurance and Managed Care*, by David Marcinko (New York: Springer, 2006), p. 29.*

The long-term care industry generated $149.3 billion in annual GDP in 2011, accounting for 5.5 percent of all healthcare spending.[215] Patients in these settings are often referred to as "*residents*" and fall into two general categories: (1) patients recently *discharged from an acute care facility*, who are medically unable to live independently; and (2) patients *entering from independent living*, who have experienced a decline in health that leaves them medically unable to live independently. The level of services provided varies among the three types of *long-term care enterprises*, according to *patient needs* and among the types of facility the patient resides in.

11.2.1 Skilled Nursing Facilities

Skilled nursing facilities (SNFs) are inpatient institutions primarily engaged in providing *skilled rehabilitation services* for *injured*, *disabled*, or *sick* residents.[216] Accordingly, the staff at an SNF often consists of *registered nurses*, *licensed practical and vocational nurses*, *physical and occupational therapists*, *speech pathologists*, and *audiologists*.[217] An SNF may exist as a *freestanding entity* or as part of a *hospital* or *health system*. A significant proportion of the patients who require long-term care are *elderly*, *children*, *teenagers*, and *other adults* who have recently been discharged from a hospital and are in a transitional period before returning home.[218]

11.2.2 Nursing Homes

Nursing home is a *broadly construed term* that designates a place where the elderly may reside to receive *nursing care* with no expectation of returning to *independent living*. These facilities may supply some *rehabilitation therapy services*, for example, *physical therapy* and *speech therapy*; however, those patients who require a *higher level of care* may likely transfer to an SNF. Accordingly, as a patient's condition worsens, many nursing homes

TABLE 11.22 Classification of Long-Term Care Enterprises

	Acute Care		Chronic Care				
	Short-Term	Long-Term	Sub-Acute	Long-Term			
Type of Inpatient Services and Enterprises	Inpatient care received for serious injuries that require treatment options less than 25 days.	Inpatient care received for serious injuries that require treatment options more than 25 days.	Comprehensive inpatient care for acute illness or injury to treat an underlying long-term condition. Typically between acute and long-term chronic care.	Care provided for both medical and nonmedical needs for patients whose chronic condition or demographic requires care for long periods of time.	Facility Description	Size of the Market (in billions)	Number of Facilities in United States
Long-Term Care Facilities	N/A	N/A	X	X	Facilities and organizations that provide a wide-range of health and health-related services on a formal and informal basis to persons with functional disabilities and chronic conditions over an extended period of time (generally 90 days or more).[13]	$110.7[1]	69,228

Nursing Facilities (NFs)	N/A	X	N/A	X	An institution that provides rehabilitation services and daily living services to the functionally disabled, injured, or chronically ill.[11]	$60.89[1]	N/A
Intermediate Care Facilities (ICs)	N/A	*X*	N/A	*X*	Institutions such as rest homes or homes for the aged that are licensed.	N/A	N/A
Skilled Nursing Facilities (SNFs)	N/A	N/A	X	N/A	Facilities that are primarily engaged in providing skilled nursing care and related services to residents who require medical or nursing care and rehabilitation services for injured, disabled, or sick residents. These facilities are not primarily for the care and treatment of mental diseases.[10]	$32 billion in revenue from Medicare payments[2]	16,000[4]
Freestanding	N/A	N/A	*X*	N/A	SNFs that are not tied to a larger hospital or health system.	$44.29[1]	15,040[5]
For-Profit	N/A	N/A	*X*	N/A	SNFs that operate to maximize profits for investors or owners.	$27.68[1]	11,200[5]
Not-for-Profit	N/A	N/A	*X*	N/A	SNFs that operate under a charitable purpose for the community they serve.	$11.07[1]	4,000[5]
Government Owned	N/A	N/A	*X*	N/A	SNFs owned by one of the geopolitical subdivisions in which they are located.	$5.54[1]	800[5]
Hospital SNF Department	N/A	N/A	*X*	N/A	SNFs that are owned by a parent hospital to health system.	N/A	960[5]

(*continued*)

TABLE 11.22 Classification of Long-Term Care Enterprises (*continued*)

	Acute Care		Chronic Care				
	Short-Term	Long-Term	Sub-Acute	Long-Term			
Assisted Living Facilities	N/A	X	N/A	X	Facilities that provide housing and long-term healthcare services for aging individuals who require assistance performing routine tasks—e.g., bathing, eating, dressing, and taking medication—but that do not provide high-level medical care.	$22.10[2]	51,37[6]
Mentally Ill Patients	N/A	*X*	N/A	*X*	Assisted living facilities that only house residents with mental illness.	N/A	N/A
Private	N/A	*X*	N/A	*X*	Assisted living facilities that are owned and operated by a private organization.	N/A	30,307[7]
Public	N/A	*X*	N/A	*X*	Assisted living facilities that are owned and operated by a geopolitical entity.	N/A	668[7]
Not-for-Profit	N/A	*X*	N/A	*X*	Assisted living facilities that operate under a charitable purpose for the community they serve.	N/A	13,202[7]
Government Sponsored	N/A	*X*	N/A	*X*	Assisted living facilities that receive significant funding from a geopolitical entity.	N/A	668[7]
Continuing Care Retirement Communities (aka Congruent Care Facilities)	N/A	N/A	N/A	X	Unlicensed facilities that "*combine private living quarters with centralized dining services, shared living spaces, and access to social and recreational activities.*"	$11.86[2]	1,861[8]

For-Profit	N/A	N/A	N/A	X	Congruent care facilities that operate to maximize profits for investors or owners.	N/A	335[8]
Not-for-Profit	N/A	N/A	N/A	X	Congruent care facilities that operate under a charitable purpose for the community they serve.	N/A	1,526[8]
Independent Living Facilities	N/A	N/A	N/A	X	Facilities that do not provide any medical services and allow residents to live with limited assistance.	$19.94[2]	N/A
Adult Day Care Facilities	N/A	N/A	N/A	X	Community-based group care that is structured, holistic, and individualized but provides less than 24-hour care.[13]	N/A	N/A
Home Healthcare Services*	X	X	X	X	Service provided in patients' homes instead of in hospitals, typically for the management of chronic diseases.	$69.80[9]	N/A

Factoid

In Europe, some nursing homes have even installed "fake" bus stops outside of their facilities, to prevent wandering patients from using legitimate public transportation, and provide a safe spot where facility staff can retrieve the patient.

"Fake Bus Stops for Alzheimer's patients in Germany," International Association of Chiefs of Police, November 18, 2011, http://www.theiacp.org/About/Governance/Divisions/StateAssociationsofChiefsofPoliceSACOP/CurrentSACOPProjects/MissingAlzheimersDiseasePatientInitiative/AlzheimersSuccessStory/tabid/1007/Default.aspx?id=1665 (accessed November 17, 2012).

also include *transitional services to* ease patient transfers to their final placement location, either an *SNF* or a *home hospice care*.

While Medicare requires nursing homes to be licensed, state licensure varies as to what services are included as nursing care. As such, the services provided at nursing homes may overlap with *SNFs* and *assisted living facilities*, as well as functioning as a *rest home* for the elderly.[219]

11.2.3 Assisted Living Facilities

Similar to *SNFs* and *nursing homes*, *assisted living facilities* provide *housing* and *long-term healthcare services* for aging individuals who require assistance performing *routine tasks*, e.g., *bathing*, *eating*, *dressing*, and *taking medications*, but they are distinct from *nursing homes* in that patients in these facilities do not require the *level of medical supervision* of those residing in *SNFs*.[220] In contrast to an *SNF* or a *nursing home*, where *clinical care* is the primary focus, *assisted living facilities* often focus on "*maximizing residents' dignity, autonomy, and independence*."[221] In addition, some assisted living facilities are designed to provide services focused on residents with *significant* and *specific impairments*, for example, *mentally illness*,

[219]David E. Marcinko and Hope R. Hetico, *Dictionary of Health Insurance and Managed Care* (New York: Springer, 2006), pp. 162, 200.

Factoid

Assisted living facilities are not regulated federally but face a myriad of state regulations, which offer 70 different licensing requirements.

2012 Cost of Care Survey, *Genworth Companies, 2012, p. 89*.

developmental disabilities, *Alzheimer's disease*, or *dementia*.[222] Generally, *assisted living facilities* are significantly *cheaper* than SNFs, with a *national median monthly rate* of $3,300, as compared to the *national median monthly rate* of $6,750 for a private room in an *SNF*.[223]

11.2.4 Congregate Care Facilities

Unlike *SNFs*, *nursing homes*, and *assisted living facilities*, *congregate care facilitates*, or "*independent living*" *communities* (also referred to as *senior living*), are *not licensed* to provide healthcare services, but rather "combine private living quarters with centralized dining services, shared living spaces, and access to social and recreational activities," as well as offering "transportation services, personal care services, rehabilitative services, spiritual programs, and other support services."[224] The distinction between *congregate care* and *assisted living facilities* has become *blurred*, as more *congregate care facilities* begin to offer healthcare services through *outside licensed agencies*, and *assisted living facilities*, in turn, implement designated sections for *independent living*.[225] Depending on the *amenities* offered by a particular facility, for example, *the size of a resident's ro*om, the *level of*

housekeeping, and the *sufficiency of transportation services*, the *costs* for *congregate care* can range from $500 to more than $4,000 a month.[226]

11.2.5 Current and Future Trends: Regulatory, Reimbursement, Competition, Technology

11.2.5.1 Regulatory SNFs are *more strictly regulated* than other *long-term care enterprises*, as every SNF that accepts Medicare and Medicaid payments must be certified to meet the applicable federal regulations that are enforced by CMS.[227] Nursing homes, which are subject to regulation by the state in which they operate, are also required to implement *federal nursing home regulations* to qualify for Medicare reimbursement.[228] The *Omnibus Budget Reconciliation Act of 1987* (OBRA 87) established certain *quality assurance requirements* for SNFs and nursing homes reimbursed by Medicare and Medicaid, which are enforced at the *state level* through on-site *surveys* conducted every 15 months.[229] In addition, many states also have their own specific regulations for nursing homes, for example, certificate of need (CON) requirements, density requirements, and density codes, which have, in several states, resulted in moratoriums on the number of SNF beds allowed.[230] As a result of regulatory restrictions on the supply of SNF beds and other market factors, for example, high construction costs and limits on reimbursement for those costs, as well as local zoning, planning, and use ordinances, the number of SNFs decreased from 19,000 in 1985 to 16,700 in 1995 and to 16,000 in 2011.[231]

[231] Alison Sahoo, "Long-Term Care Market," Kalorama Information, March 2012, p. 11.

In contrast to SNFs and nursing homes, *assisted living facilities* are *not* typically regulated by the federal government, unless they obtain *federally assisted financing*.[232] Instead, *assisted living facilities* are subject to a myriad of state regulations, promulgated through various *licensing requirements*.[233] Generally, states have implemented two forms of licensure for assisted living facilities: (1) *assisted living community standards*, which set required *disclosure*, *services*, *admission thresholds*, *resident assessment*, *medication management*, *physical plant*, *staffing*, *staff training*, and *fire safety protocols*; and (2) *second level of licensure for assisted living facilities*, which augment existing licensure; for example, in 2011, Georgia passed a second level of licensure for assisted living facilities that was more *stringent* than its basic licensure requirements for personal care homes.[234]

Traditionally, *congregate care facilities* have avoided many state *licensure laws*, for example, state CON requirements (see Section 3.4.3, "Certificate of Need," in Chapter 3, "Regulatory Environment") by not providing *clinical healthcare services*. However, as *congregate care facilities* continue to evolve into a model more closely resembling an *assisted living facility*, licensure requirements may follow, particularly if healthcare services are provided "*in-house*," rather than by an outside agency.[235]

11.2.5.2 Reimbursement SNFs and nursing homes are typically reimbursed on a *per diem basis*, that is, reimbursement is paid at a *fixed* amount per day, in accordance with the *level of care provided*.[236] SNFs may be reimbursed by Medicare, Medicaid, commercial payors, or self-pay. As of 2011, most SNFs had been certified to participate in both the Medicare and Medicaid programs, with only 5 percent of facilities having no certification for public payor programs.[237] However, according to a 2012 MedPAC Report, Medicaid accounted for 63 percent of the total patient

[237]Alison Sahoo, "Long-Term Care Market," Kalorama Information, March 2012, p. 11.

SNF bed days, while Medicare reimbursed only 12 percent of the total SNF patient bed days in 2010.[238] Many state Medicaid programs use a *cost-based reimbursement system*, that is, reimbursing an SNF for only the *reasonable direct* and *indirect allowable costs* associated with providing routine patient care services within a statutorily set return.[239] (See Section 2.4.1.3.1.4, "Skilled Nursing Facility Reimbursement," in Chapter 2, "Reimbursement Environment.")

In contrast to SNFs and many nursing homes, *assisted living facilities* often charge a *monthly room rental rate* for their services, which may vary based on the *level of care* required by a specific resident.[240] Typically, monthly rates range between $625 and $9,750, with a median monthly charge of $3,300.[241] In addition, 33 percent of *assisted living facilities* charge a *nonrefundable one-time entrance fee* or, in the case of not-for-profit enterprises, require that the patient provide an *endowment*.[242] Time spent in an *assisted living facility* is typically self-paid by patients.

Congregate living facilities may use a variety of payment models for those residents who do not *purchase* their *living unit*, including, but not limited to, (1) establishing an *annual or monthly rental charge*; (2) operating as a *condominium complex*, with *additional fees for higher levels of service*; or (3) offering all of a resident's services for a *single lump sum payment*.[243] There are three typical types of *out-of-pocket payment plans* for congregate care residents: (1) a "*life-care*" plan, (2) a "*straight-rental*" plan, and (3) a "*condominium*" plan. A "*life-care*" plan is designed to encourage the resident to stay at a facility for the *remainder of his or her life*, that is, a resident will endow a significant sum of money to the facility, which is then used to pay for *nursing or care* services that may be required later in life. On top of the *endowment*, these residents may also be required to pay a *monthly fee*. Under a "*straight-rental*" plan, residents make *monthly rental payments*

that cover their *room* and *congregate services*. Similarly, under a "*condominium*" plan, residents *purchase their living unit* and pay a *monthly fee*, which includes the costs for congregate care services.[244]

11.2.5.3 Competition The SNF and nursing home market is *highly fragmented*, with the top five nursing home operators controlling just over 8 percent of all SNFs and nursing homes in the United States.[245] SNFs typically compete, to some extent, with *short-term acute care hospitals* that also offer *skilled nursing*, *rehabilitation*, and *sub-acute care services*. However, competition between SNFs and *short-term acute care hospitals* has somewhat declined, as the percentage of hospitals offering these services declined from 50 percent of all s*hort-term acute care hospitals* in 2000, to under 40 percent in 2010.[246]

Both SNFs and *congregate care facilities* have begun expanding their *service lines* to offer services similar to *assisted living facilities*.[247] In addition, *assisted living facilities* located in close proximity to *short-term acute care hospitals*, *long-term acute care hospitals*, and SNFs have the potential to realize certain benefits from the *complementary services* provided by the facility, as residents are able to use more intensive clinical services without the added inconvenience and cost burden of *significant transportation*.[248]

11.2.5.4 Technology In addition to the *managerial* and *clinical technologies* required to maintain a long-term care enterprise, SNFs require additional technologies to *sufficiently provide care* for their unique patient populations. Unlike many other healthcare providers, a significant proportion of the largely aged SNF patients have *degenerative cognitive diseases*, for example, *dementia* and *Alzheimer's disease*, that require a high level of *constant* and *continuous* care. Included in the substantial medical needs these patients require is the risk of *wandering* and *elopement*, which may put

[248]Ibid.

them at risk of *physical harm*.[249] Specific technological devices can be used to prevent patient wandering, including, but not limited to, (1) *door and bed alarms*, (2) *video surveillance*, and (3) *electronic tagging*, such as a bracelet or a device sewn into clothing.[250]

11.2.6 Value Drivers of Long-Term Care Enterprises

Value drivers for *long-term care enterprises* are those factors that have an impact on the *revenue expectations* of the enterprise, the *operating expense burden* of the enterprise, or the *capital expense burden* of the enterprise. Some of the *value drivers* identified for these healthcare inpatient enterprises are (1) *Scope of Services*, (2) *Capacity*, (3) *Revenue Stream*, (4) *Payor Mix*, (5) *Operating Expense*, (6) *Capital Structure*, (7) *Supplier*s, (8) *Market Rivalries and Competitors*, and (9) *Subject Entity Nonsystematic Risk*.

11.2.6.1 Scope of Services As with hospitals, *long-term care enterprises* may positively affect their *value* by *diversifying* the *scope of services* they offer. Diversification may increase the total *utilization of services*, reducing costs per unit of productivity and increasing margins as a result of the substantial *fixed cost nature* of the industry subsector. In addition, the *diversification of services* typically results in *less volatile revenue generation,* which can reduce *investor uncertainty* and, consequently, *capital costs*.

As mentioned earlier, the *scope of services* offered by various *long-term care enterprises* is associated with the *level of care* required by its patients/residents. For example, SNFs offer the highest level of clinical care, while *assisted living facilities* and *congregate care facilities* focus on providing residents with *daily living conveniences*, as well as limited rehabilitation services.

In addition to daily living activities, *assisted living facilities* range in the quality of, and scope of, services offered, based on a resident's ability and willingness to pay for enhanced amenities.[251] *High-end facilities* may feature *fitness centers*, *swimming pools*, *gift shops*, *chapels*, *spas*, and *landscaped grounds*, while *low-end facilities* tend to be older, offer a *few basic services*, and may use *communal bathing areas*.[252] Similar *disparities* between

[249] Marie Boltz, "Wandering and Elopement: Litigation Issues," National Council of Certified Dementia Practitioners, http://www.nccdp.org/wandering.htm (accessed November 17, 2012), pp. 1–5.

[250] Ibid.

[251] Alison Sahoo, "Long-Term Care Market," Kalorama Information, March 2012, p. 191.

[252] Ibid., pp. 191–192.

facilities may be apparent within the *congregate care industry*, where payment for resident services is typically paid *out of pocket*. Residents typically live in an assisted living facility for two to three years, until their medical needs require *skilled nursing care*.[253]

11.2.6.2 Capacity The *capacity* of a long-term care enterprise differs from other healthcare enterprises, in that the *resources* necessary to care for their patient populations include *extended daily conveniences*, for example, bathing facilities and individual rooms. When assessing the sufficiency of a long-term care enterprise's *capacity* to generate sustainable revenues, the valuation analyst should consider the type of "*clientele*" that the subject facility is designed to accommodate, which affects the amenities provided over and above basic care.

Of note is that in addition to the resources for *extended daily convenience*s and *patient amenities*, SNFs must also have the *medical staff* and *equipment* and *technology* to care for the continuum of *long-term clinical treatments* of both *acute* and *chronic* conditions. The medical services provided at an SNF may, in some cases, allow a valuation analyst to use *measures of capacity* similar to those used for other healthcare enterprise, for example, production wRVU and full-time equivalent (FTE) employees, when *benchmarking* the *capacity* of a subject long-term care facility to industry norms, as well as the more *traditional SNF capacity measures* of *beds*, *rooms*, or *square footage*.

11.2.6.3 Revenue Stream Most long-term care enterprises are typically reimbursed on either a *per-bed day* or a *monthly rental* basis, in contrast to other inpatient enterprises, which may be reimbursed on either a *per-diem* or a *case-based* basis. Accordingly, the *measure of productivity* required for projections of long-term care *revenue* is *patient bed days*. Even for those SNFs, nursing homes, assisted living facilities, and congregate care facilities that are paid *out of pocket*, a monthly rental rate may be broken down by day, allowing for a comparable unit of productivity metric for all long-term care enterprises. The aging baby boomer population, assuming reimbursement yield is not consequently reduced, will likely increase the *utilization demand* for long-term care services in the future, thereby increasing *patient volumes* and, as a consequence, *revenue*.[254]

---

[253] Ibid., p. 26; National Center for Assisted Living, "Resident Profile," 2012, http://www.ahcancal.org/ncal/resources/Pages/ResidentProfile.aspx (accessed August 11, 2012).

[254] Christopher J. Truffer, et al., "Health Spending Projections through 2019: The Recession's Impact Continues," *Health Affairs* 29, no. 3 (March 2010): 523, 527.

In 2012, nearly half of all nursing home residents in the United States were ages 85 years or older, and nearly 90 percent were ages 65 and older.[255] The SNF industry in 2012 was generally stable, with an annual revenue growth rate of .9 percent, anticipated to grow over five years approximately 4.5 percent, from $110 billion in 2012 to $115 billion by 2017.[256] In contrast to the SNF industry, the *assisted living industry* is expected to increase over a five-year period by 40.3 percent, from $56.3 billion in 2011 to $79 billion by 2016.[257]

The *State of Senior Housing Report* by the *American Seniors Housing Association* also reported that in 2011, the average length of stay at an SNF was 25.6 months.[258] The same study reported that occupancy rates can range from 62 percent to 98 percent, with a national average of 88 percent.[259]

Unlike the *reimbursement measures* used by Medicare for inpatient hospitals, those SNFs that are eligible for Medicare reimbursement receive payments based on *resource utilization groups* (RUGs), which take into account *functional status* and *anticipated use* of *services and resources* by residents. In addition, the reimbursement rate is based on *a case-mix* of the *severity of medical conditions of residents* and may be adjusted in a similar manner as inpatient hospitals (see Section 11.1.6.2, "Reimbursement"). An example of the application of the revenue stream can be found online at

Factoid

Recently, newer models of bundled payment have gained popularity because they share the financial risk between the payer and provider, as well as allow for a flexible definition regarding the scope of payment.

TABLE 11.23 Variables to Consider for Long-Term Care Revenue Projections

Type of Variable	Examples Found in Long-Term Care
Changes in the Regulatory Environment	New Licensing Restrictions; Changes to CON Laws; Moratoriums of Facilities
Changes in Reimbursement Yield	Changes in Medicaid Per Diem Rates
Changes in the Competitive Environment	Addition of Swing Beds to Short-Term Acute Care Hospitals; Congregate Care Contracts with Outside Medical Service Companies
Changes in Technology	Expansion of Remote Monitoring; EHR; Improvements in Surgery Recovery Time
Changes in Demand for Services	Shifts in Population Demographics; Growth in Population; Increase in Market Service Area Wages; Improvements in Transportation; Changes to RUG Case Mix
Changes in Rivalry and Market Share	Opening of New Long-Term Care Facilities; Acquisitions of Competing Facilities; Closure of Long-Term Care Facilities
Changes in Payor Mix	Changes in Out-of-Pocket Expenses; Changes to State Medicaid Rates; Changes in Long-Term Care Insurance Prevalence.

http://www.wiley.com/go/healthcarevaluation. An important consideration when projecting revenue for an SNF is that these facilities are subject to consolidated billing (similar to *bundled payments*), under which a facility must include *all* of the *Medicare-covered services* (with a few exceptions that are billable as outpatient procedures by an *outside supplier*) that a resident received during the course of a *covered inpatient stay.*[260]

Controlled separately by each state, Medicaid has typically reimbursed long-term care enterprises at a rate that is below the cost of providing care to residents. For example, in 2011, for every dollar of allowable cost incurred by long-term care providers, Medicaid reimbursed, on average, 90 cents.[261] Valuation analysts should be aware of each state's method for calculating Medicaid reimbursement rates when considering the projection of revenue. Several variables that should be considered in projecting revenue for the subject long-term care enterprise are set forth in Table 11.23.

[260] Centers for Medicare and Medicaid Services, "Skilled Nursing Facility Prospective Payment System," Payment System Fact Sheet Series, October 2012, p. 3.

TABLE 11.24 SNF Payor Mix

Payor	Percent
Medicaid	63%
Medicare	14%
Private and Other	22%

Distribution of Certified Nursing Facility Residents by Primary Payer Source, 2010, Henry J. Kaiser Family Foundation, 2012, http://www.statehealthfacts.org/comparebar.jsp?ind=410&cat=8&sub=97&print=1 (accessed December 8, 2012). An example of the application of revenue stream can be found online at http://www.wiley.com/go/healthcarevaluation.

11.2.6.4 Payor Mix While Medicare and Medicaid are the dominant payors for SNFs (see Table 11.24), the single largest impact on value for a nursing home is likely to be the ability to attract and retain *private pay patients*, as private payors typically reimburse at *significantly higher per diem rates* than the government payors.

Although most *assisted living facilities* are paid directly *out of pocket* by residents, Medicaid represents a significant (approximately 20 percent) and growing proportion of payments made to *assisted living facilities*.[262] Medicaid payments frequently do not cover the *cost of providing services*, as these rates typically exclude *food*, *housing*, and *utilities*.[263] Medicare, Medicaid, and traditional health insurance plans do not provide reimbursement for congregate care services, and much of the revenue for these facilities comes from *out-of-pocket* payments.[264]

PAYOR MIX

The percentage mix of different payors representing the patient population served by a given provider.

Essentials of Health Care Finance, *6th ed., by William O. Cleverly and Andrew E. Cameron (Sudbury, MA: Jones and Bartlett, 2007), p. 106.*

[262] Robert Mollica, Ari Houser, and Kathleen Ujvari, "Assisted Living and Residential Care in the States in 2010," AARP Public Policy Institute, April 2012, p. 4; Alison Sahoo, "Long-Term Care Market," Kalorama Information, March 2012, pp. 183 and 185; "Need To Know: Single White Female Remains Typical Resident," *Senior Living Executive* (July/August 2012): 6.

[263] David Kyllo, "Assisted Living Properties," National Fire Protection Association, July 21, 2010.

[264] Alison Sahoo, "Long-Term Care Market," Kalorama Information, March 2012, p. 186.

TABLE 11.25 Variables to Consider for Long-Term Care Expense Projections

Type of Variable	Examples Impacting Long-Term Care
Changes in the Regulatory Environment	Changes to Safety Protocols
Changes in the Reimbursement Environment	Changes in Covered Services
Changes in the Competitive Environment	Lower Workforce Turnover
Changes in Technology	Acquisition of New Technology
Changes in Demand for Services	Changes in Capital Expenditures to Meet Demand Shifts
Changes in Rivalry and Market Share	Changes in Awareness of Services, Joint-PR Efforts
Changes in Suppliers	JIT Inventories, GPOs

11.2.6.5 Operating Expense *Fixed costs* consist of *certain labor expenses*, as well as *property taxes*, *insurance*, *utilities*, and other occupancy-related expenses, and are proportionately more significant for long-term care enterprises. Accordingly, healthcare *utilization rates* (i.e., *occupancy rates*) have a significant effect on the *value* of *long-term care enterprises*, as they affect the potential for achieving *economies of scale* that allow for the opportunity to *distribute those fixed costs* over a *wider patient* and *revenue* base in order to *reduce per-patient expense*s and realize *greater profit margins*. Of note is that since *assisted living facilities* are regulated by state governments, operators tend to concentrate their ownership of *multiple facilities* within a handful of states or regions, which enhances their ability to achieve economies of scope and scale that make up a significant value driver.[265]

In addition to the variables described in Table 11.24, the projected cash flow for the subject long-term care enterprise may be affected by the variables described in Table 11.25.

In 2010, 25 percent of freestanding SNFs had Medicare margins of approximately 27 percent or higher, with 25 percent having Medicare margins of 9 percent or less. Since 2005, SNF Medicare margins have increased, as set forth in Table 11.26.

11.2.6.6 Capital Structure SNFs have varying capital structures based on the SNF's configuration of *real and tangible property*, *ownership and governance structure*, *location*, and *size*.[266] In addition, SNFs can operate as an

[265] Ibid., p. 177.

[266] Risk Management Association, *Annual Statement Studies: Financial Ratio Benchmarks*, 2012, p. 1477.

TABLE 11.26 Medicare Margins for Freestanding SNFs, 2004 to 2010

Type of SNF	2004	2005	2006	2007	2008	2009	2010
All	13.7%	13.1%	13.3%	14.7%	16.6%	18.0%	18.5%
Urban	13.2%	12.6%	13.1%	14.5%	16.3%	17.9%	18.5%
Rural	16.1%	15.2%	14.3%	15.5%	18.0%	18.7%	18.4%
For-Profit	16.1%	15.2%	15.7%	17.2%	19.1%	20.2%	20.7%
Not-for-Profit	3.5%	4.5%	3.5%	4.1%	6.9%	9.6%	9.5%

TABLE 11.27 Leverage Ratios for Nursing and Personal Care Enterprises (SIC 805)

	2011	2012
Debt/Market Value Equity	61.00%	102.44%
Liquidity	1.04%	1.12%
Cost of Debt	4.60%	7.23%
Cost of Equity	14.94%	13.61%

Ibbotson Cost of Capital Data is only available for SIC 8011 for 2010; all other capital analyses will contain a four-year trend from 2009 to 2012. *Ibbotson Cost of Capital Yearbook* (Chicago: Morningstar editions 2012, 2011, 2010, and 2009).

For illustration purposes, various metrics describing the *capital structure* of long-term care enterprises, which operate within SIC Code 805, are presented in Table 11.27.

Real Estate Investment Trust (REIT)

Any corporation, trust, or association that acts as an investment agent specializing in real estate and real estate mortgages.

11.2.6.7 Suppliers SNFs typically purchase two primary categories of supplies: (1) *medical supplies*, for example, blood testing tools, stethoscopes, and thermometers, as well as other diagnostic supplies; and (2) *basic household supplies*, such as cleaning supplies, paper towels, and toilet seats.[270] Similar to hospitals, SNFs and *assisted living facilities* may join *group purchasing organizations* (GPOs) to help reduce supply costs.[271] SNFs, *assisted living facilities*, and *congregate care facilities* all provide meal services to their residents, which may either be outsourced or prepared in house.[272] An assessment of the *requisite* supplies necessary for the *provision of services* in long-term care facilities is a *due diligence consideration* regarding the determination of the *capacity* of the enterprise.

11.2.6.8 Market Rivalries and Competitors Competition among *long-term care enterprises* for *patients* is anticipated to increase, with a resulting impact on *pricing* and *revenue*, while the reimbursement from Medicaid and private patient sources is facing significant pressure. These circumstances have a continuing impact on the mix of *owners* and *investors* for long-term care facilities. In 2011, approximately 70 percent of SNFs were *proprietary facilities*, 25 percent were *nonprofit organizations*, and the remaining 5 percent were owned by *governmental entities*.[273] In addition, approximately 94 percent of all SNFs were *freestanding nursing homes*, while the other 6 percent were affiliated with, or under the administrative control of, an *acute care hospital* or *health system*.[274]

The market for *nursing homes* continues to be dominated by *large nursing home chains*, which, as of 2010, included (1) *HCR ManorCare*, (2) *Golden Living*, (3) *Life Care Centers of America*, (4) *Kindred Healthcare*, (5) *Genesis HealthCare*, and (6) *Sun Healthcare Group*.[275] In addition, real estate investment trusts (REITs) have also become a significant proportion of SNF real property buyers.[276] Typically, many REITs will purchase the *real property* from the *nursing home operator*, which will then, in turn, lease the real property to the nursing home operator.[277] Most of

PORTER'S FIVE FORCES OF COMPETITION

Competitive strategy devised by Harvard's Michael D. Porter. Includes (1) potential entrants, (2) supplies, (3) buyers, (4) the threat of substitutes, and (5) rivalry among existing competitors.

the *national nursing home chains* continually engage in the process of *buying* and *selling* nursing homes, as well as the real property interest related thereto.[278]

The *assisted living market* is *large* and highly *fragmented*.[279] As of 2012, the largest assisted living company in the United States, *Brookdale Senior Living*, operated 430 assisted living communities.[280] Other major for-profit assisted living chains include (1) *Emertis*, (2) *Five Star Quality Care*, and (3) *Sunrise Senior Living*, as well as not-for-profit entities, for example, *Evangelical Lutheran Good Samaritan Society.*[281] The distribution of ownership types in the assisted living market is set forth in Table 11.28

The relative size of assisted living facilities is an important value driver. An illustration of the assisted living market, as classified by the AARP, is set forth in Exhibit 11.5.[282]

Merger and acquisition activity related to *long-term care enterprises* is dominated by *national chains*, although private equity firms also make up a small segment of the transactional market.[283] As shown in Table 11.23, from

[278] Irving Levin Associates, *SeniorCare Investor* 24, no. 3 (April 2012): 2 and 9–10.

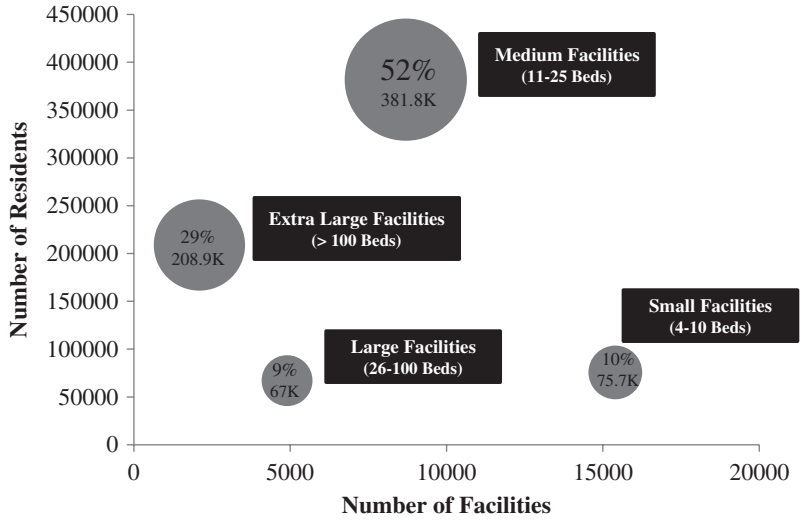

EXHIBIT 11.5 Facility Size Compared to Number of Residents in 2010
"Assisted Living and Residential Care in the States in 2010," by Robert Mollica and Ari Houser, AARP, The Commonwealth Fund, July 2012, p. 4; "Residential Care Facilities: A Key Sector in the Spectrum of Long-term Care Providers in the United States," by Eunice Park-Lee, et al., Centers for Disease Control and Prevention National Center for Health Statistics, NCHS Data Brief, No. 78, December 2011, p. 1.

January 1, 2011, to June 30, 2012, approximately 63 percent of the reported acquisitions of *assisted living enterprises* involved *for-profit operators* as the *purchaser* and represented 85 percent of the *total value exchanged* in these reported transactions.[284] While *assisted living facilities* may be acquired by *national*, *regional*, and *mom-and-pop operators*, in 2012, *national operators* accounted for 72 percent of the *value exchanged* in *assisted living enterprise acquisitions*.[285]

As of 2010, there were approximately 19,002 congregate care facilities in the United States, of which nearly half were sectarian. Specifically, of those with sectarian affiliations, 21.1 percent were Lutheran,

TABLE 11.29 Analysis of Assisted Living Transactions

	Number of Acquisitions	Percent of Acquisitions	Value of Acquisitions	Percent of Value
Ownership Type				
For-Profit	36	63.16%	$1,077,121,135	85.29%
Not-for-Profit	4	7.02%	$ 48,350,000	3.83%
Government	0	0.00%	$ 0	0.00%
Not Disclosed	17	29.82%	$ 137,387,500	10.88%
Total	57	100.00%	$1,262,858,635	100.00%
Enterprise Scope				
National	16	28.07%	$ 913,666,000	72.35%
Regional	19	33.33%	$ 102,514,000	8.12%
Mom-and-Pop	10	17.54%	$ 126,966,135	10.05%
Not Disclosed	12	21.05%	$ 119,712,500	9.48%
Total	57	10.00%	$1,262,858,635	100.00%

Author's compilation from *The Health Care M&A Report*, Irving Levin Associates, Inc., Norwalk, CT [First Quarter 2011; Second Quarter 2011; Third Quarter 2011; Fourth Quarter 2011; First Quarter 2012; and Second Quarter 2012].

17.6 percent were Methodist, 13.8 percent were Presbyterian, and 12.8 percent were Roman Catholic. In addition, 82 percent were not-for-profit, and the majority were affiliated with a congregate care chain.[286] The top five congregate care providers as of January 1, 2012, were: (1) *Holiday Retirement*, (2) *Brookdale Senior Living*, (3) *Erickson Living Management*, (4) *Life Care Services, LLC*, and (5) *Five Star Senior Living*.[287]

11.2.6.9 Subject Entity Nonsystematic Risk As discussed earlier, a *discount rate*, by which the *expected future stream of economic benefit* to be derived from ownership of a subject interest is *discounted* to *present value*, is selected

[286] CCRC Task Force, "Today's Continuing Care Retirement Community (CCRC)," American Senior Housing Association, July 2010, pp. 5–6.

[287] Anya Martin, "2012 Largest Senior Living Providers," *Senior Living Executive*, March/April 2012, p. 14.

by the valuator to represent the *expected risk-adjusted rate of return* that a universe of typical buyers and investors would require to invest in the subject property interest being *valued*, given both the *systematic risk* of the market and the *unsystematic risk* of the subject enterprise.[288] Specific risk factors to consider may include:

1. The stability of certain operational aspects of a long-term care enterprise;
2. The inherent uncertainty regarding the ability of a long-term care enterprise to attain certain performance assumptions;
3. Competition from multiple sources for long-term care services;
4. The ability of a long-term care enterprise to continue to roll over the current portion of its interest-bearing debt;
5. The reimbursement risk associated with low Medicaid reimbursements;
6. The ability to maintain a profitable payor mix;
7. Issues maintaining labor supply; and
8. A long-term care enterprise's high utilization of debt relative to the industry.

11.3 TYPICAL VALUATION CONSIDERATIONS

As discussed in Section 8.1, "Valuation Methodology," in Chapter 8, "Valuation Approaches and Methods," there are three general approaches to *value*: (1) the *income approach*, (2) the *market approach*, and (3) the *asset/cost approach*, each with its own specific valuation methods. Each of these approaches should be considered for each valuation assignment, and, if possible, multiple approaches and methods should be used.

Accordingly, for any inpatient enterprise, the choice of a *valuation methodology* depends primarily on the *purpose* of the valuation report and the specific *characteristics* of the subject enterprise, as well as on the *availability* and *reliability* of data to support the method. In addition, the specific value drivers for each enterprise (discussed earlier) will augment the selected methodology through which the chosen valuation technique is completed.

[288] Also discussed in Section 8.4, "Discounts and Premiums," in Chapter 8, "Valuation Approaches and Methods."

Discussed later are several specific valuation concerns that are presented by the various valuation methods and techniques related to the valuation of an inpatient enterprises.

As discussed in detail in Section 8.1.1.5, "Pro-Forma Income Statements," financial statements for inpatient enterprises are most often prepared to reflect the *specific needs of the inpatient enterprise's management*, whether for *operational* or *tax posture* reasons. Accordingly, the valuation analyst should analyze and consider adjustments to the subject enterprise's *historical financial statements*, for the purpose of arriving at an indication of a "*normalized*" level of income and an *economic basis* for reporting of assets, in contrast to *cost basis* reporting. *Normalizing and control level adjustments*, that is, adjustments that can be made by the party/interest that exercises "*control*" over the enterprise, may be made to reflect the *true economic status* of the inpatient enterprise. These types of adjustments include those set forth in Table 11.30.

Once *normalized* and *restated*, these historical financial statements form the underlying basis for further analysis used in the valuation of the subject enterprise, by comparing them against the performance of *similar companies* (reported in industry surveys and public filings) to assist in measuring the *relative risk of investment* in the subject enterprise as compared to investments in other companies operating within the same or a similar industry. This analysis is often called "*benchmarking*" and may include the metrics set forth in Table 11.31.

Careful consideration should be given during a *benchmarking* analysis as to how the inpatient enterprise is *reimbursed*, as different *payment structures* incentivize different *patient care aspects*. For example, the portion of hospital revenue based on a *per diem rate* incentivizes the maximization of the enterprise's *occupancy rate* and *length of stay*, while the portion of hospitals revenue based on reimbursement on a *case rate* or *per DRG basis* incentivizes the maximization of *patient turnover*; similarly, the portion of a hospital's revenue that is based on reimbursement on a *cost-plus margin basis* incentivizes the maximization of *cost*. Further, the valuation analyst should carefully consider any *horizontal synergies* that may be created from owning multiple facilities that are located in a specified *geographic region*, based on the *span of control*, *attributes*, and *capabilities* of the hospital system's management (see Section 14.4.2.2.4 for a discussion of *depth of management*). Sources for *industry benchmarking* related to inpatient enterprises are set forth in Table 11.32.

TABLE 11.30 Examples of Normalizing and Controlling Adjustments for Inpatient Enterprises

Income Statement Normalizing Adjustments	Balance Sheet Normalizing Adjustments	Income Statement Control Level Adjustments	Balance Sheet Control Level Adjustments
Gains/Losses from Nonrecurring Events	Accounts Receivable	Administrative and Clinical Expense (e.g., rent)	Related Party Loans
Revenue, Expense (timing), and Bad Debt Expense Recognition	Accounts Payable	Management Fees	Loans to Shareholders
Taxes	Tangible Personal Property	Travel Expenses	Related Party Accounts Receivable
Depreciation	Real Property	Contracted Housekeeping and Dietary Services	Related Party Accounts Payable
Inter-Entity Revenue/ Expenses	Accrued Expenses	Related Party Lease Expenses	Long-Term Debt
Joint Expenses/Revenue Allocation	Accrued Income	Physician Services Agreement Fees	Short-Term Debt and Accounts Payable
Diagnostic Testing and Imaging Expenses	Capital Lease Recognition	Professional Development Expense	Cost and Weight of Debt
Pharmaceutical Expenses	Nonoperating Assets (e.g., endowments)	Billing Expenses	Cost and Weight of Equity

TABLE 11.31 Variables to Consider for Benchmarking Inpatient Enterprises

Profitability	Liquidity	Operating Efficiency	Leverage	Quality	Other Ratios
Operating Profit Margin	Current Ratio	Days in Accounts Receivable	Debt to Equity Ratio	Mortality and Morbidity Rates	Revenue per Bed Day
EBITDA Margin	Quick Ratio	Inventory Turnover	Interest-Bearing Debt/Assets	Readmission Rates	Average Length of Stay
EBITDAR Margin	Working Capital to Revenue	Net Asset Turnover	Endowment to Debt	Percentage of Procedures with Complications	Beds per Square Foot
Free Cash Flow to Equity Margin	Interest Coverage Ratio	Net Property and Equipment to Revenue	Altman Z-score	Hospital Acquired Infection Rate	Capital Expenditures to Revenue
Free Cash Flow to Firm Margin	Days of Working Capital	Revenue to Fixed Costs	Interest Coverage Ratio	Specialist Staff Mix	Depreciation to Revenue
Return on Sales	Working Capital, Excluding Interest-Bearing Debt	Patients per Hospitalist	Degree of Financial Leverage	Patient Ratings of Physicians' Communication	Encounters per Physician
Medical Supplies per Adjusted Bed Day	Cash to Current Assets	Bad Debt Expense to Revenue	Degree of Total Leverage	Patient Survey Ratings of Health Promotion and Education	DRG Case Mix
Salary/Benefits Expenses	Cash to Current Liabilities	Revenue per Square Foot	Fixed Assets to Equity	Patient Ratings of Medical Staff	Percentage of Medicaid Revenue

TABLE 11.32 Sources for Inpatient Enterprise Benchmarking Data

Source	Description
BizMiner Industry Financial Profiles	Based on annual income tax returns, U.S. Census data, U.S. Bureau of Labor data, commercial real estate surveys, credit reporting agencies, and business directories
Integra Industry Reports	Based on annual income tax returns, U.S. Department of Labor data, the National Company Database of Financial Product Usage and Demand, the Industry Geographic Analysis Database, U.S. Bureau of Labor Statistics, and the Purchase Opportunity Profiles Database
IRS Corporation Source Book of Statistics of Income	Published by the Internal Revenue Service, based on annual tax returns
Risk Management Association (RMA) Annual Statement Studies	Based on financial statements submitted to financial institutions across the United States

HORIZONTAL INTEGRATION

Financial integration that requires collaboration among rivals.

Dictionary of Health Insurance and Managed Care, *by Edward Marcinko (New York: Springer, 2006), p. 144.*

VERTICAL INTEGRATION

Financial integration that requires collaboration among the various providers along a continuum of care.

Dictionary of Health Insurance and Managed Care, *by Edward Marcinko (New York: Springer, 2006), p. 293.*

The sources listed in Table 11.32 and other *sources of data* useful for benchmarking are included in the *Key Sources*. For a general discussion regarding the utilization of *industry benchmarking* in performing a *valuation analysis*, see Chapter 8, "Valuation Approaches and Methods."

There are several useful sources of information as to the performance of inpatient enterprises, including *The SeniorCare Investor Newsletter*, published by Irving Levin Associates, Inc., which tracks *mergers*, *acquisitions*, *IPOs*, *bankruptcies*, and "*corporate shake-ups*" within the *long-term care market*, including *nursing home* and *assisted living companies*, *retirement communities*, *REITs*, and *home health care*, as well as *corporate earnings*, *key financial indicators*, and *stock forecasts*. Irving Levin Associates, Inc., also publishes the *Healthcare M&A Information Source*, which provides information related to transactions of healthcare enterprises, including hospitals and long-term care facilities.

Among the pertinent considerations regarding the valuation of an inpatient enterprise using an *income approach–based method* are those illustrated in Table 11.33.

TABLE 11.33 Typical Considerations in Using Income Approach–Based Methods

Pertinent Consideration	Description
Projection of Capital Expenditures	■ *Depreciation* and *capital expenditures* are typically of *greater* magnitude for *inpatient enterprises*, due to the significant *investment* in *facilities* and *equipment* required to operate an *inpatient enterprise*.
Projected Cost of Debt and Interest Expenses (Equity Basis of Value Only)	■ *Historical interest expense* may be a useful indicator of the *future expected interest expense*. ■ The terms, including interest costs for existing debt, are determined based on the *facts and circumstances* extant at the time the debt was issued. ■ Any changes in those *facts and circumstances* may affect the efficacy of the *historical interest expense* for projection purposes. ■ The factors that may affect the interest expense for an inpatient enterprise include: (1) The *nature* and *scope* of the inpatient enterprise's operations; (2) The current level of debt held by the inpatient enterprise; and (3) The availability of capital to the subject hospital within debt markets.
Selection of Methodologies	■ The selection of a particular method will depend on the *scope* and *nature* of the valuation assignment undertaken. ■ A prerequisite is the *existence of a positive net cash flow* accruing to the owners of the enterprise, which can be capitalized to arrive at an *indication of value*. ■ The *capitalized positive net cash flow* for the inpatient enterprise should also be *sufficient in magnitude* to support the investment in the *tangible* and *intangible* assets that make up the *subject inpatient enterprise*.

The application of a *market approach–based methodology* requires the valuation analyst to use market data related to companies or transactions similar to the subject enterprise. Table 11.34 illustrates some of the *pertinent facts and considerations* that a valuation analyst should review in applying the *market approach–based methodologies*.

TABLE 11.34 Typical Considerations in Using Market Approach–Based Methods

Pertinent Considerations	Description
Availability of Data (Guideline Transaction/Merged and Acquired Method)	▪ The *Guideline Transaction/Merged & Acquired Method* requires the use of reliable transaction data from a sufficient number of reliably reported transactions of enterprises offering: (1) Similar services to those provided by the subject inpatient enterprise; (2) Occurring within a reasonable historical time frame, representing similar economic realities as of the date of the valuation; and (3) With sufficiently specific and validly reported data.
Availability of Data (Guideline Public Company Method)	▪ The *Guideline Public Company Method* requires the use of a *sufficient* number of *freely traded (public) companies*, offering *similar services* to those provided by the subject hospital's enterprise as of the *date of the valuation*. ▪ The use of this method in the valuation of inpatient enterprises is common and is *recommended* in engagements where *sufficiently similar guideline public companies* exist. ▪ To facilitate the *comparability* of the subject enterprise and the *guideline inpatient enterprises*, the valuation analyst should employ *common sized multiples*, for example, price to revenue or price to EBITDA.
Income-Based Multiples	(1) Price to Net Income; (2) Price to Operating Income; (3) Price to EBITDA; (4) Price to EBITDAR; (5) Price to Revenue; (6) Price to Free Cash Flow to the Firm; (7) Price to Free Cash Flow to Equity.
Asset-Based Multiples	(1) Price to Book Value; (2) Price to Bed; (3) Price to Operating Room; (4) Price to Employee; (5) Price to Square Foot; (6) Price to Patient Bed Day; (7) Price to Admitting Physicians; (8) Price to Inpatient Admissions.

(*continued*)

TABLE 11.34 Typical Considerations in Using Market Approach–Based Methods (*continued*)

Pertinent Considerations	Description
Size Adjustment	■ *Pricing multiples* derived from the data of larger publicly traded companies can distort the indications of the value of smaller companies (if not appropriately adjusted). ■ The valuation analyst may choose to make adjustments to the utilized multiples in an effort to mitigate the impact of these distortions. (See Chapter 8, "Valuation Approaches and Methods")
Adjustment to Reflect Real Property Expenses	■ It is often the case that the value of an inpatient enterprise's real property, e.g., *buildings and land*, comprise a significant proportion of the inpatient enterprise's overall value. ■ Not all inpatient enterprises *own* the real property within which they operate, i.e., the real property may be *leased* from a *third party.* ■ The *guideline inpatient enterprises*, and/or *market transactions*, selected should reflect the same position, in regards to real property ownership, as the subject inpatient enterprise or, in the alternative, that adjustments are made, as necessary, to accommodate any differences in the treatment of *real property.*

In considering an *asset/cost approach–based methodology*, the valuation analyst should review the *pertinent facts and circumstances* particular to the use of these methods. An illustration of some of these considerations is presented in Table 11.35.

11.3.1 Other Pertinent Valuation Considerations

In addition to the typical valuation considerations described earlier, the valuation of inpatient enterprises should also include specific considerations of the *type*, *nature,* and *scope* of the subject enterprise being appraised. Table 11.36 illustrates some of the consideration specific to the valuation of hospitals.

There also exist considerations unique to the valuation of long-term care facilities that are distinct from those of hospitals. An illustration of some of these considerations can be found in Table 11.37.

TABLE 11.35 Other Pertinent Considerations in Using an Asset/Cost-Based Approach

Pertinent Considerations	Description
Selection of Methodology	▪ May be applicable if after application of the *normalizing adjustments* to the subject inpatient enterprise's *revenues* and *expenses,* a *negative net cash flow* (or an *insufficiently positive net cash flow*) results. ▪ Indicates that the enterprise is worth more *dead* than *alive*, that is, the assets are worth more *sold separately* than if they were utilized in the *continued operation* of the enterprise or *the whole is lesser than the sum of its parts.*" ▪ Under the principle of *highest and best use*, to maximize the value of the enterprise to its owners, the assets should be transacted at the *sum* of their *individual asset values*.
Types of Tangible Assets Typically Found in Inpatient Enterprises	(1) Cash; (2) Accounts Receivable; (3) Prepaid Expenses; (4) Medical Equipment; (5) Office Equipment and Furniture. (6) Buildings; (7) Leasehold Improvements; (8) Land; (9) Construction in Progress.
Types of Intangible Assets Typically Found in Inpatient Enterprises	(1) Leasehold Interests; (2) Easements; (3) Building Permits; (4) Zoning Waivers; (5) Payor Contracts; (6) Managed Care Agreements; (7) Provider Service Agreements; (8) HMO Enrollment Lists; (9) Custodial Rights to Patient Medical Records; (10) Trained and Assembled Workforce in Place; (11) Employment Contracts; (12) Union Agreements; (13) Patients; (14) Copyrights; (15) Trademarks; (16) Royalty Agreements; (17) Trade Secrets; (18) Management Protocols and Procedures; (19) Treatment Plans/Care Mapping; (20) Management Information Systems; (21) ACO Contracts; (22) Organizational Documents; (23) Noncompete Covenants; (24) Vendor Contracts; (25) Supplier Contracts; (26) GPO Contracts; (27) Certificate of Need; (28) Brand Name.

TABLE 11.36 Other Pertinent Considerations in the Valuation of Hospitals

Pertinent Considerations	Description
Trauma Certification Level	▪ Affects the procedural mix that a hospital is capable of performing. ▪ The *existence* and *maintenance* is important to projecting the *amount* and *types* of procedures that will be performed at the hospital in the future.
General vs. Specialty Hospital	▪ *Specialty hospitals* will operate with a lower *overhead cost burden* than traditional *general hospitals*. ▪ The *gains to specialization* realized in *specialty hospitals* may result from: (1) *Efficiency gains* from performing a *high volume* of a *limited set of procedures*; and (2) The *exclusion* of *nonprofitable departments* (such as emergency departments).
For Profit vs. Not-for-Profit	▪ *Not-for-profit/tax-exempt* enterprises are motivated by their *stated charitable mission*. ▪ *For-profit* enterprises are motivated by the *profit maximization* motive. ▪ These differences impact the hospital's: (1) *scope of services* offered; (2) *payor mix*; and (3) *level of indigent care* provided.
Critical Access Hospital Designation	▪ Medicare Reimbursed on a *cost plus margin basis*. ▪ Payments equal to 101% of the *reasonable cost* of providing the service. ▪ *Expands access* to healthcare services by supporting *rural hospitals*.
Sole Community Hospital Designation	▪ *Enhanced Medicare reimbursement* to hospitals designated as *sole community hospitals*. ▪ Payments based on the historical hospital specific rate for the services provided. ▪ *Expands healthcare access* in *rural communities*, similar to the *critical access hospital designation*.
Governance	▪ *Sectarian or nonsectarian*. ▪ *Affects scope and nature of services provided*. ▪ The valuation analyst should consider whether the historical operating expense structure is indicative of the anticipated future expense burden.

TABLE 11.37 Other Pertinent Considerations in the Valuation of Long-Term Care Enterprises

Pertinent Considerations	Description
Occupancy Rates	■ The ability to distribute these fixed expenses over multiple revenue sources (i.e., residents) may greatly improve a long-term care facility's profitability. ■ Consideration should be given to the historical occupancy rates for the subject long-term care facility, as well as the future anticipated occupancy rates.
Payor Mix	■ A significant portion of revenue for long-term care facilities is derived from Medicaid payments, which are typically lower than other sources of revenue. ■ The portion of revenue derived from commercial insurance and other private payors may have a substantial impact on the projection of future reimbursement yields for the subject enterprise.
Ancillary Services and Technical Component Service Lines	■ Long-term care facilities may include the provision of ancillary services, such as physical therapy services. ■ Augments revenue generated from the residents. ■ Consideration should be given to isolating and valuing, *separately and distinctly*, any *significant ancillary services and technical component service lines*.
Membership in a Long-Term Care System	■ There may exist economies of scale available to long-term care facilities that are part of a larger healthcare system. ■ Consideration should be given to whether these economies of scale would be expected by the universe of typical buyers, sellers, and investors in the subject enterprise.

11.4 CONCLUSION

As mentioned in the introduction to this book, the continued rise in healthcare expenditures, the growing segment of the U.S. population that is uninsured or underinsured, and the increase in demand for care from the changing patient demographic of the aging baby boomer population are just a few of several catalysts that have led to the perception that the current

healthcare environment may be the "*perfect storm*" driving this new *era of reform*. Regardless of the perspective, it is clear that change is happening and will need to continue, to address these circumstances.

> *To meet the needs of the baby boom generation, clinical integration within hospital and health systems is critical to ensure that quality is at a high level, costs are reduced, and the standard of performance is consistent across all sites of care and among all physicians. . . . New organizational models are being created to better align the interests of physicians and hospitals and to increase accountability for quality, cost, and service. These new models will help repair our broken system and help hospital leaders lead with quality as they work with physicians to bend the cost curve.*[289]

In the wake of the June 2012 U.S. Supreme Court's ACA decision, which cemented this new *era of healthcare reform, inpatient enterprises*, including *hospitals* and *long-term care enterprises*, will need to accelerate their integration with *physicians* and other *outpatient enterprises* in order to develop *new models* of *cooperation* and *collaboration* among providers and increase the *efficiency*, *access to*, and *quality* of healthcare services delivered in the United States. In the 1990s, hospitals took on the role of *integrators* and *coordinators of care* when the "*covered life*" became the focus of *cost containment* strategies under the regime of *managed care*, which attempted to hold providers *accountable* for providing care to a population through *clinical practice standardization*, *selective contracting*, *low-cost settings*, *reduced discretionary hospital admissions*, and *effective use of staff*.[290] In that same manner, the role of hospitals is again evolving to that of "*population health manager*," as providers seek to navigate to an *accountable care* delivery system, that is, the latest version in a dialogue that has been progressing for several decades as to how to *manage* the *rising cost* of healthcare in a manner that addresses the dynamics of both *cost* and *quality*. The ability of hospitals to *cost-effectively* predict *patient outcomes*, as these enterprises accept greater *performance* and *service utilization risk*, will focus on maximizing the *number* of *patient lives covered*, rather than the *units of care* provided.[291]

[291] Healthcare Financial Management Association, "Value in Health Care: Current State and Future Directions," June 2011, p. 35.

FOUR PILLARS OF HEALTHCARE ENTERPRISES

The four elements of the healthcare industry: reimbursement, regulatory, competition, and technologies.

The concept of the "Four Pillars" was developed by the book's author, Robert James Cimasi, MHA, ASA, FRICS, MCBA, AVA, CM&AA.

The challenges facing *inpatient enterprises*, in relation to their *economic value*, is described by the following:

> *The key questions for the new value equation can be articulated as this: How does a healthcare system produce a certain amount of healthcare at a stated and consistent quality, and provide that care to a population at a predetermined price? This is a classic manufacturing or production problem. Most healthcare organizations have never asked themselves this question, let alone tried to answer it. The solution requires changing the structure of delivery from its current orientation of "one physician taking care of one patient"—a system that has endured for decades if not centuries—to a team- and population based approach, which relies on the collection and use of accurate data, hind-end analytical techniques, and the constant measurement of cost and quality outcomes.*[292]

These *new integrated models of care delivery* and *provider affiliations* will interject new forms of volatility into the U.S. healthcare delivery system. In turn, this volatility will likely lead to the perception of greater investor risk, having a turbulent effect on existing traditional providers, and will most likely encourage a flight toward the perceived safety of size through consolidation, driving the volume, pace, and intensity of deals in the *healthcare inpatient enterprises transactional marketplace*. Within this context, the valuation of the various *inpatient enterprises* involved in these new affiliations and integration activities will necessarily involve a careful consideration of the *value drivers* that may be attributed to the subject enterprise within the construct of the *Four Pillars of Healthcare Valuation*, that is, *regulatory, reimbursement, competition*, and *technology.*

The Health Care M&A Report (Second Quarter 2012), Norwalk, CT: Irving Levin Associates, 2012

United States Department of Health and Human Services (HHS)

"The Department of Health and Human Services (HHS) is the United States government's principal agency for protecting the health of all Americans and providing essential human services." HHS has 11 agencies, among which are the Centers for Medicare and Medicaid Services (CMS), Indian Health Services (IHS), the Office of the Inspector General (OIG), and the National Institutes of Health (NIH).

"About HHS," Department of Health and Human Services, http://www.hhs.gov/about/ (accessed October 6, 2009)

http://www.hhs.gov/

Centers for Medicare and Medicaid Services (CMS)

The Centers for Medicare and Medicaid Services administer the Medicare, Medicaid, and CHIP programs. CMS is responsible for setting reimbursement rates under Medicare and Medicaid. The CMS website contains important information for beneficiaries of these programs, as well as guidelines for providers.

"Mission, Vision & Goals: Overview," Centers for Medicare and Medicaid Services, U.S. Department of Health and Human Services, http://www.cms.hhs.gov/MissionVisionGoals/ (accessed September 22, 2009)

http://www.cms.hhs.gov

United States Department of Health and Human Services (HHS) Office of Inspector General (OIG)

The Office of the Inspector General of the United States Department of Health and Human Services oversees all HHS programs in order to protect the integrity of the programs and the health and welfare of beneficiaries.

"Office of the Inspector General," U.S. Department of Health and Human Services, http://oig.hhs.gov/ (accessed September 22, 2009)

11.6 ACRONYMS

Acronym	Full Title
3PL	Third-Party Logistics
ACA	Patient Protection and Affordable Care Act
ADE	Adverse Drug Event
AHA	American Hospital Association
AHC	Academic Health Center
ALL	Acute Lymphoblastic Leukemia
AMA	American Medical Association
AMC	Academic Medical Hospital
AOA	American Osteopathic Association
APC	Ambulatory Payment Classification
ASC	Ambulatory Surgery Center

ASHA	American Surgical Hospital Association
BBA	Balanced Budget Act of 1997
BPCA	Best Pharmaceuticals for Children Act
CAH	Critical Access Hospital
CF	Conversion Factor
CMS	Centers for Medicare and Medicaid Services
CON	Certificate of Need
CPOE	Computerized Physician Order Entry
CPT	Current Procedural Terminology
DME	Durable Medical Equipment
DNVHC	Det Norske Veritas Healthcare, Inc.
DoD	Department of Defense
DOL	Department of Labor
DRG	Diagnosis-Related Group
EHR	Electronic Health Record
FDA	Food and Drug Administration
FDASIA	Food and Drug Administration Safety and Innovation Act
FTC	Federal Trade Commission
GAO	U.S. Government Accountability Office
GDSN	Global Data Synchronization Network
GPO	Group Purchasing Organization
HCFA	Health Care Financing Administration
HHS	Department of Health and Human Services
HIPPS	Hospital Inpatient Prospective Payment System
HIT	Health Information Technology
HOPPS	Hospital Outpatient Prospective Payment System
ICU	Intensive Care Unit
IDS	Integrated Delivery System
IRS	Internal Revenue Service
IT	Information Technology
JIT	Just-in-Time
LOS	Length of Stay
LTACH	Long-Term and Acute Care Hospital
LTCH	Long-Term Care Hospital
MCO	Managed Care Organization
MDC	Major Diagnostic Category
MHPA	Mental Health Parity Act
MHPAEA	Mental Health Parity and Addiction Equity Act
MMA	Medicare Prescription Drug, Modernization and Improvement Act
MMIS	Materials Management Information System
NCQA	National Committee for Quality Assurance

NICU	Neonatal Intensive Care Unit
NIH	National Institutes of Health
NRP	National Research Program
OBRA	Omnibus Budget Reconciliation Act of 1987
OIG	Office of the Inspector General
PCP	Primary Care Physician
PDU	Product Data Utility
PHO	Physician Hospital Organization
PPACA	Patient Protection and Affordable Care Act
PPI	Physician Preference Item
PPS	Prospective Payment System
PREA	Pediatric Research Equity Act
RFID	Radio-Frequency Identification
RN	Registered Nurse
RPRI	Rural Policy Research Institute
SCH	Sole Community Hospital
SIMS	Supply Information Management System
SKU	Stock Keeping Unit
SNF	Skilled Nursing Facility
SSA	Social Security Act
TCO	Total Cost of Ownership
TJC	The Joint Commission

CHAPTER 12

The Valuation of Outpatient Enterprises

As demand for healthcare services continues to grow, *the site of service* at which these services are performed is experiencing a simultaneous transformation from the *inpatient* (e.g., hospital) setting to the *outpatient* setting.[1] This transformation is being driven by such factors as

[1]Harry A. Sultz and Kristina M. Young, "Hospitals: Origin, Organization, and Performance," in *Health Care USA: Understanding its Organization and Delivery*, 6th ed. (Boston: Jones and Bartlett Publishers, 2009), pp. 75, 103; "Ambulatory Care," in Ibid., pp. 121–124.

(1) *technological advancements*, (2) an increasingly *consumer-driven* and *convenience-driven* healthcare delivery environment, (3) *pressure from payors* and *potent demand*, and (4) the *entrance* and *diversification* of new and different *outpatient enterprises* (see Chapter 4, "Competition," and Chapter 5, "Technology"). Each of the outpatient enterprises discussed in this chapter (e.g., *physician professional practices*, *ambulatory surgery centers* (ASC), *diagnostic imaging centers*), whether affiliated with a larger hospital or healthcare system or operated as an independent freestanding facility, are influenced by certain market forces related to the *four pillars of healthcare valuation*, that is, (1) *regulatory*, (2) *reimbursement*, (3) *competition*, and (4) *technology*—each of which relates to almost all aspects of the U.S. healthcare delivery system. Each *outpatient enterprise* has unique *value drivers* that affect the *typical valuation approaches, methods, and techniques* that are often used in determining the *value* of these enterprises.

12.1 OVERVIEW OF VALUATION CONSIDERATIONS PERTINENT TO OUTPATIENT ENTERPRISES

Similar to that of other healthcare enterprises, the appraisal of outpatient enterprises should consider each of the three general valuation approaches, that is, the *income approach*, the *market approach*, and the *asset/cost approach*, each of which has its own specific valuation methods and techniques. Also, to assist in measuring the *relative risk of investment* in an outpatient enterprise, each valuation assignment should include a *benchmarking analysis*. "*Benchmarking*" is an analytical tool used to compare the subject enterprise's "*normalized*" financial statements against the performance of *similar companies* (reported in industry surveys and public filings), and may include the metrics set forth in Table 12.1.

Examples of various sources to locate outpatient enterprise benchmarking data are set forth in Table 12.2.

VALUATION APPROACHES

There are three main valuation approaches: (1) the income approach, (2) the market approach, and (3) the asset/cost approach, each with its own specific valuation methods.

TABLE 12.1 Variables to Consider for Benchmarking Outpatient Enterprises

Profitability	Liquidity	Operating Efficiency	Leverage	Quality	Other Ratios
Operating Profit Margin	Current Ratio	Days in Accounts Receivable	Debt-to-Equity Ratio	Mortality	Revenue per Outpatient Procedure
EBITDA Margin	Quick Ratio	Inventory Turnover	Interest-Bearing Debt/ Assets	Percentage of Procedures with Complications	Percentage of Medicaid Revenue
EBITDAR Margin	Working Capital to Revenue	Net Asset Turnover	Endowment to Debt	Patient Satisfaction Surveys	Percentage of Medicare Revenue
Free Cash Flow to Equity Margin	Days of Working Capital	Net Property and Equipment to Revenue	Altman Z-score	Percentage of Procedures Requiring Hospital Transfer	Capital Expenditures to Revenue
Free Cash Flow to Firm Margin	Working Capital Excluding Interest-Bearing Debt	Revenue to Fixed Costs	Interest Coverage Ratio	Patient Rating of Physician Communication	Depreciation to Revenue
Return on Sales	Endowment to Assets	Patients per FTE Provider	Degree of Operating Leverage	Patient Survey Rating of Health Promotion and Education	Encounters per Provider
Profit per Outpatient Procedure	Cash to Current Assets	Nonmedical Staff to Medical Staff Ratio	Degree of Financial Leverage	Patient Rating of Medical Staff	Case Mix
Return on Assets	Cash to Current Liabilities	Bad Debt Expense to Revenue	Degree of Total Leverage	Average Waiting Times	Revenue per Square Foot

TABLE 12.2 Sources for Outpatient Enterprise Benchmarking Data

Source	Description
BizMiner Industry Financial Profiles	Based on annual income tax returns, U.S. Census data, U.S. Bureau of Labor data, commercial real estate surveys, credit reporting agencies, and business directories.
Integra Industry Reports	Based on annual income tax returns, U.S. Department of Labor data, the National Company Database of Financial Product Usage and Demand, the Industry Geographic Analysis Database, U.S. Bureau of Labor Statistics, and the Purchase Opportunity Profiles Database.
IRS Corporation Source Book of Statistics of Income	Published by the Internal Revenue Service, based on annual tax returns.
Risk Management Association (RMA) Annual Statement Studies	Based on financial statements submitted to financial institutions across the United States.
MGMA Surveys	A comprehensive financial census of the MGMA membership designed to assist medical practice administrators in measuring and improving their organization's performance. Information is presented on revenue, staffing, operating costs, and other critical performance metrics for practices reporting at least three (3) full-time equivalent physicians.
SEC Filings	Publicly available financial data found in 10-Ks and 10-Qs.

"BizMiner Data and Sources," The Brandow Company, 2012, http://www.bizminer.com/resources/technical/our-data.php (accessed December 17, 2012); "MicroBilt's Integra Financial Benchmarking Data," by MicroBilt, 2012, http://www.microbilt.com/financial-benchmarking.aspx (accessed September 30, 2012); "SOI Tax Stats—Corporation Source Book," Internal Revenue Service, August 15, 2012, http://www.irs.gov/uac/SOI-Tax-Stats—-Corporation-Source-Book:—U.S.-Total-and-Sectors-Listing (accessed December 17, 2012); *2011–2012 Annual Statement Studies*, by Risk Management Association, 2012; "AHD.com Current Data Sources," American Hospital Directory, October 3, 2012, http://www.ahd.com/data_sources.html (accessed December 17, 2012).

For a detailed discussion regarding *benchmarking* in the healthcare industry, see Section 8.3.1, "Financial and Operational Benchmarking," in Chapter 8, "Valuation Approaches and Methods."

Pertinent considerations regarding the valuation of an outpatient enterprise using *income approach–based valuation methods* include those illustrated in Table 12.3, as well as those discussed in Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods."

The application of a *market approach–based methodology* requires the valuation analyst to use market data related to companies or transactions similar to the subject enterprise (see Section 8.1.2, "Market Approaches," in Chapter 8, "Valuation Approaches and Methods," for further discussion).

TABLE 12.3 Typical Valuation Considerations for Income Approach–Based Methods

Pertinent Consideration	Description
Projection of Revenue	Revenue projections should be based on sound, realistic assumptions regarding the future operating abilities of the subject enterprise. Forecasting techniques typically rely on logic posited on the Principle of Induction, which states that the *most recent past* may serve as the *best indicator of the future; however, past performance* is *not* always the *prologue to future performance*, e.g., reimbursement yields based on past data may be unreliable in the new reimbursement paradigm of payment based on quality and value; note that deviations from historical or industry trends should be *well reasoned* and *defensible*. *Revenue Projections* consist of two factors: (a) *volume* and (b) *reimbursement yield*. Volume is a function of two elements: (a) *changes in utilization demand* for services and (b) *changes in market share*. *Utilization Demand* is driven by two factors: (a) *population growth* and (b) *incidence and prevalence of disease*. *Market share* is based on the ability and capacity to obtain existing volume from competitors. In healthcare, *reimbursement yield* is driven by government regulation and other payor determinations, e.g., special attention should be given to bundling and unbundling of procedure codes, as well as procedure volume caps, which both affect the *reimbursement yield*.

(*continued*)

TABLE 12.3 Typical Valuation Considerations for Income Approach–Based Methods (*continued*)

Pertinent Consideration	Description
Projection of Economic Costs (i.e., Both Operating and Capital)	*Expense projections* should take into account the *most probable level* of economic operating expense burden and economic capital expense burden required to generate the level of revenue projected for the enterprise. When appraising a *control level of interest, the most probable level of expense burden* may be indicated from normative industry benchmark survey data. When appraising a *minority level of interest, depending on the facts and circumstances*, the property holder may be unable to make decisions related to the costs incurred by the enterprise, and therefore the *historical costs* are used as a basis for projection; under these circumstances, the expense projections should include consideration of the *fixed and variable portions* of operating expenses, which are typically projected at different rates of growth. As the level of revenue generated by the subject enterprise changes, the amount of *working capital* required to produce that level of revenue may also change. *Capital expenditures* should also be accounted for in the determination of the *periodic net economic benefit* accruing to the owner of the subject enterprise; note that in addition to *maintenance capital expenditures* for existing assets, the current capacity of the organization should be considered in light of the forecasts of increased patient/procedure volume in order to determine whether *additional capital expenditures* are warranted to accommodate the capacity needed to handle the increased volume.
Risk Adjusted Required Rate of Return	The *discount rate* used to *present value* the *future net economic benefit* should: (1) reflect the risk associated with investment in the subject property interest and (2) be at the level of cash flow used, e.g., *after-tax net cash flow* should be discounted at an *after-tax discount rate*.

Table 12.4 illustrates some of the *pertinent facts and considerations* that a valuation analyst should review in applying the *market approach–based methodologies*.

In considering an *asset/cost approach–based methodology*, the valuation analyst should review the *pertinent facts and circumstances* particular to the use of these methods (see Section 8.1.3, "Asset/Cost Approach–Based Methods," in Chapter 8, "Valuation Approaches and Methods," for further discussion). An illustration of some of these considerations is presented in Table 12.5.

TABLE 12.4 Typical Valuation Considerations for Market Approach–Based Methods

Pertinent Considerations	Description
Availability of Data (Guideline Transaction/ Merged and Acquired Method)	The Guideline Transaction/Merged and Acquired Method requires the use of reliable transaction data from a sufficient number of reliably reported transactions of enterprises offering: (1) Sufficiently specific and validly reported data; (2) Similar services and modes of delivery as those provided by the subject enterprise; (3) Transactions occurring within a reasonable historical time frame, representing similar economic realities as of the date of the valuation; and (4) A similar geographic/market service area scope.
Availability of Data (Guideline Public Company Method)	The *Guideline Public Company Method* requires the use of a *sufficient* number of *freely traded (public) companies*, offering *similar services* to those provided by the subject enterprise as of the *date of the valuation* The use of this method is *recommended* in engagements where *sufficiently similar guideline public companies* exist. Note that limited *publicly traded* physician professional practice enterprise data is available, making the use of the guideline public company method difficult. To facilitate the *comparability* of the subject enterprise and the *guideline inpatient enterprises*, the valuation analyst should employ *common sized multiples*, e.g., price to revenue or price to EBITDA.
Income-Based Multiples	(1) Price to Net Income; (2) Price to Operating Income; (3) Price to EBITDA; (4) Price to EBITDAR; (5) Price to Revenue; (6) Price to Free Cash Flow to the Firm; and (7) Price to Free Cash Flow to Equity.
Asset-Based Multiples	(1) Price to Book Value; (2) Price to Capacity Measure (e.g., Price to Operating Room for ASCs or Price to Chair for Infusion Centers); (3) Price to Provider; and (4) Price to Square Foot
Size Adjustment	*Pricing multiples* derived from the data of larger publicly traded companies may distort the indications of the value of smaller companies (if not appropriately adjusted). The valuation analyst may choose to make adjustments to the multiples used in an effort to mitigate the impact of these distortions. (See Chapter 8, "Valuation Approaches and Methods.")

TABLE 12.5 Typical Valuation Considerations for Asset/Cost Approach–Based Methods

Pertinent Considerations	Description
Use of Method	Asset/Cost Approach–Based Valuation Methods may be used to derive the value of a subject enterprise by separately identifying and appraising each *tangible* and *intangible* asset of the enterprise, aggregating the separately appraised indications of value into an accumulated value of the enterprise in its entirety.
Brief Description of Methodology	Asset/Cost Approach–Based Valuation Methods, under the *Principle of Substitution*, use the *replacement cost*, and in some rare instances the *reproduction cost*, as an indication of value for the subject property; note that when using an Asset/Cost Approach–based valuation method, the indication of value of the subject property should include consideration of the *economic depreciation* inherent in the property interest, i.e., the *functional/technological obsolescence*, *economic obsolescence*, and *physical deterioration*.
Types of Tangible Assets Found in Outpatient Enterprises Typically Appraised Using an Asset/Cost Approach–Based Valuation Method	(1) Medical Equipment; (2) Office Equipment and Furniture; (3) Supplies; (4) Buildings; (5) Leasehold Improvements; (6) Land; and (7) Construction in Progress.
Types of Intangible Assets Found in Outpatient Enterprises Typically Appraised Using an Asset/Cost Approach–Based Valuation Method	(1) Building Permits; (2) Zoning Waivers; (3) Payor Contracts, Managed Care Agreements, ACO Contracts; (4) Provider Service Agreements; (5) HMO Enrollment Lists; (6) Custodial Rights to Patient Medical Records; (7) Trained and Assembled Workforce in Place; (8) Employment Contracts; (9) Management Protocols and Procedures; (10) Treatment Plans/Care Mapping; (11) Management Information Systems; and (12) Certificate of Need.

12.2 PROFESSIONAL PRACTICES

Professional practices consist of *physicians*, *allied health professionals*, and *midlevel* and *technician and paraprofessional providers*, who typically provide services in an outpatient setting. The different types of *professional practices*, as well as the distinct *value drivers* related to these enterprises, will be discussed later.

12.2.1 Physician Professional Practices

As discussed in Chapter 2, "Reimbursement Environment," there are *two types of revenue streams*, that is, (1) the *professional component*, under which physician-centric work is reimbursed; and (2) the *ancillary services and technical component* (ASTC), under which tests and procedures are reimbursed. Both types of revenue may be provided by a *physician professional practice*; however, *the type of provider* who may perform *professional component services* is limited to those with certain credentials, for example, *licensed physicians*, *allied health professionals*, and certain *midlevel providers* (discussed later), while any qualified healthcare provider may perform ASTC services.

Physician professional services may be performed by either (1) a *Doctor of Medicine* (MD), also known as an *allopathic physician*, or (2) a *Doctor of Osteopathy* (DO), also known as a *holistic physician*.[2] In the United States,

PROFESSIONAL PRACTICE

Some number of providers (physicians, allied health professionals, or midlevel service providers) who form a legal entity through which they offer services (either through an outpatient facility or by contracting with another facility for their services).

[2] *Allopathy* is defined as the traditional form of medicine, whereby interventions and remedies are used to treat various illnesses or conditions. David E. Marchinko, ed., *Dictionary of Health Insurance and Managed Care* (New York: Springer, 2006), p. 18. *Osteopathy* is defined as a "whole person" approach to medicine, whereby physicians examine the whole body under the philosophy that health systems, e.g., the musculoskeletal system, assist the body's natural ability to heal. "About Osteopathic Medicine," American Osteopathic Association, http://www.osteopathic.org/osteopathic-health/about-dos/about-osteopathic-medicine/Pages/default.aspx (accessed January 3, 2013).

Midlevel Provider

Health practitioners who must hold a license to practice medicine and may (in some capacity) practice independently.

prior to beginning either an *allopathic* or an *osteopathic* medical education, students must earn a bachelor's degree from a four-year university.[3] Following undergraduate studies, the *Medical College Admission Test* (MCAT), a multiple choice standardized test designed to assess the examinee's (1) *problem-solving*, (2) *critical thinking*, (3) *writing skills*, and (4) *knowledge of science* is used by medical schools as a measure of a student's ability and likelihood of success in medical school, to determine acceptance.[4] While MDs and DOs possess many similarities as to their respective educational background and training, their schools differ by their fundamental philosophies.[5]

Allopathic universities and medical schools are accredited by the *Liaison Committee on Medical Education* (LCME).[6] After completion of medical

DOCTOR OF MEDICINE (MD)

Allopathic physicians graduate from a medical school or university accredited by the Liaison Committee on Medical Education (LCME).

"Doctor," definition in Stedman's Medical Dictionary, *edited by William R. Hensyl (Baltimore: William & Wilkins, 1990), p. 462.*

[6] "Overview: Accreditation and the LCME," Liaison Committee on Medical Education, 2012, http://www.lcme.org/overview.htm#recognition (accessed December 12, 2012).

DOCTOR OF OSTEOPATHY (DO)

Holistic physicians graduate from a medical school or university accredited by the Commission on Osteopathic College Accreditation that emphasizes a "*whole person" approach to medicine.*

"What Is a Doctor of Osteopathic Medicine (D.O.)?" American Osteopathic Association, 2012, https://www.osteopathic.org/osteopathic-health/about-dos/what-is-a-do/Pages/default.aspx (accessed August 11, 2012); "Osteopathic Medical Education" the American Osteopathic Association, 2009, http://www.osteopathic.org/index.cfm?PageID=ost_ome (accessed October 2, 2009).

school, newly graduated MDs enter into residency programs accredited by the *Accreditation Council for Graduate Medical Education* (ACGME) for an average of three to four additional years of training.[7] Similarly, *Osteopathic* students must complete four years at an osteopathic medical school accredited by the *Commission on Osteopathic College Accreditation* in order to receive their degrees as DOs.[8] Similar to their *allopathic* counterparts, DOs

Allopathy

The traditional form of medicine, whereby interventions and remedies are used to treat various illnesses or conditions.

Dictionary of Health Insurance and Managed Care, *edited by David E. Marchinko (New York: Springer, 2006), p. 18.*

[7] "Preparing for Medical School," American Medical Association, 2012, http://www.ama-assn.org/ama/pub/education-careers/becoming-physician/medical-school/preparing-medical-school.shtml (accessed August 9, 2012).

[8] "Colleges of Osteopathic Medicine," American Osteopathic Association, 2009, http://www.osteopathic.org/index.cfm?PageID=sir_college (accessed October 2, 2009); "Osteopathic Medical Education" the American Osteopathic Association, 2009, http://www.osteopathic.org/index.cfm?PageID=ost_ome (accessed October 2, 2009).

Osteopathy

A "whole person" approach to medicine, whereby physicians examine the whole body under the philosophy that health systems, for example, the musculoskeletal system, assist the body's natural ability to heal.

"About Osteopathic Medicine," American Osteopathic Association, http://www.osteopathic.org/osteopathic-health/about-dos/about-osteopathic-medicine/Pages/default.aspx (accessed January 3, 2013).

complete a 12-month internship, followed by an *American Osteopathic Association* (AOA) approved residency program in the specialty area of their choice, which may, depending on their designated specialty, last from two to six years.[9] Of note is that many *osteopathic physicians* choose to complete their residency through an *allopathic residency program*. A 2009 study found that from 1985 to 2006, the number of DOs in allopathic residencies, that is, those accredited by the ACGME, increased 419 percent, from 1,277 DOs in 1985 to 6,629 in 2006.[10]

Factoid

The number of DOs accredited by the ACGME increased 419 percent from 1985 (1,277 DOs) to 2006 (6,629 DOs).

"The Impact of Osteopathic Physicians' Participation in ACGME-Accredited Postdoctoral Programs, 1985–2006," by Mark Cummings and Donald J. Sefcik, Academic Medicine *84, no. 6 (June 2009): 733.*

[9] "Osteopathic Medicine," American Osteopathic Association, 2009, http://www.osteopathic.org/index.cfm?PageID=ost_omed (accessed October 2, 2009); "What Is a Doctor of Osteopathic Medicine (D.O.)?" American Osteopathic Association, 2012, https://www.osteopathic.org/osteopathic-health/about-dos/what-is-a-do/Pages/default.aspx (accessed August 11, 2012); "Osteopathic Medicine," American Osteopathic Association, 2009, http://www.osteopathic.org/index.cfm?PageID=ost_omed (accessed October 2, 2009).

[10] Mark Cummings and Donald J. Sefcik, "The Impact of Osteopathic Physicians' Participation in ACGME-Accredited Postdoctoral Programs, 1985–2006," *Academic Medicine* 84, no. 6 (June 2009): 733.

PRIMARY CARE

Services that are managed by a personal physician that typically include diagnostics, preventive services, and health maintenance.

Physician Characteristics and Distribution in the US, *2009 Edition, American Medical Association, 2009, p. xviii; "Primary Care," American Academy of Family Physicians, 2006, http://www.aafp.org/online/en/home/policy/policies/p/primarycare.printerview.html (accessed July 17, 2009).*

Osteopathic medical schools, unlike *allopathic programs*, emphasize "*a 'whole person' approach to medicine*" and, "*regard [the] body as an integrated whole*," rather than treating a patient's specific symptoms or illness.[11] Accordingly, osteopathic medical education typically has an intensified focus on *primary care* and *preventative medicine*.[12] While trained *allopathic physicians* are more prevalent in the U.S. healthcare market, the number of graduating *osteopathic physicians* is growing, with 65,565 DOs in the United States as of 2010, compared to 919,810 MDs in the same year.[13]

Outpatient enterprises may be classified by (1) the *Standard Industrial Classification* (SIC) and/or (2) the *North American Industry Classification System* (NAICS), which may assist in the benchmarking process discussed

[11] "What Is a Doctor of Osteopathic Medicine (D.O.)?" American Osteopathic Association, 2012, https://www.osteopathic.org/osteopathic-health/about-dos/what-is-a-do/Pages/default.aspx (accessed August 11, 2012).

TABLE 12.6 SIC and NAICS Codes for Outpatient Services—MD and DO Services

SIC		NAICS		
Code	Title	Code	Title	Description
8011	"Offices and Clinics of Doctors of Medicine"	621111	"Offices of Physicians (except Mental Health Specialists)"	This code is used for both MD and DO physicians who have independent medical or surgical practices, either general or specialized (not including psychiatry or psychoanalysis). The practice setting may be either office-based or hospital-based.
8031	"Offices and Clinics of Doctors of Osteopathy"			
8093	"Specialty Outpatient Facilities, NEC"	621410	"Family Planning Centers"	This code is used for medical staff operating office-based, independent practices, providing a broad range of family planning services, e.g., contraception, genetic and prenatal counseling, voluntary sterilization, and terminations of pregnancies.
		621493	"Freestanding Ambulatory Surgical and Emergency Centers"	This code is used for office-based practices that provide outpatient surgical services (e.g., orthoscopic or cataract surgery) or emergency care services (e.g., setting broken bones), often having in-office operating and recovery rooms.
		621112	"Offices of Physicians, Mental Health Specialists"	This code is used for both MD and DO physicians who have independent practices, either office-based or hospital-based specializing in a psychiatry or psychoanalysis
		621420	"Outpatient Mental Health and Substance Abuse Centers"	This code is used for office-based, independent practices that provide services for the diagnosis and counseling or treatment of mental health and/or substance abuse disorders.

12.2.1.1 Types of Physician Professional Practices In addition to the *site of service* at which physician services may be performed, physician professional practices may also be classified by the *type* and *scope* of services provided. The *Association of American Medical Colleges* (*AAMC*)[15] recognizes three defined general physician specialty categories: (1) *Primary Care*, (2) *Medical Specialties*, and (3) *Surgical Specialties*.[16]

12.2.1.1.1 Primary Care Practices *Primary care* may generally be classified as consisting of *general practice* and four *specialties*: (1) *family medicine*, (2) *internal medicine*, (3) *pediatrics*, and (4) *obstetrics and gynecology*.[17] Each of the *primary care specialties* is represented by an *American Board of Medical Specialties* (ABMS)–approved *medical specialty board*. *Primary care services* typically include those services related to: (1) *health promotion*, (2) *disease prevention*, (3) *health maintenance*, (4) *counseling*, (5) *patient education*, and (6) the *diagnosis* and *treatment* of *acute* and *chronic illnesses*, which are performed and managed by a *personal physician* who often *collaborates* with other healthcare providers and uses *consultations* or *referrals* to other specialists, when appropriate.[18] The supply and distribution of

[15]The American Association of Medical Colleges (AAMC) is a not-for-profit association, founded in 1876, that represents all levels of medical education, including medical schools, teaching hospitals, students, faculty, and research institutions. Factoid

The total number of general practice physicians has decreased by almost 80 percent between 1975 and 2010, while the number of family medicine physicians steadily increased during the same time.

American Medical Association, Physician Characteristics and Distribution in the US, *2012 Edition (Chicago: American Medical Association, 2012), p. 443.*

from 42,374 in 1975 to 8,591 in 2010.[19] A portion of this decline has been attributed to the advent of the *family medicine physician* specialty designation in 1975. The number of *family medicine physicians* totaled 12,813 in 1975 and has steadily increased to 87,618 in 2010.[20] Among all of the primary care specialties, *internal medicine* has represented the largest segment of the U.S. physician supply since 1975, with 54,331 physicians in 1975, accounting for 13.8 percent of the total physician population and 161,276 physicians in 2010, accounting for 16.6 percent of the total physician population.[21]

A table of the certification requirements related to each of the *primary care physician professional* specialties can be found online at http://www.wiley.com/go/healthcarevaluation.

12.2.1.1.2 Specialty Care Practices *Specialty care* physicians, in contrast to *primary care physicians*, are those practitioners who have obtained certification by a specialty board in one of the various medical specialties, as defined by the ABMS, including, but not limited to:

1. **Allergy and Immunology**—The evaluation, diagnosis, and management of immune system disorders;
2. **Anesthesiology**—Pain relief management; the evaluation of risk and the management of pain conditions before, during, and after surgical procedures;

SPECIALTY CARE

Services that are generally referred and operate under one of the various medical specialties.

[19] American Medical Association, *Physician Characteristics and Distribution in the US*, 2012 Edition (Chicago: American Medical Association, 2012), p. 443.

[20] Ibid.

[21] Ibid., p. 288.

3. **Dermatology**—The diagnoses and treatment of skin, mouth, external genitalia, hair, and nail disorders and diseases;
4. **Cardiology**—The diagnosis and treatment of diseases and disorders of the heart;
5. **Emergency Medicine**—The immediate and accurate recognition, evaluation, treatment, and stabilization of victims of acute illness or injury;
6. **Medical Genetics**—Diagnostic and therapeutic care for patients suffering from genetically linked diseases and disorders;
7. **Neurology**—The diagnosis and treatment of conditions related to neurological structures;
8. **Nuclear Medicine**—The evaluation of molecular, metabolic, physiological, and pathologic conditions, diseases, and disorders through the utilization of tracers (e.g., radiopharmaceuticals) and molecular imaging;
9. **Pathology**—The application of knowledge of disease form and functionality in the diagnosis, management, and treatment of disease;
10. **Physical Medicine and Rehabilitation**—The evaluation, diagnosis, and treatment of patients with musculoskeletal system disorders and conditions;
11. **Preventive Medicine**—Focuses on preventing adverse health conditions and premature death;
12. **Psychiatry**—The prevention, diagnosis, and treatment of disorders relating to psychological health;
13. **Radiology**—The use of imaging and other radiological methods to diagnose and/or treat disease; and
14. **Oncology**—The study, classification, and treatment of tumors and cancer.

Each specialty varies in the *type and scope of services* typically provided, the *certifications* available, and the type of patients and conditions typically treated.[22]

The supply and distribution of specialty physicians in the United States, as of 2010, as reported by the AMA, is set forth in Table 12.9.

The percentage change in the supply of specialist physicians in the United States for the period from 1975 to 2010, as reported by the AMA, is set forth in Table 12.10.

While the ABMS and the AOA offer many of the certifications available to physicians, they are also the umbrella organizations for various certification boards, through which physicians become certified in a particular specialty. A table of the certification requirements related to each type of *specialty physician professional*, as well as the contact information

for applicable certification boards, can be found online at http://www.wiley.com/go/healthcarevaluation

12.2.1.1.3 Surgical Practices *Surgeons* are practitioners who have obtained *certification* from a specialty board in either:

1. *General surgery;*
2. *Colon and rectal surgery;*
3. *Neurological surgery;*
4. *Ophthalmic surgery;*
5. *Orthopedic surgery;*
6. *Otolaryngology surgery;*
7. *Plastic surgery;*
8. *Thoracic and cardiovascular surgery; or*
9. *Urology surgery* or another surgical specialty.

The supply and distribution of surgeons in the United States, as of 2010, as reported by the AMA, is illustrated in Table 12.11.

The percentage change in the supply of *surgeons* in the United States, for the period from 1975 to 2010, as reported by the AMA, is set forth in Table 12.12.

From 1975 to 2010, the number of *surgeons* in the United States increased 63.3 percent, from 74,284 surgeons to 121,311 surgeons, representing a per capita growth from 33.9 surgeons per 100,000 persons in 1975 to 39.3 surgeons per 100,000 persons in 2010.[23] This growth may likely be largely attributable to a trend toward *surgical subspecializations*, with 70 percent of all medical residents completing surgical fellowships in 2004.[24] The decline of *general surgeons* and the increasing trend toward *surgical subspecialization* may be due, in part, to the decline in the average general surgeon's income from 2011 to 2012, which, at 12 percent, was the largest income decrease for any physician specialty.[25] Despite the decline in

General surgeons ranked among the top ten specialty fields for physicians in 2010, representing 6.5 percent of the total physician population.

American Medical Association, Physician Characteristics and Distribution in the US, *2012 Edition (Chicago: American Medical Association, 2012), p. 1.*

the number of general surgeons, in 2010, with 37,100 general surgeons, this specialty still ranked among of the top ten fields for physicians, representing 6.5 percent of the total physician population.[26]

A table of the certification requirements related to each type of surgeon can be found online at http://www.wiley.com/go/healthcarevaluation.

12.2.1.2 Current and Future Trends: Regulatory, Reimbursement, Competition, and Technology

12.2.1.2.1 Regulatory Improving *access to primary care* services is a primary goal of the *Patient Protection and Affordable Care Act* (ACA). As discussed in Chapter 6, "Healthcare Reform," the ACA has ushered in a host of reform initiatives that are likely to have a significant impact on physician professional practices, for example (1) the *individual mandate*, (2) the *voluntary Medicaid expansion program*, (3) increased *funding for primary care services*, (4) increased *fraud and abuse scrutiny*, and (5) *various reimbursement cuts*.[27]

12.2.1.2.2 Reimbursement While physician professional practices may be reimbursed by numerous different payors (see the discussion of the payor mix, later), Medicare acts as the *gold standard*, with most other payors, for example, commercial payors, typically reimbursing physicians at a multiple of the Medicare established rate. Accordingly, trends within the Medicare program are often mimicked in reimbursement trends for other payors.

[27] Within the June 28, 2012, Supreme Court ruling upholding most of the ACA, the required Medicaid expansion (whereby states would have to increase Medicaid eligibility to 133 percent of the Federal Poverty Limit in 2014) was changed to a voluntary program. (See Chapter 6, "Healthcare Reform.") For more information on how these regulations affect all healthcare enterprises, see Chapter 3, "Regulatory Environment."

During the last several years, physicians have faced decreasing Medicare reimbursements. Since 2002, the *sustainable growth rate* (SGR) formula used under the *Medicare Physician Fee Schedule* (MPFS) has indicated that reimbursement should be adjusted *downward*. While Congress has *intervened* every year since 2003 to *maintain* physician payment rates and frequently increased payments slightly instead, the topic regarding the continued threat of the application of SGR cuts to physician reimbursement (which are estimated to reach 30 percent in 2014) has become an increasingly heated debate and a source of uncertainty regarding reimbursement.[28] While the topic of the SGR was not specifically addressed in the ACA, the possible repeal of the SGR has been suggested by many physician advocacy groups, as well as by the *Medicare Payment Advisory Commission* (MedPAC).[29]

A survey performed by *the Physicians Foundation* found that in 2012, 8.6 percent of those physicians surveyed had closed their practice to Medicare patients due to reimbursement constraints, as compared to 6.2 percent of physicians surveyed in 2008. The survey also indicated that in 2012, 22.9 percent of surveyed physicians "*place[d] new or additional limits on Medicare acceptance*," and an additional 28.3 percent of surveyed physicians would do so if Medicare reimbursements were to decrease by 10 percent or more.[30]

As discussed in Chapter 2, "Reimbursement Environment," physicians bill for their *professional services* through the use of the *current procedural terminology* (CPT) codes. *Primary care physicians* generally bill under *evaluation and management* (E/M) codes (CPT codes 99201–99499) that quantify the cost of a *patient visit* or a *diagnostic consultation*, rather than for procedures (all remaining CPT Codes). In contrast, specialty physicians

[28] See Table 2.8, "Annual Updates to the MPFS CF (CMS Final Rule v. Congressional Action), 1997–2013," in Chapter 2, "Reimbursement Environment." Of note is that on January 1, 2013, the 112th Congress passed *The American Taxpayer Relief Act of 2012*, which averted the "*fiscal cliff*" and prevented the threatened 27 percent SGR cuts for another year. "American Taxpayer Relief Act of 2012" H.R.8 (January 1, 2013), p. 84. "CBO Estimate of Changes in Net Federal Outlays from Alternative Proposals," Congressional Budget Office, April 30, 2010, http://www.coburn.senate.gov/public//index.cfm?a=Files.Serve&File_id=a7b5187f-3998-4685-9a5a-6b764e8ba14f (accessed February 7, 2013).

[29] For more information on the continued *SGR debate* and proposals for the *repeal* of the SGR, see Section 2.4.1.3.2.6, "The Sustainable Growth Rate—a Continuing Saga," in Chapter 2, "Reimbursement Environment."

[30] *A Survey of America's Physicians: Practice Patterns and Perspectives*, The Physicians Foundation, 2012, pp. 42, 47.

and surgeons more often bill under *procedure codes*. Physician services performed in an *office setting* are reimbursed by Medicare, under the MPFS for both the *technical* and the *professional components;* however, similar physician services provided in a *hospital outpatient department* are reimbursed at a higher rate under the *Outpatient Prospective Payments System* (OPPS).

Unique to anesthesiology reimbursement is the application of a *specialty specific conversion factor* (CF) to anesthesiology services performed under the MPFS, rather than the CF applied for all other physician services. From 1992 (when the current *Resource Based Relative Value Scale* [RBRVS] physician fee schedule and the associated CF methodology went into effect) to 2012, the percentage change for the *anesthesia* CF (157 percent from 1992 to 2012) has been significantly larger than the *general* CF (109.8 percent from 1992 to 2012).[31] For a detailed discussion of the MPFS and a description of the conversion factor, see Chapter 2, "Reimbursement Environment."

Under the current reimbursement environment, it is critical that physicians and support staff collaborate together to ensure that all services rendered are accurately and completely captured in the charges to third-party payors. However, with the passage and affirmation of the ACA (see Chapter 6, "Healthcare Reform"), the reimbursement environment is slowly shifting from the current *fee-for-service* (FFS) *model* (where purely higher utilization leads to higher reimbursement) to a *value-based reimbursement model* emphasizing *episodes of care*, *quality outcomes*, and the *reduction of costs*.

In addition to these *regulatory reforms* mandated under the ACA related to physician professional practices, several *reimbursement reforms* have also been initiated by the legislation. For example, in an attempt to address the reimbursement gap between *primary care physicians* and *specialty physicians*, Congress enacted the *Medicare Primary Care Incentive Program* (PCIP) in 2010 as part of the ACA.[32] The *PCIP* provides a quarterly *incentive payment* of 10 percent of Medicare's program payments to *qualified*

[32] Medicare generally reimburses medical procedures, typically provided by specialists and surgeons, at significantly higher rates than office visits, which are typically provided by primary care physicians. See the discussion on evaluation and management (E/M) codes and the current debate regarding the specialist heavy makeup of the Relative Value Scale Update Committee (RUC) (Section 2.4.1.3.2.7) in Chapter 2, "Reimbursement Environment." "Patient Protection and Affordable Care Act: Section 550l (a)," *Pub. L.* 111-148, March 23, 2010, p. 124, Stat. 652.

primary care physicians, for eligible primary care *services*, which include (1) *office and other outpatient visits*; (2) *nursing facility, domiciliary, rest home, or custodial care*; and (3) *home health services*.[33]

In addition to increasing the reimbursement yields for primary care services, the ACA implemented several *episode-based payment* models designed to promote lower costs and higher quality of care, for example, *Bundled Payments for Care Improvement Initiative* (*Bundled Payments Initiative*). CMS recently implemented the *Bundled Payments Initiative* on August 23, 2011, presenting four options, that is, (1) apply a discounted *inpatient prospective payment system* (IPPS) payment only to inpatient services; (2) apply a retrospective comparison of target price and actual FFS payment to inpatient stay, as well as postdischarge services; (3) apply a retrospective comparison of target price and actual FFS payment to postdischarge services only; and (4) apply a prospectively set payment only to inpatient services, through which participating physicians could receive *incentive payments* for achieving certain objectives, all of which are designed to encourage *coordination of care* and *lower costs* by allowing providers to *share in the cost savings achieved*, based on the historic *FFS payment rate* and a *discounted target price per episode of care*.[34] For more information on bundled payments, see Section 2.7.1.1.1, "Bundled Payments," in Chapter 2, "Reimbursement Environment."

12.2.1.2.3 Competition The ACA's *individual mandate*, as well as the demographic time bomb resulting from the aging U.S. population, may result in a physician manpower shortage in the United States

[33] Qualified physicians include those providers with specially designations of family medicine, internal medicine, geriatric medicine, or pediatric medicine, and whose historical Medicare claims data for the previous two-year period (or the total amount of historical data available less than two years old) consists of at least 60 percent eligible primary care services (CPT codes 99201 through 99215, office and other outpatient visits; 99304 through 99340, nursing facility, domiciliary, rest home, or custodial care; and 99341 through 99350, home services). Nurse Practitioners (NP), Clinical Nurse Specialists (CNS), or Physician Assistants (PA) who meet the eligibility criteria set forth above may also qualify for incentive payments. "Summary Information Regarding Medicare's Primary Care Incentive Payment Program (PCIP)," Centers for Medicare and Medicaid Services, MLN Matters Number: SE1109, November 27, 2012, http://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNMattersArticles/downloads/SE1109.pdf (accessed December 8, 2012).

(see Secion 4.3.4, "The Physician-Workforce Shortage: Demand Outpaces Supply" in Chapter 4, "Competition").[35] In 2010, prior to the passage of the ACA, there was a shortage of 13,700 physicians across all specialties.[36] The demand for physician services will only increase as the ACA makes healthcare available to the pool of uninsured individuals in the United States. In the specialty of cardiology, in particular, the *American College of Cardiology* (ACC) determined that as of 2009, "the overall demand for cardiologists in total and each of the 4 secondary specialty subgroups [i.e., general, interventional, electrophysiology, and pediatric cardiology] far exceeds the supply, currently and in the short term."[37] As the physician manpower shortage continues to worsen, *nonsurgical specialists* are projected to account for 6.3 percent of the shortage, while *surgeons* and *primary care physicians* are expected to account for 32.9 percent and 37.3 percent of the shortage, respectively.[38]

One reason for the continuing decline in the number of primary care physicians is the growing income gap between *primary care physicians* and *specialists*. This gap results in fewer new physicians choosing the primary care field.[39] For example, in 1985, a physician in *family practice* earned an

PRIMARY CARE AND SPECIALIST INCOME GAP

In the United States, there is a history of primary care physicians receiving a smaller income than specialists. In 2011, the gap in annual mean income between *family medicine physicians* and *radiologists and orthopedic surgeons* had reached approximately $325,000.

MGMA Physician Compensation and Production Survey: 2012 Interactive Report Based on 2011 Data*, Medical Group Management Association, 2012, Summary Tables 92.1, 114.1, and 143.1.*

annual median income of approximately $80,000, while a *radiologist* and an *orthopedic surgeon* earned an annual median income of approximately $170,000 and $190,000, respectively, or 2.25 times the income of a *family practice physician*.[40] By 2011, the gap in annual mean income had grown so that *radiologists* and *orthopedic surgeons* earned 2.48 times the income earned by *family medicine physicians*; in other words, *family physicians* earned an annual mean income of approximately $218,000, and *radiologists* and *orthopedic surgeons* earned an annual mean income of approximately $516,500 and $569,000, respectively.[41]

In addition to the ACA's provisions designed to improve the primary care physician workforce, for example, §5501, *Expanding Access to Primary Care Services and General Surgery Services*, *family medicine physicians* are attempting to reinforce the supply of *primary care physicians* through a collaboration between the *American Board of Family Medicine*, the *Association of Family Medicine Residency Directors*, and *TransforMed* (a subsidiary of the *American Academy of Family Physicians*).[42] The *Preparing the Personal Physician Initiative* (P4) is a six-year comparative case study of 14 residency programs across the country, with the goal of restructuring the educational models used for primary care training to remove requirements that are no longer relevant, and to instead focus on the treatment of patients

[40] Ibid., p. 32.

[41] *MGMA Physician Compensation and Production Survey: 2012 Interactive Report Based on 2011 Data*, Medical Group Management Association, 2012, Summary Tables 92.1, 114.1, and 143.1.

with chronic conditions.[43] One anticipated outcome of the *P4* initiative is a better understanding of how *family medicine residency programs* can best train physicians to use the *Patient Centered Medical Home* (PCMH) healthcare delivery model.[44]

As discussed throughout this book, in Chapter 2, "Reimbursement Environment," Chapter 4, "Competition," and Chapter 6, "Healthcare Reform," the PCMH was developed as a mechanism for "*reengineering*" the healthcare delivery system to focus on *coordinated care* and *preventative health services*.[45] The *American Academy of Pediatrics (AAP)* pioneered the *medical home model* in 1967, in an effort to recognize the unique needs of children and families and to focus on such *key principles* as (1) *family-centered partnerships*, (2) *community-based systems*, (3) and *comprehensive care*.[46]

Factoid

In 1967, the American Academy of Pediatrics first pioneered the medical home model meeting children's and families' unique needs and focusing on key principles, including family-centered partnerships, community-based systems, transitions, and value.

Again," *Family Practice Management*, September 2007, www.aafp.org/fpm (accessed October 2, 2009), p. 38.

12.2.1.2.4 Competition between Physicians Increased access to specialists and improved technologies have amplified the amount of competition among physician practices, particularly for those providers who have a large portion of their practice revenue attributed to *ancillary services and technical component* (ASTC) *services*, for example, diagnostic imaging. As imaging technology is becoming more advanced, there is a growing trend toward *cardiologists*, instead of *radiologists*, reading images for cardiac-related imaging services, for example, coronary CT and coronary PET scans.[47] Proponents of *cardiologist's* interpretation of imaging scans have suggested that having *cardiologists* trained in reading the images will provide more continuity of care for patients.[48] As might be expected, *radiologists* took exception to the concept that a *cardiologist* may be better suited to interpret scans.[49]

There is also likely to be increased competition among physician providers with the advent of ACOs under the *Medicare Shared Savings Program* (MSSP) *Final Rule*, which governs federal ACOs. As discussed in Chapter 2, "Reimbursement Environment," under the MSSP, if a Medicare beneficiary receives his or her primary care services from a *specialist*, that specialist is considered a *primary care physician* for the purposes of *beneficiary assignment* to the ACO.[50] In addition, these *specialists* are restricted to only participating in one ACO per *tax identification number* (TIN), an *exclusivity requirement* generally reserved for *primary care physicians*.[51]

Factoid

With the advancement of imaging technology, there is a growing trend toward cardiologists, as opposed to radiologists, reading images for cardiac-related imaging services.

"Are Cardiologists the QB of Cardiac Imaging?" by Cristen C. Bolen, Diagnostic & Invasive Cardiology, *Reilly Communications Group, May/June 2008, http://new.reillycomm.com/diagnostic/article_detail.php?id=611 (accessed August 19, 2008).*

[51] Ibid., p. 67809.

Factoid

The number of hospital-based physicians has increased significantly from 2005 to 2010, while the number of office-based physicians has declined, both by 3.3 percent.

Physician Characteristics and Distribution in the US, *American Medical Association, 2002–2003 edition, p. 329; 2003–2004 edition. p. 320; 2004 edition, p. 322; 2005 edition, p. 311; 2006 edition, p. 311; 2007 edition, p. 311; 2008 edition, p. 403; 2009 edition, p. 406; 2010 edition, p. 438; 2011 edition, p. 436; 2011 edition, p. 436; 2012 edition, p. 440.*

In addition to competition between *physician specialties*, competition for the employment of *physicians* has also increased. Since 2005, the number of physicians in *hospital-based practices* has increased significantly from 155,248 physicians (21.6 percent of active physicians) in 2005 to 752,572 physicians (24.9 percent of active physicians) in 2010, while the number of physicians in *office-based practices* has declined, from 563,225 physicians (78.4 percent of active physicians) in 2005 to 565,024 physicians (75.1 percent of active physicians) in 2010.[52]

Among the main drivers of *hospital-physician alignment* are *economic changes*, for example, the *Great Recession* and the *downward pressure on reimbursement rates*, which have resulted in reduced profitability for *independent practitioners* and *small group practices*, straining their *capital resources*.

From a *physician perspective*, hospital employment provides *value* through *decreased financial risk* and more *desirable work-life balance*.[53] Accordingly, younger physicians are less likely to (1) *take call coverage*, (2) *work longer hours*, and (3) undertake the *entrepreneurial challenge* of opening private practice, in contrast to collecting a salary. This change in the style of practice aligns with recent demographic shifts related to age and gender. Mimicking national population trends, the physician population is *aging* and *diversifying*. A greater percentage of physicians are over

[52] *Physician Characteristics and Distribution in the US*, American Medical Association, 2002–2003 edition (p. 329); 2003–2004 edition (p. 320); 2004 edition (p. 322); 2005 edition (p. 311); 2006 edition (p. 311); 2007 edition (p. 311); 2008 edition (p. 403); 2009 edition (p. 406); 2010 edition (p. 438); 2011 edition (p. 436). 2011 edition (p. 436); 2012 edition (p. 440).

[53] Healthcare Financial Management Association, "The New Era for Hospital-Physician Alignment," January 2011, p. 2.

55 years old, and the number of female physicians is increasing.[54] These changing demographics influence providers' *perceptions of value*. Whereas in the past, providers generally valued profits over personal time, today's providers prioritize a more flexible *work-life balance*.

Of note is that the increasing trend in *hospital employment of physicians* may act to *limit* the *potential investor/buyer pool* and decrease the number of *joint ventures between physicians* and *hospitals*, which may affect the *valuation of physician practices* (discussed later).

12.2.1.2.5 Competition with Midlevel Providers In addition to competition among physician providers, there is also likely to be increased competition among *physicians* and *midlevel providers*, as the *scope of services* these nonphysician practitioners may perform continues to expand (see Section 3.8.2.2.2, "Nonphysician Scope of Practice," in Chapter 3, "Regulatory Environment"). An increased growth in patient demand for healthcare services, along with the lagging shortage of physicians, has resulted in increased volumes of *nonphysician practitioners* providing heretofore traditionally physician services.[55] For example, there has been an increase in the utilization of emergency department *nurse practitioners* and *physician's assistants*, which have reportedly been acceptable to patients, as providing quality care, thereby alleviating the *volume-induced pressure* placed on emergency departments and allowing for improved patient satisfaction and shorter wait times.[56] Several studies have indicated that a *physician assistant* can perform approximately 80 percent of the services typically provided by a *primary care physician*.[57]

In addition, in the primary care arena, the services offered by *certified nurse midwives* and *certified midwives* have begun to overlap with physicians, particularly those specializing in *obstetrics and gynecology*. The *scope of service* for these two midlevel providers includes (1) *primary care*, (2) *gynecologic and family planning services*, (3) *preconception care*, (4) *care*

[54] American Medical Association, *Physician Characteristics and Distribution in the US*, 2011 Edition (Chicago: American Medical Association Press, 2011), p. 8; American Medical Association, *Physician Characteristics and Distribution in the US*, 2012 Edition (Chicago: American Medical Association, 2012), p. 8.

[56] Michael D. Menchine, Warren Wiechmann, and Scott Rudkin, "Trends in Midlevel Provider Utilization in Emergency Departments from 1997 to 2006," *Society for Academic Emergency Medicine* 16, no. 10 (October 2009): 963.

[57] Linda J. Vorvick, "Physician Assistant Profession (PA)," U.S. National Library of Medicine, August, 12, 2011, http://www.nlm.nih.gov/medlineplus/ency/article/001935.htm (accessed December 18, 2012).

during pregnancy, (5) *childbirth and the postpartum period*, (6) *care of the normal* newborn during the first 28 days of life, and (7) treatment of *male partners for sexually transmitted infections*.[58] While legislation that expands the scope of practice for nurse midwives has been strongly opposed by physicians in some states, for example, the *American Congress of Obstetricians and Gynecologists* (ACOG) opposed a New York bill (*The Midwifery Modernization Act*) that repealed the requirement that midwives must have a "*written practice agreement*" with a physician, although, more recently, the *American College of Nurse-Midwives* (ACNM) and the ACOG have emphasized increased *collaboration* between these two providers.[59]

Similarly, *gastroenterologists* are facing increased competition from *nonphysician endoscopists* (e.g., nurses, nurse practitioners, physician and medical assistants), for procedures such as *flexible sigmoidoscopies* for colorectal cancer screenings, *colonoscopies*, and *upper endoscopies*.[60]

Factoid

Ophthalmologists face competition from optometrists, as 44 percent of the refractive surgeries, preliminary discussions and initial screenings, performed in 2006, were done by optometrists rather than ophthalmic surgeons.

[59] Despite opposition, the Midwifery Modernization Act passed the New York Legislation in August 2010. "Midwife Reform Bill Signed into Law," New York State Assembly, August 2, 2010, http://assembly.state.ny.us/comm/?sec=post&id=019&story=40267 (accessed December 5, 2012); Anemona Harocollis, "Doctors' Group Fights a Bill That Would Ease Restrictions on Midwives," *New York Times*, June 17, 2010, http://www.nytimes.com/2010/06/18/nyregion/18midwives.html (accessed December 5, 2012); "Midwifery Modernization Act," Congress of New York 8117—B (May 5, 2009); "Joint Statement of Practice Relations between Obstetrician-Gynecologists and Certified Nurse-Midwives/Certified Midwives," American College of Nurse-Midwives and American College of Obstetricians and Gynecologists, College Statement of Policy, February 2011, p. 1.

[60] American Society for Gastrointestinal Endoscopy, "Endoscopy by Nonphysicians," *Gastrointestinal Endoscopy* 69, no. 4 (2009): 767–768.

Likewise, *ophthalmologists* continue to face competition from *optometrists*, as 44 percent of the refractive surgeries, preliminary discussions, and initial screenings performed in 2006 were done by optometrists, rather than ophthalmic surgeons.[61] Of these patients, one-third received preoperative care from an optometrist and 16 percent received optometric postoperative care.[62]

Physician professional practices, particularly primary care practices, may also face growing competition from those *sites of service* focused on providing "*convenient care*," for example, retail clinics, which have been gaining an increased presence in the current healthcare marketplace. These *sites of service* (discussed later) benefit from *economies of scale* resulting from the size of their *retail affiliates*, for example, *Walgreens* and *Wal-Mart*, as well as from typically lower overhead costs than those generally experienced by physician practices.[63] In response to the increase in prevalence of *retail clinics* in the United States, some physician practices have increased their *hours of operation* and shifted to a *customer service–focused* practice.[64]

As discussed in Chapter 4, "Competition," the *corporatization of medicine* has intensified, driven, in part, by the growth of *retail clinics*. In November 2011, it was leaked to the press that Wal-Mart intended to become the "*largest provider of primary healthcare services in the nation.*"[65] Although Wal-Mart recanted parts of its claim as "*overwritten and incorrect,*" nationally, the use of retail clinics has grown significantly in recent years, for example, from 2007 to 2009 the use of retail clinics increased by a *factor of 10* among

individuals with commercial insurance.[66] In many ways the *corporatization of medicine* is a throwback to the "*drugstore physician*" of the 1900s, when drug manufacturers marketed their products as if they were physicians, leading to published articles and pamphlets "discredit[ing] the claims of the patient medicine companies to provide personal medical advice," and the eventual passage of the *Pure Food and Drug Act of 1906*, which established the predecessor of the modern day *Food and Drug Administration* (FDA).[67]

12.2.1.2.6 Technology In addition to such process technologies as *(1) clinical protocols* and (2) *management protocols* (see Section 5.2.1, "Technology as 'Process'," in Chapter 5, "Technology"), physician professional practices are also experiencing a rapid evolution in *clinical treatment technologies*, for example, (1) *pharmaceuticals*, (2) *surgical devices,* and (3) *minimally invasive techniques*. Further, as new drugs designed to manage a host of chronic conditions continue to enter the healthcare market, the *demand for*, and *amount spent on*, *specialty drugs* is expected to increase during the next decade.[68] Specifically, as of 2011, four specialty classes accounted for 70 percent of all spending on specialty drugs, that is, *inflammatory conditions*, *multiple sclerosis* (MS), *cancer*, and *human immunodeficiency virus* (HIV).[69]

Another significant technological advancement in professional practices is the implementation of *electronic health records* (*EHR*) systems, to assist providers in the timely collection, storage, and analysis of patient health information. Through healthcare reform legislation, such as the ACA, quality metrics are becoming a more important factor in determining reimbursement rates. This movement necessitates the collection of not only

patients' vital statistics, symptoms, and physicians' clinical determinations, but also the collection of data related to the *quality of care* provided, as well as the clinical outcomes of the patient. This information will need to be summarized and transmitted to payors to verify that the subject enterprise has met the quality standards necessary for reimbursement. Should this trend toward *quality-based payments* continue, then the effective use of EHR systems may be a necessity in maintaining a professional practice's ability to generate *net economic benefit* into the future. For a more thorough discussion of the use of EHR systems, see Chapter 5, "Technology."

12.2.1.3 Value Drivers As noted in Chapter 7, "Basic Valuation Tenets," and in Chapter 11, "Inpatient Enterprises," the *value* of a healthcare enterprise is predicated on the enterprise's ability to generate an anticipated *net economic benefit* in the future, in an amount that is sufficient to support the investment in the assets making up the enterprise, which *net economic benefit* accrues to the owners of the enterprise and is available to be capitalized into an indication of *value*. Some of the factors to be examined in identifying the *risk adjustments* and potential *value drivers* for healthcare outpatient enterprises are the (1) *Scope of Services*, (2) *Capacity* for future growth, (3) nature and stability of the *Revenue Stream*, (4) *Payor Mix*, (5) efficiency of *Operating Expenses*, (6) adequacy of the *Capital Structure*, (7) stability of the *Supply Chain*, (8) *Market Rivalries and Competitors*, and (9) *Subject Entity–Specific/Nonsystematic Risk*.

The impact of these *value drivers*, within the context of the *Four Pillars* of the healthcare industry discussed earlier, were mentioned in the July 19, 2012, meeting of the *House Committee on Small Business* titled, "Health Care Realignment and Regulation: The Decline of Solo and Small Medical Practices?" at which Mark Smith, the president of Merritt Hawkins, the largest physician recruitment and consulting firm in the United States, noted that physicians are more readily choosing *not* to be in private practice, and that it was projected that within the next two years, "*75 percent of all newly hired physicians will be hospital employees.*"[70] Specifically, Smith cited five primary reasons for this "*industry transformation*," including (1) flat or *declining reimbursement*, (2) *growing regulatory* and *administrative paperwork*, (3) *malpractice insurance costs*, (4) the implementation of *information technology*, and (5) the effects of *health reform*.[71]

[70] "Testimony of Mark Smith," at "The Decline of Solo and Small Medical Practices," Testimony before the United States House of Representatives, Committee on Small Business, Subcommittee on Investigations, Oversight and Regulations, July 19, 2012, pp. 2–3.

[71] Ibid., p. 3.

PRIVATE PRACTICE INDUSTRY TRANSFORMATION

There are five primary reasons why physicians are choosing hospital employment and no longer enter into private practice: (1) flat or declining reimbursement, (2) growing regulatory and administrative paperwork, (3) malpractice insurance costs, (4) the implementation of information technology, and (5) the effects of health reform.

"Testimony of Mark Smith," at "The Decline of Solo and Small Medical Practices," Testimony before the United States House of Representatives, Committee on Small Business, Subcommittee on Investigations, Oversight and Regulations, July 19, 2012, p. 3.

12.2.1.3.1 Scope of Services The *scope of services* offered by a physician professional practice affects the level of *revenue* (and subsequent *economic benefit*) generated by the enterprise. Some organizations may seek *economies of scope* by offering multiple service lines. For example, a *multi-specialty physician professional practice* may be able to add additional service lines with minimal incremental increases in expense levels, since it may already have in place the necessary equipment and personnel being used in similar functions. In contrast, a *single-specialty practice* may not be able to achieve profitability from adding new service lines, due to the additional operational and capital cost requirements, reducing the profit margins for the services already offered by the *single-specialty practice*.

As reimbursement rates for the *professional fee component* of physician practices have decreased, many physicians have attempted to offset diminished professional revenues by adding ASTC services, which are typically more *profitable* than professional services, to the services provided by their practices.

The top 10 utilized CPT codes for each subclassification of *primary care*, *specialty care*, and *surgical care* are set forth in Table 12.13, Table 12.14, and Table 12.15.

These tables reflect the existing scope of practice for various specialties and may provide an insight into the types of services that may be offered, should the organization decide to increase its scope of services.

SURGICAL CARE

Services that incorporate an operation to treat an illness or a condition.

TABLE 12.13 Top CPT Codes for Primary Care, by Subclassification

Primary Care	CPT Code	Description	Percentage	Primary Care	CPT Code	Description	Percentage

12.2.1.3.2 Capacity The *capacity* of a physician practice may be defined as the availability of those *resources* needed to treat the *patient volume* and manage the *throughput* of a particular practice, and may include (1) *provider related resources*, (2) *building and office space*, and (3) *support staff. Provider considerations* include the determination as to whether a practice has a *sufficient number of physician/provider man-hours* to *efficiently* and *effectively* care for patient volumes. The *sufficiency* of a particular practice's *provider related resources* may be examined by comparing the practice's physician provider workload to *industry benchmarks*, using *work relative value units* (wRVUs) or *full-time equivalents* (FTEs), as the measure of *capacity.* Both the *Medical Group Management Association* (MGMA) and the *American College of Medical Practice Executives* (AMGA) publish *surveys* and *benchmarking analyses* related to *physician productivity.* A valuation analyst, in competing the required *due diligence* for an engagement, should ensure that the subject enterprise has *sufficient resources* to service its projected *patient volumes.* For a more detailed discussion of *benchmarking* and *benchmarking resources*, see Chapter 8, "Valuation Approaches and Methods."

12.2.1.3.3 Revenue Stream In healthcare, the *revenue* generated by a physician professional practice has traditionally been dependent on two factors: (1) the *volume* of services performed and (2) the reimbursement received for those services. Accordingly, increasing either the *volume* of services provided or the *reimbursement yield* will result in a corresponding increase in the *revenue* generated by a practice.

Changes in reimbursement for physician professional practices, as discussed in Chapter 8, "Valuation Approaches and Methods," are dependent on payments received from third-party payors, such as commercial and governmental payors. As has been previously noted, trends in reimbursement by commercial payors tend to be correlated with trends in Medicare reimbursement. In assessing the most probable changes to anticipate for reimbursement, the valuation analyst may begin with the historical trends in Medicare reimbursement for the physician professional services provided by the subject enterprise, as adjusted to reflect any anticipated changes in that historical relationship.

Changes in *volume* are a function of two factors: (1) *changes in utilization demand for services*, that is, the size of the pie, and (2) *changes in market share*, that is, the size of a practice's piece of the pie. In addition, an important consideration of the *revenue stream* is the *source* of patient *volumes.* For example, a *primary care practice* may attempt to form stable relationships with their patients in order to ensure repeat business, while the patient volumes of a *specialist or surgical practice* are more dependent on *referrals* from other physicians, emphasizing the *value* of the *relationship between physicians*, in contrast to the *relationship between a physician and a patient.* Of note is that as *chronic*

diseases remain the leading cause of deaths in the United States, specialists may also form more *long-term relationships* with patients, which may result in a greater proportion of patient *volumes* from returning patients.[72]

The main factor that affects how *volume* translates to *revenue* is *reimbursement yield*. A consideration related to reimbursement is the shift away from a *FFS reimbursement model* toward models of reimbursement that focus on the *value* of services provided, for example, *episode-based payment* models and *capitation-based models*. While *FFS reimbursement* remains the most significant *driver of reimbursement yield* today, as *value-driven methods of reimbursement* gain acceptance in the U.S. healthcare delivery system, valuation analysts may need to consider *alternative revenue* streams, for example, shared savings.[73]

Each payor's *reimbursement yield* is different. A review of a practice's *managed care contracts* and related *fee schedule* is imperative to developing a *reimbursement yield projection* for a payor. It should be noted that across the country, managed care provider reimbursement schedules are being linked to (normally as a multiple of) Medicare reimbursement. Therefore, the projected change for Medicare physician and ancillary services reimbursement may, if deemed appropriate, be used as a proxy for the projected reimbursement rate for the services rendered by a physician practice.

12.2.1.3.4 Payor Mix *Payor mix* may be defined as the percentage of an enterprise's *revenues*, *gross charges*, or another *defined category* that is derived from *reimbursement payments* received by the enterprise, for example, Medicare, Medicaid, commercial payors, or self-pay. *Payor mix* is often a significant factor driving the individual *value* of a specific enterprise, since it directly affects the level of *revenue* (and subsequently the *net economic benefit*) generated by a healthcare enterprise. As many physician practices continue to receive decreasing Medicare and Medicaid reimbursement rates, those enterprises that can maintain a *profitable payor mix*, under which those payors with typically higher reimbursement rates (e.g., commercial payors) subsidize the lower reimbursement rates, are likely to be the most financially stable. Payor mix may vary significantly by specialty. For example a *pediatric practice* will typically treat a lower percentage of Medicare beneficiaries than a *cardiology practice*. The payor mix maintained by a broad classification of physician practice types, as a percentage of gross charges and revenue, is set forth in Table 12.16.

Furniture and equipment	0.63%	0.66%	0.44%	0.47%
Furniture/equipment depreciation	0.53%	0.55%	0.56%	0.95%
Promotion and marketing	0.35%	0.23%	0.40%	0.32%
Outside professional fees	0.31%	0.28%	0.26%	0.32%
Consulting fees	0.24%	0.29%	0.20%	0.26%
Other insurance premiums	0.18%	0.20%	0.17%	0.17%

(*continued*)

TABLE 12.17 Physician Practice Operating Costs as a Percentage of Medical Revenue (*continued*)

Operating Costs	Primary Care Practices	Specialty Care Practices	Surgical Practices	Multispecialty Practices
Radiology and imaging	0.16%	*	1.00%	0.87%
Legal fees	0.13%	0.17%	0.15%	0.11%
Other ancillary services	0.02%	0.42%	0.94%	0.53%
Total Nonprovider Related Operating Cost	77.14%	61.34%	50.43%	71.62%

"Cost Survey," Medical Group Management Association, CD, 2012—Table 5b: "Operating Cost as a % of Total Medical Revenue" [103–Primary Care Practices; 104–Nonsurgical Medical Specialty Practices; 105–Surgical Practices; 1–Multispecialty Practices].

[1]Includes general administrative; patient accounting; general accounting; managed care administrative; information technology; housekeeping, maintenance, security; medical receptionists; medical secretaries, transcribers; medical records; other administrative support; registered nurses; licensed practical nurses; medical assistants, nurses' aides; clinical laboratory; radiology and imaging; and other medical support services.

*Not given.

As indicated in Table 12.17, a higher proportion of medical revenue in a *primary care practice* is expended on *nonprovider related expenses*, particularly as related to *general operating expenses*, which account for 42.53 percent of revenue in a *primary care practice* and are 9 percent higher than in a *multi-specialty practice*, 33.51 percent of revenue.

Provider compensation–related expenses may be defined as the *total compensation*—that is, salary, bonuses, and benefits paid to the physicians and midlevel providers of the practice—and often reflect a significant portion of a *professional practice's expense structure*. Management of *provider compensation–related expenses* can have a dramatic impact on the value of a professional practice enterprise.[74]

The ability to efficiently and effectively operate an enterprise can provide significant *value* to the owners of a business. *Operational efficiencies* typically include any means by which a business is able to reduce the *economic operating cost burden* associated with generating the *economic benefit* of the organization. Efforts to reduce operating costs for *physician professional practices* may include *renegotiating contracts with vendors*,

[74]For more information on *provider compensation–related expenses*, see Chapter 15, "Healthcare Services."

using new technologies to streamline processes, *replacing fixed costs* with more variable components, *implementing various policies* aimed at reducing workforce turnover, and a plethora of related concepts and methodologies.

Typically, the ability to operate more efficiently provides a *competitive advantage* to a firm. In the aggregate, operational efficiencies may be produced as an industry *integrates horizontally* (i.e., as firms in the industry merge together), and redundant fixed cost operating functions are consolidated to reduce costs, producing *economies of scale*. As healthcare expenditures continue to outpace the general rise in price of most other goods in the U.S. economy, and based on the fact that the U.S. government is one of the top payors for healthcare services, policies enacted by the central government may continue to increase the likelihood of consolidation in the industry in an effort to achieve some semblance of scale economies. This concept is embodied in a quote from Nick A. Fabrizio, PhD, FACHE, principal of *Medical Group Management Association*'s healthcare consulting group:

> *The economic reality of the past ten years is that the physician's overhead—the cost of having a medical practice—has increased every year. Total operating costs per FTE physician have been rising rapidly over the past several years.... This increase has occurred at a faster rate than increases in reimbursement—a recipe for disaster. Many physicians see only two ways to survive in today's environment: merge with another practice and form a larger group, thus taking advantage of economies of scale and enhanced revenues; or join a hospital and become a hospital employee, allowing the hospital to assume financial responsibility for their practice overhead.*[75]

As alluded to earlier, the trend in increased hospital employment of physicians may be due, in part, to the variance in the operating costs between *physician*- and *hospital*-owned practices, which for primary care practices was higher under *physician ownership* ($502,687 annually per FTE physician), as compared to hospital *ownership* ($465,565 annually per FTE physician).[76]

Another notable trend in the economic operating costs of *physician professional practices* is the continued increase in medical care costs, measured by the *Practice Expenses* component of the *Medicare Economic Index*

---

[75] Nick A. Fabrizio, "Employing Physicians: The Future Is Now," *Futurescan*, 2012, pp. 44–45.

[76] *Cost Survey for Primary Care Practices* (Englewood, CO: Medical Group Management Association, 2011), p.18.

(MEI), which is one factor used by CMS in the development of the *conversion factor* for payments to physicians through the MPFS, in comparison to a rise in general price inflation (as calculated by the percentage of change in the consumer price index). The percentage increase in the *Practice Expenses* component of the MEI has outpaced inflation as far back as Q1 of 1996, as illustrated in Exhibit 12.1.

Recent innovations in technology have increased the ability of physician professional practices (both hospital and physician-owned) to operate more efficiently, for example, the implementation of *electronic health records* (EHR), *computerized physician order entry* (CPOE), and so on, which allow an organization to use less human-related capital in favor of the less costly use of the physical capital that makes up the technology system. Larger organizations have an enhanced ability to amortize the capital expense burden associated with the investment in these technologies over a larger patient base, in comparison to a smaller organization, thus generating

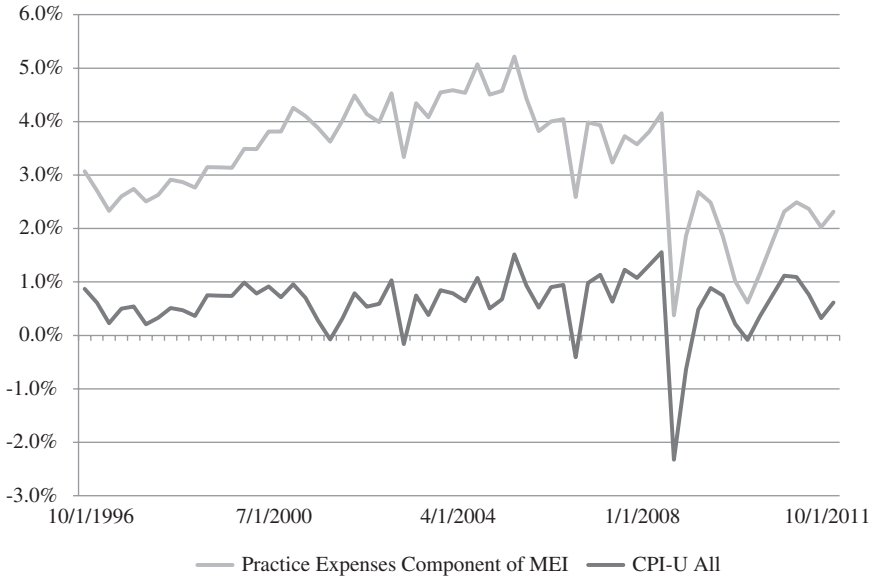

EXHIBIT 12.1 Inflation Compared to Practice Expense Component of MEI, by Quarter

"Quarterly Index Levels in the CMS Medicare Economic Index Using HIS Global Insight Inc. (IGI) Forecast Assumptions, by Expense Category, 1996–2021," Centers for Medicare and Medicaid Services, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/downloads/mktbskt-economic-index.pdf (accessed December 13, 2012).

a larger efficiency gain, for example, in the case of EHR, the amount of administrative support staff cost burden reduced by the software system is higher on a percentage basis in terms of the cost of the EHR for larger organizations compared to smaller organizations.[77]

12.2.1.3.6 Capital Structure The *capital structure* of an enterprise, including *physician professional practices*, may be characterized by its *debt-to-equity ratio*, which is a measure of a company's *leverage* and indicates the proportion of *debt* and *equity* that a company uses to finance its assets (see Chapter 9, "Costs and Sources of Capital"). Other measures of the extent of *leverage* employed by an enterprise include, but are not be limited to, *total liabilities to book value of total capital*, *total liabilities to market value of equity*, *interest-bearing debt (IBD) to market value of invested capital (MVIC)*, *IBD to book value of total capital*, and *IBD to market value of equity, as well as others*.

The capital structure decision affects the *economic capital cost burden* of an enterprise. *Value* is created through the capital structure decision by affecting the *risk-adjusted required rate of return* that an investor would require to invest capital in the subject enterprise. The *risk-adjusted required rate of return* for debt is called the *cost of debt*, while the *risk-adjusted required rate of return* for equity is called the *cost of equity.* In combination, the *cost of debt* and the *cost of equity* form the total cost of capital for the firm, known as the *weighted average cost of capital* or *WACC*.[78]

In terms of *value* (all else being equal), the *lower* the *required rate of return on an investment* (i.e., the combination of equity and debt used in the investment's capital structure), the *greater* the *value* of the enterprise. *Debt financing* is typically cheaper than *equity*, in terms of the *risk-adjusted*

CAPITAL STRUCTURE OF AN ENTERPRISE

Capital structure is characterized by its debt-to-equity ratio, which is a measure of a company's leverage in the market and indicates what proportion of debt or equity a company uses to finance its assets.

[77] For more information regarding technological innovations in the healthcare industry see Chapter 5, "Technology."

[78] For a more thorough discussion of the *WACC* and its various components and calculations, see Section, 9.2.1.4, "Weighted Average Cost of Capital (WACC)," in Chapter 9, "Costs and Sources of Capital."

required rate of return demanded by each type of investor, due to the priority claim that lenders have on the assets of the firm in the case of bankruptcy, as well as the priority that lenders have on the income of the enterprise over that of the equity holders. The decision to add more debt to the capital structure typically involves an increase in the *risk perception* of the equity investors, since the increase in leverage typically increases the probability of financial distress and also lowers the amount of cash flow available to the equity holder. Therefore, generally speaking, if taxes, transaction costs, costs of financial distress, and other related economic costs of leverage are ignored, as the amount of debt in the capital structure of a particular enterprise increases, the *risk-adjusted required rate of return* demanded by equity investors should also increase, maintaining a constant *WACC* and creating no additional *value* in the firm due to the capital structure decision.[79]

However, if taxes are considered, and the tax code in which the enterprise operates allows for the deductibility of interest payments from taxable income, then a tax-paying entity would realize an increase in the indication of *value* through the use of additional debt financing.[80] It should be noted, however, that the benefit from tax deductibility must be weighed against any anticipated costs of financial distress (or bankruptcy) and transactions costs that may arise with the issuance of additional debt financing.

For illustration purposes, various metrics describing the *capital structure* of physician professional practices, which operate within SIC Code 8011, are presented in Table 12.18.

It is worth mentioning that a benchmark *debt-to-equity ratio* may be calculated by using two types of industry data: (1) a *composite of industry statistics sources*, for example, tax returns and balance sheets, which report the historical *value/cost* of the *debt* and *equity* employed, commonly referred to as *book value*, and (2) selected *guideline public companies in the industry*, for which current prices of the publicly traded debt and equity are reported and are commonly referred to as *market value*. It should be noted that for the purpose of establishing the *fair market value* of a business enterprise, it is important to use formulas based on *market values* of *equity* and *debt*, rather than *book values*.[81] However, in the healthcare industry,

TABLE 12.18 Leverage Ratios for Physician Offices (SIC 8011)

	2010
Debt/Market Value Equity	25.26%
Liquidity	*
Cost of Debt	*
Cost of Equity	14.27%

Ibbotson Cost of Capital Data is only available for SIC 8011 for 2010; all other capital analysis will contain a four-year trend from 2009 to 2012. *Ibbotson Cost of Capital Yearbook*, (Chicago: Morningstar, editions 2012, 2011, 2010, and 2009).
* Not given.

public markets do not exist for the debt of physician professional practices. Therefore, when appraising a physician professional practice, the valuation analyst will typically use the book value of debt, as reported on the subject enterprise's balance sheet. Accordingly, benchmark data sources also reflect leverage ratios that are calculated based on the book value of debt. (See *Key Sources* for benchmark data sources.)

Table 12.18 illustrates that in 2010, for every $100 of equity employed by the owners of the business enterprise, a corresponding $25.26 of debt (*debt/market value* equity) was used. The amount of leverage employed by an enterprise is determined by many factors, including but not limited to the *capital-intensive nature of the business operations*, for example, practices with ancillary services, rather than surgical or hospital-based physician practices, are highly leveraged due to the capital requirement needed to fund the assets of the business, such as expensive *imaging equipment*.

In addition, a firm's ability to access more *debt* in its capital structure may be constrained by lenders' concerns regarding the firm's ability to repay the liability in the future. A key factor affecting a lender's assessment of the potential risk of lending to an enterprise is the *liquidity profile* of that enterprise. Firms with higher *liquidity*, that is, a greater ratio of current assets to current liabilities, will appear to be better capable of meeting its obligations in the future, and lenders will therefore demand less compensation in the form of interest payments from the borrower, for providing capital to the subject enterprise.

12.2.1.3.7 Suppliers The supply chain may be defined as the set of relationships that manages the movement of supplies between the manufacture

Distributor

In the supply chain, a distributor is a company that acts as middleman between the manufacturer and the provider.

"The Post-Reform Environment for Distributors and Manufacturers," Health Industry Distributors Association, presented at Med SC Spring Meeting, May 18, 2011.

and the distributor through various distribution channels. The *supply chain* may also have a big impact on the *economic operating cost burden* incurred by a physician professional practice. The level of impact that the *supply chain* may have on the *value* of a healthcare provider enterprise depends on the level of *net economic cost burden* incurred by the enterprise, in relation to the amount of drugs and supplies required by the provisions of those *services* and the generation of *revenues* that provide a *net economic benefit* of ownership. Interruptions in the *supply chain* may limit a practice's ability to provide medical services and may therefore negatively affect the *generation of revenue*.

Many healthcare providers (typically, small to medium-size physician practices) usually do not obtain their supplies *directly* from a manufacturer, but instead use a *distributor or supplier.* In 2010, U.S. healthcare distributors delivered supplies to more than 200,000 sites of care, including 195,000 physician offices. Generally, physician practices order 96 percent of the medical products and supplies used from a distributor.[82]

12.2.1.3.8 Market Rivalries and Competitors Competition between physician professional practices (and other enterprises that offer similar services) affects both the *revenue* generated by an enterprise and the economic operating cost burden associated with the generation of that *revenue*. The *net economic benefit* generated from the operation of an enterprise is directly affected by increased/decreased competition, for example, as more competitors enter the market, existing providers may be forced to compete by either *accepting lower reimbursement* or *increasing the quality* of services, in order to retain market share. However, by the enterprise *accepting lower reimbursement*, the revenue generated by the enterprise would decrease, and

[82] "The Post-Reform Environment for Distributors and Manufacturers," Health Industry Distributors Association, presented at Med SC Spring Meeting, May 18, 2011.

by *increasing quality*, the economic operating cost burden may increase, in either of which events the amount of *net economic benefit* accruing to the owner would be reduced.

It is estimated that the segment of the U.S. population over age 65 will *double* between 2005 and 2030, resulting in a significant increase in *demand* for *preventive healthcare* and *chronic disease management services*, thereby increasing the amount of economic benefit accruing to professional physician practices.[83] In addition, as the general health status of the U.S. population declines, due to increased rates of chronic diseases, for example, *obesity*, *allergies*, and *cardiovascular disease*, the demand for specialists in these fields will likely increase.[84] The supply of physicians from 1975 to 2010, as compared to the total U.S. population, is set forth in Table 12.19.

TABLE 12.19 Population to Physician Ratio, 1975–2010

	1975	1980	1985	1990	1995	2000	2010	Percentage Change (1975–2010)	Percentage Change (1990–2010)	Compound Annual Growth Rate (1975–2010)
Total Population	219,272,000	231,266,000	242,946,000	252,164,000	262,755,000	282,217,000	309,051,000	**40.9%**	**22.6%**	**1.0%**
Total Number Physicians	393,742	467,679	552,716	615,421	720,325	813,770	985,375	**150.3%**	**60.1%**	**2.7%**
Ratio	557	494	440	410	365	347	314	**–43.7%**	**–23.5%**	**–1.6%**
Office-Based	215,429	272,000	330,197	360,995	427,275	490,398	565,024	**162.3%**	**56.5%**	**2.8%**
Ratio	1,018	850	736	699	615	575	547	**–46.3%**	**–21.7%**	**–1.8%**
Hospital-Based	96,508	104,512	118,623	142,875	154,856	157,032	187,548	**94.3%**	**31.3%**	**1.9%**
Ratio	2,272	2,213	2,048	1,765	1,697	1,797	1,648	**–27.5%**	**–6.6%**	**–0.9%**

American Medical Association, *Physician Characteristics and Distribution in the US,* 2012 Edition (Chicago: American Medical Association, 2012), pp. 440–444, 449–452.

Factoid

The population-to-physician ratio has decreased significantly during the last 25 years, and the decrease in the population-to-physician ratio for physicians practicing in an office-based setting was much more pronounced than for those physicians practicing in a hospital-based setting.

American Medical Association, Physician Characteristics and Distribution in the US, *2012 Edition (Chicago: American Medical Association, 2012), pp. 440–444, 449–452.*

As indicated in Table 12.19, the *population-to-physician ratio* has decreased significantly during the past 25 years. Of note is that the decrease in the *population-to-physician ratio* for a physicians practicing in an *office-based setting* (–43.7 percent from 1975 to 2010) was much more pronounced than for those physicians practicing in a *hospital-based setting* (–27.5 percent from 1975 to 2010).[85]

The percentage of growth in the supply of physicians from 1975 to 2010 is illustrated in Exhibit 12.2.

Physician practices compete with other *physician practices*, *midlevel providers*, *hospital outpatient departments*, and other *outpatient providers* that generate *ASTC revenues* (discussed earlier). In light of the continuing concerns regarding the supply of primary care physicians, specialists, and surgeons, those physician providers who have existing affiliation relationships with hospitals and health systems (e.g., participating in ACO or comanagement arrangements) may be in the best position to benefit in an era of reform that increasingly reimburses providers based on "*quality*" over "*quantity.*"

12.2.1.3.9 Subject Entity Specific/Nonsystematic Risk As discussed in Chapter 9, "Costs and Sources of Capital," the *discount rate* at which the measured expected future stream of economic benefit of ownership is discounted to present value is selected by the valuation analyst to represent the rate of return a typical investor in the enterprise being valued would require in *discounting* the expected *stream* of the *net economic benefits* of ownership in the subject enterprise, given the systematic risk of the market, as well as the unsystematic risk of investment in the enterprise. In contrast, the capitalization rate is the rate by which a single estimate of benefit is divided to determine value.

[85] American Medical Association, *Physician Characteristics and Distribution in the US*, 2012 Edition (Chicago: American Medical Association, 2012), pp. 440–444, 449–452.

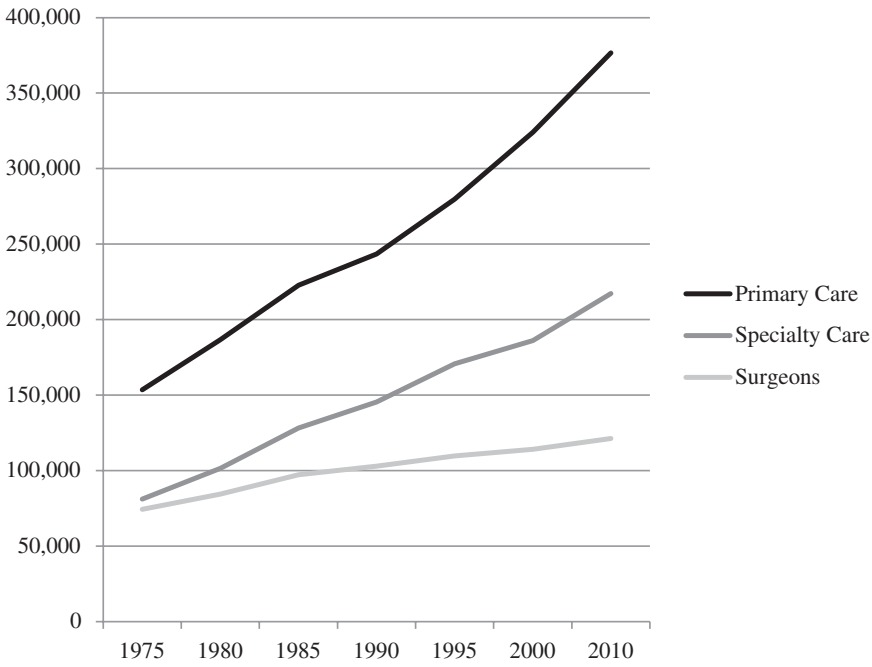

EXHIBIT 12.2 Supply of Physicians, 1975–2010

This exhibit does not include specialties not discussed (68,950 physicians), inactive physicians (125,928 physicians), or physicians who are not classified under a specific specialty (64,585 physicians); therefore, total supply numbers will not add up to the total number of physicians (985,375) indicated in Table 12-19: "Population to Physician Ratio, 1975–2010," earlier. American Medical Association, *Physician Characteristics and Distribution in the US*, 2012 Edition (Chicago: American Medical Association, 2012), pp. 440–444, 449–452.

As described in more detail in Chapter 8, "Valuation Approaches and Methods," the *cost of equity* may be developed by "*building up*" the aggregate elements of several rates and risk adjustments, including:

1. The *risk-free rate*;
2. The *investment alternative* (equity risk premium);
3. The *healthcare industry risk premium*;
4. The *small public company risk premium*; and
5. The *specific risk premium* for the particular physician practice being valued.[86]

[86] A discussion of the first four rates and risk adjustments is set forth in Chapter 9, "Costs and Sources of Capital."

The adjustment for the *specific risk premium* for the particular physician practice being valued is somewhat more subjective than the other four elements used in the *buildup method*, in that it reflects the valuation analyst's *informed assessment* of the various *risk factors* that are inherent and specific to the enterprise being valued and reflects the *extra return of required* by investors in the enterprise based on the valuation analyst's subjective assessment of the *risk factors* related to the enterprise.[87] Specific risk factors to consider when valuing a physician professional practice include:

1. *Uncertainty* related to the *continuity of the revenue stream* of the *subject enterprise*;
2. *Uncertainty* related to the *probability* of the subject enterprise *achieving the projections* used by the valuation analyst;
3. Level of *competition* in the subject enterprise's market service area;
4. *Stability of the subject enterprise's provider workforce* compared to that of normative industry benchmark survey data;
5. *Operational and financial performance* of the practice compared to normative industry benchmark survey data; and
6. The level of *technological obsolescence* of the services provided by the subject enterprise.

12.2.1.4 Pertinent Valuation Considerations: Physician Professional Practices In addition to the typical valuation considerations described earlier, the valuation of inpatient enterprises should also include specific considerations of the *type*, *nature*, and *scope* of the subject enterprise being appraised.

As discussed in Chapter 11, "Inpatient Enterprises," the valuation analyst should consider any necessary *normalizing adjustment* to the revenues and expenses of the subject enterprise. The specific purpose for and examples of *normalizing adjustments* the valuation analyst should consider in the valuation of professional physician practices are illustrated in Table 12.20. Further, revenue stream considerations are a significant value driver for the valuation of professional physician practices. Table 12.21 provides specific consideration for the projection of revenue for professional physician practices. Two examples of the application of pertinent valuation considerations for physician professional practices can be found online at http://www.wiley.com/go/healthcarevaluation.

12.2.2 Allied Health Practices

Allied health professionals include those providers who practice "*parallel*" to physicians, often striving to meet demands for care that *align* (and sometimes

[87] See Section 9.2.1.2.1.5, "Subject Entity Specific Risk Premium," in Chapter 9, "Costs and Sources of Capital," for further discussion of this method.

TABLE 12.20 Normalizing Adjustment Considerations pertinent to Professional Practices

Specific Purposes for Normalizing Adjustments for the Valuation of Physician Professional Practices	Specific Examples of Normalizing Adjustments for Physician Professional Practices
Level of Interest Normalizing Adjustments—Revenues and expenses are to be reflective of what the *typical* buyer (i.e., buyer of a controlling or a minority interest) should expect to realize.	Typical expenses requiring Normalizing Adjustments for the purposes of deriving cash flow related to a control/minority interest in a physician professional practice may include: (1) Owner's Discretionary Expenses (e.g., family members on a payroll, automobiles, etc.); (2) Office Rent Expense (if office space is leased from an entity with common ownership as the practice); and (3) Gifts and charitable donations, or other nonoperating expenses.
Adjustment of Owner-Provider Compensation to Fair Market Value—Typically, the owner compensation encompasses the most significant expenses for professional practices. As required by Revenue Rulings 59–60 and 68–609, as well as set forth under the definition of *Fair Market Value*, which assumes a *"hypothetical willing"* buyer of the subject enterprise, rather than an individual specific buyer,owner compensation should be adjusted to a *"reasonable amount for the services performed by the owner or partners engaged in the business."*	Typical steps for adjusting owner-provider's compensation to *Fair Market Value* should include the following: (1) Identifying the specific tasks, duties, responsibilities, and accountabilities (TDRAs) of the owner-provider; (2) Determining the range of industry compensation for the owner-provider's production/input based on the TDRAs of the owner-provider; and (3) Selecting the *Fair Market Value* cost to replicate or replace the owner-provider's services; See Chapter 15, "Healthcare Services," for further discussion of determining *Fair Market Value* for healthcare services.

(*continued*)

TABLE 12.20 Normalizing Adjustment Considerations pertinent to Professional Practices (*continued*)

Specific Purposes for Normalizing Adjustments for the Valuation of Physician Professional Practices	Specific Examples of Normalizing Adjustments for Physician Professional Practices
Adjustment for Nonrecurring and Extraordinary Revenue and Expenses—Revenue and expenses that are nonrecurring and/or extraordinary should be identified and adjusted appropriately to reflect the ongoing operations of the subject professional practices.	Typically nonrecurring and/or extraordinary revenues and expenses in a physician professional practice include: (1) Medicare payment settlements; (2) Legal expenses related to the defense of medical malpractice; (3) Certain furniture and equipment purchases; (4) Gains or losses on asset sales; and (5) Consulting expenses related to nonrecurring projects.
Adjustment for Timing of Revenue and Expense Recognition—Financial statements prepared for closely held physician professional practices (as with other small businesses) are most often prepared by tax counsel to reflect the specific circumstances of the individual owner's tax posture, and to minimize the client's exposure thereto, and therefore, are typically prepared on a *cash basis* or *income tax basis*. It is important that the valuation analyst make normalizing adjustments that match the timing of the subject practice's revenue to the period in which the expenses related to the generation of the revenue occurred (i.e., *accrual basis*).	In addition to the typical accrual adjustments required to convert cash basis financial statements to accrual basis (e.g., timing of revenue and estimating the practices accounts receivable and accounts payable), other revenue, expenses, assets, and liabilities that may require *adjustment for timing recognition* may include: (1) Medicare payment settlements; (2) Consideration of capitation and copay reimbursement; (3) Value of medical supply and other inventory on-hand; (4) Contingent liabilities (e.g., pending medical malpractice claims); (5) Incurred But Not Reported (IBNR) liabilities; and (6) *Fair Market Value* of key person life insurance policies.

compete) with those met by physicians. Allied health professionals are state licensed and credentialed healthcare providers who receive formal academic and clinical training. Allied health practitioners often work with physicians and other healthcare professionals to provide high-quality patient care.

Allied Health Professionals

Providers who practice "*parallel*" to physicians but provide a scope of services that is distinctly different from physicians, representing 60 percent of the U.S. healthcare workforce, providing diagnostic, technical, and therapeutic services *incident to* (supporting) or *in lieu of* (replacing) physicians.

"Allied Health Professionals Highlights: Workforce Shortage Crisis," Allied Health Professionals, November 12, 2006, http://www.californiahealthline.org/Features/2009/Shortage-of-Allied-Health-Workers (accessed April 10, 2009).

TABLE 12.21 Revenue Stream Considerations Pertinent to Professional Practices

Specific Purposes for the Projection of Revenue for the Valuation of Physician Professional Practices	Specific Considerations for the Projection of Revenue for Physician Professional Practices
Traditionally, revenue for physician professional practices has been based on the *Fee-for-Service* convention, which is driven by *patient volume*, based on changes in the *utilization demand/market share* for services provided.	Typical steps for projecting patient volume of a professional practice include: (1) Review and analyze *historical patient volume trends* and compare to industry benchmarks; (2) Obtain *demographic projections* of the subject practice's market service area; (3) Obtain projected *incidence and prevalence* of specific injuries, ailments, or diseases treated by the subject enterprise; (4) Research *new technologies and treatments* for the injuries, ailments, or diseases treated by the providers of the subject enterprise, and assess their impact on future patient volume; (5) Review the *payor contracts* of the subject professional practice and determine the likeliness of renewal and impact of nonrenewal; (6) Assess the *patient volume capacity* of the subject practice; (7) Assess the *competitive landscape* of the market service area; and (8) Conduct *management interviews* and assess the *achievability* of revenue projections.

(*continued*)

TABLE 12.21 Revenue Stream Considerations Pertinent to Professional Practices (*continued*)

Specific Purposes for the Projection of Revenue for the Valuation of Physician Professional Practices	Specific Considerations for the Projection of Revenue for Physician Professional Practices
In addition to patient volume, revenue for physician professional practices is dependent on the *reimbursement yield* (received) for services provided.	Typical steps for projecting *reimbursement yield* of a physician professional practice include: (1) Review and analyze historical trends in the subject professional practice's payor mix; (2) Review the payor contracts of the subject enterprise, and determine the reimbursement methodologies of each payor (e.g., % of Medicare, discounted fee-for-service, capitation, shared savings, etc.); (3) Research historical (and projected, if available) trends in government payor reimbursement for the services provided at the subject enterprise; (4) Research historical (and projected, if available) trends in commercial and other payor reimbursement for the services provided at the subject enterprise; and (5) Review changes in CMS coding procedures for the services rendered by the providers of the subject enterprise, i.e., CMS annually updates the Physician Fee Schedule, and periodically bundles, or roll-ups, CPT codes. For example, in 2010 three former SPECT related CPT codes (i.e., 78465—SPECT myocardial perfusion imaging multiple study, 78480, and 78478—add on codes for wall motion and ejection fraction) were combined into one new CPT code (i.e., 78452). Note that the bundling of these codes had a significant impact (decrease) on the revenue of cardiology practices beginning in 2010. See Chapter 2, "Reimbursement Environment," for further discussion.

12.2.2.1 Types of Allied Health Professional Practices Types of allied health professionals include (1) *dentists*, (2) *optometrists*, (3) *chiropractors*, (4) *psychologists*, and (5) *podiatrists*. These professionals typically provide a *scope of services* that is distinct from an *allopathic* or *osteopathic* physician's *scope of practice*. However, even though the services rendered by an allied health professional may differ from those of an *allopathic* or *osteopathic* physician, the valuation methodology for a*llied health professional practices* is similar in nature to *physician professional practices*. A brief classification and current overview of each type of allied health professional practice is set forth below.

12.2.2.1.1 Dental Practices Dental practitioners provide a broad range of services to patients, including (1) *prophylaxis* (e.g., cleaning), (2) periodic *oral evaluation*, and (3) *direct restoration*.[88] As of 2012, in the United States there were 170,725 dental offices and clinics. Although most dentists operate *private practices* consisting of one or two dentists (68.7 percent and 19.6 percent, respectively), *dental practice management companies* have gained traction in the market as the continually rising cost of operating a practice has driven increased consolidation of the dental industry.[89] It is estimated that in the United States, as of 2012, there were more than 4,000 publicly traded or privately held *dental management companies*.[90]

There are currently 64 accredited *dental education programs* in the United States, each accredited by the *Commission on Dental Accreditation* (*CODA*), an accreditation authority acting under the *American Dental Association* (*ADA*). Most dental education programs require students to have at least a bachelor degree prior to acceptance. While no specific undergraduate degree is required by dental schools, an undergraduate degree in a science, such as biology, may increase the probability of acceptance. Most undergraduates applying for acceptance to a dental program will, typically in their junior year, take the Dental Acceptance Test (DAT), which is used by dental schools, in addition to other factors, in determining those applicants who are most likely to succeed in a dental education program.[91] Individuals

Factoid

There are currently 64 accredited dental education programs in the United States, each accredited by the Commission on Dental Accreditation (CODA), an accreditation authority acting under the American Dental Association (ADA).

"DDS/DMD Programs—U.S.," American Dental Association, http://www.ada.org/267.aspx (accessed August 22, 2012).

who successfully complete a *dental education program* are awarded either a *Doctorate of Dental Surgery* (*D.D.S.*) or a *Doctorate of Dental Medicine* (*D.M.D.*), two degrees that are functionally *identical*.[92]

Dental specialists, for example, *orthodontists*, *periodontists*, or *oral and maxillofacial surgeons*, must complete additional *postgraduate training*, as well as a separate *competency exam* administered by the national board for the specialty in order to become "*board certified*."[93] There are currently nine dental specializations recognized by the ADA, including (1) *dental public health*, (2) *endodontic*, (3) *oral and maxillofacial*, (4) *oral and maxillofacial surgery*, (5) *oral pathology*, (6) *orthodontia*, (7) *pediatric dentistry*, (8) *periodontics*, and (9) *prosthodontics*.[94] As of December 2011, the most popular dental specializations were *Oral and Maxillofacial Surgery* (7,335 certified practitioners) and *Orthodontics* (7,708 certified practitioners).[95] However, most dentists are general practitioners, accounting for 84 percent of the dental industry as of 2012.[96]

[95] American Dental Association, *Report of the ADA-Recognized Dental Specialty Certifying Boards*, April 2012, p. 7.

[96] U.S. Bureau of Labor Statistics, "Dentists," in *Occupational Outlook Handbook*, 2013–2013 Edition, March 29, 2012; Anna Son, *IBISWorld Industry Report 62121: Dentists in the US*, IBISWorld, August 2012, p. 14.

Operatory

The space and equipment used in the provision of professional dental services.

Dental offices are typically organized around the *operatory*, that is, the space and equipment used in the provision of professional dental services. *Efficient design management* related to the use of the *operatories* within a dental practice is key to *maximizing* the practice's ability to generate *net economic benefit*, whereby greater patient throughput in the *operatories* will translate into *greater productivity* (measured by procedure volume) *per unit of output*, thereby lowering *total cost per unit of output*, which in turn will increase the practice's *profit margin per unit of output*. *Operatories* may be used as a *unit metric* during the benchmarking process to *compare* the subject dental practice's *historical operating performance* against *industry normative data*. Typically, the valuation analyst will express the *subject data* as a *percentage of revenue*, referred to as "*common sizing*," to allow for a comparison across practices; for example, the valuation analyst may compare the *revenue*, *expenses*, *profit*, or *support staff* of the subject enterprise to *industry-indicated normative data* on a *per operatory* basis.[97] The *operatory* may also be used as a unit metric to analyze the *capacity utilization* of the subject enterprise. The comparison of *output measures* (e.g., *procedure volume* or *patient visits*) *per operatory* can provide insight regarding the ability of the subject enterprise to achieve the *output* (revenue) projected by the valuation analyst within the *capacity* of the current *level of capital* employed by the subject enterprise.

The SIC and NAICS codes for *dentists* are set forth in Table 12.22.

12.2.2.1.2 Optometric Practices *Optometrists*, or *Doctors of Optometry (OD)*, are the primary providers of eye and vision-related care, providing primary eye care to two-thirds of U.S. patients.[98] Optometrists are trained to examine a patient's eyes to determine the nature and degree of a vision problem, as well as diagnose, treat, and manage diseases, injuries, and disorders of the visual system, including a patient's eyes and associated structures.[99] As

[97] Common size refers to expressing the historical financial metrics as a percentage or ratio of some measure. See Section 8.3.1, "Financial and Operational Benchmarking," in Chapter 8, "Valuation Approaches and Methods."

Zipperer, American Medical Association, 1995, p. 225.*

[100] Mark K. Colip, "AOA Research and Information Center (RIC): Building a New Information Resource for Our Profession and Industry," American Optometric Association, Spring 2011, p. 1.

Factoid

As of 2010, a majority of optometrists operated in private practice (75 percent), with the remaining workforce operating in corporate practice (8.6 percent) or other practice types (16.4 percent).

"AOA Research and Information Center (RIC): Building a New Information Resource for Our Profession and Industry," by Mark K. Colip, American Optometric Association, Spring 2011, p. 1.

optometrists operating in a corporate practice are approximately 10 years younger than those operating in private practice.[101]

Individuals seeking employment must first complete a *Doctor of Optometry* (OD) degree. In 2011, there existed 20 accredited *Doctor of Optometry* programs in the United States, including one in Puerto Rico. Applicants to OD degree programs are required to have at least three years of postsecondary education but are not required to have a bachelor's degree. An OD degree requires four years of study, beyond the three-year prerequisite for acceptance to the program.[102]

In addition to completing an OD degree, optometrists must also pass a national examination administered by the *National Board of Examiners in Optometry* (NBEO) in order to practice.[103] Some optometrists also participate in residency programs (often one year) following optometry school, which offer training in optometric subspecialties such as family practice optometry, pediatric optometry, geriatric optometry, vision therapy and rehabilitation, low-vision rehabilitation, cornea and contact lenses, refractive and ocular surgery, primary eye care optometry, ocular disease, and community health optometry.[104]

In addition to the *provision of medical services* by optometrists, as noted earlier, a significant portion of an *optometric practice's revenue* may be generated from the *retail sales of optical lenses and frames*. In 2012,

[101] Ibid., pp. 2–3.

[102] Bureau of Labor Statistics, "Optometrists," in *Occupational Health Handbook*, 2012– 2013 Edition, May 24, 2012, http://www.bls.gov/ooh/healthcare/optometrists.htm#tab-4 (accessed December 7, 2012).

[103] "Doctors of Optometry and Their Education," American Optometric Association, http://www.aoa.org/x5879.xml (accessed December 7, 2012).

[104] Bureau of Labor Statistics, "Optometrists," in *Occupational Health Handbook,* 2012– 2013 Edition, May 24, 2012, http://www.bls.gov/ooh/healthcare/optometrists.htm#tab-4 (accessed December 7, 2012).

Exam Lane

Refers to the area where optometrists assess the patient's visual acuity, eye, and systemic health, in determining the appropriate prescription an/or course of treatment required by the patient.

43 percent of revenue in the optometric industry was generated by the *sale of optical goods*.[105] The economic factors affecting the *retail portion* of an optometric practice may be *distinct* from the economic factors affecting the *professional services portion* of the practice and are subject to those factors considered by the *Four Pillars*, that is, *regulatory, reimbursement, competition, and technology.* Consequently, the valuation analyst should consider performing his or her *analyses* and *projections* related to the subject optometric practice as *two separate* and *distinct service lines*, that is, the *professional service line*, as well as a *retail sales service line* with *revenues* and *economic operating* and *economic capital cost burdens* projected *separately* for each service line.

A typical unit of *capacity measure* for optometric enterprises is the "*lane*," which refers to the exam lane where optometrists assess the patient's *visual acuity*, *eyes*, and *systemic health*, in determining the *appropriate prescription* and/or *course of treatment* required by the patient. Similar to the *operatories* discussed for dental practices, the number of *optometry lanes* used at an optometric practice can provide insight to the valuation analyst regarding the *efficiency* of the subject enterprise in using its assets, as well as provide a convenient *measure of capacity* utilization for comparison to *industry normative data*.

The SIC and NAICS codes for optometrists are set forth in Table 12.23.

12.2.2.1.3 Chiropractic Practices *Chiropractic treatment* focuses on *spinal manipulation* to treat *neuromusculoskeletal* conditions, for example, *back pain, neck pain, joint pain*, and *headaches*. Treatments can include natural and noninvasive physical therapy modalities, exercise programs, nutritional advice, orthotics, lifestyle modifications, and other patient education.[106] Chiropractors often assess patients through clinical examinations, laboratory testing, diagnostic imaging, and other diagnostic

TABLE 12.23 SIC and NAICS Codes for Optometrists

SIC		NAICS	
Title	**Code**	**Title**	**Description**
"Offices and Clinics of Optometrists"	61320	"Offices of Optometrists"	This code is used for doctors of optometry (OD) who have independent practices, either office-based or hospital-based, specializing in optometry to conduct eye exams and prescribe visual aids.

"Division of Corporate Finance: Standard Industrial Classification (SIC) Code List," U.S. Securities and Exchange Commission, October 26, 2011, http://www.sec.gov/info/edgar/siccodes.htm (accessed October 31, 2012); *Annual Statement Studies: Financial Ratio Benchmarks,* 2011–2012 Edition, Risk Management Association (Philadelphia: Risk Management Association, 2011), pp. 84, 85.

interventions.[107] The chiropractic industry is dominated by independent practices, with the top four chiropractic providers accounting for less than 2 percent of the total U.S. market (56,314 chiropractic establishments), as of 2012.[108]

Acceptance to a chiropractic college typically requires completion of, at a minimum, 90 credit hours of undergraduate education. It is not required, but completion of a bachelor program may be helpful in gaining acceptance to a chiropractic college. The completion of a chiropractic degree requires four years and may include coursework in biology, anatomy, and physics.

Chiropractors

Chiropractic treatment focuses on spinal manipulation (referred to as spinal adjustment) and the body's natural power to heal itself without relying on drugs or surgery. Chiropractors use various forms of therapy including massage, ultrasound, electric, acupuncture, or heat, and various supports (e.g., braces) in providing patient care

"The Chiropractic Profession," by David A. Chapman-Smith, NCMIC Group Inc., 2000, p.1; "Chiropractors," Occupational Outlook Handbook, *Bureau of Labor Statistics, 2008–2009 Edition, p. 1.*

[107] Ibid.

[108] Anna Son, *IBISWorld Industry Report 62131: Chiropractors in the U.S.,* IBISWorld, January 2013.

Some chiropractors may also complete residency programs to obtain additional training in chiropractic specialties.[109]

In addition to achieving a doctor of chiropractic degree from a chiropractic college accredited by the *Council on Chiropractic Education*, chiropractors must pass a national board examination in order to practice.[110] As of 2012, there are only 18 accredited chiropractic colleges in the United States.[111] *Specialization* is a growing trend within the chiropractic profession, as many chiropractic colleges offer postgraduate specialty education in *sports injuries* and *occupational health* to orthopedics and neurology.[112] Specializations can also be obtained from various specialty boards, for example, *American Academy of Chiropractic Physicians* (AACP), *the American Chiropractic Board of Sports Physicians* (ACBSP), *the College on Forensic Sciences* (CFS), and *the International Academy of Chiropractic Neurology* (IACN).[113]

The revenue stream of a chiropractic practice, to a great extent, relies primarily on the labor of the chiropractor as the main input in generation of revenue. As such, the most efficacious measures of *efficiency*, as well as *capacity utilization,* are based on a *per provider* metrics, for example, *revenue, expenses, profits,* or *support staff* per practitioner. However, the valuation analyst may consider other capacity measures, such as *revenue, expenses, profit,* or *support staff* per *chiropractic table* or on a *per square foot* basis. In addition, it should be noted that modern chiropractic practices provide related ancillary services, such as *massage therapy*, *acupuncture*, and *nutritional supplements*, as well as *retail sales* of certain medical devices, such as *transcutaneous electrical nerve simulation units* (TEN units).

The SIC and NAICS codes for chiropractors are set forth in Table 12.24.

TABLE 12.24 SIC and NAICS Codes for Chiropractors

SIC		NAICS		
Code	**Title**	**Code**	**Title**	**Description**
8041	"Offices and Clinics of Chiropractors"	62130	"Offices of Chiropractors"	This code is used for doctors of chiropractic (DC) who have independent practices, either office-based or hospital-based, specializing in chiropractic diagnostics and therapeutic manipulation of the neuromusculoskeletal system.

"Division of Corporate Finance: Standard Industrial Classification (SIC) Code List," U.S. Securities and Exchange Commission, October 26, 2011, http://www.sec.gov/info/edgar/siccodes.htm (accessed October 31, 2012); *Annual Statement Studies: Financial Ratio Benchmarks*, 2011–2012 Edition, Risk Management Association (Philadelphia: Risk Management Association, 2011), pp. 84, 85.

12.2.2.1.4 Psychology Practices *Psychologists* conduct *psychological* and *neuropsychological* testing, make clinical diagnoses, and design treatment plans related to mental health.[114] Psychologists who practice in the healthcare industry provide care in clinics, hospitals, schools, and private settings,[115] while other psychologists who choose to work in businesses, industry, government, and nonprofit organizational settings often providing training, conduct research, and design organizational systems.[116] In 2012, there were 117,827 psychology-related enterprises in the United States, with most having fewer than five employees, and the four largest enterprises accounted for less than 1 percent of the total industry revenue.[117]

While licensed clinical, counseling, and research psychologists are typically required to have a doctoral degree, either a PhD in psychology or a Doctor of Psychology (PsyD), *school psychologists* are generally only required to obtain a master's degree.[118] In addition, the *Commission for*

[114] U.S. Bureau of Labor Statistics, "Psychologists," in *Occupational Outlook Handbook*, 2013–2013 Edition, March 29, 2012.

[116] Ibid.

[117] Anna Son, *IBISWorld Industry Report 62133: Psychologists, Social Workers and Marriage Counselors in the US*, IBISWorld, May 2012, pp. 23, 34.

[118] U.S. Bureau of Labor Statistics, "Psychologists," in *Occupational Outlook Handbook*, 2013–2013 Edition, March 29, 2012.

Psychologists

Psychologists conduct psychological and neuropsychological testing, make clinical diagnoses, and design treatment plans for patients.

"Comparison of Psychiatrists and Psychologists in Clinical Practice," by David P. Pingitore, et al., Psychiatric Services *53, no. 8 (2002): 977, http://psychservices.psychiatryonline.org/cgi/reprint/53/8/977 (accessed September 1, 2009).*

the Recognition of Specialties and Proficiencies in Professional Psychology (CRSPPP) recognizes 12 specialties, including (1) *clinical neuropsychology*, (2) *clinical health psychology*, (3) *psychoanalysis psychology*, (4) *school psychology*, (5) *clinical psychology*, (6) *clinical child psychology*, (7) *counseling psychology*, (8) *industrial-organizational psychology*, (9) *behavioral psychology*, (10) *forensic psychology*, (11) *family psychology*, and (12) *professional geropsychology*, which require additional postdoctoral training.[119]

Similar to chiropractic practices, psychology practices typically require limited amounts of *physical capital*, that is, the key input in the production of output in a psychology practice is the psychologist. Assessment of *resource utilization*, as well as the assessment of *capacity utilization*, is therefore typically performed on a *per provider* basis. Metrics related to *physical capital* that may be informative to the valuation analyst include *revenue*, *expenses*, or *profit* per number of providers, while certain *occupation cost metrics* that may be informative include *number of providers* or *support staff* per *occupation cost dollars* expended or per *square foot*. In this regard, occupation costs typically include furniture, rent, amortization of tenant build-out, depreciation, and return on capital equipment.

The SIC and NAICS codes for psychologists are set forth in Table 12.25.

12.2.2.1.5 Podiatry Practices The recognition of podiatry as a healthcare profession is relatively recent, with the AMA formally recognizing the practice of podiatry in 1939.[120] *Podiatry* is a health profession concerned with medical and surgical treatment of disorders of the foot, ankle, and related

SIC		NAICS		
Code	**Title**	**Code**	**Title**	**Description**
8049	"Offices and Clinics of Health Practitioners, NEC"	621330	"Offices of Mental Health Practitioners (except Physicians)"	This code is used for mental health practitioners who have independent practices, either office-based or hospital-based, focused on the diagnosis and treatment of mental, emotional, behavioral, or social dysfunctional disorders.

"Division of Corporate Finance: Standard Industrial Classification (SIC) Code List," U.S. Securities and Exchange Commission, October 26, 2011, http://www.sec.gov/info/edgar/siccodes.htm (accessed October 31, 2012); *Annual Statement Studies: Financial Ratio Benchmarks*, 2011–2012 Edition, Risk Management Association (Philadelphia: Risk Management Association, 2011), pp. 84, 85.

structures of the leg.[121] Podiatrists must obtain a *Doctor of Podiatric Medicine* (DMP) from an accredited podiatric college of medicine in order to provide services. Most accredited podiatric colleges require a bachelor's degree prior to acceptance to their program, although some applicants may be accepted with only three years of undergraduate education.[122] Education and training programs in the podiatry field will typically last for four years, with an additional three years spent completing a residency program. In 2011, there were only nine accredited programs in the United States.[123] Currently, specialty certifying boards exist in the recognized areas of *podiatric orthopedics*, *podiatric surgery*, and *primary podiatric medicine*.[124]

Many podiatrists operate as solo practitioners.[125] In 2012, there were 11,920 enterprises providing podiatric services in the United States, with

Podiatry

A health profession concerned with medical and surgical treatment of disorders of the foot, ankle, and related structures of the leg.

"Podiatry and the Detection of Foot Problems," in Podiatry Source Book *by Ivy Alexander (Detroit: Omnigraphics, 2007), p.15; "Career as a Podiatrist," by the Institute for Career Research, 2002, p.1.*

Podiatrists

Podiatrists are the only medical professionals trained exclusively to provide total care of the foot. Podiatric treatment can include a multitude of invasive and noninvasive therapies. Treatments can include the prescription of medication and/or orthotics, surgical procedures, the establishment of the therapeutic programs for patients, and the application of appliances to feet or footwear.

"Career As a Podiatrist," Institute for Career Research, 2002, p. 5; "Podiatrist Consumer Fact Sheet," Division of Professional Licensure, Massachusetts Office of Consumer Affairs and Business Regulations, 2009, http://www.mass.gov (July 16, 2009).

92 percent of them having fewer than 10 employees, and the four largest enterprises accounting for 1.5 percent of the total industry revenue, making podiatry the allied health profession with the smallest U.S. market presence.[126]

While some podiatry practices also use limited amounts of *physical capital*, similar to chiropractic and psychology practices, podiatry practices are in many ways more similar to physician medical practices than other allied

Factoid

Podiatry is the allied health profession with the smallest U.S. market presence, and many podiatrists operate as solo practitioners.

TABLE 12.26 SIC and NAICS Codes for Podiatrists

SIC		NAICS		
Code	**Title**	**Code**	**Title**	**Description**
8043	"Offices and Clinics of Podiatrists"	621391	"Offices of Podiatrists"	This code is used for doctors of podiatry (D.P.) who have independent practices, either office-based or hospital-based, focused on the diagnosis and treatment of diseases and deformities of the foot.

"Division of Corporate Finance: Standard Industrial Classification (SIC) Code List," U.S. Securities and Exchange Commission, October 26, 2011, http://www.sec.gov/info/edgar/siccodes.htm (accessed October 31, 2012); *Annual Statement Studies: Financial Ratio Benchmarks*, 2011–2012 Edition, Risk Management Association (Philadelphia: Risk Management Association, 2011), pp. 84, 85.

health professions. *Resource* and *capacity utilization* is commonly measured on a *per provider* basis. Some podiatry practices include facilities for certain surgical procedures and require greater *physical* plant and *investment capital* for FF&E, tenant build-out, and medical technology. Accordingly, the valuation analyst should develop metrics related to the subject *podiatry practice's* historical operating data related to *revenue, expenses*, *profits*, and *support staff*, on a *per exam room* of *per square foot* basis, to *benchmark* to *industry normative data* in determining the relative *capacity utilization* of the subject enterprise. This serves as the basis for determining the comparative operating and performance risk in investing in the subject podiatry practice.

The SIC and NAICS codes for podiatrists are set forth in Table 12.26.

12.2.2.2 Current and Future Trends: Regulatory, Reimbursement, Competition, and Technology

12.2.2.2.1 Regulatory All allied health professionals are regulated at both the state and federal level. Perhaps the primary regulatory issue affecting *healthcare providers,* including *allied health professionals,* is related to state laws that typically control the *licensure* of *healthcare providers* and regulate entry into the medical field and the professional's scope of practice. Similar to the *licensure* requirements for physicians, each state has a *board* that *certifies* and *licenses* each type of allied health professional. State *licenses by credentials* are, in some states, granted to individuals who already hold a license in another state and have been in continuous practice for a specified period of time (generally, five years), in order to allow seasoned professionals to practice outside of their home state without the burden of

taking additional state examinations.[127] Significant regulatory concerns for allied health professional include their *scope of practice*, that is, which services they may provide. A table of the requirements for certification for each type of allied health professional can be found online at www.wiley.com/go/healthcarevaluation.

12.2.2.2.2 Reimbursement *Allied health* professional practices are typically more heavily reimbursed through *private payors* (i.e., *commercial insurance* or *self*-pay) than medical physician practices, for example, the optometric practice industry has historically been reimbursed through *out-of-pocket* payments received directly from patients, as well as through *stand-alone vision care insurance plans,* which may provide coverage for basic services, such as routine eye exams, or comprehensive coverage, including primary eye care benefits, as well as eye glasses and contacts. In addition to *private pay*, certain *allied health professional services* may be reimbursed under *Medicare* and *Medicaid*. The *Social Security Act, §1861(r)(5)*, which determines which services are paid for by Medicare, defines "*physician*s" to include not only MDs and DOs but also (1) *dentists*, (2) *podiatrists*, (3) *optometrists*, and (4) *chiropractors*; however, payment for chiropractic treatment is limited to manual manipulation of the spine to correct subluxations.[128] While not included in the definition of a "*physician*" under the *Social Security Act, §1861(r) (5)*, Medicare will also reimburse for *diagnostic* and *therapeutic services* provided by *clinical psychologists*.[129]

However, in contrast to Medicare reimbursement for physician services, there are typically *greater limitations* placed on the scope of *allied health* services that are covered. For example, Medicare coverage for *dental services* is statutorily *restricted* under the *Social Security Act* to a very limited set of circumstances, that is, typically "*necessary care*" that is not *primary care* or *preventative* in nature. However, most state *Medicaid* programs include some coverage for dental services as part of Medicaid's *Early Periodic Screening, Diagnosis, and Treatment* (EPSDT) *Program*, which requires

[127] American Dental Association, "License Recognition: Dentists," April 6, 2009, http://www.ada.org/prof/prac/licensure/licensure_recognition.pdf (accessed October 6, 2009).

See also, Centers for Medicare & Medicaid Services, "Medicare Physician Guide: A Resource for Residents, Practicing Physicians, and Other Healthcare Professionals," October 2009, p. 19, http://www.cms.hhs.gov/MLNProducts/Downloads/physicianguide.pdf (accessed November 10, 2009).

[129] Ingenix, "Current Procedural Coding Expert," 2010, p. 452.

that dental coverage be made available to eligible individuals age 20 and younger, with an optional benefit for adults.[130]

Similar to medical physician reimbursement initiatives mandated under the ACA, there are also ACA provisions applicable to services provided by *allied health professionals*. For example, the ACA provides that *stand-alone vision insurance plans* will be excluded from participation in the *health insurance exchanges* (HIE) unless they are contracted to provide services through a *comprehensive qualified health plan* (QHP).[131]

Significantly, several states have cut funding for *adult Medicaid* coverage for various allied health services, for example, in nearly half of the states, dental coverage includes only services related to *pain relief* and *emergencies*.[132] In addition, five states eliminated Medicaid coverage for chiropractic services completely in fiscal years 2009 and 2010.[133] Similar reductions in coverage have also occurred for mental health services.[134] However, despite these reductions, the ACA has expanded access to the Medicaid program for many individuals, which may have the potential to offset previously mandated state coverage reductions.[135]

12.2.2.2.3 Competition *Allied health professionals may* be classified as providers who practice *"parallel"* to physicians, that is, while allied health professionals often strive to meet demands that *align* (and sometimes compete) with those met by physicians, they typically provide a scope of services that is distinctly different from a physician's scope of practice, as

---

further discussed in Section 12.2.1, "Physician Professional Practices." Some *allied health professionals* compete directly with their respective "*physician counterparts*," for example, *optometrists* and *ophthalmologists*.[136] In recent years, advances in optometric technology, such as *laser eye surgery*, have escalated the "*financial turf wars*" between these two providers, particularly as related to whether optometrists may perform the often profitable *LASIK procedures*.[137]

Similar to the competition among optometric and ophthalmology providers, *psychologists* and *psychiatrists* have had a long history of competition in the United States, related to the right of psychologists to prescribe medication, which has historically been restricted to psychiatrists only.[138] Since 1990, twelve states have rejected legislation that would allow psychologists to have prescribing privileges, and to date, *New Mexico* and *Louisiana* are the only two states that grant licensed *doctoral-level psychologists* any level of *prescribing rights*.[139] In addition, technological developments related to the surgical treatment of foot and ankle conditions and the resulting overlap among those procedures that may be performed by *podiatrists* and *orthopedic surgeons* have also led to increased competition between these providers. Further, "*nontraditional*" healthcare providers, such as chiropractors, have taken a larger share of the *medical physician practice market*, which may be in part due to the wide range of services provided by many *chiropractic practices*, for example, *acupuncture*, *massage therapy*, *neuropathy*, and *nutritional supplements*, among others.[140]

[140] See Section 4.4.3, "Threats from Substitute Products or Services," in Chapter 4, "Competition" for further discussion.

PSYCHOLOGISTS AND PSYCHIATRISTS DISTINCTION

The primary distinction between the two professions, in addition to educational requirements, is that while both psychologists and psychiatrists make clinical diagnoses based on the *Diagnostic and Statistical Manual of Mental Disorders* (*DSM*), psychologists in most states do not have legal authority to prescribe medications, whereas psychiatrists do.

DSM-IV Basics: A Primer for School Psychologists, *by Ken Merrell, School Psychology Program, University of Iowa (December 2000) http://www.education.uiowa.edu/schpsych/handouts/DSM-IV.pdf (accessed September 2, 2009); "Clinical Judgment and Decisionmaking," by Howard N. Garb,* Annual Review of Clinical Psychology *1 (2005): 70–71; "Comparison of Psychiatrists and Psychologists in Clinical Practice," by David P. Pingitore, et al.,* Psychiatric Services *53, no. 8 (2002): 997, http://psychservices.psychiatryonline.org/cgi/reprint/53/8/977 (accessed September 1, 2009).*

Significantly, the dental profession has not experienced the same "*turf wars*" seen in the other allied health professions, likely due, in large part, to the fact that the dental profession does not have a "*substitute service*" provider.[141] However, despite the fact that many dental practices typically

Factoid

New Mexico and Louisiana are the only two states that grant licensed doctoral-level psychologists the right to prescribe medication.

"Prescribing Privileges for Psychologists: An Overview," National Alliance on Mental Illness, http://www.nami.org/Template.cfm?Section=Issue_Spotlights&template=/ContentManagement/ContentDisplay.cfm&ContentID=8375 (accessed June 30, 2009); "Louisiana Grants Psychologists Prescriptive Authority," by Jennifer D. [141] Michael E. Porter, *Competitive Strategy: Techniques for Analyzing Industries and Competitors* (New York: Free Press, 1980), p. 4. See Section 4.4, "Porter's Five Forces of Competition," in Chapter 4, "Competition," for further discussion.

generate only 8.5 percent of their revenue from *oral surgery*, certain practices with an *oral surgery* service line component may experience competition from *oral and maxillofacial surgeons*.[142]

12.2.2.2.4 Technology Similar to physician practices, advancements in various technologies have improved the *efficiency*, *productivity*, and *quality*, as well as *expanded the scope of service* and potential revenue stream for many allied health professional practices, for example, *laser therapy* may be used for the treatment of many eye conditions, as well as for the treatment of *psoriatic plaque* and *plantar verruca* in some podiatric patients.[143] In addition to the *clinical technological* advancements used by many allied health professionals, psychology practices have taken advantage of *management technology* developments related to *telehealth services*, that is, "providing psychological services remotely, via telephone, email or videoconferencing," through the utilization of *distance therapy* and *web-based teleconferencing*.[144] Similar to *medical physician* practices, many *allied health* practices have the potential to gain efficiencies from the utilization of other *management technologies*, such as *electronic medical records* and *computerized physician order entry*.[145]

12.2.2.3 Value Drivers As with the valuation any other type of healthcare enterprise, the appraisal of *allied health professional practices* should include consideration of the *key metrics* that determine the value of the subject enterprise. These metrics are referred throughout this text as "*value drivers*." Most of the *value drivers* that may have an impact on the appraisal of an *allied health professional enterprise* are similar to those for *physician professional practices*, that is, (1) *Scope of Services*, (2) *Capacity* for future growth, (3) nature and stability of the *Revenue Stream*, (4) *Payor Mix*, (5) efficiency of *Operating Expenses*, (6) adequacy of the *Capital Structure*, (7) stability of the *Supply Chain*, (8) *Market Rivalries and Competitors*, and (9) *Subject Entity Specific/Nonsystematic Risk*.

[145] See Section 5.2.2, "Electronic Health Records," and 5.2.3, "Electronic Prescribing: Computerized Physician Order Entry (CPOE)," in Chapter 5, "Technology," for a further discussion of these technologies.

12.2.2.3.1 Scope of Services Diversifying service offerings may provide added *patient convenience* translating into *increased customer loyalty,* which may increase the *net revenue* generated by the enterprise, thereby increasing its *value*, all else being equal. In addition to the *revenue stream opportunities* created by *diversifying service offerings*, an enterprise may be able to *decrease* the risk from *potential negative changes* in *reimbursement, regulatory, competitive, and/or technological factors* associated with the particular services already being offered by the organization. This decrease in exposure to negative industry trends through diversification of services may lower the actual and/or perceived risk of investment in the *subject allied health professional practice*, decreasing the *risk-adjusted required rate of return* and thereby increasing the value of the enterprise. Note that any additional economic benefit in achieving the expansion of services should also include any *economic operating* and *capital costs* required in expanding the *scope of services* offered.

Among the most prevalent services offered by each type of allied health professional enterprise are those set forth in Table 12.27.

12.2.2.3.2 Capacity In performing the requisite *due diligence* for an appraisal, the valuation analyst should ensure that the subject enterprise has *sufficient resources* and *capacity* to support the projected *patient volumes*. This *consideration of capacity* should be addressed regardless of the type of practice enterprise being appraised. *Capacity* metrics that may be used for benchmark comparison purposes can be differentiated into (1) *Labor-based metrics* and (2) *Capital-based metrics*.

Labor-based metrics measure the *labor available* (e.g., staff and/or provider FTEs) for the *provision of patient services* (measured in number of visits, work RVUs, procedure volume, etc.). *Capital-based metrics* measure the amount of *equipment and technology used,* as well as the *physical space available* for the *provision of patient services*. While *labor-based metrics* are generally similar for each type of allied health professional practice discussed in this chapter, the *capital-based metrics* for each type of entity are considered unique. The typical *capital-based metrics* of the various allied health professional practices are summarized in Table 12.28.

Benchmarking analysis, for those metrics that are reported in normative industry benchmark survey data, may assist in (1) *determining the efficacy* of the analyst's projections of *patient volume* and *requisite economic operating and capital costs*, and (2) *assessing the efficiency* of the enterprise's use of *capital.*[146] Note that should the forecasted level of *patient/procedure*

[146] See Section 8.3.1, "Financial and Operational Benchmarking," in Chapter 8, "Valuation Approaches and Methods," for further discussion of benchmarking.

TABLE 12.28 Typical Labor and Capital Metrics for Allied Health Professional Practices

Allied Health Professional Practice Type	Labor-Based Metric	Capital-Based Metric
Dental Practice	Number of FTE Dentists, Hygienists, or Dental Assistants	Per Exam Room, per Office Square Foot, and/or per Operatory
Optometric Practice	Number of FTE Optometrists or Optometric Assistants	Per Exam Room, per Office Square Foot, and/or per Lane
Chiropractic Practice	Number of FTE Chiropractors or Other Rehabilitative Therapists	Per Table, per Exam Room, and/or per Office Square Foot
Psychological Practice	Number of FTE Psychologists or Psychologist Assistants	Per Provider Office and/or per Office Square Foot
Podiatric Practice	Number of FTE Podiatrists, Podiatric NPs, or Podiatric Assistants	Per Exam Room and/or per Office Square Foot

volume, which consists of both *utilization demand* and *market share*, be higher than the *current capacity levels* of the subject enterprise, for example, the *projected patient visits per exam room* exceeds the industry benchmark norm of *patient visits per exam room* by a significant margin, then the valuation analyst should consider either *reducing the projected patient/procedure volume* or *increasing the expected capital and operating expense burdens* to reflect the costs that would be incurred to create the *necessary capacity levels* to render the amount of forecasted services.

12.2.2.3.3 Revenue Stream Similar to that of physician professional practices, the revenue stream for *allied health professional practices*, is primarily driven by two factors: (1) *patient volume*, which is based on *changes* in the *utilization demand for services* provided by the subject enterprise, as well as *changes* in the subject enterprise's *market share* and (2) the *reimbursement yield* for those services provided at the subject enterprise. The current levels of revenue produced by the subject enterprise, as well as the anticipated level of revenue to be generated in the future, are key factors in determining the economic value of an ownership interest in the subject enterprise. All else being equal, specifically: (1) *operating profit margins*, (2) *requisite working and fixed capital expenditure levels*, and (3) *investment risk profile*,

the higher the level of revenue produced by the subject enterprise, the higher the net economic benefit that would accrue to the owner of the subject enterprise, and therefore the higher the economic value.

12.2.2.3.4 Payor Mix In contrast to a professional physician practice, whose primary source of reimbursement is *Medicare* and other *third party payors*, a significant portion of allied health professional services are the patient's responsibility (i.e., they are considered *out-of-pocket* payments). See Table 12.29 for an illustration of the payor mix for different types of allied health professional practices, as well as that for physician professional practices.

As a consequence, the utilization of allied health professional services and the revenue derived from those activities may be more significantly affected by *general economic trends* because of their direct correlation with the individual patient's ability to pay for healthcare, some of which may be discretionary, in contrast to those instances where patients use services, but the cost of those services is reimbursed by third party payors. This reliance on *out-of-pocket* payments *increases the volatility of the revenue stream* for allied health professional practice enterprises, which may *increase the risk-adjusted required rate of return* associated with an investment in these types of enterprises, thereby decreasing their value.

12.2.2.3.5 Operating Expenses *Operating expenses* for *allied health professional practices* can be classified into two types of expenses: (1) *non-provider compensation–related operating expenses* (i.e., practice overhead costs) and (2) *provider compensation–related expenses*, which are similar to those of professional physician practices (see Section 12.2.1.3.5, "Operating Expenses"). The median *total operating expenses,* which include both of these categories of expenses, measured as a percentage of *medical revenue*, for each type of allied health practice, are set forth in Table 12.30.

While the variation in total operating expenses reported in Table 12.30 may not seem significant, it should be noted that certain types of *allied health professional practices* require less *supplies and capital* than other types of outpatient enterprises, for example, a *psychology practice* typically does not require a *significant amount of supplies* and does not use *specialized medical tools or equipment* and therefore would have *lower* economic operating and capital costs, in contrast to that of a *physician professional practice* or even other types of *allied health professional practices*.

As previously mentioned, one category of expenses for *allied health professional practices* is the *provider compensation–related expenses*. The *median compensation* for various types of allied health providers is set forth in Table 12.31.

TABLE 12.29 Allied Health Payor Mix

Payor Type	Physician Multispecialty Practice (MGMA)	Dentists (ADA)	Chiropractors (IBIS)	Optometry (AOA)	Psychology (IBIS)	Podiatry (IBIS)
Private Insurance	55.28%	44.1%	42.0%	19.0%	27.0%	51.2%
Patient Out-of-Pocket	5.98%	37.9%	28.0%	29.0%	22.0%	12.6%
Medicare	26.84%	*	8.0%	*	6.0%	27.9%
Medicaid	9.58%	*	1.0%	*	14.5%	N/A
Other Government Payors	0.97%	*	N/A	*	17.0%	N/A
Other Insurance (e.g., Prop. & Caus.)	N/A	N/A	14.0%	N/A	N/A	N/A
Workers Comp	0.99%	N/A	5.0%	N/A	N/A	N/A

*Breakdown of government mix not provided. Dentists' government programs accounted for 5.7% of gross billings, while optometry government programs accounted for 19.0% of gross billings received.

TABLE 12.30 Analysis of Operating Expenses—Allied Health Practices

Allied Health Professional Practice Type	Operating Expenses as a Percentage of Revenue
Dental Practices	88.37%
Optometric Practices	89.78%
Chiropractic Practices	86.92%
Psychology Practices	86.24%
Podiatry Practices	89.57%

Bizminer 5 Year Industry Financial Report, released December 2012, for: (a) NAICS Code 6212—Offices of Dentists; (b) NAICS Code 621320—Offices of Optometrists; (c') NAICS Code 621310—Offices of Chiropractors; (d) NAICS Code 621330.02—Clinical Psychologists; and, (e) NAICS Code 621391—Offices of Podiatrists.

Note: Operating expenses represent the cost of sales plus operating expenses, as a percentage of revenue, which includes the clinical provider's compensation.

TABLE 12.31 Median Annual Compensation Rates for Allied Health Providers

Allied Health Occupation Type	OES—May 2011 Release	MGMA—2012 Report	Sullivan & Cotter—2012 Data	AMGA—2012 Report
Psychologists	$90,010	*	$102,043	$106,969
Chiropractors	$66,060	*	*	$106,657
Dentists	$142,740	$182,401	$157,013	$169,747
Optometrists	$94,690	*	$134,950	$140,815
Podiatrists	$119,250	$198,134	$163,388	$193,790

May 2011 data from the Occupational Employment Statistics Query System for each allied health professional practice, http://data.bls.gov/oes/ (accessed February 27, 2013); *2012 Physician Compensation and Production Survey*, by Medical Group Management Association (MGMA), 2012 report based on 2011 data; *2012 Physician Compensation and Productivity Survey Report*, by Sulliven, Cotter, and Associates, Inc., effected January 1, 2012; and,*2012 Medical Group Compensation and Financial Survey* by American Medical Group Association (AMGA), 2012 report based on 2011 data.

OES = Occupational Employment Statistics; MGMA = Medical Group Management Association; and AMGA = American Medical Group Association.

When appraising the entirety of an *allied health professional practice* where the owner is also a provider of professional clinical services to patients of the subject enterprise, an adjustment to reflect the *most probable compensation* for the services rendered by the owner is typically warranted. In this circumstance, the valuation analyst should first determine the amount and classification of the specific *tasks, duties, responsibilities, and accountabilities* (TDRAs) rendered by the owner provider to patients of the subject enterprise. Then, applicable benchmark survey compensation data can be used to calculate the *most probable price* those TDRAs would command in the marketplace, which should replace the reported owner compensation, if any, for the subject enterprise (see Chapter 15, "Healthcare Services," for more information on valuing healthcare services).

Two elements that may affect the level of *allied health provider compensation expense* in the future are (1) the *forecasted level of supply* of allied health professional services and (2) the *forecasted level of demand* for allied health professional services. Table 12.32 sets forth the projected level of employment for various types of allied health providers (i.e., the supply of allied health professional services).

Table 12.33 sets forth the projected growth in *revenue* for the various types of *allied health professional practices*, as well as the forecasted compound annualized growth rate (CAGR) in the largest patient demographic for each type of allied health professional practice. Note that, as set forth in Table 12.33, *revenue projections* consist of (1) forecasts of *utilization demand/market share* (i.e., *patient/procedure volume*) and (2) forecasts of *reimbursement yield per patient/procedure*. In addition, the level of *demand* for most healthcare services is typically a function of (1) *population growth* for the patient population who will use the services provided at the subject enterprise and (2) the *incidence and prevalence of specific injuries, ailments, and diseases* treated by the providers of the subject enterprise. The reported CAGR in revenue presented in Table 12.33 includes any projected changes in *utilization demand/market share* for allied health professional services, as well as any projected changes in *reimbursement yield per service*. Therefore, the variance between the growth rates reported in Table 12.32 and Table 12.33 does not directly reflect the difference in *projected supply* and

ALLIED HEALTH PROVIDER CLASSIFICATION

Allied health professionals can be classified into five categories: dentists, optometrists, chiropractors, psychologists, and podiatrists.

TABLE 12.32 Employment Projections for Allied Health Professionals

Provider	Employment in 2010	Projected Employment in 2020	CAGR in Employment 2010–2020
Dentists	155,700	187,900	1.90%
Optometrists	34,200	45,500	2.90%
Chiropractors	52,600	67,400	2.51%
Psychologists	174,000	211,600	1.98%
Podiatrists	12,900	15,500	1.85%
Total	429,400	527,900	2.09%

"Dentists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2013–2013 Edition, March 29, 2012; "Optometrists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2013–2013 Edition, March 29, 2012; "Chiropractors," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2013–2013 Edition, May 24, 2012; "Psychologists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2013–2013 Edition, March 29, 2012; and "Podiatrists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2013–2013 Edition, April 6, 2012.

projected demand for allied health professional services. However, based on these tables it appears that (1) *revenue* for allied health professional practices is expected to increase above the current U.S. long-term inflation target of 2 percent set by the Federal Reserve,[147] and (2) the *supply* of allied health professional services will outpace population growth in the largest patient demographic for each of the types of allied health professional practices, except psychology practices (1.98 percent vs. 2.39 percent) and podiatry practices (1.85 percent vs. 2.39 percent).

12.2.2.3.6 Capital Structure The implications of the capital structure decision for allied health professional practices are similar to those of physician professional practices, as discussed in Section 12.2.1.3.6, "Capital Structure." These implications include (1) the mix of debt and equity financing affects the *risk-adjusted required rate of return* for investment in the subject enterprise, (2) *debt financing* is typically cheaper than *equity financing*, and (3) *financing costs* reflect the risks associated with each type of capital provided, for example, debt financing typically considers the four C's of the

[147] Board of Governors of the Federal Reserve System, "Federal Reserve Press Release," January 25, 2012, http://www.federalreserve.gov/newsevents/press/monetary/20120125c.htm (accessed April 9, 2013).

TABLE 12.33 Compound Annualized Growth Rate in Revenue and Largest Patient Demographic for Allied Health Professional Practices[148]

Allied Health Professional Practice Type	Projected Revenue CAGR (5 Years)	Largest Patient Demographic (LPD)	Projected CAGR in LPD (5 Years)
Dental Practices	3.40%	Individuals Aged 35–54 (31.7% of All Patients)	–0.51%
Optometric Practices	3.60%	Individuals Aged 35–54 (24.0% of All Patients)	–0.51%
Chiropractic Practices	2.20%	Individuals Aged 31–55 (29.0% of All Patients)	–0.51%
Psychology Practices	4.50%	Individuals Aged >56 (46.6% of All Patients)	2.39%
Podiatry Practices	3.90%	Individuals Aged >55 (66.5% of All Patients)	2.39%

obligor, that is, ***c****redit risk* (default risk) of the borrower, ***c****apacity of the borrower* to make timely repayments of both principal and interest (short term liquidity and interest coverage), ***c****ollateral* to cover the lender in case of borrower default, and an analysis of the ***c****ovenants* included in the indenture agreement, and equity financing considers the risks associated with

[148]The compound annualized growth rate (CAGR) in revenue and the Largest Patient Demographic (LPD) are from the IBIS World Report for each type of practice, i.e., *IBISWorld Industry Report 62121: Dentists in the US*, by Anna Son, IBISWorld, March 2013, pp. 4 and 18, respectively; *IBISWorld Industry Report 62132: Optometrists in the US*, by Austen Sherman, IBISWorld, February 2013, pp. 3 and 16, respectively; *IBISWorld Industry Report 62131: Chiropractors in the US*, by Austen Sherman, IBISWorld, January 2013, pp. 3 and 15, respectively; *IBISWorld Industry Report 62133: Psychologists, Social Workers and Marriage Counselors in the US,* by Anna Son, IBISWorld, May 2012, p. 3; and *IBISWorld Industry Report 62139a: Podiatrists in the US*, by Nikolas Hulewsky, IBISWorld, December 2012, pp. 3 and 15, respectively, except for the LPD for psychology practices, which data is from *2008 APA Survey of Psychology Health Service Providers*, by the American Psychology Association, 2008, Table 1. The CAGR in the LPD is from *Pop-Facts: Demographic Trend 2013: USA*, Claritas, Nielson SiteReports, http://www.claritas.com/Reports/ba-671283447.pdf (accessed April 8, 2013). Note that the growth rate for the U.S. population demographic of individuals 35 to 54 was used as a proxy for the growth rate in the 31 to 55 demographic, and the growth rate in the U.S. population demographic of individuals age 55 and older was used as a proxy for the 56 and older demographic.

an investment in the residual ownership interest (subordinate to any debt holders) of the subject enterprise.[149]

As noted in Table 12.3, when appraising an ownership interest that is at a *control level of value*, it is assumed that the owner of that property interest would be able to change the *capital structure* of the enterprise. Since there are not, currently, any publicly traded allied health professional practices, data and information pertaining to the most probable capital structure for these types of enterprises can be derived from normative industry benchmark survey data (see *Key Sources* at the end of this chapter) or through techniques such as the *iterative method*.[150] Note that most normative industry benchmark survey data reports capital structures based on book values, which may not accurately reflect the capital structure based on market values, and, as previously mentioned, for the purpose of establishing the *fair market value* of a business enterprise, it is important to use formulas based on *market values* of *equity* and *debt*, rather than *book values*.[151]

12.2.2.3.7 Market Rivalries and Competitors As previously discussed in the classification sections for each type of allied health professional practice and as set forth in Table 12.34, the majority of *allied health professionals* are in *private practice*. However, it should be noted that some allied health professionals operate in either *corporate* or *not-for-profit facilities*, for example, podiatrists often work within *hospitals* or *orthopedic and primary care group practices*; psychologists work within *psychiatry practices, physician group practices*, *schools*, and *research facilities*; and optometrists practice in *ophthalmology practices, physician offices*, *hospitals*, or *retail clinics*.[152] In addition to practice structure, most allied health professional practices are relatively small, in terms of the number of employees per practice, as set forth in Table 12.35.

TABLE 12.34 Practice Structure of Allied Health Professional Practices

Allied Health Practice Type	Practice Structure
Dental Practices	About 68.7% of practices are solo practices, with more than 90.0% of dentists in private practice.
Optometric Practices	Industry is dominated by independent and small practices; two-thirds (roughly 66%) of optometrists are in private practice.
Chiropractic Practices	Industry is dominated by independent and small practices.
Psychology Practices	Industry is dominated by independent and small practices.
Podiatry Practices	Industry is dominated by small practices.

IBISWorld Industry Report 62121: Dentists in the US, by Anna Son, IBISWorld, March 2013, p. 24; *IBISWorld Industry Report 62132: Optometrists in the US*, by Austen Sherman, IBISWorld, February 2013, p. 26; *IBISWorld Industry Report 62131: Chiropractors in the US*, by Austen Sherman, IBISWorld, January 2013, p. 25; *IBISWorld Industry Report 62133: Psychologists, Social Workers and Marriage Counselors in the U.S.*, by Anna Son, IBISWorld, May 2012, pp. 25–26; and, *IBISWorld Industry Report 62139a: Podiatrists in the US*, by Nikolas Hulewsky, IBISWorld, December 2012, p. 21.

TABLE 12.35 Allied Health Professional Practices by Employment Size

Allied Health Professional Practice Type	Number of Employees per Practice						
	1–4	5–9	10–19	20–49	50–99	100–249	250 or more
Dental Practices	40.5%	39.9%	16.8%	2.5%	0.1%	0.0%	0.0%
Optometric Practices	56.7%	30.0%	11.3%	1.8%	0.1%	0.0%	0.0%
Chiropractic Practices	78.2%	17.6%	3.8%	0.4%	0.0%	0.0%	0.0%
Psychology Practices	82.1%	8.0%	5.3%	3.1%	1.1%	0.4%	0.1%
Podiatry Practices	67.1%	25.1%	6.8%	0.9%	0.1%	0.0%	0.0%

"2010 County Business Patterns (NAICS)," by United States Census Bureau, http://censtats.census.gov/cgi-bin/cbpnaic/cbpdetl.pl (accessed April 8, 2013).

Due to the fragmented nature of the allied health professional practice industry, intermarket rivalry is considered to be above average for each type of allied health professional practice.[153] In addition, as the scope of practice of some allied health professionals is expanded, for example, *optometrists performing surgery*, competitive rivalries between allied health professionals and physicians are likely to increase.[154] The enactment of the ACA's *individual mandate* may also affect the competitive market for some allied health professions, as a greater number of individuals are anticipated to obtain commercial insurance, either directly or indirectly through mandated state health insurance exchanges, allowing for an increase in the utilization of services provided by allied health professionals.[155]

12.2.2.3.8 Subject Entity Specific/Nonsystematic Risk When using a *build-up method* to calculate an appropriate *risk-adjusted required rate of return* for investment in an *allied health professional practice*, the elements that should be considered in determining the appropriateness and level of *Subject Entity Specific/Nonsystematic Risk* to be included in the analysis are similar to those discussed for appraising a *physician professional practice*.[156] These elements include:

1. *Uncertainty* related to the *continuity of the revenue stream* of the *subject enterprise*;
2. *Uncertainty* related to the *probability* of the subject enterprise *achieving the projections* used by the valuation analyst;

[156] See Section 12.2.1.3.9, "Subject Entity Specific/Nonsystematic Risk," in this chapter.

3. Level of *competition* in the *subject enterprise's market service area*;
4. *Stability of the subject enterprise's provider workforce*, compared to that of normative industry benchmark survey data;
5. *Operational and financial performance* of the practice, compared to normative industry benchmark survey data; and
6. The level of *technological obsolescence* of the services provided by the subject enterprise.

Note that factors that have the potential to increase the *Subject Entity Specific/Nonsystematic Risk* would increase the *risk-adjusted required rate of return* and thereby decrease the *value of the subject allied health professional practice*.

12.2.2.4 Other Pertinent Valuation Considerations: Allied Health Professional Practices In addition to the *value drivers* previously discussed for *allied health professional practices*, as well as the *normalizing adjustments* for *physician professional practices* discussed in Section 12.2.1.4, "Pertinent Valuation Considerations: Physician Professional Practices," which approximate the types of adjustments that should be made when appraising an *allied health professional practice*, Tables 12.36 and 12.37 illustrate *other pertinent valuation considerations* related to the appraisal of *allied health professional practices*.

12.2.3 Non-physician Providers

Nonphysician providers (NPPs) are often referred to by many in the healthcare industry as "*midlevel providers*." Although *nurse practitioners* and *physician assistants* are often thought of as having "*pioneered*" the *midlevel provider* subset of *nonphysician providers*, in recent years, the designation "*midlevel provider*" has been expanded to encompass many other nonphysician clinical practitioners, including *advanced practice nurses*, *clinical nurse specialists*, *certified nurse midwives*, *certified registered nurse anesthetists*, and *rehabilitation therapists* (e.g., *physical therapists*, *occupational therapists*, and *audiologists and speech-language pathologists*). In addition, there has been a growing trend of relaxing the scope of practice related to regulatory restraints for certain types of NPPs. It should be noted that the intent of this section is not to delve into the particular nuances between every type of *midlevel provider* but rather to provide an overview of this increasingly important "*class*" of *licensed nonphysician* providers vis-à-vis their role in the provision of healthcare services to a growing patient population, as well as the specific *drivers of value* that may be attributed to their practice, particularly in light of the anticipated *primary care* physician manpower shortage.

A unique *scope of practice* is attributed to each type of *midlevel provider* and varies on the basis of practice setting and, accordingly, on the

TABLE 12.36 Other Pertinent Valuation Considerations for Appraising Allied Health Professional Practices—Demand Factors

Demand Factors	Impact on Value of Allied Health Practice	Source
Dentistry		
Provisions of the Affordable Care Act (ACA) enable approximately 3 million children to gain dental benefits by 2018, since certain dental services are considered *essential health benefits*.	Potential for increase in *utilization demand for services*, which may yield a higher level of a net economic benefit, ceteris parabis, thereby producing an increase in value to the subject enterprise.	*Potential Effects of the Affordable Care Act on Dentistry* (Chicago: American Dental Association, October 2012), https://www.ada.org/sections/newsAndEvents/pdfs/PotentialEffectsoftheACAonDentistry_NewsStory_Fiinal.pdf (accessed April 1, 2013).
Optometry		
Similar to the demand factor for dentistry, provisions of the Affordable Care Act (ACA) *enable children to gain access to vision care* as an *essential care benefit*.	Increased demand for services, ceteris paribus, may increase the *utilization demand/market share* of the enterprise, yielding increased economic benefit, and thereby increased value for the subject enterprise.	"AOA's Patient Access Message Key as HHS Releases Plan for Pediatric Essential Eye Health Benefit," *American Optometric Association News* 51, no. 7 (January 2013): 1 and 17.
Incidence and prevalence of certain diseases that affect vision typically increase with age, e.g., *diabetes and macular degeneration*; as the *baby boomer generation continues to increase in age* the demand for optometric services should also increase.	Increased *demand for services*, ceteris paribus, may *increase the utilization demand/market share of the enterprise*, yielding increased economic benefit, and thereby increased value of the subject enterprise.	"Baby Boomers Are Coming: is Your Practice Ready?" American Optometric Association, November 28, 20122, http://newsfromaoa.org/2011/11/28/baby-boomers-are-coming-is-your-practice-ready/ (accessed April 1, 2013).

Chiropractic		
A particular provision of the ACA (i.e., Section 2706—*Harkin Amendment*) has been interpreted by some to mean that chiropractic services should receive *equal consideration* for reimbursements from insurers as other service providers.	Potential for increase in *reimbursement yield* for services rendered, which may enable the subject entity to generate a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value of the subject enterprise.	"Chiropractors Hope Affordable Care Act Levels Field for Treatment, Reimbursements" by Robert Joiner, St. Louis, MO, *STL Beacon*, November 27, 2012, https://www.stlbeacon.org/#!/content/28166/chiropractorsandaca (accessed April 1, 2013).
Similar to that for other healthcare enterprises, creating a *niche focus* may increase patient volume.	Potential for increase in *utilization demand for services*, which may yield a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value to the subject enterprise.	"The Secrets of Specialty Practice," by Karen Appold, *Chiropractic Economics*, no. 4 (March 15, 2013): 34–40.
Psychology		
Similar to other services offered by allied health professionals, mental health and substance abuse services are designated by the ACA as *essential health benefits.*	Potential for increase in *utilization demand for services*, which may yield a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value to the subject enterprise.	"Supreme Court upholds Affordable Care Act: What Psychologists Need to Know," by Government Relations and Legal & Regulatory Affairs staff, Practice Update, July 16, 2012, American Psychological Association, http://www.apapracticecentral.org/update/2012/07–16/affordable-care-act.aspx (accessed April 1, 2013).
Podiatry		
Increase in the *incidence and prevalence* of diseases treated by podiatrists, in particular *diabetes*, is anticipated to occur due to various factors, e.g., the *aging of the baby boomer population.*	Potential for increase in *demand for services*, ceteris paribus, which may *increase the utilization demand/market share of the enterprise*, yielding increased economic benefit, and thereby increased value of the subject enterprise.	"Podiatrists Finding New Demand for Their Specialized Care," *Chicago Tribune News*, February 26, 2013, http://articles.chicagotribune.com/2013–02–26/classified/chi-podiatrist-careers-20130227_1_podiatric-medicine-podiatrists-internal-medicine (accessed April 1, 2013).

TABLE 12.37 Other Pertinent Valuation Considerations for Appraising Allied Health Professional Practices—Supply Factors

Supply Factors	Impact on Value of Allied Health Practice	Source
Dentistry		
Disproportionate number of physicians in suburban areas, and overall lack of dentists in general to meet current dental care needs.	Workforce shortage may cause *compensation levels to be elevated*, *decreasing the net economic benefit* generated by the enterprise, which in turn produces a *lower value for the organization*, all other things being equal.	*Dental Crisis in America*, A Report from Chairman Bernard Sanders Subcommittee on Primary Health and Aging, US Senate Committee on Health, Education, Labor & Pensions, February 29, 2012, http://www.ada.org/sections/newsAndEvents/pdfs/dental_crisis_in_america_the_need_to_expand_access.pdf (accessed April 1, 2013).
Introduction of a "midlevel" dental provider to perform basic oral health services, currently used in Minnesota and some Alaska territories.	Increased *competition* may increase the *risk-adjusted required rate of return*, ceteris paribus, thereby decreasing the value of the enterprise.	*Dental Crisis in America*, A Report from Chairman Bernard Sanders Subcommittee on Primary Health and Aging, US Senate Committee on Health, Education, Labor & Pensions, February 29, 2012, http://www.ada.org/sections/newsAndEvents/pdfs/dental_crisis_in_america_the_need_to_expand_access.pdf (accessed April 1, 2013).
Optometry		
Provisions of the ACA include a 2.3% medical device excise tax.	The *retail device segment* of an allied health practice may see a *decrease in profit margin* with the additional tax burden, at least to the extent that the taxes are passed on in the form of price increases for devices to the practice from the manufacturer who incurs the tax, which the practice is not able to again pass along to the retail consumer.	"Price Hikes Likely," by Jaimy Lee, ModernHealthcare.com, December 8, 2012, http://www.modernhealthcare.com/article/20121208/MAGAZINE/312089973/ (accessed April 1, 2013).

Employment of optometrists expected to grow by 33% from 2010 to 2020, which is above average for all occupations.	*Increase in the supply* of optometrist services, excluding consideration of any changes in demand, would tend to *decrease compensation levels*, thereby *increasing the net economic benefit* generated by an optometric practice; however, as mentioned earlier, there are significant factors that are affecting the demand side of the equation, therefore the valuation impact of increased employment of optometrists is *ambiguous*.	"Optometrists," in *Occupational Outlook Handbook,* U.S. Bureau of Labor Statistics, May 24, 2012, http://www.bls.gov/ooh/healthcare/optometrists.htm (accessed April 1, 2013)
Chiropractic		
Employment of chiropractors expected to grow by 28% from 2010 to 2020, which is above average for all occupations.	*Increase in the supply* of chiropractor services, excluding consideration of any changes in demand, would tend to *decrease compensation levels*, thereby *increasing the net economic benefit* generated by and *value* of the subject enterprise.	"Chiropractors," in *Occupational Outlook Handbook,* U.S. Bureau of Labor Statistics, March 29, 2012, http://www.bls.gov/ooh/healthcare/chiropractors.htm (accessed April 1, 2013).
Psychology		
Employment of psychologists expected to grow by 22% from 2010 to 2020, which is above average for all occupations.	*Increase in the supply* of psychology services, excluding consideration of any changes in demand, would tend to *decrease compensation levels*, thereby *increasing the net economic benefit* generated by and *value* of the subject enterprise.	"Psychologists," in *Occupational Outlook Handbook,* U.S. Bureau of Labor Statistics, March 29, 2012, http://www.bls.gov/ooh/Life-Physical-and-Social-Science/Psychologists.htm (accessed April 1, 2013).
Podiatry		
Employment of podiatrists expected to grow by 20% from 2010 to 2020, which is above average for all occupations.	*Increase in the supply* of podiatry services, excluding consideration of any changes in demand, would tend to *decrease compensation levels*, thereby *increasing the net economic benefit* generated by and *value* of the subject enterprise.	"Podiatrists," in *Occupational Outlook Handbook,* U.S. Bureau of Labor Statistics, April 6, 2012, http://www.bls.gov/ooh/healthcare/podiastrists.htm (accessed April 1, 2013).

types of services that they perform.[157] Generally, these *licensed professionals* must work under the *supervision of a physician*; however, in response to the anticipated *physician workforce shortage*, many states have expanded the *scope of practice* for these providers, which authorizes them to act, under certain conditions, independently, that is, *in lieu* of physician supervision.[158] Table 12.38 illustrates the typical scope of services, as well as the level of autonomy, for various classifications of NPPs.

12.2.3.1 Current and Future Trends for Nonphysician Practices

12.2.3.1.1 Regulatory Perhaps the most significant regulatory question pending for *nonphysician providers* is *the level of physician supervision* mandated by state and federal law.[159] In addition, the *degree of autonomy* differs for each type of midlevel provider and is typically mandated on a state-by-state basis.[160]

In light of the anticipated physician workforce shortage, the *scope of services* granted to certain midlevel providers has gained some regulatory traction in many states, for example, as set forth in Table 12.39, in 17 states CRNAs may receive Medicare reimbursement for anesthesia services performed *without* the supervision of a physician anesthesiologist.[161]

In addition, under the January 2010 update of the *Hospital Outpatient Prospective Payment System Final Rule*, *outpatient therapeutic services* provided in a hospital setting may be directly supervised by certain NPPs who are permitted to provide direct supervision *in lieu* of physicians, if they are authorized by statute or regulations to *personally perform* the services they are overseeing.[162]

Nurse Practitioner	Order, perform, interpret diagnostic testing; diagnose and treat acute and chronic conditions; prescribe medications and other treatments; manage patients' overall care; counsel and educate patients.	med-high	"What's an NP?" American Association of Nurse Practitioners, 2013, http://www.aanp.org/all-about-nps/what-is-an-np (accessed March 25, 2013).
Clinical Nurse Specialist	Practice in a wide variety of healthcare settings; provide direct patient care; provide expert consultation for nursing staffs; implement improvements in healthcare delivery systems.	med-high	"CNS FAQs," National Association of Clinical Nurse Specialists, 2013, http://www.nacns.org/html/cns-faqs.php (accessed March 25, 2013).
Certified Nurse Midwife	Diagnose and coordinate birthing process; provide GYN care to women; provide medical care to newborns for a month after birth; perform physicals; prescribe medication and order lab testing; educate and counsel women.	med-high	"Become a Midwife," American College of Nurse-Midwives, 2010, http://www.midwife.org/Become-a-Midwife (accessed March 25, 2013); "Nurse Midwives," U.S. Bureau of Labor Statistics, 2010 Edition, http://www.bls.gov/soc/2010/soc291161.htm (accessed March 25, 2013).

(*continued*)

TABLE 12.38 Nonphysician Provider Classification (*continued*)

Provider Classification	Typical Scope of Services	Level of Autonomy	Source
Certified Registered Nurse Anesthetist	Administer anesthesia; monitor patient's vital signs; oversee patient recovery from anesthesia; assist anesthesiologists, surgeons, physicians, or dentists.	low	"Nurse Anesthetists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2010 Edition, http://www.bls.gov/soc/2010/soc291151.htm (accessed March 25, 2013).
Rehabilitation Therapist	Provide various therapies to patients recovering from injury or trauma; help patients return to normal life; analyze disorders and provide treatment.	low	"Rehabilitation Counselors," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2012 Edition, http://www.bls.gov/ooh/community-and-social-service/rehabilitation-counselors.htm#tab-2 (accessed March 25, 2013).
Physical Therapist	Diagnose patients' dysfunctional movements; plan treatment; use exercise and hands-on therapy to treat patients; evaluate patients' progress; educate patients and their families about injury and illness.	high	"Physical Therapists," in *Occupational Outlook Handbook*, Bureau of Labor Statistics, 2012, http://www.bls.gov/ooh/healthcare/physical-therapists.htm#tab-2 (accessed March 25, 2013).
Occupational Therapist	Treat patients with injuries or disabilities through the therapeutic use of everyday activities; help patients develop, recover, and improve skills needed for daily living and working; establish treatment plan, demonstrate exercises; evaluate patient's home or workplace; educate patients and their families.	high	"Occupational Therapists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2012 Edition, http://www.bls.gov/ooh/healthcare/occupational-therapists.htm#tab-2 (accessed March 25, 2013).
Audiologist and Speech Language Pathologist	Diagnose patients by listening to and communicating with patient to determine level of speech or language difficulty; identify treatment options; teach patients how to make sounds and improve their voices; teach alternative communication methods; counsel patients and families.	high	"Speech-Language Pathologists," in *Occupational Outlook Handbook*, U.S. Bureau of Labor Statistics, 2012 Edition, http://www.bls.gov/ooh/healthcare/speech-language-pathologists.htm#tab-2 (accessed March 25, 2013).

TABLE 12.39 States That Have Implemented the Supervision Opt-Out Option, as of April 2012

State	Date of Implementation
Iowa	December 2001
Nebraska	February 2002
Idaho	March 2002
Minnesota	April 2002
New Hampshire	June 2002
New Mexico	November 2002
Kansas	March 2003
North Dakota	October 2003
Washington	October 2003
Alaska	October 2003
Oregon	December 2004
Montana	January 2004 (Reversed in May 2005 and reinstated in June 2005)
South Dakota	March 2005
Wisconsin	June 2005
California	July 2009
Colorado (For critical access hospitals [CAHs] and specified rural hospitals)	September 2010
Kentucky	April 2012

"Fact Sheet Concerning State Opt-Outs and November 13, 2001 CMS Rule," American Association of Nurse Anesthetists, April 2012, http://www.aana.com/advocacy/stategovernmentaffairs/Pages/Fact-Sheet-Concerning-State-Opt-Outs.aspx (accessed November 15, 2012).

12.2.3.1.2 Reimbursement Reimbursement for services provided by *nonphysician providers* is distinct from *reimbursement* provided to *physicians*. Services provided by *nonphysicians* that are rendered under the supervision of a *physician* are typically defined as *incident-to* services.[163] These

[163] Centers for Medicare and Medicaid Services, "'Incident to' Services," MLN Matters, SE0441, 2004, http://www.cms.hhs.gov/mlnmattersarticles/downloads/se0441.pdf (accessed February 1, 2010).

services are reimbursed by Medicare under *incident-to rules*, which allow *physicians* to bill for the services provided by *nonphysician providers* at 100 percent of the amount published in the *Physician Fee schedule* for those services. Conversely, services provided by *physician assistants*, *nurse practitioners*, and *clinical nurse specialists* independently, that is, *in lieu* of physician supervision, may be billed to Medicare *directly*, generally at 85 percent of the amount published by CMS in the *Physician Fee Schedule* for those services.[164]

Similar to *physicians*, who have been facing *decreased reimbursement* for their professional clinical services under traditional *fee-for-service* (FFS) reimbursement models during the last decade, many *nonphysician providers* are also experiencing declining reimbursement trends, likely due to the fact that their reimbursement is often tied to the reimbursement of the physician who is "*supervising*" their work. Significantly, however, the ACA includes provisions allowing for certain midlevel providers to be eligible for many of the same reimbursement incentives designed to increase payments to *primary care physicians*, for example, *nurse practitioners* are eligible for the same 10 percent bonus reimbursement paid to primary care providers by Medicare during the 2011–2016 period.[165] As there continues to be an increasing movement toward reimbursing providers based on alternative reimbursement structures that emphasize *value-based purchasing* (which shift a portion of the financial risk from the insurer to the provider), in contrast to FFS models, which have traditionally incentivized the volume of patients treated, in contrast to the *value* of care provided, it is likely that *nonphysician providers* will be an important component in future *value-based* reimbursement models.

12.2.3.1.3 Competition The impending *physician workforce shortage*, paired with declining reimbursement rates for physician *professional* and *technical component revenue streams*, has fueled demand for alternative provider manpower.[166] To meet this demand, the healthcare workforce has

[164] Centers for Medicare and Medicaid Services, "Medicare Claims Processing Manual," Chapter 12, Sections 110–120, December 18, 2009. See Section 3.8.2.2.2, "Nonphysician Scope of Practice," in Chapter 3, "Regulatory Environment," for additional information.

[165] "Patient Protection and Affordable Care Act, Sec. 5501," *Pub. L.* 111-148, 124 Stat. 652 (March 23, 2010).

[166] See Section 4.3.4, "The Physician-Workforce Shortage: Demand Outpaces Supply," in Chapter 4, "Competition," for further discussion.

continued to diversify, with versatility no longer limited to the *horizontal expansion* of specialty and subspecialty areas of medical expertise. Rather, healthcare enterprises are increasingly relying on *nonphysician providers* to meet the growing demand for healthcare services and have solicited a *vertical expansion* in the role of the *nonphysician workforce* to provide services that *support, supplement, and parallel physician services*.[167] In light of the fact that the gap between the *supply* and *demand* for physician services is projected to increase significantly, as the *sources* of physician manpower remain insufficient, and the *drivers* of demand (i.e., the *aging population* and the expected increase in the number of insured under the ACA's *individual mandate*) intensify, the *nonphysician provider workforce* is expected to see continued growth in both *scope* and *volume* in the future, as enterprises adopt care models that strategically allocate physician and nonphysician manpower resources.[168]

12.2.3.1.4 Technology *Clinical-related diagnostic* and *therapeutic technologies* continue to *emerge* and *evolve* at a rapid pace throughout the entire U.S. healthcare delivery system, as further discussed in Section 5.3, "Clinical Technology," in Chapter 5, "Technology." Technological advancements in the healthcare industry have produced: (1) less *invasive procedures*, (2) shorter *recovery times*, and (3) a lower probability of *complications* during and after a procedure, all of which have served as a catalyst to shift the delivery of certain services from an *inpatient setting* to more of an *outpatient setting*.[169]

In addition, these technological developments have afforded physicians the *capability* and *opportunity* to provide *safe*, *effective*, and *efficient*

---

[167] A 2009 Office of the Inspector General (OIG) report indicated that approximately 50 percent of Medicare-billed physician services that exceed a 24-hour workday were actually performed by qualified nonphysician practitioners, i.e., midlevel providers. "Prevalence and Qualifications of Nonphysicians Who Performed Medicare Physician Services," Office of the Inspector General, August 2009, p. 8; "Nurse Practitioners and Primary Care," Health Policy Brief, *Health Affairs*, October 25, 2012, p. 1.

[168] See Section 6.3.2, "Physician Manpower and Workforce Changes," in Chapter 6, "Healthcare Reform," for further discussion.

[169] "Chart 3.14: Percentage Share of Inpatient vs. Outpatient Surgeries, 1990-2010," in *Trendwatch Chartbook 2012: Supplemental Data Tables, Utilization, and Volume*, American Hospital Association, 2012, http://www.aha.org/research/reports/tw/chartbook/2012/chart3-14.pdf (accessed May 14, 2012).

services in an *outpatient setting* and have in turn allowed *nonphysician ancillary service providers* the opportunity to expand their *scope of services* as they *support, supplement, and parallel* those outpatient services provided by physicians. For example, the use of *remote patient monitoring*, *telemedicine*, and *mobile health* provide additional service offerings that may be provided by *nonphysician providers*.[170] The higher costs associated with *inpatient care* and the overall increase in healthcare demand have contributed to increased *outpatient service utilization*, a growth pattern that will likely continue in response to persistent *cost containment pressures*, and the technologies that have permitted the shift from inpatient to outpatient.[171]

12.2.3.2 Value Drivers: Nonphysician Provider Practices Those *risk adjustments* and potential *value drivers* that may be attributed to *nonphysician provider practices* are often similar to those that may be attributed to *physician professional practices*, that is, (1) *Scope of Services*, (2) *Capacity* for future growth, (3) nature and stability of the *Revenue Stream*, (4) *Payor Mix*, (5) efficiency of *Operating Expenses*, (6) adequacy of the *Capital Structure*, (7) stability of the *Supply Chain*, (8) *Market Rivalries and Competitors*, and (9) *Subject Entity Specific/Nonsystematic Risk*.

This similarity is due to the fact that many of the services provided by NPPs are performed under the "*supervision*" of a physician, rather than "*in lieu*" of a physician, as previously discussed. However, there are several key differences that the valuation analyst should be mindful of when appraising a midlevel provider practice. For example, the *scope of services* provided by a midlevel provider practice, which necessarily affects the level of *revenue* (and subsequent *net economic benefit*) that may be generated by the practice enterprise is *restricted* by the *level of autonomy* afforded to the particular type of *midlevel provider,* which may vary based on the particular state in which the NPP is licensed to provide services.[172]

---

[170] See Section 5.2.4, "Telemedicine and Telehealth," in Chapter 5, "Technology," for further discussion of these technologies.

[171] American Hospital Association, *Trendwatch Chartbook 2012: Supplemental Data Tables, Utilization, and Volume*, 2012, http://www.aha.org/research/reports/tw/chartbook/2012/table3-4.pdf (accessed May 15, 2012) p. A-25; "Payments to Hospitals for Inpatient Hospital Services," 42 U.S.C. § 1395(ww)(b)(2).

[172] See Section 3.8.2.2.2, "Nonphysician Scope of Practice," in Chapter 3, "Regulatory Environment," for further discussion.

In the same manner, the *capacity* for future growth, as well as the *nature* and *sustainability* of the NPP's *revenue stream*, is inherently tied to the regulatory restrictions placed on the *scope of services* the NPPs may perform *in lieu* of a physician, for example, an NPP may be unable to "*grow*" his or her practice, despite an increase in patient demand for services, if there is a shortage of *physicians* in the market service area in which the NPP primarily draws his or her patients, since most states require that a physician *supervise* certain services performed by NPPs. Similarly, the future sustainability of the NPP's *revenue stream* will be dependent on whether NPPs are given the authority to provide a greater number of healthcare services *in lieu* of a physician, thereby allowing them to *independently bill* (and receive reimbursement for) their services. As NPPs are granted increasing autonomy, and the number of services they are able to perform *in lieu* of a physician expands, the NPP's payor mix will likely become increasingly important as the NPP's payor mix may be different for those services that are performed *in lieu* of a physician and billed directly, as compared to those services that are performed under a *supervising physician* that the *physician* bills as *incident to services*.

As the *scope of services* that NPPs are permitted to perform expands, there will likely be an increased competitive environment not only among NPPs and *physicians*, but also within the NPP workforce itself.[173] Due to the looming uncertainties related to the *scope of practice* trends anticipated to be experienced by NPPs and the resulting instability related to the competitive marketplace in which NPPs and physicians operate, NPP practices have the potential to experience a significant level of *nonsystematic risk*.

12.2.3.3 Other Pertinent Valuation Considerations: Nonphysician Provider Practices

Despite potentially significant differences in *scale* (which will reduce the likelihood of any possible *economies of scale*), the *valuation* of a *midlevel provider practice* is likely to be similar to those performed for a *physician practice* or an *allied health practice*, once the specific considerations of the practice being valued are incorporated into the valuation analysis. However, as illustrated in Tables 12.40 and 12.41, there are other pertinent considerations that should be considered when appraising a *nonphysician provider enterprise*.

[173] See Section 4.3.4, "The Physician-Workforce Shortage: Demand Outpaces Supply," in Chapter 4, "Competition," for further discussion.

TABLE 12.40 Other Pertinent Valuation Considerations for Appraising Nonphysician Provider Practices: Demand Factors

Demand Factors	Impact on Value of NPP Practice	Source
Enactment of the ACA, which increases the numbers of the insured patient population.	Potential for increase in *utilization demand/market share* for NPP services, which may yield a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value to the enterprise.	"Fast-Growing Physician Assistant Workforce Ready to Meet Healthcare Demand," Alexandria, VA, American Academy of Physician Assistants, October 5, 2012.
Changing patient population demographics, specifically the aging of the baby boomer generation and their increased utilization of healthcare services.	Potential for increase in *utilization demand/market share* for NPP services, which may yield a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value to the enterprise.	"Testimony of the Nursing Community Regarding Fiscal Year 2013 Appropriations for the Title VIII Nursing Workforce Development Programs, the National Institute of Nursing Research, and Nurse-Managed Health Clinics," U.S. Senate Appropriations Subcommittee on Labor, Health and Human Services, Education, and Related Agencies, Department of Health and Human Services, April 27, 2012.
Primary care physician shortage is thought to be increasing the demand for: (a) *complimentary services* to help free up physicians to perform tasks outside of the scope of practice for NPPs, as well as, (b) *substitute services* for those tasks that can be performed independently by NPPs, e.g., seeing established patients for outpatient visits, both of which have the potential to increase the demand for NPP services.	Potential for increase in *utilization demand/market share* for NPP services, which may yield a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value to the enterprise.	"Fast-Growing Physician Assistant Workforce Ready to Meet Healthcare Demand," Alexandria, VA, American Academy of Physician Assistants, October 5, 2012.

TABLE 12.41 Other Pertinent Valuation Considerations for Appraising Nonphysician Provider Practices: Supply Factors

Supply Factors	Impact on Value of NPP Practice	Source
Recent efforts by the American Academy of Physician Assistants to create a uniform application for PA licensure will streamline the process to become a PA and allow for more individuals to enter the PA profession.	Increased *competition* may increase the idiosyncratic risk of NPP practices, yielding lower valuations.	"Emphasizing Need for a Modern, Uniform Licensure Process," Alexandria, VA, American Academy of Physician Assistants, October 25, 2012.
Backlash to the expanding scope of services and autonomy of NPPs by competitor organizations, e.g., the American Academy of Family Physicians, may create regulatory hurdles to these trends,	Increased uncertainty regarding the ability of NPP enterprises to increase utilization demand/market share increases the idiosyncratic risk of NPP practices, yielding lower valuations,	"Primary Care for the 21st Century: Ensuring a Quality, Physician-Led Team for Every Patient," American Academy of Family Physicians, September 18, 2012,
Recent legislative efforts to expand the scope of practice for some NPPs may provide more revenue stream opportunities for NPP enterprises and increase the level of supply of NPP services.	Potential for increase in *utilization demand/market share* for NPP services, which may yield a higher level of net economic benefit, ceteris parabus, thereby producing an increase in value to the enterprise.	"Nurse Practitioners Hemmed in by Scope of Practice Laws and Payment Policies," by Tammy Worth, *Healthcare Finance News*, March 21, 2013, http://www.healthcarefinancenews.com/news/nurse-practitioners-hemmed-scope-practice-laws-and-payment-policies (accessed March 29, 2013).
Recent legislative efforts to close the gap between physicians and NPPs may provide higher profit potential and therefore compensation increases that make the NPP profession a more viable option in contrast to other professions.	In the enterprise setting, the higher levels of reimbursement have the potential to increase the net economic benefit of the organization. However, should increased reimbursement and increased demand for NPP services cause NPP compensation levels to increase, the compensation burden may offset any enhancement in reimbursement causing an unpredictable change in the level of net economic benefit, and the related value of the enterprise.	"Nurse Practitioner Pay Equity Easily Passes House," by Christopher David Gray, *The Lund Report*, March 20, 2013, http://www.thelundreport.org/resource/nurse_practitioner_pay_equity_easily_passes_house (accessed March 29, 2013).

(*continued*)

TABLE 12.41 Other Pertinent Valuation Considerations for Appraising Nonphysician Provider Practices: Supply Factors (*continued*)

Supply Factors	Impact on Value of NPP Practice	Source
Lower certification requirements relative to physician certification and licensure requirements. For example, typically no residency for PA or NP positions, coupled with other supply factors, e.g., increasing autonomy and equality of pay, have the potential to make the NPP profession more attractive when compared to primary care physician positions; note that there is a gradual shift toward residency requirements for some NPPs, including provisions in the ACA that mandate funding for family nurse practitioner residency training programs.	Increased *competition* may increase the idiosyncratic risk of NPP practices, yielding lower valuations; also, as residency requirements increase, NPPs may demand higher compensation levels to offset the opportunity cost of residency, which has the potential to decrease the level of net economic benefit to the NPP enterprise.	"Residency Programs for Primary Care Nurse Practitioners in Federally Qualified Health Centers: A Service Perspective," by Margaret Flinter, APRN, MSN, OJIN, *Online Journal of Issues in Nursing* 10, no. 3, manuscript 5 (September 30, 2005).
Supervisory requirements may lead to loss of elements of control in independent NPP practices where the NPP is the owner but relies on the supervision of a physician in order to bill payors for services rendered; this may cause a decrease in the willingness of many NPPs to operate independent practices.	Decrease in span of control may yield additional uncertainty, increasing the *risk-adjusted required rate of return* that an investor in the enterprise would demand.	"AMA Scope of Practice Data Series: Nurse Practitioners," American Medical Association, 2009.

12.3 FREESTANDING OUTPATIENT AMBULATORY ENTERPRISES

In addition to outpatient services provided in an office-based setting, outpatient services may also be provided at such enterprises as:

1. *Ambulatory Surgery Centers (ASCs)*;
2. *Diagnostic Imaging Centers*;
3. *Dialysis Centers*;
4. *Cancer Treatment Centers*;
5. *Rehabilitation Therapy Centers*;
6. *Cosmetic and Aesthetic Medicine Centers*;
7. *Walk-in Clinics,* for example, Urgent Care Centers and Retail Clinics;
8. *Wound Treatment Centers*;
9. *Pain Management Centers*; and
10. *Laboratories*.

12.3.1 Types of Freestanding Outpatient Ambulatory Enterprises

12.3.1.1 Ambulatory Surgery Centers (ASCs) *Ambulatory Surgery Centers* (ASCs) are outpatient facilities where surgeries that do not require inpatient hospital admission or a length of stay lasting more than 24 hours may be performed.[174] ASCs may be classified as *single specialty*, or *multi specialty* and may be owned by *hospitals*, *physicians*, or other *healthcare corporations*. Note that according to recent studies, physicians maintain *some* amount of ownership in approximately 90 percent of ASCs.[175] The distribution of ASC ownership, as published by the *Ambulatory Surgery Center Association* (ASCA), is set forth in Exhibit 12.3.

Since their inception more than 20 years ago, the number of ASC facilities, as well as the number of procedures performed in ASCs, has expanded significantly, due, in large part, to the advancement of *minimally invasive surgical techniques* and the shift of the provision of services from the *inpatient* to the *outpatient* setting. In 2011, there were approximately 5,300 *Medicare licensed ASCs* that performed more than *23 million surgeries*.[176]

Factoid

In 2011, there were approximately 5,300 Medicare-licensed ASCs that performed more than 23 million surgeries.

"History," Ambulatory Surgery Center Association, 2012, http://www.ascassociation.org/AboutUs/WhatisanASC/History (accessed December 4, 2012).

Despite their initial growth, the rate at which new ASCs have been developed has decreased since 2005.[177] The change in the number of Medicare-certified ASCs, as well as the change in Medicare payments to ASCs from 2006 to 2010, is set forth in Table 12.42, and Exhibit 12.4.

Many *patients* have reported a favorable opinion of ASCs, due to:

1. *Less paperwork* to complete;
2. *Decreased waiting time*;
3. *Convenient locations*;
4. *Easier scheduling*; and
5. *Lower costs* and *copayments* relative to surgery services provided at an *inpatient hospital outpatient setting*.[178]

TABLE 12.42 Change in Number of Medicare-Certified ASCs and Medicare Payments to ASCs, 2006–2010

	2006	2007	2008	2009	2010
Medicare ASC payments (in billions)	$2.80	$2.90	$3.10	$3.20	$3.40
Compound Annual Growth Rate	*3.70%*	*3.57%*	*6.90%*	*3.23%*	*6.25%*
Number of Medicare-Certified ASCs	4,608	4,879	5,095	5,217	5,316
Compound Annual Growth Rate	5.64%	5.88%	4.43%	2.39%	1.90%
Medicare Payments per Facility (in thousands)	$608	$594	$608	$613	$640
Compound Annual Growth Rate	–1.83%	–2.18%	2.36%	0.81%	4.27%

Report to the Congress: Medicare Payment Policy, Medicare Payment Advisory Commission, March 2012, p. 123, 128.

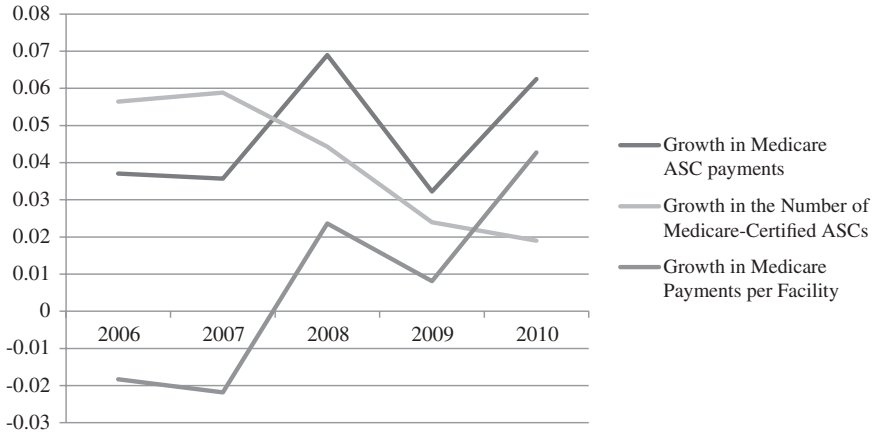

EXHIBIT 12.4 Trends in the Number of Medicare-Certified ASCs and Medicare Payments to ASCs, 2006–2010

Report to the Congress: Medicare Payment Policy, Medicare Payment Advisory Commission, March 2012, pp. 123, 128.

Likewise, many *physicians* have a favorable opinion of ASCs, due to:

1. The ability to *set* and *maintain their own schedule*;
2. The ability to *customize their surgical environment*; and
3. The *use of specialized staff*, which often *minimizes* turnaround time and *maximizes* the number of procedures that can be performed.[179]

12.3.1.2 Hospital Outpatient Departments *Hospital outpatient departments* (HOPDs), while typically not "*freestanding*," offer many of the same services provided by ASCs and other types of freestanding outpatient enterprises. Significantly, in contrast to ASCs and other freestanding outpatient enterprises, HOPDs typically have access to the market leverage maintained by the *parent hospital organization* and are reimbursed under the OPPS, which allows them to receive a "*heightened reimbursement differential*" for the same services or procedures provided in an *independent freestanding facility.*[180] While inpatient admissions have *declined* 1 percent per year from

[179] "2C Ambulatory Surgical Centers," in *Medicare Payment Policy: Report to Congress*, Medicare Payment Advisory Commission, March 2010, http://www.medpac.gov/documents/mar10_entirereport.pdf (accessed August 24, 2011).

[180] See Section 2.4.1.3.1.2, "Hospital Outpatient Reimbursement," in Chapter 2, "Reimbursement Environment," and Section 11.1.6.2, "Reimbursement," in Chapter 11, "Inpatient Enterprises," for further discussion of this topic.

Hospital Outpatient Department

Typically offer many of the same services provided by freestanding outpatient enterprises; have access to the market leverage maintained by the parent hospital organization and are reimbursed under the OPPS.

"*Hospital Inpatient and Outpatient Services,*" *in* Report to the Congress: Medicare Payment Policy, *Medicare Payment Advisory Commission, March 2012, pp. 46–47, 51.*

Factoid

While inpatient admissions have declined 1 percent per year from 2004 to 2010, hospital outpatient services grew 4.2 percent per year from 2004 to 2010.

"Hospital Inpatient and Outpatient Services," in Report to the Congress: Medicare Payment Policy, *Medicare Payment Advisory Commission, March 2012, pp. 46–47.*

2004 to 2010, hospital outpatient services grew 4.2 percent per year from 2004 to 2010.[181] Further, in 2010, the volume of patient visits to HOPDs grew by 6.7 percent, while visits to freestanding outpatient enterprises grew by less than 1 percent.[182] It should be noted that many HOPDs are "virtual" outpatient providers, in that they use the same physical plant, for example, certain operating rooms, preoperative and postoperative, for patients on both an inpatient and an outpatient basis.

12.3.1.3 Diagnostic Imaging Centers The utilization of *outpatient diagnostic imaging services* has grown at a rate much greater than other physician services, likely due to technological advances that allow for more *efficient*, *effective*, and *safe* procedures. For example, *computed tomography* (CT) technology has transformed both *diagnostic* and *interventional* medicine, as the quality of CT images surpasses the *anatomical detail* of *competing imaging technologies*, such as X-ray, due to the *cross-sectional scanning*

[181] "Hospital Inpatient and Outpatient Services," in *Report to the Congress: Medicare Payment Policy*, Medicare Payment Advisory Commission, March 2012, pp. 46–47.
[182] Ibid., p. 51.

Factoid

The number of CT and MRI scans per 1,000 *Medicare Part B FFS beneficiaries* grew significantly between 2000 to 2009, with only a slight decrease from 2009 to 2010.

A Data Book: Health Care Spending and the Medicare Program, *MedPAC (June 2012), p. 112.*

capabilities they afford.[183] In addition, *functional MRI* (fMRI), a combined *positron emission tomography* (PET) and *magnetic resonance imaging* (MRI) *system*, enables physicians to *observe brain function* while patients perform *physical* and *mental tasks* and is one of the most *popular methods of brain imaging* used in the current healthcare market.[184]

The June 2012 MedPAC publication *A Data Book: Health Care Spending and the Medicare Program* reported that the number of CT and MRI scans per 1,000 *Medicare Part B FFS beneficiaries* grew significantly between 2000 to 2009, with only a slight decrease from 2009 to 2010.[185] The number of CT scans performed on parts of the body other than the head more than doubled between 2000 and 2010, from 258 scans per 1,000 Medicare Part B beneficiaries in 2000 to 548 scans per 1,000 Medicare Part B beneficiaries in 2010. Similarly, the number of MRI scans performed for Medicare Part B beneficiaries, on parts of the body other than the brain, more than *doubled* during the same time period.[186]

Despite slowed growth from 2005 to 2011, likely due to decreasing reimbursement trends as a result of the *Deficit Reduction Act of 2005*, the number of *freestanding diagnostic imaging centers* doubled from 3,068 in 2000 to 6,431 in 2008.[187] While there was a brief period of *stagnation*

End Stage Renal Disease

The final stage of kidney failure, marked by the complete or nearly complete irreversible loss of renal function, where the body retains fluid and harmful waste buildup.

The Kidney Diseases Dictionary, *by The National Kidney and Urological Diseases Information Clearinghouse, U.S. Department of Health and Human Services, NIH Publication No. 03–4359, 2003, p. 6.*

Hemofiltration

A technique for the treatment of ESRD patients that removes fluid, electrolytes, and other toxic substances from the blood by filtration.

"End Stage Renal Disease (ESRD)," in Medicare Benefit Policy Manual, *Centers for Medicare and Medicaid Services, 2011, http://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/downloads/bp102c11.pdf (accessed April 1, 2013), p. 5.*

Hemodialysis

The process of filtering blood through an artificial membrane, known as a dialyzer, to remove wastes and excess fluids, and is most often provided in a dialysis facility three times a week for three to four hours per treatment.

The Kidney Diseases Dictionary, *by The National Kidney and Urological Diseases Information Clearinghouse, U.S. Department of Health and Human Services, NIH Publication No. 03–4359, 2003, p. 5; "Chapter 6: Outpatient Dialysis Services," in* Report to the Congress: Medicare Payment Policy, *Medicare Payment Advisory Board, March 2012, p. 143.*

Hemodialysis is the process of *filtering blood* through an *artificial membrane*, known as a *dialyzer*, to remove *wastes* and *excess fluids* and is most often provided in a *dialysis facility* three times a week for three to four hours per treatment.[198] To perform hemodialysis, a physician creates a vascular access pathway using an *arteriovenous* (AV) *fistula*, *AV graft*, or *central venous catheter*, to transport blood from the body to the *dialyzer* and back to the body.[199]

Peritoneal dialysis uses the lining of the patient's abdomen as a filter to clear wastes and extra fluids.[200] Through a surgically implanted catheter, a cleaning solution, called the *dialysis solution*, is gravity-drained from a bag into the patient's abdomen.[201] Fluids and wastes flow through the lining of the abdominal cavity and remain trapped, purifying the dialysis solution and the patient's blood.[202] There are two types of peritoneal dialysis: *continuous ambulatory peritoneal dialysis*, which can be done at home or at work, and *continuous cycler assisted peritoneal dialysis*, which uses a machine called a cycler to empty and fill the abdomen three to five times at a dialysis center while the patient sleeps.[203]

CMS requires dialysis centers to be certified by Medicare in order to received Medicare reimbursement for dialysis services, a critical requirement as Medicare covers approximately 90 percent of all ESRD beneficiaries in the United States.[204] As of 2011, approximately 96 percent of outpatient dialysis facilities were Medicare certified to offer *in-center hemodialysis*, and 46 percent were certified to offer *peritoneal dialysis*.[205] Certification for

[201] Medicare Payment Advisory Commission, "Section 2C: Outpatient Dialysis Services," in *Report to the Congress: Medicare Payment Policy*, March 2009, p. 134.

[202] Ibid.

[203] Ibid.

[204] MedPAC, "Outpatient Dialysis Services Payment System, *Payment Basics*, (September 2012), p. 1.

[205] "Outpatient Dialysis Centers" in *Report to the Congress: Medicare Payment Policy*, Medicare Payment Advisory Commission, March 2012, pp. 151–152.

DIALYSIS CENTERS OLIGOPOLY

A small number of firms in the United States provide a vast majority of dialysis services. Together, the two largest dialysis chains, Fresnius and DaVita, account for about 60 percent of all dialysis facilities and about 70 percent of all freestanding dialysis facilities.

Report to the Congress: Medicare Payment Policy, Outpatient Dialysis Services: Assessing Payment Adequacy and Updating Payments, *MedPAC, March 2009, p. 137.*

in-home hemodialysis training is also required, which service has increased in popularity from 13 percent in 2006, to 23 percent in 2011.[206]

An increasing proportion of the *outpatient dialysis centers* are *freestanding facilities*, owned by *publicly traded companies* and/or are operated by *a for-profit chain*, that is, approximately 81 percent of dialysis facilities were affiliated with a chain organization as of 2011.[207] In 2005 and 2006, the *four largest dialysis center chains* merged into *two chains*, with DaVita acquiring Gambro in 2005, and Fresenius Medical Care merging with Renal Care Group in 2006. Together, Fresenius and DaVita accounted for approximately 60 percent of *all* dialysis facilities and approximately 70 percent of all *freestanding* dialysis facilities as of 2011.[208]

According to a 2007 article in the *Journal of the American Society of Nephrology*, industry consolidation among dialysis centers may have potential advantages, for example, certain *economies of scale*, *technical efficiencies*, *improved information and tracking systems*, *access to capital*, and *vertical integration opportunities*.[209] Industry consolidation also has the potential to offer certain clinical advantages, including the potential for *improved compliance with process and protocols*, *accountability*, *standardization of care* across a large system, and *integrated information* and *reporting systems*.[210]

12.3.1.6 Rehabilitation Therapy Centers *Freestanding rehabilitation therapy centers* often focus on an *interdisciplinary approach* to treatment, due to

[209] Jonathan Himmelfarb, Arnold Berns, Lynda Szczech, and Donald Wesson, "Cost, Quality, and Value: The Changing Political Economy of Dialysis Care," *Journal of the American Society of Nephrology* 18, no. 7 (2007): 2023.

[210] Ibid., p. 2024.

Rehabilitation Therapy Centers

Focus on an interdisciplinary approach to treatment, due to the scope of conditions treated and the wide range of providers who typically work together in developing and executing a patient's treatment plan.

"Increasing Physical Function through Psychiatric Intervention for Children with Pediatric Neurotransmitter Disorders," by S. Evans, K. Forester, J. M. Pettiford, and O. Morozova, Journal of Inherited Metabolic Diseases *32 (2009): 382.*

the scope of conditions treated, as well as the wide range of providers who typically work together in developing and executing a patient's treatment plan. Specific providers commonly employed in freestanding rehabilitation therapy centers include *physiatrists, surgeons, physical therapists, occupational therapists, rehabilitation nurses, speech-language pathologists, respiratory therapists, recreation therapists, social workers, psychologists, and rehabilitation counselors.*[211] The majority of patients receiving rehabilitation therapy suffer from the one or more of the four categories of conditions, as set forth in Table 12.43.

The market for rehabilitation therapy is highly fragmented and primarily consists of small independent providers. Even larger rehabilitation providers did not independently control more than 5 percent of the market as of 2012, for example, *Kindred Healthcare* had an estimated market share of 3.1 percent, *Selected Medical Holding Corporation* had an estimated market share of 2.6 percent, *Physiotherapy Associates* had an estimated market share of 1.8 percent, *Concentra, Inc.* had an estimated market share of 1.6 percent, and *U.S. Physical Therapy Inc.* had an estimated market share of 0.8 percent.[212]

12.3.1.7 Cosmetic and Aesthetic Medicine Centers *Cosmetic and aesthetic medicine centers* provide outpatient surgical services related to the *elective enhancement* of an individual's appearance.[213] In 2011, approximately 60 percent of *cosmetic and aesthetic* procedures were performed in an *office-based setting*, with 22 percent performed in a *freestanding surgical center*,

[211] S. Evans, K. Forester, J. M. Pettiford, and O. Morozova, "Increasing Physical Function through Physiatric Intervention for Children with Pediatric Neurotransmitter Disorders," *Journal of Inherited Metabolic Diseases* 32 (2009): 382.

and the remaining 18 percent performed in a HOPD.[214] These services are often performed by surgeons and specialists trained in *dermatology*, *facial plastic*, *general surgery*, *plastic surgery*, *otolaryngology*, *oculoplastic surgery*, *gynecological surgery*, and *orthomaxillofacial surgery.*[215] *Cosmetic and aesthetic medicine centers* may also offer *reconstructive surgery* services, which have the dual purpose of *restoring function* and *aesthetic appearance* to damaged or deformed structures of the body.[216] Table 12.44 illustrates the top surgical procedures performed in *cosmetic and aesthetic medicine centers* in 2011.

In addition to *surgical* cosmetic procedures performed by physicians, there are many *nonsurgical* cosmetic and aesthetic procedures that may be performed by certain *nonphysician providers,* for example, those nonsurgical procedures described in Table 12.45.

Cosmetic and Aesthetic Medicine Centers

Provide outpatient surgical services related to the elective enhancement of an individual's appearance.

In 2011, $10 billion was spent on cosmetic procedures in the United States, the distribution of which is set forth in Table 12.46.

The number of surgical cosmetic procedures performed in the United States increased 174 percent from 1997 to 2011 and 109 percent between 2010 and 2011.[217] In 2011, 9 million cosmetic procedures were performed,

with *surgical* procedures accounting for 18 percent of the procedures performed and 63 percent of total expenditures.[218]

12.3.1.8 Walk-in Clinics: Urgent Care Centers and Retail Clinics *Walk-in clinics* are typically characterized by their hours of operation, generally providing care *after hours* and *on weekends*. While the services offered by *retail clinics* and *urgent care facilities* may overlap, the two facilities are typically differentiated by the *level* and *scope of care* provided, as well as their *location* and *ownership structure*.[219] *Urgent care* may be characterized as healthcare that is delivered to treat an *acute* illness on a *walk-in basis*, while *retail clinics*, which also offer *walk-in services*, may be characterized as providing healthcare services for the treatment of *non-acute* illnesses and conditions.

Retail Clinics are often owned by, and operated within, retail grocery stores or department stores.[220] In contrast, *urgent care centers* are typically

[220] Ibid.

Walk-In Clinics

Centers that provide treatment of nonacute illnesses and conditions after hours and on weekends.

"ER, Urgent Care, or Retail Clinics: What's the Difference?" The Alliance, http://www.alliancehealthcoop.com/ERC/pdfs/ERUrgent_TA53–1004.pdf (accessed October 19, 2012).

Urgent Care

Healthcare that is delivered on a walk-in basis with no appointment for acute illness.

freestanding facilities that may be owned and operated by a group of physicians and may be eligible for one of two *certifications* offered by the *Urgent Care Association of America* (UCAOA): (1) *Category 1* certifies that *licensed physicians* are on site during the clinics hours of operation, and (2) *Category 2* certifies that *licensed providers*, that is, physicians and midlevel providers (NPs and PAs), are on site during the clinics hours of operation. To qualify as either a *Category 1* or a *Category 2* certified urgent care center, facilities must meet the following minimum criteria:

1. Accept and advertise that "*walk-ins*" of all ages are welcome;
2. Provide *X-ray* and *phlebotomy* services;
3. Maintain on-site, licensed providers who can (a) obtain and read an electrocardiogram (EKG) and an X-ray; (b) administer per os (orally), intramuscular (IM), and intravenous (IV) medication/fluids; and (c) perform minor procedures;
4. Maintain on site the following equipment: (a) automated external defibrillator (AED), (b) oxygen, (c) drug cart, and (d) a working phone;
5. Contain two or more examine rooms;
6. Maintain a separate waiting area and patient-specific restrooms;
7. Be open seven days a week, for more than four hours a day, for a total of 3,000 hours per year;

Retail Clinics

Those facilities owned by, and operated within, retail grocery stores or department stores offering walk-in services for basic treatment and care.

8. Maintain a medical director who is a licensed physician; and
9. Perform both administrative and medical activities in an ethical manner.[221]

In addition to *certification*, *urgent care centers* may also seek facility *accreditation* through the *Urgent Care Center Accreditation* (UCCA) *Program* operated through the *American Academy of Urgent Care Medicine* (AAUCM).[222] Accreditation is awarded to those facilities that are found to be in compliance with AAUCM standards, including, but not limited to:

1. Having been in operation for at least six months;
2. Having a supervisory physician who is responsible for the care provided at the practice;
3. Compliance with all federal, state, and local regulations; and
4. Submitting an accreditation survey every three years that is completed through *documentation*, *on-site observations*, and/or *interviews*.[223]

URGENT CARE ASSOCIATION OF AMERICA (UCAOA) CERTIFICATIONS

Category 1 includes licensed physicians who are on site during the clinic's hours of operation. Category 2 includes licensed providers, that is, physicians and midlevel providers (NPs and Pas) who are on site during the clinic's hours of operation.

Note that while many *retail clinics* are unlikely to meet the necessary criteria to become a *certified urgent care center*, most states require retail clinics to become *licensed* with the state in order to operate.[224]

Urgent care centers have been part of the U.S. healthcare delivery system for more than 30 years, with their recent growth occurring during the 1990s.[225] As of 2011, there were over 8,700 urgent care clinics in the United States.[226] The first *retail clinic* opened in 2001. Since that time, the rate at which additional retail clinics are established has been inconsistent. For example, only 29 additional retail clinics were opened between 2001 and 2005; however, between 2006 and 2008 the industry experienced a rapid "*10-fold*" increase. This rapid increase was reversed in 2009 with the closing of approximately 5 percent of *retail clinics*.[227] As of 2011, reports indicate that approximately 1,227 retail clinics were in operation, a slight increase from the 1,197 reported as of February 2010.[228] Approximately 100 separate operators managed the 1,227 clinics in operation across 42 states.[229] Significantly, while only 11 percent of retail clinics were operated by health care organizations in 2008, this percentage increased to 60 percent (approximately 120 clinics) by 2009. However, despite this initial entrance of hospital- and physician-operated clinics, the overwhelming majority of

Factoid

Urgent care clinics grew significantly during the 1990s, and as of 2011, there were more than 8,700 urgent care clinics in the United States.

"The Case for Urgent Care," Urgent Care Association of America, September 1, 2011, http://www.ucaoa.org/docs/WhitePaperTheCaseforUrgentCare.pdf; "About Urgent Care," Urgent Care Association of America, September 15, 2011, http://www.ucaoa.org/home_abouturgentcare.php (accessed October 18, 2012).

[228]Ibid.

[229]Ibid.

retail clinics in operation as of 2011 were run by retailers who owned the building in which the clinic was located.[230]

It should be noted that not only have the number of retail clinics in operation increased significantly during the last decade, so, too, have the number of *patient visits* to retail clinics. As reported in an August 2012 *Health Affairs* article, there were approximately 1.48, 3.52, and 5.97 million *patient visits* to retail clinic visits in 2007, 2008, and 2009, respectively, representing an average annual increase of 102 percent.[231] The future viability of the retail clinic market going forward will likely result from the degree of autonomy afforded to nonphysician (midlevel) providers vis-à-vis their scope of practice in treating patients *in lieu of physicians*, as many "*profitable*" retail clinics are dependent on these lower-cost providers for the delivery of care.[232] In addition, continued growth in the retail clinic marketplace will likely depend on (1) whether retail clinics can continue to "dispel" concerns over the quality of care delivered at these facilities, and (2) whether retail clinics are able to continue to provide patients with convenient and cost-effective access to healthcare services, particularly among *newly insured* individuals who may seek to obtain primary care services in a "*traditional*" office-based setting once they are no longer paying for primary care services *out of pocket*.[233]

12.3.1.9 Wound Treatment Centers The prevalence of *chronic wounds* in the United States is estimated to afflict approximately 2 percent of the U.S. population.[234] Chronic wounds are defined as those that are "resistant to therapy, provide an additional risk of mortality and morbidity to the patient, as well as diminish the patient's quality of life."[235] These wounds encompass

a wide range of etiologies, from diabetes to trauma and, as such, require a different set of skills or expertise than caring for other types of injuries or ailments.[236] Because a *chronic wound* is generally a visible exhibition of an *underlying condition*, *chronic wounds* may be classified by their unique characteristics or *source of* origin, which include (1) *pressure*, (2) *venous*, (3) *arterial*, (4) *diabetic*, (5) *nonhealing surgical*, (6) *cancer-related*, (7) *inflammatory*, and, (8) *mixed etiologies*.[237] Patients who are most likely to need wound care treatment are those with diabetes (reported to affect 8.3 percent of the U.S. population as of 2011), who are 15 to 25 percent more likely to develop foot ulcers initially and whose wounds have a 50 percent chance of reoccurrence within five years.[238]

Wound Treatment Centers

Facilities that treat chronic wounds; may be freestanding or affiliated with a hospital or a health system.

"Wound Healing Center Receives Top Accreditation Rating," MetroHealth, *July, 25, 2008, http://metrohealth.net/blog/2008/07/25/wound-healing-center-receives-top-accreditation-rating/ (accessed November 26, 2012).*

Factoid

There are approximately 900 wound and hyperbaric centers in the United States, including both hospital-based and freestanding centers.

"Wound Healing Center Receives Top Accreditation Rating," MetroHealth, *July, 25, 2008, http://metrohealth.net/blog/2008/07/25/wound-healing-center-receives-top-accreditation-rating/ (accessed November 26, 2012).*

While many *wound treatment centers* are affiliated with a hospital or a health system, some also operate as freestanding facilities. As of 2008, there were approximately 900 *wound* and *hyperbaric* centers in the United States, including both hospital-based and freestanding facilities.[239] Recently, there has been an increasing trend toward the development of a multidisciplinary approach to wound care treatment, which allows each provider to contribute his or her individual expertise to the development of a comprehensive treatment plan.[240] Table 12.47 illustrates the scope of services that may be provided at wound care centers.

Typically, wound care services are performed by physicians who are board certified and have received specialized education and training in wound management, as well as podiatrists, nurses, and other nonphysician providers and staff.[241] In addition to provider certification, wound treatment centers may seek accreditation through the *Joint Commissions Disease Specific Care Certification Program*, and centers offering more advanced wound treatment, for example, *hyperbolic oxygen therapy*, may also pursue voluntary accreditation from the *Undersea and Hyperbaric Medical Society.*[242] While the outpatient setting at which most wound treatment centers operate

Factoid

Approximately 100 million individuals in the United States suffered from chronic pain in 2011.

"Relieving Pain in America: A Blueprint for Transforming Prevention, Care, Education, and Research," Board on Health Sciences Policy, 2011, p. 1.

pain centers focus on the *diagnosis* and *management* of *chronic pain,* often through the use of a *team* of physicians, psychologists, nurses, and physical and occupational therapists, while *modality-oriented pain centers* offer only specific treatment options, for example, *nerve block clinics*, *transcutaneous nerve stimulation clinics*, *acupuncture clinics*, and *biofeedback clinics*.[245] Both types of pain centers typically focus on developing a treatment plan that is aimed at *controlling* the pain in a manner that allows patients to resume their typical schedule, for example, *returning to work, resuming home responsibilities, participating in recreational activities*.[246] However, certain studies have indicated that *multidisciplinary pain management centers* may be associated with better outcomes for patients suffering from chronic pain.[247]

Pain Management Center

A center offering services that focus on the diagnosis and management of chronic pain generally through the use of a multidisciplinary approach. Multidisciplinary pain centers typically include physicians, psychologists, nurses, and physical and occupational therapists.

"Finding the Right Care for Chronic Pain; The Team Approach to Pain Management Enables Chronic Pain Sufferers to Resume Work and Reduces Their Use of Health Care Services," Business & Health *14, no. 11A (Fall 1996).*

[247] Timothy S. Clark, "Interdisciplinary Treatment for Chronic Pain: Is It Worth the Money?" *Baylor University Medical Center Proceedings* 13, no. 34 (July 2000): 243.

12.3.1.11 Laboratories Medical laboratories are facilities that provide an *isolated setting* in which samples of tissues, fluids, and other bodily substances can be tested and/or stored. Medical laboratories may be located within an inpatient or outpatient facility or may operate as a freestanding facility.[248] See Table 12.48 for a distribution of the 232,996 medical laboratories (approximate) registered with CMS through the *Division of Laboratory Services* as of 2012.[249]

Medical laboratories may generally be classified as (1) *clinical laboratories* and (2) *reference laboratories*, independent of the laboratory's location. *Clinical laboratory services* involve the *collection* and *examination* of bodily materials for the purpose of *diagnosing, preventing, treating, or assessing* an illness or a condition.[250] In contrast, *reference laboratories* may be categorized as either (1) a *biobank* or *biorepository* or (2) an *independent laboratory.* A *biobank* or *biorepository* serves as a "*warehouse*" that *collects*, *catalogs*, and *stores* samples of bodily substances and reference materials, which may then be used to identify unknown samples in furtherance of scientific research and development.[251] As of 2012, there were more than 300 million specimens stored in *biobanks* or *biorepositories* throughout the United States.[252] In contrast to a *biobank* or *biorepository*, an *independent laboratory* typically receives samples from a hospital or a physician practice for *diagnostic* or *pathologic* testing.[253] The distinction between *clinical laboratories* and *independent laboratories* is that *independent laboratories* do *not* collect specimens from patients directly but rather, receive specimens from other labs or healthcare providers.[254]

"Laboratories by Type of Facility," Centers for Medicare and Medicaid Services, July 2012, http://www.cms.gov/Regulations-and-Guidance/Legislation/CLIA/Downloads/factype.pdf (accessed November 16, 2012).

Laboratories

Facilities that provide an isolated setting in which samples of tissues, fluids, and other bodily substances can be tested and/or stored; may be located within an inpatient or outpatient facility or may operate as a freestanding facility.

"Chapter 16: Laboratory Services," in Medicare Claims Processing Manual, *Centers for Medicare and Medicaid Services, June 8, 2012.*

Medical Laboratory

A facility that offers isolated conditions for which samples of tissues, fluids, and other bodily substances can be tested or housed.

"Chapter 16: Laboratory Services," in Medicare Claims Processing Manual, *Centers for Medicare and Medicaid Services, June 8, 2012.*

All laboratories that handle human specimens for purposes of *assessment*, *diagnosis*, *prevention*, or *treatment* must operate in accordance with *Clinical Laboratory Improvement Amendments* (CLIA) standards and are monitored by CMS and applicable state agencies.[255] In addition, certified laboratories that meet the requisite standards may receive accreditation. The distribution of *accredited* medical laboratories in the United States as of July 2012, by accrediting organization, is set forth in Table 12.49.

Biobank/Biorepository

A "warehouse" that collects, catalogs, and stores samples of bodily substances and reference materials, which may then be used to identify unknown samples in furtherance of scientific research and development.

"Biorepository," in Dictionary of Cancer Terms, *National Cancer Institute, National Institutes of Health, http://www.cancer.gov/dictionary?cdrid=561323 (accessed December 7, 2012).*

[255] "Laboratory Requirements," 42 CFR Part 493 (October 1, 2011a). See Section 3.6.1, "Clinical Laboratory Improvement Amendments," in Chapter 3, "Regulatory Environment," for further discussion.

TABLE 12.49 Distribution of Accredited Medical Laboratories by Accrediting Organization, as of 2012

Accrediting Organizations	Number	Percentage*
COLA**	6,463	41.28%
College of American Pathologists	5,728	36.58%
The Joint Commission	2,380	15.20%
American Osteopathic Association	128	0.82%
American Association of Blood Banks	218	1.39%
American Society for Histocompatibility and Immunogenetics	122	0.78%

Note that the data in this table represents labs whose membership with the accreditation organization has been confirmed and that some labs are accredited by more than one organization. http://www.cms.gov/Regulations-and-Guidance/Legislation/CLIA/Downloads/factype.pdf (accessed November 16, 2012).
*Facilities may be accredited by more than one organization.
**Commission on Office Laboratory Accreditation (COLA) is an independent nonprofit accreditor.

Clinical Laboratory

Services provided at these sites involve the collection and examination of bodily materials for the purposes of diagnosing, preventing, treating, and assessing an illness or a condition.

"Chapter 15: Covered Medical and Other Health Services," in Medicare Claims Processing Manual, *Centers for Medicare and Medicaid Services, June 8, 2012.*

Independent Laboratory

Receives samples from a hospital or a physician practice for diagnostic or pathologic testing; does not collect specimens from patients directly.

"Where Lab Tests Are Performed," American Association for Clinical Chemistry, October 1, 2012, http://labtestsonline.org/lab/labtypes/ (accessed December 7, 2012); "Chapter 16: "Laboratory Services," in Medicare Claims Processing Manual, *Centers for Medicare and Medicaid Services, June 8, 2012, p. 6.*

12.3.2 Current and Future Trends: Regulatory, Reimbursement, Competition, Technology

12.3.2.1 Regulatory Freestanding outpatient enterprises must meet the applicable federal and state *licensing, certifications, and accreditation requirements* prior to providing services at a facility, which is similar to that of inpatient enterprises. In addition, those outpatient enterprises that receive

federal funding from Medicare or Medicaid must also adhere to the federal and state fraud and abuse laws, such as *Anti-Kickback Statutes*, the *Stark Law*, and the *False Claims Act*.[256]

Recent regulatory reforms under the ACA, which may significantly affect freestanding outpatient enterprises, include the requirement that providers making self-referrals for imaging services disclose their ownership interest in any *imaging equipment* to patients and inform them of alternate providers for such services.[257]

12.3.2.2 Reimbursement Reimbursement to *outpatient enterprises* is generally made under either the Medicare Physician Fee Schedule (MPFS) or the Hospital Outpatient Prospective Payment System (OPPS). In addition, certain outpatient facilities, such as clinical laboratories, may also use a *facility-specific* Prospective Payment System (PPS), which sets payment at the lesser of (1) *the amount billed*, (2) the *local OPPS fee for a geographic area*, or (3) the *CMS established national limit*, that is, a percentage of the median of all local fee schedule amounts for each laboratory test code.[258]

As with *physician professional practices*, *freestanding outpatient enterprises*, for example, *ASCs, freestanding diagnostic imaging centers, and dialysis facilities*, have continued to face cuts to reimbursement during the last several years. For example, the *Deficit Reduction Act*, signed into law on February 8, 2006, capped the *technical component* (including the *technical component* of the *global fee*) for certain *imaging services* provided in *physician offices* and *freestanding diagnostic facilities* at the same amount as the *outpatient department fee* paid to a hospital for the same service.[259] The ACA continued these reimbursement cuts for imaging services, reducing payments by 50 percent for the *technical component* of *subsequent imaging services* performed on

---

[256] See Chapter 3, "Regulatory Environment," for further discussion of the rules and regulations that impact the healthcare industry.

[257] "The Impact of healthcare Reform on ASCs," SurgiStrategies, http://www.surgistrategies.com/news/2012/06/the-impact-of-healthcare-reform-on-ascs.aspx (accessed December 9, 2012).

[258] Centers for Medicare and Medicaid Services, "Chapter 16: "Laboratory Services," in *Medicare Claims Processing Manual*, June 8, 2012. For an in-depth discussion of the specific reimbursement methodologies related to the MPFS and OPPS, see Section 2.4.1.3.1.2, "Hospital Outpatient Reimbursement," in Chapter 2, "Reimbursement Environment."

[259] Prior to the DRA, the MPFS reimbursed for certain imaging services provided in an outpatient setting at a higher rate than those same imaging services provided in a hospital setting. Lesley A. Herrmann, et al., "Medicare Provisions in the Deficit Reduction Act of 2005," *Health Law Bulletin* (February 2006); Sharron Swann, "New Payment Limits for Medicare Part B Providers for Imaging, ASC, and Therapy Services Under the Deficit Reduction Act of 2005," Brown McCarroll, LLP, February 21, 2006.

consecutive body parts.[260] The ACA implemented a phased-in revision of the 50 percent *utilization assumption rate* for services using *advanced diagnostic imaging equipment*, that is, 65 percent for services furnished after January 1, 2010, 70 percent for services furnished after January 1, 2013, and 75 percent for services furnished after January 1, 2014.[261]

At the same time, many *freestanding outpatient enterprises* that are participating, or plan to participate, in pilot projects or demonstration programs related to *value based purchasing* (VBP) and *bundled payments* based on a single *episode of care* are facing decreasing reimbursement rates.[262] Many of these programs were initiated by the ACA in an effort to control the increasing percentage of U.S. GDP attributed to healthcare expenditures, which is anticipated to reach 24 percent by 2037.[263]

Note that the ACA requires a *VBP program* be implemented for ASCs by January 2011 in an effort to emphasize *quality performance* in ASCs through *financial incentives* for *achieving certain quality metrics*. While CMS missed this initial deadline, a limited implementation plan report was submitted to Congress in April 2011. However, to date, HHS lacks the statutory authority to establish the program. In the March 2012 *Report to Congress*, MedPAC suggested that Congress direct HHS to implement a *VBP program* no later than 2016 that would provide financial incentives to high-performing ASCs and penalize low-performing ASCs, using the recently established *Quality Reporting Program for ASCs*, which has required ASCs to submit quality data to CMS since 2012.[264]

Factoid

The percentage of the U.S. GDP attributed to healthcare expenditures is anticipated to reach 24 percent by 2037.

[261] Ibid.

[262] See Section 2.7.1, "Shift from Fee-for-Service," in Chapter 2, "Reimbursement Environment," for further discussion.

[263] Congressional Budget Office, "The 2012 Long-Term Budget Outlook," Pub. No. 4507, June 2012, p. 3.

[264] Medicare Payment Advisory Commission, "Ambulatory Surgical Centers Services," in *Report to Congress: Medicare Payment Policy*, March 2012, p. 129.

Similarly, the *Medicare Improvements for Patients and Providers Act of 2008* (MIPPA) outlined the requirements for the four-year phased-in implementation of a *bundled Prospective Payment Syste*m (PPS) for ESRD outpatient maintenance dialysis services provided on or after January 1, 2011.[265] The ESRD PPS uses "a single payment to ESRD facilities, i.e., hospital-based providers of services and renal dialysis facilities, that will cover all the resources used in providing an outpatient dialysis treatment, including supplies and equipment used to administer dialysis in the ESRD facility or at a patient's home, drugs, biologicals, laboratory tests, training, and support services."[266] Under the phase-in schedule set forth in the ESRD PPS *Final Rule*, published August 12, 2010, providers will receive a 100 percent bundled payment beginning in 2014.[267] The ACA also implements a *quality incentive payment program* for dialysis facilities. Measures of quality include *anemia management*, *dialysis adequacy*, *patient satisfaction*, *bone mineral metabolism*, and *vascular access*. Implemented in 2012, facilities that do not achieve or make progress toward these and other specified quality measures receive a 2 percent *reduction* in their *bundled payment rate*.[268]

12.3.2.3 Competition *Freestanding outpatient enterprises,* for example, *outpatient cancer treatment centers, diagnostic imaging centers, ASCs and dialysis centers*, typically compete with *hospital outpatient departments* over the *technical component revenues* from procedures and diagnostic testing provided in these facilities. In addition, ASCs and diagnostic imaging centers may also face competition from *physician practices* that perform *office-based surgeries* and other *technical component revenue-producing services*, such as *medical imaging* and *cardiac catheterization services*, on site at the practice. Competition among these providers is likely to further grow as

Cancer Treatment Centers

A facility that provides treatment for the chronic condition and focuses on disease management; often provides chemotherapy and radiation therapy.

"Cancer Care in America," by Regina Herzlinger, Boston Healthcare Associates, March 2002, p. 5.

(1) reimbursement for these services becomes increasingly based on *quality* versus *quantity*, and (2) the market for these providers evolves, due to increased *integration* and *affiliation* among hospitals, physician practices, and other outpatient providers who become affiliated with an ACO.[269]

Some general, short-term, acute care hospitals may have competitive advantages over ASCs, including their *established managed care contracts*, *community position*, *physician loyalty*, and *geographical convenience* for physician inpatient and outpatient practices. However, ASCs compete favorably with general, short-term, acute care hospitals on the basis of *cost*, *quality*, *efficiency*, and *responsiveness* to physician needs in a more comfortable environment for the patient.

ASCs have been able to compete better than community hospitals for more profitable patients by (1) concentrating only on *specific diagnosis-related groups* (DRG); (2) *treating far fewer Medicaid patients*, who may cost more to treat and generate significantly lower reimbursement yield; and (3) *opting out of emergency room departments* and services.[270]

12.3.2.4 Technology Continuous advancements in technology, particularly those related to *minimally invasive surgery* and *diagnostic imaging*, have allowed procedures that have been traditionally performed in an *inpatient setting* to be performed in an *outpatient* setting, such as ASCs.[271] *Minimally invasive surgery procedures* typically decrease the risks traditionally associated with surgery through the use of several small incisions to guide fiberoptic cameras to the area(s) of interest.[272] In addition, developments in

[269] See Chapter 4, "Competition," for further discussion of this topic.

[270] Stuart H. Altman, David Shactman, and Efrat Eilat, "Could U.S. Hospitals Go the Way of U.S. Airlines?" *Health Affairs* 25, no. 1 (January/February 2006): 19.

[272] Mayo Clinic, "Minimally Invasive Surgery," 2009, http://www.mayoclinic.org/minimally-invasive-surgery/ (accessed April 6, 2009).

the various imaging modalities have allowed for testing to provide certain advantages for a given patient condition or specialty that the other procedures lack. For example, in cardiology, *single-photon emission computed tomography* (SPECT) is the most *widely available procedure* and is the most *extensively validated*, while *PET* is associated with the highest levels of *diagnostic performance*, and MRI offers a nonradiation alternative that maintains similar *levels of accuracy.*[273] CT appears to *expedite* and *improve* initial triage of patients on an *outpatient basis*, allowing patients to either return home or be admitted to an inpatient facility for evaluation.[274]

Much like *diagnostic imaging* technology, *radiation therapies* have been developed, adapted, and improved during the last several decades.[275] In addition to executing treatment plans developed based on *diagnostic imaging* scans, *image guided radiotherapy* (IGRT) is implemented by one-third of all radiation oncology sites, with ultrasound, X-ray, and CT imaging technologies being used most frequently.[276] One type of *intensity-modulated radiation therapy* (IMRT) treatment used custom-tailored 3D CT images alongside computer generated dose calculations and is thought by many to most effectively treat the unique three-dimensional shape of a tumor, thereby allowing for increased precision in the administration of high-dose radiation, while preserving the surrounding tissue.[277]

12.3.3 Value Drivers: Freestanding Outpatient Enterprises

While the *value drivers* identified for healthcare freestanding outpatient enterprises are similar to those of other healthcare outpatient enterprises,

[277] Radiological Society of North America, "Intensity-Modulated Radiation Therapy (IMRT)," RadiologyInfo, June 10, 2009, http://www.radiologyinfo.org/en/info.cfm?PG=imrt (accessed June 26, 2009).

for example, *scope of services, capacity, and revenue stream*, there are several specific dynamics related to these freestanding outpatient enterprises that should be taken into consideration during the appraisal process.

12.3.3.1 Scope of Services The *scope of services* provided by a particular freestanding outpatient enterprise is a key element affecting the overall indication of *value* attributed to that enterprise. For example, multi specialty ASCs that have a *higher percentage of orthopedic cases*, which are reimbursed at *more lucrative rates* than gastroenterology cases, will generate *larger amounts* of *revenue per case*, typically leading to *higher net economic benefit* and an increased *value* of the subject enterprise. In addition, the *diversification of services offered* may lower the *actual* and/or *perceived* risk of investment in a particular freestanding outpatient enterprise, in contrast to the industry of freestanding outpatient enterprises.

Advancements and *trends in technology* also affect the *scope of services* offered at certain freestanding outpatient enterprises. For example, diagnostic imaging enterprises have expanded the scope of services offered through (1) mobile health services, (2) the use of *picture archiving and communication system* (PACS), and (3) advancements in noninvasive imaging techniques. As advancements in technology allow for *better* and *earlier detection* of various diseases, the *scope of services*, in regard to *prevention* and *screening*, may provide higher quality and more efficient means of delivery for other types of healthcare provider entities that may outsource certain procedures to freestanding outpatient enterprises, for example, a *cardiology practice* that contracts with a freestanding outpatient diagnostic imaging facility to provide technical component testing services in the form of nuclear imaging studies may be able to provide higher quality services to its patients in contrast to cardiology practices that do not provide nuclear imaging studies.[278] See Table 12.50 for a description of typical services provided at various freestanding outpatient enterprises.

In addition to the *added revenue opportunities* created by *expanding the scope of services*, a freestanding outpatient enterprise may be able to create value through *economies of scale*. As more revenue is produced by the additional services rendered, only the variable portion of each expense would increase, while the fixed portion remains constant, thereby increasing the incremental benefit generated by each additional service. Note that this incremental benefit would only increase up to the point of *capacity*, where additional capital costs would reduce the benefit generated by the additional services.

Medication Management	
Physical Therapy	
Psychological Evaluation and Referrals	
Laboratories	

12.3.3.2 Capacity *Capacity* is another key element that affects the value attributable to freestanding outpatient enterprises. One *measure of capacity* for *freestanding outpatient enterprises* is the amount of *physical space* used in the provision of services, as illustrated in Table 12.51. For example, when appraising a dialysis center, the number of dialysis stations currently in operation could be used as a *measure of capacity*, or, for an ASC, the number of *operating rooms* available, as well as *average turnover rates*, can be used as *measures of capacity*. The most probable level of physical space or other measure of capacity required for a particular freestanding

TABLE 12.51 Freestanding Outpatient Enterprises: Factors Affecting Capacity

Freestanding Outpatient Center	Volume Metric	Factors Effecting Capacity
Ambulatory Surgery Centers (ASCs)	Cases	Number of Operating Rooms/ Procedure Rooms
		Operating Room Throughput or Turnover Time
Diagnostic Imaging Centers	Procedures	Number of Machines
		Per Throughput Capacity of Equipment (Technology)
		Number of FTE Technicians
Dialysis Centers	Procedures	Number of Dialysis Treatment Stations
		Number of FTE Dialysis Technicians
Walk-In Clinics: Urgent Care Centers and Retail Clinics	Visits	Number of Exam Rooms
		Per Throughput of Layout of Facility

Pain Management Centers	Procedures	Number of FTE Providers
Laboratories	Samples	Number of Blood-Drawing Stations
		Number of FTE Phlebotomists
		Number of FTE Laboratory Technologists

outpatient enterprise is often based on normative industry benchmark survey data related to comparable enterprises (see *Key Sources* at the end of the chapter for a list of applicable normative industry benchmark survey data).

12.3.3.3 Revenue Stream Similar to that of *physician professional practices*, the two main *drivers of revenue* for *freestanding outpatient enterprises* are:

1. *Changes in reimbursement yield*, driven by trends in reimbursement from Medicare and private payors; and
2. *Changes in patient volume*, which are based on:
   a. Changes in utilization demand for services; and
   b. Changes in the level of market share of the subject enterprise.

As *advancements in technology* and an increased *focus on cost reduction* continue to drive U.S. healthcare delivery into the *outpatient setting*, the increased growth in the utilization of those services offered by freestanding outpatient enterprises will likely endure. During 2010, 20 percent of all *outpatient volume growth* resulted from a movement of patient encounters from *freestanding outpatient enterprises* to *hospital-owned outpatient facilities*. Accordingly, *hospital-based outpatient physician office visits* grew by 6.7 percent from 2009 to 2010.[279] Despite this trend in *hospital ownership*, some *freestanding outpatient enterprise industries* have been able to survive independently and even grow. For example, approximately 300 new urgent care centers are being opened each year, that is, 332 from 2008 to 2009 and 304 from 2009 to 2010.[280] As hospital emergency departments continue to experience *dramatic overcrowding* (136.1 million visits in 2009 and many departments closing) and *long wait times* (rising 25 percent from 2003 to 2009), demand for the services provided at *urgent care clinics* may increase.[281] In addition, recent studies have indicated that the use of urgent care centers as an alternative to hospital emergency departments may present significant savings, prompting *payors* to use *education campaigns* that have

[280] Urgent Care Association of America, "About Urgent Care," September 15, 2011, http://www.ucaoa.org/home_abouturgentcare.php (accessed October 18, 2012).

[281] Urgent Care Association of America, "The Case for Urgent Care," September 1, 2011, p. 1; WellPoint, "Emergency Room Interventions Using Google Maps and Education Empower Consumers to Choose ER Alternatives for Non-Emergency Conditions," press release, June 23, 2011, http://ir.wellpoint.com/phoenix.zhtml?c=130104&p=irol-newsArticle&ID=1579424&highlight= (accessed October 18, 2012).

successfully promoted the use of urgent care clinics.[282] The value proposition of urgent care clinics has recently garnered increased investor interest in these types of enterprises, for example, private equity firms and private insurance companies are increasing their ownership of urgent care clinics.[283]

As discussed in Section 12.3.2, "Current and Future Trends: Regulatory, Reimbursement, Competition, Technology," most *freestanding outpatient enterprises* are reimbursed under the MPFS or the OPPS. However, certain facilities are reimbursed under a different, or modified, payment system, which affects the *unit of productivity* used to *measure reimbursement yield*, as well as the trends associated with the given reimbursement method. The payment system used is a key consideration when *projecting revenue streams* for the valuation of any type of *freestanding outpatient enterprises*.

Additional considerations may include the implementation of a *bundled payments system*, which currently exists under the ESRD PPS, MPFS for *diagnostic imaging services*, and ASC PPS, whereby the *integral services* and *items* used within the *primary service* being provided are *reimbursed* by a *single payment*. Bundled payments may be implemented through the various *measures of productivity*, for example, the ESRD PPS bundles items and services based on the *episodes of care*; the OPPS bundles items and services within a single APC; and reimbursements for *diagnostic imaging* are bundled through the CPT coded procedures that are associated with *integral services*. Bundled payments may limit the revenue streams generated by freestanding outpatient enterprises by lowering the *perceived volume of services provided*; if, for example, there are *multiple procedures* performed on a single day, the bundled payments for the subsequent services may be subject to *discounting*, that is, the second procedure may be reimbursed at a lower rate than the initial procedure.[284]

[284]Margaret M. Maley, "Back to Basics: The Multiple Procedure Reduction Rule and Modifier 51," American Academy of Orthopaedic Surgeons, *AAOS Now*, September 2010, http://www.aaos.org/news/aaosnow/sep10/managing1.asp (accessed February 7, /2013). For more information on the specifics of *bundled reimbursement*, see Section 2.4.1.3.1.2, "Hospital Outpatient Reimbursement," and Section 2.4.1.3.1.7, "ESRD Reimbursement," in Chapter 2, "Reimbursement Environment."

Bundling may also be implemented in the form of a *global payment*, in other words, the professional component and the ASTC are reimbursed together as a single payment. *Freestanding outpatient enterprises* typically bill only for the ASTC, while the physician who performs the professional component of the service bills separately.[285] However, in certain circumstances, for example, an anesthesiologist contracted to operate within an ASC, the facility may bill for both the *professional component* and the *ASTC portions* of the service provided and then subsequently *compensate* the physician for the professional services component of the treatment.

Other considerations regarding *reimbursement yield* that are likely to affect the *revenue streams* of freestanding outpatient enterprises include:

1. **Quality reporting programs**, for example, those used by ASCs;
2. **Method and frequency of rate updates**, for example, APC payments are based on CPI-U, while similar hospital codes are updated based on the hospital market basket (which is further discussed in Chapter 2, "Reimbursement Environment");
3. **Stability of payment rates**, for example, reductions in reimbursement to curb utilization and spending are applied more often to certain CPT codes;
4. **Referring physician utilization trends**, for example, increased scrutiny of physician referrals under fraud and abuse laws may affect patient volumes; and
5. **Dependence on payor mix**, for example, dialysis centers (discussed earlier).

For those freestanding outpatient enterprises where *reimbursement yield* for certain services is subject to *continuously changing payment rates*, for example, diagnostic imaging and to a lesser extent surgical procedures, the projection of *revenue streams* by individual *modality*, instead of for the *enterprise as a whole*, may be more appropriate.

Although utilization of outpatient services has increased, outpatient enterprises have experienced reductions in *reimbursement yield*, reducing their revenue growth. Despite this declining *reimbursement yield*, overall *revenues* for outpatient enterprises are projected to *grow* at a 7.0 percent annual rate, due, in part, to the *implementation* of the *individual mandate* portion of the ACA, which is anticipated to increase the number of individuals with insurance.[286] An example of the application of the revenue stream can be found online at http://www.wiley.com/go/healthcarevaluation.

---

[285] As further discussed in Section 2.4.1.3.1, "Facility-Based Reimbursement Rates," in Chapter 2, "Reimbursement Environment."

TABLE 12.52 2012 Outpatient Payor Mix

Payor	Mix
Private Insurance	38%
Medicare	25%
Other	16%
Medicaid	11%
Out-of-Pocket	7%
Other Government	5%

IBISWorld Industry Report 62149: Emergency and Other Outpatient Care Centers in the US, by Anna Son, IBIS World, November 2012, p. 19.

12.3.3.4 Payor Mix The overall 2012 payor mix for all *outpatient enterprises*, defined by IBISWorld as *ASCs, dialysis centers, HMO medical centers, biofeedback centers, infusion therapy centers, sleep therapy centers, and pain management centers*, is set forth in Table 12.52.[287]

However, the typical payor mix in 2011 for ASCs only, as reported by the *Multi-Specialty ASC Intellimarker Survey*, included the distribution of payors (by gross charges) as set forth in Table 12.53.

It should be noted that the *reimbursement yield* of a given ASC is significantly affected by whether the particular facility bills on an *in-network* or *out-of-network* basis for a particular *insurance plan*. Under certain insurance coverage plans, patients are given financial incentives, for example, lower *deductibles* and *co-insurance* payments, to see providers who are considered to be "*in-network*," referring to a contractual relationship entered into by the

TABLE 12.53 Typical ASC Payor Mix

Payor	Mix
Commercial	59%
Medicare	24%
Worker's Compensation	4%
Medicaid	3%
Other Pay	3%
Self Pay	2%

OUT-OF-NETWORK CAP

In an effort to mitigate paying higher reimbursement rates for OON services, certain payors have instituted internal fee schedules that cap the allowable charge that these payors will reimburse providers for OON services.

"ASC and Payor Negotiations," by Gary Scott Davis, Kriste Goad, and Naya Kehayes, McDermott Will & Emery, 2012 ASC Symposium (2012), http://www.mwe.com/info/ASC/2012materials/Operations-Administrative/ASC-Payor.pdf (accessed April 2, 2013); "Health Plans Seek Leverage When Physicians Submit Extremely High Bills," by Joseph Burns, Managed Care *(August 2011), http://www.managedcaremag.com/archives/1108/1108.gouging.html (accessed April 2, 2013).*

provider with the payor to offer services at a *discounted rate*.[288] In an effort to mitigate paying *higher reimbursement rates* for *out-of-network* (OON) *services*, certain payors have instituted *internal fee schedules* that cap the allowable charge that these payors will reimburse providers for OON services.[289] For example, Aetna has instituted policies to cap *nonparticipating physicians* at a reimbursement rate of 125 percent of Medicare rates.[290] However, it should be mentioned that certain states, such as New Jersey, have limited the ability of certain commercial insurers to cap the reimbursement to nonparticipating providers.[291] In addition, certain provisions of the recently enacted

[290] Aetna, "Balance Billing by Non-Par Physicians Under Involuntary Situations," http://www.aetna.com/health-reform-connection/aetnas-vision/balance-billing-non-participating-physicians.html (accessed April 15, 2013).

[291] "DOBI Levies Nearly $9.5 Million in Penalties against Aetna Health," State of New Jersey Department of Banking and Insurance, July 25, 2007, http://www.state.nj.us/dobi/pressreleases/pr070725.htm (accessed April 15, 2013).

Affordable Care Act (ACA), for example, state health insurance exchanges created by the ACA advocating that reimbursement rates for OON services be standardized, may also affect the ability of providers to bill exorbitant amounts for OON services.[292] These trends related to capping OON charges may result in a decreased *reimbursement yield* for those freestanding outpatient enterprises that rely on an OON strategy.

12.3.3.5 Operating Expenses The *operating expenses* of each freestanding outpatient enterprise are *dependent* on the *specialty*, or *modality*, practiced within the enterprise. Accordingly, those enterprises that use *sophisticated technologies* typically incur *higher operating expenses,* where the economic cost burden associated with the capital used is included in the operating expenses (either through depreciation, lease expense, or both). While higher costs typically indicate lower value, it should be noted that enterprises that use more *sophisticated technologies* may be able to increase market share, and therefore, from a *financial economic perspective*, the costs of these technologies must be weighed against any future benefits when assessing the value proposition of new technology and the impact it may have on the value of an enterprise.

In addition to *equipment and technology costs*, there may be significant *human resources/personnel costs* (*wages and benefits*) associated with the staff required to operate freestanding outpatient enterprises, for example, *nonphysician ancillary service providers* (midlevel providers, technicians, and paraprofessionals) and *administrative staff*, and in certain enterprises, such as ASCs, these *staffing costs* may represent the *largest operating expense* incurred by the organization.

Additional considerations regarding the operating expenses incurred by an ASC include:

1. The *size of the facility*, for example, the number of operating rooms and the number of cases;
2. The *ability of the ASC to manage supply costs*;
3. Whether the center *directly employs* or *contracts* with anesthesiologists;
4. Whether the *management of an ASC is performed by a third party*; and
5. Whether the *ASC employees a medical director.*

[292] California Medical Association, "Exchange's Plans to Cap Out-of-Network Costs Could Be First Step toward Rate Setting," August 16, 2012, http://www.cmanet.org/news/detail/?article=exchanges-plans-to-cap-out-of-network-costs (accessed April 2, 2013).

Similar to an ASC, *cancer treatment centers* that use *radiation therapy equipment* and *chemotherapy equipment* may also have *higher capital and operating expenses* than other outpatient enterprises. Considerations that may be particularly applicable to a *diagnostic imaging center* may include:

1. Whether the equipment was leased or acquired;
2. Whether the center employs a medical director; and
3. Whether the enterprise has a picture archiving and communication system (PACS) that must be updated and maintained.

For other outpatient enterprises, the main expense incurred is likely to be the purchase of those *medications* required to treat their specific patient base, for example, by *dialysis centers* and *chemotherapy centers*, as well as assembling a *staff* with the specific *training* and, possibly, the *certifications* required to administer those medications.

In addition to the types of operating expenses incurred by an organization, the amount of *fixed* and *variable* expense should be considered when performing an appraisal of a freestanding outpatient enterprise, as each type of expense is projected differently.[293] Also, some freestanding outpatient enterprises may incur a higher amount of *fixed expenses* than others, for example, a *diagnostic imaging center,* which uses more capital than a *pain management center,* would have more *fixed expenses* in its operating expense structure.

Similar to trends affecting other healthcare entities, *freestanding outpatient enterprises* may benefit from increased utilization of *administrative related technology*, for example, EHR systems, which most often reduce the economic operating costs associated with the provision of administrative tasks and duties. Note that the underlying trend of operating expenses for most healthcare enterprises is rising, due to increases in *medical care input costs*, which are putting downward pressure on the *profit margins* of these facilities.

However, as illustrated in Table 12.54, the three-year trend in total operating expenses as a percentage of revenue for certain types of freestanding outpatient enterprises indicates that operating expenses have dropped, however minimally.

12.3.3.6 Capital Structure The implications of the capital structure decision for freestanding outpatient enterprises are similar to those of physician professional practices, as discussed in Section 12.2.1.3.6, "Capital Structure."

[293] See Section 8.1.1.4.1, "Economic Operating Cost Burden," in Chapter 8, "Valuation Approaches and Methods," for further discussion.

TABLE 12.54 Three-Year Trend in Total Operating Expenses for Certain Freestanding Outpatient Ambulatory Enterprises

Freestanding Outpatient Ambulatory Enterprises NAICS Code Description	NAICS Code	Operating Expenses as a Percentage of Net Revenue 4/1/09–3/31/10	4/1/10–3/31/11	4/1/11–3/31/12
Outpatient Mental Health and Substance Abuse Centers	621420	95.9%	93.9%	95.4%
Kidney Dialysis Center	621492	88.4%	86.1%	86.5%
Freestanding Ambulatory Surgery and Emergency Centers	621493	80.1%	80.1%	77.5%
Medical Laboratories	621511	88.4%	89.6%	88.2%
Diagnostic Imaging Centers	621512	87.6%	85.3%	87.5%
All Other Miscellaneous Ambulatory Health Care Services	621999	90.8%	90.7%	90.6%

Annual Statement Studies: Financial Ratio Benchmarks, 2012–2013, 2012 Edition, by the Risk Management Association (RMA), Philadelphia, data for all survey respondents in each period used.

These implications are (1) the mix of debt and equity financing affects the *risk-adjusted required rate of return* for investment in the subject enterprise; (2) *debt financing* is typically cheaper than *equity financing*; and (3) *financing costs* reflect the risks associated with each type of capital provided, for example, *debt financing* typically considers the four Cs of the *obligor*, that is, *credit risk* (default risk) of the borrower, *capacity of the borrower* to make timely repayments of both principal and interest (short-term liquidity and interest coverage), *collateral* to cover the lender in case of borrower default, and an analysis of the *covenants* included in the indenture agreement; and equity financing considers the risks associated with an investment in the residual ownership interest (subordinate to any debt holders) of the subject enterprise.[294] Various metrics describing the *capital structure* of freestanding outpatient enterprises are presented in Table 12.55.

As set forth in Table 12.55, in 2012, for every $100 of *equity* employed by the owners of the business enterprise, a corresponding $29.26 of *debt* (*debt/market value equity*) is used. Note that the amount of debt used by a specific freestanding outpatient enterprise will likely be affected by (1) the

TABLE 12.55 Leverage Ratios for Outpatient Facilities (SIC 8093)

	2011	2012
Debt/Market Value Equity	28.63%	29.26%
Liquidity	2.18%	2.01%
Cost of Debt	4.60%	3.85%
Cost of Equity	14.94%	13.33%

Ibbotson Cost of Capital Yearbook (Chicago: Morningstar, editions 2012, 2011, 2010, and 2009).

age of the equipment and other technology used by the enterprise and (2) the enterprise's dependence on technology, for example, an ASC will have higher *capital needs* related to *obtaining* and *maintaining* surgical equipment, compared to a *less capital intensive* pain management center.

Data and information pertaining to the most probable capital structure of a freestanding outpatient enterprise can be derived from normative industry benchmark survey data (see *Key Sources*), as well as comparable publicly traded company data, for those freestanding outpatient enterprises that have comparable publicly traded companies. In addition, the capital structure can be determined through techniques such as the iterative method.[295] As previously mentioned, for the purpose of establishing the *fair market value* of a business enterprise, it is important to use formulas based on *market values* of *equity* and *debt*, rather than *book values*.[296]

12.3.3.7 Suppliers The amount of *bargaining power* an enterprise commands in the marketplace, the higher the value the organization can create through the supply chain, ceteris paribus. In general, enterprises achieve a significant amount of their *bargaining power* from their *size,* since larger enterprises, with greater patient populations, represent a larger portion of business for vendors and therefore have more *negotiating power* than smaller enterprises. In addition, those larger outpatient enterprises that are able to reap the benefits of this increased *market leverage* may be able to lower operating costs by negotiating lower supply prices, thereby improving profit margins, which may increase the indication of *value* of the enterprise.

[295] See Section 9.2.1.3, "Capital Structure," in Chapter 9, "Costs and Sources of Capital," for further discussion of determining the capital structure.

[296] Shannon P. Pratt and Roger J. Garbowski, *Cost of Capital: Applications and Examples*, 3rd ed. (Hoboken, NJ: John Wiley & Sons, 2008), pp. 276–277.

12.3.3.8 Market Rivalries and Competitors The *freestanding outpatient enterprise* industry has been experiencing, and is forecasted to continue to experience, significant *consolidation*, through mergers and acquisitions by both *hospitals* and *corporations*. This trend toward consolidation decreases the *competition* and *rivalry* among freestanding outpatient enterprises and has also resulted in an increase in the number of *joint ventures* between freestanding outpatient enterprises and hospitals. *Affiliation* and *integration* among smaller outpatient enterprises may allow these providers to obtain greater *negotiating leverage* and the potential to *gain access* to better managed care and commercial contracts, enhancing their *profitability* and increasing their indication of *value*.[297]

Similar to that of inpatient enterprises, freestanding outpatient enterprises are subject to various legislative barriers to entry, including state *certificate of need* (CON) laws and *licensure requirements*.[298] These barriers to entry also limit the amount of competition in the *freestanding outpatient enterprise* industry and may provide economic profits to organizations that are able to obtain licensure.

12.3.3.9 Subject Entity Specific/Nonsystematic Risk While an investor in a particular *freestanding outpatient enterprise* would have additional investment opportunities available to him or her, for example, government bonds, equity indexes, the discount rate used to *present value* all the expected future net economic benefits should consider these opportunity costs, as well as any idiosyncratic risk associated with an investment in the specific subject enterprise.[299] This *subject entity–specific/nonsystematic (idiosyncratic) risk* for *freestanding outpatient enterprises* would include the *various risk factors* that are *inherent and specific to the enterprise* being valued, as well as the *enterprise's operational performance* compared to the *most probable* performance of similar enterprises as reported in normative industry benchmark survey data. *Subject Entity–Specific/Nonsystematic Risk factors* for most *freestanding outpatient enterprises* include, but are not necessarily limited to:

1. The *uncertainty related to the continuity of the projected revenue stream*, based on the *probability of achieving the projected productivity volume* and the efficacy of the *projected reimbursement yield* used in the analysis;

---

[297] Anna Son, *IBISWorld Industry Report 62149: Emergency and Other Outpatient Care Centers in the US*, IBIS World, November 2012, p. 23.

[298] See Chapter 3, "Regulatory Environment," for further discussion.

[299] See Chapter 9, "Costs and Sources of Capital," for further discussion.

2. The *risk related to the probability of achieving industry-indicated operational and financial benchmarks* used in the analysis;
3. The *competitive marketplace* within which the freestanding outpatient enterprise operates; and
4. The *historical operations* of the freestanding outpatient enterprise *in comparison to the industry benchmarks*.

Examples of *subject entity–specific/nonsystematic risk considerations* related to the valuation of an ASC or diagnostic imaging center, include, but are not necessarily limited to:

1. The *diversity of specialties and services offered at the enterprise being valued* (see *operating costs*);
2. The *percentage of out-of-network patient volumes* (see *reimbursement trends*);
3. *Capital needs* related to the facility and equipment (see *capital structure*);
4. *Operating performance* (see *operating costs*);
5. The *stability and relative size of current and future reimbursement revenues* (see *revenue stream*); and
6. *Relationship with independent surgeons/referring physicians in the market service area* of the subject enterprise (see *competition* and *revenue stream*).

Examples of the *subject entity–specific/nonsystematic risk considerations* related to the valuation of a dialysis center, include, but are not necessarily limited to:

1. The *volume and diversity of the number of referral sources*, for example, *nephrologists* (see *revenue stream*);
2. *Demographic trends* in the specific market service area of the subject enterprise, such as the *aging baby boomer population* and the resulting need for geriatric services (see *competition trends* and *revenue stream*);
3. *Regulatory barriers*, for example, CON laws (see *market rivalries and competitors*); and
4. The *influence of payor mix* (see *reimbursement trends*).

12.3.4 Other Pertinent Valuation Considerations: Freestanding Outpatient Enterprises

In addition to the list of value drivers related to *freestanding outpatient enterprises,* there exist other unique considerations to the valuation of *freestanding*

TABLE 12.56 Other Pertinent Valuation Considerations—Freestanding Outpatient Enterprises

Pertinent Considerations	Description
Capital Expenditures	*Freestanding outpatient enterprises*, such as cancer treatment centers or diagnostic imaging centers, may require greater levels of capital to support their projected revenue stream than other outpatient enterprises do. The valuation analyst should carefully consider the *capital requirements* of the subject enterprise when projecting the capital expenditures required to support the revenue stream being forecast.
Selection of Methodology	*Income approach–based methods* are primarily used to appraise *Freestanding Outpatient Enterprises*; however, depending on the nature of the specific subject enterprise being appraised, *market approach–based methods* may be used, for example, numerous publicly traded companies exist that provide diagnostic imaging services; however, there are very few publicly traded comparable cancer treatment companies. *Cost approach–based methods* can be used to value *Freestanding Outpatient Enterprises*; however, these methods are often time consuming and cost prohibitive.

outpatient enterprises. Table 12.56 illustrates some of the other pertinent considerations related to the valuation of freestanding outpatient enterprises.

12.3.5 Isolated ASTC-Related Valuation Considerations

12.3.5.1 Isolating the ASTC Service Line There are two general types of services provided by a physician practice: (1) *professional services* and (2) *ancillary and technical component services* (ASTC). *Professional services* are those services that require the presence of a physician or a midlevel provider (MLP) and also requires the contribution of that provider's *time* and *effort*, that is, the "*sweat of their brow*." ASTC services, conversely, are services that do not *require* a professional provider's work input but that may nevertheless be performed by the physician or the MLP, for example, performing diagnostic imaging tests.[300]

[300] For a further discussion of *professional component services* versus *ASTC service line related services*, see Chapter 2, "Reimbursement Environment."

These ASTC related services are referred to as "*technical*" because they are technologically intensive in nature, such as *radiography* (X-rays) and other *diagnostic imaging procedures*, and the provision of these ASTC services may require significant *capital equipment* and an appropriately trained *technical staff*. These services are referred to as "*ancillary*" because they are not directly related to the provision of *professional medical services* but can *assist* in the provision of these services. As these services can assist a physician in the performance of his or her duties, they are often *offered by*, and *integrated with*, a professional practice enterprise, in contrast to being provided through a *freestanding ancillary service enterprise*. An example of an application of isolating the ASTC service line can be found online at http://www.wiley.com/go/healthcarevaluation.

12.3.5.1.1 Hypothetical Condition The fact that these *ASTC services* are often integrated within a *physician practice enterprise* does not restrict these *ASTC service lines* from having *value*, separate and apart from that of the *physician practice enterprise* within which they are integrated (i.e., as an *independent ASTC Service Line*). Service lines, or business units, within large corporations are commonly separately *valued* and sold as though they were independent, *stand-alone entities*. The use of a *hypothetical condition* is required for the valuation of an *integrated ASTC service line* as a *stand-alone ASTC Service line*. Under applicable valuation standards, the use of this *hypothetical condition* must be disclosed to the client within the valuation report. A *hypothetical condition* can be defined as:

> *an assumption contrary to that which currently exists but, for the purposes of a valuation, has been assumed to be that which would typically be expected by the universe of typical purchasers.*[301]

Specifically, in the case of an *integrated ASTC service line* being valued as a *stand-alone ASTC service line*, the valuation analyst considers the *ASTC Service Line* as an *independent*, *stand-alone operating entity.* This is contrary to the fact that the *ASTC Service Line* is currently, as of the valuation date, being operated as a service line, or business unit, integrated within the *physician practice enterprise.*

Accordingly, the valuation analyst should *include* only the assets, liabilities, revenue, incurred expenses and/or personnel of the *physician practice enterprise* that are required in the production of the *net economic benefit stream* of the *ASTC Service Line* and should *exclude* any *assets, liabilities, revenue, incurred expenses,* and/or *personnel* of the *physician practice*

[301] American Society of Appraisers, "Hypothetical Condition," in *ASA Business Valuation Standards—Definitions*, 2009, p. 28.

enterprise that are not required in the production of the *net economic benefit stream* of the *ASTC Service Line*.

In addition to the already mentioned *underlying assumptions*, which support the *hypothetical condition*, other criteria should be considered in developing an appraisal of an ASTC Service Line to be consistent with the valuation standard of *Fair Market Value*, including:

1. An assessment of whether the market service area of the physician practice enterprise contains sufficient *demand* for the *ancillary and technical services* to support the projected, post-transaction volume of procedures of the ASTC Service Line, as an *independent operating enterprise*;
2. An assessment of whether there is a sufficient *supply* of *physician manpower* within the geographic proximity limitations of the market service area, *separate and aside* from the physicians of the subject physician practice enterprise, to support the projected, post-transaction volume of *ancillary and technical services* to be provided by the ASTC Service Line, as an *independent operating entity*;
3. The distinct *revenue stream*, from which the economic benefit of the ASTC Service Line is derived, should be *separately identifiable* and *quantifiable* from the *revenue stream* of the *professional component* of the physician practice enterprise;
4. An *appropriate economic operating expense burden*, accurately allocated between the defined services and revenue of the ASTC Service Line to be appraised and the residual physician practice enterprise revenue streams, as well as an *economic capital expense burden*, should be developed to be applied against the distinct *revenue stream* of the ASTC Service Line, to arrive at the economic benefit of ownership of the ASTC Service Line to be capitalized into Fair Market Value;
5. An appropriate *risk-adjusted required rate of return* for the ASTC Service Line should be developed that reflects the *hypothetical nature* of the ASTC Service Line *and* the *uncertainty* related to the *projected operations* of the ASTC Service Line, which may *reasonably* be projected to be *encountered* due to the *independent nature* of the ASTC Service Line being valued, in contrast to the *historical organizational structure* of the physician practice enterprise; and
6. An analysis to ensure that the *anticipated hypothetical transaction* would be conducted in *compliance* with the *Medicare Anti-Kickback Statute*, which makes it illegal to knowingly pay or receive any remuneration from the seller to the buyer related to the volume or value of referrals.[302]

[302] "Criminal Penalties for Acts Involving Federal Health Care Programs," 42 U.S.C.A. § 1320a-7b(b) (2010).

12.3.5.1.2 Global vs. Professional + Technical The determination of the *revenue stream* attributable to the ASTC Service Line, *distinct* and *separately identifiable* from the *revenue stream* of the *professional component* of the physician practice enterprise, is an important task in the valuation of an *ASTC Service Line*. Using the CPT-coded procedure volume reports of the physician practice enterprise, the valuation analyst, with the agreement of all parties to the transaction, may identify the procedures, performed within physician practice enterprise, that make up the defined *services* and *revenue* of the ASTC Service Line.[303]

Each CPT-coded procedure may fall into one of three categories: (1) *professional component services only*, that is, does not include any *ancillary* or *technical component services*; (2) *technical component services only*; i.e., does not include *physician work component services*; or (3) *global services*, i.e., includes *both* professional component services *and* technical component services. For those *global service procedures*, the valuation analyst must determine the proper allocation of revenues generated from those codes between *professional component revenues* and the *technical component revenues*. One method that may be used in the allocation of revenue between *professional component* and *technical component services* for global procedures is to calculate the *percentage* of the procedure's *total RVUs*, as reported by the CMS Physician Fee Schedule, that consists of *professional services only* (i.e., indicated by the ratio of RVUS from the "*26*" modified CPT code to the RVUs from the global code) and the *percentage* of the *total RVUs* for the specific global procedure CPT code that is composed of *technical services only* (i.e., as indicated by the ratio or RVUs from the "*TC*" modified CPT code to the RVUs from the global CPT code). For more discussion on the use of modifiers in the CPT system, see Chapter 2, "Reimbursement Environment. An example of the application of the global versus professional and technical components can be found online at http://www.wiley.com/go/healthcarevaluation.

12.3.5.1.3 Physician Supervision of Diagnostic Tests" While the *ASTC services* are not *professional services* and need not be provided by a physician, many services, including *diagnostic imaging services*, require physician *supervision* to be provided. In the case where those *ancillary services and technical component services* allocated to the *ASTC service line* cannot be performed without *direct physician supervision*, it may not be appropriate to consider the ASTC Service Line as an *independent*, *standalone entity*, apart and distinct from the physician practice enterprise.

[303] For more discussion on the CPT system, see Chapter 2, "Reimbursement Environment."

ASTC services may require one of the following three levels of physician supervision:

1. *General Supervision*: The service is provided under the direction of a physician but a physician's presence is not require for this service;
2. *Direct Supervision*: The service is provided under the supervision of a physician and the physician must be present, although not necessarily in the same room, for the service to be provided; and
3. *Personal Supervision*: The service requires a physician's presence within the room where the service is being provided.[304]

Each CPT-coded procedure is given a *status code*, within the CMS *Physician Fee Schedule*, related to the level of supervision required.

ASTC services that require only *General Supervision* or *Direct Supervision* and thus do not require a physician to be present *in the room* can be appropriately *separated* from the physician practice enterprise and can be valuated as an *independent*, *stand-alone operating entity.* Further, *diagnostic procedures* performed within a *hospital setting* are exempt from the physician supervision requirement.

12.3.5.1.4 Appropriate Allocations (Income Statement and Balance Sheets) Once the allocation of revenue related to the ASTC Service Line has been completed, the valuation analyst should proceed with the allocation of *both* the *operating and the capital expense burdens*, as well as the distribution of the *assets* and *liabilities* of the physician practice enterprise between the *ASTC Service Line* and the *residual practice*. These *pro-forma* financial statements will form the basis of the valuation analyst's projection of the *net economic benefit* accruing to the owners of the *ASTC Service Line* and the *residual practice.*

The *appropriate economic operating expense and capital burden* of the ASTC Service Line may be determined by allocating each operating expense of the physician practice enterprise between the ASTC Service Line and the residual practice based on several assumptions, including, but not limited to, the following:

1. **Identification of specific expenses** to the ASTC Service Line and the residual practice. Certain staff costs (i.e., salaries and benefits) are incurred

[304] Centers for Medicare and Medicaid Services, "Chapter 15: "Covered Medical and Other Health Services, Section 80," in *Medicare Benefit Policy Manual*, June 8, 2012, pp. 89–91.

exclusively for the generation of technical component revenues (e.g., radiation technologists, nuclear technicians, etc.), and, therefore, those costs could be entirely allocated to the *economic operating expense burden* of the ASTC Service Line.

2. **Percentage of ASTC Service Line revenue and residual practice revenue to total physician practice enterprise revenue;**
3. **Percentage of Total Office Square Footage** that is either for the exclusive use of technical component services (e.g., radiology imaging rooms) or that is for the exclusive use of professional component services (e.g., physician offices).
4. **Percentage of Total Tangible Personal Property Value** related to those assets that are for the exclusive use of technical component services (e.g., radiology equipment), or those assets that are for the exclusive use of professional component services (e.g., furniture in the physicians' offices).

The *assets* and *liabilities* of the *physician practice enterprise* should also be allocated between those *assets and liabilities* related to the *ASTC Service Line* and those related to the *residual practice*. The allocation of the assets and liabilities may be based on assumptions similar to those described earlier related to the allocation of expenses.

An *ASTC Service Line*, once disaggregated from the *residual practice*, can be valued like any other healthcare-related entity, given the appropriate attention to the additional risk in forecasting revenues, expenses, and capital needs from the perspective of a new market entrant, competitor start-up. All three basic approaches to valuation, that is, the *Income*, *Market*, and *Asset*, may be applicable, and all should be considered. However, a significant motivation for maintaining an *ASTC Service Line* within a physician practice is the service line's ability to generate *positive net economic benefit*. As such, an *Income Approach* is typically an acceptable valuation methodology for an *ASTC Service Line*, although the valuation analyst should consider all applicable valuation methodologies.

Within the *Income Approach*, it is important to reflect the *higher degree of uncertainty*, due to the *hypothetical nature* of the *ASTC Service Line*, and the regulatory risk related to the prohibition of considering the volume of value of referrals, which would result in an increased *perception of ris*k by potential investors in the *ASTC service line*, demanding a greater *risk-adjusted required rate of return*, in contrast to a valuation of an already *free-standing diagnostic imaging center.* Similarly, within the *Market Approach*, if used, it is important to select appropriate comparable transactions and companies for the *ASTC Service Line* and adjust them, if possible, reflecting the hypothetical nature of the *ASTC Service Line*.

12.4 HOME HEALTH AND HOSPICE ENTERPRISES

Home health enterprises may be classified as those enterprises that coordinate the delivery of healthcare services to patients in their *homes*. In 2012, there were approximately 297,198 home healthcare agencies in the United States, representing an average annual growth rate of approximately 5 percent since 2007.[305] In 2010, more than 62 percent of Medicare certified home health agencies were freestanding, while 12 percent were hospital-based.[306] Overall, the *home health industry* was expected to amass revenues of approximately $69.8 billion in 2012, with an annual revenue growth rate of 4.6 percent between 2007 and 2012.[307]

There are three types of services that typically fall under the umbrella of home health: (1) *home health enterprises*, which provide medical and supportive care; (2) *home care aide enterprises*, which provide nonmedical care or custodial/nonmeal care; and (3) *hospice enterprises*, which provide end-of-life care.[308] Two of the main types of home healthcare services are (1) *infusion therapy*, and, (2) *respiratory therapy*, as described further in Table 12.57.

Integral to the delivery of many home health services is the utilization of *durable medical equipment* (DME), that is, medical equipment designed for repeated use in order to improve the quality of life for patients with illnesses

Home Health

Healthcare services that are offered to patients in their homes include (1) home healthcare enterprises, which provide medical and supportive care; (2) home care aide enterprises, which provide nonmedical care or custodial care; and (3) hospice enterprises, which provide end-of-life care

or injuries, including equipment for *home respiratory therapy*, *home infusion therapy*, and *diabetic care supplies*, as well as for *patient positioning* and *mobility*.[309] Medicare assigns DME into separate categories, based on the nature, price, and maintenance frequency of an item, as follows:

1. Inexpensive or routinely purchased equipment;
2. Items requiring frequent and substantial servicing;
3. Prosthetic and orthotic devices;
4. Capped rental items; and
5. Oxygen and oxygen equipment.[310]

Factoid

In 2012, there were approximately 297,198 home healthcare agencies in the United States.

Durable Medical Equipment

Medical equipment designed to be used (with repeated use) in order to improve the quality of life of patients with illnesses or injuries.

Durable Medical Equipment: U.S. Market Size, Segments, Growth and Trends, 2nd Edition, *Research and Markets, April 2011.*

DME includes not only *physical medical equipment*, but also any *drugs* and *medications* necessary for the equipment to function, for example, *heparin* administered through a *dialysis machine*. The largest category of DME is *oxygen* and *related supplies*, making up approximately 25 percent of all DME spending by Medicare in 2010.[311]

Similar to the *increased utilization* of home health services among Medicare beneficiaries, the number of Medicare beneficiaries using *hospice services* has also been increasing during the last decade, for example, the number of *hospice beneficiaries* in 2010 exceeded 1.1 million, more than double the number of beneficiaries in 2000. Likewise, the number of *hospice providers* participating in Medicare increased by 58 percent between 2000 and 2011, with Medicare payments for hospice services increasing from approximately $3 billion in 2000 to $13 billion in 2010.[312] Significantly, the number of *for-profit* hospice providers has also been growing, for example, approximately 55 percent of hospice agencies were *for-profit* enterprises as of 2011, as compared to 34 percent in 2001.[313]

Factoid

The largest category of DME is *oxygen* and *related supplies*, making up approximately 25 percent of all DME spending by Medicare in 2010.

12.4.1 Current and Future Trends: Regulatory, Reimbursement, Competition, Technology

12.4.1.1 Regulatory In addition to the state licensure requirements, home health agencies must be certified by Medicare in order to receive reimbursement for services provided to patients who are Medicare or Medicaid beneficiaries. Home health agencies may meet the requisite Medicare certification requirements by obtaining *accreditation* through an accepted national *accreditation organization*, that is, (1) the *Joint Commission*; (2) the *Accreditation Commission for Home Care*, Inc.; and (3) the *Community Health Accreditation Program*.[314] In addition, home healthcare agencies must also be compliant with federal *HIPAA* requirements and the federal *Anti-Kickback Statute*; for example, the "*Home Health Fund*" was subject to a 1995 OIG "*Fraud Alert*" related to such legally impermissible practices as providing free services to a retirement home or an adult congregate care

facility in exchange for home health service referrals (see Section 3.3.1.2, "OIG Fraud Alerts"), as well as applicable state CON regulations (see Section 3.4.3, "Certificate of Need," both in Chapter 3, "Regulatory Environment").[315] As of March 2012, 16 states and the District of Columbia had CON laws that included the regulation of home health services, as set forth in Table 12.58.[316]

For a complete list of states that have a CON program in place, see Table 3.12, "States with CON Legislation."

While fraud and abuse scrutiny has increased across the entire healthcare delivery system in recent years, particularly since the formation of the Health Care Fraud Prevention and Enforcement Action Team (HEAT) in May 2009, reimbursement for hospice services has received specific attention, due, in part, to reports by the Medicare Payment Advisory Committee (MedPAC) regarding increased lengths of stay for residents in hospice enterprises during the last several years.[317] As a result of this increased scrutiny, many hospice providers who allegedly sought false

Medicare claims have been subject to whistleblower suits and are now facing legal and financial repercussions. For example, a 2012 whistleblower suit involving two former employees of AseraCare Hospice, a company owned by Golden Living that operates 65 hospice centers across 19 states, accused AseraCare of "*reckless business practices*."[318] The suit alleged that the company sought claims for hospice care for patients who were not terminally ill in order to maximize Medicare reimbursements, and that from 2005 to 2009, approximately 36 percent to 79 percent of patients discharged were still living.[319] The government joined the whistleblower suit on January 12, 2012, and is seeking treble damages and a penalty of $5,000 to $11,000 per claim.[320]

12.4.1.2 Reimbursement Approximately 3.4 million Medicare beneficiaries received home health services in 2010 and 2011.[321] More than 12,000 home health agencies participated in the Medicare program in 2011, with Medicare payments for home health services totaling approximately $19.6 billion in 2010.[322] Medicare reimburses for home health services under the home health prospective payment system (PPS), which was implemented on October 1, 2000. This episode-based PPS relies on a 153-category *case-mix adjuster* to establish payment rates based on patient characteristics, including (1) *clinical severity*, (2) *functional status*, and, (3) the *need for rehabilitative therapy services*. While the PPS is similar to the methodology used for *skilled nursing facility* reimbursement, payment is based on a 60-day *episode of care*, as compared to the *daily unit* of payment utilized for skilled nursing reimbursement.[323] Significantly, respiratory care services are

specifically *excluded* from Medicare's home health PPS.[324] However, respiratory care services may be covered under Medicare if they are furnished as part of a "*plan of care*" by a nurse or a physical therapist as a "*skilled care*" visit, rather than as a "*home health episode*."[325]

The ACA included several reimbursement initiatives aimed at bringing payments for the *home health services* more "*in line*" with the costs of providing those services, that is, in:

1. 2011: The standard 60-day episode rate was reduced by 1 percent;
2. 2012 and 2013: The market basket update was reduced by 1 percent;
3. 2014–2016: A phased rebasing was implemented to lower payments to a level to reflect changes in average visits per episode and other factors that may have changed since the rate was originally set. The secretary of Health and Human Services may lower payments by no more than 3.5 percent a year, for a cumulative reduction to payments of 14 percent by 2016. These reductions will be offset by the payment update for each year.
4. 2015 and beyond: The market basket was reduced by multifactor productivity for each year.

Medicare reimbursement for DME is provided under a fee schedule developed from suppliers' previous Medicare charge history. Actual reimbursement payments are typically 80 percent of the lesser of either: (1) the supplier's actual charge; or (2) the Medicare fee schedule for an item or a service. In addition, under the *Medicare Prescription Drug, Improvement, and Modernization Act of 2003* (MMA), the *secretary of HHS* established a program under which DME suppliers must participate in the *competitive bidding program* in order to obtain Medicare contracts.[326]

Medicare reimbursement for *home infusion therapy services*, which differs from reimbursement for other services provided by *home health agencies*, is set forth in Table 12.59.

In contrast to reimbursement for home health services, Medicare reimbursement for hospice services is based on an *adjusted per diem rate* for each

TABLE 12.59 Reimbursement for Home Infusion Therapy Services

	Part A Home Health	Part B DME Benefit	Part C Medicare Advantage (MA)	Part D Prescription Drug Plan	State Medicaid Program	Other Payer Coverage
Requirement	Homebound and in need of part-time or intermittent skilled nursing or therapy services, if such services are reasonable and necessary to the treatment of the illness or injury.	If medically necessary for the drug to be administered through an infusion pump (except for IVIG).	Coverage of at least Part A/B services. Coordinated care plans may include additional coverage and mechanisms to control utilization.	Drugs that are not currently covered under Parts A and B of Medicare, or otherwise excluded under Part D.	If coverage is not available through Parts A, B, C, or D of Medicare, the Medicaid home health benefit may cover services, equipment, and supplies necessary to administer home infusion drugs.	Varies, but generally like Part C.
Professional Fees	Yes—If homebound or if drug is covered under Part B (except for IVIG, where all components are billed under Part B).	No—Except for cases of IVIG.	Yes	No—But Plan must require the contracted pharmacies to provide necessary DME, supplies, and services to dispense a drug billed to Part D Plan.	Yes—May be billed separately or as part of bundled rate.	Varies, but generally like Part C.

Equipment and Supplies	Yes—In certain circumstances under the DME, prosthetic, or home health benefit,	Yes—Supplies are billed separately by the vendor under either the DME, prosthetic, or home health benefit.	Yes—Most often included in bundled payment.	No—Cost of supplies, equipment, and professional fees must be covered via Medicare Parts A or B, MA, Medicaid, other insurance, or out of pocket.	Yes—May be billed separately or as part of bundled rate.	Varies, but generally like Part C.
Drug Ingredient and Dispensing Fee	No—Drugs/ biologicals are specifically excluded from the Part A home health benefit.	Yes—Part B pays for about 30 drugs & TPN under DME benefit, but there is no separate dispensing fee paid.	If covered, under Part B, yes. If not covered under Part B, must be covered under Part D in a MA-PD plan.	Yes.	No—Unless drugs are included in bundled rate, which does not trigger Medicaid FFP exclusion.	Varies, but generally like Part C.

"Memorandum to All Part D Sponsors from Gary Bailey, Deputy Director, Center for Beneficiary Choices Regarding Home Infusion Therapy," Center for Beneficiary Choices, CMS, March 10, 2006, Attachment A, p. 3; *Report to the Congress: Medicare and the Health Care Delivery System*, Medicare Payment Advisory Commission, June 2012, Chapter 6, pp. 175–179.

day a beneficiary is enrolled in the *hospice benefit program*, regardless of the level of services received on that day.[327] In addition to the *per diem rate*, hospice facilities may bill Medicare separately for *prescription drugs* or *respite care*.[328] Significantly, Medicare *caps* payments to hospice facilities in two ways: (1) the *inpatient cap* limits the number of days of inpatient care that the hospice may provide, to no more than 20 percent of the total inpatient care days; and (2) the *aggregate cap* is an absolute dollar limit on the average annual payment per beneficiary that an agency can receive. The *aggregate cap* amount for the year ending October 31, 2012, was $25,377.01.[329]

Individuals covered under Medicare Part A can elect to receive hospice care if they:

1. Have a terminal illness with a prognosis of under six months, if the disease runs its normal course;
2. Receive treatment in a Medicare-approved hospice center; and
3. Sign a statement electing hospice care and waiving all other rights to Medicare payments associated with the terminal illness.[330]

During the first 90 days of hospice care, the beneficiary must receive a signed certification of a terminal illness from a physician describing the clinical findings that support a life expectancy of under 6 months.[331] After the initial 90-day period, a physician must recertify that the patient is still eligible for hospice care.[332]

Between 2005 and 2011, Medicare spending on hospice care for nursing home residents increased 70 percent. In light of this trend, the *U.S. Department of Health and Human Services* (HHS) and the *Office of Inspector General* (OIG) recommended in the *Health Care Fraud and Abuse Control Program Annual Report for Fiscal Year 2011*, that CMS begin to monitor payments to "hospices that depend heavily on nursing facility residents and modify the payment system for hospice care in nursing facilities," and

[327] Medicare Payment Advisory Commission, "Hospice Services Payment System," *Payment Basics*, October 2012, p. 1.

modify the current hospice reimbursement structure, which incentivizes hospices to target "*nursing facility beneficiaries who often receive longer but less complex care.*"[333] While, to date, no action has been taken to change reimbursement incentives for hospice services, fraud and abuse scrutiny of these facilities will likely continue to be present going forward as the U.S. healthcare delivery system evolves within the new era of reform.

12.4.1.3 Competition According to a *March 2012 MedPAC Report*, patient access to home health services appears to be adequate as the supply of providers continues to increase to the meet the growing demand, for example, 420 new home health agencies entered the market in 2011, totaling approximately 11,900 home health agencies in the United States.[334] Most of the growth in newly developed home health agencies has been in the *for-profit sector*, with the greatest amount of growth concentrated in Texas, California, Florida, and Illinois.[335] Competition among home healthcare providers is largely *variable*, due to the wide spectrum in the *scope of services* that may be provided by a given home health agency. For example, home health agencies may provide services that require a licensed provider, for example, home infusion therapy; respiratory care; physical, occupational, and speech therapy; and skilled nursing services, or may provide services that do not require a licensed provider, such as those provided by a home health aide.[336]

[335] Ibid.

[336] Medicare Payment Advisory Commission, "Home Health Care Services Payment System," October 2012, http://www.medpac.gov/documents/MedPAC_Payment_Basics_12_HHA.pdf (accessed March 19, 2013).

Due to the wide range of services provided, the home health industry is highly fragmented, with no single provider accounting for more than 3.5 percent of industry revenue.[337]

Similar to *home health agencies*, *hospice services* vary in scope and provide *palliative services*, which focus on providing patients with relief from the symptoms, pain, and stress of a serious illness.[338] These services include (1) skilled nursing services; (2) drugs and biologicals for pain control and symptomatic management; (2) physical, occupational and speech therapy; (3) counseling services; (4) home health aide services (5) short-term inpatient care; (6) inpatient respite care; and (7) such other palliative services as may be required for the management of terminal illness.[339] Accordingly, hospice providers may compete with *short-term acute care hospitals*, *long-term acute care hospitals*, skilled nursing facilities, and home health agencies, all of which offer certain hospice care services under their continuum of care.[340]

12.4.1.4 Technology Technological advancements in DME and other *home health supplies*, such as those related to *infusion therapy,* have increasingly allowed patients to receive medical care in their homes, rather than at an inpatient or outpatient facility. For example, Medicare spending on *home infusion therapy* drugs, as well as the number of beneficiaries receiving these drugs, increased rapidly between 2006 and 2009, with the number of Part D enrollees receiving Part D–covered home infusion drugs increasing at a rate of 21 percent per year, as compared to a growth rate of 5 percent per year for the overall Part D population.[341] In addition, advancements in *telemedicine* have allowed for *remote patient monitoring* for such conditions as (1) *active heart monitoring*, (2) *blood pressure*, (3) *diabetes*, (4) *prescription compliance*, and (5) *sleep apnea*, which have permitted some patients to

[340] National Hospice and Palliative Care Organization, *NHPCO Fact and Figures: Hospice Care in America*, 2011 Edition (Alexandria, VA: NHPCO, January 2012), p. 8.

[341] *Report to the Congress: Medicare and the Health Care Delivery System*, Medicare Payment Advisory Commission, Washington, D.C., June 2012, pp. 177–178.

remain in their homes unless a need for acute healthcare services arises.[342] As *home care* services have come "*full circle*" as a prominent healthcare delivery system, and home health providers are increasingly being viewed as a critical link in the array of patient-centered healthcare services aimed to bring care back into the community, technology will likely play an increasingly prominent role in *managing patient populations* in need of home health services, particularly as hospitals incur penalties for patients who are readmitted within 30 days of discharge.[343]

12.4.2 Value Drivers: Home Health Enterprises

Similar to those of other outpatient enterprises, the *value drivers* identified for home health enterprises are: (1) *Capacity*, (2) *Revenue Stream*, (3) *Payor Mix*, (4) *Operating Expenses*, (5) *Capital Structure*, (6) *Suppliers*, (7) *Market Rivalries and Competitors*, and (5) *Subject Entity Specific/Nonsystematic Risk*.

12.4.2.1 Capacity The *capacity* of a home health enterprise differs from other types of outpatient enterprises previously discussed, in that home health services are not provided at a specific *facility*, but rather in a *patient's home*. Consequently, the requisite *due diligence* to ensure that the subject enterprise has *sufficient resources* to handle the projected *patient volumes* may require different considerations. Accordingly, capacity, as a *unit of measurement* for home health enterprises, is typically based on labor metrics, for example, the number of FTE provider manpower necessary to provide quality services efficiently and effectively to meet the available demand.

12.4.2.2 Revenue Stream Reimbursement for home health services is significantly limited by (1) the *type of condition being treated*, (2) the *type of service being performed* (see above), and (3) the source of payment. Accordingly, only certain *patient populations* are likely to generate a steady *revenue stream*, such as those patients who exhibit chronic health conditions. In addition, several services are reimbursed under *episode-based payments*, which use a different *unit of productivity*—that is, the *episodes of*

---

[342] Steff Descgebes, "Top 5 Conditions for Telemedicine Treatment," *Healthcare IT News*, July 27, 2012, http://www.healthcareitnews.com/news/top-5-health-conditions-telemedicine-treatment (accessed September 26, 2012); *Connected Care: Technology-enabled Care at Home* (Washington, DC: Deloitte Center for Health Solutions, 2008), pp. 3–7.

care (measured in 60-day episodes for Medicare reimbursements)—than the metrics used for *other professional practices*, such as *wRVUs* or *procedure volumes*.[344]

Home health is one of the fastest growing healthcare industries, with home health agency industry revenue predicted to increase 5.1 percent annually, reaching $89.6 billion in 2017. Despite this anticipated growth in revenue, industry profit margins are expected to continue declining from 7.1 percent of revenue in 2007 to 6.9 percent of revenue in 2012, and 6.5 percent of revenue by 2017, likely resulting from reimbursement cuts and a shortage of skilled providers. The projected growth in the home health agency industry, along with the projected declining margins, is expected to fuel consolidation within the home health industry, including *home healthcare agencies*, *home care aide organizations*, and *hospices*.[345] It should be noted that for *hospice enterprises*, for-profit entities typically experience significantly higher profitability than their not-for-profit counterparts.[346]

In 2001, an equal number of referrals for home health services (approximately two million each) came from the community in which an enterprise is situated and the hospital and/or post-acute care setting in which the patient was originally treated. However, as the home health industry has grown, the source of patient volumes has changed. For example, between 2001 and 2008 the number of within-community referrals increased by 48 percent, while the number of referrals from a hospital and/or a post-acute care setting increased only 12 percent during the same period.[347] An example of the application of the revenue stream can be found online at http://www.wiley.com/go/healthcarevaluation.

12.4.2.3 Payor Mix Similar to that of most healthcare enterprises, the *payor mix* affects the *revenue* (and subsequent *net economic benefit*) generated by an enterprise and is often a significant factor driving the *value* of a specific home health enterprise.

---

[344] MedPAC, "Home Health Care Services Payment System," October 2011, *Payment Basics*, p. 1. A more detailed discussion of Medicare reimbursement for home health is set forth in Section 2.4.1.3.1.5, "Home Health Reimbursement," in Chapter 2, "Reimbursement Environment."

TABLE 12.60 Home Health Payor Mix, 2012

Payor	Mix
Medicare	41%
Medicaid	24%
State and Local Governments	15%
Out-of-Pocket	10%
Private Insurance	8%
Other	2%

IBISWorld Industry Report 62161: Home Care Providers in the US, by Anna Son, IBIS World, August 2012, p. 18.

Medicare remained the largest single payer of home healthcare services, paying for 41 percent of all home health expenditures in 2012. The typical payor mix for a home health enterprise is set forth in Table 12.60.

Since *commercial payors* typically pay higher reimbursement rates than *public payors*, the ability of the subject enterprise to obtain reimbursement from these higher-paying sources may positively affect their revenue-generating capabilities. However, since the demand for home health services is typically driven by an older patient demographic, Medicare reimbursement will likely continue to be a major funding source for home health enterprises.

12.4.2.4 Operating Expenses Typically, the largest operating cost for home health enterprises is staff costs, which include both *skilled labor*, for example, physicians, nurses, social workers, chaplains, therapists, and counselors, and *unskilled labor*, such as nurses' aides, home care aides, food service workers, and janitors.[348] However, the skilled labor component, also referred to as the *provider compensation–related expense*, is usually the largest single expenditure. In 2012, the *provider compensation–related expense*s were anticipated to make up 51.5 percent of *home health revenues*, in contrast to provider compensation expense to revenue of 44.0 percent for the *entire healthcare industry.*[349]

[348] BizMiner, *Homes for the Elderly 5-Year Industry Financial Report*, August 2012, p. 2; Hospice Association of America, "Hospice Facts and Statistics," November 2010, p. 6.

[349] Anna Son, *IBISWorld Industry Report 62161: Home Care Providers in the US*, IBIS World, August 2012, pp. 15 and 25.

12.4.2.5 Capital Structure The implications of the capital structure decision for home health enterprises are similar to those of physician professional practices, as discussed in Section 12.2.1.3.6, "Capital Structure." These implications include (1) the mix of debt and equity financing affects the *risk-adjusted required rate of return* for investment in the subject enterprise; (2) *debt financing* is typically cheaper than *equity financing*; and (3) financing costs reflect the risks associated with each type of capital provided, for example, debt financing typically considers the risk of the four Cs: **c**redit risk (default risk) of the borrower, **c**apacity of the borrower to make timely repayments of both principal and interest (short-term liquidity and interest coverage), **c**ollateral to cover the lender in case of borrower default, and an analysis of the **c**ovenants included in the indenture agreement.

Due to the presence of publicly traded companies operating in the home healthcare industry, data and information pertaining to the most probable capital structure of a home health enterprise can be derived from normative industry benchmark survey data (see *Key Sources*), as well as comparable publicly traded company data. In addition, the capital structure can be determined through techniques such as the *iterative method*.[350] As previously mentioned, for the purpose of establishing the *fair market value* of a business enterprise, it is important to use formulas based on *market values* of *equity* and *debt*, rather than *book values*.[351]

12.4.2.6 Suppliers The *healthcare industry supply chain* may also have a significant impact on the economic operating cost burden incurred by a home health enterprise, due to the amount of drugs and supplies required by the organization to generate the services provided by the subject home health enterprise. Enterprises, in general, generate a significant amount of their *bargaining power* from their size, with larger enterprises being more likely to have greater *negotiating power* with vendors and suppliers, which may translate into *lower operating costs* and a greater *value* attributable to the enterprise.[352]

---

[350] See Section 9.2.1.3, "Capital Structure," in Chapter 9, "Costs and Sources of Capital," for further discussion of determining the capital structure.

[351] Shannon P. Pratt and Roger J. Garbowski, *Cost of Capital: Applications and Examples*, 3rd ed. (Hoboken, NJ: John Wiley & Sons, 2008), pp. 276–277.

[352] See Chapter 4, "Competition," and Chapter 11, "Inpatient Enterprises," for further discussion.

12.4.2.7 Market Rivalries and Competitors The *home health* market is *highly fragmented*, with the largest four companies accounting for only 10.2 percent of total industry revenue. While *concentration* in the industry is currently *low*, consolidation is projected to increase over the next decade, with 459 mergers and acquisitions of home health enterprises occurring between 1999 and 2009.[353] The most significant transaction to date was the acquisition of *Apria Healthcare Group* by *Blackstone Group*, a private equity and investment management firm, in 2008, which at $1.6 billion was nearly twice the size of the next largest transaction.[354]

In 2010, the *home infusion therapy* market consisted of approximately 700 to 1,000 national, regional, and local providers, which is a significant decline from 3,000 to 4,000 providers in the market in 2005.[355] This decline is mostly attributable to the high market transaction activity between 2002 and 2007, when many providers were acquired by larger companies.[356] However, the industry generated annual net revenues of $11 billion in 2010 and is projected to continue its revenue growth trend.[357] Similarly, the *respiratory therapy* market consisted of more than 2,000 regional and local providers as of 2012.[358]

The market for *home medical equipment* peaked in 2004 and 2005, with 99 transactions in each year; however, the number of transactions fell to below 40 in 2008, due to such reimbursement changes as the 36-month cap on oxygen reimbursement. While the home medical equipment market has not returned to the activity seen in 2004, the number of transactions has increased since 2009, reaching approximately 55 in 2011.[359]

[359]The Braff Group, "Home Medical Equipment," *Market Watch* 2012, p. 1.

There were approximately 7,789 providers of *hospice* and *palliative care* in the United States as of 2012.[360] In 2010, for-profit facilities represented 53.9 percent of all hospice facility owners, not-for-profit facilities represented 32.7 percent of *hospice facility owners*, and *governmental* and other owners account for the remaining 13.4 percent of hospice facility owners.[361] Also, as of 2010, 58 percent of hospice enterprises were *freestanding independent facilities*.[362] Since 2007, industry revenues have seen an average annual growth of 9.8 percent, with revenue projected to reach $20.6 billion by 2013.[363] From 2008 to 2011, the number of hospice *merger and acquisition transactions* grew significantly from under 20 in 2008 to more than 40 in 2011. Some industry experts predicted that the hospice merger and acquisition "*bubble*" is poised to burst in early 2013, noting market deflation among the largest providers and the possibility of future reimbursement cuts.[364]

12.4.2.8 Subject Entity Specific/Nonsystematic Risk In the determination of the adjustment for the *specific risk premium for the interest in a home health enterprise*, a valuation analyst may, somewhat subjectively, consider the various risk factors that are inherent and specific to the enterprise being valued, as well as the enterprises operational performance as compared to the industry benchmarks. Specific risk factors may include (1) *diversity of referral sources*; (2) *depth of management*; (3) *stability of business*; (4) *level of competition*; (5) *operational performance*; (6) *risk related to future changes in reimbursement*, due to the contracting ability of the subject enterprise; (7) *diversity of payor mix*; and (8) *variance* in availability of workforce in the market service area.

12.4.2.8.1 Other Pertinent Valuation Considerations: Home Health Enterprises Table 12.61 illustrates some of the other pertinent considerations related to the valuation of home health enterprises.

TABLE 12.61 Other Pertinent Valuation Considerations: Home Health Enterprises

Pertinent Considerations	Description
Operating Expense Structure	*Home health enterprises* do not require the development of facilities for the provision of medical services and therefore have significantly different expense structures from other outpatient enterprises.
	Human resource–related expenses represent the greatest portion of a *home health enterprise's* expenses, requiring greater scrutiny as to the *market value* of these services.
Capital Expenditures	*Home health enterprises* typically have lower capital requirements than other outpatient enterprises, due mainly to the lack of significant facilities or equipment related to *ancillary services and technical component service lines*.
	Home infusion and *respiratory therapy* may require *greater* capital expenditures than other home health enterprises, related to the equipment necessary for the provision of these services.

12.5 CONCLUSION

The value of outpatient enterprises is significantly tied to the rapidly evolving U.S. healthcare industry, eminent in the modern era of health reform.[365] The ability of outpatient enterprises to operate in a *continuum of care* in the new *value based purchasing paradigm* may determine their viability as an ongoing enterprise in the future. The analysis of an outpatient enterprise should start with the understanding that

> *Under the new value-based business model, providers will achieve success by offering services with the best possible quality, outcomes, and access for the lowest possible cost across the continuum of patient care needs and sties. The new value proposition will demand a totally different system of care. The physician-centric approach to episodic patient care, which comes with costs the American society can no longer afford, will require the close integration of hospitals, physicians, and other providers.*[366]

[365] See Chapter 6, "Healthcare Reform," for further discussion.

[366] Kenneth Kaufman and Mark E. Grube, "The Transformation of America's Hospitals: Economics Drives a New Business Model," *Futurescan 2012*, Society for Healthcare Strategy and Market Development of the American Hospital Association, 2012, pp. 6–7.

The number of healthcare services provided at outpatient enterprises continues to increase, due to rapidly evolving *technological advances* that allow many services and procedures to be performed in a *safe*, *high quality*, and often *less costly* environment than at many inpatient providers. At the same time, the *transactional environment* related to many of these outpatient enterprises, such as physician practices, is also increasing as these enterprises are being acquired by hospitals and health systems. Further, in addition to the increased hospital employment of physicians, the overall healthcare transactional market is likely to experience increased transactional activity as a result of the ACA and other healthcare reform initiatives, as physician practices and other outpatient enterprises, for example, ASCs, diagnostic imaging centers, and cancer treatment centers, participate in such integration activities as *accountable care organizations*, *medical homes*, and *comanagement* arrangements. These topics will be discussed further in Chapter 13, "The Valuation of Other Healthcare-Related Enterprises."

12.6 KEY SOURCES

Physician Characteristics and Distribution in the US

Published by the American Medical Association, this source provides statistics regarding physician demographics for various specialties.

Physician Characteristics and Distribution in the US, Chicago: American Medical Association (Published annually)

American Board of Medical Specialties (ABMS)

A not-for-profit organization, assisting the 24 approved medical specialty boards in the development and use of standards in the ongoing evaluation and certification of physicians.

CHAPTER 13

The Valuation of Other Healthcare-Related Enterprises

In addition to those enterprises that provide *inpatient* and/or *outpatient* services, the U.S. healthcare delivery system consists of numerous types of healthcare enterprises other than inpatient enterprises (see Chapter 11, "Inpatient Enterprises") and outpatient enterprises (see Chapter 12, "The Valuation of Outpatient Enterprises"). These other healthcare enterprises (including those listed in Table 13.1) are a significant component of the U.S. healthcare transactional marketplace and have the potential to hold significant *value* for their owner(s)/investor(s), resulting from the integral

TABLE 13.1 Types of Other Healthcare Enterprises

Healthcare Provider Management Services	Healthcare Support Service Businesses
Management Service Organizations (MSOs)	Revenue Cycle Management Companies
Physician Practices Management Companies (PPMCs)	Billing Companies
Physician Hospital Organizations (PHOs)	Collection Agencies
Independent Practice Associations (IPAs)	Transcription Services
Accountable Care Organizations (ACOs)	Healthcare Informatics

Commercial ACOs	Real Estate Leasing and Development
Co-Management Companies	Utilization Management and Case Management Firms
Disease Management	
Healthcare Payors	**Supply Side Enterprises**
Health System Plans	Group Purchasing Organizations (GPOs)
Blue Cross Blue Shield (BCBS)	Medical Equipment Leasing and Sales
Indemnity Insurers	Used Equipment Companies
Administrative Services Only (ASO) Services	Durable Medical Equipment
Provider-Sponsored Organizations	Office Equipment Vendors
Government Risk Contractors	
Managed Care Organizations	
Health Maintenance Organizations (HMOs)	

role these enterprises play in supporting the delivery of the medical care across the *patient care continuum*.

While each of the enterprises included in Table 13.1 is an important component of the U.S. healthcare delivery system, this chapter focuses on the following three categories, as representative of the valuation consideration of other healthcare entities:

1. **Management service enterprises**—which provide management or other administrative services to healthcare providers;

3. **Third-party payor enterprises**—which finance or reimburse the cost of healthcare services to the provider; and
4. **Supply side enterprises**—which provide the supplies to the provider that are required in the provision of healthcare services.

13.1 MANAGEMENT SERVICE ENTERPRISES

> *What was commonplace in 1997 is long gone, and new trends have replaced it. Thus we need to begin to work with the system as it is and where it is going, as accurately as we can predict to improve care decisions and raise the bar on evidence-based medicine as we know it. This way, everyone benefits: payers, employers, employees, consumers, providers, and vendors who are interrelated and interdependent on a working and integrated system.*[1]

Management service enterprises in the healthcare industry may be classified as those enterprises that provide *management* or other *administrative services* to healthcare providers. These enterprises often have the goal of facilitating the *integration of care* and/or improving *efficiencies* in order to lower the costs related to the provision of care and to improve quality and increase beneficial outcomes. The management of healthcare services has evolved through several phases, particularly during the last three decades, with new models appearing during each phase.

Management Service Organization (MSO)

A corporation owned by the hospital or by a physician-hospital joint venture that provides management services to one or more medical group practices.

A Guide to Physician Integration Models for Sustainable Success, *American Hospital Association, September 2012, http://www.hpoe.org/Reports-HPOE/guide_to_physician_integration_models_for_sustainable_success.pdf (accessed October 31, 2012).*

[1] Maria K. Todd, *Physician Integration and Alignment: IPA, PHO, ACOs, and Beyond* (Boca Raton, FL: CRC Press, 2013), p. 11.

13.1.1 Types of Management Service Enterprises

The rapid growth of *managed care* and the increased *integration* among providers,[2] as well as the changing reimbursement environment in the late 1980s and early 1990 led to the acceleration in the growth of management service enterprises. The volume of management service enterprises increased throughout the *provider integration frenzy* of the 1990s, but then declined as the *transactions pendulum* reversed itself and healthcare providers began the process of disintegration.[3] By the end of the 1990s, many of these management service enterprises were no longer financially viable and were consequently dissolved; however, several management service enterprises were able to evolve in response to the changing healthcare environment over the past decade and remain solvent.[4] Among the types of management service enterprises that emerged during that period include:

1. *Physician Practice Management Companies;*
2. *Management Service Organizations* (MSOs);
3. *Physician Hospital Organizations* (PHOs);
4. *Independent Practice Associations* (IPA);
5. *Co-management Arrangements*; and
6. *Accountable Care Organizations* (ACOs).

MANAGED CARE

A healthcare delivery system that manages the costs, quality, and access to healthcare delivered by a contracted panel of providers.

Essentials of Managed Health Care, *6th ed., by Peter R. Kongstvedt (Burlington, MA: Jones & Bartlett Learning, 2013), p. 657.*

Todd, *IPA, PHO, & MSO Development Strategies: Building Successful Provider Alliances*, Healthcare Financial Management Association (New York: McGraw-Hill, 1997), p. 3.

13.1.1.1 Practice Management Companies *Physician Practice Management Companies* (PPMCs) are enterprises that specialize in the management of large physician group practices or *independent practice associations* (IPAs), typically through *ownership of the practice* and/or *management agreements*. PPMCs are very similar to MSOs (discussed later), with the primary difference being that they typically do *not* include hospitals or other inpatient enterprise partners and generally manage larger numbers of more *geographically dispersed* and *unaffiliated* physician professional practices. PPMCs are *physician-dominated* and typically have common ownership with the physician practices with which they affiliate.

In the mid-1990s, large PPMCs began to expand into other *nonphysician medical practice arrangements*, such as *pharmaceutical benefits management* and *specialized management enterprises*, such as *dental management companies*.[5] For example, Caremark International merged with Medpartners/Mullikin in 1996 to form MedPartners, Inc.[6] By 1998, Medpartners, Inc., had changed its name to Caremark and discontinued all nonpharmaceutical services to focus on providing comprehensive prescription benefit management programs.[7]

Pharmaceutical benefits management (PBM) companies emerged in the early 2000s as a means of reducing costs and increasing access to pharmaceuticals through *economies of scale*, primarily for senior citizens.

Physician Practices Management Company

Management firms that specialize in the management of large group practices or independent practice associations through ownership, management agreements, or both.

A Guide to Consulting Services for Emerging Healthcare Organizations*, by Robert James Cimasi (New York: John Wiley & Sons, 1999).*

Factoid

In 2012, the number of publicly traded PPMCs in the United States was only 17.

"Physician Practice Managment Companies," Bloomberg, *http://www.bloomberg.com/markets/companies/phys-practice-mgmnt/ (accessed November 16, 2012).*

PBMs typically contract with employers, third-party payors, and MCOs for administrative services related to overseeing the pharmacy benefits for enrolled beneficiaries. PBMs leverage their *size* when negotiating contracts with manufacturers and pharmacies to obtain cost concessions, acting as an *intermediary* between the third-party payor and the pharmaceutical vendor. PBMs typically generate revenue through *fees from customer contracts* and by *operating mail order pharmacies*, whereby a proportion of the cost savings achieved through contract negotiations is passed along to beneficiaries, with the remainder flowing to the earnings of the PBM.[8]

As of 2012, the PBM industry was fairly concentrated, with the top three companies managing 65 percent of outpatient prescription volumes, and the PMB industry adjudicating approximately 80 percent of all prescriptions dispensed in the United States.[9] The top 10 PMB companies by market share and covered lives are set forth in Table 13.2.

In April 2012, Express Scripts, Inc., a publicly traded PBM, acquired Medco Health Solutions, Inc., which created one of the largest PBM companies in the United States, approximately 30 percent of the market, as measured by the number of prescriptions filled per year.[10] For more information

on the competitive concerns related to the merger of Express Scripts and Medco, see Section 4.6.2, "Reform of the Insurance Industry," in Chapter 4, "Competition."

Currently, *specialized management companies* are more prevalent than the traditional PPMCs of the past, which have been supplanted by other types of arrangements with similar goals and objectives, such as *co-management arrangements* (see Section 13.1.1.3, "Physician Hospital Organizations [PHOs]"). Some publicly traded PPMCs have maintained growth into the new millennium, for example, Mednax purchased 10 physician practices in 2011 and 14 in 2010 and plans to use emerging models of integration to foster new growth in the future. In order to participate in ACOs, current PPMCs are focusing on hospital-based medicine in an attempt to lower readmissions to achieve financial incentives for improving quality and lowering costs.[11]

13.1.1.2 Management Service Organization A *Management Services Organization* (MSO) provides *management services* to one or more providers and may be established as a *separate legal entity* or a division of an existing enterprise.[12] Typically, an MSO employs a *nonphysician staff* to provide *administrative* and *management* services to contracted medical practices in exchange for either a *flat fee* or a set *percentage of the medical practice's revenues*.[13]

The *scope of services* typically provided by an MSO may be characterized by two classifications, either (1) a comprehensive MSO, or (2) a limited MSO. The various levels along the spectrum of MSO activities, ranging from comprehensive to limited, are set forth in Exhibit 13.1.

The scope of MSO services may also reflect the specific needs and concerns of the healthcare entity contracting with the MSO. For example, as *fraud and abuse scrutiny increases* (see Chapter 3, "Regulatory Environment") and the claims submission process for reimbursement becomes significantly more complex (see Chapter 2, "Reimbursement Environment"), MSOs may choose to focus their services on *coding*, *billing*, and *other revenue cycle management* tasks. *Modern Healthcare's 32nd Annual Outsourcing*

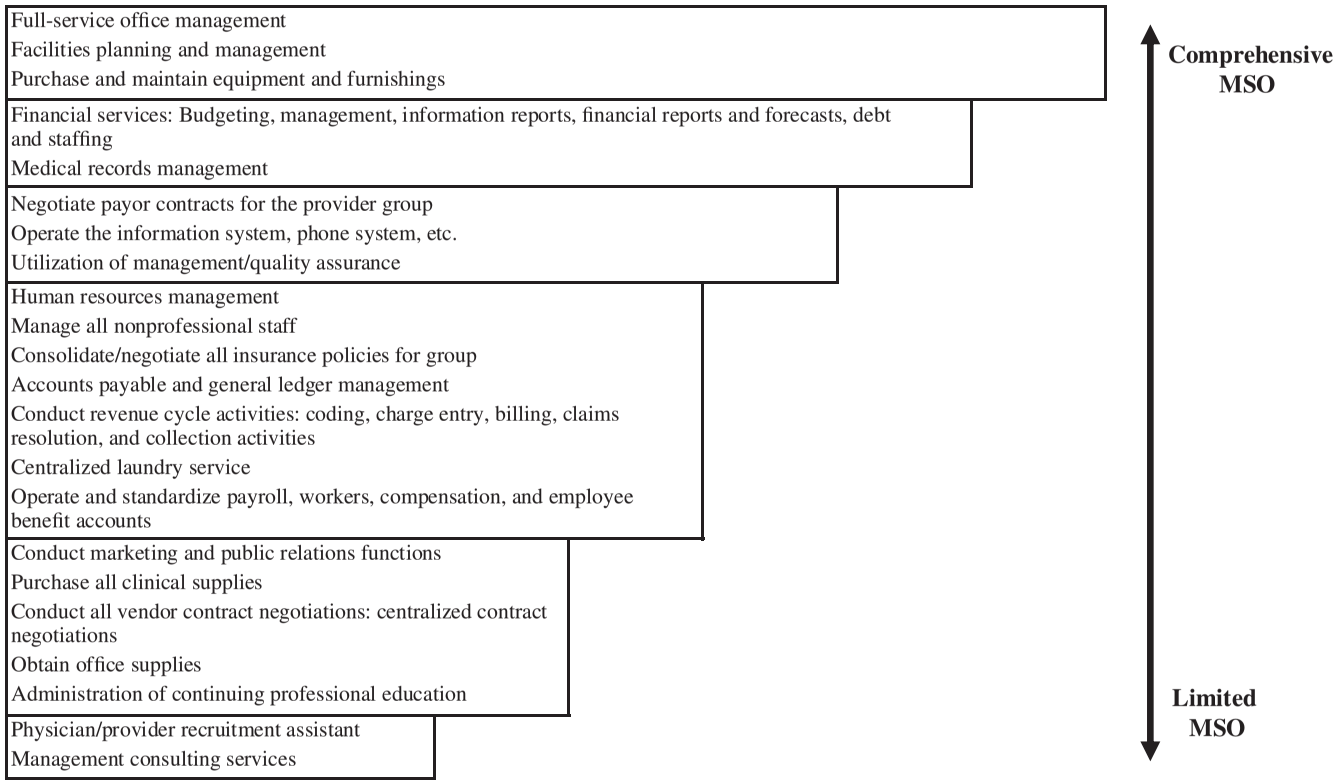

EXHIBIT 13.1 Range of MSO Services

REVENUE CYCLE

The multistep process in which a patient is provided with, is charged, and pays for medical services, including scheduling, diagnosis, coding, billing, claims resolution, and collection.

Survey, completed in 2010, found a 13.7 percent increase from 2008 to 2009 in the number of *healthcare provider enterprises* using *outside firms* to manage their *revenue cycle*.[14] During that period, the *Fraud Enforcement and Recovery Act* was signed into law by President Obama, which reduced the government's *burden of proof* in cases involving fraud by no longer requiring the showing of a *specific intent* to defraud the government.[15]

Similarly, as a result of pressure to decrease *operating overhead costs* for healthcare providers, medical transcription services have been outsourced to less expensive service providers, rather than remaining *in-house*, a trend that is possible due to the increasing ease with which *electronic information* may be shared.[16] For example, one cost advantage of outsourcing *coding services* is that coding providers will often charge a *set fee* per procedure coded, in contrast to an *internal coding department*, which has the potential for *high overhead costs* and other *less predictable cost factors*.[17] The medical transcription industry is expected to grow by 6 percent from 2010 to 2020.[18] In 2010, the number of transactions among *revenue-cycle management* companies *doubled* from 2009, with

most consolidation taking place between *small* and *mid-size* revenue-cycle management companies.[19]

With healthcare enterprise capital expense burdens continuing to rise and healthcare reform provisions being implemented that incentivize the *value* of care provided, many *utilization and case management enterprises* are promoting best practices regarding the *coordination of care*, as well as the *efficient* and *effective* delivery of care.[20] *Utilization management* firms may support healthcare enterprises by ensuring that healthcare services are being delivered at a *cost-efficient* level by assisting providers with managing the finite amount of healthcare resources available to patients.[21] The largest accrediting agency for *utilization and case management enterprises* is URAC, formerly known as the *Utilization Review Accreditation Commission*. In addition to accrediting *utilization and case management companies*, URAC also accredits specific case management programs and healthcare providers that focus on best practices for *utilization and case management*.[22]

13.1.1.3 Physician Hospital Organizations (PHOs) A *Physician Hospital Organization* (PHO), in the 1990s sometimes derided as "*physician hostage organizations*," integrates a hospital (or a group of hospitals) with a physician organization (or group of physicians) through *contractual relationships*, for the purpose of *negotiating managed care contracts* for both parties. In many cases, the PHO is owned jointly by both the physicians and the hospital and may be structured as a *not-for-profit* organization. Participants in the PHO

Physician Hospital Organization

Organizations that unite a hospital, or group of hospitals, and a physician organization through a contractual relationship for the purpose of contracting with managed care organizations.

The Managed Health Care Handbook, *3rd ed., edited by Peter R. Kongstvedt (Gaithersburg, MD: Aspen Publishers, 1996), p. 999.*

typically provide a *modest investment* on an *annual* or *monthly basis* to fund the PHO's capital and operating expenses.

Hospitals and physicians often have differing motivations for joining a PHO. For example, hospitals may seek to expand their control over the *range of healthcare services provided* and *improve relationships* with certain physician practices, while physicians may be seeking some level of security under the shelter of a hospital's more significant capital base. However, at least one *common objective* desired by all parties is the *improved leverage* offered by PHOs in negotiating *managed care contracts*.

The PHO generally has two basic models by which it could negotiate contracts on the behalf of its members: (1) the *messenger model* and (2) the *preferred model*. Under *the messenger model,* a PHO analyzes each contract offered by a given third-party payor, for example, a *health maintenance organization* (HMO) or a *preferred provider organization* (PPO), and presents the contract (with its analysis) to each hospital and physician group, who will then *independently* decide whether to accept the terms of the contract on a member-by-member basis.

In contrast, under a *preferred model,* the physicians and the hospital establish the criteria for accepting a third-party payor contract *prior* to the contract negotiations. With such criteria in place, the PHO can negotiate with third-party payors with the assurance that its agreement criteria are met during a defined negotiation period, for example, 120 days.[23] If the PHO cannot reach an agreement with the third-party payor during the negotiation period, the third-party payor is free to negotiate with each physician individually. This "*back-door*" strategy is often executed by *managed care organizations* that believe they (1) are in a position to negotiate better rates with *individual* providers, (2) do not need *all of the PHO physicians* in their network, or (3) do not need the *PHO hospital(s)* in their network.[24]

Health Maintenance Organization

A group of participating healthcare providers that furnishes medical services to enrolled members of a group health-insurance plan.

Black's Law Dictionary, *9th ed., edited by Bryan A. Garner (St. Paul, MN: West, 2009), p. 788.*

[23] Robert James Cimasi, *A Guide to Consulting Services for Emerging Healthcare Organizations* (New York: John Wiley & Sons, 1999), pp. 51–53.
[24] Ibid.

Preferred Provider Organization

A corporation that receives health insurance premiums from enrolled members and contracts with independent doctors or group practices to provide care.

Dictionary of Health Insurance and Managed Care, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2006), p. 226.*

Another means by which PHOs may be classified is through a description of their *provider panels*, which may operate under either (1) an *open model* or (2) a *closed model*. An *open model PHO* is one that allows any member of a hospital's medical staff to join, generally with a minimum credentialing requirement, which may be equivalent to obtaining admitting privileges at the hospital. Since specialists often have "*more to lose*" than primary care physicians by not consolidating contracting efforts, *open model PHOs* are often dominated by physician specialists.

Many *open model PHOs* are established with the vision of one day becoming "*closed panel*" *PHOs*, whereby cost-effective providers remain within the PHO and other physicians are removed; however, in practice, few PHOs have made such a transition.

Some PHOs began as *closed panels* and *limit membership* to a *defined group of physicians*. PHOs that begin as *closed panels* have a *higher* percentage of *primary care physicians* in their membership. While this may increase the attractiveness of the PHOs to those seeking managed care contracts, *closed panel HMOs* are often difficult to implement, due to political conflicts between the hospital and medical staff. For example, specialists have often been hospital "*allies*," and since *closed panel* PHOs disproportionately favor *primary care providers*, hospital administrators often choose *not* to exclude specialists based on their historical relationships with these groups.

13.1.1.4 Independent Practice Associations (IPAs) An *Independent Practice Association* (IPA) is a legal entity composed of *independent physicians* that is developed for the purpose of *improving leverage* against third-party payors through the utilization of contract(s) to provide specified medical services. IPAs may be considered a "*first step*" toward *integration* and are often developed by member physicians to (1) *preserve clinical autonomy*, (2) *avoid joining a group practice*, (3) *maintain their presence in the market*, and (4) *achieve negotiating leverage with third-party payors* by continuing to build relationships with a large number of third-party payors, thereby decreasing the likelihood that patients may discontinue receiving services

from a particular physician provider in the event that the patient changes his or her health coverage to a different third-party payor.[25] While IPAs were commonly associated with the *managed care boom* of the 1990s, they are once again receiving attention for their potential role in promoting the *development*, *implementation*, and *operation* of ACOs, as discussed in Section 13.1.1.6, "Accountable Care Organizations."[26]

13.1.1.5 Co-Management Arrangements *Co-management Organizations* are typically formed through a contractual agreement between a group of physicians and a hospital, for the purpose of the physicians providing *management services* to a specified hospital *service line* related to the *specialty* of the contracted physicians.[27] A *co-management agreement* between a *physician group* and a *hospital* typically requires:

> *direct physician participation in the design and oversight of annual clinical capital and operating budgets, the development and implementation of clinical strategies and business plans, the efficient delivery of physician and clinical staff services, the periodic assessment of the quality of patient care delivered, the measurement of patient satisfaction, and the development of clinical outreach programs.*[28]

Of note is that the *first generation* of *co-management arrangements* evolved from *gainsharing arrangements*, whereby hospitals gave physicians a share of agreed-on reductions in the hospital's patient care costs, which were attributable, in part, to the cost-cutting efforts of the physicians.[29] See Chapter 15, "Healthcare Services."

Co-management arrangements typically provide a predetermined fixed *management fee* to be paid to the physicians by the hospital, as well as some form of *performance-based compensation*, which are *contingent* on

GAINSHARING

Arrangements in which hospitals gave physicians a share of any reduction in the hospital cost for patient care, attributable, in part, to the physicians' efforts.

"Can Hospitals Share Cost Savings with Their Oncologist?" by Paul F. Danello, Journal of Oncology Practice *1 no. 4, November 2005.*

the attainment of *specified, mutually agreed on, and objectively measured targets* (not related to the volume or value of referrals).[30] These targets are often based on several metrics, including:

1. *Clinical* and *outcome quality indicators;*
2. *Patient and physician satisfaction measures;* and
3. *Measurable improvements* in *operating efficiency.*[31]

The co-management arrangement is subject to review by a competent valuation professional to ensure that the *total compensation package*, including all benefits and prerequisites, to be paid to the physicians is at *Fair Market Value* and is *commercially reasonable.*[32] Furthermore, the arrangement should be reviewed by legal counsel to ensure that the arrangement is not structured in such a way that it may be construed as *legally impermissible* under *Stark* and *Anti-Kickback* regulations, as well as the applicable 501(c)(3) requirements for arrangements involving tax-exempt organizations.[33]

Fair Market Value

The price at which property or the right to use property would change hands between a willing buyer and a willing seller, neither being under any compulsion to buy, sell, or transfer property or the right to use property, and both having reasonable knowledge of relevant facts.

"Excess Benefit Transaction." 26 CFR 53.4958–4(b)(i).

13.1.1.6 Accountable Care Organizations (ACOs) *Accountable Care Organizations* (ACOs) may perhaps best be defined as healthcare organizations in which a set of providers, usually physicians and hospitals, are held *accountable* under contract(s) with third-party payor(s) for the *cost* and *quality* of care delivered to a specific local population base.[34] ACOs are designed to induce their participants to increase *quality* healthcare services, while simultaneously decreasing healthcare delivery *costs* through the means of providing *financial incentives* tied to the achievement of certain agreed-on *cost* and *quality targets*.[35]

Section 3022 of the Affordable Care Act (ACA) directed the *secretary of Health and Human Services* (HHS) to create the *Medicare Shared Savings Program* (MSSP) by January 1, 2012, with the intent of encouraging the development of *Federal Medicare ACOs*, that is, by "promote[ing] accountability for a patient population and coordinat[ing] items and services under [Medicare] parts A and B, and encourag[ing] investment in infrastructure and redesigned care processes for high quality and efficient service delivery."[36]

Although a *Federal ACO* must be a *single legal entity*, it may consist of any number of *ACO participants* (i.e., providers that are included in the single legal entity) and *ACO providers/suppliers* (i.e., providers that may

[34] As discussed previously in Chapter 3, "Regulatory Environment," and Chapter 4, "Competition." Taxpayer Identification Number

A federal taxpayer identification number or employer identification number as defined by the IRS in 26 CFR 301.6109–1.

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (November 2, 2011): 67974–67975; "Quality Reporting System," 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

ACO Participant

An individual or group of ACO provider(s)/supplier(s) that is identified by a Medicare-enrolled TIN, that alone or together with one or more other ACO participants comprise(s) an ACO, and that is included on the list of ACO participants that is required under 42 CFR § 425.204(c)(5).

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (November 2, 2011): 67974–67975; "Quality Reporting System," 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

TABLE 13.3 Potential Federal ACO Participants: The Eligible Entities[37]

Eligible Entities	Potential Provider Organizations	Definition
ACO professionals in group practices	Primary Care Physician Practices	Practice that provides the patient with services, including health promotion, disease prevention, health maintenance, counseling, and so on, beginning at the first point of entry.
Networks of individual practices of ACO professionals	Independent Practice Associations (IPA)	Legal entities of independent physicians that contract with health insurance companies to provide medical services.
	Multispecialty Physician Groups (MSPG)	Group practice with physicians practicing in more than one specialty.
Partnerships or joint venture arrangements between hospitals and ACO professionals	Integrated Delivery Networks (IDN)	A network of facilities and providers working together in order to provide a continuum of care to a market or a geographic area.
	Clinical Integrated Networks (CIN)	Physicians, hospitals, and care delivery resources that collaborate as an integrated unit to increase care quality and coordination.
Hospitals employing ACO professionals	Hospital Medical Staff Organizations (MSO)	A legal entity owned by physicians, hospitals, or lay investors that provides an array of practice management services. In some cases, the hospital owns the entity that may sell management services to medical staff.
	Physician Hospital Organizations (PHO)	An enterprise that unites a hospital or a group of hospitals with a physician organization through a contractual relationship.
	Extended Hospital Medical Staff	A multispecialty group associated with a hospital that provides the hospital with direct and indirect referrals.
Critical Access Hospital (CAH)	Critical Access Hospital (CAH)	A rural hospital providing both inpatient and outpatient services located more than 35 miles from the nearest facility. The hospital must provide emergency services 24 hours a day, contain fewer than 25 inpatient beds, and have an average length of stay of less than 96 hours.
Such other groups of providers of services and suppliers as the secretary of HHS determines appropriate.		

[37] "Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations and Medicare Program: Waiver Designs in Connection with the

ACO Provider/Supplier

An individual or entity that (1) is a provider (as defined at 42 CFR § 400.202) or a supplier (as defined at 42 CFR § 400.202); (2) is enrolled in Medicare; (3) bills for items and services it furnishes to Medicare fee-for-service beneficiaries under a Medicare billing number assigned to the TIN of an ACO participant in accordance with applicable Medicare regulations; and (4) is included on the list of ACO providers/suppliers that is required under 42 CFR § 425.204(c)(5).

Integrated Delivery System

An organized system of healthcare providers spanning a broad range of health services, optimizing costs and outcomes, and accepting and managing financial arrangements to delivery care to a defined population.

Essentials of Managed Health Care, *6th ed., by Peter R. Kongstvedt (Burlington, MA: Jones & Bartlett Learning, 2013), p. 656.*

ACO Professional

An ACO provider/supplier who is either of the following: (1) a physician legally authorized to practice medicine and surgery by the State in which he performs such function or action; (2) a practitioner who is one of the following: (i) a physician assistant (as defined at 42 CFR § 410.74(a)(2)); (ii) a nurse practitioner (as defined at 42 CFR § 410.75(b)); (iii) a clinical nurse specialist (as defined at 42 CFR § 410.76[b]).

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (November 2, 2011): 67974–67975; "Quality Reporting System," 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

A *Federal ACO's* legal structure should provide both the *basis* for its *shared governance* and the *mechanism* to (1) *receive any shared savings* from CMS and (2) *distribute those shared savings payments* among the ACO participants. A *federal ACO* must accept the *responsibility* and *accountability* for the "overall care of the Medicare fee-for-service beneficiaries assigned to the ACO" through a formal application to the *Centers for Medicare and Medicaid Services* (CMS) in order to participate in the MSSP.[38] Once ACOs are accepted into the program, the MSSP requires that ACO participants collect and submit to CMS specific *expenditure information* and *quality data*.[39] CMS requires reporting for 33 *quality metrics*, divided into *four domains of care*, including (1) *patient/caregiver experience* (seven

[38] "Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," *Federal Register* 76, no. 212 (November 2, 2011): 67975.

[39] Ibid., p. 67870.

measures); (2) *care coordination/patient safety* (six measures); (3) *preventive health* (eight measures); and (4) *at-risk population* (11 measures), or risk termination from the MSSP.[40] These *quality measures*, as well as the reporting methods required of providers, are set forth by category, in Table 13.4.

ACOs are responsible for *collecting* and *transmitting* to CMS the data related to these 33 *quality measures* listed earlier; this is achieved through the utilization of the *Group Practice Reporting Option* (GPRO) *web interface*, which provides ACOs with examples as to the assignment of *vulnerable populations* to specific care categories (e.g., diabetes and heart failure).[41] For those quality measures that use survey reporting methods, CMS will bear the *administrative* and *financial* burden of collecting the *survey data* for the first two years of the ACO contract, after which period the ACOs must assume the *responsibility* of *acquiring* and *paying* for a *CMS-certified survey vendor* to continue reporting on these metrics.[42]

It should be emphasized that CMS *prospectively* defines the *Medicare beneficiary population* for which an ACO will be *accountable* by determining which patients are likely to receive the *majority of their primary care services* from providers participating in the ACO (not necessarily limited to the care received from primary care physicians) during the *participation period*.[43] The *quality* and *cost* outcomes of this assigned beneficiary

---

[40] Ibid., pp. 67899–67890, 67951.

[41] Chronic heart failure is currently the only major cardiovascular disorder that is continuing to increase in prevalence and incidence. This condition affects approximately 5 million people in the United States, primarily the elderly; cited in Leanne Groban and John Butterworth, "Preoperative Management of Chronic Heart Failure," *International Anesthesia Research Society* 103, no. 3 (September 2006): 557.

[42] *Accountable Care Organization 2012 Program Analysis: Quality Performance Standards Narrative Measure Specifications—Final Report*, by RTI International, to Quality Measurement & Health Assessment Group, Office of Clinical Standards & Quality, Centers for Medicare and Medicaid Services, Waltham, MA, December 12, 2011, p. 3.

[43] In assigning beneficiaries, CMS uses a stepwise process: (1) identification of beneficiaries who have received at least one primary care service from an ACO provider or supplier and (2) confirmation that the total charges billed for services from the beneficiary's ACO provider exceed the total charges billed for services from other non-ACO providers. Though this process is most directly applicable to primary care providers, the Final Rule also applies the beneficiary assignment process to specialists acting as primary care providers. For example, an elderly patient who receives most of his care from a cardiologist may also receive traditional primary care services, for example, blood pressure readings and annual wellness visits, from that cardiologist. "Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," *Federal Register* 76, no. 212 (November 2, 2011): 67855.

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," *Federal Register* 76, no. 212 (November 2, 2011): 67899–67890.

Shared Savings

A portion of the ACO's performance year Medicare fee-for-service Parts A and B expenditures, below the applicable benchmark, it is eligible to receive payment for from CMS. An ACO's eligibility for shared savings will be determined for each performance year. For an ACO requesting interim payment, shared savings may result from the interim payment system calculation.

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (November 2, 2011): 67974–67975; "Quality Reporting System," 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

population determine the amount of *shared savings* (or *shared losses*, where applicable) an ACO may be eligible for, as calculated under the chosen disbursement model, that is, either the *one-sided* or the *two-sided shared savings disbursement model.*[44] An illustration of the various scenarios resulting in *shared savings* or *losses* for both the *one-sided* and the *two-sided distribution models* is set forth in Exhibit 13.2 and Exhibit 13.3.

Shared Losses

A portion of the ACO's performance year Medicare fee-for-service Parts A and B expenditures, above the applicable benchmark, it must repay to CMS. An ACO's eligibility for shared losses will be determined for each performance year. For an ACO requesting interim payment, shared losses may result from the interim payment calculation.

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (November 2, 2011): 67974–67975; "Quality Reporting System" 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

[44] As discussed in Section 2.7.2, "ACOs," in Chapter 2, "Reimbursement Environment"; Paul H. Keckley and Michelle Hoffman, "Accountable Care Organizations: A New Model for Sustainable Innovation," Deloitte Center for Health Solutions, 2010, p. 11; See Chapter 2, "Reimbursement Environment," Exhibit 2.18, "One- and Two-Sided Distribution Models for Federal ACOs."

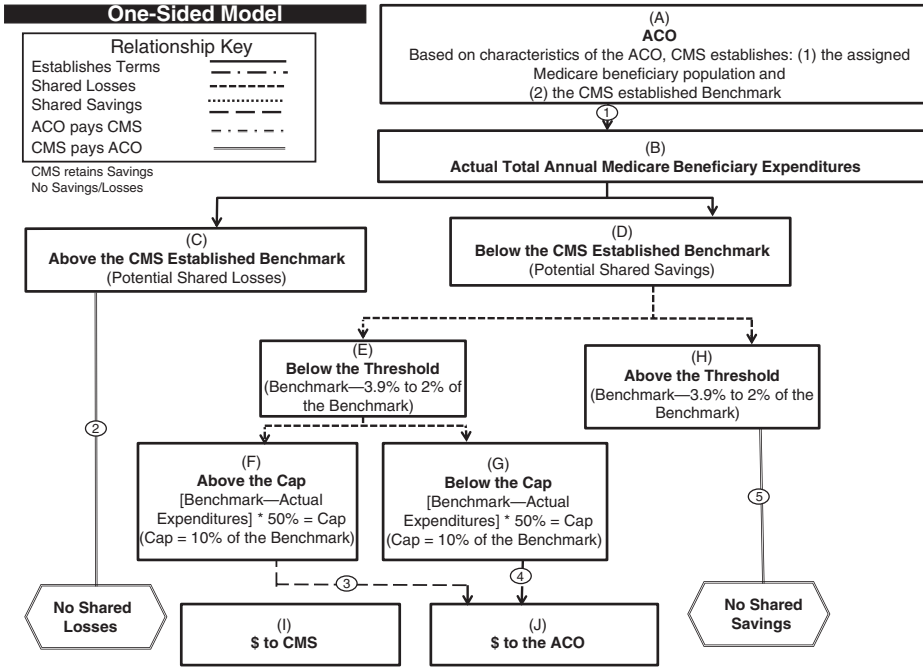

EXHIBIT 13.2 Relationship between an ACO and CMS Resulting in Shared Savings under the One-Sided Model

Each type of *distribution model*, that is, the *one-sided risk model* or the *two-sided risk model*, presents a different profile of the *potential benefits* (*shared savings amount*) that an ACO may achieve and *risks* (*shared losses*) that an ACO may incur. Generally, the *one-sided model* provides *lower risks* and *lower rewards*, while the *two-sided model* provides *higher risks* and *higher rewards*.

One-Sided Model

A model under which the ACO may share savings with the Medicare program, if it meets the requirements for doing so, but is not liable for sharing any losses incurred under subpart G of this part.

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (2011): 67974–67975; "Quality Reporting System," 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

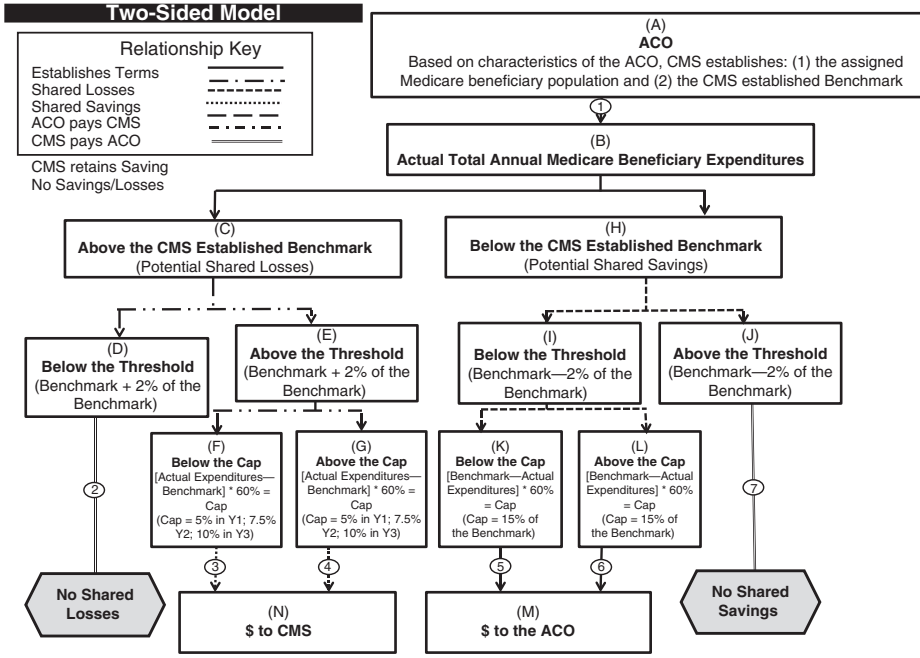

EXHIBIT 13.3 Relationship between an ACO and CMS Resulting in Shared Savings or Shared Losses under the Two-Sided Model

Two-Sided Model

A model under which the ACO may share savings with the Medicare program, if it meets the requirements for doing so, and is also liable for sharing any losses incurred under subpart G of this part.

"Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations," Federal Register *76, no. 212 (2011): 67974–67975; "Quality Reporting System," 42 USC § 1395w-4(k)(3)(A); "Definitions Specific to Medicare," 42 CFR § 400.202 (2012).*

In hopes of incentivizing participation in the MSSP, CMS also created the *Pioneer ACO Model*, *which* is intended for "*mature ACO*" organizations that have already begun *coordinating care efforts.*[45] Paralleling the traditional

[45]US Department of Health and Human Services, "Affordable Care Act Gives Providers New Options to Better Coordinate Health Care," May 17, 2011, http://www.healthcare.gov/news/factsheets/accountablecare05172011a.html (accessed July 15, 2011).

MSSP ACO model, the *Pioneer Model* is designed to incentivize *the reduction of healthcare expenditures* and *increase quality outcomes*.[46] Although the *Pioneer Model* is separate and distinct from the MSSP model, the two programs are designed to be *complementary* and work *cooperatively* with each other.[47] In addition to *flexibility* within the *core payment arrangement*, after the first *two years* of its *contract term* with CMS, *Pioneer ACO Model Participants* are given the option to *transition* from a *volume-based FFS reimbursement model* to a *population-based payment model* for their *Medicare* beneficiaries. Furthermore, by *performance year two*, at least 50 percent of a *Pioneer ACO Model Participant's* revenue must be generated by *alternative Value-Based Purchasing (VBP) arrangements* with *non-Medicare payors* (either commercial or public), which may cause *Pioneer ACOs* to more closely resemble some of the reimbursement models used within the *commercial ACO* market.[48]

Commercial ACOs, in contrast to *federal ACOs*, establish contracts with *private third-party payors* and are able to negotiate a *wider range* of *reimbursement models*, *patient populations*, *service lines*, and *savings disbursement methods* than their *federal ACO counterparts*, thereby providing *commercial ACOs* with *greater flexibility* in *design* and *operation*.[49] Significantly, in contrast to *federal ACOs*, the *commercial ACO market* has no single set of uniform standards regarding ongoing monitoring of the ACO's adherence to specified *quality performance benchmarks*. In response to this lack of either regulatory or industry oversight, the *National Committee for Quality Assurance* (NCQA) launched an ACO *accreditation program*, setting forth requirements for:

1. *Quality metrics, monitoring performance;*
2. *Reporting data;*
3. *Reimbursement;* and
4. *Savings and loss distribution*.[50]

[50] *Standards and Guidelines for the Accreditation of Accountable Care Organizations* (Washington, DC: National Committee for Quality Assurance, 2011).

For more information on the *reimbursement models* used for both *federal ACOs* and *commercial ACOs*, see Chapter 2, "Reimbursement Environment."

While almost any healthcare enterprise can participate in an ACO, larger enterprises may be best suited, from the perspective of financial returns, for ACO status, as larger organizations may be more capable of gaining access to the *significant capital required* for ACO *development, implementation*, and *operation*, for example, *healthcare information technologies* such as *electronic health records* (*EHR*). Other suggested characteristics of successful ACOs include strong *physician leadership*, established *patient-centered care* initiatives, and *efficient* and *effective communication* between providers.[51] By October 2012, 318 ACOs were serving patients in 48 states, including 161 ACOs using only private third-party payors, 126 using only public payors, and 31 ACOs using both public and private third-party payors.[52] At the beginning of 2013, CMS announced another 106 federal ACOs had been accepted into the Medicare Shared Savings Program (MSSP).[53] An example of the application of the revenue stream can be found online at http://www.wiley.com/go/healthcarevaluation.

13.1.2 Current and Future Trends: Regulatory, Reimbursement, Competition, and Technology

13.1.2.1 Regulatory Many *management service enterprises* involve the integration of various provider networks, which has traditionally been scrutinized by the *Federal Trade Commission* (FTC) as generally being *anti-competitive* and *legally impermissible* under antitrust laws.[54] However, *integration* is not considered to be a *per se* violation of antitrust regulations, such that the FTC will typically review *joint contracting arrangements* under a *rule of reason* analysis, determining whether the arrangement would actually lead to *pro-competitive* outcomes (see Section 3.4,

[51] American Medical Group Association, "Accountable Care Organizations: Principles," May 28, 2010, http://www.amga.org/AboutAMGA/ACO/principles_aco.asp (accessed August 27, 2010).

[52] Harris Meyer, "Many Accountable Care Organizations Are Now Up and Running, If Not Off to the Races," *Health Affairs* 31, no. 11 (November 2012).

[53] John Commins, "Medicare ACOs Add 106," *HealthLeaders Media* (January 11, 2013), http://www.healthleadersmedia.com/print/HOM-288223/Medicare-ACOs-Add-106 (accessed January 11, 2013).

[54] Barry Bader, "Clinically Integrated Physician-Hospital Organizations," *Great Boards* 9, no. 4 (Winter 2009): 2.

"Competition," in Chapter 3, "Regulatory Environment").[55] In addition, while some management service enterprises facilitate the integration of two healthcare providers, for example, some ACOs may act as a negotiating body for a set of providers, whereby each provider retains its *corporate autonomy*, even in these scenarios, providers and management enterprises must be attentive as to their compliance with the antitrust prohibitions against *price fixing*.

Some provider integration relationships have obtained certain protections from antitrust scrutiny. For example, in order to encourage providers to develop ACOs, the *U.S. Department of Justice* (DOJ) and the FTC issued a joint policy statement in October 2011 regarding a "*safety zone*" for certain ACOs, whereby the ACO will be *safe* from antitrust scrutiny, if an ACO's individual participants do not have a *combined share* of more than *30 percent* of each *common service* within each participant's "*primary service area*."[56]

Further guidance regarding *potential antitrust concerns* was provided in the FTC's February 13, 2013, release of an *advisory opinion* approving the proposal for the *clinical integration* of *Norman Physician Hospital Organization* (Norman PHO), a network of 280 physicians consisting of 28 medical specialties and the 288-bed Norman Regional Health System, located in Norman, Oklahoma.[57] The proposal for a *clinically integrated program*, submitted to the FTC on May 26, 2011, was made to replace "*messenger model operations*," where providers supply *individually determined reimbursement rates* for services, with a *coordinated reimbursement*

---

[55] *Per se* is defined in *Black's Law Dictionary* as "Of, in, or by itself; standing alone, without reference to additional facts," *Black's Law Dictionary*, 9th ed., edited by Bryan A. Garner (St. Paul, MN: West, 2009), p. 1257; letter from Markus H. Meier, Assistant Director, Federal Trade Commission Bureau of Competition, to Christi J. Braun and John J. Miles, law firm of Ober, Kaler, Grimes & Shriver, Greater Rochester Independent Practice Association, Inc., Advisory Opinion, September 17, 2007, http://www.ftc.gov/bc/adops/gripa.pdf (accessed April 18, 2008). *Rule of Reason* is defined in *Black's Law Dictionary* as "The judicial doctrine holding that a trade practice violates the Sherman Act only if the practice is an unreasonable restraint of trade, based on the totality of economic circumstances," *Black's Law Dictionary*, p. 1449.

[56] Federal Trade Commission, "Federal Trade Commission, Department of Justice Issue Final Statement of Antitrust Policy Enforcement Regarding Accountable Care Organizations," press release, October 20, 2011, http://www.ftc.gov/opa/2011/10/aco.shtm (accessed July 15, 2012).

[57] Markus H. Meier, "Re: Norman PHO Advisory Opinion," Federal Trade Commission, February 13, 2013, pp. 2–3.

and *clinical care plan* across all participating providers and specialties.[58] The FTC approved the Norman PHO proposal, citing the program's potential to "create a high degree of interdependence and cooperation … and to generate significant efficiencies in the provision of physician services" while "appear[ing] unlikely to unreasonably restrain trade."[59]

Approval of the Norman PHO proposal denotes "the FTC's first advisory opinion on a proposed clinically integrated network (CIN) since the [Affordable Care Act] was enacted."[60] The FTC's judgment in the case of the Norman PHO may prove to be a *watershed* decision regarding the future of *clinical integration*, as healthcare providers attempt to *bridge* service gaps and *increase integration* to stem the *rising costs* of healthcare, while *increasing the quality of care*.[61]

Included among the clinical integration plan elements proposed by the Norman PHO are:

1. A new *organizational structure* to support *clinically coordinated care*;[62]
2. *Obligatory* practitioner agreements for participating providers;[63]
3. Regular physician *quality* and *performance audits*;[64]
4. Physician-developed, *evidence-based clinical practice guidelines*;[65] and
5. Implementation of an *electronic platform* supported by a *medical informatics officer*.[66]

The successful implementation of some or all of these *proposed integration elements* may potentially provide value to:

1. **Patients,** through *reduced medical errors*, earlier *disease detection*, more timely *communication* and *scheduling*, elimination of *unnecessary* and *duplicative paperwork* and *tests*;

---

[58] Michael E. Joseph, "Re: Norman Physician Hospital Organization," McAfee & Taft on behalf of Norman Physician Hospital Organization, May 26, 2011, http://www.ftc.gov/os/2013/02/130213normanphoincomingadvltr.pdf.

[59] Ibid.

[60] Polsinelli Shughart LLP, "Clinical Integration on a Promise and a Plan," *Health Care Law in the News*, March 2013, p. 2.

[61] Joe Carlson, "Beyond ACOs: FTC Provides Another Path to Coordinated Care," *Modern Healthcare*, March 9, 2013, http://www.modernhealthcare.com/article/20130309/MAGAZINE/303099969/&template=# (accessed March 11, 2013).

[62] Ibid.

[63] Ibid.

[64] Ibid.

[65] Ibid.

[66] Ibid.

2. ***Payers***, through *centralized administrative work*, elimination of *duplication of services*, avoidance of *preventable hospitalization*, and *lower costs of care*; and
3. ***Providers***, through more timely receipt of *protected health information* (PHI) and *scheduling of services*, more streamlined *referrals*, and *reduced paperwork*.[67]

The FTC approval of the Norman PHO's *proposed* plan for clinical integration based on *expected* benefits, despite the incomplete execution of the plan, may pave the path for entities "to establish a joint venture evaluated under the antitrust rule of reason which is deemed to be legally compliant," especially for networks already piloting or implementing integration plans.[68]

Despite the tentative approval of the Norman PHO, the FTC explicitly reserved the right to revoke approval if future implementation of the program, "*results in substantial anticompetitive effects, if . . . used for improper purposes, if facts change significantly, or if it otherwise would be in the public interest to do so.*"[69] Despite its obvious benefit in providing a pathway to clinical integration, there are several potential pitfalls in the Norman PHO integration plan, including:

1. Maintaining *a nonexclusive structure*;
2. Avoiding *vertical arrangements* that may prevent collaboration between the Norman PHO and *non-network providers*; and
3. Potential "*spillover effects*" of participating physicians improperly *leveraging market power* associated with *network participation* to drive *non-network contract reimbursement rates*.[70]

Should the Norman PHO fail to appropriately *operate* and *maintain* a reliable *antitrust-compliant network*, it could jeopardize future proposals for *clinical integration* beyond the ACO model. But although the results of *full clinical integration* have yet to be achieved for the Norman PHO, the recent FTC decision provides helpful *guidance* and *encouragement* to *other provider networks* that may choose to forgo an ACO model in lieu of *alternate integration* models in an effort to adhere to changing *clinical* and *quality* outcomes in the era of healthcare reform.

[70] Ibid.

In addition to the antitrust regulations discussed earlier, provider management services arrangements must also ensure that they are in regulatory compliance with applicable Stark, Anti-Kickback, and IRS provisions.

13.1.2.2 Reimbursement Compensation for services provided by management service organizations are typically determined in one of three ways: (1) as a *flat fee*, (2) as a *percentage of practice revenue*, or (3) as a *hybrid approach* combining elements of both the *flat fee* method and the *percentage of practice revenue* method. *Flat fee* reimbursement for management service enterprises involves the payment of *contractually* agreed-on fixed amounts to management service enterprises by the contracting healthcare provider entity. *Percentage of practice revenue* methods determine reimbursement based on a contractually agreed-on portion of the revenue generated by the contracting entity over the specified time period when the management services will be provided. The *hybrid model* uses elements of both the *flat fee* and the *percentage of practice revenue* methods, with some portion of reimbursement coming in the form of a *fixed fee*, while other reimbursement is variable, based on some measure of economic activity over a specified period of time during which management services are provided. An example of the *hybrid model* is a *percentage of total billings* or a *percentage of total collections* for the provision of billing services.

13.1.2.3 Competition Often the main competitors for *management service enterprises* are *healthcare provider enterprises* who retain certain support services *in-house* or who decide to fully integrate, by means of acquisition and/or employment, with a hospital or a healthcare system who would provide these management services. In addition, certain services are increasingly provided by *competitive substitutes*, for example, although the demand for *transcription services* is growing, advances in *speech recognition software technology* may ultimately render human transcriptionists obsolete.[71]

13.1.2.4 Technology To facilitate reimbursement models based on achieving certain "*value-based*" quality metrics, the utilization of EHR systems that can document the achievement of stated *quality* and *cost* benchmarks will likely become increasingly important for these integrated providers seeking to align *financial* and *quality incentives*. For more information regarding the adoption and utilization of EHRs by different types of healthcare

[71]United States Department of Labor Bureau of Labor Statistics, "Medical Transcriptionists Job Outlook," March 29, 2012, www.bls.gov/ooh/healthcare/medical-transcriptionists.htm#tab-6 (accessed November 12, 2012).

enterprises, see Section 5.2.2, "Electronic Health Records," in Chapter 5, "Technology."

13.1.3 Value Drivers of Healthcare Management Service Enterprises

While the *value drivers* of any enterprise are, to some extent, unique to the subject enterprise, the notion that "If you have seen one, you have seen one" is, perhaps, more pertinent to *management service enterprises*. The *value* of a healthcare enterprise is based on the enterprise's ability to generate *net economic benefit*, beyond the operating and capital expense burdens necessary to produce the revenue stream of the enterprise, which *net economic benefit* accrues to the owners of the enterprise.[72] Factors that may represent value drivers for *management service enterprises* include (1) *Scope of Services*, (2) *Revenue Stream*, (3) *Capital Structure and Operating Expenses*, (4) *Market Rivalries and Competitors*, and (5) *Subject Entity Nonsystematic Risk*.

13.1.3.1 Scope of Services The *diversification of services* may allow *management service enterprises* to benefit from *economies of scale and scope* emanating from the *vertical integration* in the healthcare industry. This *vertical integration* may result in a more stable revenue stream for these management service enterprises, particularly as trends lead toward a greater portion of the services provided by management service enterprises being outsourced and/or automated by provider client organizations. The *scope of services* provided by a particular management service enterprise will vary based on the *purpose*, or *function*, of the enterprise. For example, an MSO may offer any number of the following services, such as (1) *operations management*, (2) *billing* and *collection activities*, (3) *marketing*, (4) *contract negotiation*, (5) *new assets acquisition*, (6) *personnel management*, (7) *leasing*, (8) *physician recruitment*, (9) *MIS development*, (10) *purchasing*, and (11) *facilities development*.[73]

---

[72] As noted in Chapter 7, "Basic Valuation Tenets."

[73] Robert James Cimasi, *A Guide to Consulting Services for Emerging Healthcare Organizations* (New York: John Wiley & Sons, 1999), p. 57, citing Douglas Goldstein, "From Physician Bonding to Alliances: Building New Physician-Hospital Relationships" (Alexandria, VA: Capital Publications, 1992); Gerald R. Peters, "*Healthcare Integration: A Legal Manual for Constructing Integrated Organizations*," National Health Lawyers Association, 1995.

13.1.3.2 Revenue Stream As mentioned earlier, compensation for the provision of management services by management service enterprises can use one of three methods: (1) *flat fee*, (2) *percentage of revenue*, or (3) *hybrid method*. The primary concern for the valuation analyst should be the magnitude of the payments to be received by the management service enterprise, as well as the relative stability of those anticipated payments. Management service enterprises that contract with multiple provider entities may hold a *portfolio* of contracts that may use any of the three compensation models.

Flat fee arrangements will typically have the most certainty regarding the amount and timing of payments, as these should be terms to the agreement for the provision of the management services. *Flat fee* arrangements provide a *steady*, *known* stream of payments to the management service enterprise, regardless of the *operational* and *financial performance* of the healthcare provider entity contracting for the management services, except in the case where the management services contract is *abrogated* in the event of bankruptcy. The risk associated with the *flat fee* method will be the least among the alternative compensation models for management service enterprises.

Percentage of revenue payments, conversely, will typically be less certain regarding the amount to be paid, representing a *down-side risk*. However, *percentages of revenue* payments also have the potential for an *up-side* benefit, if the contracting healthcare provider entity is capable of generating significant revenues during the term of the management services agreement. This *up-side* benefit is counterbalanced by the *down-side risk* of the contracting healthcare provider entity underperforming during the contract period. In developing an indication of value for a management service enterprise using a *percentage of revenue* compensation model, the valuation analyst should consider the most likely payments to be received, based on an analysis of the historical payment pattern, as well as an assessment of:

1. The *expected operational* and *financial performance* of the contracting healthcare provider entity;
2. The expectations as to the *attrition* of *provider clients* (i.e., projected loss of contract revenue); and
3. The expectations regarding the addition of new clients (i.e., projected additional contract revenue).

Percentage of revenue contracts typically hold the most risk for management service enterprises and, as such, require careful *due diligence* by the valuation analyst.

The *hybrid model*, which combines elements of both the *flat fee* and the *percentage of revenue* methods, acts to mitigate the management service enterprise's exposure to the *business risk* of the contracting healthcare

provider, by providing some fixed payments that would result in a minimum level of revenue, regardless of the *operational* and *financial performance* of the contracting healthcare provider entity. On a *risk/reward* spectrum, the *hybrid model* would be located somewhere between the *flat fee* method and the *percentage of revenue* method.

13.1.3.3 Capital Structure and Operating Expenses The capital structure of management service enterprises typically exhibits lower levels of debt than the overall healthcare industry does. According to the *Ibbotson's 2012 Cost of Capital Yearbook*, the median management service enterprises (SIC code 8741, which includes all management service enterprises operating outside the healthcare industry) had a ratio of debt to total capital of just 16.01 percent in the latest period and a five-year average median ratio equal to 10.22 percent.[74] The lower levels of debt of management service enterprises is likely the outcome of the *lower physical capital requirements* necessary to operate a management service enterprise, which is relatively more *labor intensive*, as compared with, for example, a hospital, which would have a more significant level of *physical capital requirement* that may lead *to increased utilization of debt financing*. Elevated levels of debt utilization by a management service enterprise may warrant *increased scrutiny* by the valuation analyst, as the subject management service enterprise may be funding *ongoing operation*s through debt, bringing into question the *profitability* and *sustainability* of the subject enterprise.

In addition, newer, emerging enterprises may require greater capital funds, as their expenses may include start-up costs, such as the costs associated with implementing an EHR system. The estimated initial *start-up costs*, as well as ongoing *fixed* and *variable operating expenses*, incurred by an ACO will likely vary, based on the size of the enterprise, for example, the start-up costs for *a* "*Large Federal ACO*" with 80,000 Medicare beneficiaries may be as much as $12 million.

Generally, the operating expenses incurred by a management service enterprise include the cost of negotiating and establishing the contractual relationship between the management service enterprise and the participating provider(s), as well as the ongoing expenses related to the provision of the management services.

Management service enterprises generate value by providing management services at a *lower cost* to their member provider participants, thereby *enhancing* their provider members' *profit margins*, due to the management service enterprise's ability to leverage *economies of scale* and *scope*.

[74] *Ibbotson Cost of Capital 2012 Yearbook, Data through March 2012* (Chicago: Morningstar, 2012).

Consequently, these types of management service enterprises may act as an umbrella overarching two or more integrating or coordinating member providers, and, in this event, the objective of the management service enterprise may not be to seek to generate internal *profit margins* but to enhance the *profitability* of its member provider clients. This type of subject management service enterprise is organized in such a manner to channel the flow of *net economic benefits* to the provider member clients through the terms of the management service agreement, which may tend to reduce the revenue generated by the subject management service enterprise, as well as the indication of value for the subject management service enterprise. In the alternative, the *net economic benefit* generated by these types of management service enterprises may be retained by the subject management service enterprise and, subsequently, distributed to the provider member clients as *profit*.

The *operational performance* of a management service enterprise has a direct impact on the *operating cost burden* of that enterprise. *Value*, for management service enterprises, is created, in part, by realizing cost reductions as a result of the *economies of scale* and *scope* that exist in the healthcare industry and through *enhanced operational performance*.

13.1.3.4 Market Rivalries and Competitors *Management service enterprises* are found throughout the United States, providing services to a variety of *healthcare provider enterprises*, "*prevalent*" models including MSOs, PPCMs, and IPAs, experienced their "*hay day*" in the *integration fueled* transactional market of the 1990s. The resurgence of provider integration activities as a means *of coordinating care* toward better quality and lower cost in this current era of healthcare reform may once again be driving the expansion of both traditional and new models of *management service enterprises*.

An illustration of the evolution in the number of management service enterprises between 2000 and 2010 is set forth in Table 13.5.

TABLE 13.5 Number of Management Service Enterprises, 2000 and 2010

Type of Enterprise	2000	2010
Physician Hospital Organizations (PHOs)	905	675
Management Services Organizations (MSOs)	482	413
Independent Practice Associations (IPAs)	969	621
Physician Practice Management Companies (PPMCs)	259	120

National Directory of Physician Organizations, 2nd ed. (Manasquan, NJ: Managed Care Information Center, 2000), p. A33–A71; "National Directory of Physician Organizations," Health Resources Publishing, CD-ROM, 2010.

TABLE 13.6 Number of Management Service Enterprises Affiliated with Community Hospitals Between 2000 and 2010

	Year		
Type of Enterprise	**2000**	**2005**	**2010**
Community hospitals affiliated with an MSO	655	438	454
Community hospitals with open PHOs	939	751	630
Community hospitals affiliated with closed PHOs	360	249	203
Community hospitals affiliated with an IPA	831	700	563

"AHA Hospital Statistics 2002," American Hospital Association, 2002, p. 10; "AHA Hospital Statistics 2007," American Hospital Association, 2007, p. 10; "AHA Hospital Statistics 2012," American Hospital Association, 2012, p. 12.

The change between 2000 and 2010 in certain types of management service enterprises that were specifically affiliated with a *community hospital* is set forth in Table 13.6.

In contrast, ACOs, which formally came into existence in 2010, have been steadily increasing in both the *federal* and *commercial* markets.[75] As was noted earlier, there are 318 ACOs, federal and commercial, operating in 48 states, with another 106 federal ACOs already accepted to the MSSP.[76]

13.1.3.5 Subject Entity Nonsystematic Risk While an investor in a particular *third-party payor enterprise* would have additional investment opportunities available to him or her (e.g., government bonds, equity indexes), the discount rate used to determine the present value of the expected future net economic benefits accruing to the owners of a subject supply side enterprise should also include a consideration of the *idiosyncratic risk* associated with an investment in the specific subject third-party payor enterprise.[77] This *subject entity–specific/non-systematic (idiosyncratic) risk* for *third party payor enterprises* would include the *various risk factors* that are *inherent and specific to the enterprise* being valued, as well as the *enterprise's operational performance* compared to the *most*

[75] David Muhlestein, et al., *Growth and Dispersion of Accountable Care Organizations: June 2012 Update* (Salt Lake City, UT: Leavitt Partners, 2012), p. 3.

[76] See Section 4.5.4.2, "Accountable Care Organizations," in Chapter 4, "Competition."

[77] See Chapter 9, "Costs and Sources of Capital," for a more detailed discussion of discount rates.

probable performance of similar enterprises as reported in normative industry benchmark survey data. *Subject Entity–Specific/Nonsystematic Risk Factors* for most *third-party payor enterprises* include, but are not necessarily limited to,

1. *Client diversification*, which lowers a subject enterprise's dependence on a single client (*concentration risk*), so that, to use the old saying, "*all of their eggs aren't in one basket*"; and
2. *Contract Negotiation Innovation*, which may *lower risk*, particularly as *emerging reimbursement models* gain popularity among providers and third-party payors, by allowing enterprises that can easily modify negotiation tactics to fit these new models to gain a *competitive edge* in the market, in contrast to enterprises that continue to use boilerplate negotiating strategies for more traditional flat *fee-for-service* contracts.

In addition to the risks related to the management service enterprise being valued, client provider members should also be subject to a risk assessment by the valuation analyst as to the *stability* and *future sustainability* of the subject management service enterprise's *provider client* and/or *member*-generated revenue.

13.1.4 Other Pertinent Valuation Considerations

As discussed in Chapter 8, "Valuation Approaches and Methods," there are three approaches that can be used for a valuation assignment: (1) the *income approach*, (2) the *market approach*, or (3) the *cost approach*. Each approach should be considered for each valuation assignment, and, if possible, multiple methods should be used.

When appraising a *management service enterprise*, the enterprise being valued is typically *administrative in nature*, coordinating and/or facilitating the delivery of care from separate healthcare providers (see Chapters 11, "Inpatient Enterprises," and 12, "The Valuation of Outpatient Enterprises"). The *administrative nature* of *management service enterprises* is a significant factor in determining the *limiting factors* of each valuation method. The valuation analyst should determine which methodologies to employ in developing his or her indication of value after careful considerations of the *scope of the engagement*, the *nature of the value result desired*, and the *availability* of data and information to support the analyst's conclusion.

Table 13.7 illustrates some of the considerations pertinent to the valuation of a management service enterprise.

TABLE 13.7 Other Pertinent Considerations Related to the Valuation of Management Service Enterprises

Pertinent Considerations	Description
Operating Expenses and Capital Requirements	■ *Economies of scale* exist for many management service enterprises. Larger enterprises will be capable of distributing the *fixed* portion of their expenses across multiple customers, thereby reducing their *per customer* expenses and possibly enhancing their operating margins. ■ *Industry-specific information* can be leveraged across multiple customers, that is, operational methods and techniques may be applied in numerous contexts with minimal *incremental expense*. ■ *Scope of expertise* is important in assessing a management service enterprise's ability to leverage both *economies of scale* and its *industry-specific information*, as information specific to a particular industry subspecialty may not be applicable across all subspecialties. The acquisition of the knowledge, skills, and abilities, as well as the physical capital, necessary to expand into a new specialty, may require a significant investment of *time* and *capital* to accomplish. ■ *Manpower leverage*: A management service enterprise with a wide geographic scope may be capable of negotiating more favorable contracts with providers, due to its access to multiple geographic markets.
Intangible Assets	■ *Intangible assets*, such as a *trained and assembled workforce in place* and *protocols and procedures*, may make up a significant portion of the value of a management service organization, although this value may be limited to the *industry subspecialty* in which it operates. ■ *Contracts in place* and *existing customer relationships* may also provide significant value to an enterprise by reducing the uncertainty regarding the attainment of projected revenue levels.
Selection of Methodology	■ *Income-Based Approaches* are commonly used to value management service enterprises that are capable of producing *sufficient net economic benefit* to support the assets, both *tangible* and *intangible*, of the subject enterprise. ■ A *Multiperiod Discounting Method*, for example, the *discounted net cash flow method*, is typically used for the valuation of management service enterprises, as opposed to a *single period capitalization method*, such as an *income multiple*, due to the volatility of the underlying industry sector and/or subspecialty that forms its client base.

Pertinent Considerations	Description
Selection of Methodology (*cont.*)	■ *Market-Based Approaches* are also used in the valuation of management service enterprises, often in addition to *Income-Based Approaches*. ■ Numerous publicly traded management service enterprises are available to the valuation analyst to form the basis of a value indication using the Guideline Public Company Method. ■ Market transaction data may also be available to the valuation analyst to use in employing the *Guideline Transaction/Merged and Acquired Method*. ■ *Asset/Cost-Based Approaches* may also be employed in the valuation of a management service enterprise. However, the *Asset/Cost-Based Approaches* may fail to reflect the entirety of the *intangible* asset value of the enterprise, particularly if the enterprise is capable of producing significant *net economic benefit* accruing to the owners of the enterprise.

13.2 THIRD-PARTY PAYORS

Third-party payors may be classified as parties, other than the *patient*, that *reimburse* the healthcare provider for the cost of healthcare services to the provider. In addition to providing *payment* to providers for medical services rendered, third-party payors typically establish a *network of providers* for their enrollees to use. Among the unique characteristics of a healthcare third-party payor enterprise are the specific coverage plans offered and the associated models of reimbursement employed, the selection of which may be based on (1) the *ownership structure*, (2) the *enrolled patient population*, and (3) the amount of *risk* shared between the third-party payor and the healthcare provider along the *risk spectrum*, that is, from *fee-for service* (FFS) to full *capitation* (see Exhibit 2.6, "U.S. Health Insurance Providers and Plans," and Exhibit 2.14, "U.S. Health Insurance Reimbursement Options," both in Chapter 2, "Reimbursement Environment").

RISK SPECTRUM

The risk spectrum is the compilation of all levels of financial risk borne by healthcare payors and providers, ranging from fee-for-service, placing a majority of risk on payors, to full capitation, placing a majority of risk on providers.

13.2.1 Types of Third-Party Payors

There are two general classifications of payors: (1) *public payors,* which are operated by *federal or state governments*, the most notable of which are *Medicare* and Medicaid (See Section 2.4, "Public Payors"); and (2) *private third-party payors*, which consist of *for-profit commercial insurers*, *not-for-profit commercial insurers*, and *self-funded plans* (Section 2.5, "Private Payors"). Within this *private third-party payor arena*, which, in contrast to *public payors*, are subject to *financial appraisal, for-profit insurers* are taxable entities organized as either *mutual insurance companies* (which are owned by their policyholders) or *stock insurers* (which are owned by their shareholders).[78] *Not-for-profit insurers* are typically owned by a *not-for-profit parent organization*, for example, a *not-for-profit health system* such as *Kaiser* or *Geisenger* or a nonprofit managed care organization such as *Blue Cross Blue Shield* (BCBS).[79]

Factoid

In 1977, the independent accrediting agencies of Blue Cross insurance plans and Blue Shield insurance plans combined to form the Blue Cross and Blue Shield Association.

The Blues: A History of the Blue Cross and Blue Shield System*, by Robert Cunningham III and Robert M. Cunningham Jr. (DeKalb, IL: Northern Illinois University Press, 1997), pp. 196–199.*

[78] Alma Koch, *Introduction to Health Services* (Clifton Park, NY: Thomson Delmar Learning, 2008), p. 114.

[79] Susan Namovicz-Peat, *AIS's Directory of Health Plans: 2012* (Washington, DC: Atlantic Information Services, 2012), pp. 3–10; Alliance for Advancing Nonprofit Health Care, "Basic Facts and Figures: Nonprofit Health Plans," 2012, pp. 1–4. A *health system insurance plan* is a *combination* of a *healthcare provider* and a *health insurance provider*, which creates a health plan *controlled by the health system* that also *manages the delivery* of healthcare services. See Section 2.5.2.1, "Health System Plans," in Chapter 2, "Reimbursement Environment," for further discussion. In 1977, the independent boards of directors of the *Blue Cross* and *Blue Shield* accrediting associations merged to form a single not-for-profit *Blue Cross Blue Shield Association*, consisting of 38 independent BCBS companies. In the eight decades since the establishment of its two original component organizations, BCBSA has grown to cover nearly 100 million individuals in the United States as of 2012, through 38 independent companies that have been granted a license to the BCBS trademark from the BCBSA. Blue Cross Blue Shield Association, "About the Blue Cross and Blue Shield Association," http://www.bcbs.com/about-the-association (accessed August 15, 2012). See Section 2.5.2.2, "Blue Cross Blue Shield," in Chapter 2, "Reimbursement Environment."

TABLE 13.8 Top 10 Third-Party Payors by Enrollment as of 2012

Healthcare Payor Enterprise	Enrollees (in millions)	For-Profit/ Not-for-Profit
United Healthcare	34.7	For-Profit
WellPoint, Inc.	29.6	For-Profit
Aetna	18.6	For-Profit
Health Care Service Corporation	12.8	Not-for-Profit
Cigna	11.5	For-Profit
Kaiser Permanente	9.00	Not-for-Profit
Humana, Inc.	6.7	For-Profit
Blue Cross Blue Shield of MI	4.4	Not-for-Profit
Highmark, Inc.	4.4	Not-for-Profit
Coventry Health and Life Insurance Company	3.6	For-Profit

AIS's Directory of Health Plans: 2012, by Susan Namovicz-Peat (Washington, DC: Atlantic Information Services, 2012), pp. 10–11.

The 10 largest *for-profit health plans* by total enrollment and the 10 largest *not-for-profit health plans* by total enrollment are set forth in Table 2.13, "Ten Largest For-Profit Health Plans by Total Enrollment," and Table 2.15, "Ten Largest Not-for-Profit Health Plans by Total Enrollment," respectively, in Chapter 2, "Reimbursement Environment."

Both *for-profit* and *not-for-profit insurers*, which offer various plan options for enrollees, provide for various "*trade-offs*" between (1) *premium costs,* (2) *scope* of *services covered,* and (3) the degree of *flexibility* for the enrollee (patient) to choose his or her provider. As of 2012, total enrollment in *not-for-profit* health plans was approximately 104.3 million, while enrollment in *for-profit* health plans topped 122.4 million.[80] The top 10 nongovernmental healthcare third-party payor enterprises in the United States as of 2012 are set forth in Table 13.8.

In addition to being classified as *for-profit* or *not-for-profit*, *healthcare third-party payor enterprises* may also be classified by the varying *levels of provider coverage* that are offered under the plan and the *risks* associated with each. For example, in the *commercial risk-based* insurance market, the most popular plan type used (as measured by the number of enrollees) is the *preferred provider organization* (PPO), which accounted for approximately 24.2 percent of the market in 2012. See Table 13.9 for a further description

[80] Alliance for Advancing Nonprofit Health Care, "Basic Facts and Figures: Nonprofit Health Plans," 2012, p. 1, calculated from Susan Namovicz-Peat, *AIS's Directory of Health Plans: 2012* (Washington, DC: Atlantic Information Services, 2012), p. 3.

TABLE 13.9 Commercial Insurance Market as of 2012

Health Plan Option	Acronym	Percentage of Market
Preferred Provider Plan	PPO	24.17%
Health Maintenance Organization	HMO	21.42%
Medicare Supplemental Plans	MSP	7.57%
Point of Service Plans	POS	5.47%
Fee-for-Service/Indemnity	FFS	3.76%
Other Unspecified Plans		37.60%

AIS's Directory of Health Plans: 2012, by Susan Namovicz-Peat (Washington, DC: Atlantic Information Services, 2012), pp. 14–15.

TABLE 13.10 Government-Sponsored Public Insurance Market as of 2012

Health Plan Option	% of Market
Medicaid HMOs	48.24%
Medicaid FFS Plans	26.63%
Medicare Coordinated Care Plans	18.52%
Local CHIP Plans	5.67%
Medicare PFFS	0.91%
PACE	0.03%

AIS's Directory of Health Plans: 2012, by Susan Namovicz-Peat (Washington, DC: Atlantic Information Services, 2012), pp. 14–15.

of those types of third-party payor enterprises making up the *commercial risk-based* insurance market:

In comparison, the *government-sponsored/public insurance market* was dominated by *Medicaid HMOs*, making up 48.24 percent of the market in 2012, as set forth in Table 13.10.

13.2.1.1 Managed Care Organizations (MCOs) In a broad sense, a *Managed Care Organization* (MCO) may be described as a "organized system of care that seeks to influence the selection and utilization of health services…of an enrolled population."[81] MCOs integrate the *financing* and the *provision* of

[81] R. Danielle Federa and Tracey L. Camp, "The Changing Managed Care Market," in *JACM on Managed Care*, edited by Seth B. Goldsmith (Gaithersburg, MD: Aspen Publishers, 1995), p. 3. The article was previously published in *Journal of Ambulatory Care Management* 17, no. 1 (1994): 1–7.

Factoid

Henry J. Kaiser, a prominent industrialist and shipbuilder, is often credited with establishing the first MCO in 1930 in California, Kaiser Permanente.

"Health Maintenance Organizations," by Diana Barrett, in Making Sense of Managed Care—Volume 1: Building Blocks and Fundamentals, *edited by Kimball Austin Miller and Elaine King Miller (Tampa, FL: Hillsboro Printing, 1997), pp. 47–48.*

health services under the administration of a single entity in an effort to contain costs.[82] To achieve this, MCOs *share risk* with the healthcare provider by (1) reimbursing providers at predetermined levels (such as capitated payments) and (2) holding providers *accountable* for the quality of services provided.[83] In this manner, providers are then incentivized to *manage care* and *maintain quality*, as well as *manage costs*.[84] MCOs are typically established through the creation of a *provider network*, either through an existing integrated health system or through *contractual relationships* with *independent providers*.[85] Each type of managed care plan has a *varying degree of risk* shared between the participating *third-party payors* and *providers* (see Exhibit 2.12, "Managed Care Plan Options," in Section 2.5.1.2, "Managed Care").

The origin of managed care can be traced to the early twentieth century. In 1910, the Western Clinic in Tacoma, Washington, began offering *prepaid medical services* through its own providers to its members for a premium payment of $.50 per month, effectively becoming the first MCO in the United States.[86] In the period following World War II, MCOs

enjoyed wider popularity following passage of the *Health Maintenance Organization Act of 1973*, and approximately 30 *health maintenance organizations* (HMOs), one type of MCO, had been established by the end of the 1970s.[87] Following the 1970s, the number of HMOs rapidly grew in the United States, peaking in the 1990s with enrollment increasing each year from 15 to 20 percent in many states.[88] HMO enrollment continued to increase until the late 1990s, when HMOs began to consolidate, and an *anti–managed care sentiment* emerged in the United States, resulting in a decline in the number of HMOs and the number of enrollees in HMOs.[89]

13.2.1.1.1 Health Maintenance Organizations (HMOs) A HMO may be defined as "*a group of participating healthcare providers that furnish medical services to enrolled members of a group health-insurance plan.*"[90] In an HMO, a combination of *payors* and *providers* are held *accountable* for the costs of providing *specified healthcare services* to a *group of enrollees*, as well as assuming the *financial risk* of covering the cost to provide those specified healthcare services to the plan's enrollees at a *fixed per-member-per month price.*[91] HMOs are commonly known as *prepaid health plans*, as enrollees (or their employer) typically pay the HMO a *fixed price*, regardless of whether they use any medical services.[92] Typically, HMO enrollees are required to receive all of their care from the plan's *participating providers*, except for care provided in emergency situations, for which the HMO offers a *point of service*

[87] See Section 1.5.4, "Health Maintenance Organization Act of 1973," in Chapter 1, "The Chronology of U.S. Healthcare Delivery," for further discussion regarding the historical development of *HMOs*, and Section 2.5.1.2, "Managed Care," in Chapter 2, "Reimbursement Environment," for additional information regarding the various types of MCO plan models. option.[93] (See Section 2.5.1.2.2, "Health Maintenance Organizations [HMOs]," in Chapter 2, "Reimbursement Environment," for a further discussion of HMOs.)

Despite the decreasing number of *operating HMOs* (from 902 in 1998 to 442 in 2011), the average enrollment per HMO plan has steadily been increasing from approximately 109,000 in 1999 to approximately 180,000 in 2011, which may be indicative of a trend toward consolidation within the HMO plan marketplace.[94] Further, while the number of HMO plans has remained stagnant from 2007 to 2011, the number of Medicare HMO plans and Medicaid HMO plans has increased by 32.8 percent and 16.9 percent, respectively, during that same time period.[95] In 2011, 83.4 percent (approximately 66.3 million) of all HMO enrollees were part of an HMO chain or network. Further, 77.5 percent of these enrollees were included under one of the *five largest HMO chains*, that is, (1) United Healthcare, (2) Blue Cross Blue Shield Association, (3) Kaiser Foundation Health Plan, Inc., (4) Aetna, and (5) Coventry Health Care, Inc.[96]

See Table 2.14, "Common Forms of HMOs," in Chapter 2, "Reimbursement Environment," as well as the following exhibits for an illustration of the five "*common*" models of HMOs.

A *Staff Model HMO* (or *Closed-Panel HMO*) is a *self-contained HMO* that directly employs or enters into a contractual relationship with physicians and staff and typically owns the fixed assets required for the delivery of care.[97]

Factoid

In 2011, there were 564 HMOs operating in the United States.

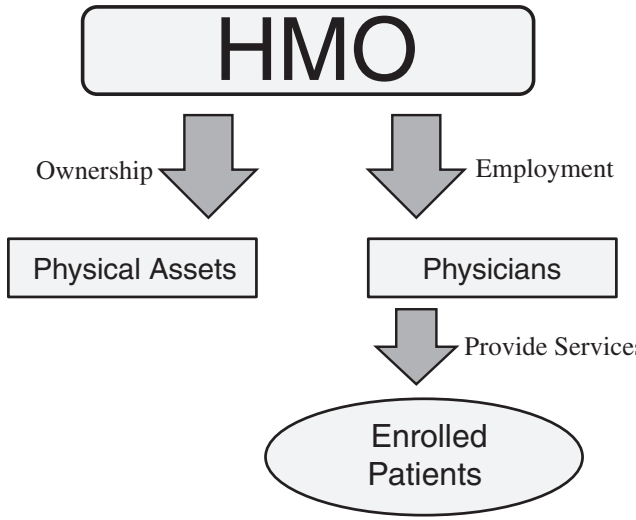

EXHIBIT 13.4 Staff Model HMO

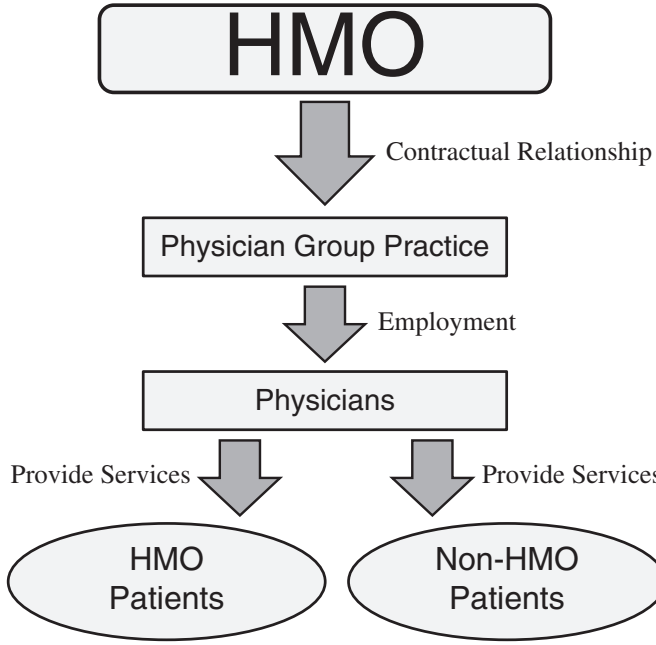

EXHIBIT 13.5 Group (Open) Panel Model HMO

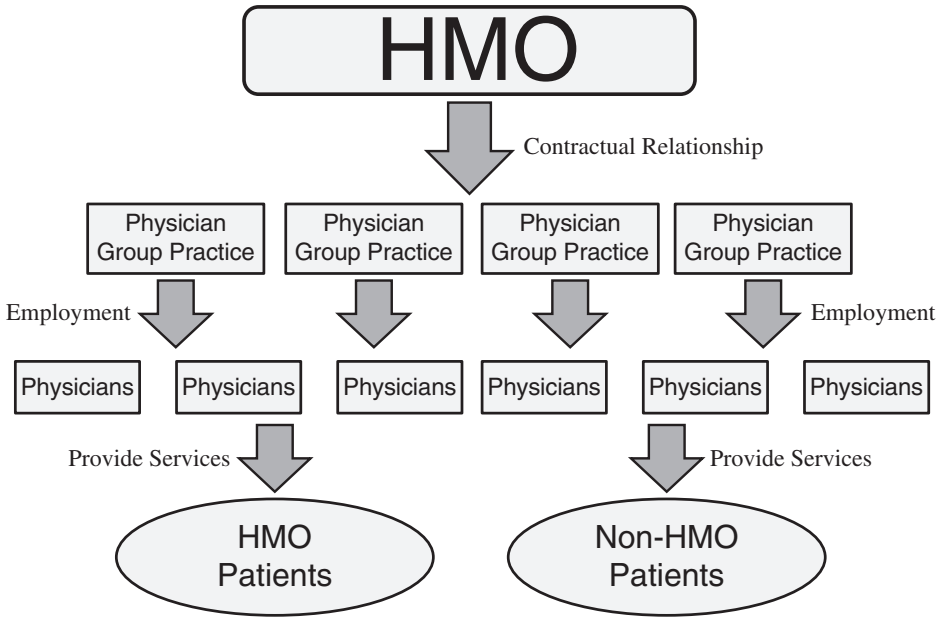

EXHIBIT 13.6 Network Model HMO

Staff Model HMOs are referred to as "*Closed-Panel HMOs*" because only *employed physicians* are permitted to provide services to enrollees.[98]

In contrast to a *Staff Model HMO*, a *Group Model HMO* typically does not own many fixed assets and *contracts* with one or more *medical group practices* for inpatient and diagnostic services needed by its *enrollees*.[99] In addition, unlike in a *Staff Model HMO*, physicians participating in a *Group Model HMO* are employed by their respective group practices, not by the HMO.[100] Further, participating physicians are not restricted to providing service to patients who are enrolled in the HMO plan.[101]

Similar to a *Group Model HMO*, a *Network Model HMO* enters into a contractual relationship with *group practices* and *individual physicians*. However, unlike a *Group Model HMO*, which typically has a primary, *large*

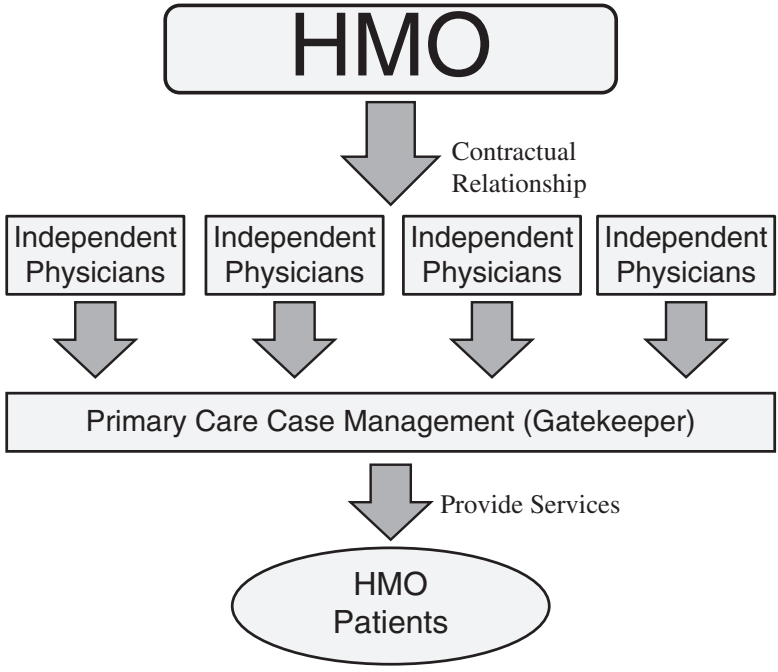

EXHIBIT 13.8 Direct Contract Model HMO

multispecialty group practice with which it contracts, a *Network Model HMO* enters into contracts with *numerous* small plan practices in order to meet the needs of its enrollees.[102]

In an *Independent Practice Association (IPA) Model HMO*, individual physicians join together to form the IPA (as discussed earlier in this chapter) and enter into a *contractual relationship* to provide services to enrollees in the plan, typically, on a *heavily discounted FFS model*. Physicians participating in an IPA may (1) retain their individual practices, (2) participate in several HMOs simultaneously, and (3) provide services to patients who are not enrolled in one of the participating HMOs.[103] IPAs often provide physicians with the bargaining power or market leverage of larger provider practices in negotiating managed care contracts.[104]

Similar to a *Network Model HMO,* a *Direct Contract Model HMO* enters into a *contractual relationship* directly with *individual physicians*, rather than with the physician group practice or an IPA.[105] *Direct Contract HMOs* typically contract with both primary care and specialist physicians and may also use a primary-care case management approach as a *gatekeeping*

GATEKEEPING

A cost and care utilization containment method widely used in managed care, requiring patients to gain preapproval for nonemergency healthcare services from their primary care physician.

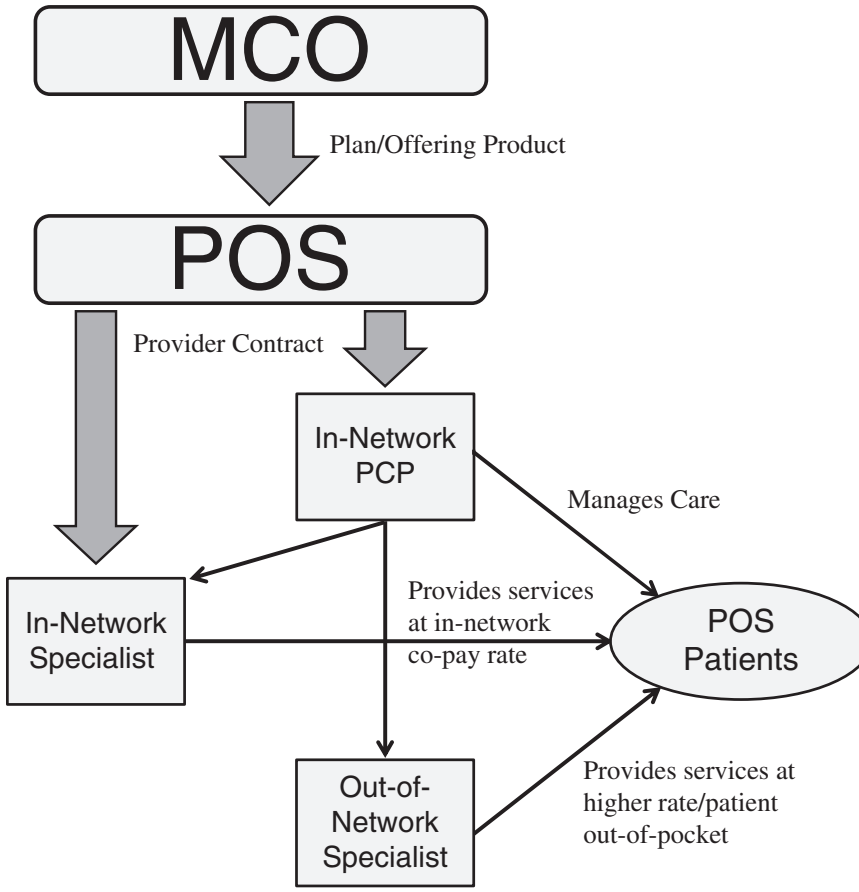

EXHIBIT 13.9 Point of Service Plan Model

function. Similar to an *IPA HMO Model*, *Direct Contract HMO* physicians may be reimbursed on either a *capitated* or an *FFS* basis.[106]

13.2.1.1.2 Point of Service (POS) Plans A *Point of Service* (POS) *Plan*, a hybrid form of an HMO, can be characterized as an HMO with additional *indemnity insurance* to cover *non-network* or *unauthorized* procedures for enrolled patients (see Exhibit 13.9).[107] In a *POS plan*, healthcare providers

[106] Peter R. Kongstvedt, *Essentials of Managed Health Care*, 2nd ed. (Gaithersburg, MD: Aspen Publishers, 1997), p. 47.

[107] Kimbal Austin Miller, MD, and Elaine King Miller, eds., *Making Sense of Managed Care, Volume I: Building Blocks and Fundamentals* (San Francisco: Jossey-Bass, 1997), p. 12.

contract with the POS to form a *network of providers,* with subscribers having the *option* of *choosing network* or *non-network* physicians for their healthcare needs. However, enrollees typically incur *higher* copayments and deductibles when obtaining care from *non-network* providers.[108] *POS plans* became increasingly popular in the early 2000s as an alternative to HMOs in the wake of the public backlash against the restrictions on patient choice on providers and the "*gatekeeping*" function of HMOs. (See Section 2.1.5.2.4, "Point-of-Service [POS] Plans," in Chapter 2, "Reimbursement Environment.") However, despite their early "*acceptance*" by consumers, as of 2012, only 9 percent of individuals covered under an employee-sponsored insurance plan were enrolled in a POS plan, as compared to 21 percent in 2000.[109]

13.2.1.1.3 Preferred Provider Organizations (PPOs) In contrast to the various types of HMOs described earlier, a *Preferred Provider Organization (PPO)* may be defined as "a corporation that receives health insurance premiums from enrolled members and contracts with independent doctors or group practices to provide care."[110] Typically, subscribers of a PPO receive treatment on an *FFS basis* from *network providers*. While patients enrolled in a PPO are not *required* to receive services from the *preferred panel of providers*, they are *incentivized* to stay within the *preferred panel network* through *discounts* and other *economic benefits*, including a *reduced* (or lack of) *deductible* or *copayment*.[111] (See Section 2.5.1.2.3, "Preferred Provider Organizations [PPO]," in Chapter 2, "Reimbursement Environment.")

PPOs typically do not accept the *financial risk* of an enrolled patient population, but rather act as the health plan's *third-party administrator* by *processing claims* and providing *financial incentives* for patients to receive services from those providers who participate in the PPO's panel.[112] An illustration of a typical *PPO* is set forth in Exhibit 13.10.

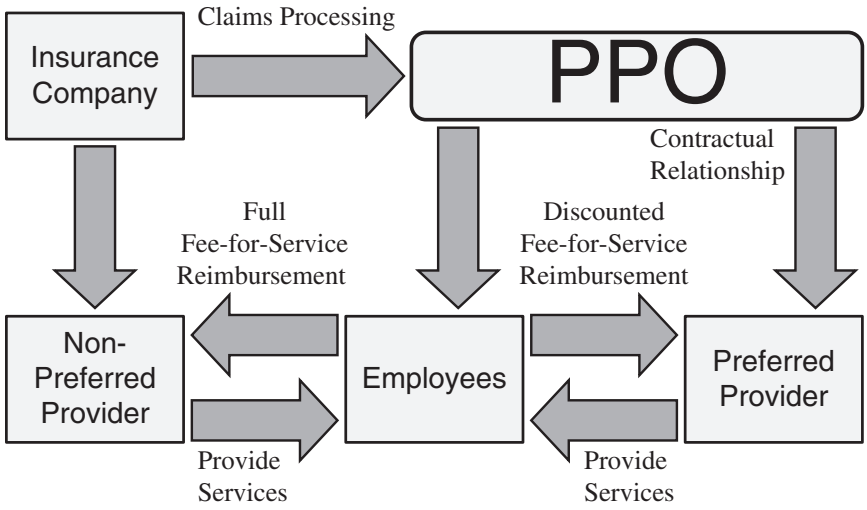

EXHIBIT 13.10 Preferred Provider Organization Model

Similar to the decreasing prevalence in the number of HMO plans during the last decade, the number of *PPOs* has also been declining, with 988 PPOs operating in 2000, as compared with 469 in 2011.[113] In addition, while total enrollment in PPOs *declined* from 156.4 million in 2007 to 146.1 million in 2010, total enrollment in PPOs *rebounded* to 150 million in 2011.[114] Furthermore, the average number of providers *affiliated* with a *PPO network*, across all provider types (e.g., primary care physicians, specialists, ancillary providers, and hospitals) also expanded in 2011, *increasing* by 4.8 percent for all physicians and 9 percent for primary care physicians from 2010.[115] The 10 largest PPOs by enrollment as of 2012 are set forth in Table 13.11.

13.2.1.1.4 Exclusive Provider Organizations (EPOs) An *Exclusive Provider Organization* (EPO), a *submodel* type of PPO, may be defined as "a plan in which patients must go to a participating provider or receive no benefit."[116]

Similar to a PPO, an EPO uses a *limited panel of providers* from which patients are encouraged to receive services. However, unlike a PPO, an EPO enrollee who chooses to use *nonemergency services* from a physician who is *out-of-network* typically must *self-pay* for these *nonemergency services*.[117] (See Section 2.5.1.2.3, "Preferred Provider Organizations," in Chapter 2, "Reimbursement Environment.") Although EPOs still represent only a small presence in the current insurance market, they have recently gained some popularity as an option for *self-funded employer plans* as a means of cost savings; for example, a survey by the *Society for Human Resource Management* found that in 2010, 9 percent of employers offered an EPO plan

Exclusive Provider Organization

A managed care plan in which patients must use a participating, in-network provider for nonemergency services or receive no insurance reimbursement, and they have to self-pay.

option to their employees.[118] An illustration of a typical *EPO* is set forth in Exhibit 13.11.

13.2.1.1.5 Medicare and Medicaid Managed Care Over the years, there have been various types of Medicare managed care models; this chapter focuses on Provider Sponsored Organizations (PSOs) and Medicaid Managed Care (MMC) plans. Generally classified as a *public payor, Medicare Part C*, or *Medicare Advantage*, is actually *administered* through *managed plans* offered by *private insurance companies*. Federal regulation mandates that *Medicare Advantage organizations* must pay 95 percent of *clean claims* submitted by *nonparticipating providers* within 30 days and pay interest on those *clean claims* that are not paid prior to this deadline.[119] *Medicare Advantage* plans have increased in popularity in recent years, with Medicare enrollment in private health plans rising from 5.6 million in 2005 to 13.7 million in 2013.[120] Under the ACA, government subsidies to insurance companies for the

Provider-Sponsored Organization

A cooperative venture of group providers who control an integrated provider system engaged in both delivery and financing of health care services.

Essentials of Managed Health Care, *6th ed., by Peter R. Kongstvedt (Burlington, MA: Jones and Bartlett Learning, 2013), p. 39.*

administration of *Medicare Advantage plans* will be reduced, leading some to conjecture that there might be an uncertain future for this Medicare option, but as of 2013, "the Medicare Advantage marketplace remains robust . . . with little change in the number of plans offered, and relatively modest increases in average premiums."[121] See Section 2.4.1, "Medicare," in Chapter 2, "Reimbursement Environment," for a further description of *Medicare Advantage* (Medicare Part C) vis-à-vis other *Medicare* reimbursement programs.

Provider Sponsored Organizations (PSOs), that is, a "cooperative venture of group providers who [control] an integrated provider system engaged in both delivery and financing of health care services," were first established as a *pilot program* as part of the *Medicare + Choice* (now known as *Medicare Advantage*) provision of the *Balanced Budget Act of 1997*.[122]

Factoid

Medicare beneficiaries being treated for five or more conditions account for 75 percent of all Medicare spending.

[122] Peter R. Kongstvedt, *Essentials of Managed Health Care*, 6th ed. (Burlington, MA: Jones and Bartlett Learning, 2013), p. 39; "The Balanced Budget Act of 1997," *Pub. L.* 105-33, § 1855(d), 111 Stat. 316 (August 5, 1997).

PSOs were established with the purpose of controlling contracts directly with CMS for *Medicare risk-contracts*, while avoiding the "*middleman*," that is, Medicare HMOs.[123] PSOs have been perceived by some as a "*failed experiment*," due to the deep financial losses resulting from healthcare plans taking on full risk for older adults without the *case and utility management* strategies used by HMOs.[124]

Medicaid Managed Care (MMC) plans began to surface during the 1990s, and by 2011, there were 42.4 million individuals (approximately 74 percent of the Medicaid population) in the United States covered by MMC plans.[125] Many states welcomed the perceived cost efficiencies of managed care and began to mandate that Medicaid enrollees join MMC plans because of the plans' touted ability to *control and estimate costs*.[126] However, several studies have recently raised issues about the sustainability of cost savings achieved by these plans.[127] See Section 2.4.2.1, "Medicaid Overview," in Chapter 2, "Reimbursement Environment," for a detailed discussion of the *Medicaid managed care* program. While there is still uncertainty regarding how many states will participate in the *voluntary Medicaid expansion* program called for under the ACA, the increase in the number of Medicaid-eligible individuals in states that do choose to participate will likely have a significant impact on overall MMC enrollment. As of 2013, only seven states had expanded Medicaid coverage under the provisions of the ACA (CA, CT, CO, DC, MN, NJ, and

STABLE RISK GROUPS

Enrollee populations that have general good health and are at low risk of requiring expensive or excessive healthcare services, or the employer has a low number of enrollees.

covered under *the indemnity plan*, the patient may then *submit a claim* to the insurer and receive *partial reimbursement* for his or her cost of the visit.[131]

13.2.1.2 Administrative Services Only (ASO) Plan An *administrative services only* (ASO) plan is a *self-insured* plan that contracts with an MCO or an insurance company for the provision of *administrative services* for the plan, e.g., *claims processing, actuarial analysis, and utilization review.*[132] In some circumstances, the *self-insured* plan may "*rent*" access to the third-party payor's *provider network* and may receive healthcare services on a *discounted* basis.[133] In an *ASO arrangement,* the healthcare third-party payor does *not* assume any of the *risk* of the *covered population*, and its administrative responsibilities are limited to those set forth in the service contract.[134]

ASO plans permit *stable risk groups*, such as *employee populations* of a *single large employer*, to *self-fund* their own plan, thereby allowing *large employers* to *retain the risk* of insuring their stable employee population while *outsourcing* the administrative tasks required for the operation of the plan to an outside enterprise. Although returns are typically low for enterprises providing ASO services (as well as their associated risks), their *bargaining power* with healthcare providers may be strengthened by the number of patients they represent through their ASO arrangement.[135]

MORAL HAZARD

Moral hazard occurs when the policy holder can take steps to reduce his or her probability of loss, but the insurance company cannot distinguish between loss due to carelessness and loss due to a random event that the policy holder could not have prevented

Microeconomics with Calculus, *2nd ed., by Brian R. Binger and Elizabeth Hoffman (Reading, MA: Addison-Wesley Educational Publishers, 1998), p. 538.*

As of 2012, 27.84 percent of insured individuals were enrolled in an ASO plan.[136] Of those individuals enrolled in an ASO plan, approximately 90.63 percent were enrolled in a plan managed by the *commercial market*, as compared to 4.09 percent who were enrolled in plans sponsored by the *government*.[137] This type of third-party payor plan is often captive to the employer sponsor and is therefore typically not transferred.

13.2.2 Current and Future Trends: Regulatory, Reimbursement, Competition, and Technology

13.2.2.1 Regulatory The managed care industry is subject to a broad spectrum of *regulation* and *legislation*. The industry has recently come under increasing public scrutiny regarding the *legal permissibility* of certain *insurer methods* and *practices*. This has led to the introduction of several types of *reform legislation* on the *national* and *state level*, some of which have the potential to exert significant changes on the *market structure* and *profitability* of the industry. Areas of regulation that may affect the third-party payor industry include:

1. **Corporate practice of medicine.** In many states, statutes may prohibit corporations from practicing medicine. Specifically, they *prohibit corporations*, including *hospitals* and *clinics*, from employing physicians to provide medical treatment. Several states explicitly prohibit the *corporate practice of medicine* by *separate statute*, while other state courts have read a *prohibition on the corporate practice of medicine* into the *state's*

[136] *AIS's Directory of Health Plans: 2012* (Washington, DC: Atlantic Information Services, 2012), p. 14.

[137] The sponsorship of the remaining 5.27 percent of those individuals enrolled in an ASO plan was unspecified. *AIS's Directory of Health Plans: 2012* (Washington, DC: Atlantic Information Services, 2012), p. 15.

Any Willing Provider Laws

Laws that require managed care plans to contract with all healthcare providers that meet their terms and conditions.

Dictionary of Health Insurance and Managed Care, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2006) p. 25.*

medical practice act.[138] The primary rationale for prohibiting the corporate practice of medicine is the fear that *physicians' medical decisions* will be controlled by their *corporate nonphysician supervisor's decisions.*[139] However, this prohibition has, in the past, been inconsistently enforced across jurisdictions, with some states explicitly prohibiting corporations from employing physicians for the provision of medical services, while in other states there is no statutory direction.[140]

There are some exceptions to the general prohibition for the *corporate practice of medicine*, including (1) professional corporations, a special corporate form *solely owned* by *licensed professionals*, which are allowed to *employ physicians*; and (2) many states allow *exempt organizations, hospitals, and foundations* to employ physicians.[141] (See Section 3.7, "Corporate Practice of Medicine and Related Provisions," in Chapter 3, "Regulatory Environment.")

2. **"Any willing provider"** laws. These require third-party payors such as HMOs, PPOs, and insurance companies to contract with *any* healthcare provider *willing* to meet the third-party payor's *established terms of participation*. These laws also address issues related to *consumer freedom* to use *non-network providers* related to providers who have been dropped from *preferred* or *exclusive provider panels.*[142] (See Section 3.4.2, "Any Willing Provider Statutes," in Chapter 3, "Regulatory Environment.")

3. **Employee Retirement Income Security Act of 1974 (ERISA).**[143] This law contains *preemption provisions* that allow certain *state legal claims* to be brought against insurance plans but requires others to be removed to *federal court* where *damages are limited* to those stipulated under ERISA (generally, the amount of benefits provided under the plan and potentially attorney's fees and other costs of litigation). There have been *regulatory changes considered* and *court decisions* that could affect these protections for managed care enterprises under ERISA. Such changes may also *increase* the *administrative requirements* and *costs* for which plans are responsible.
4. **Health Insurance Portability and Accountability Act of 1996 (HIPAA).** This act serves many purposes; it is most widely used for safeguarding the privacy of *Protected Health Information* (*PHI*), or individually identifiable health information.[144] This protection extends to information relating to the "past, present or future physical or mental health condition of an individual; the provision of healthcare services to an individual; or the past, present or future payment for the provision of healthcare to an individual."[145] The *HIPAA Privacy Rule* provides standards for the *use* and *disclosure* of PHI by *covered entities*, as well as rights for individuals to control how their PHI is used.[146] *The Privacy Rule* governs such covered entities as "health plans, healthcare clearinghouses, and any health care provider who transmits health information in electronic form in connection with a transaction for which the Secretary of HHS [Department of Health and Human Services] has adopted [HIPAA] standards."[147] Transactions by healthcare providers falling under the HIPAA Privacy Rule include *claims*, *benefit eligibility inquiries*, *referral authorization requests*, and *other transactions for which HHS has established particular standards.*[148] These transactions are covered regardless of whether they are performed by the *healthcare provider* themselves, a *billing service*, or *any other third party under contract with the provider.*[149] When a *covered*

[148] Ibid.

[149] Ibid.

entity contracts with a third-party entity to perform *billing* or *other business associate activities*, *claims processing*, *data analysis*, *utilization review*, *and so on*, the *covered entity* must impose *specific safeguards* of PHI.[150] The *business associate agreement* and the covered entity *cannot authorize* the business associate to use the PHI in a way that would *violate the Privacy Rule.*[151] (See Section 3.5.1, "Health Insurance Portability and Accountability Act [HIPAA]," in Chapter 3, "Regulatory Environment.")

5. **Prompt payment mandates.** Medicare law 42 USC 1395u(c)(2)(B) mandates prompt payment of bills submitted by providers and states that "payment must be issued for at least 95% of all submitted clean claims within 30 calendar days of the date on which the claim is received. A clean claim is defined as a claim without defect or need for any required substantiating documentation that would otherwise prevent timely payment from being rendered within 30 days. If payment is not issued as required, interest must be paid for the period beginning on the day after the required payment date and ending on the date on which payment is made."
6. **Impact of the ACA.** The ACA has had a significant impact on the healthcare third-party payor industry, not only because of the expanded *volume* of the insured population that is anticipated to enter the health insurer marketplace as a result of the June 2012 SCOTUS decision upholding the ACA's provisions related to the *individual mandate,* but also the ACA's provisions related to prohibiting health insurers from excluding individuals on the basis of a preexisting condition and *mandating* health insurance *coverage for dependent children.*[152]

13.2.2.2 Reimbursement Third-party payors are currently experimenting with *novel* reimbursement models along the *risk spectrum*, which include *value-based reimbursement options* and *episode-based payment models*, in contrast to these models at either end of the spectrum, from Fee-for-Service (*FFS*) models to the *full-capitation* models of the past. (See Exhibit 2.14, "U.S. Health Insurance Reimbursement Options," in Chapter 2, "Reimbursement Environment.")

[152] Kaiser Family Foundation, "A Guide to the Supreme Court's Affordable Care Act," Focus on Health Reform, May 2012; Kaiser Family Foundation, "Health Insurance Market Reforms: Pre-existing Condition Exclusions," September 2012. See Section 6.4.1, "Impact on Individuals," and Section 6.4.3, "Impact on Insurers," both in Chapter 6, "Healthcare Reform."

Third-party payors typically create a *risk pool* from the enrollees in the plan, within which the expenses associated with the most costly enrollees, that is, those who will require the third-party payor to reimburse providers for a *large amount of* or *expensive care*, are offset by healthy, typically young, patients, who are less likely to use a significant amount of care. The type of insurance plans a third-party payor offers will also affect the expense associated with the plan's enrollees. For example, under a *capitated* plan, third-party payors provide a *per member per month* (PMPM) reimbursement payment to providers, under which the risk of excessive services associated with individual patients are borne by the provider. In contrast, under a *fee-for-service* plan, whereby the third-party payor is responsible for the expense of costly patients, managing an effective *risk pool* may be more significant. New regulations established under the ACA, for example, the requirements to maintain a specified *medical loss ratio*, as well as provisions against denying coverage based on preexisting conditions, may also affect the operating expense incurred by third party payors. (See Chapter 6, "Healthcare Reform.")

13.2.2.3 Competition Consolidation within the healthcare third-party payor industry has been observed during the last decades. Fueled by the decline of employer-based health insurance, third-party payors have sought to augment declining enrollments through a process of acquiring plans.[153] Of note is that as a result of this expansion by acquisition, in only three states (Colorado, Oklahoma, and Wisconsin) do the three largest commercial third-party payors account for less than 50 percent of the total market enrollment.[154] This continuing trend toward the consolidation of the healthcare third-party payor market may lead to more limited competition, which may ensure that historical premium growth rates may continue in the near future and may subject third-party payors to greater regulatory scrutiny. As was noted earlier, the *net impact* of the ACA and its *individual mandate* on healthcare third-party payor profitability is, as yet, indeterminate, although it is anticipated to increase market demand for healthcare third-party payor services. This expansion of the insured population, should it prove to be profitable to third-party payors, may give rise to increased value in existing payors but may also incentivize new participants to enter the healthcare third-party payor marketplace. The ultimate method by which the healthcare exchanges will develop within the third-party payor industry is a "*wild card*" in this value equation.

13.2.2.4 Technology Within this *emerging network* of *accountable* third-party payor and provider relationships, third-party payors will need to increasingly

[153] Jamie Robinson, "Consolidation and the Transformation of Competition in Health Insurance," *Health Affairs* 23, no. 6 (November/December 2004): 11–24.
[154] Ibid.

rely on a stable and robust *technological infrastructure* that can *record*, *measure*, *monitor*, and *manage* the high volume of *enrollee data* for which they are responsible, particularly as third-party payors begin to participate in *state health insurance exchanges*. As such, the *interoperability* of these healthcare information technology systems between third-party payors and providers will be instrumental in allowing access not only to billing information, but also to the quality metrics on which *value-based payments* will be based.

13.2.3 Value Drivers: Third-Party Payors

As discussed earlier in this chapter and noted in Chapter 7, "Basic Valuation Tenets," the *value* that may be attributed to a specific healthcare third-party payor is based on its ability to generate *net economic benefit* beyond the operating and capital expense burden necessary to produce the revenue stream. The most significant value driver for healthcare third-party payor enterprises is likely to be their ability to *manage* or, in some cases, *avoid risk*. For commercial insurers, *value* is often created through their ability to collect *premium dollars* from enrollees, while *minimizing administrative* and *clinical costs*. Commercial health insurers benefit from enrollees *limiting* their utilization of the healthcare services covered under the plan. This may be achieved through a strategy of enrolling "*healthy individuals*" and avoiding the risk associated with "*sick or at-risk individuals*," either through establishing *eligibility criteria* that make it more difficult or more costly for those likely to have conditions requiring significant utilization of health services to obtain coverage or by *denying coverage* to individuals with *preexisting conditions*. While the ACA contains regulations that attempt to prevent or limit this behavior, commercial health insurers may still structure their coverage options to attract a greater portion of healthy enrollees.[155]

Managed care plans may also create *value* through the establishment of a *comprehensive provider network* by contracting with a sufficient base of primary care physicians, specialists, and facilities. Traditionally, managed care plans created value by controlling the utilization of healthcare services of their enrolled population, typically through *specialist restriction practices*.[156]

In addition to the ability to *mitigate risk*, the (1) *Revenue Stream*, (2) *Operating Costs*, (3) *Capital Structure*, (4) *Market Rivalries and Competitors*,

(5) *Scope of Services*, and (6) *Risk Adjustments* of a subject healthcare third-party payor all have the potential to affect the value that may be attributed to these enterprises.

13.2.3.1 Revenue Stream Third-party payors typically generate *revenue* from the *premiums* paid by the enrolled population covered (also known as "*covered lives*"). Accordingly, increasing the *volume* of *covered lives* will result in a corresponding increase in the *revenue* generated by a third party-payor. The potential increase in volume of covered lives is a function of two factors: (1) *changes in utilization demand for coverage* and (2) *changes in market share*.

In addition to a market services area's changing demographics, for example, increases or decreases in total population and the proportion of the population eligible for Medicare, the utilization demand for coverage has been, and will continue to be, affected by several of the provisions of the ACA that are designed to expand access to insurance coverage. Since the passage of the ACA in 2010, *preexisting conditions cannot* be used as a *means for denying coverage* to *children*, and *dependent coverage* was extended to include children up to the age of 26, each of which may increase the number of covered lives for third-party payors.[157] However, these provisions, particularly the acceptance of *preexisting conditions*, may also be associated with higher medical loss payments for third-party payors, as *preexisting conditions* tend to be an indication of *future medical care needs*. The provision of the ACA that will likely have the most significant impact on the volume of covered lives is the *individual mandate*, discussed more fully in Chapter 6, "Healthcare Reform," that requires all U.S. citizens and legal residents to maintain "*minimum essential coverage,*" which necessarily requires them to obtain some form of health insurance coverage.

Some provisions of the ACA may also act to lessen the volume of covered lives for third-party payors by affecting their market share. For example, for those states that choose to participate in the Medicaid expansion, some individuals currently receiving healthcare coverage from third-party payors may become newly eligible for Medicaid coverage.[158] Similarly, other changes in the insurance market may also affect the volume of covered lives for third-party payors, for example, as the aging baby boomer population becomes

[157]"Patient Protection and Affordable Care Act, Sec. 1302, 2714," *Pub. L.* 111-148, 124 Stat 119 (March 23, 2010).

[158]The current status of the Medicaid expansion is fully discussed in Chapter 6, "Healthcare Reform."

eligible for Medicare, those third-party payors incapable of replacing these lost *covered lives* may have difficulty maintaining their current revenue levels (with the exception of those commercial third-party payors that offer Medicare Advantage plans).

In addition, acquisitions related to horizontal consolidators within the third-party payor industry are often motivated by a desire to expand through procurement of the *covered lives* of the other third-party payors. The volume of covered lives of third-party payors may be affecting by the attractiveness of their *provider network* and patient choice, for example, by increasing the number of providers to facilitate patient access and by increasing access to the types of specialist included in the network and/or by lowering copayment or deductible amounts. (See Chapter 6, "Healthcare Reform," for a fuller discussion of the ACA.)

While each payor uses its own methodology for establishing annual *premium rates*, these rates are designed to cover the *anticipated costs* related to paying for the care provided to enrollees. Accordingly, rates typically vary, based on the *health status* and *coverage plan* chosen by the enrollee. The methods used to determine those factors that may affect the cost of care for a defined population are typically referred to as *rating practices*, several of which are set forth in Table 13.12.

Of note is that premium rates paid by Medicare and Medicaid enrollees are set by CMS and the applicable state Medicaid agency. See Section 2.4.1, "Medicare," and Section 2.4.2, "Medicaid and CHIP," in Chapter 2, "Reimbursement Environment."

Rate bands and *community ratings* are the two main forms of state rate restrictions. States that have implemented *rate bands* limit a third-party payor's ability to use *health status rating practices* by establishing a *range*, or *band*, of rates a third-party payor may charge, typically based on the third-party payor's *average premium rate* (commonly known as the *index rate*).[159] An illustration of a hypo*thetical rate band restriction* is set forth in Exhibit 13.12.

Community rating is generally a restriction that requires third-party payors to set *one premium rate* for all enrollees in the same plan. States may also implement an *adjusted* or *modified community rating* restriction, which allows third-party payors to adjust the *single premium rate* based on

[159]Kaiser Family Foundation, "Health Insurance Market Reforms: Rate Restrictions," Focus on Health Reform June 2012, pp. 1–2; "Health Insurance 101: Setting Insurance Premiums," Community Catalysis, Georgetown University Health Policy Institute, 2011, http://101.communitycatalyst.org/aca_provisions/setting_premiums (accessed January 17, 2013).

TABLE 13.12 Common Rating Practices

	Description	When Applied to Plan	Example(s)
Health Status Rating	Premiums may be set higher for individuals more likely to use a greater amount of, or more expensive, healthcare services.	Typically at issuance	Chronic conditions, allergies.
Demographic Rating	Premiums may be set higher based on demographic factors that are typically associated with a higher use of healthcare services.	At issuance and renewal	Age, gender, and geographic location.
Industry Rating	Premiums may be set higher for enrollees in professions that are associated with high medical costs.	Typically at issuance	Loggers, miners.
Durational Rating	Premiums may be raised after a year or more, as indicators of future cost change. This practice is not common among payors.	At renewal	Preexisting condition exclusion period ends, medical underwriting expires.
Tier Rating	Payors may put enrollees into tiers of premium rates based on various factors that may suggest the amount of, and cost of, healthcare services that may be used. This practice is also known as re-underwriting.	At issuance and renewal	Historical use of healthcare services, health status.
Experience Rating	Group premiums are based on the group's history of insurance claims. This practice is common among payors.	At renewal	Dependent on group's historical usage of healthcare services.

"Health Insurance Market Reforms: Rate Restrictions," Kaiser Family Foundation, Focus on Health Reform, June 2012, pp. 1–2; "Health Insurance 101: Setting Insurance Premiums," Community Catalysis, Georgetown University Health Policy Institute, 2011, http://101.communitycatalyst.org/aca_provisions/setting_premiums (accessed January 17, 2013).

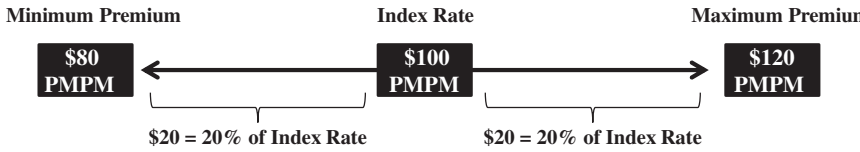

EXHIBIT 13.12 Hypothetical 20 Percent Rate Band Restriction

minimal demographic factors, typically not *experience* or *health status*.[160] In addition, some states impose *renewal rate protections*, which limit a third-party payor's ability to raise *premium rates*, typically limiting any inflation to 10 to 15 percent of the third-party payor's *best business rate*, that is, the lowest rate available.[161]

As of January 2012, 18 states and the District of Columbia (DC) limited third-party payor *rating practices*. "Of those states (including the District of Columbia), 12 imposed *rate bands;* 6 imposed an *adjusted community rating restriction;* and, 1, New York, imposed a *community rating restriction*. In addition, almost all states allowed for some kind of *rating practices* based on *age* (48 states and D.C.), *health status* (43 states and D.C.), and *tobacco use* (45 states and D.C.), while a majority of states allowed for rating practices based on *gender* (37 states) and the *industry* in which an enrollee is employed (37 states and D.C.).[162] Further, in 2014, ACA provisions will limit the rating practices of third-party payors on a federal level, that is, all third-party payors, regardless of which state they reside in, will be allowed to *adjust premiums* based only on: (1) *individual enrollment versus family enrollment*, (2) *geographic location*, (3) *age*, and (4) *tobacco use*.[163]

Despite regulations restricting certain *premium rate–setting practices* by commercial third-party payors, rates for *employer-sponsored health*

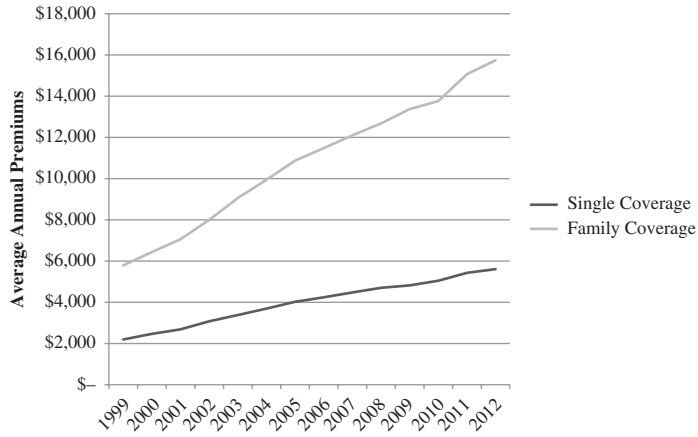

EXHIBIT 13.13 Growth in Average Annual Premiums for Employer-Sponsored Plans, 1999 to 2012
Employer Health Benefits: 2012 Annual Survey, by Gary Claxton, et al., Kaiser Family Foundation, 2012, p. 30.

plans increased 127 percent for individual coverage, and 145 percent for family coverage from 2000 to 2012.[164] This growth in annual premiums is illustrated in Exhibit 13.13.

In addition, in 2012, there were significant variations in annual average premium payments based on the benefits offered, cost sharing, and geographical location, for example, 19 percent of individuals paid an annual premium of less than $4,492 for individual coverage (which is less than 80 percent of the average annual premium paid for individual coverage), and 18 percent of individuals paid an annual premium of more than $6,738 (which is more than 120 percent of the average annual premium paid for individual coverage). Similar variation was seen in the family market.[165]

Metropolitan Statistical Area

Typically, a geographic area that includes one city with at least 50,000 inhabitants.

Dictionary of Health Insurance and Managed Care, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2006) p. 186.*

[164] Gary Claxton, et al., *Employer Health Benefits: 2012 Annual Survey*, Kaiser Family Foundation, 2012, p. 30.
[165] Ibid., p. 3.

Another important consideration when projecting revenues for a healthcare third-party payor enterprise is accounting for changes in the circumstances that generate enrollee volume, for example, (1) *commercial employer groups*, (2) *state or local employment groups*, (3) *insurance companies*, (4) *Medicare beneficiaries* (Medicare advantage), (5) *Medicaid beneficiaries*, and (6) *individual markets*. Regulatory and financial trends may affect a third-party payor's enrollment differently, based on the enrollee population. One such regulatory change that may be a significant consideration for the projection of patient utilization/demand for the services offered by a healthcare third-party payor is the implementation of the *individual mandate* and *state health insurance exchanges* in 2014. Under the *individual mandate*, most individuals will be required to obtain insurance, typically from those commercial third-party payors who are included in a state's health insurance exchange. Participation in a state health insurance exchange may form the basis for a projection of increased market demand/utilization for a subject healthcare third-party payor. For more information on the *state exchanges* and the *individual mandate*, see Chapter 6, "Healthcare Reform."

Despite the ACA provision requiring third-party payors to submit rate increases of 10 percent or more to HHS for state and federal review, premiums are still projected to grow during the next decade.[166] A 2012 study performed by the Commonwealth Fund suggested that "[a]bsent a significant change in the way private insurance and health care markets function, cost pressures will continue to push up private insurance costs and out-of-pocket medical expenses."[167] In contrast to the long-held view that the economics of the healthcare industry display inelastic demand, purchasers of *healthcare insurance* tend to exhibit *price elastic demand*, that is, small increases in premiums tend to lead to large decreases in quantity sold. Accordingly, increasing price cost pressures may drive premium increases, which may lead to a reduction in *covered lives* but not necessarily a reduction in *profits*. An example of the application of other pertinent valuation considerations can be found online at http://www.wiley.com/go/healthcarevaluation.

[167] Cathy Schoen, et al., *Realizing Heath Reform's Potential: State Trends in Premiums and Deductibles, 2003–2011: Eroding Protection and Rising Costs Underscore Need for Action*, The Commonwealth Fund, pub. 1648, vol. 31, December 2012, p. 2.

Health Savings Account

A tax-exempt trust or custodial account that a qualified individual may set up to pay or reimburse certain medical expenses in which they incur.

Publication 909, *"Main Content," Internal Revenue Service, 2011, http://www.irs.gov/publications/p969/ar02.html (accessed November 28, 2012).*

13.2.3.2 Operating Expense The expenses incurred by third-party payors are typically categorized as either *medical expenses*, also referred to as *medical losses*, or *administrative expenses*. *Medical* expenses may be defined as the expenses incurred by the third-party payor related to the provision of healthcare services to enrollees. The proportion of medical expense to total premium revenue is commonly referred to as the *medical loss ratio* (MLR). Under the ACA, third-party payors are required to have a *minimum MLR* in order to reduce third-party payor spending on activities that do *not directly benefit* enrollees, that is, *administrative tasks* and *profits*.[168] As set forth in the *MLR Final Rule*, published on December 2, 2011, certain *commercial third-party payors* are required to spend at least *80 percent* of insurance premiums on *medical care* and *healthcare quality improvement* in the *individual* and *small group markets* and 85 percent of premiums on these components in the *large group markets*, exclusive of administrative costs.[169] The MLR requirements do not apply to self-funded plans where the patient or the employer assumes the risk for medical care.[170] For more information on the MLR, see Chapter 4, "Competition."

The *MLR Final Rule* allows the secretary of HHS, through *the Center for Consumer Information and Insurance Oversight* (CCIIO), to adjust the MLR standard in states where it is determined that meeting the 80 percent MLR standard might destabilize the individual market. In order to qualify, a state must demonstrate that requiring its insurers to meet this standard

[168] "Patient Protection and Affordable Care Act," *Pub. L.* 111-148, 124 Stat 130 (March 23, 2010).

[169] "Medical Loss Ratio Requirements under the Patient Protection and Affordable Care Act," *Federal Register* 76, no. 235 (2011): 76574–76594.

[170] MLR requirements also do not apply to long-term care, dental, vision, or retiree health plans. Suzanne M. Kirchhoff and Janemarie Mulvey, "Medical Loss Ratio Requirements Under the Patient Protection and Affordable Care Act (ACA): Issues for Congress," Congressional Research Service, September 18, 2012, p. 4.

would decrease the availability of insurance plan choices for consumers.[171] As of February 2012 (when the last request was submitted), 17 states had applied for an adjustment to the MLR standard, as set forth in Table 13.13.

Administrative expenses for third-party payors may be defined as the *nonmedical related overhead expenses* necessary to the operations of the third-party payor. Typically, *administrative expenses* include, but are not limited to, (1) *claims adjustment expenses*, excluding depreciation; (2) *IS implementation expenses*, excluding depreciation; (3) *administration expenses*, excluding depreciation; (4) *depreciation for expenses*; (5) *case-management*; (6) *contracting*; and (7) *network development*. There is growing investor concern that these regulations may tend to create a *manufactured bottom line* by controlling the third-party payors' *administrative expenses*, that is, cash flow to the owners of third-party payors.

Uncertainty within the U.S. healthcare delivery system has resulted in an increased transactional marketplace, with larger third-party payor enterprises citing the ability to *spread costs over a larger membership* as a significant reason for consolidation. However, according to the *Sherlock Company*, as of 2012, only 19.4 percent of third-party payors reported that their *expenses* were affected by *economies of scale*.[172] The study further indicated that in 2012, there were five areas that had the potential to be significantly affected by economies of scale: (1) *other provider network management and services*, (2) *information systems operations and support services*, (3) *information systems application and maintenance*, (4) *audits*, and (5) *printing and mailroom services*.[173] While larger third-party payors typically offer lower *per member per month* (PMPM) rates ($30.15 for *larger third-party payors*, as compared to $32.78 for *smaller third-party payors*), the magnitude of this *economy of scale* varies based on *product mix*, that is, the types of plans offered by a third-party payor, and may not be as significant as *effective plan management*.[174]

Despite concerns among third-party payors and their investors that the ACA may significantly hinder their ability to maintain their current level of profitability, the *commercial healthcare third-party payor industry* has realized increased revenues in the post-ACA period, with revenues up by 10 percent from April 2011 to October 2012, as compared to 21 percent

Nickel, State of Wisconsin, February 16, 2012, p. 2.

TABLE 13.14 Third-Party Payor Current and Historical Operating Margins

Date	Operating Margin
3/2013	3.6%
12/2012	4.2%
12/2011	5.2%
12/2010	6.3%
12/2009	5.0%

Note: Data collected from Sherlock Company *PULSE* newsletters for the corresponding month and year.

during the same time period for all health third-party payors and significantly increased profitability, as displayed in Table 13.14.[175]

13.2.3.3 Capital Structure A consideration unique to healthcare third-party payor enterprises is the existence of *net worth requirements*, which mandate that third-party payors maintain *sufficient capital reserves* that would be available to pay for *outstanding* and *impending claims* based on "incurred liabilities, prior experience, and projections that assumed moderately adverse conditions."[176] These regulations vary by state and are designed to protect enrollees against a third-party payor's *insolvency.* See Chapter 3, "The Regulatory Environment."

States use various methodologies for establishing the *minimum regulatory capital levels* that third-party payors are required to maintain under the regulations of the states in which they operate (Statutory Reserves). One model, in use in 37 states (as of July 2010), uses as the basis for the minimum capital reserves the *risk-based capital (RBC) system*, developed by the *National Association of Insurance Commissioners* (NAIC).[177] The intent of the RBC is to "provide a capital adequacy standard that is related

[175] "Health Plan Dashboard," *Pulse*, September 2012, p. 1.

[176] General Accounting Office, *Private Health Insurance: Federal and State Requirements Affecting Coverage Offered by Small Businesses*, GAO-03-1133, September 2003, p. 28.

[177] Ibid., p. 39. The National Association of Insurance Commissioners (NAIC) is an accreditation and regulatory support organization operated by chief insurance regulators from all 50 states, the District of Columbia, and 5 U.S. territories. National Association of Insurance Commissioners, "FAQ," http://www.naic.org/documents/about_faq.pdf (accessed January 17, 2013).

to risk, raises a safety net for insurers, is uniform among the states, and provides regulatory authority for timely action."[178] The NAIC RBC system is developed to systematically assess the riskiness of the portfolio of assets held by the third-party payors as reserves against projected future *actuarial loss claims*. It is intended to limit the risk of insolvency among third-party payors by reducing the "*book value*" of reserves in accordance with the riskiness of the asset type. Risk considerations included in the NAIC's RBC calculation are:

1. **Asset risk—affiliates**, that is, "the risk of default of assets for affiliated investments";
2. **Asset risk—other**, that is, "the potential for default of principal and interest or fluctuation in fair value of assets";
3. **Underwriting risk**, in other words, "[that] medical expenses will exceed the premiums collected";
4. **Credit risk**, that is, an adjustment for the potential "beneficial effect of managed care arrangements in decreasing the fluctuations in medical expenses"; and
5. **Business risk**, in other words, an adjustment for instability resulting from poor controls of administrative expenses and medical expenses, based on "Administrative Expense Risk (variability of operating expenses), Non-Underwritten and Limited Risk (collectability of payments for administering third party programs), Guaranty Fund Assessment Risk and Excessive Growth."[179]

The RBC ratio is then calculated as the ratio of total capital to adjusted capital for the healthcare third-party payor. The median *RBC ratios* for third-party payors located in states that have adopted the RBC system are typically higher for those third-party payors with a greater number of assets, as indicated in Table 13.15.

Two other capital considerations that should be analyzed when assessing the capital structure of a healthcare third-party payor are (1) *incurred but not reported* (IBNR) *liabilities* and (2) *reported but not recorded liabilities*. IBNR typically consists of those expenses that have been *incurred* by a provider for services rendered to a patient covered by the third-party payor, for which a claim has yet to be submitted, that is, *reported*; see Chapter 14,

[178] National Association of Insurance Commissioners, "Risk-Based Capital: General Overview," July 15, 2009, http://www.naic.org/documents/committees_e_capad_RBCoverview.pdf (accessed January 17, 2013).

Payor Assets (in millions)	RBC Ratio	Number of Payors
Less than $10	1165%	269
$10 to $25	491%	99
$25 to $100	497%	217
$100 to $250	496%	132
$250 or More	639%	139
All Payors	606%	856

Private Health Insurance: State Oversight of Premium Rates, General Accounting Office, GAO-11–701, July 2011, p. 41.

"The Valuation of Tangible and Intangible Assets." Similarly, *reported but not recorded liabilities* refer to those claims that have been submitted by the provider but have yet to be processed for reimbursement by the third-party payor. To determine the *true net economic value* that may be attributed to a subject healthcare third-party payor, including the impact of any *IBNR* and *reported but not paid* liabilities, the valuation analyst may perform a *lag analysis* that considers such factors as (1) *time from date of service performed to receipt of claim*, (2) *provider contract rate changes*, (3) *service utilization trends*, and (4) *membership demographics and volumes*.

13.2.3.4 Market Rivalries and Competitors As indicated earlier in this chapter, the *commercial health insurance market* includes all non-Medicare and non-Medicaid *individual*, *group*, and *employer markets*.[180] Within the commercial market, groups may be classified by *membership size*, as (1) *individual*, (2) *small group* (2–50 members), (3) *mid-market* (51–5,000 members), and (3) *large case* (more than 5,000 members).[181]

While consolidation within a given market has the potential to result in larger enterprises with greater market power and may act as a *market entrance barrier* to emerging enterprises, provisions in the ACA provide for the establishment of ACOs, a new competitor to traditional third-party payors. In the employer-purchased insurance market, some employers have expressed concerns regarding a possible *domino effect*, whereby the

[180] James C. Robinson, "The Commercial Health Insurance Industry in an Era of Eroding Employer Coverage," *Health Affairs* 25, no. 6 (2006).

[181] Peter R. Kongstvedt, *Essentials of Managed Health Care*, 6th ed. (Burlington, MA: Jones and Bartlett Learning, 2013), p. 354.

increased market leverage of third-party payors resulting from *provider consolidation,* including *the formation of ACOs*, may result in *higher prices* for *private sector purchasers*.[182] In contrast, other employers view ACOs as a means of reducing *healthcare costs,* thereby making the provision of *health benefits to employees* more affordable, which has been a significant issue for small business owners as *healthcare premiums* have continued to rise.[183]

In 2010, there were 1,061 *life/health insurance enterprises* in the United States, including for-profit, not-for-profit, and government payors. Since 2010, there has been an increase in the number of transactions taking place among healthcare third-party payor enterprises. One result of this consolidation is that as of 2012, there were only 38 Blue Cross and Blue Shield enterprises, covering nearly 100 million individuals. A 2012 study by the American Medical Association examined competition in health insurance markets across the United States and found that the majority of commercial health insurance markets in the United States are highly concentrated. Two recent attempts to consolidate were closely scrutinized and, as a result, canceled by one of the companies, including a 2010 Blue Cross Blue Shield of Michigan and Physicians Health Plan of Mid-Michigan merger. Recent consolidation attempts have been more closely analyzed. Coupled with other market conditions, including insurer profitability, lower scope of benefits, and high barriers to entry, a 2012 AMA study suggests that health insurers have been exercising increasing market power and, in turn, "causing competitive harm to consumers and providers of care."[184] In considering the competitive environment, the valuation analyst should be concerned with

[184] American Medical Association, "Competition in Health Insurance: A Comprehensive Study of U.S. Markets," 2012, pp. 4, 9.

the ability of the subject third-party payor enterprise to achieve its projected level of revenue. Anticipated changes in the competitive market may lead the valuation analyst to project future revenues significantly different from the historical performance of the subject third-party payor. Further, uncertainty regarding the future competitive environment within which the subject third-party payor will operate may tend to increase the investor's perception of risk and thereby drive up the *required rate of return*, resulting in a lower indicated value.

13.2.3.5 Scope of Services As discussed in Section 4.5.1, "Intermediary Role of Insurance," in Chapter 4, "Competition," third-party payors perform an intermediary function between consumers and providers of healthcare services by managing the purchase of and payment for healthcare services, through the credentialing of provider panels, negotiation of provider reimbursement, and coordination of wellness and case management programs in the provision of healthcare coverage to consumers. The scope of services provided by third-party payors may be described by the range of insurance products provided to enrollees, beneficiaries, and employers. As discussed earlier, these products include HMOs, PPOs, POS, EPOs, Indemnity Insurers, HSAs and other high deductible plans, as well as Medicare Advantage and Medicaid Advantage and other supplemental plans. Commercial third-party payors may also provide administrative-only services (ASOs) to MCOs and other healthcare payors.

Third party payors have increasingly been venturing into the provision of clinical services, opening *retail clinics* and *other sites of care*. Under this scenario, the value of the clinical portion of the healthcare third-party payor enterprise would also need to be, in most instances, separately appraised, as it involves a significantly different *market* and

COVERAGE GAP

In a consumer-directed health plan, on a patient's HSA being extinguished, the coverage gap is the high deductible amount paid out of pocket by the patient before his or her health insurance will begin reimbursing for healthcare services.

"Consumer-Driven Health Care: What Is It, and What Does It Mean for Employees and Employers?" by Song G. Yi., Bureau of Labor Statistics, October 25, 2010, http://www.bls.gov/opub/cwc/cm20101019ar01p1.htm (accessed November 2, 2012).

financial environment in regard to *reimbursement*, *regulatory*, *competition*, and *technology.*

13.2.3.6 Subject Entity–Specific/Nonsystematic Risk While an investor in a particular *third-party payor enterprise* would have additional investment opportunities available to him or her (e.g., government bonds, equity indexes), the discount rate used to determine the present value of the expected future net economic benefits accruing to the owners of a subject supply side enterprise should also include a consideration of the *idiosyncratic risk* associated with an investment in the specific subject third-party payor enterprise.[185] This *subject entity–specific/nonsystematic (idiosyncratic) risk* for *third-party payor enterprises* would include the *various risk factors* that are *inherent and specific to the enterprise* being valued, as well as the *enterprise's operational performance* compared to the *most probable* performance of similar enterprises as reported in normative industry benchmark survey data. *Subject entity–specific/nonsystematic risk factors* for most *third-party payor enterprises* include, but are not necessarily limited to,

1. Competitiveness of the subject third-party payor's premium rates;
2. The diversification of enrollment/covered lives for the subject third-party payor;
3. The diversification and size of the third-party payor's provider network;
4. State and local regulatory oversight unique to the geographic region within which the subject third-party payor operates;
5. The utilization of healthcare information technology, for example, care mapping, case management, and executive decision support systems; and
6. Uncertainty regarding the profitability of the specific patients covered by the ACA's *individual mandate* who may constitute a significant source of new *covered lives* for the subject third-party payor enterprise.

13.2.4 Other Pertinent Valuation Considerations

Each of the three recognized valuation approaches (i.e., income, market, and asset/cost) may be applicable to the valuation of third-party payors. The valuation analyst should determine which methodologies to employ in developing his or her indication of value after careful considerations of the *scope of the engagement*, the *level of value desired*, and the *availability* of data and information to support the analyst's conclusion. Table 13.16 illustrates some of the other pertinent considerations related to the valuation of third-party payors.

[185] See Chapter 9, "Costs and Sources of Capital," for a more detailed discussion of discount rates.

TABLE 13.16 Other Pertinent Considerations Related to the Valuation of Third-Party Payors

Pertinent Considerations	Description
Economies of Scale	▪ *Distribution of* ***Actuarial Risk***. Healthcare payors with larger pools of beneficiaries, can distribute the *medical loss risk* across greater numbers of *beneficiaries*, which, depending on the *risk profile* of the pool of beneficiaries, may lower the *per beneficiary* expense. ▪ Size also generates *leverage* for the healthcare payor when bargaining with *providers* for reimbursement rates. Providers may be more willing to accept *price concessions* if they anticipate greater patient volumes from an association with a healthcare payor.
Adverse Selection	▪ *"**Adverse selection** occurs when different groups of people have different intrinsic probabilities of sustaining losses, but the . . . [healthcare payor] . . . cannot distinguish between one group [and] another."*[*] ▪ May arise under circumstances where those individuals with the lowest anticipated costs choose to *self-insure* rather than join the *risk pool* of *covered beneficiaries* of the healthcare payor. ▪ As a result, the *pool* of covered beneficiaries is relatively *riskier* than the population in general and the premiums required to offset this excess risk may therefore be greater.
Moral Hazard	▪ *"**Moral hazard** occurs when the policy holder can take steps to reduce his or her probability of loss, but the insurance company cannot distinguish between loss due to carelessness and loss due to a random event which the policy holder could not have prevented."*[†] ▪ A consequence of this concept is that an individual may be more likely to engage in *riskier* behavior as a result of receiving coverage from a healthcare payor and therefore the anticipated expenses related to the beneficiary may be greater when coverage is extended.
Selection of Methodology	▪ *Income-based approaches* are commonly used to value healthcare payors that are capable of producing *sufficient net economic benefit* to support the assets, both *tangible* and *intangible*, of the subject enterprise. ▪ *Market-based approaches* are also used in the valuation of healthcare payors, often in addition to *income-based approaches*. ▪ Numerous publicly traded healthcare payors are available to the valuation analyst to form the basis of a value indication using the *Guideline Public Company Method*.

Pertinent Considerations	Description
	■ Market transaction data may also be available to the valuation analyst to use in employing the *Guideline Transaction/Merged and Acquired Method*. ■ Asset/Cost-Based Approaches may also be employed in the valuation of a healthcare payor. However, the *Asset/Cost-based approaches* may fail to reflect the entirety of the *intangible* asset value of the enterprise, particularly if the enterprise is capable of producing significant *net economic benefit* accruing to the owners of the enterprise
Affordable Care Act	■ Any *modifications* to the ACA, for example, changes to the *minimum MLR*, may have a *material* impact on the profitability of healthcare payors and may affect the value indication determined by the valuation analyst. ■ An increased *required rate of return* may be necessary to reflect the *uncertainty* generated by the possibility of modifications to the ACA.

13.3 SUPPLY SIDE ENTERPRISES

Healthcare-related supply side enterprises provide medical supplies to healthcare enterprises providing healthcare services to patients. These supplies can range from tongue depressors to pharmaceuticals to high-end surgical machines. Supply side enterprises may be classified into two types: (1) the *manufacturers* that *build*, and in many cases *distribute*, supplies (e.g., *medical equipment sellers* and *lessors)*; and (2) enterprises that take advantage of *economies of scale* to negotiate better prices for their healthcare provider members (e.g., *group purchasing organizations*). Numerous independent suppliers exist within the healthcare industry, including:

1. Medical consumables suppliers, that is, bandages, gauze, needles, and so on;
2. Durable medical equipment suppliers;
3. Used medical equipment companies; and
4. Office equipment vendors.

While healthcare providers may *independently* contract with suppliers, the greatest portion of medical supply expenditures originates from *GPOs*

Group Purchasing Organization

Purchasing agents that negotiate contracts for the purchase of medical goods and services on behalf of their members, which generally consist of healthcare provider organizations.

An Analysis of Group Purchasing Organizations' Contracting Practices under Antitrust Laws: Myth and Reality, *by Robert Bloch, et al. Mayer, Brown, Rowe & MAW, October 2003, http://www.ftc.gov/ogc/healthcarehearings/docs/030926bloch.pdf (accessed November 28, 2012).*

Durable Medical Equipment

Durable medical equipment (DME) is medical equipment designed to improve the quality of life of patients with illnesses or injuries and must be able to withstand repeated use; primarily serve a medical purpose; and generally not be useful to a person lacking an injury or an illness.

"Durable Medical Equipment Payment System," MedPAC, October 2011, http://www.medpac.gov/documents/MedPAC_Payment_Basics_11_DME.pdf (accessed November 5, 2012).

and *medical equipment leasing and sales enterprises* (see Section 11.1.7.8, "Cost Reduction Methods," in Chapter 11, "Inpatient Enterprises"). Accordingly, while other supply side enterprises exist, for example, *independent suppliers*, the scope of this chapter focuses on these significant types of enterprises.

13.3.1 Medical Equipment Leasing and Sales Enterprises

The demand for *medical equipment* and *devices* by hospitals and providers continues to rise, due to rapidly developing *technological advancements* and the *increased utilization* of healthcare services by the aging *baby boomer* population. At the same time, the number of *medical equipment and device suppliers* has been decreasing at a rate of approximately 5.5 percent per year during the last five years, resulting in approximately 828 companies in the United States as of 2012. This decline may likely be due, in part, to *consolidation* and *vertical integration* within the medical equipment and

device industry, with large firms expanding their *product lines* by purchasing small *niche technology* providers.[186]

Some types of medical equipment and devices are typically *leased* by healthcare providers, rather than being purchased, including *office equipment*, as well as new, and often expensive, *major medical equipment*.[187]

As of 2010, there were 3,002 enterprises engaged in the *sale* or *lease* of *medical equipment and supplies* that generated revenues of approximately $2.9 billion. Some of the largest companies in this industry included *Apria Healthcare Group, Inc.*, *Rotech Healthcare Inc.*, *Universal Hospital Services*, and *Hill-Rom Co., Inc.*[188] A separate discussion of the durable medical equipment supplier industry is provided in Chapter 12, "The Valuation of Outpatient Enterprises."

The *used medical equipment and devices* market (i.e., medical equipment and devices being sold or leased to patients in contrast to providers) consists of (1) hospitals and other healthcare providers reselling outdated equipment and (2) medical equipment manufacturers selling *used* equipment and devices on an "*as is/where is*" basis, in which the *purchaser* takes

Factoid

Almost half of U.S. medical supplies and equipment are imported from only four countries: 17 percent from Mexico, 15 percent from Ireland, 9 percent from Germany, and 8 percent from China.

"Reliance on Overseas Manufacturers Worries Supply Chain Experts," by Haydn Bush, Hospitals & Health Networks*, July 2011, http://www.hhnmag.com/hhnmag/jsp/articledisplay.jsp?dcrpath=HHNMAG/Article/data/07JUL2011/0711HHN_Inbox_supplychain&domain=HHNMAG (accessed November 27, 2012).*

on the *financial risk* of the machine *malfunctioning*.[189] As stated in a recent article published by the *Healthcare Financial Management Association*, the resale of *used medical equipment* may be a profitable way for many *original equipment manufacturers* (OEMs) and *lessors* to recoup a portion of their *initial capital investments* by reselling equipment returned to them following the completion of a lease.[190] In this scenario, OEMs are typically responsible for the *refurbishing process* of the equipment, which includes (1) *selecting* the *optimal equipment* to be *refurbished*, (2) *de-installing* the equipment from the lessee's location (e.g., *cleaning*, *replacing* parts, *updating* software), (3) *customizing* the system to the client's needs, and (4) professionally *installing* the *refurbished equipment* at the new lessee's location.[191]

13.3.2 Group Purchasing Organizations (GPOs)

Group Purchasing Organizations (GPOs) are enterprises that *negotiate* contracts for the *purchase* of medical *goods* and *services* on behalf of their healthcare provider members, which typically consist of *health systems*, *hospitals*, and *nursing homes*. GPOs may be generally classified into two basic types: (1) *Integrated Health Networks* (IHNs) and (2) *Voluntary GPOs*.

GROUP PURCHASING

Group purchasing allows healthcare provider enterprises to consolidate and leverage their purchasing power to purchase goods and services at lower prices from suppliers.

[189] Siemens, "From Used Medical Equipment to Proven Excellence Quality," http://www.medical.siemens.com/webapp/wcs/stores/servlet/LandingPage~q_catalogId~e_-1~a_catTree~e_100010,1007660,1010354~a_Identifier~e_~a_langId~e_-1~a_pageId~e_143481~a_storeId~e_10001.htm (accessed November 7, 2012); Jeffrey Gren, "Pre-Owned Medical Equipment: Regulation & Markets," U.S. Department of Commerce, Regulation and Supply of Refurbished Medical Devices, 9th Global Harmonization Task Force Conference, May 15, 2002.

Factoid

Ninety-seven percent of all not-for-profit and nongovernment hospitals participate in group purchasing.

"A Primer on Group Purchasing Organizations: Question and Answers," Healthcare Supply Chain Organization, http://c.ymcdn.com/sites/www.supplychainassociation.org/resource/resmgr/research/gpo_primer.pdf (accessed November 8, 2012).

IHNs consist of *affiliated* hospitals and healthcare facilities, which have increasingly been performing their own group purchasing functions since 1991, while *Voluntary GPOs* are made up of *unaffiliated* hospitals, each of which maintains its *independent status* but "engages in particular joint activities with other member hospitals through the hospital organization, including group purchasing."[192] Historically, GPOs have been successful in using *product management* and *volume aggregation* techniques to obtain lower prices than their members could achieve by purchasing supplies individually and have, accordingly, become more popular as healthcare providers continue to face *cost pressures* from rising healthcare expenditures.[193]

As of 2013, there were approximately 620 enterprises participating in some form of group purchasing activity, accounting for more than 12,000 member institutions.[194] However, only 30 *group purchasing enterprises* were classified by the *Healthcare Supply Chain Association* (HSCA) as "*true GPOs, that negotiate sizeable contracts for their members*" as of 2011. In contrast to "true GPOs," the remaining organizations typically offer members access to larger contracts and negotiate *regional* vendor contracts.[195]

TABLE 13.17 M&A Transactions in the GPO Sector

Year	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
# Deals	3	1	1	3	5	7	6	2	2	2	5

"The Health Care M&A Report: Fourth Quarter 2012," by Irving Levin Associates, Inc., "Health Care M&A Monthly" (Norwalk, CT: Irving Levin Associates, Inc., 2012), pp. 73, 78, 176.

Currently, the GPO industry is extremely consolidated, with the six largest GPOs accounting for 90 percent of the market revenue in 2007. As of 2012, the six largest GPOs, as measured by *annual purchasing volume*, were (1) *MedAssets*, (2) *Novation LLC*, (3) *Premier, Inc.*, (4) *HealthTrust Purchasing Group*, (5) *Amerinet, Inc.*, and (6) *PDM Healthcare*.[196]

13.3.3 Current and Future Trends: Regulatory, Reimbursement, Competition, and Technology

13.3.3.1 Regulatory GPOs can be compensated by either the *suppliers* or the *healthcare provider enterprise*. Anti-kickback provisions in federal and state regulations are applicable to GPOs. Contracts involving GPOs should be carefully constructed to avoid the perception of any unsubstantiated payments between the GPO and the healthcare providers they serve. Of note is that a "*safe harbor*" may be available to GPOs under the federal *Anti-Kickback Statute*, which applies to "any amount paid by a vendor of goods or services to a person authorized to act as a purchasing agent for a group of individuals or entities who are furnishing services reimbursed under a Federal health care program."[197] In addition, in 2005, nine GPOs formed the *Health Group Purchasing Industry Initiative* (HGPII), a private organization responsible for monitoring the daily activities of its member GPOs in order to promote *best practices* and *public accountability*.[198] Through *HGPII*, GPOs are self-regulated, and each of the current 11 members (as

[196] "GPO Facts and Figures: GPO Headliners 2012," *Healthcare Purchasing News*, http://www.hpnonline.com/resources/GPOs.html (accessed December 14, 2012).

[197] "Criminal Penalties for Acts Involving Federal Health Care Programs," 42 USC § 1320a-7b(b)(3)(C), March 23, 2010. See Section 13.2.3.1, "Revenue Stream," in this chapter and Section 3.3.1, "Anti-Kickback," in Chapter 3, "Regulatory Environment."

[198] "Letter from GAO to the U.S. Senate regarding Group Purchasing Organizations: Federal Oversight and Self-Regulation," by Linda T. Kohn, director of Healthcare, U.S. Government Accountability Office, to Herb Kohl, chairman, U.S. Senate and Charles E. Grassley, Ranking Member U.S. Senate, GAO-12-399R, March 30, 2011, p. 8.

of October 2011) is required to submit accountability reports describing its contracting practices and other purchasing policies.[199]

In 2001, HealthTrust Purchasing Group (HPG), a GPO with $3.3 billion in contracting volume, signed an exclusive participation agreement with the publicly traded Health Management Associates (HMA), a 37-facility operator of nonurban acute care hospitals in Tennessee, which also established HMA as an equity partner in HPG.[200] Consequently, HPG may now be subject to the tighter regulatory scrutiny that is typically unique to healthcare providers.

As discussed in Chapter 3, "Regulatory Environment," both the Stark Law and the anti-kickback prohibitions are applicable in situations where there may exist a referral relationship between the lessor and the lessee. Before rendering an opinion of value, the valuation analyst needs to review payments made between the parties to ascertain whether they exceed *fair market value*, which may be construed as a *legally impermissible transaction*.

13.3.3.2 Reimbursement GPOs act as *middle men* between healthcare provider enterprises and their vendors. A typical GPO enters into a contract with a vendor to provide certain products to a healthcare enterprise that is a member of the GPO. GPO revenues are derived from *administrative fees* negotiated with the vendor to allow the vendor access to the GPO's members. After amounts necessary to cover operating expenses and to fund new operations for the GPO have been deducted, some portion of this *administrative fee* may be shared with the healthcare enterprises that are members of the GPO, and the remainder is used. The *administrative fee* is typically based on a *percentage* of the purchases of the GPO member healthcare enterprises and is received by the GPO at the time the individual purchases are made.[201]

Medical reimbursement revenues for *medical equipment leasing and sales enterprises* are typically provided for in the *lease* or *sales contract*. Draft lease agreements will typical itemize the specific terms of the arrangement, including:

1. Identification of the equipment to be provided by the leasing company;
2. Terms related to the delivery and installation of the equipment;

---

[199] Ibid., pp. 11–12.

[200] Hospital Corporation of America, "HealthTrust Purchasing Group Signs an Exclusive Agreement with Health Management Associates," May 23, 2001, http://phx.corporate-ir.net/phoenix.zhtml?c=63489&p=irol-newsArticle_pf&ID=561223&highlight= (accessed January 28, 2013).

[201] GAO, "Group Purchasing Organizations: Services Provided to Customers and Initiatives Regarding Their Business Practices," August 2010, pp. 6–7.

3. Terms of any maintenance agreements included with the lease agreement;
4. Lease payment amounts;
5. The timing of payments;
6. The term of the contract;
7. Terms related to early termination of the lease, that is, termination fees; and
8. Terms for the return or sale of the equipment at the expiration of the lease.

Sales contracts will similarly be constructed, specifying (1) the specific assets to be transferred, (2) the amounts to be paid for the assets, and (3) arrangement for the delivery of the purchased assets.

13.3.3.3 Competition The number of existing medical equipment suppliers has decreased at a rate of approximately 5.5 percent per year since 2008; this is most likely the result of the growing amount of medical supply purchases being conducted through GPO contracts, for example, 90 percent of hospital purchases were made through the collective volume of the nation's six largest GPOs.[202] This period of decrease in supply side enterprises represents a diminution in the competition in the supply side enterprise industry.

The healthcare industry, which accounted for 7.0 percent of all new business volume in equipment financing in 2011, is expected to grow in that:

> *80% of healthcare companies say they are very likely (57%) or likely (23%) to make a significant acquisition of medical equipment.*[203]

[202] Yair Holtzman, "The U.S. Medical Device Industry in 2012: Challenges at Home and Abroad," Medical Device and Diagnostic Industry, July 17, 2012, http://www.mddionline.com/article/medtech-2012-SWOT (accessed November 7, 2012); U.S. Government Accountability Office, "Group Purchasing Organizations: Services Provided to Customers and Initiatives Regarding Their Business Practices," GAO-10-738, August 2010, p. 4, citing Eugene Schneller, "The Value of Group Purchasing—2009: Meeting the Needs for Strategic Savings," *Health Care Sector Advances, Inc.*, April 2009, https://www.novationco.com/media/industryinfo/value_of_gpo_2009.pdf (accessed November 8, 2012); U.S. Government Accountability Office, "Group Purchasing Organizations: Services Provided to Customers and Initiatives Regarding Their Business Practices," GAO-10-738, August 2010, p. 4.

[203] Equipment Leasing and Finance Association, "Fact Sheet: Equipment Finance in the *Medical Equipment Industry*," http://www.elfaonline.org/Research/PDFs/EMA/FactSheetMedicalAug2012.pdf (accessed April 15, 2012), August 2012, p. 1; Forbes Insights, *U.S. Capital Goods and Equipment Financing Outlook: A Focus on Essential Acquisitions*, New York, 2012, p. 2.

As a result of this growth in demand, there may be new entrants into the medical equipment leasing and sales industry, reflecting a growing intensity in the competitive market.

13.3.3.4 Technology The struggle of many of the U.S. healthcare delivery system's providers to fund *emerging technologies* in the current capital environment can be attributed to several factors, including:

1. The indefinite duration of the recovery from the recent economic downturn;
2. The sluggish rebound of the capital investment market to prerecession levels;
3. The uncertainty surrounding the ultimate impact of *healthcare reform*; and
4. Continuing reimbursement and cost containment pressures.[204]

However, recent data suggests that many healthcare provider enterprises are still committed to *capital spending*, and many remain confident that they will be able to secure funding for future projects, including those related to new medical technology systems, which will likely result in a continued demand for resources provided by GPOs and other medical suppliers.[205]

Technological advancement affects both the operations and the product lines offered by many medical equipment leasing and sales enterprises. Information technology advances allow for the efficient management of client lease contracts and the *real-time* monitoring of inventory by these firms, allowing for expanded operations without compromising their *span of control.*

13.3.4 Value Drivers for Supply Side Enterprises

The ability to negotiate and sustain contracts with large healthcare systems may perhaps be the most significant value driver for GPOs. The mutually beneficial relationship between healthcare providers and GPOs creates a significant value driver, as additional healthcare providers contracting with GPOs create greater *group purchasing bargaining power* and, accordingly, lower prices to the healthcare provider.

For medical equipment and device suppliers, a primary *value driver* may be the ability to patent *medical devices* and *equipment*, particularly

[204] Karen Minich-Pourshadi, *2011 Capital Spend: EMR Dominates Budgets*, HealthLeaders Media Intelligence Report, March 2011, p. 3.

[205] Ibid., pp. 8, 11.

those that are unique and have few substitute products. Medical devices and equipment are *required* to have *approval* from the FDA prior to *commercialization*, either through sales or leases. FDA approval can act as a significant barrier to entry for healthcare suppliers, and the future economic benefit from any patent cannot be realized until *after* the approval is gained from the FDA. Because a healthcare supplier can typically control the price at which it will sell its product, and the population of potential customers is typically well known, gaining FDA approval removes the single largest source of uncertainty related to the future economic benefit to be derived from ownership of the patent, and, as such, FDA approval of a product is a significant value driver for healthcare suppliers.[206]

In addition, a healthcare enterprise, historically, was capable of financing large equipment–related capital expenditures through lease arrangements without the requirement to *book* the liability on the enterprise's balance sheet. The trend toward convergence between the U.S. generally accepted accounting procedures (GAAP) and the international financial reporting standards (IFRS) may eliminate this perceived "*off balance sheet*" benefit to lease financing, in contrast to outright purchasing of medical equipment and devices.[207]

Value drivers that may be attributable to healthcare supply side enterprises include (1) *Scope of Services*, (2) *Capacity*, (3) *Revenue Stream*, (4) *Operating Expense*, (5) *Capital Structure*, (6) *Suppliers*, (6) *Market Rivalries and Competitors*, and (7) *Subject Entity Nonsystematic Risk*.

13.3.4.1 Scope of Services While GPOs and medical equipment sales and leasing companies have a distinct scope of services, each may benefit from the *ability to diversify* the services offered, which has the potential to reduce risk, particularly considering the *rate of technological advancement* in the healthcare industry. This *diversification benefit* should be considered against the offsetting capital costs required to expand their scope of services, which may be a particular concern for medical sales and leasing companies if they are not *middle men* but are also the *manufacturers* of the products they sell.

13.3.4.2 Capacity The *capacity* of a *supply side enterprise* may be defined as the *availability* of those *resources* needed to manage customer demands and is an important consideration for the appraisal of a *healthcare supply enterprise*. Resources applicable to supply side enterprises may include

[206] A more in-depth discussion of the valuation of patents can be found in Section 14.4.2.3.4, "Patents," in Chapter 14, "The Valuation of Tangible and Intangible Assets."

[207] See Section 8.1.1.2.1.3, "Operating versus Capital Leases," in Chapter 8, "Valuation Approaches and Methods," for a fuller discussion of accounting standards regarding leases.

(1) *raw materials*, (2) *manufacturing equipment*, (3) *building and office space*, and (4) *support staff*. Accordingly, the valuation analyst, in completing his or her *due diligence*, should ensure that an enterprise has *sufficient resources* to generate the projected revenues for the subject enterprise, as well as to meet customer (i.e., provider) demands. A shortage of capacity may impinge on the supply side enterprise's growth potential, which may adversely affect the valuation analyst's volume and revenue projections. Also, excessive unused capacity may indicate inefficient use of resources and may result in the enterprise incurring unnecessary expenses, reducing its profitability.

13.3.4.3 Revenue Stream Healthcare suppliers, such as GPOs, typically derive their revenues from the following sources:

1. *Contract administration fees* (CAFs) from manufacturers/vendors;
2. *Membership fees* from member providers;
3. *Administrative fees* from authorized distributors to distribute products under the GPOs' contracts; and
4. *Miscellaneous service fees*.[208]

The *CAFs* earned from vendors, which are typically based on a *percentage of dollars spent* by their hospital and health system clients, are the primary source of revenue of GPOs. These vendors typically pay *administrative fees* to GPOs, as well as provide their products at *discounted prices*, as GPOs provide vendors with a single access point to all of the GPO's clients, thereby allowing these vendors to reduce their marketing, sales, and overhead expenses related to the *negotiation* and *management* of contract terms within *a highly fragmented provider market*.

The terms of CAFs can vary greatly, depending on the individual contract negotiated with each vendor, and are typically based, in part, on the level of the provider's total expenditures on products purchased through the GPO contract. However, it should be noted that a GPO does not always retain the entire amount of the CAF; for example, in some circumstances, the GPO *shares*, or *distributes* a portion of, these payments with its hospital and health system clients as refund payments conditioned on the achievement of certain performance targets, measured by *provider supply savings*.

In 2008, the average CAF paid by vendors, weighted by purchasing volume, ranged from 1.22 percent of customer purchases to 2.25 percent of

[208] Qiaohai (Joice) Hu, Leroy B. Schwarz1, and Nelson A. Uhan, "The Impact of Group Purchasing Organizations on Healthcare-Product Supply Chains," *Manufacturing & Service Operations Management* 14, no. 1 (Winter 2012): 3.

purchases.[209] As many CAFs account for the *value and volume of services provided* by a vendor, in order to operate in compliance with the federal Anti-Kickback Statute, many GPOs seek to meet the requirements of the established "*safe harbor*" for GPOs under the Anti-Kickback Statute, which necessitates that (1) there is a *written agreement* between the GPO and each of its customers that specifies either that the vendor will pay a fee of no more than *3 percent of the purchase price of goods or services provided* or that each vendor will pay a *fixed sum* or *percentage* of the value of purchases made by provider members under the contract between the vendor and the GPO; and (2) if any entity participating in the arrangement is a provider of healthcare services, the GPO must disclose, in writing, annually, to the provider of healthcare services and to HHS, the amount received from each vender related to purchases.[210]

It is important for the valuation analyst to review the GPO's contracts with both the *manufacturers/vendors* and *provider clients*, as well as to examine *provider clients' purchasing trends*, in order to accurately project the *revenue* of the subject GPO. In addition to trending historical purchases, the valuation analyst should consider the changes in utilization demand related to a given product(s), for example, *capital and regulatory requirements* related to certain medical equipment may determine which providers purchase (or lease) various types of equipment or supplies.

13.3.4.4 Operating Expense Operating expenses for GPOs are primarily administrative and generally fixed, at least over the short run. Included among these expenses may be costs related to (1) developing *new* healthcare enterprise members, (2) developing *vendor contracts*, or (3) *maintenance* and *monitoring* of existing vendor contracts. A useful metric for evaluating operating expenses for GPOs may be to consider costs on a *per contract* basis, which allows for comparisons of enterprises, regardless of size. If *economies of scale* exist in the GPO industry, then it would be anticipated that larger GPOs would have lower *per contract* expenses.

Medical equipment leasing and sales enterprise expenses are largely determined by the nature of the enterprise under consideration. Enterprises solely involved in sales and the leasing of equipment will have different cost considerations than enterprises that are also involved in

---

[209] U.S. Government Accountability Office, "Group Purchasing Organizations: Services Provided to Customers and Initiatives Regarding Their Business Practices," GAO-10-738 (U.S. Government Accountability Office: Washington, DC, August 2010), p. 11.

[210] "Exceptions," 42 CFR § 1001.952(j) (2009).

the manufacture of the equipment. Operating expenses for enterprises' strictly provided leasing and sales services would be centered on the *cost of goods sold* (or *leased)*, as well as the *marketing* and *sales* expenses related to *identifying* and *contracting* with *potential customers*, and may be similar to other retail operations. Those medical equipment leasing and sales enterprises that include the manufacture of the products sold, conversely, will have operating expense more similar to traditional manufacturing firms, including expenses related to *property, plant, and equipment*.

13.3.4.5 Capital Structure GPOs and medical equipment leasing and sales enterprises are service-oriented organizations and would be expected to have capital structures similar to other service-oriented enterprises. As such, they may require less investment in *physical capital*, such as *machinery and equipment*, than other enterprises whose focus is in the *nonservice arena*. This may indicate that these enterprises will be financed largely through *equity*. However, the extent of capital investment may be dependent on the nature of the supply side enterprise's operation, for example, supply side enterprises that do not rely on *just in time* (JIT) inventory methods may require greater levels of capital related to warehouse expenses than other enterprises do. Greater levels of capital demand may act to increase financing costs for some enterprises, which may limit their access to capital markets and may be reflected in their capital structures.

In addition, the high levels of consolidation within the GPO market during the last decade may have necessitated some GPOs accessing *debt markets* to finance acquisitions, and their capital structure may reflect the increased use of *debt*. Also, medical equipment leasing and sales enterprises that engage in the manufacture of the equipment may have significantly different physical capital requirements and may therefore have capital structures more reflective of the manufacturing industry.

13.3.4.6 Suppliers As mentioned earlier, GPOs do not *purchase equipment* for providers but rather *contract* with suppliers in order to establish discounts for providers. Often, *medical equipment leasing and sales enterprises* will be the *OEM* and are the origin of the healthcare *supply chain*. As a manufacturer, *medical equipment leasing and sales enterprises* will likely contract with suppliers of those *raw materials*, or *components of a product* that are required for assembly, as well as with suppliers of the *manufacturing* and *fabricating equipment* used to assemble a product. Alternatively, *used equipment dealers* may either *resell* or *lease* equipment that has been returned to them at the completion of a lease or *purchase*

used equipment for the purpose of *reselling* or *leasing* it. Unlike medical equipment lessors, office equipment vendors are rarely the OEMs of office supplies, furniture, and equipment. The *depth of management* of supply side enterprises may provide efficiencies for their enterprises through *supply chain management*, which may provide market leverage when negotiating *supply chain contracts* (e.g., materials, components, and manufacturing equipment). This *depth of management*, to the extent that it produces a market advantage, may enhance the value of a *medical equipment leasing and sales enterprise*.

13.3.4.7 Market Rivalries and Competitors The market reach for GPOs is significantly widespread, as 96 percent of all acute care hospitals and 98 percent of all community hospitals contract with at least one GPO. In addition, 97 percent of all *not-for-profit* and *nongovernment hospitals* participated in *group purchasing*.[211] In 2010, approximately 72 percent of *community hospitals* (3,595 hospitals) had a GPO affiliation.[212] In 2009, approximately 72 percent of all non–labor related hospital purchases were transacted through GPO contracts.[213]

In recent years, competition in the GPO market has been altered through increasing consolidation with the merger of some of the larger GPOs, leading to a diminution of the intensity of competition. For example, in 2007, Consorta, a resource management firm catering to *nonprofit* and *faith-based health systems*, became an equity owner in HealthTrust Purchasing Group (HealthTrust), which took over the purchasing services for Consorta.[214] In addition, in 2010, MedAssets purchased the Broadlane Group, which increased the purchasing volume of MedAssets from approximately $24 billion in 2009 to $45 billion in 2011.[215]

[213] U.S. Government Accountability Office, "Group Purchasing Organizations," GAO-13-399R, March 30, 2012, p. 4; citing Healthcare Supply Chain Association, *Frequently Asked Questions* (accessed December 14, 2011), http://www.supplychainassociation.org/?page=FAQ (accessed November 8, 2012).

[214] Company Profile, http://www.healthcaregpoii.com/signatorycompanies/consorta.html (accessed March 20, 2013).

[215] U.S. Government Accountability Office, "Group Purchasing Organizations: Federal Oversight and Self-Regulation," GAO-12-399R, March 30, 2012, p. 5.

As was noted earlier, medical equipment leasing may be construed as an alternative form of asset purchase financing. With the amending of the Bank Holding Act by the U.S. Congress, banks were allowed to own holding companies, which included equipment leasing companies.[216] This opened the equipment leasing market to new, well-financed entrants. In developing an indication of value for a medical equipment leasing and sales enterprise, the valuation analyst should consider all alternative sources of equipment financing available to a healthcare enterprise when assessing the competitive environment.

13.3.4.8 Subject Entity Nonsystematic Risk While investors in a particular *supply side enterprise* would have additional investment opportunities available to them (e.g., government bonds, equity indexes), the discount rate used to determine the present value of the expected future net economic benefits accruing to the owners of a subject supply side enterprise should also include a consideration of the idiosyncratic risk associated with an investment in the specific subject supply side enterprise.[217] This *subject entity–specific/nonsystematic (idiosyncratic) risk* for *supply side enterprises* would include the *various risk factors* that are *inherent and specific to the enterprise* being valued, as well as the *enterprise's operational performance* compared to the *most probable* performance of similar enterprises as reported in normative industry benchmark survey data. *Subject Entity–Specific/Nonsystematic Risk Factors* for most *supply side enterprises* include, but are not necessarily limited to:

1. The *uncertainty related to the continuity of the projected revenue stream*, based on the *probability of achieving the projected productivity volume*, and the efficacy of the *projected reimbursement yield* used in the analysis;
2. The *risk related to the probability of achieving industry-indicated operational and financial benchmarks* used in the analysis;
3. The *competitive marketplace* within which the supply side enterprise operates;
4. The *historical operations* of the freestanding outpatient enterprise *in comparison to the industry benchmarks*;
5. The underlying stability of the current contracts in use by the *supply side enterprise*;

[216] Amy Miller Holmes, "The History of Equipment Leasing," CAE, Equipment Leasing Association, 2003.

[217] See Chapter 9, "Costs and Sources of Capital," for a more detailed discussion of discount rates.

6. The remaining duration of lease agreements and current clients' payment history for the subject *supply side enterprise*; and
7. The risk of obsolescence of the technology mix currently leased by a specific *supply side enterprise*. An enterprise with aging and outdated leasable assets may require significantly greater future capital investment in comparison to an enterprise with more *up-to-date* equipment.

13.3.5 Other Pertinent Valuation Considerations

The approaches used to value *GPOs* will likely be similar to those used for *a management service enterprise* (see earlier), as the services offered by both types of enterprises are primarily *administrative* in nature. However, the valuation of *medical equipment leasing and sales enterprises*, particularly those operating as *original equipment manufacturers* (OEMs), may be more similar to a *manufacturing enterprise*. The valuation analyst should determine which methodologies to employ in developing his or her indication of value after careful consideration of the *scope of the engagement*, the *nature of the value result desired*, and the *availability* of data and information to support the analyst's conclusion. Table 13.18 illustrates some of the other pertinent considerations related to the valuation of supply side enterprises.

TABLE 13.18 Other Valuation Considerations Pertinent to Supply Side Enterprises

Pertinent Considerations	Description
Economies of Scale	▪ *Group Purchasing Organizations* with greater numbers of members may be able to gain an advantage when bargaining with suppliers, such as bulk purchasing discounts. ▪ Similarly, *medical equipment leasing companies* may be able to attain more favorable financing terms based on their volume of business, that is, a leasing company diversified across clients may be more attractive to lenders than a small concentrated physician practice is.
Intangible Assets	▪ A significant portion of the value of *supply side enterprises* may be constituted in the intangible assets made up of the enterprise's *current ongoing contracts*, as well as its *established client relationships*. ▪ In addition to directly affecting the cash flow of the enterprise, these contracts and relationships may reduce the perceived *riskiness* of the enterprise's operations, thereby reducing the *required rate of return* used in the *income-based approaches*, resulting in an increased *indication of value*.

Pertinent Considerations	Description
Selection of Methodology	■ *Income-based approaches* are common used to value supply side enterprises that are capable of producing *sufficient net economic benefit* to support the assets, both *tangible* and *intangible*, of the subject enterprise. ■ *Market-based approaches* are also used in the valuation of supply side enterprises, often in addition to *income-based approaches*. ■ Numerous publicly traded supply side enterprises are available to the valuation analyst to form the basis of a value indication using the Guideline Public Company Method. ■ Market transaction data may also be available to the valuation analyst to use in employing the *Guideline Transaction/Merged and Acquired Method* ■ Asset/Cost-based approaches may also be employed in the valuation of a supply side enterprise. However, the *Asset/Cost-based approaches* may fail to reflect the entirety of the *intangible* asset value of the enterprise, particularly if the enterprise is capable of producing significant *net economic benefit* accruing to the owners of the enterprise
Additional Risk Factors	■ *Technology*: In maintenance of their share of the marketplace, supply side enterprises may need to expend *time* and *capital* in ensuring that their product offerings include the *most up-to-date*, technologically advanced products. The projection of expenses for a supply side enterprise should include a consideration of possible future expenses related to *market research*. ■ The existence of a *disaster recovery plan*, for example, loss of Just In Time Inventory delivery services due to a *natural disaster*. The absence of a disaster recovery plan may increase investors' uncertainty regarding the sustainability of *net economic benefit* projected for the subject supply side enterprise, thereby increasing the *required rate of return* for investment and reducing the indication of value.
Capital Considerations	■ *Access to capital*: Continued restrictions on supply side enterprises access to capital markets may constrain their ability to take advantage of strategic opportunities. ■ Nonfinancial capital constraints, for example, increasingly restrictive debt covenants, may also restrict a supply side enterprise's access to capital and reduce its strategic flexibility.

13.4 CONCLUSION

What's old is new again.

As *provider coordination* and *cost efficiencies* gain traction in this new *era of reform*, relationships among providers will likely continue to consolidate and evolve in an effort to adapt to the changing paradigms of healthcare delivery in the United States. As the U.S. healthcare industry becomes increasingly complex, due to *new regulations*, *decreasing reimbursement* to providers, *increasing competition*, and rapidly developing technological advancements, healthcare providers will likely increase their scrutiny of their relationships with "*other healthcare related enterprises.*" In many cases, the traditional supplier/customer relationship of the past may give way to the formation of *collaborative arrangements* that facilitate *integration*, *value-based reimbursement*, and *efficient operational management* in the provision of the continuum of patient care. The *value drivers* of these other enterprises rely on their ability to accommodate the providers' needs, based mainly on the shift to a new paradigm of healthcare delivery, where value is ascribed to lower cost with higher quality and improved outcomes.

CHAPTER 14

The Valuation of Tangible and Intangible Assets

Healthcare industry transactions often consist of not only the transfer of *going-concern enterprises*, but in many cases the transfer of ownership of *specific assets*, which are usually classified in two general categories: *tangible* and *intangible. Tangible assets* may be defined as "physical assets (such as . . . inventory, property, plant and equipment, and so on)," as well as *financial assets,* for example, *cash, accounts and notes receivables, prepaid expenses, and intercorporate investments.*[1] In contrast, an *intangible asset* may be defined as:

> *[a] nonphysical business asset that grants certain rights and privileges ([e.g.,] copyright, trade names, services marks, brand names,*

[1] Shannon Pratt, *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, 5th ed. (New York: McGraw-Hill, 2008), p. 1074. Note that the

> *etc.) that have business enterprise economic value for owners. It is an asset without physical form, such as a patent, trademark, physician goodwill, or copyright.*[2]

The main distinction between these definitions of *tangible* and *intangible* assets is the aspect of their *physicality*, although this is not an exclusive definitional barrier. *Physical* tangible assets also possess an *intangible* aspect in regard to the *legal rights of property ownership* attached to them. Furthermore, there is often some *physical* evidence or element of an *intangible asset* that provides some form of assurance as to its *economic existence*. For example, *real property* consists of *tangible* property, such as *land* and *land improvements*, but also consists of *intangible* property, such as *leasehold improvements* and *mineral rights*. Relationships between an employer and its employees, which form the basis of a "*trained and assembled workforce-in-place*," are *intangible*; however, they may be evidenced by a *physical document* such as employment agreements. Likewise, *intangible assets* related to *intellectual property rights*, for example, *trade names*, *trademarks*, *service marks*, *patents*, and *copyrights*, may be evidenced by *certificates*, *licenses*, *and other related documents*.

Tangible Assets

> Physical assets, including cash, accounts receivable, inventory, property, plant and equipment, and so on.
>
> Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008(9), p. 1074.*

Footnote 1 (*Continued*)

typical definition of an intangible asset would include financial assets, for example, stocks and bonds; however, accountants usually classify financial assets as "tangibles." Clyde P. Stickney, et al., *Financial Accounting: An Introduction to Concepts, Methods, and Uses* (Mason, OH: South-Western Cengage Learning, 2010), p. 879. International Financial Reporting Standards (IFRS), IAS 32.11, defines financial assets as (1) *cash*, (2) an *equity instrument* of another entity, (3) a *contractual right to receive* cash or another financial asset from another entity, (4) a *contractual right to exchange* financial assets or financial liabilities with another entity under conditions that are favorable to the entity, or (5) a contract that will or may be settled in the entity's own equity instruments (under certain other circumstances).

[2]David Edward Marcinko, *Dictionary of Health Economics and Finance* (New York: Springer, 2007), p. 197.

THE FOUR CATEGORIES OF PROPERTY

(1) Personal property that is tangible, (2) personal property that is intangible, (3) real property that is tangible, and (4) real property that is intangible.

From an *economic perspective* it may be useful to consider assets, or *property*, within the context of four principal categories:

1. Personal property that is tangible, for example, furniture, fixtures, and equipment;
2. Personal property that is intangible, for example, a trained and assembled workforce;
3. Real property that is tangible, for example, a building; and
4. Real property that is intangible, for example, a use right.

This issue of *property as an economic physicality* involves other aspects of the definition of assets, including such attributes as whether the item:

1. Is able to be *touched and felt* (tangible);
2. Is able to be *seen or observed* (visible); and
3. Has a *physical, material body* (corporeal).

Exhibit 14.1 depicts a representative classification of tangible and intangible assets in the context of a professional practice.

PROPERTY AS AN ECONOMIC PHYSICALITY

"These perplexing questions as to the nature of the thing to be valued might seem to be of no concern to the student of valuation, however . . . [h]ow one shall define property in a given case is bound up with the question [of] how one shall find value in that same case. The two problems must be treated together by persons who understand their interrelationship."

Intangible Assets

Nonphysical business assets that grant certain rights and privileges, including copyrights, trade names, services marks, brand names, and so on.

Dictionary of Health Economics and Finance, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2007), p. 197.*

Over the years, with the growing complexities arising from the *corporatization of medicine*, a significant majority of healthcare transactions *do not* encompass the simple acquisition of the *entirety* of a business enterprise as a going concern.[3] Most often, these transactions are more *complex* in nature, encompassing a *series* of *distinct*, yet *related*, *transactions* and *contractual relationships* for the *acquisition, lease, or co-venture* of specified *assets* (both tangible and intangible), as well as specified *services* (both clinical and nonclinical), with perhaps only some portion of the target enterprise (e.g., *ancillaries service line*) being considered as a *going-concern enterprise*. Consequently, these transactions often present *multiple*, *interrelated elements* and a higher degree of complexity than is typically addressed within the scope of a more straightforward *business enterprise value* (BEV) assignment of determining *Fair Market Value* for a

[3]See Section 3.7, "Corporate Practice of Medicine and Related Provisions," in Chapter 3, "Regulatory Environment."

Fair Market Value

The value in arm's-length transactions, consistent with general market value, without taking into account any ability between parties to refer business to each other.

"Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," 42 CFR § 411 and 424 (Jan. 4, 2001); "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," 42 CFR § 411 and 424 (March 26, 2004).

going-concern enterprise considered in its *entirety*, as briefly alluded to in the introduction to this chapter.

An illustrative example of a potential hospital-physician practice integration transaction, which encompasses professional medical services, medical directorship services, an intangible asset transaction (Trained and Assembled Physician Workforce), a business entity transaction (Ancillary Services and Technical Component Service Line), and a lease for services and assets, is presented in Exhibit 14.2.

Several representative elements of the illustrative transaction depicted earlier are defined next:

1. **Box E—ACME Medical Center (AMC).** Hospital/Health System, acquiring party of hospital/physician practice transaction;
2. **Box D—Physician Practice (LEGACY PRACTICE).** Selling, leasing, or service provider party to exempt hospital/physician practice transaction;
3. **Box I—ASTC Service Line.** Illustrates which assets and/or going-concern elements would be included in the transaction. Components in sub-boxes J through N represent those assets making up the LEGACY PRACTICE ASTC service line, to be acquired by AMC at *Fair Market Value in Use as a Going Concern*, as would be detailed in a *Service Line Purchase Agreement* for a given transaction;
4. **Box O—Premises, Equipment and Employee Lease Agreement.** Illustrates those elements of the LEGACY PRACTICE that would be leased to AMC under a *Premises, Equipment, and Employment Lease Agreement*;
5. **Box W—Trained and Assembled Physician Workforce in Place (TAWF).** Represents the intangible asset related to those LEGACY PRACTICE

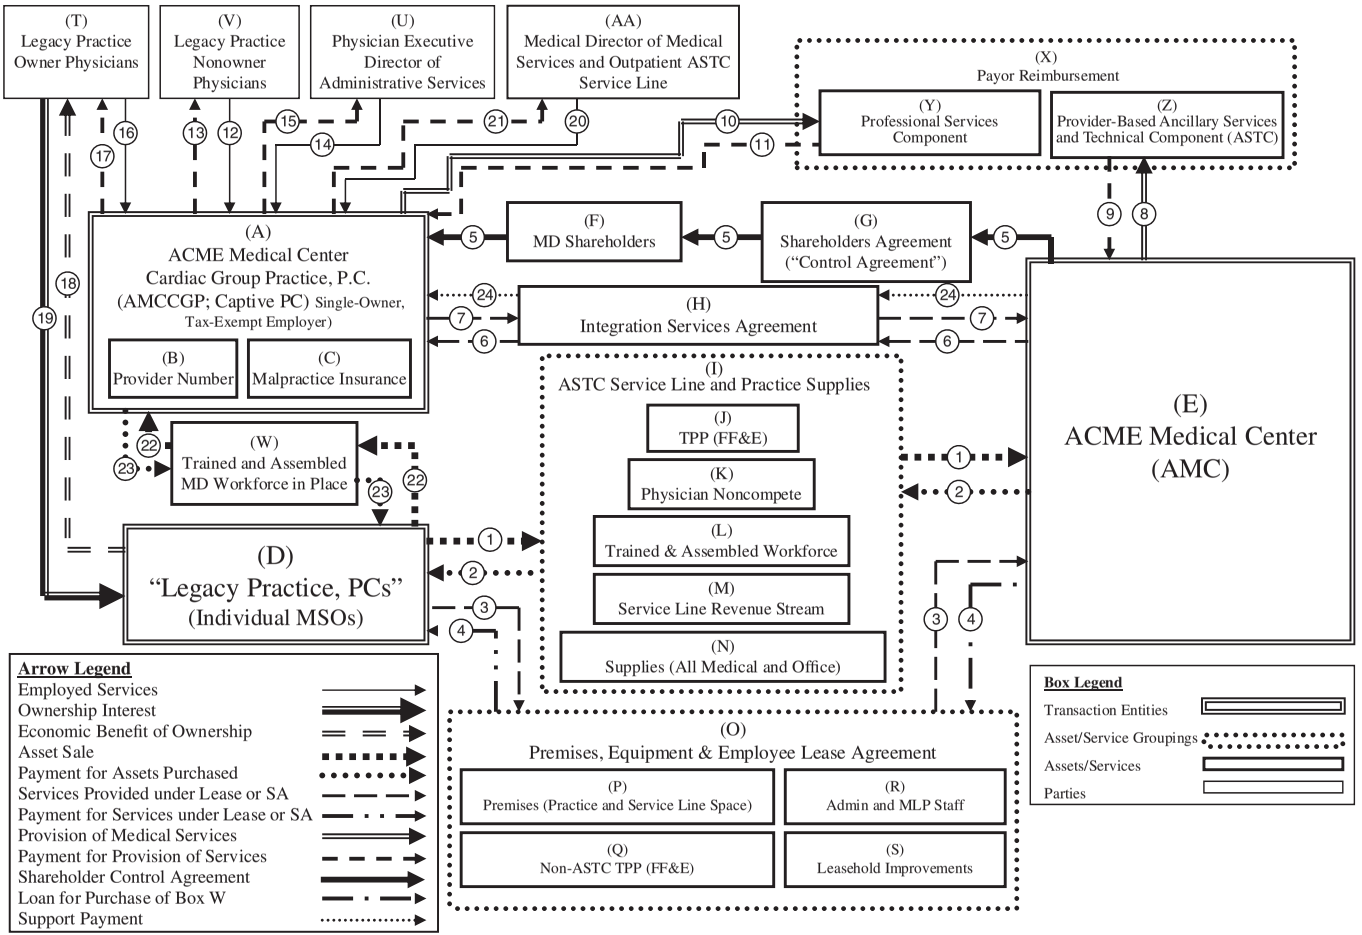

EXHIBIT 14.2 Illustrative Integration Transaction

physicians who will be employed by AMC, following the closing of the transaction in accordance with the *Physician Employment Agreement*; and

6. **Boxes T, V, U, AA.** Each represents compensation arrangements for various *physician services* (e.g., clinical productivity, coverage/call, medical directorship(s), and administrative/executive), each with its own specific *tasks, duties, responsibilities, and accountabilities* (TDRA), to be provided to AMC's CAPTIVE PC, by the *owner physician*(*s*) and *employed associate physicians* of the LEGACY PRACTICE.

Having set forth the distinctions between *tangible* and *intangible* assets, the following sections further discuss the *classification* and *valuation* of specific types of *tangible* and *intangible* assets.

14.1 CURRENT AND FUTURE TRENDS REGARDING TANGIBLE ASSETS

14.1.1 Regulatory Environment Related to a Tangible Asset Transaction

Healthcare transactions, including the *transfer of tangible assets* between healthcare enterprises, are *subject to regulatory scrutiny*, for example, provisions of the *Stark Law*, the *Anti-Kickback Statute*, *Antitrust laws*, and IRC 501(c)(3) provisions governing *tax-exempt organizations* related to *excess benefit* and *private inurement* (as further discussed in Chapter 3, "Regulatory Environment"). Accordingly, the *separate* and *distinct* regulatory thresholds of *Fair Market Value* (FMV) and *Commercial Reasonableness* must both be addressed within the context of the *unique regulatory structure* of the *healthcare industry*. For example, inherent in the definition of *Fair Market Value* for healthcare valuation assignments is the *assumption* that the transaction would occur between a *hypothetical willing buyer* and a *hypothetical willing seller*, neither of whom is in a position to make *referrals* to the other.[4] The threshold of *Commercial Reasonableness* also requires

[4] "Program Integrity; Medicare and State Health Care Programs; Permissive Exclusions," 42 CFR §1001.952(b)(5), (2009), p. 735; "Exceptions to the Referral Prohibition Related to Compensation Arrangements," 42 CFR §411.357(d); "Limitation on Certain Physician Referrals," 42 U.S.C.A. §1395nn(a) (2010); Social Security Act § 1877(a). See Section 7.2.1.1.1, "Requirement for Fair Market Value in the Healthcare Industry," in Chapter 7, "Basic Valuation Tenets," for further discussion of this standard of value.

Commercial Reasonableness

The Department of Health and Human Services has interpreted *commercially reasonable* to mean that an arrangement appears to be "a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals." The Stark II, Phase II, commentary also suggests that "an arrangement will be considered 'commercially reasonable' in the absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential DHS referrals."

"Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," 42 CFR § 411, 42463 Federal Register *1700 (January 9, 1998); "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," 42 CFR § 411 and 424 (March 26, 2004).*

that a transaction make *prudent business sense*, even in the absence of *referrals*.[5] Note that these two separate and distinct thresholds are related and not mutually exclusive.

Additional restrictions may apply to the *transfer* of ownership of certain assets, for example, *potentially harmful medical equipment*, as well as certain *drugs* and *narcotics,* which can only be sold to *specific licensed healthcare professionals,* within regulatory guidelines. Similarly, certain tangible assets consisting of some types of *healthcare facilities* and certain categories of *medical technology* and *equipment* may require government approval for transfer, for example, a *Certificate of Need*. In addition, certain *environmental laws and regulations* may play a role in the *transfer of certain tangible healthcare assets*, for example, seemingly innocuous assets such as lead shielding for a diagnostic facility leasehold improvement may be classified as a *hazardous* item and be subject to federal and state laws regarding its disposal.

14.1.2 Reimbursement for Tangible Assets

Healthcare entities are directly reimbursed not only for *services* rendered, but also for tangible assets such as *durable medical equipment*, *medical*

[5] 69 *Federal Register* (March 26, 2004): 16107. See Chapter 16, "The Threshold of Commercial Reasonableness," for further discussion of this threshold.

devices, and *supplies* used during the provision of healthcare services (e.g., stents). Tangible assets are directly reimbursed under the *prospective payment systems* used for *Medicare* and *Medicaid* under the *Resource-Based Relative Value System* through the inclusion of the *Practice Expense Relative Value Unit*.[6] The *Practice Expense Relative Value Unit* (PE RVU) reflects the *costs* of a physician practice, including the operating expenses and capital expenses, for example, costs of *acquiring equipment and office space* requisite to support the medical procedures being performed. Similarly, for *inpatient* services, a payment by Medicare for a particular *Diagnosis-Related Group* (DRG) encompasses both *operating expenses* related to the treatment of the diagnosis, as well as *capital expenses* necessary for the treatment of the diagnosis.[7]

14.1.3 Competition in the Tangible Asset Market

Competition related to *regulatory* and *economic* factors, discussed in depth in Chapter 3 "Regulatory Environment," has, more than ever, driven the focus on the importance of *ownership* of the tangible assets of healthcare entities. *Healthcare enterprises* compete with one another to offer the *latest services* at the *highest quality.* Often, these new services and service lines are *dependent* on the purchase of new *equipment*, for example, the *da Vinci System*.[8] Similarly, increases in *quality* and *profitability* may be related to the acquisition and implementation of new technologies and equipment, such as the *quality* increase in image clarity and patient throughput derived

[6] See Section 2.4.1.3.2, "Physician Reimbursement and Billing: The Resource-Based Relative Value Scale (RBVRS)," in Chapter 2, "Reimbursement Environment"; Centers for Medicare and Medicaid Services, "Medicare Physician Fee Schedule—Payment System Fact Sheet Series," December 2011, Department of Health and Human Services.

[7] Centers for Medicare and Medicaid Services, "Acute Care Hospital Inpatient Prospective Payment System," Payment System Fact Sheet Series, February 2012.

[8] The *da Vinci System*, developed by *Intuitive Surgical, Inc*. in 1998 and approved by the FDA in 2000, revolutionized minimally invasive surgery by overcoming the limitations of both traditional surgical procedures and conventionally implemented noninvasive laparoscopic technology. While originally limited to *cardiac endoscopy*, the use of the *da Vinci system* has expanded to include *gastrointestinal*, *cardiothoracic*, *gynecologic*, *urologic*, and *other specialty surgical* procedures. Anne Staylor, "Trends in MIS, Part II," *Medtech Insight* 14, no. 6 (June/July 2012): 18; M. J. Mack, "Minimally Invasive and Robotic Surgery," *Journal of the American Medical Association* 285, no. 5 (2001): pp. 569–570.

from a 64-slice CT machine, in contrast to that of a 16-slice CT machine.[9] A healthcare enterprise capable of offering minimally invasive robotic surgery and high-quality diagnostic imaging may *derive not only the revenue* (and the net economic benefit) from providing these services, but may also *gain market share* in other services through the *public relations benefit* associated with being perceived as being a "*cutting edge*" provider offering patients *new, high quality, technologically advanced services*.

14.1.4 Technology in the Tangible Asset Market

In almost all instances, the *rapidly changing* healthcare industry technologies require, at least in part, a *tangible asset* component. However, as healthcare entities move toward the new revenue paradigm of value-based reimbursement and the concept of *Accountable Care Organizations* (*ACOs*), the purchasers and payors of healthcare services, in contrast to providers, are not focused primarily on the *competitive benefit* of the acquisition of new technologies and new services; they are instead requiring a clear demonstration of how these new technologies exhibit value, that is, *enhance quality with measurable patient outcomes and control costs*.[10]

Technological developments in the healthcare industry can result not only in *enhanced value* from the new and higher quality services, but can also *adversely affect the value* of existing *tangible personal property* already in place. This loss of value derives from the relative *functional obsolescence* and *technological obsolescence* of the existing technology in comparison to the new technology. *Functional obsolescence* can be defined as the *loss of utility* resulting from the *inefficiencies* of the asset, as compared to a more efficient or less costly replacement asset. *Technological obsolescence* can be

---

[9] A computed tomography (CT machine) uses multiple X-ray images to produce tomographic images, commonly referred to as slices, which together generate a three-dimensional image. These cross-sectional images have evolved since the first commercial scanner became available in 1967, from the 4-slice CT scanner to the 16-slice CT scanner, and finally, the 64-slice CT scanner, with each version raising the standard for image quality and accuracy, allowing for the improved production of three-dimensional images. Sal Martino, Jerry Reid, and Teresa G. Odle, *Computed Tomography in the 21st Century: Changing Practice for Medical Imaging and Radiation Therapy Professionals* (Albuquerque, NM: American Society of Radiologic Technologists, 2008), p. 2, 8; Lee W. Goldman, "Principals of CT: Multislice CT," *Journal of Nuclear Medicine Technology* 36, no. 2 (June 2008): 58, 60.

[10] "Hospital Budgets on the Rise as Purchasing Patterns Shift, Survey Finds," *Medtech Insight* (March 2012): 48–49. See Section 6.4.4.1, "ACA's Establishment of Accountable Care Organizations," in Chapter 6, "Healthcare Reform," for a more in-depth discussion of ACOs.

defined as the *loss of utility* resulting from the *differences* in *capabilities* between the old asset and the replacement asset.[11]

14.2 CLASSIFICATION AND VALUATION OF TANGIBLE ASSETS

The American Society of Appraisers (ASA) defines tangible assets as "land, land improvements, buildings, machinery and equipment, office furniture and equipment, and other tangible assets."[12]

In addition, as briefly noted in the introduction to this chapter, most accountants classify financial assets, for example, cash, accounts and notes receivables, prepaid expenses, intercorporate investments, as tangible assets as well.[13]

With regard to the importance of identification of property, which would include defining the concept of property as an economic physicality, James C. Bonbright stated,

> *These perplexing questions as to the nature of the thing to be valued might seem to be of no concern to the student of valuation, however . . . [h]ow one shall define property in a given case is bound up with the question [of] how one shall find value in that same case. The two problems must be treated together by persons who understand their interrelationship.*[14]

---

[12] *Valuing Machinery and Equipment: The Fundamentals of Appraising Machinery and Technical Assets*, 3rd ed. (e-book) (Washington, DC: The American Society of Appraisers, 2011), p. 125.

[13] International Financial Reporting Standards (IFRS), IAS 32.11, defines *financial assets* as (1) *cash*, (2) an *equity instrument* of another entity, (3) a *contractual right to receive* cash or another financial asset from another entity, (4) a *contractual right to exchange* financial assets or financial liabilities with another entity under conditions that are favorable to the entity, or (5) a contract that will or may be settled in the entity's own equity instruments (under certain other circumstances). The typical definition of an *intangible asset* would include financial assets such as stocks and bonds; however, accountants usually classify financial assets as "tangibles." Clyde P. Stickney, et al., *Financial Accounting: An Introduction to Concepts, Methods, and Uses* (Mason, OH: South-Western Cengage Learning, 2010), p. 879.

[14] James C. Bonbright, *The Valuation of Property: A Treatise on the Appraisal of Property for Different Legal Purposes, Volume I* (New York: McGraw-Hill, 1937), p. 99.

PRINCIPLE OF SUBSTITUTION

A prudent investor would pay no more for a property than the cost of acquiring an equally desirable substitute or one of equal utility.

Handbook of Business Valuation, *2nd ed., by Thomas L. West and Jeffrey D. Jones (New York: John Wiley & Sons, 1999), p. 165.*

Under the *Principle of Utility,* which is derived from the economic *Principle of Scarcity*, tangible assets may generate a *net economic benefit* for a healthcare enterprise by either (1) *directly generating revenue* for the healthcare enterprise or (2) allowing the healthcare enterprise to *avoid* an *economic operating expense* or *economic capital expense* that would be required to *replace* or *reproduce* the tangible assets.[15] It should be noted that the utility to be derived from tangible assets, which serves as a guide in determining their value, is the *expected utility* to be derived from those assets in the future, based on the economic *Principle of Anticipation*, bounded by the cost of obtaining a *substitute tangible asset* that provides a *similar level of utility* as the *subject tangible asset*, as set forth by the economic *Principle of Substitution.*[16]

Each valuation engagement should include *proper* consideration given to each of the three general approaches to value, that is, the *Income*, *Market*, and *Asset/Cost Approaches.*[17] The choice among the numerous generally accepted healthcare valuation *approaches*, *methods*, and *techniques* for the appraisal of tangible assets depends primarily on the:

1. Purpose of the valuation report;
2. Objective and purpose of the valuation engagement;
3. Standard of Value;

[15] See Section 7.1.1, "Scarcity," in Chapter 7, "Basic Valuation Tenets," for further information regarding the interplay between scarcity and utility. See Section 7.1.2, "Utility Theory," in Chapter 7, for additional information regarding the *Principle of Utility*.

[16] See Section 7.1.3.1, "Principle of Anticipation," in Chapter 7, "Basic Valuation Tenets," for additional information regarding the *Principle of Anticipation*. See Section 7.1.2.1, "The Principle of Substitution," in Chapter 7, for additional information regarding the *Principle of Substitution*.

[17] Ian Ratner, Grant Stein, and John Weitnauer, *Business Valuation and Bankruptcy* (Hoboken, NJ: John Wiley & Sons, 2009), p. 26.

STANDARDS OF VALUE

Various methods used to answer the question "*Value to whom?*" and outline the type of value to be determined, including Fair Market Value, Fair Value, Market Value, Investment (Strategic) Value, or Book Value.

4. Premise of Value;
5. Specific characteristics of the subject asset; and
6. Availability of reliable data.

A more detailed discussion of the selection of appropriate valuation approaches and methodologies may be found in Chapter 8, "Valuation Approaches and Method."

At the outset of each valuation engagement, it is critical to appropriately define (and have all parties agree to) the *Standard of Value*, which outlines the type of value to be determined. The *Standard of Value* is often described as answering the question "*Value to whom?"* There are various commonly referred to *Standards of Value*, including *Fair Market Value*, *Fair Value*, *Investment (Strategic) Value*, and *Fundamental Value*, and further information on the various *Standards of Value* can be found in Section 7.2.1, "Standards of Value," in Chapter 7, "Basic Valuation Tenets." In addition, the standard of *Fair Market Value* is most often the valuation standard sought in the valuation of healthcare related enterprises, assets, and services.[18]

Recall that the standard of *Fair Market Value* is defined as the most *probable price* that the subject asset should bring if exposed for sale on the open market, as of the valuation date, but *exclusive* of any element of value *arising* from the *accomplishment* or *expectation* of the sale. This *Standard of Value* assumes an anticipated *hypothetical transaction*, in which the buyer and the seller are each *acting prudently* with a *reasonable equivalence of knowledge*, and where the *price* is *not affected* by any *undue stimulus or coercion*. Implicit in the definition of *Fair Market Value* for those transactions taking place in the healthcare industry is the assumption that the anticipated hypothetical transaction would be conducted in compliance with Stark legislation prohibiting physicians from making referrals for "*designated health services*" reimbursable under Medicare or Medicaid to an entity with which

[18] As set forth in Section 7.2.1.1.1, "Requirement for Fair Market Value in the Healthcare Industry," in Chapter 7, "Basic Valuation Tenets."

Factoid

Fair value is the price that would be received to sell an asset or paid to transfer a liability (an exit price) in an orderly transaction between market participants at the measurement date.

"Statement of Financial Accounting No, 157: Fair Value Measurements," Financial Accounting Standards Board, September 2006, p. 2.

the referring physician has a *financial relationship*, as well as with the *Anti-Kickback Statute*, which makes it legally impermissible to knowingly pay or receive any remuneration related to the volume or value of referrals.[19]

In addition to identifying the *Standard of Value* to be used in the valuation engagement, it is imperative that the *Premise of Value*, that is, an assumption further defining the *Standard of Value* to be used and under which a valuation is conducted, is determined at the outset of the valuation engagement. As discussed in Chapter 7, "Basic Valuation Tenets," the *Premise of Value* defines the hypothetical terms of the sale, that is, "*the most likely set of transactional circumstances that may be applicable to the subject valuation; e.g., going concern, liquidation, [etc.]*"[20] and answers the question "Value under what further defining circumstances?"

Factoid

The Bradford Case examined the permissibility of arrangements between physicians and hospitals under the Stark Act and the Anti-Kickback Act. Specifically, it was related to the valuation of a noncompete clause found to be in violation of the Stark Law.

U.S. ex rel., Singh v. Bradford Regional Medical Center, *752 F.Supp. 2d 602 (November 10, 2010).*

[19] 42 U.S.C.A. § 1395nn(a); Social Security Act § 1877(a). *U.S. ex rel v. Bradford Medical Center et al*. See Section 7.2.1.1, "Fair Market Value," in Chapter 7, "Basic Valuation Tenets," for further discussion of the standard of *Fair Market Value*.

[20] Richard Rickert, "The Principles and Concepts of Valuation: Theory of Utility and Value, Value Influences, and Value Concepts," in *Appraisal and Valuation: An Interdisciplinary Approach, Volume I* (Washington, DC: American Society of Appraisers, 1987), pp. 6–7.

PREMISE OF VALUE

The Premise of Value defines the hypothetical terms of the sale, that is, "the most likely set of transactional circumstances that may be applicable to the subject valuation; e.g., going concern, liquidation," and answers the question "Value under what further defining circumstances?"

Appraisal and Valuation: An Interdisciplinary Approach, Volume I, *by Richard Rickert (Washington, DC: American Society of Appraisers, 1987), pp. 6–7.*

Value in Use as a Going Concern is the *Premise of Value* that *assumes that the assets will continue to be used as part of an ongoing business enterprise, producing an economic benefit of ownership of a going concern.* Supporting a valuation premise of *Value in Use as a Going Concern* requires a reasonable likelihood that the subject enterprise would generate, in the reasonably foreseeable future, *sufficient net margin* to generate the requisite economic cash flow to *support the value of the capital investment* required to generate the revenue stream of the provider enterprise.[21]

In the event that a business enterprise fails to produce *sufficient evidence* to indicate a *reasonable likelihood* that it would, as a *going-concern enterprise*, meet this threshold, then the valuation premise of *Value in Use as a Going Concern* cannot be supported, and the adoption of the *Value in Exchange* premise of value may be indicated as the *highest and best use* of the component assets of the enterprise.[22] While *tangible assets* may be valued as part of a going-concern enterprise, the valuation of an individual tangible asset may be achieved under the *Value in Exchange* premise of value.

Value in Use

The premise of value that assumes that the assets will continue to be used as part of an ongoing business enterprise, producing an economic benefit of ownership of a going concern.

[21] Jay Fishman, "Valuation Terminology and Methodology," in *Financial Valuation: Businesses and Business Interests*, ed. James Zukin (New York: Maxwell MacMillan, 1990), pp. 2-43–2-44.

[22] See Section 7.2.2.2, "Highest and Best Use," in Chapter 7, "Basic Valuation Tenets," for further discussion of this concept.

THE THREE LEVELS TO THE PREMISE OF VALUE IN EXCHANGE

(1) Value in Place, as part of a mass assemblage of assets; (2) Value in Exchange, as part of orderly disposition; and (3) Value in Exchange, as part of a forced liquidation.

Valuing a Business: The Analysis and Appraisal of Closely Held Companies, *5th ed., by Shannon Pratt (New York: McGraw-Hill, 2008), pp. 48–49.*

Under the valuation premise of *Value in Exchange*, there are three distinct categories, defined by the means and circumstances by which the asset is converted into cash:

1. ***Value in place**, as part of a mass assemblage of assets*, but not in current use in the production of income, and not as a going-concern business enterprise.[23]
2. ***Value in exchange**, as part of an orderly disposition*, but not part of a mass assemblage of assets; the assets will be sold individually, and they will receive normal exposure on an appropriate secondary market.[24]
3. ***Value in exchange**, as part of a forced liquidation*, but not part of a mass assemblage of assets; the assets will be sold individually, but they will receive less than normal exposure on an appropriate secondary market.[25]

With respect to tangible personal property appraised under either Value in Exchange, as part of an orderly disposition, or Value in Exchange, as part of a forced liquidation, additional defining aspects of the premises of value may be used, including: (1) Fair Market Value—Removed and (2) Fair Market Value—Installed.[26] These valuation aspects further define the condition of the asset to be transacted, related to whether the asset will

be considered to be used in its present location (installed) or not in its present location (removed).

14.2.1 Classification and Valuation of Tangible Real Property

Based on the definition of real property as "the bundle of legal rights which people have in . . . the very objects, particularly the tangible objects to which these rights attach," and with the premise that any given legal right is intangible, so it is a logical deduction that real property is an intangible asset.[27] However, while real estate encompasses the land, the buildings, and any permanent fixture related to the land and the buildings, real property encompasses all of the rights of ownership that define real estate. These rights of ownership, when combined, may represent the real estate itself or, when separated, may represent a right or access to the real estate that does not have a physical nature. Real property, therefore, may include both tangible real property and intangible real property.[28]

The subject of an appraisal related to the ownership of *real estate* is *always*, in actuality, *real property* (i.e., the *rights* related to the real estate) and, therefore, when appraising *real estate*, the *rights* and *benefits* related to the *real estate* should be clearly defined.[29] Note that when the *real property* encompasses *all rights* and *benefits* related to the *real estate*, the property interest is referred to as a *fee simple interest*.[30]

Real Estate

The physical land and all appurtenances affixed to the land, such as structures.

[30] Ibid.

Recent economic trends, that is, *relatively low borrowing costs* and *relatively higher asset prices*, coupled with the *uncertainty* surrounding the *impact of certain provisions* of the *Patient Protection and Affordable Care Act* (ACA) on the ability of an organization *to fulfill its goals and mission* (i.e., either *for-profit* or *not-for-profit*), have led to a renewed interest by some healthcare enterprises in "*monetizing*" the value of their real property in order *to fund certain strategic and operational objectives*, for example, *implementing electronic health records systems* and *closer alignment with physicians*. Other motivations for healthcare enterprises to divest their ownership in *real property* include the *increased regulatory scrutiny* of transactions that may be subject to *federal and state fraud and abuse laws* or the *IRS regulations* pertaining to *excess benefit* and *inurement of private benefit*.[31]

14.2.1.1 Tangible Real Property Valuation Methods In many healthcare transactions, the *real property* used by the subject enterprise being acquired is *not owned by the subject enterprise*; rather, it is *leased*. In some instances, the subject enterprise may lease the real property used for its business operations from a *related party*, that is, one in which the owner of the real property holding company is also an owner of the subject enterprise, in which case a *separate appraisal* of the *lease rate* being paid by the subject enterprise may be warranted in order *to ensure that the payment is at FMV*. Accordingly, should the *real property* be owned by the subject enterprise (and is to be included in the transaction), a *separate* appraisal of the *real property interest* is often warranted to ensure that the *capital structure* of the entity

Real Property

Land and anything growing on, attached to, or erected on it, excluding anything that may be severed without injury to the land. Can be either corporeal or incorporeal, including all interests, benefits, and rights inherent in the ownership of real estate.

reflects the asset being stated at FMV. As real property valuation requires *specific knowledge and skill sets*, a licensed, certified real estate appraiser may be engaged to complete the real property valuation.

14.2.1.1.1 Income Approach for Valuing Tangible Real Property The application of an *Income Approach–based valuation method* in assessing the value of *tangible real property* involves the analysis of the *income-producing capabilities* of the subject property, including the projection of the related *revenue streams* and the *economic cost burdens* (in operating or capital costs) necessary to support those *revenue streams*. The *net economic benefit* derived from these revenue streams and expenses is then *capitalized* to derive an indication of value. Note that the *Single Period Capitalization Method* converts a *single year* of *net economic benefit* into an indication of value, while the *Discounted Net Cash Flow Method* converts a *projected stream of net economic benefits* into an indication of value (see Chapter 8, "Valuation Approaches and Methods," for a further discussion of these methods, as well as other *Income Approach–based valuation methods*).

14.2.1.1.2 Market Approach for Valuing Tangible Real Property Using the *Guideline Transactions Method* under the *Market Approach*, an indication of value can be derived from *valuation metrics* reported in *transactions* of *properties* deemed to be *comparable* to the subject property.[32] The application of this methodology begins with the definition of the subject asset's *market*, which may be defined as making up one of the four *categories of productivity attributes*: (1) *locational*, (2) *physical*, (3) *legal*, and (4) *design*.[33] It is from this identified market segment that *guideline transactions* with *homogenous badges of comparability* to the subject property are derived. In addition to transactions, *comparable* may also be derived from *real estate listings* and *purchase offers*. However, regardless of the foundation for the comparable property, it is important that each source be verified to ensure they are "factually accurate and that the [elements of the] transactions reflect arm's-length, market considerations."[34]

CAPITAL SOURCES USED FOR THE PURCHASE OF TANGIBLE ASSETS

(1) Equity, (2) bank debt, (3) seller financing, and (4) capital leasing.

Once comparable properties have been identified, *units of comparability*, for example, *price per square foot*, are selected, and a comparison is made between the *guideline transactions* and the *subject asset* being valued. *Adjustments* may be required to reflect *differences* in the *guideline transactions* and the *subject property.* Finally, the *adjusted guideline transactions* are aggregated and *weighted* based on the *similarity* of the transaction to the subject property.

Healthcare facilities are often *special-use buildings*, which may *limit the market* of comparable buildings from which to derive an *indication of value*. If the current or prospective use of the property is *functionally* or *technologically obsolete*, due to its *purpose-specific design*, the *highest and best use* of the property may be as *undeveloped land*, in other words, the structure is demolished and sold for scrap.[35] An example of this would be the case of an *aging hospital facility* that exhibits the following value considerations:

1. *Presence of toxic, radioactive medical waste* on the facility grounds that was disposed of prior to the enactment of applicable environmental regulations;
2. *Use of hazardous building materials*, for example, asbestos and/or lead-based paint, prior to the enactment of applicable building regulations;
3. *Architectural designs* that are *inefficient for use* in contemporary healthcare service delivery models; and
4. *Engineering specifications* that are *costly to retro-fit* with new technologies.

In this circumstance, the *market-derived value estimate* must be adjusted for all *expenses necessary* to deliver the property in an *undeveloped state*, including *demolition* and any *remediation* that may be necessary.

14.2.1.1.3 Asset/Cost Approach for Valuing Tangible Real Property The application of *Asset/Cost Approach–based valuation methods* in valuing

[35] Ibid. pp. 25–26, 262–263.

real estate involves *two distinct property interests*: (1) the *land* and (2) any and all *land improvements* (including the buildings). The *combination* of the valuation of these *two property interests* results in the aggregate value of the property interest referred to as *real estate*.[36] Typically, *Asset/Cost Approach–based valuation methods* have limited application to the valuation of *land*, since it was not created, it exists. However, *Market Approach–based valuation methods*, for example, the *guideline transactions method*, considering the *land* as though it were *vacant* and *ready for improvement*, can be used to determine the value of the *land portion* of the real estate.

The *separate* valuation of the *buildings* and other *land improvements* may be performed under either the *Replacement Cost Method*, which is the quantification of the current costs required to re-create an asset with *equal utility* to the subject asset, or the *Reproduction Cost Method*, which is the quantification of the costs needed to create an *exact duplicate* of the subject asset. Utilization of the *Replacement Cost Method* includes the *estimation of all costs* (i.e., *direct costs, indirect costs, and an appropriate entrepreneurial profit/incentive*) related to the replacement of the land improvements as of the date of valuation, less all *depreciation* including:

1. *Physical deterioration*: the decrease in value related to the *wear* and *tear* placed on the asset, in comparison to a replacement asset;
2. *Functional and technological obsolescence*: the decrease in value related to *inefficiencies* and *capabilities* of the asset, as compared to a replacement asset; and
3. *Economic (external) obsolescence*: the decrease in value *unrelated to* or *outside of* the asset, such as an economic recession.[37]

Depreciation

The continuous decline in value of an asset (including buildings, instruments, and equipment) in the course of its operations.

Dictionary of Health Economics and Finance, *edited by David Edward Marcinko and Hope Rachel Hetico (New York: Springer, 2007), p. 108.*

14.2.1.2 Classification and Valuation of Land and Land Improvements Those *tangible real property assets* known as *land* can be regarded as one of the basic *agents of production*, along with *labor, capital, and entrepreneurial coordination*, and include a number of unique attributes:

1. Each plot of land is *unique*;
2. Each plot of land is *immobile*;
3. Each plot of land is *durable*; and
4. The *supply* of land is *finite*.[38]

Perhaps the most important factor related to land is its *location*. An analysis of the location of a plot of land can be examined on *three* levels:

1. The *internal structure* of the site;
2. The *location* and interaction of the site with the *immediate surroundings* (e.g., adjacent buildings and roadways); and
3. The *location* and *interaction* of the site within an *urban structure* (i.e., the city the site is located in, the city's economics, and the plot of land's interaction with the city).[39]

Each plot of land is *unique* and *is not* created *equal* and may, in fact, have been altered by *human interaction*. Regarding vacant land, a *greenfield*

THE THREE LEVELS OF AN ANALYSIS OF THE LOCATION OF A PLOT OF LAND

(1) The internal structure of the site, (2) the location and interaction of the site with the immediate surroundings (e.g., adjacent buildings and roadways), and (3) the location and interaction of the site within the urban structure (i.e., the city the site is located in, the city's economics, and the plot of land's interaction with the city).

UNIQUE ATTRIBUTES OF A PLOT OF LAND

(1) Each plot of land is unique; (2) each plot of land is immobile; (3) each plot of land is durable; and (4) the supply of land is finite.

The Appraisal of Real Estate, *12th ed. (Chicago: Appraisal Institute, 2001), p. 3.*

site can be defined as an *untouched*, *undeveloped* plot of land. In contrast, a *brownfield site* is "real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant."[40] The development of a *brownfield site*, therefore, may include extra costs such as *remediation*, which could negatively affect the potential use and therefore the value of the land. Due to the nature of healthcare services and the environmental waste they may generate, many sites on which healthcare entities, such as hospitals, reside *may require remediation* in some form should the land be *sold* or *repurposed*. This requirement serves as a *negative reversion* to the value of that *real property interest*.

Those *tangible real property assets* known as *land improvements* include *all permanent structures* (i.e., buildings), as well as all *permanent changes* to *land* that act to increase the land's value, for example, levees, dams, or other drainage/watershed infrastructure.[41]

Special use buildings are buildings that have *unique architectural features* and *engineering designs*, used for a *specific* purpose, for example, a *cancer treatment center* or a *diagnostic imaging center*, which is constructed

Brownfield Site

An abandoned, idled, or underused industrial or commercial site that is difficult to expand or redevelop because of environmental contamination.

Land Improvements

Relatively permanent structures built on, or physical changes made to, a property to increase its utility and value.

The Dictionary of Real Estate Appraisal, *4th ed. (Chicago: Appraisal Institute, 2002), p. 157.*

to include lead shielding for the purpose of blocking radiographic exposure. These *technical build-outs, features,* and *amenities*, intended to facilitate the delivery of healthcare services, may tend to actually *limit the utility* or conversion of the building for other purposes, as those conversions will often include significant additional expenses in order to *repurpose the building*.[42] In addition, healthcare facilities are subject to extensive regulation, by federal, state, and local authorities, and include such building codes as the *International Building Code* and the *Life Safety Code*, which creates complication for repurposing.[43]

Each of the three methods previously discussed in Sections 14.2.1.1.1, "Income Approach for Valuing Tangible Real Property," 14.2.1.1.2, "Market Approach for Valuing Tangible Real Property," and 14.1.1.1.3, "Asset/Cost Approach for Valuing Tangible Real Property," may be appropriate to value land and land improvements.

14.2.2 Classification and Valuation of Tangible Personal Property

Tangible personal property has, for decades, been broadly defined as:

> *Tangible things capable of ownership not classed as realty, they being furniture, fixtures, equipment, machinery, inventories, vessels, precious metals, vehicles, gems, evidences of debt, and money.*[44]

This definition, while useful, includes some *ambiguity* in that there is *no bright line* distinguishing *real property* from that of *personal property.* In cases where the definitional line may be straddled for a given asset, the *use*

Tangible Personal Property

Tangible things capable of ownership not classed as realty, they being furniture, fixtures, equipment, machinery, inventories, vessels, precious metals, vehicles, gems, evidences of debt, and money.

The Appraisal of Machinery and Equipment, *American Society of Appraisers, ASA Monograph #2, Washington, DC, 1969, p. 3.*

or *purpose* of the property may provide additional guidance as to its classification.[45] For example, ventilation for a *specific piece* of *equipment*, such as a fume exhaust for a chemotherapy center, may well be classified as *tangible personal property*, while ventilation for the office space that the equipment occupies would be classified as *tangible real property.*

14.2.2.1 Tangible Personal Property Valuation Methods When determining the value of *tangible personal property*, the three general valuation approaches, that is, the *Income*, the *Market*, and the *Asset/Cost*, should be considered before the appropriate method for the specific appraisal is selected for the assignment.[46] In addition, in regard to the valuation of *tangible personal property*, it is important to consider the applicable amount of *depreciation* related to the subject property.

Depreciation, in its *economic interpretation,* in contrast to its *tax accounting interpretation*, is the loss of value in an asset due to the *physical deterioration* in the *condition* of the asset resulting from its *use* over time, which can be calculated based on the *age* and *condition* of the asset, as well as *various forms of obsolescence. Obsolescence* is often expressed as *functional*, *technological*, or *economic* and is the loss of value due to deterioration in the *utility* of the asset. *Functional and technological obsolescence* occurs when *replacement assets* would have *greater utility*, for example, *improved production processes* or *lower operating costs*, than the original or existing equipment. *Economic obsolescence* occurs when some event or circumstance, *external* to the equipment itself, is responsible for a *decreased ability* of the equipment to *properly perform* its intended task.

[45] Ibid., p. 10.

[46] *Valuing Machinery and Equipment: The Fundamentals of Appraising Machinery and Technical Assets*, 3rd ed. (e-book) (Washington, DC: American Society of Appraisers, 2000), p. 15.

TABLE 14.3 Application of Physical Deterioration and Obsolescence

Current Cost of Replacement or Reproduction In-Place, In-Use	
< + / – >	Physical Deterioration
< + / – >	Functional Obsolescence
< + / – >	Technological Obsolescence
< + / – >	Economic Obsolescence
Results In:	**Fair Market Value In-Place, In-Use**

Examples of economic factors contributing to an impairment of an asset include *decreased demand for a product*, *limited production life*, and *environmental regulations* imposed on a type of asset that might limit or impede its operation.[47] Accordingly, the economic *Fair Market Value* of the asset being appraised should include the application of a devaluage factor to reflect both *physical deterioration* and the applicable types of *obsolescence,* as illustrated in Table 14.3.

14.2.2.1.1 Income Approach for Valuing Tangible Personal Property Income Approach–based valuation methods for tangible personal property—in particular, furniture, fixtures, and equipment—"[are] not usually applied to individual items of machinery and equipment unless they are leased," due to the difficulty in "determining income that can be directly related to a specific asset, the concern over reliability of income forecasts, and the multitude of variables involved in this valuation approach."[48] However, despite the limited applicability of Income Approach–based valuation methods to tangible personal property, they still should be understood and considered when appropriate.

Both the *Single Period Capitalization Method* and the *Discounted Net Cash Flow Method*, as applied to *tangible personal property*, are predicated on the *generation* of an *income stream* to be *capitalized* to derive value.[49] As indicated earlier, this may be accomplished by the assumption of a *lease* of the

[47] *The Appraisal of Machinery and Equipment*, American Society of Appraisers, ASA Monograph #2, Washington, DC, 1969, pp. 47–51.

[48] *Valuing Machinery and Equipment: The Fundamentals of Appraising Machinery and Technical Assets*, 3rd ed. (e-book) (Washington, DC: American Society of Appraisers, 2000), p. 157.

[49] See Chapter 8, "Valuation Approaches and Methods," for a general discussion of these methods.

tangible personal property and begins with the determination of an appropriate *lease payment*, as derived from market-based *transactional* lease data, for the subject asset. It is important to note the *terms* of the market leases used to develop the lease payment for the subject asset. In particular, *capital medical equipment*, for example, linear accelerators or CT machines, may include in the lease a *service/maintenance package*, *supplies*, and, in some instances, *technicians* to operate the machines. That portion of the lease payment *unrelated* to the subject asset, such as the *service and maintenance*, should be *identified*, *quantified*, and *removed* from the *lease payment*. This *pure lease payment* represents the *revenue* generated solely by the subject asset. From this revenue, all expenses to *process* and *maintain* the lease should be *deducted*, resulting in the *net economic benefit* to be capitalized into value. It should be noted that *physical deterioration* and applicable types of *obsolescence* (both of which make up *economic depreciation*) are *not* expenses required to maintain the lease payment and therefore should *not* be *deducted* from the revenue generated by the subject asset. Rather, *economic depreciation* represents the *deficiencies* in the *ability* of the subject asset to *generate revenue*, due to *impairment* in the *utility* of the subject asset, and would manifest in either a *shorter term* of the lease or a *decreased lease payment*.

Once the *net economic benefit* has been determined, an appropriate *capitalization rate* or *discount rate* (depending on the methodology employed) should be determined. Due to the *physical* nature of *tangible personal property assets*, the *discount rate* and the *capitalization rate* may be heavily influenced by the availability of *collateralized* debt used to fund a purchase of the subject asset. As such, the weight of *equity and debt* used to determine the *weighted average cost of capital* for the subject tangible personal property may be *more heavily balanced* toward *debt* than the capital structure of the *healthcare enterprise* that owns or is transacting the subject tangible personal property asset.

In using the *Income Approach*–based *Discounted Net Cash Flow Method*, certain elements of the lease agreement should be used as *guidance* in determining an appropriate *projection period*, including:

1. The *term* of the lease;
2. The *probability that the lease will be renewed*; and
3. The probability that a renewed lease agreement would *include the exact same asset* being leased under the current lease agreement.

In addition, should the lease agreement include a *one dollar buyout provision*, the terminal period tangible personal property asset price should be adjusted to represent *Fair Market Value* and discounted back to the present using an appropriate, *risk-adjusted required rate of return* related to the subject tangible personal property asset.

THE INCOME APPROACH AND TANGIBLE ASSETS

The Income Approach "*is not usually applied to individual items of machinery and equipment unless they are leased.*" This is due to the difficulty in "*determining income that can be directly related to a specific asset, the concern over reliability of income forecasts, and the multitude of variables involved in this*" approach.

Valuing Machinery and Equipment *(Washington, DC: American Society of Appraisers, 2000), pp. 157, 175.*

14.2.2.1.2 Market Approach for Valuing Tangible Personal Property As related to tangible personal property, the *Market Approach* can be briefly summarized as "that approach to value where recent sales and offering prices of similar property are analyzed to arrive at an indication of the most probable selling price of the property being appraised."[50] Similar to the application of the Market Approach–based Guideline Transaction Method to real property, transactional pricing data for comparable tangible personal property asset(s) with homogenous badges of comparability to the subject tangible personal property asset should be identified. This may be achieved by searching new and/or used medical and office equipment dealers, as well as the Internet, for sales or recently sold prices of tangible personal property asset(s) similar to the subject tangible personal property asset(s).[51]

The Market Approach

The approach to value where recent sales and offering prices of similar property are analyzed to arrive at an indication of the most probable selling price of the property being appraised.

Appraising Machinery and Equipment, *edited by John Alico (New York: American Society of Appraisers, 1989), pp. 110–119.*

[50] Robert Svoboda, "Fair Market Value Concepts," in *Appraising Machinery and Equipment* (Washington, DC: American Society of Appraisers, 1989), pp. 110–119.

[51] See Chapter 8, "Valuation Approaches and Methods," for a general discussion of the *Guideline Transaction Method*.

Depending on the characteristics of the comparable tangible personal property asset, for example, condition; date of manufacture; additional/deficient product features; type of sale; or the inclusion/exclusion of the costs of transportation, installation, and assemblage of the asset, an adjustment to the reported transactional price data derived from the market may be required to indicate an asset of similar utility to the subject tangible personal property asset. More consideration should be shown for the transactional pricing data related to those comparable tangible personal property assets with the most homogenous badges of comparability to the subject tangible personal property asset. This adjusted price provides an indication of the Fair Market Value of the tangible personal property asset.[52]

The prices of goods and services change over time, and the valuation date of the appraisal and the comparable market transaction date are most often not the same. Accordingly, the comparable market pricing data may need to be indexed to the valuation date in order to reflect a similar price that would have been paid for the comparable asset as of the valuation date. It is important to note that each type of tangible personal property may experience different levels of inflation, requiring the use of asset specific price indices, for example, medical equipment indices and office equipment indices. This adjustment may be calculated by using price index data compiled in various proprietary databases, such as Marshall & Swift's *Valuation Quarterly*.[53]

14.2.2.1.3 Asset/Cost Approach for Valuing Tangible Personal Property Similar to tangible real property, when valuing tangible personal property using the Asset/Cost Approach, two general metrics may be employed, that is, replacement cost new and reproduction cost new. Replacement cost new is the cost to replace the subject asset with an asset of equal utility, based on current prices as of the valuation date. The reproduction cost new is calculated by applying an appropriate index (or trending factor) to the historical cost of the tangible personal property. This "price indexing" reflects the movement of prices over time and requires price index data such as that provided by Marshall & Swift's *Valuation Quarterly*.[54] The calculation of the reproduction cost new for the subject asset would be calculated as:

$$\text{Re production Cost New} = \frac{\text{Valuation Date Index}}{\text{Acquisition Date Index}} \times \text{Cost of Acquisition}$$

[52] Robert Svoboda, "Fair Market Value Concepts," in *Appraising Machinery and Equipment* (Washington, DC: American Society of Appraisers, 1989), pp. 110–119.
[53] *Marshall Valuation Service* (Los Angeles: Marshall & Swift/Boeckh, LLC, 2013).
[54] Ibid.

As previously mentioned, each type of tangible personal property may experience different levels of inflation, requiring the use of asset-specific price indices, for example, medical equipment indices and office equipment indices, to adjust the historical costs to the present. It should be noted that the market-derived pricing used to determine the replacement cost new for a particular piece of tangible personal property most often includes the required profit margin of the developer of the asset, and the historical cost that is indexed to the valuation date to derive the reproduction cost new typically reflects this profit margin in the historical price paid to acquire the asset. Therefore, the addition of the developer's profit margin to the value derived from either the Replacement Cost Method or the Reproduction Cost Method is typically *not* appropriate when appraising tangible personal property, in contrast to the appraisal of intangible assets that are internally developed by the owner of the asset (as discussed later in this chapter). Also, there is typically no opportunity cost incurred to replace furniture, fixtures, and equipment (FF&E), since most of these assets have established liquid markets, and replacements can be made in a relatively short period of time; however, it should be noted that some specialty equipment may have to be custom made, which may warrant the addition of the lost income of the equipment to the identified direct and indirect costs when appraising the specialty equipment using an Asset/Cost Approach–based valuation method.

Following the determination of the *index price* for the subject tangible personal property, the *economic value* is determined by applying a *devalue percentage* to the *index price* (*reproduction cost new*) to account for *physical deterioration* and various elements of *obsolescence,* that is, *functional*, *technical*, and/or *economic*, based on the *economic useful life* of the subject tangible personal property, the *age* of the subject tangible personal property, the condition of the asset, and the current *capabilities* of similar assets in the market (see Table 14.3).[55] Exhibit 14.3 sets forth an example of the methodology for valuing tangible personal property described earlier.

14.2.2.2 Classification and Valuation of Cash and Investments The *tangible asset* known as *cash*, typically classified as a *financial asset*, is any *medium* of *exchange* that is accepted at *face value*, such as *currency*, *bank checks*, *bank deposits*, or *money orders*. *Cash* is classified on an organization's balance sheet as a current asset, which is an asset that is reasonably expected to be *sold*, *consumed*, *or realized* in cash within an annual period.[56]

8	**Total**				**7**			**$550,540**	**$619,561**			**$198,101**	8
9	**Weighted Average Economic Useful Life (8)**											**5.24**	9

Notes:

1 Classified as Medical Equipment (M) or Office Equipment (O).

2 The acquisition cost and date were utilized to value these line items using the cost approach.

3 *Estimated Useful Lives of Depreciable Hospital Assets: Revised 2008 Edition*, by Health Data Management Group.

4 Equals the quotient of the current index price for type M or O (Column A) and the index at the Acquisition Date (Column G) times the Acquisition Price (Column H). Price index data from Marshall Valuation Service Quarterly Costs Indexes.

5 The Condition Factor accounts for the various elements of obsolescence, i.e., functional, technological, and economic, attributable to the subject tangible personal property asset, and is determined by the VALUATOR based on the following table:

Condition Factor Adjustment	Asset Condition
120%	Excellent
110%	Very Good
100%	Good
90%	Fair
80%	Usable
70%	Poor
5%	Scrap

6 Devaluation percentage represents the physical deterioration inherent in the subject tangible personal property asset and is calcluated based on the Economic Life (Column F) and the Acquisition Date (Column G) and the valuation date (9/30/2012).

7 The Restated Value equals the Indexed Price (Column I) multiplied by the Condition Factor (Column J) with that product then multiplied by the difference of 1 and the Devaluage Percentage (Column K).

8 Equals the weighted average Economic Life (Column F), which is weighted based on Restated Value (Column L) less the difference between the valuation date (9/30/2012) and the Acquisition Date (Column G).

EXHIBIT 14.3 Fair Market Value of Tangible Personal Property Using the Asset/Cost Approach

An entity may have *cash in excess* of the amount currently required by the operations of the business but that may be needed to fund *working capital requirements* in the near future—*usually within one year.* Furthermore, the business may choose to invest this *excess cash* in order to generate a small return, instead of letting it sit idle in the bank. This type of investment is commonly referred to as a *short-term* or *temporary* investment, and would also be classified as a *current asset* to be included in *working capital* calculations.[57] However, an enterprise may purchase *financial assets* with the intention of holding them as an investment for a period longer than one year and not as a ready source of cash. Under these circumstances, the *tangible asset* would be considered a *long-term investment* and should not be considered a *current asset* or part of *working capital.*[58]

Some business enterprises may have an *excessive* amount of *cash* and *short-term investments* than would reasonably be necessary to fund any future *working capital requirements* of the business operations. In this scenario, an analysis should be made to determine whether the *excess cash* should be classified as a *nonoperating* asset that should be excluded from *Income Approach–based valuation methods* selected to calculate the value of the *operating portion* of the subject enterprise. Any *cash* classified as a *nonoperating asset* (including any other tangible personal property classified as a nonoperating asset), having been adjusted out before the implementation of the specific *Income Approach–based valuation method* that was selected, would subsequently be added back to the calculated results of the *operating portion* of the subject enterprise, or, in the alternative, the *nonoperating asset* could be excluded from the analysis altogether.

In addition, should the *scope of the engagement* call for the *exclusion of certain working capital items*, for example, *cash* and *accounts receivable*, the valuation analyst could either remove their consideration from the calculation of *historical working capital* when performing a valuation analysis using an *Income Approach*–based valuation method, or the valuation analyst could subtract the *economic value* of the specified working capital items from the calculated value of the subject enterprise in its entirety, which would have been calculated based on the *historical working capital* without any exclusions, as previously discussed in Section 8.1.1.6.1, "Working Capital Requirements," in Chapter 8, "Valuation Approaches and Methods." It should be noted that *reducing* the *historical working capital* creates an *increase* in the amount of *working capital investment*

[57] Ibid., p. 471.

[58] Ibid., pp. 472–473.

needed to fund operations of the subject enterprise in the future, resulting in a *decrease in cash flow* in the period that the increased working capital investment is made. Also, in the event the *cash* and *accounts receivable* are to be deducted from the end result of the valuation analysis, an appropriate adjustment should be made to reflect the *required rate of return* an investor in the subject enterprise would demand for the *working capital investment*.

As *cash* can be defined as "any medium of exchange that is accepted at face value," the *Fair Market Value* of *cash* is, accordingly, the *face value* of that amount of *cash*. Similarly, *short-term investments* are financial assets that can quickly be exchanged for *cash*. Therefore, the calculation of the value of the short-term investment is the *amount of cash* that the short-term investment may be *exchanged* for, *less* any *fees or expenses* incurred in this conversion.

It should be noted that *long-term investments* may be valued using the *Market Approach–based Sales Comparison Method* or, if an *established, liquid market* does not exist for the *long-term investment*, the *Income Approach–based Discounted Net Cash Flow Method*. Similar to *cash* and *short-term investments*, it is important to determine whether the *long-term investments* carried by the subject entity are *operating assets* or *nonoperating assets* and subject to exclusion from consideration in a valuation of the *subject entity as a going concern*.

14.2.2.3 Classification and Valuation of Accounts Receivable When a subject enterprise bills for services but has *not yet collected payment*, a *tangible asset* known as *Accounts Receivable* is created.[59] Most often, entities that compile their financial statements on a *cash basis* (in contrast to an *accrual basis*) do not report accounts receivable on their balance sheet since this asset represents revenue that has not yet been collected as cash. The *economic value* of the *accounts receivable* will not (except in extraordinary circumstances) equal their face value, because:

1. The stated amount of accounts receivable may represent charges that the entity has contractually agreed to reduce through a series of discounts/allowances to the benefit of the payor and therefore does not reflect the actual amount expected to be received;
2. Revenue has yet to be collected;
3. There may be additional costs associated with collection in order to convert the receivable into cash;

[59] Ibid., p. 40.

4. The probability that 100 percent of the receivable may not be collected, resulting in a credit and collection loss; and
5. Since the time associated with collecting the funds may be several months into the future, an adjustment for the time value of money may be required.

It should be noted that since *accounts receivable* are expected to be collected within one year, they are classified as *current assets* and would be included in *working capital* calculations for determining the value of an entity using an *Income Approach–based valuation method*. However, some engagements may specify that the *accounts receivable be excluded* from the analysis. In these cases, *future working capital projections* would need to take into account the *deficiency* in requisite cash and/or accounts receivable, when performing the analysis using an *Income Approach–based valuation method,* as mentioned in Section 14.2.2.2, "Classification and Valuation of Cash and Investments," and in Section 8.1.1.6.1, "Working Capital Requirements," in Chapter 8, "Valuation Approaches and Methods."

Accounts Receivable may be valued using elements of both the *Income Approach* and the *Market Approach*. For healthcare enterprises, the *Schedule of Aged Accounts Receivable*, which details payment amounts outstanding, as well as the number of days they have been outstanding, most often reports the *gross charges* before *contractual based adjustments* in accordance with certain payor contracts. Accordingly, an *adjustment* is often made to reflect the expected amount of *collectable accounts receivable*.

In addition to the adjustment for contractual allowances, a deduction should be applied to the *collectable accounts receivable* to reflect the *cost of collection*, which can range from 5 percent for receivables less than 90 days old up to 30 percent paid for commissions to collection agencies. The *collectible accounts receivable*, adjusted for the *cost of collection*, should further be discounted for the *time value of money* to reflect the *anticipated* number of days it will take to collect the receivable, based on the *average age* of the accounts receivable. The discount rate applied to the future adjusted receivable amount should be an appropriate *risk-adjusted required rate of return* related to an *investment* in the accounts receivable, typically slightly above the *bank prime rate*. Also, it should be noted that the *accounts receivable* are expected to be collected *evenly* throughout each "*age bucket*," and therefore the *mid-period* of each bucket should be used when discounting the *future collectable receivables* to the *valuation date*. Exhibit 14.4 sets forth the methodology for valuing accounts receivable discussed earlier.

			A	B	C	D	E	F	G	H	I	J	K	L	M	N	
		Notes	0 - 30 Days		31–60 Days		61–90 Days		91–120 Days		121–150 Days		> 150 Days		Total

10	**Indicated Value of Accounts Receivable, Net (Rounded to)**														**$549,000**		10

Notes:

1 Source: Aged Accounts Receivables as of VALUATION DATE.

2 CONSULTANT calcuated a collection rate for the SUBJECT ENTITY utilizing the trailing tweleve months collections to gross charges of 35%, which is in line with industry rates.

3 Equals Line 1 plus Line 2.

4 Adjustment made for projected claims resolution costs of receivables (0-90 days = 5%, 91+ days = 30%; average collection agency cost. Source: American Collectors Association).

5 Equals Line 3 plus Line 4.

6 Equals the percentage of the Net Subtotal (Column M, Line 5).

7 Equals the weighted average days outstanding based on the midpoint of the Age Category and the Percent of Total (Line 6) (Accounts receivable greater than 150 days were considered to be 150 days old).

8 Adjustment made for the Time Value of Money utilizing the number of days outstanding (42.13) and a 3.75% discount rate.
3.75% equals the prime rate of 3.25% as of the VALUATION DATE, plus a premium over the prime rate equal to 50 basis points.
Sources: Federal Reserve Statistical Release as of the VALUATION DATE and American Capital (probable premium over prime rate: http://www.americancapital.com).

9 Equals Line 5 plus Line 8.

EXHIBIT 14.4 Fair Market Value of Accounts Receivable

Factoid

Accrual accounting methods match revenues and expenses to the time period in which they occurred, while cash-based accounting methods record revenues and expenses when they are received or paid.

Understanding Business Valuation: Practical Guide to Valuing Small to Medium Sized Businesses, *by Gary R. Trugman (New York: American Institute of Certified Public Accountants, 2008), p. 633.*

Note that some entities that use *accrual-based accounting methods* compile their financial statements in accordance with *accounting rules* that call for *allowances for uncollectable receivables* (also referred to as *bad debt*). In the case where *allowances* are reported, the valuation analyst may review the *reported allowance amounts* against *actual amounts* written off as bad debt expense in prior periods to assess the reliability of the allowance assumption before applying costs to collect and *time value of money* adjustments.

14.2.2.4 Classification and Valuation of Supplies and Drugs: Consumables and Inventory Held for Sale *Supplies and drugs* that are *consumed* in their use by the subject enterprise (also known as *consumables*) and therefore *do not directly generate revenue* can be classified as *tangible personal property.* While they are not separately sold, these consumables are a *necessary asset* to support the *revenue stream of the subject enterprise*. *Supplies and drugs* that are consumable include *office supplies*, for example, paper, pens, and pencils, as well as certain *medical supplies*, such as localized analgesics for facilitating certain examinations, latex gloves, and cotton swabs.

In contrast to *supplies and drugs* that are *consumables*, those s*upplies and drugs* that are *inventory held for sale* compose a *tangible personal property asset* that directly generates revenue for the subject enterprise.[60] This *held for sale inventory* may include:

1. *Pharmaceuticals*, for example, cancer treatment and infusion therapy drugs;
2. *Marker and identification isotopes* for certain diagnostic procedures;
3. *Antigens and serums*;
4. *Patient prescription drugs*;

[60] Ibid., p. 187.

5. *Prosthetics*, *braces*, and other related *durable medical equipment* (DME);
6. *Medical devices*, which may range from implantable cardiac devices or orthopedic joint replacement to hearing aids;
7. *Eyeglasses and frames*; and
8. *Dental appliances*.

It should be noted that some entities do not state *supplies* and/or *inventories* on their historical balance sheet. With the movement to just-in-time (JIT) inventory supply side policies in healthcare, the conversion of *supplies and drugs* into *cash* is expected to occur *within one year*—either by generating revenue through consumption in the operations or by their direct sale. Accordingly, these *tangible personal property assets* are classified as *current assets* and should be included as part of *working capital*. However, similar to *cash* and *accounts receivable*, an engagement may call for the *exclusion* of *supplies* and/or *inventory*, which would then require the valuation analyst to take into account the deficiency in requisite *supplies* and/or *inventory* needed to support the operations of the enterprise, in forecasting *future working capital projections* when using an *Income Approach–based valuation method*.

Supplies and drugs that are considered *consumables* are often not accurately accounted for on the balance sheet of a healthcare enterprise. As a *proxy* for a *physical count* of the consumables, which may not be easily ascertainable, due to their daily use and reorder, an estimate based on the reported amount of *consumables expense* from the income statement, for example, *Supplies and Drugs Expense*, *Medical Supplies Expense*, may be used to determine the *Fair Market Value* of supplies and drugs. The reported amount, which is typically for an *annual* or *quarterly* period, should be converted into an *expense per day*. This *per day expense* for the supplies and the drugs can be converted into an indication of the *Fair Market Value* of

Factoid

In 2010, the U.S. DME market was approximately $26 billion. With an estimated annual growth rate of 6 percent, it is expected to reach $31 billion by 2013.

"Durable Medical Equipment: U.S. Market Size, Segments, Growth and Trends," Research and Market, *2nd ed., http://www.researchandmarkets.com/reports/1598428/durable_medical_equipment_u_s_market_size (accessed September 7, 2012).*

the supplies and drugs using the *number of days of supplies and drugs* the subject entity maintains for operations, as follows:

$$\text{FMV Supplies} = \frac{\text{Yearly Supply Expense}}{365 \text{ days}} \times (\text{Number of Days of Supplies})$$

As the *age* of the supplies and/or drugs increases, the risk of incurring various elements of *obsolescence* increases, for example, a new and/or higher-quality supply or drug becoming available, and any supply or drug determined to be completely obsolete should be excluded from the analysis. In addition, for certain types of supplies and/or drugs, such as *radioisotopes* used for nuclear imaging or *blood supplies* used for transfusions, it is important that the *number of days of supplies on hand*, used in the *Fair Market Value* calculation, should not exceed the short *shelf life* for these assets.

The *transferability* of these supplies and drugs should also be determined in an analysis of *Fair Market Value*. Certain medicines and drugs may only be legally used by healthcare professionals who are registered with the *Drug Enforcement Agency*. Under *Fair Market Value*, the hypothetical willing buyer must also be registered with the Drug Enforcement Agency in order for those medicines and drugs to hold value.

Supplies and drugs that are *held for sale*, such as *durable medical equipment*, usually have a *longer turnover cycle* than *consumables* and, therefore, the *Replacement Cost Method* used for *consumables* may *not* apply to *inventory held for sale*. Typically, a *Market Approach-based valuation method*, such as the *Sales Comparison Method*, may be more appropriate for these assets, since they may have a more *robust secondary market*.

Similar to other types of *tangible personal property*, the inventory amounts reported on a balance sheet are most often based on the *accounting methods and tax rules*, for example, *LIFO* (last in first out) or *FIFO* (first in first out), in contrast to *financial economic concepts*, and may vary *significantly* from *Fair Market Value*.

14.2.2.5 Classification and Valuation of Furniture, Fixtures, and Equipment (FF&E) Those *tangible personal property assets* known as furniture, fixtures, and equipment (FF&E) include *medical technology and equipment*, as well as *office equipment* and *furniture*. *Trade Fixtures*, for example, articles *fixed* or *attached to the real estate* to conduct the subject entity's business, may also be considered FF&E, so long as the *removal* inflicts *no material damage* to the real estate, which circumstance is defined and enforced either by contract terms or with some statutory variability by state law.[61] As mentioned

[61] Larry L. Perdue, "Fixtures: Realty or Personality?" *The M&E Appraiser* (Spring 1989). Reprinted in *Selected Articles from the Machinery and Equipment Appraiser Journal 1984–1996*, American Society of Appraisers.

earlier, the *use* or purpose of the trade fixture is a determinant in its classification as *personal* property, in contrast to *real* property.

FF&E has been traditionally stated on balance sheets at *historical cost* subject to *accounting depreciation*, in accordance with accounting methods and tax rules, for example, *straight line, double declining balance*, which are most often based on age alone. In contrast to *accounting depreciation*, *economic depreciation* consists of *physical deterioration* and various measures of *obsolescence*. This *variance in depreciation* (between accounting and economic) may cause the *Fair Market Value* of the FF&E to be *substantially different* from the amount reported in the historical financial statements.

In addition, should the *scope of the engagement* call for the *exclusion* of certain FF&E that are necessary to produce the revenue stream of the subject enterprise, the forecast of *future net economic benefit*, used in an *Income Approach–based valuation method*, would need to take into account the *requisite additional capital expenditures* required to *replace* the FF&E being excluded.

As previously discussed, *tangible personal property*, known as *furniture, fixtures, and equipment*, may be appraised using any one of the three basic valuation approaches, that is, the *Income, Market, or Asset/Cost*. However, before an appraisal of FF&E can be developed, an accurate schedule of the FF&E should be created. While many healthcare enterprises maintain *depreciation schedules* for *tax accounting purposes*, the level of detail included in these schedules *may not be sufficient* to perform an appraisal. At a minimum, the following information should be gathered:

1. Description of the asset;
2. Manufacturer and model;
3. Serial number and asset tag;
4. Date of acquisition;
5. Cost of acquisition;
6. Maintenance records;
7. Utilization logs;
8. Lease agreements; and
9. Item location.

A *site visit* of the location where the tangible personal property is stored is warranted to observe the *condition of each item*. During the site visit, it may be useful to photograph each piece of tangible personal property in order to obtain a *visual record* of the items to be appraised.

When using the *Reproduction Cost Method*, as set forth in Section 14.2.2.1.3, "Asset/Cost Approach for Valuing Tangible Personal Property," it may be useful to determine the *date* and *cost of acquisition* for each piece of tangible personal property. This information may be included

in the *general ledger* and/or *depreciation schedule*, as well as in the *original invoices* or *purchase orders*, and may be useful in determining the *date* and *cost of acquisition* for each piece of FF&E. Usually, the *tax preparer*, who also puts together the *depreciation schedule* for *tax accounting purposes*, would be in possession of the original invoices and/or purchase order records. Also, information pertaining to the *condition of the asset* is often found in *applicable maintenance records*, which may be maintained on the premises or should be available from any *third-party maintenance contractor*, if the subject asset is covered by a service agreement. Similarly, *utilization logs* are maintained for certain equipment, for example, CT imagers, which measure their *useful economic life* in hours or number of uses. This data is useful in the determination of depreciation, that is, *physical deterioration*, *functional/technological obsolescence*, *and economic obsolescence*, applicable to the *Reproduction Cost New* calculated for the subject FF&E.

In addition to the *Reproduction Cost Method,* the appraisal of FF&E can be performed using the *Replacement Cost Method*. Under this method, the valuation analyst would determine the value of the subject asset by researching the *current costs* to acquire an asset that provides the same or similar level of utility as that of the subject asset (as previously discussed in Section 14.2.2.1.3, "Asset/Cost Approach for Valuing Tangible Personal Property"). Then applicable *depreciation*, that is, *physical deterioration, functional/technological obsolescence, and economic obsolescence*, based on the variance between the utility of the *replacement proxy* and the utility of the subject asset, would be deducted to derive an indication of value for the subject asset. It should be noted that in the event that the *replacement proxy* is based on *used* prices for comparable FF&E, the depreciation deduction should be less than what the deduction would be if the *replacement proxy* was based on *new* prices for comparable FF&E, all else being equal.

14.2.2.6 Classification and Valuation of Leasehold Improvements The *tangible personal property assets* known as *leasehold improvements* consist of *improvements* made to real estate by a *lessee* and are therefore "*owned*" by the lessee. Note that as to the definition of ownership, the lessee *maintains all economic rights* (including depreciation) related to the *leasehold improvements* only *for the term of the lease*.[62] However, as *leasehold improvements* are *permanently fixed improvements* to the real property, they *revert* to the *lessor's real property interest* at the end of the lease term.[63] Similar to FF&E, the financial reporting

[62] Internal Revenue Service, "Publication 946: How to Depreciate Property," Department of the Treasury, 2011, p. 4.

[63] "2012 US Master Tax Guide," CCH (Chicago: Walters Kluwer Business, 2011), para. 1234.

for *leasehold improvements* traditionally requires the asset to be stated on the balance sheet at *historical cost* and, furthermore, relies on *accounting depreciation* methods to record any devaluage that would occur in the asset over time. Accordingly, the *economic FMV* of the *leasehold improvement* may be substantially different than the amount reported on the balance sheet.

As *leasehold improvements* are not typically *leased* or *sold*, the *Income Approach* and the *Market Approach*, as previously discussed in Sections 14.2.2.1.1, "Income Approach for Valuing Tangible Personal Property," and 14.2.2.1.2, "Market Approach for Valuing Tangible Personal Property," may have limited applicability to a *Fair Market Value* appraisal of these assets. However, the *construction costs* and *date of construction* for the *leasehold improvements* should be readily available and may serve as the *date* and *cost of acquisition* for these *tangible personal property assets* to be used in an *Asset/Cost Approach–based valuation method*, for example, the *Trending Method*. The application of the *Trending Method* to value *leasehold improvements* should use *asset-specific indices* to derive the *reproduction cost new* (*index price*) based on changes in *applicable real property* related indices, for example, *medical office buildings* or *hospitals*, in contrast to the indices used for tangible personal property, which are usually either *medical* or *office equipment* related.

Leasehold improvements created for healthcare properties may be *task specific*, more so than other *tangible personal property*, and may be subject to *functional obsolescence*, due to their specific purpose, and *technological obsolescence* when new technology renders the old technology defunct.[64] The *resale value* (*reversion value*) of a property may be *negatively affected* by the costs associated with *preparing the real property for another use*.[65] For example, a physician's office with leasehold improvements, designed so that the facility is equipped to provide *diagnostic radiology services*, may present a *negative reversion* to the value of the property, due to factors as follows:

1. The exam rooms are *small* and have *ubiquitous plumbing fixtures*, which may not meet applicable building standards for other types of real property dwellings, for example, apartments;
2. The radiology room will have walls, doors, and a ceiling that are *lined with lead*, which local laws may classify as *hazardous waste*, resulting in a far greater cost to remove than would otherwise be the case; and
3. While the enterprise's radiology equipment may be donated and claimed as a tax credit, the *cost of removal* may greater than any potential tax credit that is received.

14.2.2.7 Classification and Valuation of Litigation Awards and Liquidated Damages *Litigation awards*, which are for cases that have already settled, can be in the form of a *tangible economic benefit*, such as *cash*, or an *intangible economic benefit*, for example, *upholding a noncompete dispute. Unsettled legal claims* that present the *potential* for future litigation awards are considered a contingent asset. It should be noted that *litigation awards* and *contingent claims* may be an asset or a liability to the subject enterprise, depending on whether the net economic benefit *accrues to* or is *incurred by* the organization.

The valuation of *litigation awards* and *liquidated damages* most often would entail developing the amounts and timing of the known future *net economic benefits* and discounting them back to the present at an *appropriate risk-adjusted required rate of return*, typically a short-term risk-free rate that encompasses the *time value of money* and maybe a small risk spread to account for any counterparty risk, since the amount of a litigation award is set by legal proceedings. This methodology would be similar to that of valuing *accounts receivable*, discussed in Section 14.2.2.3, "Classification and Valuation of Accounts Receivable."

In addition to the classification and valuation of healthcare-related *tangible* assets, this chapter also sets forth the classification and valuation of healthcare-related *intangible* assets.

14.3 CURRENT AND FUTURE TRENDS REGARDING INTANGIBLE ASSETS UNDER THE FOUR PILLARS: REGULATORY, REIMBURSEMENT, COMPETITION, AND TECHNOLOGY

The increase in *hospital-physician integration* and *transactional activity* during the last decade has led to *enhanced regulatory scrutiny* from the *Office of Inspector General* (OIG), the *Internal Revenue Service* (IRS), and the *Department of Justice* (DOJ), through such initiatives as the *Fraud Enforcement and Recovery Act* (FERA), the *Healthcare Fraud Prevention and Enforcement Action Team* (HEAT) and in certain provisions of the *Patient Protection and Affordable Care Act* (ACA) related to the *legal permissibility* of acquiring *healthcare enterprises, assets, and services*. Significant valuation issues have arisen from these regulatory concerns, including:

1. Establishing the very *existence* of certain *tangible* and *intangible* assets;
2. Whether (and under what circumstances) it is *legally permissible* for hospitals to *acquire* those assets;
3. The selection of the applicable *premise of value*; and
4. The appropriateness of certain *valuation approaches and methods*, within the selected *premise of value*, in appraising the *Fair Market Value* of these property interests.[66]

The *quality of reimbursement yield* that the subject enterprise *receives* for the provision of certain clinical services is often related to those *intangible assets* that the enterprise has in place. For example, those enterprises that use *electronic medical records* may qualify for certain *meaningful use payments* if they meet the applicable requirements.[67] In addition, an enterprise may receive different reimbursement rates for those services provided by various members of its *trained and assembled workforce*, that is, *mid-level providers,* which perform a service *in-lieu* of a physician and usually receive less reimbursement for providing the same service that is performed *incident-to* a *supervising physician*.[68]

---

[66] For more information on these topics, including those elements that the valuation analyst should consider in order to determine that the *intangible asset* being valued *does not reflect* a disguised payment for *referrals,* see Chapter 3, "Regulatory Environment."

[67] See Section 5.2.2, "Electronic Health Records," in Chapter 5 "Technology," for further discussion of this topic.

[68] See Chapter 2, "Reimbursement Environment," for a further discussion of this topic.

Taking the two examples provided earlier, whether the subject enterprise uses *electronic medical records* and consists of a *diverse workforce* will likely significantly affect the enterprise's competitive position in the current shift toward episodes of care and value-based reimbursement initiatives leading to *Accountable Care Organizations* and other integrated models of provider relationships and affiliations. As discussed in Chapter 4, "Competition," Chapter 6, "Healthcare Reform," and Chapter 13, "The Valuation of Other Healthcare-Related Enterprises," those enterprises that are composed of a *large workforce base* and that have an *electronic medical record* system already in place may be in a positive position to participate in these emerging provider organization models, which may allow them to expand their *geographic reach* and *types of services* offered.

In addition to technological advancements related to *electronic medical records* and other *process technologies,* as discussed in Chapter 5, "Technology," advancements in *clinical technology* are important *drivers* of economic value that may be attributed to certain intangible assets of an enterprise. As new technological *innovations* provide new *medical equipment* and *services*, those individuals and enterprises that hold the *market entrance barrier* that provide *access* to the *new technologies* (e.g., Certificates of Need) and the *appropriate skilled personnel* (e.g., a trained and assembled workforce) with the *expertise* and *credentials* (e.g., professional licenses and certifications) to operate the new technologies will likely have a *competitive advantage* over providers and enterprises unfamiliar with, or unprepared for, the technological developments. In addition, new technologies developed by healthcare enterprises and individuals *directly create new intangible assets* in the form of *intellectual property*, which can then be used to *generate* a net economic benefit *directly, through licensing*, or *indirectly*, through growth resulting from the *use of new or higher quality services*.

14.4 CLASSIFICATION AND VALUATION OF INTANGIBLE ASSETS

While there are many definitions describing specifically what an "*intangible asset*" is and is not, many of these definitions are *narrow* in *scope* and were created for a *specific purpose*. For example, past *Generally Accepted Accounting Principles* (*GAAP*) pronouncements, which provide guidance in valuing assets for financial reporting purposes, define *all residual value* of a business enterprise *in excess of* the value of the tangible assets of the business enterprise as *goodwill*, with no distinction between goodwill and

Goodwill

An intangible asset arising as a result of name, reputation, customer loyalty, location, products, and similar factors not separately identified.

Understanding Business Valuation: Practical Guide to Valuing Small to Medium Sized Businesses, *by Gary R. Trugman (New York: American Institute of Certified Public Accountants, 2008), p. 865.*

other intangible assets.[69] In contrast to an *accounting perspective*, intangible assets, from an *economic* and *valuation* perspective, should exhibit certain qualifications. Robert Reilly and Robert Schweihs suggest that intangible assets:

1. *Should be subject to specific identification and should have a recognizable description;*
2. *Should be subject to legal existence and legal protection;*
3. *Should be subject to the right of private ownership, and the private ownership should be legally transferable;*
4. *Should have some tangible evidence or manifestation of [their] existence;*
5. *Should have been created or have come into existence at an identifiable time or as the result of an identifiable event; and*
6. *Should be subject to being destroyed or to a termination of existence at an identifiable time or as the result of an identifiable event.*[70]

In exhibiting the earlier qualifications, an intangible asset represents a *legal bundle of rights* that conveys an *economic benefit* to its *owner* and can be classified into two broad categories: (1) *intangible real property* and (2) *intangible personal property.*

In a manner similar to that of *tangible assets*, the valuation of *intangible* assets is predicated on the economic *Principle of Utility*, derived from the

[69] Patrick R. Delaney, Barry J. Epstein, Ralph Nach, and Susan Weiss Budak, *Interpretation and Application of Generally Accepted Accounting Principles—2003* (Hoboken, NJ: John Wiley & Sons, 2003), p. 389.

[70] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 5.

economic *Principle of Scarcity* and bounded by the economic *Principle of Substitution.*[71]

As previously discussed, a significant majority of healthcare transactions *do not* encompass the *simple acquisition* of a business enterprise, in its entirety, *as a going concern.* Rather, many healthcare transactions present *multiple*, *interrelated*, *transactional* elements and a higher degree of *complexity* than are typically addressed within the scope of a more straightforward *business enterprise in use as a going-concern* valuation assignment. It is within these more complex transactions that the specific *identification*, *classification*, and *valuation* of separately identifiable and distinguishable intangible assets have become a more significant focus of an appraisal assignment.

Methods within each of the three general approaches to valuation, that is, *Income, Market, and Asset/Cost,* should be *considered* when the engagement calls for the valuation of *intangible assets.*[72] Regardless of the *valuation method* chosen for a particular engagement, the valuation of *intangible assets* requires that the valuation analyst perform a sufficient level of *due diligence* to appropriately *identify* the *existence of the intangible*, as well as to *project* the *future net economic benefit* to be derived from ownership of the subject intangible asset(s). Typically, this would entail gathering related information, including the following considerations:

1. The *historical costs* expended in creating the subject intangible asset, for example, *legal, operational, opportunity*;
2. The level of *net economic benefit* accruing to the existing owners; and
3. The *highest and best use* of the subject intangible asset based on the *current use* of the subject intangible asset and the *market potential* for other uses of the subject intangible asset.[73]

Recall that the *Standard of Value* defines the type of value to be determined and is often described as answering the question "*Value to whom?*" Analogous to valuation assignments related to tangible assets, it is also

[71] See Section 14.2, "Classification and Valuation of Tangible Assets," for a discussion of the economic principles guiding the valuation of tangible assets, and see Section 7.1.2, "Utility Theory," Section 7.1.1, "Scarcity," and Section 7.1.2.1, "The Principle of Substitution," in Chapter 7, "Basic Valuation Tenets," for further discussion of each applicable economic principle.

[72] See Chapter 8, "Valuation Approaches and Methods," for further discussion of the three general approaches to valuation.

[73] Robert F. Reilly, "Cost Approach of Health Care Entity Intangible Asset Valuation," *Journal of Health Care Finance* 39, no. 2 (Winter 2012): 7–10.

imperative to *appropriately define* (and have all parties agree to) the *Standard of Value* for assignments regarding the valuation of intangible assets.[74] Typically, for the valuation of healthcare-related enterprises, assets, and services, the standard of *Fair Market Value* is used.[75]

As set forth in the *International Glossary of Business Valuation Terms*, promulgated by the American Society of Appraisers (ASA), the standard of *Fair Market Value* is defined as:

> *The price, expressed in terms of cash equivalents, at which property would change hands between a hypothetical willing and able buyer and a hypothetical willing and able seller, acting at arm['s] length in an open and unrestricted market, when neither is under compulsion to buy or sell and when both have reasonable knowledge of relevant facts.*[76]

As it is used in the healthcare industry, the definition of *Fair Market Value* has been further established through several channels, including:

1. Federal and state legislation;
2. Pronouncements of regulatory and administrative agencies that monitor the compliance of various financial arrangements between healthcare entities; and
3. Relevant case law.

Specifically, the general definition of *Fair Market Value*, as it is used within the healthcare industry, requires that the determination of FMV must not take into account the *volume* or *value* of any *referrals* or other business that the parties may otherwise be in position to generate for the other, either *directly* or *indirectly.* This prohibition on the payment of consideration for referrals is often referred to as the *Volume or Value Standard*, and it governs the vast majority of healthcare-related transactions, including those involving intangible assets.[77]

---

[74] See Section 14.2, "Classification and Valuation of Tangible Assets," or Section 7.2.1, "Standard of Value," in Chapter 7, "Basic Valuation Tenets," for further discussion of *Standards of Value*.

[75] As set forth in Section 7.2.1.1.1, "Requirement for Fair Market Value in the Healthcare Industry," in Chapter 7, "Basic Valuation Tenets."

[76] American Society of Appraisers, "ASA Business Valuation Standards," November 2009, http://www.appraisers.org/Libraries/BV_Discipline/2009_BV_Standards.sflb.ashx (accessed February 25, 2013).

[77] See Section 7.2.1.1, "Fair Market Value," in Chapter 7, "Basic Valuation Tenets," for further discussion of the standard of *Fair Market Value*.

The Premise of Value, which further defines the Standard of Value, within the "the most likely set of transactional circumstances that may be applicable to the subject valuation; e.g., going concern, liquidation," and answers the question "Value under what further defining circumstances?" should be determined at the outset of the engagement.[78]

Due to the various types of *distinct*, *intangible assets*, the future *net economic benefit* to be derived from each one is *not homogenous*. For example, for some intangible assets a *revenue stream* that is *directly* related to that specific intangible asset can be *quantified* and will form the basis for the *economic value* attributable to the *net economic benefit* to be derived from ownership of the intangible asset, for example, a *leasehold interest*. However, many intangible assets will not *directly* produce a *revenue stream* but instead will allow their owner the ability to *reduce or avoid* an *economic operating expense* and/or *economic capital expense*, for example, *development of a trained and assembled workforce*. These *avoided costs*, quantified and projected in a similar manner to a *projected revenue stream*, form the basis for determining the *expected utility* to be derived from the ownership of the subject intangible asset.

Certain intangible assets may not possess the *level of detail and information* necessary to *directly* measure a *revenue stream* or an *avoided cost*. These may require the use of *market comparable* transactional data, with *homogenous badges of comparability* to the subject intangible asset, in order to derive an indication of their value. In addition, *Asset/Cost Approach–based valuation methods* can be used to determine the value of a subject intangible asset, assuming the availability of relevant data to quantify the amount of expenditure incurred historically to develop the subject intangible asset or the cost to replace it with one that provides a similar level of

Avoided Costs

A quantifiable amount of a future necessary economic operating expense that a purchaser will not have to pay on purchasing certain intangible assets, that is, a trained and assembled workforce.

[78] Richard Rickert, "The Principles and Concepts of Valuation: Theory of Utility and Value, Value Influences, and Value Concepts," in *Appraisal and Valuation: An Interdisciplinary Approach, Volume I* (Washington, DC: American Society of Appraisers, 1987), pp. 6–7. See Section 14.2, "Classification and Valuation of Tangible Assets," as well as Section 7.2.2, "Premise of Value," in Chapter 7, "Basic Valuation Tenets," for a further discussion of the impact that the *premise of value* may have on a valuation assignment.

utility. However, the valuation analyst should remember "that cost, price, and value are three separate and distinct valuation concepts[,]" so cost does not necessarily provide an indication of value.[79] This requires that a thorough examination of the specific facts and circumstances related to the subject intangible asset be considered before using an *Asset/Cost Approach–based valuation method* to derive an indication of value. It should be noted that in the event that an intangible assets is *produced internally*, *Asset/Cost Approach–based valuation methods* should consider the *profit incentive* required by an investor in the subject intangible asset for its *development*, as well as the *opportunity cost*, represented by foregone alternative investments, incurred during the period of development, also referred to as an *entrepreneurial incentive*. The *developer's profit margin* and the *opportunity cost* should be added to the *direct and indirect costs* to derive an indication of value when using an *Asset/Cost Approach–based valuation method*.[80] It should be noted that when using a *Replacement Cost Method* based on *market-derived data*, the *developer's profit margin* may already be included in the market-determined *Replacement Cost New*.[81]

In addition to the more commonly recognized valuation methods discussed in Chapter 8, "Valuation Approaches and Methods," there are several less common valuation methods and techniques that may be appropriate to use in valuing certain *intangible assets*.

The *Profit Split Method* is an *Income Approach–based valuation method* that first requires the calculation of the *net economic benefit generated* by the subject intangible asset.[82] This is achieved by arriving at a determination of the *economic operating expenses* associated with generating the *revenue*, as well as the applicable *economic capital expenses* associated with the use of fixed assets requisite for the generation of the *revenue*, which are both subtracted from the revenue to determine the *net economic benefit*. Once the *net economic benefit* attributable to the subject intangible asset has been established, the valuation analyst determines an appropriate

[81] See Section 14.4.2.2.2, "Trained and Assembled Workforce in Place," for an example of appraising a *trained and assembled workforce* where the market data source is assumed to include the *developer's profit margin*.

[82] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 427.

"*profit split*," under the assumption that a third-party owner of the subject intangible asset property *licenses* the *use* of that property for a *percentage* or *split* of the profits. The split is based on the concepts of *risk* and *investment return characteristics*, including an analysis of the *market conditions*, *financial profitability*, and *responsibility of each party.*

The last step in this method is to use an *Income Approach–based valuation method*, for example, a *discounted net cash flow method* or *single period capitalization method*, to calculate the present value of the "*split*" profits allocated to the subject intangible asset to be received in the *future*, that is, the *net economic benefit*, in order to arrive at the indicated value for the subject intangible asset. Note that the *risk-adjusted required rate of return,* used to discount the *future net economic benefit* to the present, should incorporate the *opportunity cost of funds,* as well as *the risk associated with the generation of the revenue by the subject intangible asset.*[83]

It should be noted that in the past, some valuation analysts have relied on the use of the *25 Percent Rule*, attributed to Robert Goldscheider, which dictates that 75 percent of the profit derived from intellectual property (IP) should go to the licensee for its role in the development of the IP, as well as the developer's assumption of operational and commercialization risks, while the other 25 percent accrues to the licensor.[84] Critics of the rule point to its "indefinite level of application[,]" for example, to gross profits or to operating profits, as well as its possible *lack of reliability in withstanding litigation scrutiny* under the standards set forth by *Daubert v. Merrill Dow Pharmaceuticals* and *Kumho Tire Co. v. Carmichael*.[85] Proponents of the rule argue that it can be used as a rough tool, in conjunction with detailed analysis of the specific facts and circumstances associated with the subject intellectual property.[86] Recent empirical tests of the rule, conducted by Gordon Smith and Russell Parr, have confirmed the rule's

[83] See Section: 8.3, "Risk Assessment," in Chapter 8, "Valuation Approaches and Methods," for a more in-depth discussion of identifying and quantifying risk for purposes of determining an appropriate risk-adjusted required rate of return.

Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 412.

[85] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 419; *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, 509 U.S. 579 (1993); *Kumho Tire Co. v. Carmichael*. 526 U.S. 137 (1999).

[86] Robert Goldscheider, "The Classic 25% Rule and the Art of Intellectual Property Licensing," *Duke Law & Technology Review* no. 006 (August 2011): 5–6.

validity generally; however, they point out the wide variation in results by industry and suggest that the rule be used in *conjunction* with other *qualitative and quantitative analysis*.[87] The use of the rule in litigation settings was dealt a setback in the recent case of *Uniloc U.S.A. v. Microsoft Corp.*, which stated,

> *This court now holds as a matter of Federal Circuit law that the 25 percent rule of thumb is a fundamentally flawed tool for determining a baseline royalty rate in a hypothetical negotiation. Evidence relying on the 25 percent rule of thumb is thus inadmissible under Daubert and the Federal Rules of Evidence, because it fails to tie a reasonable royalty base to the facts of the case at issue.*[88]

The *Relief from Royalty Method*, also referred to as the *Capitalized Royalty Income Method*, is a hybrid method incorporating elements of both an *Income Approach* and a *Market Approach*, which seeks an indication of value by assuming that the subject intangible asset could be *licensed* to another party for a fee, known as a *royalty rate*.[89] Note that most texts on the subject consider the *Relief from Royalty Method* an *Income Approach–based method*. The *Relief from Royalty Method* is based on the premise that the owner of the *subject intellectual property interest* would have to pay a third party a *royalty fee* to *license* the *intellectual property interest* in the event that he or she did not *own* the rights to the *subject intellectual property interest*. Therefore, by having ownership of the rights to the *subject intellectual property interest*, the subject enterprise is "*relieved*" of the royalty payments it would incur from licensing the *intellectual property interest* from another party. This reduction in expense serves as the *net economic benefit* derived from ownership of the *subject intellectual property interest*. To calculate this *net economic benefit*, the valuation analyst performs two steps:

1. Determines an appropriate royalty rate for the subject intellectual property interest; and
2. Forecasts the future economic benefits (e.g., revenue or gross profit) attributable to the subject intellectual property interest to which the selected royalty rate is to be applied.

---

[87] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), pp. 421–426.

[88] *Uniloc USA, Inc. v. Microsoft Corp.*, 632 F.3d 1292 (January 4, 2011).

[89] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 428.

To determine an appropriate royalty rate for the subject intellectual property interest, the valuation analyst should compile a list of applicable royalty rates from transactions that include comparable licensing arrangements for similar types of intellectual property interests. In order to establish comparability, the terms of the licensing agreements, as well as the type of property being transacted, should be scrutinized, and only those royalty rates with homogenous badges of comparability to the subject property interest should be selected. The elements of the comparable licensing agreements that should be considered include, but are not necessarily limited to,

1. Current industry conditions, in contrast to those present when the comparable licensing agreement was developed;
2. The uncertainty regarding the ability of the subject intellectual property interest to generate the level of economic benefit exhibited by the comparable intellectual property interest;
3. The age of the subject intellectual property interest in relation to the comparable intellectual property interest; and
4. The stage within the life cycle of both the subject intellectual property interest and the comparable intellectual property interest.[90]

After the *comparable royalty rates* have been identified, the valuation analyst needs to select a rate based on specified *objective* and *subjective* criteria to determine the *future net economic benefit* to be derived from ownership of the *subject intellectual property interest*. In selecting that rate, the valuation analyst could rely on *statistical analysis* establishing the most probable rate from the data sample—for example, *mean, median*, *harmonic mean*—or, in the event the data sample indicates that some of the *comparable royalty rates* are more or less efficacious than others, the analyst may choose to employ a *weighted arithmetic mean*. Once the *first step* to estimate the *net economic benefit* derived from ownership of the *subject intellectual property interest* is completed, that is, the determination of an *appropriate royalty rate*, the *second step* calls for the projection of the *level of economic benefit* of the *enterprise, product, or service* that requires the support of the *subject intellectual property interest*. Depending on the type of *subject intellectual property interest*, this may or may not be an easy task. For example, determining the *level of economic benefit*, such as *revenue*, *gross profit*, to be derived from a *patent* may be more straightforward than

[90] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), pp. 669–674.

determining the *level of economic benefit*, such as *revenue, gross profit*, to be derived from a *trademark*.

After the projection of the appropriate level of net economic benefit generated by the *subject intellectual property interest* has been completed, the valuation analyst then multiplies the *level of economic benefit* attributable to the *subject intellectual property interest* by the *appropriate royalty rate* in order to derive the *net economic benefit* attributable to ownership of the *subject intellectual property interest*. It should be noted that *various* comparable royalty rates may be applicable to *various* levels of economic benefit, for example, *net revenue, gross profit*. The valuation analyst should ensure that the *level of economic benefit* of the royalty rate *selected* is applicable to the *appropriate level of economic benefit* of the *subject intellectual property interest*.

When performing a valuation under the standard of *Fair Market Value*, the analysis considers the *hypothetical universe* of *typical buyers, sellers, owners, and investors* and ***not*** a *specific buyer* or a *specific class of buyer.*[91] Therefore, even though the *purchaser* or the *seller* of *the subject intellectual property interest* may be a *tax-exempt organization*, it is typically assumed that the *net economic benefit*, derived from the application of *comparable royalty rates* to the *subject intellectual property interest*, should be *tax affected*, given that the *hypothetical universe* prescribed by the standard of *Fair Market Value* would include both (1) *tax-paying* entities and (2) *tax-exempt organizations*, which are required to provide charitable services *in lieu of a direct tax*.

After calculating the *after-tax net economic benefit* that will be produced by the *subject intellectual property interest* in the future, the indicated future *after-tax net economic benefit* should be discounted back to the present, using an appropriate *risk-adjusted required rate of return,* which should reflect the *risks* associated with *investing in the subject intellectual property interest*.[92] Note that employing the *Income Approach–based Single Period Capitalization Method* should be limited to only those circumstances where the *after-tax net economic benefit* is determined to be stable in the future. The valuation analyst should instead consider using the *Income Approach–based Discounted Net Cash Flow Method* in the event the *after-tax net economic benefit* is projected to vary substantially in the future. Close attention

[91] See Section 7.2.1.1, "Fair Market Value," in Chapter 7, "Basic Valuation Tenets," for more information regarding the standard of *Fair Market Value*.

[92] See Section 8.3, "Risk Assessment," in Chapter 8, "Valuation Approaches and Methods," for a more in-depth discussion about identifying and quantifying risk for purposes of determining an appropriate *risk-adjusted required rate of return*.

by the valuation analyst is warranted to ensure that the *appropriate discount rate* is employed for the selected method, that is, the *Single Period Capitalization Method* would incorporate the use of the calculated discount rate less the expected long-term growth rate, while the *Discounted Net Cash Flow Method* would incorporate the use of the calculated discount rate value.[93]

The *Trended Historical Cost Method* is an *Asset/Cost Approach*, similar to the *Reproduction Cost Method* used for tangible asset valuation engagements, which starts by identifying the *historical* intangible asset *development* and/or *acquisition costs*, which are then *indexed* to the most *probable* amount anticipated to be expended to reproduce the subject intangible asset *as of the valuation date*.[94] These "*indexing*" adjustments can be made by using appropriate *inflation-based indices*, which are available from proprietary databases such as Marshall & Swift's *Valuation Quarterly* or publicly available Bureau of Labor Statistics data, for example, *consumer price inflation, producer price inflation,* or *employment cost inflation*, relevant to the specific category of identified cost being included in the method.[95] Once the indexed costs have been calculated, any pertinent *age-related deterioration* and various forms of *obsolescence*, that is, *functional*, *technological*, *or economic*, should be deducted from the indexed costs to determine the value of the subject intangible asset. Note that intangible assets do not experience *physical wear and tear* but still may be "used up" over time.[96] This method assumes that the *cost incurred* to create the subject intangible asset can provide an *appropriate indication of value* for the subject intangible asset, which may or may not be the case. It is further assumed that *rational market participants* would *not* expend the costs to create the subject intangible asset unless they were able to earn an *appropriate return on their investment*.

Another consideration when valuing intangible assets is the appropriateness of the application of adjustments, for example, a *discount for lack of marketability* (DLOM), to determine the final indication of value. The concept of a DLOM for intangible assets is not straightforward and has been

[93] See Chapter 8, "Valuation Approaches and Methods," for a general discussion of these methods.

[94] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 427.

[95] *Marshall Valuation Service* (Los Angeles, CA: Marshall & Swift/Boeckh, LLC, 2013). See http://bls.gov/bls/inflation.htm for a description of each inflation index published by the BLS.

[96] Robert F. Reilly, "Cost Approach of Health Care Entity Intangible Asset Valuation," *Journal of Health Care Finance* 39, no. 2 (Winter 2012): 16.

the subject of repeated debate among participants in capital markets, the courts, and the business valuation profession.[97] Intangible assets typically lack *established*, *transparent*, *liquid markets*, where they can be bought and sold in a fully disclosed manner, creating a *deficiency* in a *supportable base* of empirical data on which to establish the size of a discount based on comparing transactions of *freely traded* and *closely held* intangible assets. The concept of applying a DLOM in the context of valuing an intangible asset should take into account whether the *subject intangible asset* is being valued as part of an *assemblage of assets*, which would include those *tangible and intangible assets* that allow for the *full exploitation* of the subject intangible property. In the event that the subject intangible asset is being appraised as a property interest, separate and aside from any other component, a DLOM may be warranted to account for the perceived *deficiency in its value*, due to this lack of assemblage.[98]

It should be noted that payments for intangible assets should be analyzed to ensure that they are not in violation of the restrictions related to the *Anti-Kickback* and *Stark* regulations, which prohibit any consideration being paid, whether direct or indirect, based on the *volume or value of referrals* or other business that the parties may otherwise be in position to generate for each other.

14.4.1 Classification and Valuation of Intangible Real Property

As briefly mentioned in Section 14.2.1, "Classification and Valuation of Tangible Real Property," *intangible real property* may be described as *the legal rights* to *use real estate*, which typically consists of *one or more legal rights* related to the specific *real estate*, but most often does not include all of the *legal rights* related to the subject property. There are numerous types of *intangible real property*, including, but not necessarily limited to, *easements*, *permits, leasehold interests*, *in-place leases, zoning waivers* and *variances*, and *use rights*.[99]

An *easement* is the *right to perform* a *specific action* on a *specific parcel* of real estate, created (1) by *contract*; (2) through *government acquisition*, that is, *eminent domain* (which is further discussed later in this section); or (3) as *a matter of law.* Typical easements include *access* to an *adjoining property* or as a *public right of way.* For example, a hospital may be

[97] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 155.

GENERAL CATEGORIES OF INTANGIBLE REAL PROPERTY

(1) Easements, (2) permits, (3) leasehold interests, (4) zoning waivers and variances, and (5) use rights.

Valuing Intangible Assets, *by Robert Reilly and Robert Schweihs (New York: McGraw-Hill, 1999), pp. 411–412.*

Easement

An interest in land owned by another person, consisting of the right to use or control the land, or an area above or below it, for a specific limited purpose.

Black's Law Dictionary, *9th ed., edited by Bryan A. Garner (St. Paul, MN: Thomson Reuters, 2009), pp. 585–586.*

required to compensate a third party for *use* of certain land as an access point to the hospital's facilities. The property that *gains* the *easement* is known as the *dominant estate*, while the property that is *burdened* by the easement is known as the *servient estate*. In the event that an *easement* is created through *eminent domain*, the *value* of the easement is *calculated* as the *value lost* by the *servient estate*, and *not* the *value gained* by the *dominant estate*. Also, some easements do *not* have a *dominant estate*, for example, *utility access rights*, which impose access for a given utility's infrastructure on a piece of property. Other *easements* include *conservation easements* and *preservation easements*.[100]

Permits are another type of *intangible real property asset* that are derived from a *certification* by a *governmental entity* (usually, a local authority) that *authorizes* the *use* or *development* of real estate and serves as a form of *land-use control*.[101] Examples of *permits* include *occupancy permits* for residential buildings and *building permits* for new developments and typically include an inspection of the building or the property. The economic value

[100] William L. Ventolo and Martha R. Williams, *Fundamentals of Real Estate Appraisal*, 7th ed. (Chicago: Dearborn Financial Publishing, 1998), p. 29.

[101] Jeffrey D. Fisher and Robert S. Martin, *Income Property Valuation* (Chicago: Dearborn Financial Publishing, 1994), pp 200–201.

attributable to a *permit* can be derived from the *cost* and *time* expended to acquire the *permit*. Also, it should be noted that there is some portion of a Certificate of Need (CON) that may appear to relate to *real property,* which would suggest the creation of an *intangible real property asset*. However, as a CON is a precursor to licensing a facility or a service, it is most often considered a *market entrance barrier* related to *tangible personal property*, which suggests the creation of an *intangible personal property asset*.

A *leasehold interest* is a type of *intangible real property asset* that may arise when a *fee simple interest* in real property (defined in Section 14.2.1, "Classification and Valuation of Tangible Real Property") is divided by a lease agreement between a *lessor* and a *lessee*. The *lessor's partial interest* is known as a *lease fee interest*, while the *lessee's partial interest* is known as a *leasehold interest*. An *intangible personal property asset* can be created when the contractually agreed-on lease rate (*contract rate*) is *higher* or *lower* than the *market rate*. In the event that the *market rate* is above the *contract rate*, an *intangible personal property* asset known as a *positive leasehold interest* is created. In the event that the *market rate* is below the *contract rate*, an *intangible personal property asset* known as a *negative leasehold interest* is created.

The circumstances that give rise to the existence of a *negative leasehold interest*, that is, *contract rental rates* being above *market rates*, are typically not sustainable and therefore may not be *transferable*, since the lessee would generally be unwilling to accept an *above market rental rate* on *renewal* of the contract. However, there may be *additional value derived* for the lessee from the *specific location* or *other element of value related to the specific piece of real estate* that provides that lessee with enough utility to validate the continuance of the *negative leasehold interest*. For example, an *established professional practice* may derive an economic benefit *greater* than the amount expended for a *negative leasehold interest* from maintaining the same *geographic proximity* to its *existing patient base* or the convenience of the proximity to a hospital at which it provides services, such as coverage and call.

In addition, depending on the rights granted in a specific lease agreement, a similar *leasehold interest* may be created by a *sublease* agreement between a sublessor (the lessee of the lease fee interest) and a sublessee.[102] However, the economic valuation of *subleasehold* should consider that this type of *intangible real property asset* is typically subject to the approval of the lessor, which may warrant an adjustment to reflect an appropriate *discount for lack of marketability* for the asset.

---

[102] *The Appraisal of Real Estate*, 12th ed. (Chicago: Appraisal Institute, 2001), pp. 81–85.

The *intangible asset* commonly referred to as an *in-place lease* represents the value of having *existing tenants* and *contractually based lease income*, which is separate and aside from any value arising from *favorable lease rates*, that is, *leasehold interests*.

Zoning ordinances may represent another type of *intangible real property assets*. The *development* of real estate is subject to *conforming* to existing *zoning ordinances* that have been established by state and local government entities to *regulate land use*. Three broad categories of land zones include (1) *residential*, (2) *commercial*, and (3) *industrial*. These *restrictions* may include the *height and size of buildings*, *lot coverage*, *unit number*, *parking requirements*, and *setbacks*.[103] However, a developer may obtain a *variance* of certain restrictions or a *waiver* of an entire restriction. A *zoning waiver* or *zoning variance*, often referred to as a *special use permit*, is typically *applied from* and *approved by* a land use committee and may represent a *restriction* on the *highest and best use* of the subject property. Correspondingly, a *waiver* of a *zoning ordinance* removes this *restriction*, returning the property to its *highest and best use*.[104]

The economic value of the *zoning waiver* or *zoning variance* is the value of the *highest and best use* of the subject property *with* the waiver or the variance, *less* the value of the *highest and best use* of the subject property *restricted* by the *zoning ordinance*. An example of value attributable to a *special use permit* is a *nursing home facility* that has received such a permit to *exceed* population density for the given parcel of land that it occupies, which provides for a significantly *higher patient bed day revenue* than might be achieved under the *occupancy density provision* of *existing zoning ordinances*.

Use rights are another form of *intangible real property*, which include *water use rights*, *mineral and drilling rights*, *air rights*, and *subterranean rights*.[105] Depending on the type of *use right* considered, the economic value may be *quantified directly* through the *generation* of certain *revenues* (e.g., mineral rights) or may be quantified *indirectly* through the *change in value* of the *subject property* (e.g., water rights), similar to an easement. Another potential *use right* may be a *lease* whereby a hospital grants the use of an adjoining parcel of land to a physician practice for the development of an outpatient clinic. It should be noted that the *use right* granted by a lease is separate and aside from the intangible real property associated with *leasehold interests* or *in-place leases*.

---

[103] Ibid., p. 194.

[104] See Chapter 7, "Basic Valuation Tenets," for further discussion of the economic principle of *highest and best use*.

[105] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 412.

USE RIGHTS

Use rights of real estate include specific interests in a specific aspect of the real estate. Typical use rights include water use rights, mineral and drilling rights, air rights, and subterranean rights.

Valuing Intangible Assets, *by Robert Reilly and Robert Schweihs (New York: McGraw-Hill, 1999), p. 412.*

A particular attribute of *intangible real property* is that its existence can be *created*, *shaped*, or *even destroyed* by government intervention, for example, *eminent domain* or the government's *police power.*[106] *Eminent domain* and *police power* both have their source in the *authority* of the *community* to act in the *public good*; however, *police power* is restricted to the *use* of the real property, while *eminent domain* rises to the level of *taking* the real property. As such, the *use* of a *real property interest* through a *police power*, such as a *zoning requirement*, is *noncompensable*, while the *taking* of *a real property interest* through *eminent domain* is *compensable.*[107] An example of how these various types of intangible real property interest may be essential to a healthcare provider is the case of a *large, tertiary care hospital, with a regional trauma center*, being confronted by *new highway interchange construction*, with the *loss* of a small amount of its *campus land footprint*, as well as a *restriction on highway access* in regress/egress patterns. While the small amount of land acreage to be *taken for highway expansion* might have been more simple for appraisal on a *land cost per acre basis*, the result of the *taking* would have been to *reduce the overall land footprint* of the hospital campus to a degree that might *prohibit future expansion*, for example, the addition of clinical outpatient facilities and medical office buildings. Accordingly, the value of the *real property interest compensable* due to the *taking by eminent domain* would include not only the *tangible real property* but also the *future use of the remaining parcels.*

The valuation of *intangible real property* is often closely related to the valuation of the *underlying real estate*, which approaches and methods are discussed in Section 14.2.1.1, "Tangible Real Property Valuation Methods." Specifically, the use of any of the three basic approaches to valuation, that is,

[106] J. D. Eaton, *Real Estate Valuation in Litigation*, 2nd ed. (Chicago: Appraisal Institute, 1995), pp. 46–48.

[107] Ibid.

the *Income*, the *Market*, or the *Asset/Cost*, may be used, depending on the *availability* of *sufficiently reliable data* to perform the methods prescribed by each valuation approach.

14.4.1.1 Income Approach for Valuing Intangible Real Property While *Income Approach–based valuation methods* may not be applicable to all *intangible real property assets*, they may be the most pertinent methods of valuation for certain assets, such as *leasehold interests*, *permits,* and/or certain *use rights*.

For example, to develop the valuation of a *leasehold interest*, the valuation analyst determines an appropriate "*market rental rate*," which most often would require the use of a *Market Approach–based valuation method* to derive *rental rates* for real estate assets similar to the subject real estate assets. These may be found in lease agreements for real property with similar terms to that of the subject real estate lease agreement, that is, based on *homogenous badges of comparability.* Once the *market rental rate* has been established, the valuation analyst would calculate the *variance* between the *contract rental rate* and the *current market rental rate* to determine the *future revenue stream* attributable to the *positive (negative) leasehold interest* to be used in an *Income Approach–based valuation method*, for example, the *Discounted Net Cash Flow Method*.

Under the *Discounted Net Cash Flow Method*, the revenue stream, that is, the difference between the *current market rental rate* and the *contract rental rate*, would be projected over the life of the contract (and beyond, if it is determined that the lease agreement would be renewed under similar circumstances). Then, any applicable *economic operating expenses* or *economic capital expenses* incurred to derive the *revenue stream* would be applied, and this *adjusted revenue stream* would serve as the *future net economic benefit stream* attributable to the *leasehold interest*. This *future net economic benefit stream* would be *discounted back* to the valuation date, using an appropriate *risk-adjusted required rate of return*, in order to determine the value of the *leasehold interest*.

The appropriate *risk-adjusted required rate of return* for the *leasehold interest* should reflect:

1. The *opportunity cost of funds*, since investors in a *leasehold interest* could also have invested those funds in a *risk-free* investment and generated a return; and
2. The *specific risk of the investment*, including, but not limited to,
   a. *Uncertainty* as relates to the *comparability* of the agreement terms between those of the market data and those of the subject real estate lease agreement;

b. *Uncertainty* regarding the *efficacy* of current market data as an *indication of future lease rates*, causing *uncertainty* in the ability to achieve the forecasted amount of revenue in each period;
c. *Ability of the purchasing party to enforce* the terms of the lease agreement; and
d. *Uncertainty* regarding any changes in the value of the *underlying real estate assets*, due to unexpected *physical deterioration and/or functional*, *technological*, *or economic obsolescence* that would affect the *contractual rental rate*.

Once the value of the *future net economic benefit stream* related to the *leasehold interest* has been discounted to the valuation date, an analysis should be performed to determine whether there are any appropriate adjustments, such as a *discount for lack of marketability* or a *control premium*. Typically, in the event the *discount rate* used in an *Income Approach–based valuation method* includes the investment returns of *public traded companies*, it is assumed that the calculated result represents that of a *freely traded basis*, in contrast to a *closely held basis*, and therefore may warrant a *discount for lack of marketability.*[108]

In addition to *leasehold interests*, *permits* and certain *use rights* that generate a *revenue stream* may also be valued using an *Income Approach–based valuation method*. The valuation methodology related to these *permits* and *use rights* would be similar to that of *leasehold interests*, that is, determination of *the future net economic benefit* and then development of an appropriate *risk-adjusted required rate of return* to be used to discount the future cash flow to the present value, as discussed earlier.

14.4.1.2 Market Approach for Valuing Intangible Real Property

Market Approach–based valuation methods typically provide an indication of value based on *transactions* of property interests *similar* to that of the subject intangible asset. However, as is the case with many intangible assets, an *established*, *transparent, liquid market* for *intangible real property* may not exist, thereby rendering the *Market Approach* an inappropriate valuation methodology. In those circumstances in which a market for the subject asset *does exist*, and this market is *established*, *liquid*, and *transparent*, it is important to ensure that

1. The reported transactions are from *reliable sources*;
2. The market information represents negotiations at *arm's length*; and

[108] See Section 8.4, "Discounts and Premiums," in Chapter 8, "Valuation Approaches and Methods," for more information regarding the application of various discounts and premiums.

3. The selected transactions are based on *homogenous badges of comparability* to the subject assets, in order to provide a relevant indication of value for the subject property.

Market Approach–based valuation methods used for valuing *intangible real property* usually begin with the development of the *search criteria* for the subject assets, for example, *type*, *risk profile*, and *relative and absolute location*, which are referred to as *homogenous badges of comparability.* Once the search criteria are established, a list of *comparable transactions* is aggregated, with certain *adjustments* made to provide a *greater degree of comparability* between the *subject asset* and the *transactional data*. From the aggregated, adjusted transactional data, appropriate *relative pricing metrics* are derived for the subject intangible asset to calculate an indication of value. For example, a *Market Approach–based valuation method* is often used to determine *comparable lease rates* for use in determining the *net economic benefit stream* related to a *leasehold interest*, as discussed in Section 14.4.1.1, "Income Approach for Valuing Intangible Real Property."

As stated earlier, some *intangible real property assets* may *not* have a *robust*, *liquid*, and *transparent marketplace* from which *comparables* can be aggregated, and, accordingly, these assets *cannot* be valued *directly* using a *Market Approach–based valuation method*. However, both the underlying *real estate* and the underlying *real estate without the subject intangible asset* may have a *robust, liquid*, and *transparent marketplace* from which comparables may be aggregated and may therefore be valued using a *Market Approach–based valuation method*. In this circumstance, the value of the *intangible real property* may be indirectly determined by analyzing the *variance* in the *value of the real estate* and the *value of the real estate without the subject intangible asset*, known as a "*with-and-without*" analysis.[109] For example, a hospital may provide a *land lease* to a physician group practice that wants to build a medical office building in *close proximity to the hospital.* These *land leases* may incorporate a *competitive restriction* that bars the physician group from performing the types of ancillary services provided by the hospital, for example, MRI, operating rooms, without (1) the hospital's *prior approval* or (2) the hospital first being offered the *opportunity to co-venture*. The value of the lease of the medical office building *with the restriction* could be compared to the value of another lease for a medical office building with similar attributes and

[109] See Section 8.2.6, "With and Without Analysis," in Chapter 8, Valuation Approaches and Methods," for further discussion of this alternative valuation technique.

characteristics as the restricted property, such as amenities, square footage, and geographic proximity to a comparable hospital, *without the restriction*. The difference in value between the two property interests would provide an indication of value for the restriction. In the event that there is ***not*** a restriction on the property interest, and the *comparable medical office building* has similar attributes and characteristics to the *subject medical office building*, *except* that it is ***not*** in *close geographic proximity* to a comparable hospital, the difference in value between the two property interests would provide an indication of value of the *location-related intangible real property interest*.

14.4.1.3 Asset/Cost Approach for Valuing Intangible Real Property The valuation of *intangible real property* using an *Asset/Cost Approach-based valuation method* would entail the determination of the *requisite input* necessary *to reproduce* the subject property or *replace* the subject property with *intangible real property* that would provide the same or similar utility. For example, the valuation of *in-place leases* based on a *Replacement Cost Method* entails (1) estimating the *carrying costs* incurred during the hypothetical time it would take to find a tenant for the subject property, for example, *real estate taxes*, *insurance*, and *other operating expenses*; and (2) the *current costs to execute a similar lease*, for example, *legal fees, legal commissions, due diligence costs*, and *other related expenses*.[110] Note that the *carrying costs* represent *opportunity costs*, while the *costs to execute* a similar lease may already include the profit required by the owner of the lease contract. Therefore, no additional costs may be warranted to determine the value of the *in-place lease intangible asset*, using an *Asset/Cost Approach–based valuation method*.

Once the appropriate amount of *carrying costs* and *costs to execute a similar lease* has been determined, these amounts should be aggregated to provide the *ceiling of value* of the *in-place lease, intangible real property asset*. From this *ceiling of value*, applicable amounts of *depreciation*, that is, *physical deterioration*, *functional/technological obsolescence*, *and economic obsolescence,* if any, should be deducted.

It should be noted that a similar methodology could be employed for other types of *intangible real property*, for example, *certain types of agreements*, *permits*, *licenses*, and to the extent they relate to intangible real property, in contrast to intangible personal property, *Certificates of Need,* which are more thoroughly discussed in Section 14.4.2.7.2, "Certificates of Need."

[110]Excerpt from the 10-K filing for the fiscal year ending December 31, 2011, of Caplease, Inc.

14.4.2 Classification and Valuation of Intangible Personal Property

Intangible personal property encompasses all of those *intangible assets* that are *not* classified as *intangible real property*, including those in the following categories:

1. Payor/client relationships;
2. Human capital;
3. Intellectual property;
4. Operations of the enterprise;
5. Governance or legal structure of the enterprise;
6. Marketing and business development;
7. Regulatory or legal-related assets;
8. Financial condition/revenue stream of the enterprise;
9. Technology developments;
10. Patient-related assets; and
11. Goodwill.

As with any asset or service, the *economic value* analysis related to *intangible personal property* should be focused on the economic benefits *reasonably* expected to be *derived* from the *use* or *utility* of the subject intangible asset *in the future,* bounded by the *cost of an equally desirable substitute*, that is, one providing the *same or a similar level of utility*, for each of the elements of *economic benefit* (or *utility*) to be derived from the *ownership of*, or the *rights to control*, the *subject intangible asset*. This requires that a *detailed examination* of the *attributes* of the subject intangible asset be undertaken, with each element first *identified as to its existence* and then *classified* as to the *specific factors and traits* that would *exhibit* the means by which the subject intangible asset would reasonably be expected to provide *utility* to an owner of the property interest *going forward*.

14.4.2.1 Classification and Valuation of Payor- or Client-Related Intangible Assets

Intangible personal property, which may be classified as *payor/client-related*, are those property rights created by certain contractual terms included in various types of agreements, for example, *managed care agreements*, *provider service agreements*, and *HMO enrollment lists*.[111]

Similar to most intangible assets, *payor- and customer-related intangible assets* generally lack *established, transparent*, *liquid markets* with

[111]William H Black, "Valuing Professional Practices—Thorny Challenges," *Analytical Value, LLC*, 2006, p. 25.

homogenous badges of comparability to the subject intangible asset, eliminating the ability to rely on a *Market Approach–based valuation method*.

The valuation of *payor- and customer-related intangible assets* may be based on an *Asset/Cost Approach–based valuation method*. This would include the *Replacement Cost Method*, which in a similar manner to that of valuing tangible personal property, uses the current costs to *re-create* an intangible asset with the same or similar utility to the subject intangible asset to derive an indication of value, as well as the *Trended Historical Cost Method*.[112]

14.4.2.1.1 Managed Care Agreements and Provider Service Agreements *Managed care agreements* may provide the subject enterprise with a reliable, *continued revenue stream*, which may reduce the *volatility* of its *future net economic benefit stream*, thereby creating additional value. In addition, *provider service agreements* (PSAs) can provide the subject healthcare enterprise with a *competitive advantage* through organizational stability, operational efficiencies, and patient convenience. An example would be a *hospital-based anesthesia group* that is a party to a *provider services agreement* under which it is the *exclusive provider* to the hospital's procedure/surgery rooms and other cites of anesthesia services, such as inpatient and outpatient pain management. *Hospital agreements* that provide groups of physicians with *preferred block scheduling times* in hospital operating rooms or diagnostic clinics may also provide value, in that they offer the same type of competitive advantage.

Provider service agreements and *managed care agreements* may be valued using an *Income Approach–based valuation method*, for example, a *Discounted Net Cash Flow Method*, incorporating a *With and Without Technique*.[113] The basic methodology would be to value the subject enterprise using the *Discounted Net Cash Flow Method* under two scenarios: one *with* the agreement(s) in place and another *without* the agreement(s) in place, whereby the *variance* between the two scenarios would serve as an indication of value for the subject intangible asset.[114]

Provider service agreements and *managed care agreements* may also be valued as separate intangible assets, using an *Income Approach–based*

---

[112] See Section 14.2.2.1.3, "Asset/Cost Approach for Valuing Tangible Personal Property," for further discussion of the *Replacement Cost Method* related to tangible personal property. See Section 14.4, "Classification and Valuation of Intangible Assets," for further discussion of this method.

[113] See Section 8.2.6, "With and Without Analysis," in Chapter 8, "Valuation Approaches and Methods," for a discussion on the implementation of this technique.

[114] See Section 8.1.1.2, "Discounted Net Cash Flow Method," in Chapter 8, "Valuation Approaches and Methods," for further discussion of this method.

valuation method, if the *elements* of the *net economic benefit*, that is, *associated revenue*, *economic operating expenses*, *and economic capital expenses*, are readily available or easily estimated. The *risk-adjusted required rate of return* for the separately identified and valued *provider service agreement* or *managed care agreement* should reflect the risks inherent to an investment in that *subject intellectual asset*, which may be different than the risks inherent in an investment in the *subject enterprise*.[115]

14.4.2.1.2 HMO Enrollment Lists Participation in *HMO enrollment lists* may provide healthcare professional practices and other providers with access to a stable revenue base from premiums generated by *a specific patient base*, that is, the *per member per month* (PMPM) payments for a block of HMO enrollees to which they otherwise may not have access.[116] These assets may be valued using a *With and Without Technique*, in conjunction with an *Income Approach–based valuation method*.[117]

14.4.2.2 Classification and Valuation of Human Capital–Related Intangible Assets *Human capital*, in contrast to *financial* or *physical capital*, consists of the investments in *education*, *training*, and *medical care* that are not separable from the person receiving the benefit and therefore do not have *physical form* in the same manner that *financial* and *physical capital* do.[118] This concept is embodied in the definition of *human capital* by Gary Becker, as follows:

> *Schooling, a computer training course, expenditures on medical care, and lectures on the virtues of punctuality and honesty are capital too in the sense that they improve health, raise earnings, or add to a person's appreciation of literature over much of his or her lifetime. However, these produce human, not physical or financial, capital because you cannot separate a person from his or her*

[115] See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for further discussion of these methods.

[116] See Chapter 2, "Reimbursement Environment," for the discussion of HMO-related payments.

[117] See Section 8.2.6, "With and Without Analysis" in Chapter 8, "Valuation Approaches and Methods," for a discussion on the implementation of this technique, and see Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for further discussion of these methods.

Human Capital–Related Intangible Assets

Includes staff/employee and provider employment agreements, trained and assembled workforce in place, policies and procedures, and depth of management.

Intangible Assets: Valuation and Economic Benefit, *by Jeffrey A. Cohen (Hoboken, NJ: John Wiley & Sons, 2005), pp. 24–26.*

> *knowledge, skills, health, or values the way it is possible to move financial and physical assets while the owner stays put.*[119]

In the healthcare industry, those *intangible personal property assets* that may be classified as *human capital–related* include *staff/employee* and *provider employment agreements*, *trained and assembled workforce in place*, *noncopyrighted policies and procedures*, and *depth of management*.

The application of *economic principles* to support the *existence* of *value* that may be attached to certain *human capital–related* intangible assets, for example, a *trained and assembled workforce in place*, is becoming increasingly important in healthcare valuation, as it is throughout the economy, a circumstance confirmed by Bianchi and Labory, to wit:

> *The capital of a firm is less and less identifiable with its machines, buildings, and physical structures. It is increasingly related to the firm's capacity to combine skill, dexterity and judgment in an organization capable of operating in terms of work to be done. This latter form of capital has an intangible nature and depends therefore on the valuation attached to it by the market.*[120]

Human capital–related intangible assets are most often valued using *Asset/Cost Approach–based valuation methods*, for example, the *Replacement Cost Method*. Under this method, the cost to construct, at *current* prices, an intangible asset providing *equal desirability* and/or *equivalent utility* as the subject intangible asset is determined. Some have suggested that *human capital–related intangible assets*, specifically a *Trained and Assembled Workforce in Place* (TAWF), do not hold *Fair Market Value* (FMV) in

[119] Ibid.

[120] Patrizio Bianchi and Sandrine Labory, eds., *The Economic Importance of Intangible Assets* (Burlington, VT: Ashgate, 2004), pp. 28–29.

the event that the subject enterprise in which they reside, do not generate a *positive economic cash flow* and therefore cannot support a premise of value of *value-in-use*, *as a going concern* for the enterprise. This notion is incorrect; however, as under the *Principle of Substitution* and the valuation premise of *value-in-exchange*, the FMV of TAWF would be equal to the *cost of acquiring* an *equally desirable substitute* or one of *equal utility.* Under the premise of *value-in-exchange*, the avoidance of the costs *recruiting*, *hiring*, and *training* both the physician and the nonphysician staff forms a basis of economic FMV.

As previously mentioned, an *economic benefit*, supporting an indication of value, can be the result of *either* (1) an *increase in revenue* or (2) a *decrease in expenses*. The *avoidance* of an expense positively affects the *net economic benefit* flowing to the owner of an asset and, similar to directly improving revenue, a *prudent investor* would be willing to pay to receive the *anticipated benefit* of this *cost reduction.*

14.4.2.2.1 Employee and Provider Employment Agreements *Employee and provider employment agreements* provide *certain assurances* as to the expectation of the *continuity of those elements of the employment relationship*, which make up the *human capital* that adheres to the individual person, however defined under the terms of the agreement, that is to be *transferred* to the *financial and economic benefit* of the enterprise with whom the individual has contracted.

These types of agreements are most often valued using *Asset/Cost Approach–based valuation methods.*[121] When one is using these methods to value intangible assets that are developed internally by the subject enterprise, a *developer's profit margin*, which reflects the *financial incentive* required for the owner of the asset to produce the intangible asset, may be an appropriate addition to the *direct/indirect costs* and *opportunity costs* associated with *re-creating/reproducing* the subject intangible, as discussed in Section 14.4.[122]

14.4.2.2.2 Trained and Assembled Workforce in Place The determination of value attributable to the *human capital–related intangible asset* known as

[121] See Section 14.2.2.1.3, "Asset/Cost Approach for Valuing Tangible Personal Property," for further discussion of the basic elements involved in using a *Replacement Cost Method* to appraise tangible personal property, which methods may be similar to the valuation of *employee and provider employment agreements*.

[122] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 124.

trained and assembled workforce in place (TAWF) is a growing activity for healthcare valuation professionals. As defined by Elizabeth King, PhD, in the book titled *Valuation of Intangible Assets in Global Operations*:

> *An assembled workforce consists of a set of relationships between a firm and its employees (Smith and Parr, 1994: 89). Its value derives from the fact that these relationships are costly to establish in the first instance. From the standpoint of the firm, such costs include both the opportunity cost of time spent forging the necessary relationships and imparting the necessary training, and the explicit recruitment and training costs that it incurs in the process (Becker, 1964: 33).*[123]

King goes on to state that

> *explicit costs [of assembling a workforce] include: (1) outlays for services performed by executive recruiters, (2) the opportunity cost of time spent by in-house professionals whose efforts would temporarily be diverted from directly productive activities to workforce replacement activities; and (3) one-time recruitment costs, such as signing bonuses, relocation expenses, and the like.*[124]

The *existence of* and determination as to the *Fair Market Value* attributable to the intangible asset represented by a *Trained and Assembled Workforce* (TAWF), as *discrete*, *separate*, *and distinct* from other *intangible assets* and possessing *economic utility* by virtue of the *right to control* employees as the *means of production*. This concept is illustrated in well-documented and settled bankruptcy law, even in *insolvent*, *nonoperating companies* where there is no evidence that the business would have value under the premise of *value-in-use, as a going concern.*[125] Even in the absence of a *positive net cash flow* and/or the *existence of goodwill*, the property interest related to TAWF has been held to exist and, furthermore, to be transferable, thereby possessing economic value. In the event that there is *insufficient net cash flow* to support the value of the invested capital of the subject

Factoid

A trained and assembled workforce is distinguished by (1) the physicians' and other healthcare providers' workforce and (2) the non–healthcare providers' workforce.

enterprise under the premise of *value in-use*, the *highest and best use* and, therefore, the *Fair Market Value* of the TAWF are established under an alternative *valuation premise* known as *value-in-exchange*, in which event the *Fair Market Value* is *conditioned* on (1) both an *assemblage* and the *probability* of *retention* of the workforce and (2) the *existence* of an *agreement* specific to a transaction involving the transfer of the TAWF. In the *absence* of these conditions, the bankruptcy courts have held that where employees are subsequently employed by a purchasing organization, without their *retention* having been a part of the *purchasing agreement*, the TAWF *cannot* be viewed as an intangible asset subject to claims of *fraudulent conveyance*.[126]

James Hitchner, CPA, ABV, ASA, explains,

> *By acquiring fully trained personnel, the buyer avoided the expenditures associated with hiring and training equivalent personnel. The value of the assembled workforce is represented by the assemblage cost avoided. Therefore, the cost approach is the most applicable valuation approach to value this asset.*[127]

In using *Asset/Cost Approach–based valuation methods*, such as the *Replacement Cost Method*, to value a *Trained and Assembled Physician Workforce*, each and every cost related to *replacing* the intangible asset should be *quantified*. These costs include those incurred to hire and train a replacement workforce, as well as the opportunity cost of having less productive staff during the replacement period.

The first cost to consider is that of *Efficiency Costs*, which represent the difference in value derived from variances in productivity between a trained staff and the equivalent replacement staff. The calculation of *Efficiency Costs* begins with an *Industry-Indicated Salary* for each physician

[126] See *Atchison, Topeka & Santa Fe Ry. Co. v. Brown & Bryant, Inc.*, 159 F. 3d 358, 361, 365 (9th Cir. 1997).

[127] James R. Hitchner, *Financial Valuation: Applications and Models*, 3rd ed. (Hoboken, NJ: John Wiley & Sons, 2011), p 937.

based on the *Fair Market Value* (FMV) of his or her productivity, which is determined by using normative industry benchmark survey data for the specialty of the physician. Estimated FMV *Total Annual Benefits* are then added to the *Industry-Indicated Salary* to determine *Annual Employment Cost*. *Annual Employment Cost* is then used to calculate the projected *Efficiency Costs*, based on the estimated amount of time it would take the *replacement workforce* to produce output at a similar level as the subject workforce. *Efficiency Costs* can be developed from applicable market evidence regarding the timing and amount of productivity for newly hired physicians and should reflect the *projected efficiency* during the specified ramp-up period, for example, 80 percent of full productivity during the first four weeks of employment, 90 percent in weeks 5 to 8 of employment, and full productivity (100 percent) thereafter.

The next costs to consider when appraising TAWF using the *Replacement Cost Method* are *Recruiting Costs*, which can be reflected in either (1) the cost incurred by the subject enterprise to *internally* recruit and hire the workforce or (2) the cost incurred by the subject enterprise to *outsource* the recruiting and hiring functions. In the event that the *Recruiting Costs* included in the *Replacement Cost Method* are those that are incurred *directly* through the internal recruiting and hiring by the subject enterprise, the addition of an appropriate rate of return on the cost of those activities, similar to the profit margin required by a third-party staffing company, may be appropriate. However, should the *Recruiting Costs* be developed based on *market research* of the costs charged by third-party staffing companies, it may be assumed that the required profit margin of the staffing company is fully represented in the stated price for its services.

These *Recruiting Costs* are then added to *Efficiency Costs* (see earlier discussion) to determine the *Total Cost per Employee*. *Total Cost per Employee* should be adjusted for the anticipated level of employee turnover, similar to the physical deterioration of a tangible asset. The *Total Cost per Employee* should also be adjusted to reflect any anticipated *functional obsolescence* and/or *economic obsolescence* (if they exist). In the case of a TAWF, *functional obsolescence* refers to the decrease in value of the *task*, *duties*, *accountabilities*, *and responsibilities* (TDRAs) provided by the TAWF—for example, requisite skill sets change over time and may require additional future training—and/or due to technological advancements in the future, less skilled staff may be able to be replaced with higher skilled staff at a similar cost to the subject enterprise. *Economic obsolescence* related to a TAWF refers to events or circumstances not particular to the TAWF that cause a decrease in its value, for example, an *economic recession* that causes the value of all assets to decrease.

The concept of *economic obsolescence* should be considered under the notion of *highest and best use* for the asset.[128] Accordingly, even though the existing owner of the TAWF has not been able to generate *sufficient net cash flow* from the asset, this does not mean that other potential users of the asset would not be able to derive *net economic benefit* from ownership of the asset. In the example of the valuation of TAWF in this section, no additional *economic obsolescence* was applied to the TAWF, since the *avoidance of cost* serves as an *economic benefit* that a *potential purchaser* would be willing to acquire, even in the case that there were *insufficient financial/monetary benefits* to support the value of the business under the *premise of value* of *value-in-use as a going concern*, giving rise to the *premise of value* of *value-in-exchange* (see earlier for further discussion of the value of TAWF in bankruptcy court settings).[129]

In addition, due to the impracticality of forecasting the *timing* and *effect* of *technological advancement* on the functionality of a workforce, it can be assumed that the *historical workforce turnover* yields some indication as to the amount of *functional obsolescence* experienced by the workforce in the past, as during a period of time the *historical turnover rate* reflects, in part, the filtering out of staff inefficiencies experienced through lack of functionality. Therefore, this *historical turnover rate* may provide an indication of the future amount of *functional obsolescence,* as well as any future *physical deterioration*, inherent in the existing TAWF.

The turnover adjustment is commonly referred to as the *Turnover Deficiency Cost per Employee* and can be estimated by analyzing the *historical turnover rate* for the existing workforce, where the *turnover rate* is calculated as the reciprocal of the *average tenure* of the workforce in place. The *Turnover Deficiency Cost per Employee* is *subtracted* from *Total Cost per Employee* to determine the *Net Cost per Employee*, and the *Net Cost per Employee* for each staff person is then *summed* together to determine the total expected cost to replace the *Trained and Assembled Physician Workforce.*

Using the *Replacement Cost Method* to value a *Trained and Assembled Nonphysician Workforce* includes consideration of the *actual salary* of the employees in the estimation of the *Efficiency Costs* (along with *actual benefits*), since the nonphysician staff is usually not paid on a *productivity basis*, and the compensation received most often represents that of an *arm's length*

[128] See Section 7.2.2.2, "Highest and Best Use," in Chapter 7, "Basic Valuation Tenets," for further discussion of this concept.

[129] As previously discussed in Section 14.4.2.2, "Classification and Valuation of Human Capital–Related Intangible Assets," revenue increases and cost decreases both provide an economic benefit to an enterprise.

transaction for the services rendered. In addition, due to the greater *variability* of *hours* worked by nonphysician employees, it is important to *adjust* the costs used by the *Full Time Equivalency* of each employee.

It should be noted that *valuation due diligence* may reveal that the healthcare enterprise has too *few* or too *many* FTEs performing a particular position. In the case that the enterprise is determined to have too many FTEs, the value of the TAWF could be adjusted to deduct FTEs that produce duplicative *tasks*, *duties*, *responsibilities*, *and accountabilities* deemed to be unnecessary. However, in the event that the enterprise is determined to have *too few FTEs*, and based on the premise that the *avoidance of a cost* to a potential purchaser serves as the basis of economic benefit derived from TAWF, *no adjustment* would be made, since a potential purchaser would have to *incur the costs of assemblage and training* the requisite staff.

Exhibit 14.5 sets forth the methodology for valuing a *Trained and Assembled Physician Workforce in Place*, discussed earlier.

The *human capital–related intangible assets*, for example, TAWF, of enterprises that generate *positive net economic cash flow* are sometimes valued using a *With and Without Technique*.[130] However, in the healthcare industry, this type of methodology should be *heavily scrutinized* and *cautiously used*, if ever, to ensure that it is not in *violation of regulatory restrictions* related to *Anti-Kickback* and *Stark*, which prohibit any consideration being paid, whether directly or indirectly, based on the *volume or value of referrals* or *other business* that the parties may otherwise be in a position to generate for each other. Since the TAWF often involves physicians or physicians' staffs who are in fact in a position to refer, *Income Approach–based valuation methods* are usually not employed, and *Asset/Cost Approach–based valuation methods*, which rely on the *avoidance of cost*, are typically used.[131]

A highly respected valuation author, Robert Reilly, has written a recent article touching on similar issues related to the valuation of intangible assets in the healthcare industry, which provides a fresh perspective on the topic of valuing these types of assets using an *Asset/Cost Approach–based valuation method*.[132] While the terminology/nomenclature discussed in the Reilly

[130] See Section 8.2.6, "With and Without Analysis," in Chapter 8, "Valuation Approaches and Methods," for further discussion of this technique.

[131] See Chapter 3, "Regulatory Environment," for more information regarding the rules, regulations, and case law pertinent to the healthcare industry.

j	Doctor 7	$641,969	$11,165	$5,582	$0	$16,747

Productivity was assumed to equal 80%, 90%, and 100% in weeks 1–4, 5–8 and 9+ of employment,

8 Cost to Recruit Physicians ($25,000) is based upon independent research and includes such costs as: (1) staff time and/or recruiter fees, (2) interviewing candidates, (3) relocation allowance, and (4) posthire marketing.

9 Total cost per FTE (Column I plus Column J).

10 Represents the tenure of each employee. Calculated as the difference between the VALUATION DATE and the reported date of hire.

11 Based upon average tenure (average of reported tenures in Column L), as of the VALUATION DATE, of approximately 17.19 years, which equates to an average turnover rate of approximately 5.82% (1.0 ÷ 17.19). Accordingly, Turnover Difficiency Cost (Column M), on average, equals Total Cost per FTE (Column K) multiplied by 5.82%."

12 Equals Column K minus Column M.

EXHIBIT 14.5 Fair Market Value of Trained and Assembled Physician Workforce in Place

article may appear to vary from that used in this chapter, it is in fact parallel to the methodology described earlier, for example:

1. The developer's profit, described in the Reilly article as "a percentage rate of return (or profit margin) on the developer's investment in material, labor, and overhead costs," is included in the methodology described above through inclusion in the market-derived Recruiting Costs, which are based on the fees charged by third-party recruiters and are assumed to include the required profit margin for their services.[133]
2. The entrepreneurial incentive, described in the Reilly article as "[t]he lost income concept . . . considered in the context of a "make versus buy" decision, is included in the methodology described earlier through inclusion in the ramp-up portion of the Efficiency Costs, which reflect the lost productivity due to replacement of the workforce during the estimated ramp-up period.[134]
3. The physical deterioration, described in the Reilly article as "the [amount of the] intangible asset [that] can be 'used up' over time," is accounted for in the methodology described earlier, by including only personnel who are expected to be part of the TAWF going forward, for example, currently employed physicians who are not becoming employees of the purchasing organization are to be excluded from the TAWF.[135]
4. The functional obsolescence, described in the Reilly article as "inefficiencies associated with the asset operation," is accounted for in the methodology described earlier through the Turnover Deficiency Cost per Employee, which reflects the expected turnover in the workforce derived from the historical turnover rate that is assumed to be, in part, related to the filtering out of inefficient or nonfunctional staff.[136]
5. The economic obsolescence, described in the Reilly article as "the inability of the intangible asset to generate a fair rate of return on its value indication[, which] . . . is often analyzed with respect to the ability of the owner/operator to earn a fair rate of return on investment (ROI)," was taken into consideration for the methodology described earlier but deemed to be nonapplicable, since the inability of the current owner of the TAWF to generate a sufficient financial return from operations is addressed in the concept that even in the absence of a financial return,

[133] Ibid., p. 12.

[134] Ibid.

[135] Ibid., p. 16.

[136] Ibid., p. 17.

the TAWF still provides an economic benefit in the form of avoidance of cost to willing purchasers.[137]

14.4.2.2.3 Noncopyrighted Policies and Procedures The *policies and procedures* of a healthcare enterprise that contribute to the subject organization's ability to achieve certain *efficiencies* and *productivity* are often developed and refined over an extended period of time and at a significant *cost* to their owner(s). The *avoidance* of incurring the expense to create certain *policies and procedures* that provide similar utility to those that already exist in the subject enterprise is the *economic value* that a potential purchaser would realize in a transaction of the *policies and procedures*. *Value drivers* related to the *distinct selling proposition* of *policies and procedures* are the *unique attributes* that the subject policies and procedures possess and that cannot be found in generic versions. However, it should be noted that *policies and procedures* that are specific to a particular organization, in other words, those that would require *significant additional investment* to revise and modify to be used by other enterprises, would provide *lower utility to other organizations* and therefore *command lower amounts of financial consideration* in a transaction, due to the *decreased ability to transfer* the *policies and procedures* in their *current form*. In addition, when *policies and procedures* are *appropriately developed* and *consistently followed*, they may benefit the enterprise in ensuring *continuous productivity* and *consistency of performance* of a *cross-trained staff*, even in the event of *significant staff turnover*. This benefit provides value by enabling the subject enterprise to operate in a *cost-efficient manner*, as well as affording customers/clients a *reasonable expectation* as to the *degree of the quality of products/services to be received*.

Applying the *Replacement Cost Method* to value the intangible asset consisting of the existing *policies and procedures* of a healthcare enterprise involves the valuation analyst determining the *type* and *amount* of applicable *tasks*, *duties*, *responsibilities*, *and accountabilities* (TDRAs) associated with *re-creating* a similar set of equally desirable *policies and procedures*, providing equal utility as the *subject policies and procedures*. This TDRA information may be ascertained through *independent research of relevant regulatory and professional requirements*, as well as through *interviews with the subject enterprise management* as to the utilization/application of these policies and procedures in operation. These TDRAs most often include *strategic management development*, *operational management oversight*, *privacy and regulatory compliance* (e.g., HIPAA, OSHA, radiographic-related, human resources–related), and *data entry*. *Normative industry benchmark data* could then be used to determine the *costs associated* with the *performance*

[137] Ibid., p. 13.

Factoid

The HIPAA Privacy Rule protects all "individually identifiable health information" held or transmitted by a covered entity or its business associate, in any form or media, whether electronic, paper, or oral.

"HIPAA—General Information," Centers for Medicare & Medicaid Services, http://www.cms.gov/Regulations-and-Guidance/HIPAA-Administrative-Simplification/HIPAAGenInfo/index.html?redirect=/HIPAAGenInfo/ (accessed September 7, 2012).

of the TDRAs, which are identified as being necessary to *re-create* an asset with *equal utility* as that of the subject intangible asset. These costs, along with (1) other *necessary direct and/or indirect costs*, for example, *legal/regulatory filings costs* and *fixed capital investment*; (2) an appropriate *developer's profit margin*, which may or may not be applicable, depending on whether the source of the direct and indirect costs includes this margin; and (3) any *opportunity costs* incurred while developing the policies and procedures, which may vary in amount based on the *importance of the subject policy and/or procedure* to the *operations of the enterprise*, constitute the *predepreciation* value of the subject *policy and/or procedure*. Then applicable depreciation, that is, *physical deterioration*, *functional/technological obsolescence*, *and economic obsolescence*, if any, should be deducted to derive the economic value of the *subject policy and/or procedure*.

Physical deterioration may not be applicable if the *subject policy and/or procedure* is perceived to have a relatively long *estimated remaining useful life* (or the amount of the *physical deterioration* may be considered to be *de minimis*). However, depending on the *type* of policy and/or procedure being considered, an appropriate amount of *functional obsolescence* may be applicable, for example, the use of paper copies of policies and procedures may be less efficient and therefore may hold less value than electronic versions, which may justify an adjustment for *functional obsolescence* in the event the *Replacement Cost New* for the *subject policy and/or procedure* is based on the creation of electronic policies and procedures. Note that *economic obsolescence* is difficult to measure for intangible assets created by *policies and procedures* but should be considered when appropriate.

14.4.2.2.4 Depth of Management *Depth of management* is another form of *human capital–related intangible asset*, which derives its value from the *qualifications*, *skill sets*, and *experience*, as well as the *institutional*

knowledge of management personnel, that provide *competitive benefits* to the subject enterprise. This type of intangible asset has *economic value*, since the success of many organizations is most often significantly reliant on the *abilities* and *input* of its *management leadership*. The intangible asset consisting of the *depth of management* can be valued using the *Replacement Cost Method* in a manner similar to that previously described for TAWF, in Section 14.4.2.2.2, "Trained and Assembled Workforce in Place."

14.4.2.3 Classification and Valuation of Intellectual Property–Related Intangible Assets *Intellectual property* refers to *intangible assets* that are afforded special *legal recognition* and *legal protection*, which allows their owner the ability to realize the economic benefit in a more commercialized manner, for example, *license*, *joint venture*, or *other channels of exploitation* of the property interest.[138] In the healthcare industry, *intangible personal property assets* that may be classified as *intellectual property–related* include, but are not necessarily limited to, *clinical practice protocols* and *treatment plans*, *copyright-protected procedure manuals*, *other copyrighted works*, *trademarks*, *trade names*, *patents and patent applications*, *technical and specialty research capabilities*, and *other forms of trade secrets*.[139]

Intellectual property that has a *discernible*, *isolated stream of economic contribution*, which most often includes *patents*, *trademarks*, and *copyrights*, but may also include *special* "*know-how*" and *trade secrets*, can be valued using *Income Approach–based valuation methods*.[140] Other than the *patient care–related revenues* of the subject healthcare enterprise, which

Intellectual Property–Related Intangible Assets

Includes practice protocols, treatment plans, procedure manuals, technical and specialty research, patents and patent applications, copyrights, trade names, and trade secrets.

Valuation of Intellectual Property and Intangible Assets, *3rd ed., by Gordon V. Smith and Russell L. Parr (New York: John Wiley & Sons, 2000), p. 27.*

[138] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), pp. 21–26.

[139] Excerpts from a PowerPoint presentation given by Mike Pellegrino at the American Society of Appraisers International Conference, July 27, 2010.

[140] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 259.

may be *enhanced* through the *use* of its *patents*, *trademarks*, *copyrights*, *branding*, and *other intellectual property assets*, as well as any *operational efficiencies* or *other cost savings* attributable to the intellectual property assets of the subject enterprise, the owner of these assets may also generate *royalty income* through *licensing the use* of the *intellectual property interest* to third parties. Note that while there has been significant growth in *investor interest* in *healthcare intellectual property*, there has also been growing *investor concern* that *increased regulatory scrutiny* of research and consulting arrangements between pharmaceutical and medical device firms and physicians may *reduce* healthcare-related *intellectual property royalty rates*. However, based on recent studies by researchers at Invotex, the *average royalty rates* in the healthcare industry appeared to have actually *increased* (while the median rates have stayed the same).[141]

Intellectual property, where transactional data as to direct market transactions of comparable property interests exists, can be valued using a *Market Approach–based valuation method* or the related *Relief from Royalty Method*, which most often includes *patents*, *trademarks*, and *copyrights*.

Asset/Cost Approach-based valuation methods typically do not consider the *profits from commercialization*, *investment risk*, and *earnings growth potential* of intellectual property and therefore may not provide a reliable indication of value for intellectual property.[142] When these methods are used, it is important to remember that intellectual property may be considered *unique*, in that there are *legal protections* in place *that prohibit the reproduction* of the exact same intellectual property interest, which *reproduction* would be considered an *infringement on the existing legal protections*. Therefore, *Asset/Cost Approach–based valuation methods* should be conducted as though the *existing intellectual property did not exist*, similar to the "*greenfield*" premise used by real estate appraisers when valuing land, which would result in the valuation of the intellectual property from a *replacement cost perspective*, where the focus would be on the cost to replace *the utility* derived from the intellectual property, in contrast to *reproducing the exact same intellectual property interest*.[143]

[143] Robert F. Reilly, "Cost Approach of Health Care Entity Intangible Asset Valuation," *Journal of Health Care Finance* 39, no. 2 (Winter 2012): 5.

The economic value to be derived from *intellectual property* may be considered separate and aside from the economic value that the *underlying intangible asset* may possess. For example, *books and websites* may be considered a *marketing-related intangible asset*, which derive economic value from the *enhanced image* of the organization, while at the same time, the value derived from *copyrights* associated with those *books and websites* may be derived from the *legal protection* of the *marketing-related intangible asset*, consisting of those *books and websites*, from being exploited by another party without sufficient financial consideration being paid to their owner. Therefore, when valuing certain types of intangible assets, such as *marketing related intangible assets*, the analyst should consider whether the *net economic benefit* to be derived from the *intangible asset* would persist without the *legal protections* afforded by intellectual property rights, which may be the *highest and best use* of the property interest.[144] Note that inherent in the definition of *Fair Market Value* is the concept that the *hypothetical transaction* is assumed to be closed, with the *typical legal protections* in place to safeguard the *transfer of ownership* of the legal bundle of rights that define and encompass the transacted property or interest.[145]

The information regarding *intellectual property* contained in this chapter is a *brief overview* of the *various types* of these intangible assets. Each valuation assignment will entail *specific facts and circumstances* that will typically require *further research and analysis*, for example, the *term* of a patent depends on its *classification*, and the *economic benefit* to be derived from a *patented process*, *machine*, or *other form of patented product/service* would *vary*, based on the *length of time* the patent is valid. Additional information regarding specific aspects of various types of intellectual property in the United States can be found on the website for the United States Patent and Trademark Office, in the sections of the United States Code pertaining to intellectual property, and other significant sources included in the canon of professional literature related to intellectual property (see the *Key Sources* at the end of this chapter).

14.4.2.3.1 Clinical Practice Protocols and Treatment Plans *Clinical practice protocols* and *treatment plans* are composed of *standardized steps* and *agreed-on processes* related to the *diagnosis* and *management* of a patient's care. They may bring value to the subject enterprise, if *consistently followed*, *recorded*, *and reported*, inasmuch as they provide *evidence* of a *higher-quality/*

[144] See Section 7.2.2.2, "Highest and Best Use," in Chapter 7, "Basic Valuation Tenets," for further discussion of this concept.

[145] See Section 7.2.1.1, "Fair Market Value," in Chapter 7, "Basic Valuation Tenets," for a more complete definition of the standard of *Fair Market Value*.

more cost-effective delivery of services that enhances performance, leading to gains in *competitive advantage* for their owner. These protocols and plans may be especially valuable in a healthcare reimbursement environment that is being transformed into a *value-based purchasing* reimbursement paradigm.[146]

Clinical protocols and treatment plans and/or *procedure manuals* typically do not have *established liquid markets* with reported transactions of similar property interests, invalidating the use of a *Market Approach–based valuation method*. Also, it may be difficult to determine a direct income stream derived from these intangible assets. Accordingly, these property interests are typically valued using a *Replacement Cost Method*, similar to that previously described for *noncopyrighted policies and procedures*, in Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures."

14.4.2.3.2 Copyrights *Copyrights* may be defined as:

> *a form of protection provided to the authors of "original works of authorship" including literary, dramatic, musical, artistic, and certain other intellectual works, both published and unpublished.*[147]

Copyrights that are *developed* or *acquired* by healthcare enterprises may include the *design*, *structure*, and *programming code* of *proprietary software applications* that can be used to:

1. Generate schedules and patient encounter/billing forms;
2. Track patient care across multiple providers and disciplines;
3. Produce utilization and outcome reports based on the treatment provided;
4. Maintain clinical records; and
5. Perform revenue cycle tasks, for example, coding, charge entry, and claims resolution.[148]

---

[146] See Section 2.7.1.1.2, "Value-Based Purchasing," in Chapter 2, "Reimbursement Environment," for further discussion of the shift from *fee-for-service* to *value-based purchasing*.

[147] United States Patent and Trademark Office, "General Information Concerning Patents—What Is a Copyright?" November 2011, http://www.uspto.gov/patents/resources/general_info_concerning_patents.jsp#heading-4 (accessed February 18, 2013).

[148] See Section 2.2, "Healthcare Revenue Cycle," in Chapter 2, "Reimbursement Environment," for further discussion of the revenue cycle in the healthcare industry. James Cortada, Dan Gordon, and Bill Lenihan, *The Value of Analytics in Healthcare: From Insights to Outcomes*, IBM Institute for Business Value (Somers, NY: IBM Global Services, 2012), p. 3.

These *proprietary software applications* hold economic value, in that they have the capacity to (1) *increase productivity*, (2) *increase the quality of patient care outcomes*, and/or (3) *increase the reimbursement yield collected from payors*. *Copyrights* may also include the legal protection of *marketing-related* and/or *operations-related intangible assets*, such as *written materials*, *books*, *procedure manuals*, *journal articles*, *patient information brochures*, *websites*, *blogs*, and *similar communication-related assets*, which provide value to the subject enterprise through *enhanced visibility* and *operational efficiency*, respectively.

Copyrights are most often valued using *Income Approach–based valuation methods*. When copyrights are owned and exploited by the organization, the *Relief from Royalty Method* may be appropriate to appraise the subject copyright interest.[149] In the event that the subject copyright is owned by the subject enterprise but is licensed to another party, the *net economic benefit stream* attributable to the *subject copyright interest* is calculated as the *revenue stream* produced through the licensing agreement, less any applicable *economic operating costs* and *economic capital costs*. The future net economic benefit is then discounted back to the present at an appropriate *risk-adjusted required rate of return* applicable to an investment in the subject copyright. This rate should reflect the risk associated with *collecting the royalty payments*, which may include (1) investment alternatives, (2) counter-party risk of the licenser, and (3) competition from similar copyrighted works.[150]

Copyrights that have a sufficient number of transactions for similar property interests may be valued using *Market Approach–based valuation methods*.[151] In the alternative, these property interests may be valued using a *Replacement Cost Method*, similar to that previously described for *noncopyrighted policies and procedures*, in Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures." However, it should be noted that the *copyright process* provides an additional layer of *regulatory cost* that should be considered when performing *Asset/Cost Approach–based valuation methods* to appraise copyrighted material. Also, as previously mentioned, these approaches often fail to consider the *profits from commercialization*, the *investment risk*, and the *earnings growth potential* of intellectual property and therefore may not provide a reliable indication of value.[152]

---

[149] See Section 14.4, "Classification and Valuation of Intangible Assets," for further discussion of this method.

[150] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 261.

[151] See Section 8.1.2, "Market Approaches," in Chapter 8, "Valuation Approaches and Methods," for further discussion of this method.

[152] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 262.

14.4.2.3.3 Trademarks and Trade Names *Trademarks* may be defined as:

> *a word, phrase, symbol, or design, or a combination thereof, that identifies and distinguishes the source of the goods of one party from those of others.*[153]

Trade names refer to the commercial name that a business sells products or services under.[154] *Trademarks* and *trade names* hold economic value, in that they have the capacity to bring *recognition* and "*brand loyalty*" to the subject enterprise through the *perception* of *quality assurance* in the services provided by the branded organization.[155] Brands are becoming an increasingly important asset for all types of business, especially *service-oriented organizations*, such as those in the healthcare industry.[156] This *recognition* may allow an enterprise to charge *higher reimbursement rates* than its competitors for similar types of services, or it may provide the ability to gain market share from competing peers through perceived quality differences.[157] These abilities arise from the communication of the "*unique selling proposition*" of the organization, for example, *scope of services provided* and/or *quality of outcomes rendered*, which is usually accomplished through *advertising*.[158]

As with other forms of intellectual property, *trademarks* and *trade names* are most often valued using *Income Approach–based valuation methods*; however, for those property interests that have reported transactional data of comparable licensing arrangements, a *Market Approach–based valuation method* may also be appropriate.[159] One example of an Income Approach that can be used to value trademarks and trade names, such as that of a nationally renowned cancer treatment center, is the *Relief from Royalty*

[159] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 259.

Method. This method starts with transactions from *proprietary databases*, for example, KtMine, or *published books*, such as *Licensing Royalty Rates*, that include *comparable royalty rates* for *trade names* of other prestigious healthcare organizations that can be used to determine an *appropriate royalty rate* for the *subject trade name*.[160] It should be noted that it is critical that the valuation analyst review the underlying licensing agreements to ensure that the *selected* royalty rates are based on *homogenous badges of comparability*, when using *market data* to derive an *appropriate royalty rate* for the subject intangible asset.[161] This rate would then be multiplied by the *applicable* level of economic benefit, that is, the level *specified* in the *selected comparable licensing agreements*, generated by the portion of the subject enterprise that is determined to *rely on* the *trade name* to generate revenue (which in this case would be the cancer treatment center), in order to derive the *before-tax* net economic benefit attributable to the *subject trade name*. Applicable taxes would be deducted to arrive at the *after-tax* net economic benefit attributable to the *subject trade name* that is then discounted back to the present using a *risk-adjusted required rate of return*, based on the risks associated with an investment in the *subject trade name*. These risks may include:

1. The *uncertainty* related to the ability of the subject enterprise, which relies on the *subject trade name* in order to generate revenue, to achieve the level of *forecasted economic benefit*;
2. The *uncertainty* regarding whether the *selected* royalty rate is comparable to the rate that the *subject trade name* would command as a royalty in the market;
3. The risk of *brand obsolescence* or *poor brand management* post-transaction; and
4. The availability of *alternative investments*. An example of the application of trademarks and trade names can be found online at http://www.wiley.com/go/healthcarevaluation.

14.4.2.3.4 Patents *Patents* are classified by the United States Patent and Trademark Office into three subcategories: *utility patents*, *design patents*,

[160] See KtMine database website for information regarding licensing transactions, http://www.ktmine.com/. Gregory Battersby and Charles Grimes, *Licensing Royalty Rates*, 2012 ed. (New York: Aspen Publishers, 2012).

[161] Examples of *homogenous badges of comparability* for licensing agreements are discussed in Section 14.4, "Classification and Valuation of Intangible Assets."

and *plant patents*.[162] These subcategories of patents are defined by the United States Patent and Trademark Office as follows:

1. ***Utility patents*** *may be granted to anyone who invents or discovers any new and useful process, machine, article of manufacture, or composition of matter, or any new and useful improvement thereof;*
2. ***Design patents*** *may be granted to anyone who invents a new, original, and ornamental design for an article of manufacture; and*
3. ***Plant patents*** *may be granted to anyone who invents or discovers and asexually reproduces any distinct and new variety of plant.*[163]

Inventions that are *patentable* are defined by reference to the United States Code as:

> *any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof. . . .*[164]
>
> *The word "process" is defined by law as a process, act or method, and primarily includes industrial or technical processes. The term "machine" used in the statute needs no explanation. The term "manufacture" refers to articles that are made, and includes all manufactured articles. The term "composition of matter" relates to chemical compositions and may include mixtures of ingredients as well as new chemical compounds. These classes of subject matter taken together include practically everything that is made by man and the processes for making the products.*[165]

Process-related patents typically involve the *legal protection* of those business processes that are *legally transferable* to other enterprises, which enable an organization to operate in an efficient manner, for example, *six sigma design methods*. *Specialized equipment* and *instruments* that may lend to the

---

[162] United States Patent and Trademark Office, "General Information Concerning Patents—What Is a Patent?" November 2011, http://www.uspto.gov/patents/resources/general_info_concerning_patents (accessed March 4, 2013).

[163] Ibid.

[164] "Inventions Patentable," 35 USC 101 (January 2013).

[165] United States Patent and Trademark Office, "General Information Concerning Patents—What Can Be Patented," November 2011, http://www.uspto.gov/patents/resources/general_info_concerning_patents.jsp#heading-4 (accessed February 18, 2013).

increased care and *beneficial quality outcomes* received by the subject enterprise's patients make up the items covered under a *machine-related patent*. *Composition of matter–related patents* would include pharmaceuticals and other biologics, and *manufacture-related patents* would serve as the "*catch-all*" moniker for innovations that do not fall into the other categories.[166] Typically, patent rights for pharmaceuticals have a duration of 20 years.[167] However, FDA-granted exclusivity, which is another important aspect to consider when valuing patents, is dependent on the type of exclusivity granted.[168]

Most intellectual property, including patents, is valued using *Income Approach–based valuation methods*, as previously discussed in Section 14.4, "Classification and Valuation of Intangible Assets." However, *patents* that have *established liquid markets* with reported transactions of comparable property interests may also be valued using a direct *Market Approach–based valuation method*.

In the healthcare industry, patents for *pharmaceuticals* and *medical devices* most often vary in value based on the perception of the probability of obtaining FDA approval or other regulatory approvals required for the patent. These patents also vary in value based on the *perception* of the strength of legal protection of the patent, which affects (1) the investment time horizon of achieving the *future net economic benefit* and (2) the level of certainty that the patent will ultimately meet regulatory approval (in its current form).[169] Note that the approval process for patents is considered to be longer and more costly than the process for medical devices.[170]

The stratification of levels to obtain FDA approval for a patent includes:

1. Investigational New Drug permission;
2. New Drug Application—Phase 1 Clinical Trials;
3. New Drug Application—Phase 2 Clinical Trials; and
4. New Drug Application—Phase 3 Clinical Trials.[171]

[168] U.S. Food and Drug Administration, "How Long Is a Patent Granted For?" 2013, http://www.fda.gov/Drugs/DevelopmentApprovalProcess/ucm079031.htm (accessed March 1, 2013).

[169] Mike Pellegrino, "Pharmaceuticals & Medical Devices: Building and Valuing Intellectual Property Portfolios," Business Valuation Resources Webinar, December 11, 2008.

[170] Ibid.

[171] See Section 3.6.5, "Food and Drug Administration (FDA) Enforcement," in Chapter 3, "Regulatory Environment," for more information on the levels of FDA approval.

Typically, the further along the patent is in the FDA approval process, the *shorter the time horizon* of receiving the *future net economic benefit* from the investment, and the *greater the certainty* of the patented product obtaining final FDA approval. Both of these factors reduce the *perceived risk* related to an investment in the subject patent. This concept results in both *lower royalty rates* and *higher discount rates* associated with deals for patents that have not reached the *proof of concept* (POC) stage, that is, those patents that have an FDA approval level of Phase II or below, since POC is defined as an FDA approval level of Phase III and above.[172]

Determining the future net economic benefit derived from the patented product or service requires forecasting sales volume, product pricing, economic operating expenses, and economic capital expenses.[173] This future net economic benefit to be derived from ownership of, or the right to control, a patent may be determined by using either the Relief from Royalty Method, discussed in Section 14.4, "Classification and Valuation of Intangible Assets," or a Premium Pricing Method, discussed later. This forecasted benefit stream is then discounted back to the present by an appropriate risk-adjusted required rate of return to develop an indication of value for the ownership interest in the subject patent.

The *Relief from Royalty Method* uses *comparable royalty rates*, derived from market transactions of similar intellectual property interests, to establish the *revenue stream* attributable to the subject patent. This comparable market data is available from numerous sources, including *proprietary databases*, such as KtMine, or *published books*, for example, *Licensing Royalty Rates*.[174] Once the *revenue stream* generated by the subject patent has been established, applicable *economic operating costs* and *economic capital costs*, as well as *appropriate taxes*, are deducted from the *revenue stream* in order to determine the *net economic benefit* attributable to the subject patent. These expenses should reflect all of the necessary periodic costs incurred to license the subject patent interest.

[172] Licensing Executives Society (USA and Canada), *2012 Global BioPharmaceutical Royalty Rates & Deal Terms Survey*, December 2012, pp. 44, 47–48, 116.

[173] See Section 8.1.1.2.3, "Forecasting," in Chapter 8, "Valuation Approaches and Methods," for further discussion on forecasting methods and techniques.

[174] See the KtMine database website for information regarding licensing transactions: http://www.ktmine.com/. Gregory Battersby and Charles Grimes, *Licensing Royalty Rates*, 2012 ed. (New York: Aspen Publishers, 2012). See Section 14.4, "Classification and Valuation of Intangible Assets," for further discussion on selecting royalty rates based on *homogenous badges of comparability* to the subject patent interest.

The *Premium Pricing Method* is a form of *With and Without Technique* that uses the anticipated difference in product pricing between, for example, in healthcare a *branded drug* and a *generic version* to determine a basis for the *net economic benefit* attributable to the subject patent interest. The *pre-tax net economic benefit is* calculated by multiplying the estimated *percentage difference* in product pricing between the branded and unbranded products by the projected sales volume of the patented product, over the life of the patent protection for that product.[175] This *incremental benefit* for each period of the patent's remaining useful life is then tax-affected in order to derive the *net economic benefit* to be discounted back to the valuation date at an appropriate *risk-adjusted required rate of return.*

The level of risk associated with investment in a patent is based on factors that may include, but are not necessarily limited to,

1. The perceived *strength of patent protection*;
2. The perceived *risk of future product/service failures* associated with postregulatory approval clinical studies;
3. The *uncertainty related to market adoption*;
4. The *amount of competition* at the product/service level, that is, from competing patents during the protection period or from generic products once the protection period has expired;
5. The *variability in future brand affinity*;
6. The remaining useful life of patent protection; and
7. Future changes in science and technology.[176]

Other considerations for the amount of risk associated with investment in a patent may include:

1. The diversity of end-uses for the patented intellectual property;
2. The estimated remaining life of patent protection; and
3. The availability of substitute intellectual property providing similar or greater utility than the subject intellectual property.[177]

[175] Christopher Glover, "Alternative Methods of Brand Valuation," in Raymond Perrier, ed., *Brand Valuation*, 3rd ed. (London: Premier Books, 1997), pp. 21–22.

[176] Mike Pellegrino, "Pharmaceuticals & Medical Devices: Building and Valuing Intellectual Property Portfolios," Business Valuation Resources Webinar, December 11, 2008.; Michael Pellegrino, *BVR's Guide to Intellectual Property Valuation* (Portland, OR: Business Valuation Resources, 2009), chap. 6.

[177] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), p. 222.

14.4.2.3.5 Trade Secrets or Other Know-How *Technical* and *specialty research* may be considered the "*work-in-progress*" of *patents*, *copyrights*, *trademarks*, or *other intangible assets*, which usually entails special "know-how" or *trade secrets* that are often protected or "*padlocked*," in contrast to being *patented*. The decision of whether to *patent* or *padlock* is often based on factors that include:

1. The amount of expenditure invested in research and development;
2. The depth and breadth of the market for the technology;
3. The amount of competition pursuing similar research;
4. The ability to keep the technology confidential; and
5. The pace of technological advancement in the industry, which has the potential to shorten the useful economic life of the technology below the time it would take to obtain patent approval.

Trade secrets are protected from misappropriation at the *federal level* by the *Uniform Trade Secrets Act*; however, most state laws conform to the federal law, and therefore most litigation takes place at the state level.[178] Note that *trade secrets* differ from other forms of intellectual property, in that there is no statutory limit to trade-secret protection.[179]

Technical and specialty research capabilities may produce reported revenue streams based on grants or other research-related funding. Applicable *economic operating expenses*, for example, *salary*, *benefits*, and *overhead*, along with applicable *economic capital expenses*, are deducted from the reported *economic benefit* from the research grants to calculate the *net economic benefit* attributable to the *subject technical and specialty research capabilities*. This net economic benefit is then discounted back to the present at an appropriate *risk-adjusted required rate of return* applicable to the risks associated with investment in the *subject technical and specialty research capabilities,* which is in contrast to a direct investment in the subject enterprise. Risks associated with an investment in *trade secrets* include, but are not necessarily limited to,

1. The transferability of the process;
2. The level of confidentiality in the process;
3. The versatility of the "know-how";[180]

[178] Ibid., pp. 22–27.

[179] Ibid., p. 222.

[180] Ibid.

4. The relative ease with which the technology is able to be reverse-engineered; and
5. The likelihood that the technology would be independently developed by another party.[181]

14.4.2.4 Classification and Valuation of Operations and Location-Related Intangible Assets *Operations and location-related intangible assets* are certain components of a business enterprise's operations that generate *positive economic benefits* through operational efficiencies. As regards the healthcare industry, *intangible personal property* that fits into the classification of *operations-related intangibles* may include *historical information and documentation, supplier contracts, assets assemblage factors, and going-concern value.* Most *location-related intangible assets* would be classified as intangible *real property*, for example, *leasehold interests, favorable locations—close proximity to hospitals*, in contrast to intangible *personal property*, and, as such, are discussed in Section 14.4.1, "Classification and Valuation of Intangible Real Property."

Operations-related intangible personal property is most often valued using the *Replacement Cost Method* or *Income Approach–based valuation methods.*[182] However, *licensing arrangements* related to the *use* of *operations-related intangible assets* that could be used in the *Relief from Royalty Method* may exist.[183]

Operations-Related Intangible Assets

Includes computerized management information systems that produce customized reports on the financial, operating, and patient outcome performance of the subject enterprise to aid in future management decision making and strategic planning.

Valuing Professional Practices—Thorny Challenges, *by William H. Black (Sandy Springs, GA: Analytical Value, 2006), p. 27.*

[181] Ibid., pp. 22–23.

[182] See Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures," for further discussion of this method applied to the valuation of *noncopyrighted policies and procedures*. See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for further discussion of these methods.

[183] See Section 14.4, "Classification and Valuation of Intangible Assets," for further information related to the implementation of the *Relief from Royalty Method*.

14.4.2.4.1 Historical Information and Documentation *Historical information and documentation*, for example, *information regarding clinical outcomes*, *financial statements*, and *productivity reports*, creates a record against which future records can be compared and benchmarked that may (1) provide management with the *necessary data and information* to make *operational and/or strategic adjustments* to adapt to market changes, in order to *maximize* the organization's *net economic benefit* and thereby *enhance* the *value of the enterprise*; or (2) can be used to assess the efficacy of prescribed treatments, which provides valuable analytics to the subject enterprise to develop more efficacious treatment plans, as well as organizations that compile clinical data for research purposes, for example, the Regenstrief Institute.[184]

Certain types of *historical information and documents*, such as *financial records*, may be valued using *Asset/Cost Approach–based valuation methods,* similar to their application for the valuation of other types of intangible assets, for example, *noncopyrighted policies and procedures*, discussed in Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures." It should be noted that the TDRAs necessary to re-create financial records with the same or similar utility to the subject financial records would be more heavily weighted toward *data entry* than *strategic development*, which is in contrast to *noncopyrighted policies and procedures*.

Other types of *historical information and documents*, such as *historical records of clinical outcomes*, may have significant value above the cost to create the record and accordingly may be valued using an *Income Approach-based valuation method*. Typically, data regarding *clinical outcomes* may hold particular value based on either (1) the length of time that data for a *particular treatment regimen* for a *specific patient population* has been recorded and/or (2) the *number of patients* included in the treatment regimen. The *net economic benefit* attributable to this data would be in the form of *more efficient* and *efficacious treatment plans* for specified *injuries*, *ailments*, *or diseases*, which allow the enterprise to provide services at a *reduced cost*. This *net economic benefit* could be calculated by analyzing the difference in profit margins that the subject enterprise would have *with and without* the *historical records of clinical outcomes*.[185] This net economic

[184] James Cortada, Dan Gordon, and Bill Lenihan, *The Value of Analytics in Healthcare: From Insights to Outcomes*, IBM Institute for Business Value (Somers, NY: IBM Global Services, 2012), p. 3; Regenstrief Institute, http://www.regenstrief.org/, 2013 (accessed March 1, 2013).

[185] See Section 8.2.6, "With and Without Analysis," in Chapter 8, "Valuation Approaches and Methods," for further information on performing this type of technique.

benefit is then discounted back to the present using an appropriate *risk-adjusted required rate of return* applicable to an investment in the *subject historical records of clinical outcomes*.

14.4.2.4.2 Supplier Contracts *Supplier contracts*, typically those obtained through *group purchasing organizations*, can provide the subject enterprise with *pricing* and *service assurances* that may allow for *increased accuracy* and *reliability* for budgeting of the enterprise's operations, as well as a *competitive cost advantage* for producing and providing its services. The premium pricing derived from increased negotiation leverage and/or the cost avoidance from increased accuracy and reliability would serve as the *net economic benefit* attributable to supplier contracts.

Supplier contracts that provide the subject enterprise with these *favorable contract rates* can be valued using an *Income Approach-based valuation method*, in a manner similar to that described for *leasehold interests* in Section 14.4.1, "Classification and Valuation of Intangible Real Property."

14.4.2.4.3 Asset Assemblage Factors and Going-Concern Value *Asset assemblage factors* and *going-concern value* are those incremental elements of value that are created when *assets*, either tangible or intangible, are *associated together* to produce benefit above that which would be created by the *assets apart*.[186] *Going-concern value* is defined by the Internal Revenue Service as:

> *value that attaches to property by reason of its existence as an integral part of an ongoing business activity. Going concern value includes the value attributable to the ability of a trade or business (or a part of a trade or business) to continue functioning or generating income without interruption notwithstanding a change in ownership.*[187]

It should be noted that going-concern value is a *separate and distinct* intangible asset, which represents the value produced by *combining dissimilar resources*, in contrast to the value associated with goodwill, which is further discussed in Section 14.4.2.11, "Classification and Valuation of Goodwill."[188]

---

[186] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 12.

[187] "Amortization of Goodwill and Certain Other Intangibles," 26 CFR §1.197-2 (4-1-09 Edition).

[188] Merle F. Dimbath, "The Theory and Practical Determination of Going Concern Value," *Journal of Forensic Economics* 7, no. 2 (1994): 178.

Going-concern value is most often appraised by analyzing the subject property interest under the premise of *value-in-use* and under the premise of *value-in-exchange*. The resulting difference in the value of the subject property interest under each premise of value provides an indication of the *going-concern value*.[189] Or, in the alternative, the *separately identified and appraised* tangible and intangible assets, including *goodwill*, which could be valued using an excess earnings method, could be subtracted from the indication of value derived from the premise of *value-in-use* to determine any value attributable to the separate and distinct intangible asset of *going-concern value*.[190] *Asset assemblage factors* can be valued in a similar manner by assessing the difference in value between the subject property *sold as an assemblage of assets* and the value of the subject property *sold on a piecemeal basis*.[191]

14.4.2.5 Classification and Valuation of Governance or Legal Structure Related Intangible Assets In the healthcare industry, *intangible personal property* classified as *governance/legal structure-related* may include *organizational documents*, *income distribution plans*, *right of first refusal*, *antipiracy provisions*, and *covenants not to compete*.[192]

Governance and legal structure–related intangible assets, such as *income distribution plans* or *corporate by-laws*, while *necessary* to the operation of an enterprise, may *not* provide a *direct revenue stream* for use in an *Income*

Governance/Legal Structure–Related Intangible Assets

Includes organizational documents, income distribution plans, and covenants not to compete.

Valuing Intangible Assets, *by Robert Reilly and Robert Schweihs (New York: McGraw-Hill, 1999), pp. 403–404.*

Approach–based valuation method. Likewise, because of the *unique* nature of many of these documents, there may be a lack of comparable transactions providing guidance as to the value of the *subject governance/legal structure–related intangible asset*, nullifying the use of a *Market Approach–based valuation method*. However, an *Asset/Cost Approach–based valuation method*, which allows for the *quantification* of the intangible asset through the measure of the *economic input* used to *create the documents*, for example, *outside professional services* or *internal labor*, may be an appropriate technique to employ.[193]

14.4.2.5.1 Organizational Documents *Organizational documents*, such as *corporate by-laws*, *operating agreements*, and *shareholders agreements*, are a written record of the *governance rules* by which the organization *operates* and provides certain *privileges* and *protections* to the owner(s)/shareholder(s) on an *individual*, as well as a *collective*, basis. These documents provide order and structure to the management and operation of the enterprise through:

1. The establishment of the organization's vision, mission, and goals;
2. Designation of key stakeholders; and/or
3. Delegation of authority.

These documents most often do not produce direct income streams for use in an *Income Approach–based valuation method* and usually lack *established liquid markets* with reported transactions, invalidating the use of a *Market Approach–based valuation method*. However, the *Replacement Cost Method*, used in a manner similar to that used to appraise *noncopyrighted policies and procedures*, may yield an appropriate value attributable to the intangible asset consisting of *organizational documents*.[194]

14.4.2.5.2 Income Distribution Plans *Income distribution plans* are the agreed-on formula(s) by which the owner(s)/shareholder(s) are compensated, which provide the *incentives* that may influence their behavior and performance, for example:

1. Their *ability/willingness to tolerate risk* in strategic business planning;
2. Their *desire to be involved in the day-to-day management* of the business operations; or

[193] See Section 14.4.2.2.1, "Employee and Provider Employment Agreements," for further discussion on implementing the *Replacement Cost Method*.

[194] See Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures," for further discussion of the *Replacement Cost Method* used to value *noncopyrighted policies and procedures*.

3. In the case of a physician owner of a medical practice, their *willingness to exchange leisure time to devote more time to providing clinical related services*, typically measured by work Relative Value Units (wRVUs).[195]

These types of assets are typically valued using the *Replacement Cost Method* in a manner similar to that used to appraise *noncopyrighted policies and procedures* and may yield an appropriate value attributable to the intangible asset made up of *organizational documents*.[196]

14.4.2.5.3 Right of First Refusal *Governance/legal structure–related intangible assets* may also include *provisions* or *rights* that are attached to certain contracts and agreements, for example, a *right of first refusal* (ROFR), which gives the *holder* of the ROFR right the *option* to purchase property for the same price that another bidder is willing to pay for that property.[197] The ROFR may act to:

1. *Restrict the marketability* for the subject property when the *cost of performing due diligence is high*, since most purchasers would be *less willing* to expend such *investigative costs* to determine the amount they should offer for the subject property, if the right holder has the option to *purchase the property* at a price equal to the offer from a non-ROFR holder, *decreasing* the probability that the non-ROFR holder will ultimately achieve a return on his or her *due diligence investment*;
2. *Create additional legal/transactional costs* to accommodate the transfer of the ROFR; and
3. *Delay the transition* of the subject property interest. Also, the seller of a property interest subject to an ROFR may run the risk of obtaining *lower initial offers*, as well as the possibility that the *final offer* would be lower, due to the ability of the ROFR holder to price his or her *initial*

[195] wRVUs are more fully discussed in Section 2.4.1.3.2, "Physician Reimbursement and Billing: The Resource Based Relative Value Scale (RBRVS)," of Chapter 2, "Reimbursement Environment."

[196] See Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures," for further discussion of the *Replacement Cost Method* used to value *noncopyrighted policies and procedures*.

[197] Ashok Bhardwaj Abbott, "Healthcare Finance: ROFO and ROFR Agreements in Acquisitions," National Association of Certified Valuators and Analysts, December 6, 2012.

bid below what the ROFR holder would have bid, had he or she not held the ROFR right to a second bid.[198]

Since the economic value of an ROFR is partially derived from the amount of *market restriction* imposed by the right on the subject property interest, the valuation of an ROFR may be ascertained by employing *put option models*, which are often used by appraisers to value *discounts for lack of marketability.* In those instances where the ROFR has a stated *exercise price*, the *Black-Scholes model* and certain *look back put option models*, which may include (1) the Chaffee model, (2) the Longstaff model, (3) the Finnerty model, or (4) Long-Term Equity Anticipation Securities (LEAPS) studies, may be used to derive an indication of value for the ROFR.[199] However, in the event that the ROFR does not specify the price at which the holder of the right may "*exercise*" his option, the valuation may be performed using a *path dependent option*, for example, a *floating look back put option*.[200] The further description and the specific steps used in these methods were deemed to be outside of the scope of this book but are widely published in various books, journals, and treatises that address option valuation methods and techniques (see *Key Sources*).

It should be noted that the *use* of these models may be *constrained* by *the availability of reliable data* to estimate the *requisite input* for the method selected. For example, returns on publicly traded stocks are often used to derive the *volatility input* of an option pricing model.[201] However, certain types of healthcare enterprises, for example, *professional physician practices*, may lack *comparable publicly traded companies* whose investment returns could be used as a proxy for the expected investment returns of the subject property.

[201] See Section 14.4.2.8.4, "Financial Derivatives," for further discussion of the input required to value *call/purchase options* using a *binomial option model*, which is the same as those necessary to value *put options* using a *binomial option model*.

14.4.2.5.4 Covenants Not to Compete *Covenants not to compete* (CNCs) are one of the *twigs in the legal bundle of rights* that define the property interest being appraised, which involves the *restriction* of one party, by another party, from *providing the same or similar goods and services* for a *specified period of time* and *in a specified geographic area*. Since *human capital–related assets* (defined in Section 14.4.2.2, "Classification and Valuation of Human Capital–Related Intangible Assets") are often one of the most valuable assets included in transactions involving *healthcare services or service-related enterprises*, CNCs are of particular importance, since they afford the buyer some *competitive protection* from the *risk* that the seller, after receiving appropriate consideration for the *future net economic benefit* to be derived from specific forms of his or her *human capital*, could then, post-transaction, sell that same *human capital* to another buyer.

It should be noted that the concept of CNCs may already be addressed and is inherent in the definition of *Fair Market Value*, which states that *both parties* to a transaction are *well informed*; are *acting in their respective, rational, economic self-interests*; are *professionally advised*; and that the *hypothetical transaction* is assumed to be closed, with the *typical legal protections* in place to safeguard their investment in the *transfer of ownership* of the *legal bundle of rights* that *define* and *encompass* the transacted property or interest. Within that context, the existence of the CNC may be considered to be an inherent element, manifesting the "*typical legal protections*" in the *Fair Market Value* of the property interest being appraised. Accordingly, while the value of the CNC may be (1) *allocated* from the *purchase price* of the enterprise, or (2) as a distinct asset in an *Adjusted Net Asset Method*, it may be *double-counting* the value of the CNC to appraise it as a *stand-alone asset*, over and above the subject enterprise's *Fair Market Value* in-use as a going concern, arrived at through an *Income Approach–based valuation method* or *Market Approach–based methods*, unless evidence exists that the comparable companies used in the *Market Approach method* were explicitly reported to exclude a CNC.[202] The issue of *double-counting* may also be a concern when a *trained and assembled workforce* (TAWF) and a CNC are valued as separate and distinct assets, as discussed later.

In the past, methodologies used for determining the value of a CNC included the use of *Income Approach–based valuation methods* that attempted to measure the difference in *revenues* and *net economic benefit* accruing to the property interest holder, by means of a *With and Without*

[202] See Section 8.1.3.1, "Adjusted Net Asset Method," in Chapter 8, "Valuation Approaches and Methods," for further discussion of this method.

Technique, which compares the financial results of the organization benefiting from the CNC, both with the restrictions and without them.[203] However, in those instances when *physician owners* of an *enterprise*, *asset*, *or service* are transferring their rights of ownership to an entity or an organization to which they will continue, post-transaction, to *refer patients*, these methodologies may be subject to regulatory scrutiny, for example, the *Anti-Kickback Statute* and/or the *Stark Law*, to the extent that this type of analysis might be construed as either directly or indirectly taking into account the *volume or value of referrals*.

Under the *premise of value* known as *value-in-exchange*, the value of a CNC can be derived without the same level of concern regarding regulatory scrutiny related to prohibition of considering the *volume or value of referrals*, by estimating the economic benefit derived from the *expectation* of the *avoidance* of a *future expense*, for example, the *costs* associated with *recruiting*, *hiring*, *and training* a new employee to replace the employees who may leave the organization, in the absence of the CNC. This method is essentially a *With and Without Technique*, where an indication of value for the CNC is derived from the difference in value between the TAWF with the CNC and the value of the TAWF without the CNC.

In accordance with the *Principle of Substitution*, the value of acquiring a *Trained and Assembled Physician Workforce* and a *Trained and Assembled Nonphysician Workforce* is *commensurate* with the expense required to *build* a new workforce in its entirety.[204] *Implicit* in the valuation of the workforces is the *assumption* that they will continue to *exist as an assemblage of staff, producing economic benefit* after a prospective transaction. It should be noted that this *assemblage assumption* includes a further assumption of the *indicated historical rate of turnover within the subject workforce*, calculated as the inverse of the *average tenure* of the existing workforce. For example, if the average tenure of the staff making up the subject workforce was 10 years, then the resulting *turnover rate* would be calculated as 1/10 or 10 percent.

A portion of the value attributable to the *Trained and Assembled Physician Workforce* and the *Trained and Assembled Nonphysician Workforce* may be allocable to a *Covenant Not to Compete* based on the probability that the workforce will either (1) *continue to exist as an assemblage*, under the assumption that workforce turnover will be similar to the *historical rate*

[203] See Section 8.2.6, "With and Without Analysis," in Chapter 8, "Valuation Approaches and Methods," for a discussion on the implementation of this technique.

[204] See Section 14.2.2.2, "Classification and Valuation of Cash and Investments," for an example of calculating the value of a *Trained and Assembled Physician Workforce*, based on the historical workforce turnover.

of turnover, due to the presence of individual CNCs; or (2) *dissolve* as an assemblage, due to the lack of a CNC, which would equate to a *higher than the projected historical turnover* in the workforce.

The steps in determining the *Fair Market Value* of a CNC related to employment of a physician, using a *Certainty Equivalent Valuation Methodology*, begin with the creation of discrete periods (e.g., years) coinciding with the number of periods the CNC will be in effect. In each period there are two possible outcomes: (1) in the absence of a CNC, a physician can *choose to compete*; or (2) under the terms of the CNC, the physician can *choose not to compete*. The value of the *Trained and Assembled Workforce* serves as the basis for the *expected cost* to the subject enterprise *in the absence* of CNCs, while $0.00 serves as the *expected cost* to the subject enterprise with CNCs *in place*. The next step is to determine the probability that either outcome occurs.

To develop the *probability of competition* in each period, referred to here as the *outcome probability,* several methods may be used, including:

1. *Research* as to attractiveness of the current physician employment opportunity relative to other opportunities that may be available in the region;
2. *Information* based on *management* expectations and representations; and
3. *Outside business advisers* to the subject enterprise.

Note that in the absence of *reliable information* pertaining to influences of the probability of either outcome occurring, each outcome is subject to being the result of an *independent event*. In that circumstance, a "*naïve*" assumption as to the *outcome probability* may be used that reflects that there would be a 50 percent chance (one of two possible outcomes) of either of the two outcomes occurring, that is, competing or not competing, analogous to basing the assumption on the *flip of a coin* where there are only two outcomes possible: heads or tails. Once the *outcome probabilities* have been established, the *probability weighted cost of each outcome* is determined by multiplying the *outcome probability* by the indicated *value of the outcome* (either the value of the *Trained and Assembled Workforce* or $0.00), which are then summed together to derive the *expected periodic cost of competition*, which is mathematically equivalent to multiplying the *outcome probability* associated with the absence of CNCs by the value of the *Trained and Assembled Workforce*.

An illustration of a *Certainty Equivalent Valuation Methodology* used to value a CNC is set forth in Exhibit 14.6. Note that for illustrative purposes, the assumptions that were used in the exhibit are as follows:

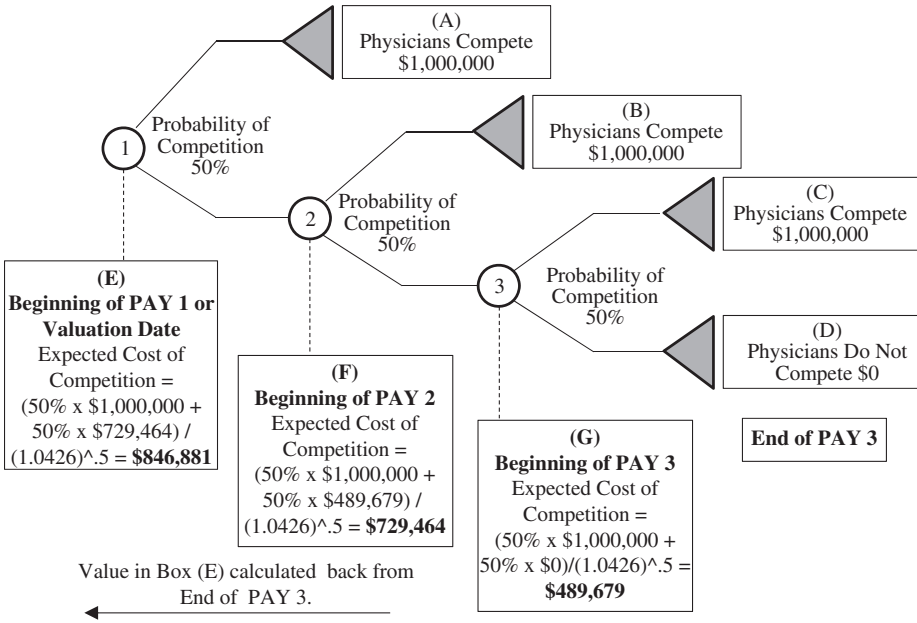

EXHIBIT 14.6 Fair Market Value of Covenant Not to Compete

(1) the CNC had a three-year term; (2) the undiscounted value of the *Trained and Assembled Physician Workforce* is assumed to be $1,000,000, which represents the cost incurred by the employer should the physicians decide to leave and compete; and (3) the probability of competition is 50 percent in each discrete period. The steps used in Exhibit 14.6 are as follows:

1. Note that the calculation starts at the end node and works backward; therefore, the Year 3 *expected cost of competition* is calculated as the sum of the products of:
   a. The full value of the TAWF, *multiplied by* the probability of competition; and
   b. The Year 4 *expected periodic cost of competition* ($0.00—since the term of the CNC is only three years), discounted back to the beginning of Year 4 (which is also the end of Year 3), *multiplied by* the probability of noncompetition (calculated as one minus the probability of competition);
2. The Year 2 *expected cost of competition* is calculated as the sum of the products of:
   a. The full value of the TAWF, *multiplied by* the probability of competition; and

   b. The Year 3 *expected periodic cost of competition,* discounted back to the beginning of Year 3 (which is also the end of Year 2), *multiplied by* the probability of noncompetition (calculated as one minus the probability of competition);

3. The Year 1 *expected cost of competition* is calculated as the sum of the products of:
   a. The full value of the TAWF, *multiplied by* the probability of competition; and
   b. The Year 2 *expected periodic cost of competition*, discounted back to the beginning of Year 2 (which is also the end of Year 1), *multiplied by* the probability of noncompetition (calculated as one minus the probability of competition).

The Year 1 *expected cost of competition* is discounted back to the beginning of the current period.

The appropriate *risk-adjusted required rate of return*, used to discount the *expected periodic cost of competition* to the beginning of each period, is typically a *risk-free rate*, since the riskiness of the CNC is reflected in the *outcome probability.* Also, the *mid-period convention* should be used to discount the *expected periodic costs of competition*, since the costs are assumed to be incurred evenly throughout each period, which, if averaged over the period, would lead to the conclusion that the cost is incurred in the middle of the period.[205]

It should be noted that in the event TAWF and CNC are being valued as separate and distinct elements of a transaction, the value of the CNC, which is part of the *typical legal protections* inherent in the definition of the FMV standard of value, is most often assumed to be included in the value of the TAWF. Therefore, in order to *avoid double counting* the economic value of the CNC, it is recommended that it be apportioned from the economic value of the TAWF, when appraised using a *Certainty Equivalent Valuation Methodology* as referenced earlier.

In addition to a CNC, which prevents employees from competing with the employer organization, a similar and related provision is an *anti-piracy clause*, which prevents terminated employees from *soliciting* other employees to leave the employer organization. These types of provisions can be valued using a similar *With and Without Technique* related to the value of the TAWF, as described earlier for a CNC. The difference in the

[205] See Section 8.1.1.7.1, "The Discrete Projection Period," in Chapter 8, "Valuation Approaches and Methods," for further information regarding the mid-period convention.

application of the method for an antipiracy provision is that in place of the probability that employees will compete in the absence of a CNC is the *joint probability* that (1) even in the absence of the antipiracy provision, there would be a *normal level of attrition* (most likely based on the historical rate) to the TAWF of the employer organization; and (2) an additional portion of the TAWF *would be successfully solicited to leave the employer organization by the terminated employees* in the event there was no antipiracy clause.

Also, in addition to a CNC related to employed services of individuals as described earlier, a CNC may be related to the services provided by an enterprise, post-transaction. For example, a transaction related to the *Fair Market Value* of the entirety of an ambulatory surgery center would be expected to include the *typical legal protections* afforded by a CNC, which protect the buyer from competition from the seller, for example, the seller "walking off" with the property interest previously transferred to the buyer. The value of the CNC could be allocated from the purchase price of the entirety of the enterprise by using a *With and* Without *Technique*, whereby the difference in value of the subject enterprise with and without the restriction would serve as an indication of value related to the CNC.[206]

Certain circumstances—namely, *marital dissolution* and *transactional tax planning*—may require the allocation of *professional and practice goodwill*, as further discussed in Section 14.4.2.11, "Classification and Valuation of Goodwill."[207] In some of these situations, it has been held by the courts that personal goodwill may include the value of a CNC. However, it should be noted that the case law regarding this topic differs from state to state (see Table 14.4) and changes frequently.

14.4.2.6 Classification and Valuation of Marketing and Business Development–Related Intangible Assets *Intangible personal property* that may be classified as *marketing and business development–related* include those assets that generate revenue for the subject enterprise through *enhanced recognition and quality assurance*. In the healthcare industry, these types of *intangible assets* may include *advertising, franchise/licensing agreements*, *joint ventures/alliances,* and *brand management services*.

---

[206] See Section 8.2.6, "With and Without Analysis," in Chapter 8, "Valuation Approaches and Methods," for a discussion on the implementation of this technique.

[207] Alina Niculita, Angelina Mckedy, and Kimberly Linebarger "How to Distinguish Personal Goodwill from Enterprise Goodwill, the Key Person Discount, and Noncompete Agreements," in *BVR's Guide to Personal v. Enterprise Goodwill*, 5th ed. (Portland, OR: Business Valuation Resources, 2012), pp. 101–102.

Marketing and Business Development–Related Intangible Assets

Includes advertising, franchise/licensing agreements, and joint ventures/alliances.

Valuation of Intellectual Property and Intangible Assets, *3rd ed., by Gordon V. Smith and Russell L. Parr (New York: John Wiley & Sons, 2000), pp. 17–18.*

Marketing and business development–related intangible assets are often intertwined with *intellectual property–related intangible assets* and usually provide *additional utility* to their owner(s), above the level of value produced by the underlying intellectual property, only when either (1) the licensing agreement grants the subject enterprise *the right to use* the intellectual property and pay another party a royalty rate *below the current market rate*, or (2) by allowing the subject enterprise *to license* the underlying intellectual property to another party at a royalty rate *above that of the current market rate*, depending on whether the subject enterprise owns the underlying intellectual property.[208] For example, most forms of *advertising* provide *important maintenance* to a *trade name or a trademarked brand*; therefore, the advertising expense may serve as an *economic expense burden* applicable to the *isolated income stream* attributed to the *intellectual property interest* to determine the *net economic benefit* derived from ownership of the intellectual property interest.[209]

In the event that the subject *marketing and business development–related intangible asset* does produce an isolated income stream above that produced by any associated intellectual property, an *Income Approach–based valuation method*, for example, the *single period capitalization method* when the *net economic benefit* is assumed to be *stable* in the future or the *discounted cash flow method* when the *future net economic benefit* is assumed to vary over the short term, may be appropriate methods to employ. Note that the methodology for valuing these types of assets would be similar to methodology used to value *leasehold interest intangible assets*, as discussed in Section 14.4.1.1, "Income Approach for Valuing Intangible Real Property," except that the net economic benefit is generated by the difference in *royalty rates*, in contrast to *lease rates*.

In the event that the *market rate* approximates the *contractual rate* for licensing *marketing and business development–related intangible*

[208] Gordon V. Smith and Russell L. Parr, *Intellectual Property: Valuation, Exploitation, and Infringement Damages* (Hoboken, NJ: John Wiley & Sons, 2005), pp. 17–19.

[209] Ibid., p. 261.

assets and therefore does not reflect a variance to serve as a *stream of future net economic benefit* above that of the underlying intangible assets for use in an *Income Approach–based valuation method*, the use of an *Asset/Cost Approach–based valuation method* may be indicated in determining the value of utility available to a potential purchaser from the avoidance of cost related to developing the *marketing and business development–related intangible asset* that is already in place. This could be determined by using the *Replacement Cost Method* in a manner similar to that used to value *noncopyrighted policies and procedures,* as discussed in Section 14.4.2.2.3, "Noncopyrighted Policies and Procedures."

14.4.2.6.1 Advertising There are ever expanding channels of healthcare *advertising programs* in support of the marketing and business development department of a healthcare organization, which include *direct mail*, *other print media*, *electronic media*, *social media*, *websites, telephone numbers*, *patient education outreach sessions*, *development of referral networks*, and *billboards*. *Advertising programs*, in addition to *publicity and personal selling*, are a method that is used to (1) *explain and differentiate a product/service*, how it can be *accessed*, what its *objectives* are, and its *unique selling proposition* in contrast to other products/services; and (2) *build goodwill* and *enhance the public's image* of a healthcare organization. Advertising can be classified into two common categories: *product* or *institutional*. *Product advertising* consists of communications meant to be (1) *informational*, (2) *competitive*, or (3) *a reminder*, while *institutional advertising* is most often used to (1) *introduce or announce* the opening of a new facility, (2) *compare programs*, or (3) *advocate a public position* of an organization, which may also assist in branding the enterprise.[210]

There is significant research evidence that in addition to providers and payors, *patients* need to be engaged in their treatment in order to be *accountable* for their care, if providers are going to be successful in *delivering quality outcomes*, as the reimbursement environment for healthcare products and services changes from the previous focus on procedure volume to that of value-based purchasing.[211] *Informational advertising* and *reminders* at the product/service level, for example, *patient appointment/treatment reminders* and *patient educational materials*, which consider health literacy and cultural competence, may go a long way in balancing the competing

[210] Eric Berkowitz, *Essentials of Health Care Marketing* (Gaithersburg, MD: Aspen Publishers, 1996), p. 309.

[211] See Chapter 2, "Reimbursement Environment," for further discussion of the reimbursement environment in the healthcare industry.

forces between *volume* and *value* brought on by the shifting reimbursement paradigm.[212]

In the past, many *not-for-profit entities* that implemented advertising programs came under heavy scrutiny for their expenditures.[213] Note that *healthcare advertising programs* have been deemed to be legally permissible under the Federal Trade Commission Act but must still comply with federal and state protections against *false*, *misleading*, or *deceptive* advertisements, and the American Medical Association's (AMA) Code of Ethics has special requirements of its members regarding the advertising it deems permissible.[214] The motivations for increased advertising and promotion may be different between *for-profit* and *not-for-profit* healthcare entities, in that *tax-exempt healthcare organizations* do not generate *net economic benefit* to the advantage of private shareholders. However, the *net economic benefit* they generate from providing goods and services may be reinvested into the enterprise to fund purchases of new technologies that *increase the ability* of the organization to *provide quality services* to their patients, including those patients who receive *charity care under* the exempt organization's mandate. Therefore, branding may be just as important to *tax-exempt organizations* as to *for-profit entities*, not only because of *increased competition* within the healthcare industry sector but also due to the *constantly evolving nature of healthcare technology* (see Chapter 4, "Competition," and Chapter 5, "Technology," for further discussion of these topics).

For those elements of an advertising program that provide a potential purchaser with an economic benefit through the *avoidance of cost* of re-creating the *advertising program*, the *Replacement Cost Method* may be used in a manner similar to that proscribed for *in-place leases*, as discussed in Section 14.4.1.3, "Asset/Cost Approach for Valuing Intangible Real Property," except that this method would entail determining the *tasks*, *duties*, *responsibilities*, *and accountabilities* associated with developing an advertising program. These TDRAs would include:

1. *Defining the target audience*;
2. *Determining the advertising objectives*, for example, awareness, interest, evaluation, trial, and adoption of the product/service;

---

[212]Wayne Clark, "Marketers and Communicators: Your Future Is Waiting," Society for Healthcare Strategy and Market Development, *Spectrum* (September/October 2012): 1–3.

[213]Philip Kotler and Roberta Clarke, *Marketing for Health Care Organizations* (Englewood Cliffs, NJ: Prentice Hall, 1987), p. 21.

[214]Steven Harris, Esq., "Advertise with Caution: State Laws Restrict How Physicians Can Market Themselves," *ENT Today*, December 2010, http://www.enttoday.org/details/article/884837/Advertise_with_Caution_State_laws_restrict_how_physicians can_market_themselves.html (accessed March 14, 2013).

3. *Determining the advertising budget*, for example, percentage of sales, competitive parity, residual, objective, and task;
4. *Developing the target message* through rational, emotional, and social appeals;
5. *Specifying the communication program* through the selection of medium and vehicles; and
6. Evaluating the response.[215]

Similar to that of *in-place leases*, market data used to determine the *direct and indirect costs* associated with the TDRAs required to *re-create* an equally desirable advertising program to that of the subject advertising program may include the *developer's profit*; if not, this information may be available in benchmark survey data regarding the return on operating expenses of *Advertising Agencies* (NAICS 541810). In addition to the difference in the required TDRAs, the *lost opportunity cost* or the *entrepreneurial incentive* should be based on the time it would take to develop the subject advertising, in contrast to the time it would take to develop a replacement lease.

14.4.2.6.2 Franchise/Licensing Agreements *Franchise/license agreements* can enable an organization to gain *access to markets* (either geographical or service) that *may not be previously feasible*.[216] An example of this may be a *start-up cancer treatment center* that licenses the *rights to use* the *trade name* of a *nationally developed cancer treatment center*, which may also include *other intellectual property* and *depth-of-management intangible assets*. Note that the value associated with the *intellectual property* and/or *operations-related intangible assets* may be separable from the value derived from the *licensing agreement* itself. In this instance, the *licensing agreement* may hold value only if the contract is for a *favorable rate*, which may be valued in a manner similar to that for *leasehold interests*.[217]

In the event that the subject agreement does not produce a direct income stream, the *Replacement Cost Method* may be used in a manner similar to that for *in-place leases*, as discussed in Section 14.4.1.3, "Asset/Cost Approach for Valuing Intangible Real Property."

[217] See Section 14.4.1.1, "Income Approach for Valuing Intangible Real Property," for further discussion of the valuation methodology for *leasehold interests*.

14.4.2.6.3 Joint Ventures and Alliances *Joint ventures and alliances* with other healthcare providers may enable an enterprise to *gain access to additional revenue streams*, provided that no legally impermissible payments are made for referrals under the *fraud and abuse* regulations. For example, Accountable Care Organizations (ACOs) are a form of an alliance, which may provide *monetary* and *nonmonetary* value to third parties, including *patients*, *employers*, and the *broader U.S. population* (SOCIETY); *health systems*, *hospitals*, and *physicians* (PROVIDERS); and *managed care organizations*, *commercial insurers*, and *Medicare* (PAYORS). SOCIETY may benefit from ACOs: (1) *monetarily*, *through cost reductions*, for example, reductions in expenditures for specified *patient populations*, reduction in medical expenditures for the *community served by an ACO*, lower overall *national healthcare expenditures* (NHE) as a percentage of gross domestic product (GDP), and/or decreasing rate of growth in medical care inflation, as well as (2) *nonmonetarily*, through *improved quality outcomes* and *greater access to care*.[218] PROVIDERS may benefit from ACOs: (1) *monetarily*, by obtaining the ability to produce *additional revenues*, which are derived from the cost savings the organization is able to achieve for specific payors; and (2) *nonmonetarily*, through improved *work-life balance*, access to *sophisticated technology*, access to *expanding social networks*, and increased *autonomy* in comparison to past managed care models. PAYORS may benefit from ACOs: (1) *monetarily*, through the anticipated reductions in *reimbursement payments* to PROVIDERS; and (2) *nonmonetarily*, through the enhanced reputation of payors that become more involved in the provision of *quality* clinical services.[219]

Alliances and joint ventures are commonly valued using *Income Approach–based valuation methods*.[220] For example, a federal ACO may provide services to Medicare beneficiaries below an *expenditure benchmark* for those services provided, which is established for the ACO by the *Centers for Medicare and Medicaid Services* (CMS). The level

[220] See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for further discussion of this method.

of *incurred costs* below the established benchmark forms the basis of "*cost savings*" achieved by the ACO under the Medicare Shared Savings Program (MSSP).[221] These *cost savings* are then *shared* by the ACO and CMS, and these "*shared payments*" form the basis of the *net economic benefit* attributable to the ACO alliance, which can be discounted back to the present to determine the value of the ACO contract. Risks associated with an investment in an ACO, above the investment alternatives available to all market participants, include, but are not necessarily limited to,

1. *Uncertainty* regarding the *long-term viability* of the ACO reimbursement model, due to its relatively new and unproven operational success;
2. *Uncertainty* regarding the ability of the subject enterprise to *achieve the projected level of shared payments*;
3. *Funding shortfall risk* for payors of shared payments;
4. *Underlying investment risk* associated with each individual ACO participant; and
5. *Uncertainty* regarding the *ability to renegotiate* future ACO contracts.[222]

14.4.2.7 Classification and Valuation of Regulatory or Legal-Related Intangible Assets *Intangible personal property assets* that derive their existence from rules and regulations may be classified as *regulatory/legal-related*.[223] Examples of *regulatory/legal-related intangible assets* in the healthcare industry include *provider medical licenses*, *provider permits*, *Certificates of Need* (CON), *Medicare certification*, and *other certifications and accreditations*. Note that certain *regulatory/legal-related intangible assets* may be classified as *intangible real property*, for example, *facility licenses*, and as such, are discussed in Section 14.4.1, "Classification and Valuation of Intangible Real Property."

Most *regulatory or legal-related intangible assets* consist of some form of *market entrance barrier*, which, by prohibiting or restricting the market, allow incumbents in the healthcare industry sector the opportunity to earn

[221] See Section 6.4.4.1, "ACA's Establishment of Accountable Care Organizations," in Chapter 6, "Healthcare Reform," for further information regarding the MSSP.

[222] Robert James Cimasi, *Accountable Care Organizations: Value Metrics and Capital Formation* (Boca Raton, FL: Taylor and Francis Group, 2013), chaps. 6 and 7.

[223] Chapter 3, "Regulatory Environment," includes a discussion of various rules and regulations that are pertinent to healthcare valuation.

Regulatory/Legal-Related Intangible Assets

Includes facility licenses, medical licenses, permits, litigation awards and liquidated damages, certificates of need, Medicare certification, and other certifications and accreditations.

higher profits through less competition. Examples of *market entrance barriers* include:

1. *Supply side economies of scale*;
2. *Demand-side benefits of scale*;
3. *Customer switching costs*;
4. *Capital requirements*;
5. *Incumbency advantages, independent of size*;
6. *Unequal access to distribution channels*; and
7. *Restrictive government policy.*[224]

Regulatory and legal-related intangible assets, such as *facility licenses* or *certifications*, typically do not have *established*, *transparent*, *liquid markets* reporting transaction data for similar types of intangible assets, invalidating the use of a *Market Approach–based valuation method*. However, *regulatory and legal-related intangible assets* that produce a direct, measurable amount of *net economic benefit* can be valued using *Income Approach–based valuation methods*.

In addition, *Asset/Cost Approach–based valuation methods* may be used to value *regulatory and legal-related intangible assets*, in particular, those that do not produce a discernible direct economic benefit, in a manner similar to that used to appraise *noncopyrighted policies and procedures*.[225]

14.4.2.7.1 Provider Medical Licenses *Provider medical licenses* establish the criteria for the minimum *base of knowledge* required to perform certain professional services. This acts to mitigate the *asymmetric information gap* faced by patients that is inherent in the *physician-patient relationship*, due to the *complex and technical nature* of the services provided in the healthcare industry, as well as the *ambiguous* terminology and language used to communicate those services. These licenses are a type of *restrictive governmental*

[224] Michael Porter, *On Competition* (Boston: Harvard Business School Publishing, 2008), p. 12.

[225] See Section 14.2.2.3, "Classification and Valuation of Accounts Receivable," for further discussion of using this method.

policy that creates a *market entrance barrier*, limiting the amount of competition to those providers who have obtained the *appropriate training* and *experience*.

Provider medical licenses typically do not possess, in the same manner as product/process licenses, an economic value as a stand-alone discrete property interest. However, for the purposes of *marital dissolution*, some courts have held that a *professional medical license* is *marital property* and has value that is *subject to division* (see Table 14.6). In these circumstances, the value of a *license*, represented by the *enhanced earning capability* afforded to the holder of the license, can be determined using a *With and Without Technique*.[226] This technique is based on the difference between the *most probable periodic income* earned by an individual *who is not licensed* in contrast to that expected to be earned by an individual *who holds a license*. Information regarding the *most probable periodic income* for the specialty and/or subspecialty of the individual who *possesses a professional medical license* is published in several sources, including *normative industry benchmark survey data*.[227] To establish the *most probable periodic income* for an individual *who is not licensed*, various sources may be used, including:

1. Federal government agency data, such as the Bureau of Labor Statistics;
2. Compensation surveys, for example, Economic Research Institute (ERI); or
3. Web-based sources, such as Salary.com, Payscale.com.

Factors to be considered when determining the *most probable periodic income* for each scenario include:

1. *Geographic location* where the individual will provide services;[228]
2. *Demographic characteristics* of the individual, for example, *gender* and *age*; and
3. *Forecasted economic conditions* of the labor market.

---

[226] John F. Burke Jr. and Harvey S. Rosen, "Valuing Educational Attainment as a Distributable Asset," in *Valuing Professional Practices and Licenses: A Guide for the Matrimonial Practitioner*, 3rd ed., edited by Ronald Brown (New York: Wolters Kluwer Law & Business, 2013), pp. 31-1–31-17.

[227] See Section 15.5.1.6, "Clinical Related Services Compensation Benchmarking," in Chapter 15, "Healthcare Services," for a list of clinical compensation benchmarking sources.

[228] Milton Friedman and Simon Kuznets, *Income from Independent Professional Practice* (New York: National Bureau of Economic Research, 1945), pp. 173–235.

Once the *most probable periodic income amounts* have been developed for both the individual *with* the license and the individual *without* the license, survey data prepared by federal government agencies, such as the *Bureau of Labor Statistics*, can be used to estimate the *work-life expectancy* of both the individual *with* the license and the individual *without* the license, which would serve as the length of time that the *income from each of the two disparate pursuits* would be expected to be generated. In the healthcare professions, there are additional sources of survey data as to what constitutes the *most probable work-life expectancy time horizon* within which the individual could perform certain services, for example, a neurosurgeon performing surgeries.

Survey data related to the *most probable amount of clinical productivity* generated by an individual at *different age levels* over time can be used to calculate the expected income of an individual with a professional medical license. For example, the *most probable retirement age*, as well as the *most probable clinical production* overtime, of an orthopedic surgeon could be developed from independent market research of other orthopedic surgeons in similar markets or by analyzing survey data compiled by industry groups, such as the *American Academy of Orthopedic Surgeons*. *Mortality tables* are then used to adjust the income levels in each future period, based on the *probability of the individual being alive* at a particular age.[229]

This expected probable income amount is then discounted back to the present at an appropriate *risk-adjusted required rate of return*, which is most often a *risk-free rate*, since the variability of the future income levels is usually taken into account in the projected income amounts but may be subject to adjustment based on consideration of several elements, including:

1. The discount rate should be adjusted for differences in the length of time each income stream will be produced only in the event that differences in work-life expectancy are ***not*** taken into account.[230]
2. The discount rate should be adjusted for differences in uncertainty arising from changes in income over time only when it is reasonably

[229] Joel Rakower, "Enhanced Earnings Capacity: Understanding the Computations," in *Valuing Professional Practices and Licenses: A Guide for the Matrimonial Practitioner*, 3rd ed., edited by Ronald Brown (New York: Wolters Kluwer Law & Business, 2013), p. 33-7.

[230] Milton Friedman and Simon Kuznets, *Income from Independent Professional Practice* (New York: National Bureau of Economic Research, 1945), pp. 142–147.

assumed that there will be differences in one income stream that do not affect the other.[231]

3. A *nominal discount rate* should be used when income figures are projected at nominal growth rates.[232]

Once the discount rates and projected *future income streams* have been established, the difference in the present value of each income scenario would give an indication of the value of the license. Note that *ceteris paribus*, the value of the license would *decline with age*, as the expected number of *work-life years* for the individual *decreases over time*. This is in contrast to the value of a *well-run business enterprise*, which with prospects for growth often *increases in value with the passage of time*.[233]

14.4.2.7.2 Certificates of Need *Certificates of Need* (CON) in the healthcare industry, which exist in 36 states, act in a manner similar to a *license* or a *permit*, in that the state government determines *where*, *when*, *and how* capital expenditures will be made for healthcare *facilities*, *services*, and *major equipment*.[234] The CON approval process requires *time* and *resources* to be spent in the pursuit of an endeavor that ultimately may fail to achieve regulatory approval, which provides existing holders of a CON a *competitive advantage* over *potential entrants*, that is, it serves as a *market entrance barrier.*

Factoid

Thirty-six states retain some type of CON Program, law, or agency as of December 2011.

"Certificate of Need: State Health Laws and Programs," National Conference of State Legislatures, http://www.ncsl.org/issues-research/health/con-certificate-of-need-state-laws.aspx (accessed September 7, 2012).

[233] Ibid., p. 31-14–31-17.

[234] *National Directory of Health Planning, Policy, and Regulatory Agencies*, 22nd ed. (Falls Church, VA: American Health Planning Association, 2011), p. 126; Robert James Cimasi, *The US Healthcare Certificate of Need Sourcebook* (Washington, DC: Beard Books, 2005), pp. 1–3.

These types of property interests manifested in a *market entrance barrier* can be valued using a *Replacement Cost Method*, which requires the summation of the *direct costs*, the *indirect costs*, the *developer's profit margin*, and the *entrepreneurial incentive* (also referred to as the *opportunity cost*) that would be incurred to re-create the market entrance barrier, for example, a CON, that provides the same or similar utility as that of the subject market entrance barrier. The *direct and indirect costs* may be developed through *independent market research* related to the type and amount of *tasks*, *duties*, *responsibilities*, *and accountabilities* (TDRAs) required to *re-create* a CON that provides an equal level of utility as that provided by the subject CON, which may or may not include the *developer's profit margin*.[235] Examples of *direct and indirect costs* include, but are not necessarily limited to,

1. The TDRAs associated with *executive management*, the *medical director*, the *business administrator*, *financial operations executive*, *legal counsel*, *professional advisers*, *expert witnesses*, *lobbyists*, *public relations support*, *and other staff* required to successfully navigate the CON approval process;[236]
2. Application preparation costs and filing fees; and
3. *Costs to perform financial feasibility analysis including Need-Based Formulas and community mapping*.[237]

In lieu of the *developer's profit margin* being included with the *direct and indirect costs*, an *appropriate profit margin* may be obtained from normative industry benchmark survey data related to an appropriate "*markup*" on similar *direct and indirect costs*, for example, the *return on operating expenses* of a consulting business (NAICS 541611 or 541613).

In addition to the *direct* and *indirect* costs associated with the *CON approval process*, the *value* of an *existing CON* may be *significantly affected* by the time and effort other market participants would be required to expend in order to *develop and implement* a successful application in achieving *a similar CON* in the same geographic market service area of the subject

[235] See Section 14.4, "Classification and Valuation of Intangible Assets," for further discussion of the *developer's profit margin*.

[236] Robert J. Cimasi, "Tips to Win: Navigating CON Laws for ASCs," January 2, 2008, http://www.surgicenteronline.com, p. 1.

[237] Robert J. Cimasi, "Developing and Implementing a Successful Certificate of Need Strategy," 2nd Annual GE Healthcare Outpatient Imaging Center Conference, Arlington, VA, July 2007, pp. 34–35.

CON. This additional value can be considered a form of *entrepreneurial incentive/opportunity cost* that may be required by the owner of the CON.

The calculation of the *entrepreneurial incentive/opportunity cost* can be determined using the *Discounted Future Benefits Method*, which calculates the value of the *opportunity cost* as the difference in *net economic benefit* generated by a *hypothetical start-up* and an *established enterprise* over the time it takes the *start-up* to reach the level of the *established enterprise*, which point in time is referred to as the *merger point*. Note that this method assumes that the *net economic benefit* for the *start-up* and the *established enterprise* are *equal* after the *merger point*, and it is unlikely that a purchaser, under the *Principle of Substitution*, in making the *buy* or *build* decision, would pay for a property interest that they could create on their own.

The *Discounted Future Benefits Method* begins with an estimate of the time it will take the *hypothetical start-up enterprise* to reach the merger point. Then, the difference between the *most probable income* generated by an *established enterprise,* which may be derived from normative benchmark industry survey data, and that generated by the *hypothetical start-up enterprise*, serves as the *gross incremental benefit* generated during the period from the *valuation date* to the *merger point*. Note that this *gross incremental benefit* includes the economic contribution of the CON, as well as the economic contribution of all of the other assets, both tangible and intangible, that produce the benefit stream. Accordingly, *contributory asset charges*, which represent the *expected rate of return* for all of the tangible and intangible assets required to generate the *gross incremental benefit*, including amounts related to goodwill, but excluding that for the CON, should be deducted from the *gross incremental benefit* to ascertain the residual *net economic benefit*, which may then be attributed to the economic value of the CON. This *net economic benefit* is then discounted back to the *valuation date* at an appropriate *risk-adjusted required rate of return* associated with an investment in the subject CON. *Risk factors* to be considered for an investment in a CON include, but are not necessarily limited to,

1. The probability of the *healthcare enterprise* being able to achieve the *projected future operating performance results* commensurate with those *past operating performance results* reported in the survey data used;
2. *Investor perceptions* as to the probable *investment time horizon* for an investment in assets similar to the CON; and
3. The probability of *regulatory restraints* manifesting a restriction and/or change in the availability of a CON.

14.4.2.7.3 Medicare Certification *Medicare certification* of an enterprise allows it to receive *reimbursement* from the federal government for patients subscribed to Medicare, with some enterprises, for example, certain types of hospitals, heavily dependent on the revenue stream of Medicare patients (see Chapter 11, "Inpatient Enterprises," for further discussion of the valuation methodology for hospitals, including their reimbursement environment). This *restrictive governmental policy* limits competition for *participating patients* to only those *certified providers*.[238]

The value of a *Medicare certification* can be determined through an *Asset/Cost Approach–based valuation method* in a manner similar to that of *Certificates of Need*, as discussed in Section 14.4.2.7.2, "Certificates of Need," except that the calculation of *opportunity costs* is based on the amount of *net economic benefit* generated by providing services to Medicare beneficiaries, and the risk involved would be related to the ability of the organization to achieve *Medicare certification*.

14.4.2.7.4 Other Certifications and Accreditations Attainment of other *certifications and accreditations*, such as those obtained by the *National Committee for Quality Assurance* (*NCQA*), the *Accreditation Association for Ambulatory Health Care* (*AAAHC*), and the *Joint Commission on Accreditation of Healthcare Organizations* (*the Joint Commission*), can create an added image of *quality* or *superior service* for an organization.[239] The *time* and *effort* expended to obtain other *certifications and accreditations* can be extensive, which cost may serve as a *market entrance barrier*, *deterring* potential competitors from entering the market, due to the cost of substantial capital resources required to achieve the subject certifications and/or accreditations deemed necessary to compete with those certified and accredited organizations already in the marketplace.

The value of *other certifications and accreditations* can be determined through an *Asset/Cost Approach–based valuation method* in a manner similar to that of *Certificates of Need*, as discussed in Section 14.4.2.7.2, "Certificates of Need," except that the calculation of *opportunity costs* is based on the amount of *net economic benefit* generated by providing services with the *certification* or *accreditation*, and the risk involved would be related to the ability of the organization to achieve the *subject certification/accreditation*.

---

[238] See Section 3.8.1.2, "Medicare and Medicaid Certification," in Chapter 3, "Regulatory Environment," for further discussion of this topic.

[239] See Section 3.8, "Licensure, Certification, and Accreditation Regulations," in Chapter 3, "Regulatory Environment," for further discussion of this topic.

Financial/Revenue Stream–Related Intangible Assets

Includes office share arrangements, management service agreements, and financing agreements, including options.

14.4.2.8 Classification and Valuation of Financial or Revenue Stream–Related Intangible Assets *Financial or Revenue Stream–Related Intangible Assets* are those assets that provide value through the use of *financial arrangements*, or those assets that derive their value from the *qualitative attributes of the subject enterprises' revenue stream*, for example, the subject enterprise has a revenue stream provided by an asset that is *not easily replaceable*, or the *payment terms* for a revenue-producing agreement are at *below market rates*. *Intangible personal property* that may be classified as *financial/revenue stream–related* include *office share arrangements*, *management service agreements*, *financial arrangements*, and *financial derivatives*, such as *swaps* and *purchase options*.

14.4.2.8.1 Office Share Arrangements An *office share arrangement* (OSA) consists of an agreement by which a professional practice *shares office space and staff* with another professional provider. From the *perspective of the lessee*, *or sublessee*, an OSA may enable the *physician lessee* to achieve *higher patient volume* in different and/or expanding *geographic areas* on a periodic basis, without bearing the *entire* burden as to the capital and operating expenses related to establishing their presence in a "*satellite*" office. From the *lessor's perspective*, an OSA presents an *economic opportunity* to generate *incremental revenue* from the use of *excess capacity* related to capital already invested in existing *premises*, *equipment*, *and staff*, with *no additional fixed operating expense* and typically only *minimal incremental variable expense*. While OSAs are common among physician practices, it should be noted that even if the arrangement is structured as a c*orporation-to-corporation contract*, an OSA is most often of a *unique personal nature* to particular physician lessors and physician lessees. Therefore, an OSA is typically not subject to transfer from one party to a successor party without *significant restrictions*, that is, the right to approve the physicians who would subsequently use the *premises*, *equipment*, *and staff* under the OSA. Also, it is not uncommon that an OSA be manifested only by an *oral agreement* and not committed to a *written contract*.

In such a case, the appraiser should seek the *advice of legal counsel* to determine whether the subject enterprise's state real estate rules and

regulations considers that an OSA is a sufficient enough *property interest* to be considered real property and subject to the *statute of frauds* in order to be enforceable.[240] As with other intangible assets, the economic value of the property interest related to an OSA is predicated on whether its legal status is subject to being afforded protection by the courts.

The economic value of an OSA may be *allocated from the purchase price* of a healthcare enterprise or may be established as a *distinct intangible asset* when valuing the overall healthcare enterprise using the *Asset/Cost Approach–based Net Adjusted Value Method*. To the extent that an OSA produces an isolated stream of *net economic benefit,* an *Income Approach–based valuation method* may be used to determine its value.[241] For example, significant portions of the *office staff*, *rent*, and most *capital costs* would be considered *fixed expenses* that would be incurred at similar levels, even in the absence of an OSA. However, the utilization of a *small portion of the staff*, for example, certain hourly employees, as well as *basic supplies* and *certain utilities*, might be increased with the presence of an OSA. The amount of increase in economic operating expenses associated with the implementation of the OSA would be subtracted from the revenue produced by the subject OSA in order to determine the *net economic benefit* attributable to the OSA.

To derive an indication of value for the subject OSA, the *net economic benefit* is discounted back to the present at an appropriate *risk-adjusted required rate of return* that reflects the risks associated with an investment in the subject OSA, which, in addition to *alternative investment risks*, include:

1. **Specific terms of the OSA**, for example, ability to assign to other parties, ability to terminate without cause;
2. **Uncertainty related to the projected level of revenue**, due to either *default risk* of the physician lessee or probable risk of losing an OSA lessee relative to the availability of similar services from competing physician groups; and
3. **Uncertainty** as to the projected amount of economic costs to be incurred to obtain the OSA revenue, which affects the projected *level of net economic benefit*.

---

[240]The statute of frauds requires that certain transactions be set forth in writing in order to be legally enforceable. See Bryan Garner, ed., *Black's Law Dictionary*, 9th ed. (St. Paul, MN: Thomson Reuters, 2009), p. 1545.

[241]See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for more information pertaining to the use of an *Income Approach–based valuation method*.

14.4.2.8.2 Management Service Agreements *Management service agreements* (MSAs) define the terms under which an outside organization provides certain *management services*, for example, *accounting*, *billing*, *and managed care contracting*, to a healthcare enterprise. Note that these agreements may provide a healthcare enterprise with *more efficient means* of obtaining management functions and services, in contrast to performing the services *in-house*.

The value of an MSA can be determined using an *Income Approach–based valuation method*.[242] In using this type of method, the *net economic benefit* attributable to the subject MSA is determined by deducting the applicable *economic operating and capital costs* from the revenue derived from the services rendered under the subject MSA. This *net economic benefit* is then discounted back to the present at an appropriate *risk-adjusted required rate of return*, reflecting the risks associated with investing in the subject MSA. In determining the appropriate *risk-adjusted required rate of return*, additional risks that should be considered, above those related to the *opportunity cost of funds*, include, but are not necessarily limited to,

1. **Default risk/counter-party risk** of party receiving the MSA services;
2. **Specific terms and restrictions of the subject MSA**, for example, time horizon, ability to assign to other parties or terminate without cause;
3. **Competitive environment** related to other providers of MSA services; and
4. **Probability of maintaining** the continuity of the revenue stream and profitability specific to the subject MSA.

14.4.2.8.3 Financing Agreements *Financing agreements* are *financial instruments* that enable an individual or an enterprise to use capital in one period in exchange for a commitment to return the principal amount of that capital with interest over subsequent periods. Note that *lease agreements* may be considered a form of *financing arrangement*.

Financing agreements produce a stream of *net economic benefit* and therefore are typically valued using an *Income Approach-based valuation method*.[243] The *net economic benefit* attributable to a *financing agreement*, for example, a *promissory note* or a *lease agreement*, can be determined by

[242] See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for more information pertaining to the use of an *Income Approach–based valuation method*.

[243] Ibid.

deducting the applicable *economic operating and capital costs* incurred in the process of:

1. **Obtaining the capital** for underwriting the credit;
2. **The costs of origination**;
3. **The costs of collecting the cash flow** stipulated in the *financing agreement*; and
4. ***Estimated credit and collection losses***, from the revenue stream stipulated in the subject agreement.

This *net economic benefit* is discounted back to the present value at an appropriate *risk-adjusted required rate of return*, to provide an indication of value for the subject *financing agreement*.

The risks associated with an investment in the *subject financing agreement* include, but are not necessarily limited to,

1. **Default risk/counter-party risk** of the borrower, which can be estimated by assessing the four "Cs" of the borrower, that is, *capacity*, *collateral*, *covenants*, *and character* (see *Key Sources* for additional sources that discuss traditional credit analysis);[244]
2. **Forecasted prepayment levels** net of any prepayment penalty (see *Key Sources* for additional sources that discuss calculating prepayment levels);
3. **Uncertainty as to the accuracy of the forecasted level of servicing costs**, which can be determined by using *normative industry benchmark survey data* or through independent market research; and
4. **Secured position** of the subject financing agreement as relates to the *priority of its claims* on the underlying cash flow.[245]

14.4.2.8.4 Financial Derivatives *Financial derivatives* (e.g., *forwards*, *futures*, *options*, or *swaps*) are defined as "financial instrument[s] whose value depends on (or derives from) the values of other, more basic, underlying variables."[246] While derivatives can be used for *speculation* and *arbitrage* purposes, the most common uses by healthcare enterprises are as a *hedge*

[244] Frank Fabozzi, *Fixed Income Analysis for the Chartered Financial Analyst Program,* 2nd ed. (New Hope, PA: Frank J. Fabozzi Associates, 2005), p. 572.

[245] Ibid., pp. 406–407.

[246] John C. Hull, *Options, Futures, and Other Derivatives*, 8th ed. (Boston: Prentice Hall, 2012), p. 1.

against the risk of uncertain input price movements for operational or transactional purposes or for compensation of executives.

For example, a hospital system that has issued *floating rate bonds*, for example, a bond that pays interest based on LIBOR (London Interbank Offered Rate) plus a risk spread, could enter into an *interest rate swap* to pay to a third party a variable rate, such as LIBOR plus a risk spread, in exchange for a *fixed interest rate*, which is commonly referred to as a *plain vanilla interest rate swap* or a *fixed for floating interest rate swap*. This type of transaction is usually considered when the fixed interest rate *established through the swap* is *lower* than the fixed interest rate the enterprise is able to borrow at *in the traditional bond market*, at least at the initiation of the transaction, which is similar to the intangible asset created by *favorable financing agreements*, mentioned in previous sections.

The economic value derived from the *interest rate swap* may be represented by the *increased certainty* as to the *amount* of cash outflow for the enterprise, since the *fixed interest payment* would be a *known outflow*, in contrast to a *variable interest payment*. The risk of this strategy lies in the *correlation* between the variable interest rate paid on the *floating rate debt* and the variable interest rate paid to a *third party as part of the interest rate swap*. The *higher the correlation* between the two variable rates, the *less volatile* or more certain the cash outflow.

Note that prior to the credit crisis in 2007, many hospitals had issued debt instruments known as *Auction Rate Securities* (ARS), which act in a manner similar to floating rate debt, since the interest rate is reset in short time intervals, usually between a week and a month.[247] Subsequent to issuing the ARS, the hospital system would enter into a *fixed for floating interest rate swap* to hedge the possibility that interest rates would increase substantially, causing the ARS interest rate to increase. However, as interest rates began to *fall* in response to the credit crisis, the *purchasers of ARS disappeared*, and the yields for ARS *increased*, based on the common contractual provision established in the ARS security agreement that called for a "*maximum rate*" to be charged in the event that no party bid on the security to establish the periodic interest rate, an event referred to as a "*failed auction.*"[248] The interest rate swaps proved to be poor hedges for the risk

[247] Ianthe Jeanne Dugan, "Hospitals' Wall Street Wounds, Wrong-Way 'Swaps' and Auction-Rate Bets Hit Hard; Brokers Defend Sales," *Wall Street Journal*, July 7, 2010, http://professional.wsj.com/article/SB10001424052748704545004575353190698790172.html?_nocache=1361299003979&user=welcome&mg=id-wsj&mg=reno64-wsj (accessed February 19, 2013).

[248] Ibid.; *Description of BOAML's Auction Rate Securities Practices and Procedures*, http://www.ml.com/media/70501.pdf (accessed February 20, 2013).

involved in the strategy, since the ARS interest rate and the variable interest rate paid as part of the interest rate swap proved to be less correlated than had been anticipated. Hospitals soon found themselves paying higher interest rates than they would have paid by issuing traditional bonds.[249]

In its simplest form, a swap is an agreement to exchange a set of payments at future points in time. Accordingly, the valuation of a swap depends on the basis for each payment amount that is to be exchanged. Typically, swap payments are based on *interest rates*, *returns on various currencies*, and/or *returns on various other securities*, such as *equity indexes*, *commodities*. At the swap initiation, the value is typically set at zero; however, swaps can be adjusted to reflect any initiation value desired.[250] A *plain vanilla interest rate swap*, as discussed in the introduction to this section, can be valued either as (1) the difference between a *fixed rate bond* and a *floating rate bond* that both have the same notional principle or (2) as a portfolio of *forward rate agreements*, which are over-the-counter (OTC) contracts at a *specified interest rate* applicable to a *specified principal amount* that will be paid by either the *borrower or the lender* at a *specified future point in time*.[251]

The following formula can be used to value an interest rate swap, at initiation, as a portfolio of *forward rate agreements*:[252]

$$FS(0, n, m) = \frac{B_0(h_n)}{\sum_{j=1}^{n} B_0(h_j)}$$

where: $FS(0, n, m)$ = the fixed swap payment
n = the various numbers of cash flow in the swap
m = the term of the underlying interest rate
$B_0(h_n)$ = the last present value factor at time = 0
$B_0(h_j)$ = the present value factor for the jth period at time = 0

[249]Ianthe Jeanne Dugan, "Hospitals' Wall Street Wounds, Wrong-Way 'Swaps' and Auction-Rate Bets Hit Hard; Brokers Defend Sales," *Wall Street Journal*, July 7, 2010, http://professional.wsj.com/article/SB10001424052748704545004575353190698790172.html?_nocache=1361299003979&user=welcome&mg=id-wsj&mg=reno64-wsj (accessed February 19, 2013).

[250]Don M. Chance, *The Analysis of Derivatives for the CFA Program* (Baltimore: Association for Investment Management and Research, 2003), p. 271.

[251]See Section 4.5, "Barriers to Free Market Competition in Healthcare," in Chapter 4, "Competition," for further discussion of valuing bonds. John C. Hull, *Options, Futures, and Other Derivatives*, 8th ed. (Boston: Prentice Hall, 2012), pp. 86–87, 168–169.

[252]Don M. Chance, *The Analysis of Derivatives for the CFA Program* (Baltimore: Association for Investment Management and Research, 2003), p. 290.

As an example, given a *swap maturity* of *one year*, with *quarterly payments* based on the annualized spot LIBOR in each quarter, the *n* would equal four, and *m* would equal 90 days. The *forward rate curve* for LIBOR at initiation, which reports the annualized spot LIBOR rates for 90-, 180-, 270-, and 360-day maturities (or as close to these maturities as possible), are used to calculate *present value factors* based on the following formula:[253]

$$B_0 = \frac{1}{1 + r\left(\frac{m}{360}\right)}$$

where: $B_0(m)$ = present value factor at initiation for an *m*-period interest rate
m = the term of the underlying interest rate
r = annualized *m*-period spot interest rate

The LIBOR spot rate for the 360 day maturity at initiation (time = 0) serves as the "*last present value factor at time = 0*" to be subtracted from one in the numerator of the formula. The present value factors for the 90-, 180-, 270-, and 360-day maturities would be summed together to calculate the denominator of the formula. The formula results in the *fixed swap payment* based on a maturity of *m* at initiation, which for this example is a *quarterly payment amount*.

After initiation, it is assumed that interests have changed, and the *new* term structure of LIBOR is used to determine the *new present value factors*. For example, if 30 days had passed since the initiation of the swap mentioned earlier, the valuation analyst would find the annualized LIBOR spot rates with 60-, 150-, 240-, and 330-day maturities to use as input to determine the *new present value factors*, since the swap payments were contractually agreed to be made on dates that correspond to those maturity dates.

The *present value* of all of the *fixed swap payments*, after initiation, is calculated as the sum of:

1. The quarterly *fixed swap payment* determined at initiation multiplied by the summation of all of the *new present value factors* (based on the new term structure of LIBOR as of the valuation date); and
2. *One*, which represents the return of the notional principal, discounted back to the valuation date using the present value factor calculated

[253] Ibid., p. 291.

based on the *new* "*last present value factor at time = 0,*" that is, the annualized 330-day spot LIBOR rate in the example given above, which reflects that the *notional principal* would be returned at the maturity of the swap.[254]

The *present value* of all of the *future floating swap payments*, after initiation, is calculated by:

1. Discounting the *next floating swap payment* back to the valuation date, which in the example given earlier is performed using a *present value factor*, based on the annualized 60-day spot LIBOR from the *new term structure* of LIBOR as of the valuation date (i.e., the annualized 60-, 150-, 240-, and 330-day spot LIBOR maturities).[255] And
2. *One*, which represents all of the *remaining floating swap payments*, *excluding* the next floating swap payment, which is accounted for in step (1), discounted back to the valuation date using a *present value factor* based on the annualized 60-day spot LIBOR from the *new term structure* of LIBOR as of the valuation date, which is the *present value factor* determined for the previous step.

The *present value* of the *fixed swap payments* is then subtracted from the *present value* of the *floating swap payments* to determine the *base value* of the swap. This *base value* is then multiplied by the *notional principal* to determine the amount of payment owed by one party to the benefit of the other party, that is, the value of the swap in the future depends on which contracted party's perspective is being considered. As market conditions change over time, the *value of the swap* would change due to *volatility* in the *underlying variable interest rates*. For example, should interest rates *increase*, the party that *pays the fixed rate*, which is also the party that *receives the floating rate*, would experience a *cash inflow*, and similarly, should interest rates *decrease*, the party that *pays the fixed rate* would experience a *cash outflow*,

[254]Notional principle represents the agreed-on principle amount that the interest rates are applied to, in order to calculate the nominal payment amount to be exchanged in each future period.

[255]In the example given above, the *first floating swap payment* is the "*next floating swap payment*" and was established at initiation to take place in 90 days; however, 30 days have passed since initiation, leaving 60 days left until the *next floating swap payment*; therefore, the *next floating swap payment amount* is determined using the annualized 90-day spot LIBOR *at initiation* (since this was the last time the payment rates were established, commonly referred to as the coupon reset date) multiplied by 90/360 to reflect the *quarterly payments* specified in the swap contract.

Purchase Option

The right, but not the obligation, to purchase an asset, an enterprise, or a service at a predetermined point or within a predetermined period in the future, typically for a predetermined price.

since *interest rate swaps* are a *zero sum game*, that is, the gain to one party is a loss to the other party.

It should be noted that the methodology used to value a *currency swap* would be similar to that for *interest rate swaps*, with an added step of converting the payments to different currencies based on *foreign exchange rates* applicable as of each valuation date. Also, *equity returns* could be supplemented for a floating interest rate as the base in determining the *floating swap payment*, which would equate to valuing equity swaps. The valuation of these types of swaps, along with other variations, for example, credit default swaps, basis swaps, index amortizing swaps, diff swaps, arrears swaps, and swaptions, were considered to be outside the scope of this book but are discussed in other sources regarding the valuation of derivatives (see *Key Sources*).

In addition to the appraisal of *swaps*, which some healthcare enterprises may use as hedges, the value of *stock options* is a growing area of the valuation profession. Stock options, which are also referred to as *purchase options*, are often used by large, publicly traded healthcare enterprises, along with *restricted stock*, to compensate executives. By *linking pay to performance*, this type of compensation package is often used in an effort to mitigate the negative effects arising from the *principle-agent relationship* inherent in the relationship between top management and shareholders in the corporate business structure. This *pay for performance* (P4P) is increasingly more prevalent in the healthcare industry as new *value-based purchasing* (VBP) arrangements are developed to rank reimbursement and compensation to the achievement of specified *organizational and population health objectives*.[256] Similar efforts of tying reimbursement for the rendering of healthcare services to quality and performance are being developed with the implementation of the *Affordable Care Act* (ACA) and other recent healthcare reform legislation.[257]

The value of the *stock option* is dependent on several factors, including:

1. The *current value* of the underlying stock;
2. The specified *predetermined purchase price*;

[256] See Chapter 2, "Reimbursement Environment," for more information on P4P and VBP.

[257] See Chapter 3, "Regulatory Environment," for more information on the ACA and other healthcare reform legislation.

3. The specified *predetermined term* of the purchase option (also referred to as the time to expiration);
4. The *risk-free* rate of return available to all investors;
5. The *amount of distributions or dividends* expected to be made by the underlying stock, which would reduce the value of the underlying stock; and
6. An estimate of the *future volatility* of the value of the underlying stock.[258]

Specific to valuing any type of *option* is the concept of "*risk neutral*" valuation, which assumes that investors are *risk-neutral*, in contrast to the theory held by modern finance (which intuitively defines the way the real world works), that investors are *risk-adverse* and therefore require a *higher rate of return* in order to compel them to invest in *riskier assets*. Note that the value of a derivative is the same under a *risk-neutral* and a *risk-adverse* environment, due to the formulas that relate the *price of the derivative* to the *price of the underlying asset*. Specifically, in a *risk-adverse environment*, when investors become more *risk adverse* they require a *higher rate of return*, causing the value of the underlying asset to *decrease*; however, the *pricing formula* for derivatives adjusts their value such that the *price of the derivative would be the same* in relation to the new decreased value of the underlying stock. This assumption helps alleviate the problem of having numerous return requirements based on the multitude of utility preferences that may be exhibited by different and varying investors.[259]

Among the numerous examples of financial models that have been developed to value certain types of derivatives, the most common model for pricing *purchase options* are:

1. The *binomial model*, which is a discrete time period model;
2. The *Black-Scholes model*, which is the continuous time period version of the binomial model; and
3. *Variations of each of these models*, which have been developed over time.

The *Black-Scholes model* and the equations derived from it form the basis for the *accurate calculation* of a *European Option*, that is, one in which the option can be *exercised only* at the date of expiration of the option. *Binomial models* are required for *American Options*, in other words, those that are assumed to be "*exercisable*" at any time during the option contract term.[260]

[259] Ibid., p. 257.

[260] Fischer Black and Myron Scholes, "The Pricing of Options and Corporate Liabilities," *Journal of Political Economy* (May/June 1973).

Factoid

The first Black-Scholes model did not consider dividends. In 1973, Merton proposed an altered model that, as an extension of the original Black-Scholes model, takes annual dividend yield into account.

"The Pricing of Options and Corporate Liabilities," by Fisher Black and Myron Scholes, Journal of Political Economy *81, no. 3 (May–June 1973): 637–654; "Theory of Rational Option Pricing," by Robert C. Merton,* The Bell Journal of Economics and Management Science *4, no. 1 (Spring 1972): 141–183.*

Exhibit 14.7 sets forth an illustration of the formulas and methodology for valuing an *American Call Option* using a *10-step binomial model*. The assumptions included in the illustration are as follows:

1. Five-year maturity;
2. Initial underlying asset price of $327,131;
3. Exercise price of $275,000;
4. Annual volatility of 47.60 percent; and
5. Risk-free alternative yield of 2.62 percent.

As mentioned earlier, another popular option pricing model used to value purchase options is the *Black-Scholes model*. The basic formula for the *Black-Scholes model* related to a *European call option* is as follows:[261]

$$C = S_0N(d_1) - Xe^{-r^{C}T}N(d_2)$$

where: c = purchase option price

S_0 = price of the underlying at time 0

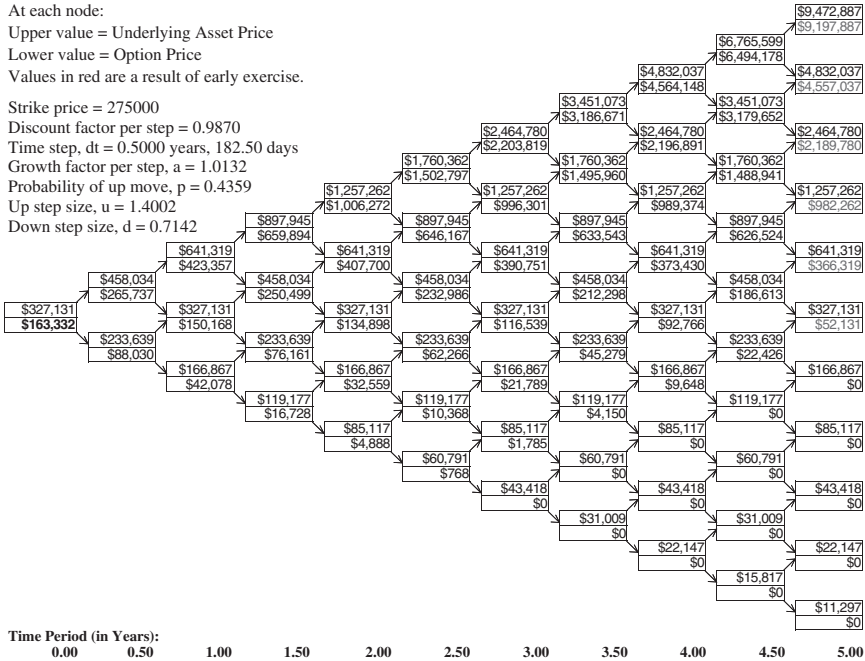
X = exercise price of the option

$$d_1 = \frac{\ln\left(\frac{S_0}{X} + \left[r + \left(\frac{\sigma^2}{2}\right)\right]\right)T}{\sigma\sqrt{T}}$$

$$d_2 = d_1 - \sigma\sqrt{T}$$

σ = the annualized standard deviation of the continuously compounded return on the underlying asset

[261] John C. Hull, *Options, Futures, and Other Derivatives*, 8th ed. (Boston: Prentice Hall, 2012), p. 313.



Notes:

1 It should be noted that at each node the top box represents the underlying equity price and the bottom box represents the value of the option.

2 At each node the underlying can go up ("u") by 39.96% or down ("d") by 28.55%, which is determined by the historical volatility and the following formula:

$$u = e^{\delta * \sqrt{\Delta T}} \qquad d = e^{-\delta * \sqrt{\Delta T}}$$

Where:
δ = Annual Volatility Assumption
ΔT = Time period per step

3 At each node the value of the option is the weighted average of the previous connected node values of the option (one up and one down). The probablity of using the down option value is one minus the up value; and, the up option value is calculated by the following formula:

$$p = \frac{e^{r\Delta T} - d}{u - d}$$

Where:
δ = Annual Volatility Assumption
ΔT = Time period per step
r = risk-free rate

EXHIBIT 14.7 Purchase Option Valuation Using a Binomial Model
Options, Futures, and Other Derivatives, 8th ed., by John C. Hull (Boston: Prentice Hall, 2012), pp. 253–279; DerivaGem—Version 2.01, accompanying software to *Options, Futures, and Other Derivatives*, 8th ed., by John C. Hull, © A-J Financial Systems, Inc., 2010.

One limitation of the *Black-Scholes model*, however, is the utilization of the concept of *constant volatility.* With the increased presence of *computer-based calculations*, more complex analyses can be performed with an *increased number of variables*, including a *changing*, or *stochastic*, *volatility* related to the value of the underlying asset. To appraise an option with a *stochastic variable(s)*, *Monte Carlo Simulations* may be employed, using

numerous iterations with varying assumptions and then taking an average or weighted average of each result.[262]

A key input to most *purchase option models* is the *volatility assumption*. The *volatility assumption* can be calculated from *historical returns on the underlying asset*, or, in the event that historical pricing data for the underlying asset is unavailable, *volatility* may be calculated by observing *historical returns for comparable assets*. Also, one note of caution is that when converting *annual returns* on publicly traded U.S. stocks *to daily returns* for use as an estimate of volatility, there are only 252 trading days in a year; also, most volatility calculations require that the returns be *log normally distributed*.[263] Another notable method for determining *volatility* is to use *reported option prices* for the underlying asset, in conjunction with an *option pricing model*, to perform an *iterative process* holding all of the other variables to the model constant, *except* for the variable related to *volatility*. Derived from this method's results is the *implied volatility*, which is included in the current option price and is often the volatility assumption used by professional traders, since it is assumed to be *forward looking*, in contrast to using *historical returns* that are *backward looking*.

This has been a general discussion of *financial derivatives*, including call options and interest rate swaps. For a more detailed examination of this topic, including, but necessarily not limited to,

1. The *estimation of volatility*, for example, the use of GARCH models, exponentially weighted moving averages, and other historical volatility adjustments;[264]
2. *Other peculiarities associated with valuing options*, such as volatility smiles and option price sensitivities (also known as the "*Greeks*"); and[265]

---

[262] See Section 8.2.2, "Monte Carlo Simulation Analysis," in Chapter 8, "Valuation Approaches and Methods," for further discussion of the *Monte Carlo Simulation technique*.

[263] Due to the continuous compounding nature of stock returns, log normal distributions are used in option pricing. Log normal distributions are those where the natural log of any random variable is normally distributed.

[264] GARCH stands for *Generalized Autoregressive Conditional Heteroscedascity* and is an econometric model used to incorporate certain assumptions regarding the underlying data set when explaining forecasts. For example, when valuing options, GARCH models can be used to incorporate the assumption that stock price volatility will exhibit mean reverting characteristics. See John C. Hull, *Options, Futures, and Other Derivatives*, 8th ed. (Boston: Prentice Hall, 2012), pp. 502–512.

3. The valuation formula for a *put option*; there are a significant number of available sources, for example, *academia, trade and professional associations*, and the *canon of professional literature* (see *Key Sources* for a sample of available sources).[266]

14.4.2.9 Classification and Valuation of Technology-Related Intangible Assets *Intangible personal property* that may be classified as *technology-related* includes *computer software/network integration*, *electronic medical records*, *technical/software documentation*, and *maintenance/support agreements*.[267]

Technology-related intangible assets typically do not include *new technologies* developed by the subject enterprise, which are most often legally protected and therefore constitute *intellectual property*.[268] The value of *technology-related intangible assets* may be derived from an estimate of expenses required to "*switch*" information technology systems, commonly known as *switching costs*, and may be valued using *Income Approach–based valuation methods*, where the *avoided expense* in each period serves as the *net economic benefit* to be discounted back to the present at an *appropriate risk-adjusted required rate of return*.[269]

Technology-Related Intangible Assets

Includes computer software/network integration, technical/software documentation, and maintenance/support agreements.

Valuing Intangible Assets, *by Robert Reilly and Robert Schweihs (New York: McGraw-Hill, 1999), p. 435.*

[265] A volatility smile refers to the change in the implied volatility of an option based on a change in its strike price, while all other variables are held constant. See John C. Hull, *Options, Futures, and Other Derivatives*, 8th ed. (Boston: Prentice Hall, 2012), p. 409.

[266] A *put option* is the opposite of a *call* (*purchase*) *option*, in that it gives the holder the right to sell property at a specified price, at or during a specified time period.

[267] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 435.

[268] See Section 14.4.2.3, "Classification and Valuation of Intellectual Property–Related Intangible Assets," for information pertaining to the classification and valuation of *intellectual property*.

[269] See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for more information on the use of an *Income Approach–based valuation method*.

For other *technology-related intangible assets*, it may be difficult to estimate the amount of *net economic benefit* directly attributable to the asset, making an *Income Approach–based valuation method* not applicable. In addition, similar to most other intangible assets, *technology-related intangible assets* usually do not have an *established liquid market* where they can be bought and sold. However, the direct and indirect costs of *maintenance* and *support agreements* or *technology-related documentation* may be used in an *Asset/Cost Approach–based valuation method*, for example, the *Trended Historical Cost Method*, similar to that used for tangible personal property.[270]

14.4.2.9.1 Computerized Management Information Systems *Computerized management information systems* may hold significant economic value in their ability to:

1. Perform data mining functions;[271]
2. Produce customized reports related to the financial, operating, and patient outcome performance metrics of the subject enterprise; and
3. *Streamline the availability of data* to be used by management in operational and strategic planning.[272]

Data mining capabilities of *computerized management information systems* are of great importance in a changing healthcare reimbursement environment related to value-based purchasing (VBP), in that they efficiently and in a timely manner provide healthcare enterprises valuable data that can be used to:

1. *Develop more efficacious treatment plans* by *analyzing the causes or symptoms* of certain diseases, injuries, or other ailments, along with *current treatment methods*;
2. Aid management of healthcare enterprises in *achieving operational efficiencies* through evidence-based medical care, reducing resource utilization in pursuit of ineffective treatments; and

[270] See Section 14.4, "Classification and Valuation of Intangible Assets," for further discussion on the use of the *Trended Historical Cost Method*.

[271] Saundra Glover, Patrick Rivers, Derek Asoh, Crystal Piper, and Keva Murph, "Data Mining for Health Executive Decision Support," *Health Services Management Research*, 23, no. 1 (2010): 45.

[272] William H, Black, "Valuing Professional Practices—Thorny Challenges," *Analytical Value, LLC* (Portland, OR: Business Valuation Resources, 2006), p. 27.

3. *Improve customer relationship management* through determination of *patient preferences*, *clinical services usage patterns*, and level of patient satisfaction with current methods.[273]

Computer software/network integration provides the organization with standardized technologies that reduce the need for duplicative resources expended for training and maintenance of multiple systems.[274] Together, both *computer software/network integration* and *computerized management information systems* may increase an organization's productivity and contribute significantly to *efficient operations*, which may *enhance the economic value* of the subject enterprise by *increasing the net economic benefit* available to the owner of the subject property interest.

With the enactment of the *Health Information Technology for Economic Clinical Health (HITECH) Act*, which is part of the *American Recovery and Reinvestment Act of 2009 (ARRA*), the government allotted $19.2 billion to incentivize providers to implement *integrated computer network systems* that would create *interoperable electronic health records* (EHRs) for each and every patient.[275] These investments are aimed at providing organizations with the ability to successfully participate in new models of reimbursement, for example, value-based purchasing, which require standardized reporting systems to achieve care coordination, quality improvement, and utilization management.[276]

The economic value of *computerized management information systems* may be determined through the use of a *With and Without Technique* in a manner similar to that used to value *office share arrangements*, as discussed in Section 14.4.2.8.1, "Office Share Arrangements," whereby the difference in the *level of net economic benefit* and therefore the value of the subject enterprise, both *with* and *without* the *computerized management information systems*, are attributed to differences in operating expenses, as well as the addition of revenue-generating opportunities.

---

[274] Healthcare Financial Management Association, "The Value Journey: Organizational Road Maps for Value-Driven Health Care," 2012, p. 9.

[275] See Section 5.2.2.2, "American Recovery and Reinvestment Act of 2009 and Health Information Technology for Economic Clinical Health Act," in Chapter 5, "Technology," for further discussion of the HITECH Act.

[276] Amy Fehn, "The Importance of Health Information Technology for Accountable Care Organizations," *American Bar Association*, June 1, 2001, p. 1.

In addition, *computerized management information systems* may be valued using a *Replacement Cost Method*. Under this method, the current cost to *re-create* equally *desirable* technology that provides equal *utility* as that provided by the subject technology is determined by (1) employing the methods prescribed by the Constructive Cost Model II (COCOMO II), which is an updated version of COCOMO I developed by Dr. Barry Boehm in 1981, and (2) by using the other steps in the *Replacement Cost Method* discussed in Section 14.4, "Classification and Valuation of Intangible Assets."[277] While the model is available in calculator format from various sources (see *Key Sources*), the intricacies of the model and its use were considered to be outside the scope of this book. In addition to the cost of *re-creating the software*, the value of *computerized management information systems*, under the *Replacement Cost Method*, should also include the cost of necessary hardware, for example, server additions and computer work stations, along with the necessary installation and set-up costs.

For those enterprises that have adequate documentation regarding the historical cost of their *computerized management information systems*, a *Reproduction Cost Method* may be employed. The steps in this method would be similar to those discussed in Section 14.2.1.1.3, "Asset/Cost Approach for Valuing Tangible Real Property," related to valuing tangible personal property using an *Asset/Cost Approach–based valuation method*.

14.4.2.9.2 Electronic Medical Records *Electronic medical records* (EMR), which include the subset of EHRs that is subsidized by the government under the HITECH Act, can provide additional economic value to an enterprise through cost savings and quality outcomes.[278] The American Medical Association (AMA) cites benefits such as the *trending of patient vitals and/or test results*, the *potential for improved supporting documentation in the event of malpractice claims*, *improved reporting about patients and practices*, and *improved communication with other physicians*, indicating that physician practices that *transition* to an EMR system *may yield various health and safety benefits*.[279] In addition, implementation of an EMR system can help *reduce adverse drug events* in the inpatient and ambulatory setting through *Computerized Physician*

[277] Barry W. Boehm, et al., *Software Cost Estimation with COCOMO II* (Upper Saddle River, NJ: Prentice Hall PTR, 2000), p. 1.

[279] American Medical Association "Electronic Medical Records: How Implementation Will Affect Staffing," 2009, http://www.ama-assn.org/amednews/2009/10/05/bisa1005.htm (accessed October 5, 2011).

Order Entry (CPOE),[280] and EMR's *point of care technology* would allow physicians not only to *retrieve patient clinical data*, but also to *retrieve important scientific information* useful in *patient care and decision making*.[281]

Similar to *computerized management information systems*, the value of an EMR system could be determined by employing the methods prescribed earlier in Section 14.4.2.1.1, "Managed Care Agreements and Provider Service Agreements." Note that in addition to the cost of re-creating the software, the value of an EMR system should also include the cost of necessary hardware, for example, server additions and computer work stations, along with the necessary installation and set-up costs.

Also, an EMR system may be valued using a *With and Without Technique* in a manner similar to that prescribed for the valuation of *computerized management information systems*, as discussed in Section 14.4.2.1.1, "Managed Care Agreements and Provider Service Agreements," whereby the difference in *operational efficiency* could serve as the *net economic benefit* to be capitalized in determining the value of the subject EMR. Note that the *risk-adjusted required rate of return* should be specific to an investment in the EMR system, which may have different investment characteristics than that of the enterprise that currently uses the EMR.

14.4.2.9.3 Maintenance and Support Relationships *Maintenance and support relationships*, evidenced through written agreements, provide an organization with *assurances* that the technology will *consistently perform as expected* during the term of the agreement. The *existence* and *implementation* of these *maintenance and support agreements* may significantly mitigate the level of "*downtime*," with the resulting loss of *productivity* and related *revenue* opportunity costs.

The economic value of *maintenance and support relationships* may be *allocated from the purchase price* of a healthcare enterprise or may be established as a *distinct intangible asset* when valuing the overall healthcare enterprise using the *Asset/Cost Approach–based Net Adjusted Value Method*. To the extent that the subject *maintenance and support relationship* produces an isolated stream of *net economic benefit*, an *Income*

[281] Steven E. Nissen, MD, et al., "Working Group 6: The Role of Technology to Enhance Clinical and Educational Efficiency," *Journal of American College of Cardiology* 44, no. 2 (2004): 258. For more information related to EMR and other healthcare-related technology, including the distinction between EMR and EHR, see Section 5.2.2, "Electronic Health Records," in Chapter 5, "Technology."

Approach–based valuation method may be used to determine its value.[282] For example, the valuation of *maintenance and support relationships* can be determined using a *With and Without Technique* in a manner similar to that used to value *management services agreements* in Section 14.4.2.8.2, "Management Service Agreements," whereby the difference in the *level of net economic benefit* and therefore the value of the subject enterprise, both *with* and *without* the *maintenance and support relationships*, are attributed to differences in operating expenses.

In addition, the *Replacement Cost Method* may be used to determine the value of *maintenance and support relationships*, in a manner similar to that of *employee and provider employment agreements*.[283]

14.4.2.10 Classification and Valuation of Patient-Related Intangible Assets *Intangible personal property* that can be considered *patient-related intangible assets* include (1) *custodial rights to patient medical charts and records* and (2) *patient recall lists*. Certain *patient-related intangible assets* can be valued using *Asset/Cost Approach–based valuation methods*, for example, *custodial rights to patient medical charts and records*, while others may be valued using *Income Approach–based valuation methods*, such as, *patient recall lists*. However, as is the case with most intangible assets, *patient-related intangible assets* typically do not have *established*, *transparent*, *liquid markets* reporting transaction data for similar types of intangible assets, invalidating the use of a *Market Approach–based valuation method*.

Patient-Related Intangible Assets

Includes custodial rights to patient medical records and patient recall lists.

14.4.2.10.1 Custodial Rights to Patient Medical Charts and Records The clinical information and data recorded and contained within the *patient medical charts and records* of a healthcare enterprise *belong* to the patient and ***not*** to the physician or the healthcare enterprise, and therefore, the clinical information and data cannot be sold by the physician or the healthcare enterprise. However, the *custodial rights* to the *structure*, *assemblage*, *and physicality* of the data in the *patient medical charts and records* may

[282] See Section 8.1.1, "Income Approach," in Chapter 8, "Valuation Approaches and Methods," for more information pertaining to the use of an *Income Approach–based valuation method*.

[283] See Section 14.4.2.2.1, "Employee and Provider Employment Agreements," for further discussion of the valuation methodology used to appraise *employee and provider employment agreements*.

constitute a *distinct*, *separate*, and *identifiable intangible asset* that can be transferred and is therefore subject to financial appraisal. The economic benefit associated with the *custodial rights to patient medical charts and records* is derived from, and typically appraised by, quantifying the avoidance of the *costs of assembling*, *maintaining*, *and storing* the *patient medical charts and records*, which represent the costs that would be incurred by a potential purchaser, who would choose to "build," rather than to "buy," the *custodial rights to the patient medical records*.

In contrast to *paper medical records*, the value of *electronic medical records* (EMR) may be significant. *Paper medical records* may have significant drawbacks that can hinder a patient's *access to quality medical care*. Studies have indicated that *paper records*, in contrast to EMR, are *costly to store and maintain*, *are cumbersome*, *are easily misplaced*, and are problematic as to their utility for *meaningful decision analysis*, especially when chronic conditions require an analysis of diagnostic or other testing data across the continuum of care and time.[284] For example, *paper charts* cannot be effectively *searched and used to track*, *analyze*, *or chart voluminous amounts of clinical medical information*; *are more difficult to copy or reproduce*; and, depending on the availability of space at the subject enterprise, may need to be *stored off-site*, at a significant inconvenience and expense.[285] While there is evidence that the investment in EMR has not yet produced a return, both government payors (through recent provisions of the HITECH Act) and private payors are driving the anticipation that EMR in some form will be a requirement in the healthcare industry within the next decade.[286]

Income Approach–based valuation methods, which measure the present value of anticipated future economic benefits that will accrue to the owner of the subject property interest, are typically not used for determining the value of *custodial rights to patient medical charts and records*, especially in instances when physician sellers of those *custodial rights* are transferring their rights of ownership to an entity or an organization to which they will continue, post-transaction, to refer patients. Under those circumstances, *Income Approach–based valuation methods* may be subject to regulatory scrutiny related to the *Anti-Kickback Statute* and/or the *Stark Law*, to the extent that this type of analysis might be construed as either *directly* or *indirectly* taking into account the *volume* or *value of referrals*. However,

[284] Medical Systems Development Corporation, "Benefits of EMR," August 11, 2008, http://msdc.com/EMR_Benefits.htm (accessed January 29, 2013).

[285] Ibid.

[286] Julia Adler-Milstein, et al., "A Survey Analysis Suggests That Electronic Health Records Will Yield Review Gains for Some Practices and Losses for Many," *Health Affairs* 32, no. 3 (March 2013): 4.

under the *premise of value* known as *value-in-exchange*, the value consisting of *custodial rights to patient medical charts and records* can be derived without the same level of concern regarding regulatory scrutiny related to prohibition of considering the *volume or value of referrals*, by using an *Asset/Cost Approach–based valuation method* to determine the economic benefit derived from the *expectation* of the *avoidance* of a *future expense*, for example, the *costs* associated with *materials*, *labor*, *and capital expense* required to re-create the *charts or the records*.

A valuation method by which the *Fair Market Value* (FMV) of *custodial rights to patient medical charts and records* can be determined involves several steps, including establishing a *ceiling* (i.e., the *upper bound*) and a *floor* (i.e., the *lower bound*) for the expected value to the *willing buyer* and the *willing seller.* The FMV of the subject *custodial rights to patient medical charts and records* would lie somewhere between the *ceiling* and the *floor*, which would depend on the facts and circumstances specific to the appraisal.

The *upper bound* is set by *the maximum allowable charge*, established by statute, to copy the chart or the record and typically includes a base fee per record, as well as a fee per page component based on the *number of pages per record*. For example, for calendar year 2013, Ohio statutes require payment of $18.34 fee *per record*, as well as an additional payment of $1.20 *per page* for the first 10 pages, an additional payment of $0.62 *per page* for pages 11 through 50, and an additional payment of $0.26 *per page* for pages 51 and higher.[287] In order to apply the *maximum allowable charge per page*, the *number of pages* to be charged at *each rate per page* needs to be determined, based on the *average number of pages per record*. The *weighted average cost* per record, calculated based on the maximum allowable charge per page, is then multiplied by the reported number of *active patient records*, to determine the *upper bound* of the value to be attributed to the *custodial rights to patient medical charts and records*. Exhibit 14.8 illustrates the calculation of the statutory *maximum allowable charge* per record.

It is important to note that only *active* medical records, typically those with some account activity during the 18 to 24 months preceding the valuation date, are included in this calculation. This timeframe is due, in great part, to recognition that the *economic benefit* of the *custodial rights to patient medical charts and records* is significantly focused on the *avoidance of cost* in having to re-create charts and records for those patients, who, in returning to the practice, would require the *historical clinical* and *demographic information* in the charts and records to be *identified*, *classified*, *and reassembled*.

The *lower bound* is based on an estimate of the empirically identifiable *direct and indirect materials, labor,* and *capital expense* required in

[287] "Fees for Providing Copies of Medical Records," Ohio Code §3701.742.

Page Ranges		Fee per Page	Indicated per Page Fees*
1	10	$2.98	$29.80
11	50	$0.62	$24.80
51		$0.26	$1.04
Total per Page Fees per Record*			$55.64
Base Fee per Record			$18.34
Maximum Allowable Charge per Record			$73.98

* Based on Average # of Pages per Record: 54

EXHIBIT 14.8 Calculation of Statutory Maximum Allowable Record Charge

re-creating the *patient medical charts and records*. For paper records, these empirically identifiable costs include:

1. *Cost of materials*, for example, paper, labels, folders, and fasteners, used to create the physical chart;
2. *Labor cost associated with copying the existing patient charts*, which data may be available from *normative industry benchmark survey data* or *independent market research*;
3. *Labor cost associated with assembling the copied pages on to a physical chart*, which data may be available from *normative industry benchmark survey data* or *independent market research*; and
4. *Capital expense*, for example, cost of equipment required to copy and assemble the charts, which may already be included in a *global copying charge* if the labor expense to copy the charts from item (2) is collected from rates charged by copying services.

For EMR, the empirically identifiable *direct and indirect materials*, *labor*, and *capital expense* required in re-creating the *patient medical charts and records* includes:

1. *Labor cost associated with converting paper charts into electronic records*, for example, data conversion programming fees, or, when this data is not readily available, a determination of the labor cost of conversion can be calculated as:

$$\left\{\frac{\left(\frac{\#\text{ of keystrokes per page} \times \#\text{ of pages per record} \times \#\text{ of records}}{\#\text{ of key strokes per minute}}\right)}{60\text{ minutes per hour}}\right\} \times \$\text{ hourly labor rate} = \$\text{ labor cost of conversion}$$

2. Some measure of the *economic capital expenses* related to only the *amortized portion of the EMR software* and the *depreciable portion of the EMR hardware* required to develop the current active records, incurred during the timeframe those active charts were developed, which timeframe would vary, based on the nature of the services provided by the healthcare enterprise.

Recall that in this manner, the *most probable price* at which the *custodial rights to patient medical charts and records* would exchange hands in the marketplace, that is, the FMV, would occur somewhere in the range between the established *upper* and *lower* bounds. Note that the construct of this valuation method recognizes that the *willing buyer* would never have to pay above the *upper bound* of this model, and the *willing seller* would not be able to sell above this amount, since it is the maximum price allowed by statute. Also, the construct of this valuation methodology recognizes that both the *willing buyer* and the *willing seller* realize that the *buyer* would agree to pay at least the amount of the empirically identifiable *materials*, *labor*, *and capital expenses* that would be required to re-create the charts and records, the avoidance of which cost has economic value and serves as the *lower bound* for this model.

This valuation model relies on the naïve assumption that the FMV lies at a measure of central tendency, best represented by the midpoint of the *upper* and *lower bounds*. Under this assumption, the FMV of the subject *custodial rights to patient medical charts and records* would be calculated by taking a *simple arithmetic average* of the *upper* and *lower bounds*. However, each valuation engagement is unique, and the weighting of the consideration afforded to the influence of each bound in the model may differ, depending on the facts and circumstances of the transaction, for example, those related to the assumed leverage of the respective buyers and sellers in the market.

14.4.2.10.2 Patient Recall Lists *Patient recall lists* can be considered an *intangible personal property asset* in the event that the following criteria are met:

1. There is physical evidence that a personal relationship between the customer and the vendor exists, for example, the ability for two-way communication;
2. There is physical evidence of an identifiable income stream generated from the customer to the vendor; and
3. There is a justified rationale for an expected future life or duration to the income stream produced by the customer relationship, for example, the historical performance of the relationship.[288]

[288] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), pp. 341–342.

The valuation of the *patient recall list* should take into account the stage of the relationship, which is based on (1) "the degree of imminence of the customer purchase transaction" and (2) "the degree of formality of the customer purchase transaction."[289]

While in a *nonhealthcare*-related industry, for example, *stock brokerage*, the purchase of *customer recall lists* is an accepted practice, in the *healthcare* industry, the purchase of *patient recall lists* may indicate an either direct or indirect payment for the *volume* or *value of referrals*, which is legally impermissible under both federal and state anti-kickback statutes.[290] One example of an arrangement where the purchase of a pharmacy's *patient recall list* was challenged as a *payment for referrals* was PharMerica, Inc.'s purchase of Hollins Manor I, LLC, which resulted in a settlement agreement between the company and the OIG for $5.9 million, as well as the imposition of a five-year *corporate integrity agreement* (CIA).[291] Furthermore, any purchase that could be construed as a violation of the *professional and ethical codes and standards* of the state, for example, *commercial bribery*, may be subject to scrutiny under the state's *anti-kickback statute* as compensation for the "purpose of improperly obtaining favorable treatment."[292]

In the event that a healthcare enterprise does not involve any payments for designated health services (DHS) under the Stark Law and does not run afoul of federal or state anti-kickback statutes, typically by not accepting payment from government payors, it may be possible to identify a circumstance where the appraisal of a *patient recall list* may be legally permissible, for example, a *cash-only* cosmetic surgery or laser hair removal center.[293] In that event, the typical valuation of a *patient recall list* entails determining the *revenue* derived from the *existing patient base*. This amount is calculated by multiplying:

1. The *projected level of current patients*, taking into account a *rate of decay* in the amount of existing patients, who are assumed to be slowly replaced over time; and

[291] Department of Health and Human Services and the Department of Justice, *Health Care Fraud and Abuse Control Program: Annual Report for FY 2005*, August 2006, p. 14. See Chapter 3, "Regulatory Environment," for additional information on CIAs.

[292] James G. Sheehan and Jesse A. Goldner, "Beyond the Anti-Kickback Statute: New Entities, New Theories in Healthcare Fraud Prosecution," *Journal of Health Law* 40, no. 2 (Spring 2007): 167–204.

[293] See Chapter 3, "Regulatory Environment," for additional information on what constitutes DHS.

2. The *most probable amount of revenue generated per patient*, which can be established through the use of *normative benchmark survey data* or by using *historical net patient revenue per patient ratios*.[294]

To calculate the *net economic benefit* attributable to the subject patient recall list, *economic operating* and *capital costs*, which are required to generate the revenue derived from the enterprise's patients, are deducted from the estimated *net patient revenue*. This *net economic benefit* is then discounted back to the present value at an appropriate *risk-adjusted required rate of return*, based on the riskiness of an investment in the subject patient recall list interest.

14.4.2.11 Classification and Valuation of Goodwill Once the *identifiable* and *separately quantifiable* intangible assets are valued, the *residual* amount of *intangible asset value* that remains, if any, is often referred to as "*goodwill*."

While there are numerous sources for guidance as to the *definition of goodwill*, for example, *IRS Revenue Ruling 59–60*, *FASB ASC 350–20*, and established judicial opinions from valuation-related case law, most of these definitions are applicable only to specific situations, for example, *purchase price allocation*, *marital dissolution*, or *bankruptcy proceedings*.[295]

The definition of *goodwill* is a hotly contested issue in the courts, especially as to the treatment of *goodwill* for purposes of marital dissolution. Table 14.4 sets forth a listing of the status of *goodwill treatment*, as well as whether each state considers a *professional medical license* part of the *divisible marital property.* Note that the concept of *personal/professional goodwill* being separate and distinct from *practice/commercial goodwill* is discussed further on in this section.

In the event that it is first determined that *intangible asset value* exists in the subject enterprise and, second, that some residual element of the value of the intangible assets is attributable to *goodwill*, then, for those engagements that require it, the next step is to *identify*, *distinguish*, *disaggregate*, and *allocate* the relevant portion of the existing *goodwill*

[294] Survivorship curves, for example, Iowa-Type Survivor Curves, may be used to estimate the remaining useful life of the current patient recall list. See Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), pp. 351–359.

[295] See Section 8.5.2, "Purchase Price Allocation," in Chapter 8, "Valuation Approaches and Methods," for further discussion.

Goodwill Hunting in Divorce (Portland, OR: Business Valuation Resources, 2011); "Your Medical License as Marital Property," by Steven Sheinwald and Jennifer Kirschenbaum, Kirschenbaum & Kirschenbaum, PC, 2013, https://www.kirschenbaumesq.com/article/your-.

to either (1) *professional/personal goodwill* or (2) *practice/commercial goodwill*.[296]

From an *economic perspective* in healthcare valuation, *goodwill* may appropriately be considered the *expectation* as to the *propensity* of the *continuity of patients* (*and the revenue stream thereof*) to be *maintained* by the *subject enterprise*, incremental to that *net economic benefit* which is quantified as the value contribution being derived from the other separately *identifiable*, *distinguished*, and *appraised tangible* and *intangible assets*. Lord Eldon, Lord Chancellor of Great Britain in the early nineteenth century, stated, "[Goodwill is] the probability that the old customers will resort to the old place."[297] Note that *goodwill* is only *one* of the several intangible assets that may be found to exist in a healthcare enterprise and should not be considered a "*catch-all-moniker*" for all of the enterprise's intangible assets in the aggregate.

14.4.2.11.1 Classification of Professional/Personal Goodwill *Professional/personal goodwill* is manifested by the *reputation* and *personal attributes* of a specific physician.[298] Since these attributes "go to the grave" with that *specific individual physician* and therefore cannot be sold, they have *no economic value*. While it is often stated that with an *extended transition period of introduction* (i.e., assisted transfer) for a new acquiring owner, a portion of *professional goodwill* may be transferred from the seller to the purchaser, any additional value that is transferred during this *extended transition period of introduction* is paid for through a *service agreement* memorializing the time required of the seller post-transaction through the *extended transition period of introduction*. The payment made by the buyer for the seller's introduction services should be recognized and appraised as services, the value of which would depend on the amount and type of tasks, duties,

---

[296]There are at least two situations when a valuation engagement may require the allocation of personal from enterprise goodwill, that is, marital dissolution and transactional tax planning. See Alina Niculita, Angelina Mckedy, and Kimberly Linebarger, "How to Distinguish Personal Goodwill from Enterprise Goodwill, the Key Person Discount, and Noncompete Agreements," in *BVR's Guide to Personal v. Enterprise Goodwill*, 5th ed. (Portland, OR: Business Valuation Resources, 2012), pp. 101–102.

[297]Anthony Richard Cragg and James Robert Vernam Marchant, *Hints to Young Valuers: A Practical Treatise on the Valuation of Property*, 2nd ed. (London: The Land Agents' Record, Ltd., 1901), p. 518.

[298]Jay Fishman, "Personal Goodwill vs. Enterprise Goodwill," in *BVR's Guide to Personal v. Enterprise Goodwill*, 5th ed. (Portland, OR: Business Valuation Resources, 2011), p. 19.

responsibilities, and accountabilities associated with the introductory services to be provided, and *not* as a part of *professional/personal goodwill*.[299]

14.4.2.11.2 Classification of Practice/Commercial Goodwill *Practice/commercial goodwill*, as distinguished from *professional/personal goodwill*, is *transferred frequently* and may be described as the *propensity* of the *continuity of patients* (*and the revenue stream thereof*) to be *maintained* by the *subject enterprise*, incremental to that which is quantified as the contribution being derived from the other *separately identifiable*, *distinguished*, *and appraised tangible* and *intangible assets*, to the *assemblage of assets* that compose the subject enterprise. In making this identification and classification as to the existence of *practice/commercial goodwill*, it should be determined whether patients return to the subject enterprise because of the specific attributes or the result of some other reason, for example, they are *mandated* to do so by their managed care insurance coverage. In that circumstance, it needs to be determined whether the *value* of the subject enterprise that may be *attributable* to what can be considered the intangible element of the subject enterprise related to the *managed care organization relationships* should be considered as an identifiable and separately valued *specific contract–related asset*, in contrast to being treated as *practice/commercial goodwill*.[300]

14.4.2.11.3 Valuation of Goodwill Within the perspective of *financial economics* (of which, valuation is a branch discipline), *goodwill* may be viewed as "the capitalization of all of the economic income from a business enterprise that cannot be associated with any other asset (tangible or intangible) of the business."[301] As such, the valuation of *goodwill* becomes an *inverse* of the *Asset/Cost Approach–based valuation method*, for example, *Adjusted Net Asset Method*. Under the *Adjusted Net Asset Method*, each individual asset is *separately identified* and *valued*, the *combination* of which is the value of the subject entity. Under an *inverse Adjusted Net Asset Method*, the value of the subject enterprise is determined (using either an *Income Approach–based valuation method* or a *Market Approach–based valuation method*), and from this value, all of the *separately appraised* assets, both *tangible* and *intangible*, are *deducted*. The residual value after these deductions is the value of the *goodwill*.

---

[299] Robert James Cimasi and Todd Zigrang, "Valuing Intangible Assets in Exempt Healthcare Organizations," *Valuation Strategies* (January/February 2013): 23.

[300] Ibid.

[301] Robert Reilly and Robert Schweihs, *Valuing Intangible Assets* (New York: McGraw-Hill, 1999), p. 383.

In the healthcare industry, this *economic definition* of goodwill is *bifurcated* between the *professional goodwill* and the *practice goodwill*. The *professional goodwill* includes those attributes that "go to the grave" with that *specific individual physician* and therefore *cannot be sold*, which leads to the logical conclusion that they have *no economic value*. The *practice goodwill* is defined as *the unidentified*, *unspecified*, *residual attributes* of the subject enterprise as an operating entity that *contribute* to the *propensity of patients* (and the revenue stream thereof) to *return* to the *subject enterprise* in the future.[302]

In those circumstances where the valuation engagement requires that the *professional goodwill* be separated from the *practice goodwill*, for example, in certain litigation related to marital dissolutions, valuation professionals have relied on certain factors to guide their allocations of total goodwill, such as those set forth in the *Lopez v. Lopez* case, which include:

1. The current age and health status of the professional;
2. The demonstrated ability to produce net economic benefit of the professional;
3. The reputation of the professional with colleagues and others within the same profession in regard to judgment, skill, and knowledge;
4. The relative success of the professional; and
5. The length of operations and scope of services related to the business the professional has an ownership interest in and provides services through.[303]

Other factors, in addition to those developed from the Lopez case, considered to be an indication of the existence of *professional goodwill* include years of experience in the current profession; the types and amount of licenses, special recognitions, and awards held by the professional; advertising strategy that promotes the professional, in contrast to the practice; level of business referrals generated by others within the organization, other than the professional; and level of emotional intelligence displayed by the professional, evidenced through interpersonal skills and personality.[304] Factors that have been recognized by valuation professionals that relate to *practice*

[303] *In re Marriage of Lopez* (1974), 38 Cal. App. 3d 93.

[304] Alina Niculita, Angelina Mckedy, and Kimberly Linebarger, "How to Distinguish Personal Goodwill from Enterprise Goodwill, the Key Person Discount, and Noncompete Agreements," in *BVR's Guide to Personal v. Enterprise Goodwill*, 5th ed. (Portland, OR: Business Valuation Resources, 2012), pp. 104–105.

goodwill include office location, business reputation, and business organization, as well as advertising strategy that promotes the practice in contrast to the professional; alliances with key firms, either vendors or competitors; and growth prospects for the practice, excluding the professional.[305]

Once the attributes that establish the portion of *professional goodwill* and *practice goodwill* that may be allocated from *total goodwill* have been identified, the valuation analyst should first quantify the importance and impact of each attribute in determining that portion of total goodwill that may be allocated to each category of goodwill, that is, *professional* or *practice.* One model that has been developed to assist the valuation professional in quantifying the subjective attributes that are identified and specified as pertaining to *professional* or *practice goodwill* is the Multi-Attribute Utility Model (MUM), which has been accepted in the courts.[306]

14.5 CONCLUSION

The U.S. healthcare delivery system is becoming a more data-driven sector of the economy than ever before, with the emergence of *Electronic Medical Records* (EMR) and *health information exchanges*, *mobile monitoring*, and *sophisticated clinical/business support systems*.[307] This phenomenon is illustrated in a recent quote from a prominent source of healthcare-related news:

> *Healthcare is rich in data. Regulators, researchers, and managers collect multitudes of indicators on patients, procedures, physicians,*

> *staff, facilities, and equipment. Indeed, the challenge for healthcare organizations is to make sense of this morass of clinical, financial, and operation[al] information generated each day. IT tools are becoming ever more powerful and hold the promise of true business intelligence and predictive capabilities. Yet, healthcare lags using data analytics to learn about the people it services and improve its operations and the bottom line. Leaders are overcoming structural and cultural hurdles to involve many end users–executives, managers and clinicians, as well as analysts.*[308]

During the next several years, as *value-based purchasing*, *accountable care organizations*, *patient-centered medical homes*, and other *changing reimbursement quality paradigms* become increasingly prevalent, the *healthcare transactional marketplace* is likely to continue to be driven by *patient outcomes* and *coordinated care efforts across specialties and enterprise types*, in an effort to further *collaboration* by various providers in order to achieve the *reform* objectives set forth under the ACA related to increased *quality*, *cost-effectiveness*, and *access to care*. Necessarily, these new provider relationships and affiliations will result in *transactional activities* related to the *integration*, *affiliation*, *acquisition*, *and divestiture* of the various *provider enterprises*, as well as the *discrete tangible* and *intangible assets* components making up these enterprises. Central to the success of these emerging healthcare organizations (EHOs), based on new models of care delivery, will be those assets that are subject to transaction and that contribute to the enterprise's *future economic benefit.*[309] These assets will serve as the "*building blocks*" for the newly developed (and often integrated) provider enterprises, provider organizations, and affiliations. In particular, intangible assets, such as *practice protocols*, *clinical and operational research*, *data analytics,* and other *intellectual property,* as well as the *human capital*–related intangible assets, which are requisite for the operation of these emerging healthcare organizations, will likely hold significant *value* for the acquirer of these assets going forward.

It is important to note, however, that due to the *increased pace of transactions* during the last several years between *physician practices* and *other healthcare enterprises*, particularly those involving tax-exempt organizations, there has been a heightened level of *regulatory scrutiny* related to

these new forms of *provider alignment*, *affiliation*, and *integration*. Accordingly, increasing importance has been placed on obtaining a *certified opinion of value*, in accordance with *professional standards*, related to each of the *discrete* and *separately identifiable tangible* and *intangible assets*, including *intellectual property*, that make up the transaction. This trend provides *significant opportunity* for those valuation professionals who understand the distinction and interrelationship of both tangible and intangible assets, within the context of the *four pillars of the healthcare industry*: (1) *Reimbursement*, (2) *Regulatory*, (3) *Competition*, and (4) *Technology.*

TDRA	Tasks, Duties, Responsibilities, and Accountabilities

CHAPTER 15

Healthcare Services

Healthcare services may be classified into two general categories, that is, *clinical related* and *nonclinical related*, with *nonclinical-related* activities falling into three generalized subcategories: *administrative*, *management*, and/or *executive*. These categories can be defined by the specific *tasks*, *duties*, *responsibilities*, and *accountabilities* (TDRAs) involved in each. This chapter addresses the classification and valuation of several of the most prevalent services rendered in the healthcare services industry, within the context of the four pillars, that is, *regulatory*, *reimbursement*, *competition*, and *technology*.

As the *corporatization of medicine* has evolved, the provision of healthcare services has transformed from a "*cottage industry*," where physicians had a more direct, personal relationship with their patients, to more of a *commercial structure*, where a patient may have multiple physicians, specializing in various fields, who may or may not *collaborate* together to provide for an *episode of care* (see Section 3.8.2, "Healthcare Professionals," in Chapter 3, "Regulatory Environment"). This trend of *corporatization* has caused an evolution in the TDRAs of physicians from the traditional role of focusing solely on *clinical related* activities, such as *production of*

professional physician services, *call coverage*, *certain medical directorships*, assisting in the *development* and *management of various clinical-related service lines*, and so on, to roles in providing *nonclinical-related* services, for example, *administrative*, *strategic management*, and/or *executive roles*. Furthermore, this shift in the TDRAs of physicians has been amplified by the increased employment of healthcare providers by larger, more integrated health systems, as these large provider organizations typically require additional administrative and managerial oversight functions and are often turning to medical professionals to fill this growing demand (for more information pertaining to the recent trend in the hospital employment of physicians, see Chapter 12, "The Valuation of Outpatient Enterprises").

The movement toward the corporatization of healthcare is paralleled by the commoditization of healthcare services into *fungible commodities* with the creation of a universal *measure of productivity* for physician *clinical services*.[1] This metric was developed to bring *equivalence per unit of care* across physician services and specialties in order to ensure *equitable*, *reasonable reimbursement rates*, while additionally providing a tool for cost containment.[2] The system, known as *Resource-Based Relative Value Scales* (RBRVS), breaks down physician clinical services into *fungible units* known as *Relative Value Units* (*RVUs*). Each total RVU consists of three components: (1) *work RVUs*, (2) *practice expense RVUs*, and (3) *malpractice RVUs*.

Relative Value Units

Fungible units of physician clinical services composed of three components: work RVUS, practice expense RVUs, and malpractice RVUs.

"A National Study of Resource-Based Relative Value Scales for Physician Services," by William C. Hsiao, et al. (Baltimore: Health Care Financing Administration, 1988).

COMPONENTS OF A RELATIVE VALUE UNIT

(1) Work RVUs, (2) practice expense RVUs, and (3) malpractice RVUs.

[1] For the definition of fungible commodities used in this book, as well as more information regarding the commoditization of healthcare, see Section 4.6.3, "Commoditization of Healthcare," in Chapter 4, "Competition."

[2] William C. Hsiao, et. al., *A National Study of Resource-Based Relative Value Scales for Physician Services*, Health Care Financing Administration, 1988.

Due to the central role played by physicians in the delivery of healthcare services, there are two general classifications of operating expenses in healthcare provider enterprises: (1) physician compensation–related expenses and (2) nonphysician compensation–related expenses. In regard to the physician compensation–related expenses, the *work RVU* component of each *total RVU* is determined by the estimated amount of "*work*" performed by a physician when providing a particular service, where "*work*" is defined as (1) the *time*, (2) the *mental effort and judgment*, (3) the *technical skill* and *physical effort*, and (4) the *psychological stress* inherent in each *professional clinical service* provided to patients in support of the forecasted revenue stream.[3]

In regard to the nonphysician compensation–related expenses, the *practice expense* and the *malpractice components* of each total RVU represent the *estimated nonprovider economic operating cost burden* required to perform a particular service in support of the forecasted revenue stream. Additional information pertaining to the history, development, and implementation of

A WORK RVU IS A WORK RVU (I.E., THEY ARE FUNGIBLE COMMODITIES)

The work RVU component of each total RVU is determined by the estimated amount of "work" performed by a physician when providing a particular service, where "work" is defined as (1) the time, (2) the mental effort and judgment, (3) the technical skill and physical effort, and (4) the psychological stress inherent in each professional clinical service provided to patients.

A National Study of Resource-Based Relative Value Scales for Physician Services, *by William C. Hsiao, et al., Health Care Financing Administration, 1988.*

Factoid

Work RVUs reflect the amount of physician resources required to perform a particular service.

A National Study of Resource-Based Relative Value Scales for Physician Services, *by William C. Hsiao, et al., Health Care Financing Administration, 1988.*

[3] Ibid.

the RBRVS reimbursement method can be found in Section 2.4.1.3.2, "Physician Reimbursement and Billing: The Resource-Based Relative Value Scale (RBRVS)," in Chapter 2, "Reimbursement Environment."

The challenge for valuation professionals is being able to *identify* and *separate* the various TDRAs for *clinical services* from those to be provided for *administrative*, *management*, and/or *executive* functions, in order to ensure that compensation for each service is in compliance with the legal implications of the *Stark Law*, the *Anti-Kickback Statute*, and *excess benefit/inurement of benefit* regulations promulgated by the *Internal Revenue Service* (IRS). See Chapter 3, "Regulatory Environment," for a more in-depth discussion of the laws and regulations of the healthcare services industry. Intrinsic to the discussion of *identifying* and *appropriately classifying* each attribute by which a physician will provide *utility* to the subject healthcare enterprise is selecting the *appropriate metric* to be used in *measuring the utility* provided. While such attributes as *tasks* and *duties* have *discretely identifiable metrics* that are more amenable to being *quantified* and *measured* (e.g., hour requirements and wRVU production as set forth in applicable benchmark sources), those attributes related to *responsibility* and *accountability* for ensuring their performance under the given contract are more complex and *varied in their scope*, thereby resulting in these attributes not being easily quantified, despite often being the *attribute of utility* that produces an *equal or greater economic benefit* for the organization. Accordingly, the *value* to be derived from the utility attached to the physician's *responsibilities* and *accountabilities* will often provide greater *economic benefit* to the contracting organization vis-à-vis the *risk/reward continuum* and the physician's *relative risk* in undertaking the given *responsibility* and *accountability* attached to the terms of the given contract.

Factoid

Tasks and duties may be measured with units of time; however, responsibilities and accountabilities (which may account for most of the service compensation) are more subjective.

Stark Law

A federal law prohibiting physicians from referring Medicare or Medicaid patients to an entity for designated health services if the physician or an immediate family member has a financial relationship with that entity.

"Limitation on Certain Physician Referrals," 42 USC §1395nn(a)(1)(A) (2011).

It should be noted that while some types of services fit easily into a *clinical-related* or *nonclinical-related* category (e.g., physician productivity related to patient care is clearly in the *clinical-related* category), due to the many permutations and combinations of TDRAs that can be present in various healthcare service roles, careful analysis is warranted to ensure that the subject services (i.e., those services under consideration in the valuation engagement) are classified into an appropriate category for benchmarking and other valuation related purposes, for example, the role of a medical directorship may be considered *clinical-related*, *nonclinical-related*, or *both*. An illustration of various types of healthcare service–related positions and the *identification* of the TDRAs associates with these roles are listed in Table 15.1.

15.1 CLASSIFICATION OF CLINICAL-RELATED SERVICES

Clinical-related services may be defined as the provision of professional medical services related to the *diagnosis* and *treatment* of patients who present with various injuries, diseases, and ailments by *physicians*, *allied health professionals*, *midlevel providers*, *technicians*, and *paraprofessionals*. *Clinical-related* services may also include *coverage and call*, *research activities*, *clinical academic appointments*, *medical outreach and public health*, and *service line medical directorships*.

Clinical-related *call coverage services* typically require a physician to be responsible for providing *professional clinical services* to patients who may need care during a time other than typical physician practice office hours (e.g., evenings, weekends, and holidays) at various sites of services, including *hospital emergency departments*, *trauma centers*, and *birthing centers*. There are two general classifications of *call coverage services*: *restricted* and *unrestricted*. *Restricted call coverage* requires that physicians be physically present at the location for which they are providing *call coverage services*. This classification of *call coverage* is more prevalent with *hospital-based*

CLINICAL-RELATED SERVICES

The diagnosis and treatment of patients with various diseases and ailments, including the provision of medical services by physicians, coverage and call, research activities, clinical academic appointments, outreach, and clinical service line medical directorships.

TABLE 15.1 Examples of Healthcare Service–Related Positions

Position Titles	Notes	Description of Typical TDRAs	Classification *(i.e., Clinical-Related, Nonclinical-Related, or Both)*
Staff Physician		Provide professional medical services related to the diagnosis and treatment of patients who present with various injuries, diseases, and ailments.	Clinical
Service Line Medical Director	(3)	Similar to a "medical director, general" but specific to a particular clinical service line, for example, cardiology, surgery, and so on.	Both
Medical Director of Clinical Research	(4)(5)	Responsible for research design, methodology, data collection, analysis, and summation of outcomes; grant proposal preparation; research conferences; compliance with protocols, regulations, and research objectives; liaison between finding agencies and the organization.	Both
Medical Director of Clinical Operations	(6)(3)	Monitors day-to-day operations; develops, implements, and monitors policies/procedures; oversees nonphysician technical and records staff; responsible for improving quality and reducing cost by streamlining workforce and technology.	Both
Medical Director of Quality Management	(3)	Responsible for developing and implementing programs to ensure compliance with internal and external quality goals and benchmarks.	Both
Residency/ Fellowship Program Director	(7)(8)	Responsible for organizational policy and compliance, strategic planning, marketing, physician compensation, and reimbursement; oversees clinical research, teaching; and supervises residents and fellows and overall medical education curriculum.	Both

President of Medical Staff	(8)	Duties generally include liaison among/between physicians, management, governing boards, organizations, and the community; setting medical staff policies, procedures, and credentialing.	Both
Chief Operating Officer	(2)	Consults, advises, and assists the CEO and/or practice administrator in providing leadership and direction in planning, directing, and coordinating both patient and nonpatient care activities.	Both
Medical Director, General	(2)	Generally responsible for all activities related to the delivery of medical care and clinical services, such as cost management, utilization review, quality assurance, and medical protocol development, as well as overseeing the activities of group physicians, including recruiting and credentialing; larger organizations may contain more than one of these positions. It should be noted that these roles may be performed for various types of entities, including hospitals, HMO/PPO/Health Plans, PHOs, MSOs, academic medical centers, group practices, and so on.	Both
Associate/Assistant Medical Director	(2)	Assists the medical director in all respects, including clinical services, utilization review, and medical protocol development; these positions are found in the same type of entities that medical directors are.	Both
Chief Medical Information Officer	(1)	Similar to "chief information officer" but performed by a licensed physician, with more of a focus on leveraging clinical data to reduce variance in care processes and quality and achieving "process agility."	Both

(*continued*)

TABLE 15.1 Examples of Healthcare Service–Related Positions (*continued*)

Position Titles	Notes	Description of Typical TDRAs	Classification *(i.e., Clinical-Related, Nonclinical-Related, or Both)*
Chief Human Resources Officer	(3)	Responsible for all human resource management and development programs and procedures, including employment, compensation and benefits, employee/labor relations, education and training, health and safety, and compliance with employment laws and regulations.	Both
Physician Chief Executive Officer	(2)	Develops and monitors organizational policy with other management personnel and board of directors; responsible for the overall operation of the organization, including patient care and contract relations; oversees activities related to growth and expansion of the organization; typically serves as a liaison between the organization, the community, and the board of directors.	Both
Chief Financial Officer	(2)	Develops financial policies and oversees their implementation; typically monitors a variety of financial activities, including budgeting, accounting, billing, payer contracting, collections, and preparation of tax returns; may obtain funds for capital development; usually prepares annual reports and long-term projections.	Nonclinical
Chief Executive Officer	(2)	Maintains broad responsibilities for all administrative positions of the medical group; typically oversees management personnel, with direct responsibilities for the specific functional areas of the organization.	Nonclinical

Chief Information Officer	(2)	Contributes to general business planning regarding technology; accountable for directing data integrity and confidentiality of patient care information; identifies new developments in information system technology and strategizes organizational modifications.	Nonclinical
Chief Legal Counsel	(3)	Responsible for planning, managing, and coordinating the legal affairs of the medical group; directs and coordinates activities of outside counsel; responsible for ensuring that organizational activities meet legal and regulatory requirements; provides legal guidance with the goal of reducing risk to the medical group.	Nonclinical

physicians (e.g., *radiologists*, *anesthesiologists*, *pathologists*, *emergency room department providers*, and *hospitalists*). *Unrestricted call coverage* allows physicians to provide *call coverage services* without having to be physically present at the entity location for the entirety of the on-call shift. Typically, the physicians should be able to arrive at the entity location where they are performing on-call services within 10 to 20 minutes and must carry a pager or another communication device to facilitate correspondence that is required to alert the physician of services needed.

There has been an *increasing demand* for *call coverage* services. According to a 2006 study conducted by the American College of Emergency Physicians, the adequacy of call coverage by specialists in the nation's emergency departments has deteriorated in recent years, due to an *increased volume of patient encounters* that have resulted from changing regulations intended to prevent discrimination in access to emergency medical services.[4]

It should be noted that in the past, physicians were almost universally expected to provide call coverage as a condition of being granted medical staff privileges at the hospital where they treated their patients. However, more recently, changes in physician manpower, including the projected *physician shortage*; the increased demand from the "*graying population*" in the United States; the growing number of older physicians, reducing the total amount of professional hours expended; the increased number of physicians entering early retirement; and a cultural shift where the growing focus of younger physicians is on quality-of-life issues coming out of training, as well as the increasing pressure on physician compensation from diminished reimbursement yield for professional services, have contributed to an environment where more physicians are demanding payment for call coverage services.[5]

15.1.1 Nonphysician Clinical–Related Services

In addition to the *clinical-related services* provided by physicians, there are certain *nonphysician providers*, that is, *allied health professionals*, *midlevel providers*, and *technicians and paraprofessionals*, who may work *synergistically* with physicians (e.g., as a physician supplement for the

[4] American College of Emergency Physicians, "On-Call Specialist Coverage in US Emergency Departments—ACEP Survey of Emergency Department Directors April 2006," (2006), p. 1.

[5] "Hospitals Employing Physicians: A Practical Guide to Buying Physician Practices and Compensating Employed Doctors," presented at the 10th Annual Conference on Emerging Issues in Healthcare Law, in Orlando, Florida, on February 17, 2009, by Leigh Walton, et al., of Bass, Berry & Sims PLC, p. 4.

provision of select services) or *in parallel to* physicians for the provision of services that, although comparable to physician services, are entirely outside the scope of physician practices. For example, *midlevel providers* are afforded a significant level of autonomy within their scope of practice and as such may act alongside—or independent of—physicians under certain conditions for the provision of previously determined services. Despite the expansion of midlevel provider autonomy, their supportive role as part of specialized medical or surgical teams remains particularly significant.[6] In such settings, the role of *nonphysician providers* is typically to support and aid in the provision of physician services, rather than independently providing billable services that generate revenue. As a result, *nonphysician providers* employed as, for example, surgical assistants may be considered a *direct expense* to the physicians who are benefiting from their services. For a more thorough discussion of the various types of *nonphysician providers*, see Chapter 12, "The Valuation of Outpatient Enterprises." It should be noted that midlevel providers, as well as technicians and paraprofessionals, are not considered a "physician" for purposes of the Stark Law's prohibition against self-referrals (see Section 3.3.2, "Stark Law," in Chapter 3, "Regulatory Environment").[7] However, *any* individual who may influence the solicitation of referrals under a federal healthcare program may be subject to the Anti-Kickback Statute, as well as federal and state fraud and abuse laws.[8]

Factoid

Healthcare services are becoming a commodity.

"Commodified Care," by William S. Andereck, Cambridge Quarterly of Healthcare Ethics *16, no. 4 (2007): 401–402.*

[8]"Criminal Penalties for Acts Involving Federal Health Care Programs," 42 USC 1320a-7b (January 4, 2012); Health Care Fraud Prevention Enforcement Action Team, "Comparison of the Anti-Kickback Statute and Stark Law," Office of Inspector General, https://oig.hhs.gov/compliance/provider-compliance-training/files/StarkandAKSChartHandout508.pdf (accessed January 8, 2013).

NONPHYSICIAN PROVIDER (NPP) CLASSIFICATIONS

NPPs may be further divided into three categories based on the types of services they provide: (1) allied health professionals (aka "parallel providers"), (2) Midlevel providers (aka "triage providers"), and (3) technicians and paraprofessionals (aka "physician extenders").

15.2 CLASSIFICATION OF NONCLINICAL-RELATED SERVICES

Nonclinical-related services are those services where the TDRAs associated with the position are not directly related to the treatment of patients. The typical *nonclinical-related* roles would include *chief executive officer, chief financial officer*, *chief information officer*, *chief legal counsel*, and other "*C-suite*" *executives*, as well as *strategic and operational management positions*, for example, practice administrators, billing managers, payer contracting managers, and so on, and *nonclinical-related* support staff. As mentioned earlier, the demand for *administrative*, *management*, *and executive services* by healthcare organizations is causing a proliferation in the types of these services required.

The *alignment*, *integration*, and *engagement* of physicians are key strategies for health systems seeking to create *high-performing*, *high-quality*, and *high-efficiency* organizations. Yet aligning physicians' interests with those of hospitals and health systems has been an ongoing struggle, particularly since the shift from *small*, *physician/provider-owned*, *independent private practices* to *captive practices* within larger integrated health systems, that is, *the corporatization of the practice of medicine*. Successful hospital enterprises have understood that "to effectively respond to the economic incentives of reform, a hospital should achieve a deeper level of integration with the physicians that practice there."[9] This has also been a factor in using

C-Suite

A slang term used to describe the top tier of decision makers within an enterprise, based off the first letter of their title, for example, CEO, CMO, COO, and so on.

[9]Healthcare Financial Management Association, "Achieving Physician Integration with the Co-Management Model," http://www.hfma.org/Templates/Print.aspx?id=20619 (accessed July 19, 2010).

EXECUTIVE/ADMINISTRATIVE HEALTHCARE SERVICES

Strategic management–related services performed by medical professionals, including alignment, integration, and engagement of physicians for health systems.

professionals with "*inside knowledge*" of the health system, as well as the collegial "doctor-to-doctor" relationship with fellow physicians within the medical staff, to perform administrative, management, or executive services within the organization in an enhanced, efficient manner.

Another way physicians and hospitals are trying to achieve *closer integration* with physicians is through *comanagement arrangements*, which have reemerged in recent years as an *alternative to joint ventures* or *strict employment arrangements* between hospitals and physicians, who share *mutual interests to lower costs*, *increase efficiency*, and *improve quality.*[10] As previously discussed in Section 4.6.4.1, "Comanagement Arrangements," in Chapter 4, "Competition," under a *comanagement arrangement*, a hospital may enter into a management agreement with an organization that is either *jointly owned* or *wholly owned* by a physician to provide the daily

Comanagement Arrangements

A comanagement arrangement is formed between a hospital and a group of physicians for the purpose of the physicians' providing "comanagement" services for a portion of the hospital's business, typically a service line related to the specialty of the participating physicians.

"How to Seal a Co-Management Deal with a Hospital," by Victoria Stagg Elliott, American Medical News*, January 24, 2011, http://www.ama-assn.org/amednews/2011/01/24/bica0124.htm (accessed November 2, 2012); "What in the World Is Medical 'Co-Management?'" by John C. Erickson III,* Physicians Practice*, http://www.physicianspractice.com/blog/what-world-medical-%E2%80%98co-management%E2%80%99 (accessed November 2, 2012).*

[10] Melanie Evans, "Co-Management Emerges as Alternative to Joint Ventures, Employment by Hospitals," *Modern Physician*, May 10, 2010, http://www.modernphysician.com/apps/pbcs.dll/article?AID=/20100510/MODERNPHYSI# (accessed July 21, 2010).

management services for the inpatient and/or outpatient components of a medical specialty service line.[11] These arrangements provide an incentive to physicians for the development, management, and improvement of quality and efficiency, as well as for making the service line more competitive in the target market.[12]

15.3 ESTABLISHING FAIR MARKET VALUE AND COMMERCIAL REASONABLENESS

Corresponding with the growing trend toward *hospital employment* of physicians, there has been an increase in *regulatory scrutiny* related to the *legal permissibility* of these arrangements under federal and state *fraud and abuse* laws, that is, Stark, Anti-Kickback, and False Claims, as well as IRS regulations related to excess benefit/inurement of private benefit, pertaining to transactions involving exempt organizations (see Chapter 3, "Regulatory Environment"). Significantly, physician compensation arrangements are scrutinized, not only as standalone payments, but also as elements of the overall consideration in the transaction, under the valuation *standard*

Fair Market Value

The value in arm's-length transactions, consistent with general market value, without taking into account any ability between parties to refer business to each other.

"Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," 42 CFR § 411 and 424 (January 4, 2001); "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," 42 CFR § 411 and 424 (March 26, 2004).

Factoid

Compensation should *not* be aggregated along ambiguous lines of demarcation.

[11] Paul F. Danello, "Clinical Co-Management: Hospitals and Oncologists Working Together," *Journal of Oncology Practice* 2, no. 1 (January 2006).

[12] Ibid.

of *Fair Market Value* (FMV), as well as the related threshold of *commercial reasonableness* (both of which are more fully described later and discussed in Chapter 3, "Regulatory Environment").

While FMV looks to the "*range of dollars*" paid for a product or a service, the threshold of *commercial reasonableness* looks to the *reasonableness* of the *business arrangement generally.*[13] It should be noted that these are two *distinct thresholds*, that is, a compensation arrangement may be simultaneously within the range of FMV and be determined to *not* be *commercially reasonable*.

The False Claims Act

Creates civil liability for knowingly presenting false or fraudulent claims for reimbursement to the federal government. Amended in 1986, it has become one of the primary weapons used to combat healthcare fraud. Under the statute's qui tam (whistleblower) provisions, any private citizen can enforce the FCA by filing a complaint alleging fraud against the federal government. The incentive is the potential to share in the recovery of any ill-gotten funds.

"False Claims Act," 31 USC 3729; "Health Care Fraud Report: Fiscal Year 1998," Department of Justice, 1998, http://www.justice.gov/dag/pubdoc/health98.htm#national (accessed December 9, 2009); "False Claims Act," 31 U.S.C.A. §3730(d)(1).

The Anti-Kickback Statute

The federal Anti-Kickback Statute makes it a felony for any person to "*knowingly and willfully*" solicit or receive or offer or pay any "*remuneration*" directly or indirectly in exchange for the referral of a patient for a healthcare service paid for by a federal healthcare program.

"Criminal Penalties for Acts Involving Federal Health Care Programs," 42 U.S.C.A. § 1320a-7b(b).

[13] "Tread Carefully When Setting Fair Market Value: Stark Law Must Be Considered," Joyce Frieden, November 1, 2003, http://findarticles.com/p/articles/mi_m0CYD/is_/ai_110804605 (accessed September 26, 2008).

15.3.1 Fair Market Value

The standard of *Fair Market Value* (FMV) related to transactions involving healthcare services is bound by three areas of law: (1) federal and state Anti-Kickback Statutes, (2) federal and state Stark Laws, and (3) IRS regulations involving excess benefit and inurement of private benefit for exempt organizations, for which an analogy may be a "*three-legged stool*," whereby if one leg of the stool fails, the stool collapses (for an in-depth discussion of the implications of the Anti-Kickback Statute, Stark Laws, and IRS regulations pertaining to compensation for healthcare services, see Chapter 3, "Regulatory Environment").

Table 15.2 sets forth the definition of *Fair Market Value* as established by the *Federal Anti-Kickback Statute*, the *Stark Law*, and *IRS regulations*.

In addition to the definitions of FMV earlier, the *Centers for Medicare and Medicaid Services* (CMS), formerly the *Healthcare Financing Administration* (HCFA), provided the following guidance for determining when a payment for services provided is within the range of FMV:

> *We believe the relevant comparison is aggregate compensation paid to physicians practicing in similar academic settings located in similar environments.* Relevant factors include geographic location, size of the academic institutions, scope of clinical and academic programs offered, and the nature of the local health care marketplace.... *We intend to accept any method [for establishing* FMV] *that is* commercially reasonable and provides us with evidence that the compensation is comparable to what is ordinarily paid for an item or service in the location at issue, by parties in arm's-length transactions who are not in a position to refer to one another.... *The amount of documentation that will be sufficient to confirm* FMV ... *will vary depending on the circumstances in any given case; that is, there is no rule of thumb that will suffice for all situations.*[14] *[Emphasis added]*

15.3.2 Commercial Reasonableness

While there is no universal, explicit definition of *commercial reasonableness*, there is guidance available from several regulatory sources, which, when taken together, indicate what is meant by the term *commercially reasonable*. For example, the *U.S. Department of Health and Human Services* (HHS) has interpreted the term *commercially reasonable* to mean that an

[14] *Federal Register* 66 (January 4, 2001): 916 and 944.

TABLE 15.2 Definitions of Fair Market Value

Anti-Kickback Statute
"Fair market value in arm's-length transactions … not determined in a manner that takes into account the volume or value of any referrals or business otherwise generated between the parties for which payment may be made in whole or in part under Medicare or a State health care program."[1]
Stark Law
"*Fair market value means the value in arm's-length transactions, consistent with the general market value. 'General market value' means the price that an asset would bring as the result of bona fide bargaining between well-informed buyers and sellers who are not otherwise in a position to generate business for the other party, or the compensation that would be included in a service agreement as the result of bona fide bargaining between well-informed parties to the agreement who are not otherwise in a position to generate business for the other party, on the date of acquisition of the asset or at the time of the service agreement.*" [Emphasis added][2]
IRS
The IRS regulations define *reasonable compensation* as the *"amount that would ordinarily be paid for like services by the enterprises (whether taxable or tax-exempt) under like circumstances"*[3] and define the standard of Fair Market Value as the *"price at which property or the right to use property would change hands between a willing buyer and a willing seller, neither being under any compulsion to buy, sell, or transfer property or the right to use property, and both having reasonable knowledge of relevant facts."*[4]

[1] "Program Integrity; Medicare and State Health Care Programs; Permissive Exclusions," 42 CFR §1001.952(b)(5), (2009), p. 735.

[2] "Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase III): Final Rule," *Federal Register* 72, no. 171 (September 5, 2007): 51081. The Stark Law (as stated in the U.S. code) also equates the terms *Fair Market Value* and *General Market Value*, to wit: "The term 'fair market value' means the value in arm's length transactions, consistent with the general market value." From "Limitation on Certain Physician Referrals," 42 U.S.C. §1395nn (April 4, 2012).

[3] Section 53.4958–4(b)(ii)(A).

[4] Section 53.4958–4(b)(i).

arrangement appears to be "a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals,"[15] while the *Stark II, Phase II* commentary suggested that "an arrangement will be considered 'commercially reasonable' in the

[15] *Federal Register* 63 (January 9, 1998): 1700.

absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential [designated health services] DHS referrals"[16] In an attempt to interpret the definition of *commercial reasonableness,* it has been suggested that if a healthcare provider collects revenues from a physician's direct and ancillary services that meet or exceed his compensation, the arrangement will appear to meet the *commercial reasonableness* threshold.[17] However, if the physician's compensation significantly exceeds the revenue he is generating, the arrangement should be more carefully analyzed to ensure that the *commercial reasonableness* standard is met.[18]

Significantly, both *services* ***and*** *payments* should be considered *commercially reasonable* for the arrangement to survive scrutiny.[19] For example, if a *specialized physician* is receiving compensation within the *higher range of FMV* to perform services that a *less skilled practitioner* could perform for *less compensation*, the arrangement may not be deemed to be *commercially reasonable*, despite the fact that it is within the range of FMV for that specialist. In such situations, there tends to be a *presumption of fraud*, unless the healthcare provider can show that using a physician of that specialty

Commercial Reasonableness

Defined by HHS as an arrangement that is "a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals."

DESIGNATED HEALTH SERVICES (DHS)

Clinical laboratory services; radiology and certain other imaging services (including magnetic resonance imaging [MRI] services, computed tomography [CT] scans, and ultrasound); radiation therapy services and supplies; durable medical equipment and supplies; orthotics, prosthetics, and prosthetic devices; parenteral and enteral nutrients, equipment, and supplies; physical therapy, occupational therapy, and speech-language pathology services; outpatient prescription drugs; home health services and supplies; inpatient hospital services; and outpatient hospital services.

"Physician Self-Referral and Hospital Ownership Disclosure Provisions in the IPPS FY 2009: Final Rule," Centers for Medicare and Medicaid Services, August 4, 2008, http://www.cms.hhs.gov/apps/media/press/factsheet.asp?Counter=3226&intNumPerPage=10&checkDate=&checkKey=&srchType=1&numDays=3500&srchOpt=0&srchData=&keywordType=All&chkNewsType=6&intPage=&showAll=&pYear=&year=&desc=&cboOrder=date (accessed August 6, 2008).

was *reasonably necessary*, for example, the physician's specific *experience* or the position's requirements could not have been adequately equaled by a less-skilled practitioner. With regard to compensation for *medical directorships*, the *commercial reasonableness* standard requires that medical director activities be fully *documented* in writing and closely *monitored* to ensure that the services of the physicians in those roles are *actually needed* by the hospital and that they are *effectively fulfilling* the medical directorship duties.[20] In addition, the *Office of Inspector General* (OIG) has advised that hospitals should ensure that they do not have multiple arrangements with different physicians for the same services, "so that in the aggregate the items or services provided by all physicians exceed the hospital's actual needs (apart from generating business)."[21] Further, the OIG has cautioned that "payment for services (which may include consultations at the hospital) which require few, if any, substantive duties by the physician, or payment for services in excess of the FMV of services rendered," is potentially

Factoid

Compensation can be at Fair Market Value and still not be considered commercially reasonable.

"Medicare Program; Physicians Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," Federal Register *69, no. 59 (March 26, 2004): 16107; "Successful Medical Practice Valuation," by Reed Tinsley,* Physicians News Digest*, July 2008, http://www.physiciansnews.com/business/708tinsley.html (accessed September 19, 2008).*

legally impermissible.[22] Additional guidance as to the definition and determination of commercial reasonableness can be found in the government expert's report in the *SCCI v. Houston* case. For an in-depth discussion of the threshold of *commercial reasonableness*, including those factors that the IRS considers in determining the *commercial reasonableness* of a physician compensation arrangement, as well as relevant case law regarding the courts' interpretation of the *commercial reasonableness* standard, see Section 3.3.3.8, "Commercial Reasonableness as Defined by Fraud and Abuse Laws," and Section 3.3.3.9, "Relevant Case Law Interpretations of Fair Market Value and Commercial Reasonableness," both in Chapter 3, "Regulatory Environment," as as well as Chapter 16, "The Threshold of Commercial Reasonableness."

Periodically, the question arises as to whether a hospital employing a physician and paying compensation to her for her *productivity* (e.g., *$ per work RVU*), in an *amount greater* than what the physician was able to achieve *historically* from her private practice earnings for the *same unit of production of services* (i.e., *$ per wRVU*), *prior to* the hospital/physician transaction will subject the compensation arrangement to *commercial reasonableness* scrutiny related to whether it makes "*prudent business sense*"

Factoid

Compensation arrangements must be at Fair Market Value and commercially reasonable.

[22] Office of the Inspector General, "Special Fraud Alert," Department of Health and Human Services, December 19, 1994, http://www.oig.hhs.gov/fraud/docs/alertsandbulletins/121994.html (accessed October 7, 2008).

SAFE HARBORS

Congress enacted safe harbors that detail specific regulatory criteria that must be met to shield an arrangement from liability under the Anti-Kickback Statute and are meant to protect practices unlikely to result in fraud or abuse.

"Criminal Penalties for Acts Involving Federal Health Care Programs," 42 U.S.C.A. § 1320a-7b(b).

for the hospital to pay a significantly higher *$ per work RVU rate* for acquiring the *production of the same unit of service*.

The analysis of the *commercial reasonableness* of physician compensation should first address the threshold issue of *FMV* related to the services to be rendered. Inherent in the definition of FMV is the notion of the *most probable price* at which a *particular property interest*, *good*, or *service* would *transact in the market* between a *willing buyer* and a *willing seller.* When establishing that physician service–related compensation is at FMV, a *market-based approach* is typically used, whereby the proposed compensation to be paid is compared to *applicable normative industry benchmark survey data*.

Typically the *mean* or *median* is the *point of central tendency* selected from this *normative industry benchmark data*, to obtain an indication of the *most probable price* that would be paid for a *similar unit of service*. These units of service may be measured on a *$ per wRVU* basis; a *$ per hour* basis; *$ salary for a specified period* (e.g., *per diem*, *monthly*, *annual*, etc.); or some other metric (see further discussion of compensation types, later).

Considering, from a statistical perspective, the question as to whether a *tax-exempt hospital* paying an *employed physician* a higher amount of compensation for the *post-practice transaction clinical related services* (e.g., $ per work RVU) than she was able to realize from her private practice, the establishment of a *measure of central tendency* from the industry normative benchmark data sample, requires that there be *observations both above and below* the specified point of central tendency, and in the case of the *median*, there would be an equal number of observations *both above and below.*[23] It is rational to assume that physicians who accept compensation levels above the amount they were able to generate from their own practice, would do so in pursuing the *level of remuneration* that *maximizes* their *individual compensation*, *wealth*, or *other measure of utility.* Additionally,

[23] William Hays and Robert Winkler, *Statistics: Probability, Inference, and Decision* (New York: Holt, Rinehart and Winston, 1971), pp. 268–275.

those physicians receiving compensation for their services at rates (e.g., $ per work RVU) above the most probable price (as set forth by the point of central tendency of the normative industry benchmark survey data) would also be acting in their own *rational economic self-interest* by not pursuing a transaction where they would be *paid less* for their services than what they are able to generate from their private practice.

According to the theory of *utility maximization*, *rational market participants* tend to make decisions in order to maximize their *own expected personal utility*, with further assumptions pertaining to each participant's decision-making criterion, to wit:

1. *Perfect rationality* (e.g., in that they prefer more benefit to less);
2. *Perfect self-interest* (i.e., the decisions people make are based solely on the consequences to themselves); and
3. *Perfect information* (i.e., an equivalency of knowledge between the parties of all information pertinent to the transaction—a key criteria in definition of FMV).[24]

According to this theory of *utility maximization*, it would make *prudent business sense* for an individual making *below the median compensation rate* for her services to pursue a transaction that would increase her compensation to the highest level, *bounded by* the exempt hospital's *restriction of not exceeding FMV*, that is, the *most probable amount* that those services would command in the open market. The concept of *utility maximization* includes both *extrinsic value*, for example, *financial gain*; and *intrinsic* value, such as *nonfinancial benefit*. This assumes that the *extrinsic value* derived from additional *cash compensation* would outweigh any *decrease* in *intrinsic value* associated with the transaction. This concept of *utility maximization* was described by Jeremy Bentham (regarded as the founder of modern utilitarianism) as being based on the premise *that utility derived from an object is its ability to*:

> *produce benefit, advantage, pleasure, good, or happiness or prevent the happening of mischief, pain, evil, or unhappiness to the party whose interest is considered.*[25]

---

[24] William Jevons, *The Theory of Political Economy*, 3rd ed. (original work published by Macmillan and Co., London, 1888, electronic version from Library of Economics and Liberty utilized), http://www.econlib.org/library/YPDBooks/Jevons/jvnPE3.html#Chapter3 (accessed September 13, 2012), p. 2.

[25] Jeremy Bentham, *Introduction to the Principles of Morals and Legislation* (Oxford: Clarendon Press, 1907), chap. I.4, http://www.econlib.org.

It should be noted that Bentham's interpretation of the concept of *utility maximization* expands on the definition of *utility* that might be expected from its reference in *Modern Portfolio Theory*, in which individuals, as *rational actors*, select investment portfolios that have *the highest return per level of risk* (based on mean-variance analysis), as that *return* applies to *wealth maximization only*, that is, the perception that an *increase in wealth* (money) is the *only* activity in which *utility* may be derived.

While the preceding paragraphs have discussed the question of the *commercial reasonableness* from the *seller's* perspective of a transaction scenario whereby a *tax-exempt* hospital pays an *employed physician* a higher amount of compensation for postpractice transaction *clinical related services* (e.g., $ per work RVU) than she was able to realize from her private practice, it is also worthwhile to consider the question from the *buyer's* perspective. For example, the economic *principle of substitution* states that the price of a *desired substitute*, or one of *equal utility*, sets the *ceiling of value* for a particular good or service. Under this principle, a potential *purchaser* of healthcare services would be *willing to pay up to the price* of a *desirable substitute*, and normative industry benchmark survey data can be used to determine the most probable price that the purchaser would expend for substitute services.

In addition, an assumption inherent in the definition of FMV is that the *hypothetical buyer* would have *access* to all *pertinent* information regarding the transaction, including the knowledge of the *level of return* on physician services that the current owner (seller) was able to generate (e.g., historical $ per work RVU). However, the *historical level of return* on physician services is strictly reflective of the outcome of the economic factors affecting the *operational performance* and *financial condition* of the physician's *prior practice*, including but not necessarily limited to, (1) the *respective marketing leverage* and *contract negotiating ability* of the practice to achieve *favorable reimbursement yields* and the revenue there from; (2) the *practice's operating expense structure*, in regard to its ability to achieve favorable *supply-side pricing* and *labor costs*; and (3) *reasonable access* to *financing from capital markets* at favorable terms, and does not take into account the *nonfinancial* factors (or *intrinsic value*) that the physician derives from her *autonomy.*

PRINCIPLE OF SUBSTITUTION

The price of a desired substitute, or one of equal utility, sets the ceiling of value for a particular good or service.

An alternative explanation as to why income levels from a physician's private practice may be lower than post-transaction employment income can be found in *behavioral finance*. According to the *theory of bounded rationality*, developed by Herbert Simon, a professor of psychology at Carnegie Mellon University and an influential author to the field of *behavioral economics*, *rational economic market participants* are *limited* by a *lack of ability* and *resources* (including *time*, *information*, *money*, and so on), causing them to use *heuristics* in order to simplify the complexities inherent in the decision-making process, which leads to "*satisficing*" (a combination of the words *suffice* and *satisfy*) in contrast to finding optimal solutions.[26] Examples of how these *behavioral aspects* can explain the phenomenon of historical compensation being significantly below the most *probable price* that should be paid for a particular set of services may include, but not necessarily be limited to (1) a potential *lack of information regarding other opportunities* to obtain higher compensation; (2) *using past experiences* (*heuristics*), which *may not be reflective of future economic market realities*, to determine the amount of *utility* one derives from *intrinsic sources* such as *personal autonomy* (and therefore one's willingness to accept lower extrinsic, financial reward); and (3) other *emotional biases* and/or *cognitive errors* affecting the level of remuneration deemed satisfactory by the recipient (e.g., *regret aversion* and/or *status quo biases* that prohibit a physician from trading autonomy for financial gain; *overconfidence bias*, causing a physician to overestimate her ability to achieve greater market leverage in private practice; and *endowment bias*, in that the practice asset is worth more to the physician because she owns it, and so on). However, the persistence of the economic outcome derived from a particular behavioral bias would be based on the type of *emotional bias* or *cognitive error* exhibited (e.g., knowledge of normative benchmark industry survey data, which reflects the *most probable compensation* rate for *a specific type of service* in a *particular geographic location*, that would generate a higher level of utility for the physician than what she was able to derive from both the intrinsic and extrinsic sources of her private practice, may influence the physician to seek higher compensation rates in order to maximize her expected utility).

Therefore, while it may be true that a potential purchaser, *bound* by the *FMV price* as a *ceiling*, would act to maximize his or her profit by acquiring physician services at the *lowest cost per unit*, that is not reflective of the *seller's* perspective, which is a requisite element of the *willing buyer*, *willing seller* concept inherent in FMV. From the *seller's* perspective, the *floor* of

[26] Herbert A. Simon, "A Behavioral Model of Rational Choice," *Quarterly Journal of Economics* 69, no. 1 (February 1955): 99–118.

SATISFICING

As opposed to finding optimal solutions, rational economic market participants are limited by a lack of ability and resources (including time, information, money, and so on), causing them to use heuristics in order to simplify the complexities inherent in the decision-making process.

"A Behavioral Model of Rational Choice," by Herbert A. Simon, Quarterly Journal of Economics *(1957): 99–118.*

value would be set by the level of income the physician was able to generate from his or her prior practice. The point where both parties will choose to transact would fall between the *ceiling* set forth by the regulatory restriction of FMV and the *floor* set forth by the historical earnings of the physician from his or her prior practice. The degree by which the final negotiated price is closer to the *point of utility maximization* for the *buyer* (i.e., the lowest available cost per unit) or to that of the *seller* (i.e., the highest possible price per unit) is determined by the trade-off between *autonomy* and *leverage* between the two parties, which is illustrated below, in Exhibit 15.1.

As detailed earlier, the more *value* physicians expect may be derived from the intrinsic and extrinsic utility that would be expected to result from their *autonomy*, the *higher the price* they would expect to receive in order for them to give up that *autonomy*, or, in other words, the *less willing* they would be to become *direct employees* (in contrast to operating as a private practice). As *negative economic forces* continue to affect solo practitioners and physicians in small group practices, for example, *decreased reimbursement rates* and *increased regulatory scrutiny* regarding their ownership in *higher-margin* ancillary services, it appears that a *tipping point* may have been reached, and that *autonomy* is increasingly being given up for the relative certainty and comfort that *employment* may bring (which a more in-depth discussion of the trend in hospital employment of physicians may be found in Chapter 12, "The Valuation of Outpatient Enterprises").

A detailed analysis of the healthcare industry is paramount to the determination of whether compensation for healthcare services is within the range of FMV and also whether the arrangement meets the threshold of *commercial reasonableness*. The analysis may be viewed through the framework of the four pillars: *regulatory, reimbursement, competition, and technology.*

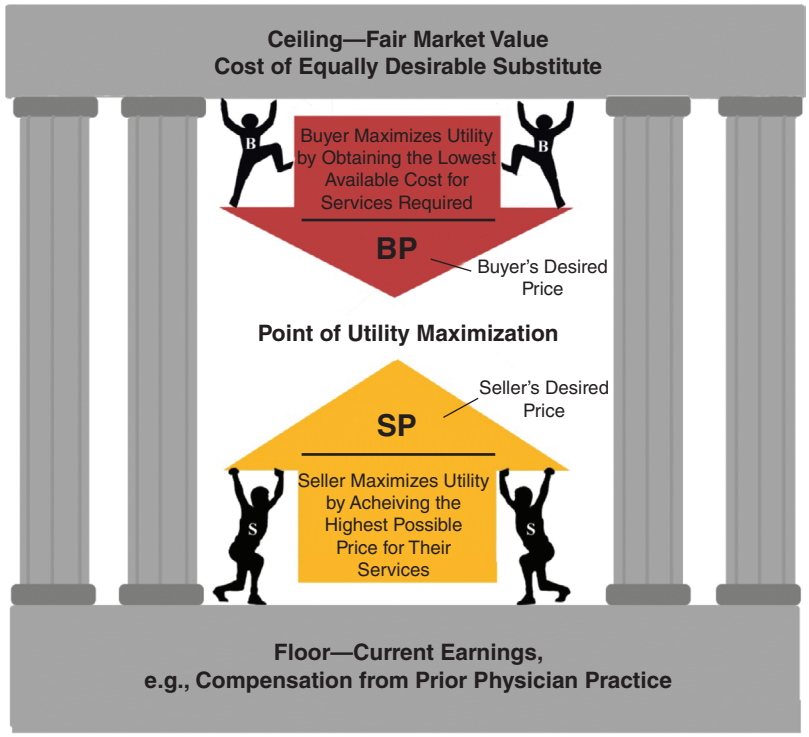

EXHIBIT 15.1 Fair Market Value and Commercial Reasonableness of Physician Compensation

15.4 FOUR PILLARS OF THE HEALTHCARE SERVICE INDUSTRY: REGULATORY, REIMBURSEMENT, COMPETITION, AND TECHNOLOGY

The *constantly evolving* nature of the healthcare industry, viewed through the context of the four pillars—*regulatory*, *reimbursement*, *competition*, *and technology*—continually affects the TDRAs that make up healthcare service positions and therefore the compensation paid to providers of those TDRAs. Generally, the compensation paid for *clinical-related services* is more sensitive to changes in the four pillars; however, as noted earlier, with the evolution of the *corporatization of medicine*, there has been an increase in the demand for *nonclinical-related services*, which may have an impact on the price paid for those services as well. This section gives a brief overview of the pertinent trends in the four pillars that are affecting the TDRAs of healthcare service positions.

Factoid

In March 2007, the IRS reported that of the 1,826 tax-exempt organizations involved in its Executive Compliance Initiative, 782 audits were conducted and $21 million in excise taxes was levied against 40 individuals and 25 different organizations.

"Executive Compensation Update for Tax-Exempt Hospitals and Health Systems," Drinker Biddle Gardner Carton, Health Law Practice Group Newsletter, *June 2007.*

One of the unique aspects of the healthcare industry in general is the regulatory environment (which is more fully discussed in Chapter 3, "The Regulatory Environment") that governs transactions of healthcare-related assets and services. In particular, transactions involving the acquisition of healthcare service providers are scrutinized under the *Anti-Kickback Statute* and *Stark Laws* that attempt to decrease fraud and abuse in the industry, which may result from the complex nature of the services provided and the lack of market controls on price and quality typically associated with the healthcare industry (for a more thorough discussion of the inelastic nature of the healthcare industry see Section 8.1.1.3.1, "Economic Trends," in Chapter 8, "Valuation Approaches and Methods").

In addition to the *Anti-Kickback Statute* and the *Stark Laws*, the IRS scrutinizes compensation arrangements involving tax-exempt organizations. Specifically, the IRS prohibits *excess benefit transactions* and *inurement of private benefits* between tax-exempt organizations and *disqualified persons.* A *disqualified person* is any person in a position to exercise *substantial influence* over the affairs of the *organization* at any time in the lookback period (five years) or family members of the *disqualified person.* To be a *disqualified person*, it is not necessary that the person actually exercise *substantial influence*, only that the person be in a position to exercise *substantial influence*.[27]

As set forth in Section 3.2.2.7, "IRS Determinants of 'Reasonable Compensation,'" in Chapter 3, "Regulatory Environment," an *excess benefit transaction* can be characterized as a transaction in which "the value of the economic benefit provided exceeds the value of the consideration received

[27] Lawrence M. Brauer, et al., "An Introduction to I.R.C. 4958 (Intermediate Sanctions)," 2002 Exempt Organization CPE Text, 2002; "Taxes on Excess Benefit Transactions," 26 U.S.C.A, Section 4958 (March 23, 2010).

Excess Benefit Transactions

As defined by the IRS, an excess benefit transaction is one in which the value of the economic benefit provided exceeds the value of the consideration received for providing the benefit.

"Excess Benefit Transaction," 26 CFR §53.4958–4(a)(1) (2012).

for providing the benefit."[28] In addition, the IRS defines *inurement of private benefit* as when an e*xempt organization* is "organized or operated for the benefit of private interests" and has explicitly stated that "[n]o part of the net earnings of a section 501(c)(3) organization may inure to the benefit of any private shareholder or individual[, whereby] a private shareholder or individual is a person having a personal and private interest in the activities of the organization."[29] However, prohibitions related to *excess benefits* and *inurement of private benefit* do not unilaterally prevent *tax-exempt organizations* from paying *financial incentives* (e.g., shared savings related to quality improvements or other *incentive compensation arrangements*) to physicians as part of the compensation package. For a more thorough discussion of the factors that the IRS considers when determining whether *incentive compensation arrangements* are in conflict with the IRS prohibitions against *excess benefit transactions* and *inurement of private benefits*, for example, whether

"ONE PURPOSE" TEST

In *United States v. Greber*, the court determined that if even one purpose of a remuneration arrangement is to induce referrals, it constitutes an illegal kickback under the Anti-Kickback Statute.

United States v. Greber, *760 F.2d 68 (3rd Cir. 1985).*

[28] "Excess Benefit Transactions," 26 CFR §53.4958-4(a)(1) (2012).

[29] Internal Revenue Service, "Inurement/Private Benefit—Charitable Organizations," February 2, 2012, http://www.irs.gov/charities/charitable/article/0,,id=123297,00.html (accessed August 7, 2012); "Exemption from Tax on Corporations, Certain Trusts, etc.," 26 USC §501(c)(3) (2012).

there is a *reasonable ceiling on the amount a physician may earn* included in the arrangement, see Section 3.2.2.7, "IRS Determinants of 'Reasonable Compensation,'" in Chapter 3, "Regulatory Environment."

In addition to the increased scrutiny of compensation arrangements under the *Fraud Enforcement and Recovery Act* (*FERA*) and the *Healthcare Enforcement Action Team* (*HEAT*), there has been increased concern related to reimbursement yield for healthcare services with the enactment of the 2010 *Patient Protection and Affordable Care Act* (*ACA*), in part, to control the rise in costs associated with healthcare services, while also improving health outcomes. Provisions in the ACA serve as a catalyst for other *reimbursement initiatives* aimed at compensating physicians based on *value*, rather than *volume*, by (1) implementing policies developed to increase the *coordination of care*, (2) *bundling of provider payments*, (3) pursuing *value-based purchasing initiatives*, and (4) allowing providers to receive a *share of the savings* attributable to *achieving the cost-cutting benchmarks* (for a more in-depth discussion of the provisions of the ACA, as well as other reimbursement trends affecting the TDRAs of healthcare service positions, see Chapter 2, "Reimbursement Environment").

Within this evolving *regulatory* and *reimbursement* environment, faced with emerging configurations of provider integrations and affiliations (e.g., *accountable care organizations*), the *competitive marketplace* in which *healthcare services* are delivered is likewise evolving and adapting to *physician manpower shortages*, as well as the *increased scope of services* provided by *midlevel providers*, such as nurse practitioners and physician assistants.

Further, the role of rapidly developing *therapeutic* and *process technologies* is also having a profound impact on the provision of *healthcare*

Factoid

In 2011, healthcare expenditures in the United States totaled $2.7 trillion, or 17.9 percent of the Gross Domestic Product (GDP) and are projected to surpass 20 percent of GDP by 2018.

"National Health Expenditure Projections 2011–2021," Centers for Medicare and Medicaid Services, January 2012, http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/Proj2011PDF.pdf (accessed July 6, 2012).

Electronic Health Record

An electronic record of health-related information on an individual that comes to nationally recognized interoperability stands and that can be created, managed, and consulted by authorized clinicians and staff *across more than one health care organization.*

"Table 5: Electronic Health Records Definitions," within "Defining Key Health Information Technology Terms," by the National Alliance for Health Information Technology, to the National Coordinator for Health Information Technology—Department of Health and Human Services, April 28, 2008, p. 15.

services. It should be noted that the *labor productivity* of the healthcare services industry has been highly resistant to *automation*. Accordingly, *technological advancements* in the healthcare industry have failed, to date, to produce the *large shifts* in the *productivity curve* typically associated with innovation, as demonstrated in other industries (e.g., the creation of the automobile assembly line allowed higher output/productivity levels to be achieved, while simultaneously requiring lower amounts of labor hours).[30] The relegation of healthcare services to that of a *mass assemblage factory* is unlikely, at best, due to the *complexity* and *variability* in the types of

Computerized Physician Order Entry

A computer system that permits clinical providers to electronically order laboratory, pharmacy, and radiology services.

"Electronic Health Records Overview," National Institute of Health: National Center for Research Resources, April 2006, p. 7.

[30]The general level of output of either goods or services of a particular industry consists of two components: (1) the productive capacity of labor and (2) the amount of hours spent by labor producing output. Furthermore, the productivity of labor is a function of the level of capital employed (both physical capital and human capital), coupled with the ability to use that capital in increasingly efficient ways (also known as technological advancement). Michael Parkin, *Economics*, 8th ed. (Boston: Pearson Addison Wesley, 2008), pp. 559–561.

treatments and *procedures* performed, thereby resulting in an increased demand for a *highly skilled* and *knowledgeable workforce*. This phenomenon of comparatively lower productivity gains in the healthcare services industry is sometimes referred to as the "Baumoll Effect," or "cost disease," as more thoroughly discussed in Section 4.2.2, "Productivity Growth Rates of Healthcare Services," in Chapter 4, "Competition."

15.5 VALUATION OF HEALTHCARE SERVICES

The *fundamental economic facts* or *economic behavior* that will occur under certain conditions form the basis of the *economic laws* governing what will happen objectively in certain *economic situations* (as more fully discussed in Chapter 7, "Basic Valuation Tenets"). Recall that the principle of scarcity influences market participants to assign relative value to goods and services in order to choose between the limited amounts available.[31] Scarcity of goods and services leads to the concept that *economic value* derives from some form of *economic usefulness*, also termed *utility*, which arises from the *benefits* and/or *satisfaction* to be derived from the *use* or ownership of properties and services, the *use* of money in exchange for those properties or services, the *use* or consumption of goods, and the *use* of intangibles for investment purposes.[32]

COMPONENTS OF THE GENERAL LEVEL OF OUTPUT OF EITHER GOODS OR SERVICES OF A PARTICULAR INDUSTRY

The productive capacity of labor (function of the level of capital employed, in other words, both physical capital and human capital, coupled with the ability to use that capital in increasingly efficient ways, that is, for technological advancement) and the amount of hours spent by labor producing output.

Economics, *8th ed., by Michael Parkin (Boston: Pearson, 2008), pp. 559–561.*

[31] Michael Parkin, *Economics*, 8th ed. (Boston: Pearson Addison Wesley, 2008), p. 2.
[32] Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach,* American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987).

The dynamics as to how *economic value* is created in this *use* and *exchange continuum* may be understood within the context of three additional basic principles related to the economic benefits to be derived from the *right to control* the *subject services* to be performed under the *contractual arrangement*. First, the *Principle of Substitution* posits that what normally sets the limit of what would be paid for property is the cost of an *equally desirable substitute* or one of *equal utility*. This principle is the basis for the decision as to whether to "*buy or build*" a product or service. Second, the *Principle of Investment Limits* (and its corollary the *Principle of Diminishing Marginal Utility*) posits that resources are not normally spent in pursuit of diminishing returns from property.[33] Third, and perhaps, most important, the *Principle of Anticipation* posits that the economic benefits of ownership of, or the contractual rights to control, the subject services to be performed under the contractual agreement are created from the *expectation of those benefits or rights* to be derived in the *future*; therefore, all economic value is *forward looking*.[34]

PRINCIPLE OF INVESTMENT LIMITS

A concept stating that resources are not normally spent in pursuit of diminishing returns from property.

PRINCIPLE OF ANTICIPATION

A concept stating that the economic benefits of ownership of, or the contractual rights to control, the subject services to be performed under the contractual agreement are created from the expectation of those benefits or rights to be derived in the future; therefore, all economic value is forward looking.

"Appraisal and Valuation: An Interdisciplinary Approach," *by Richard Rickert, American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987), 3-47.*

[33] Charles F. Kaiser and Amy Henchey "Q. Valuation of Medical Practices," *Internal Revenue Service 1996 Exempt Organizations Continuing Professional Education Text*, 1996.

[34] Richard Rickert, *Appraisal and Valuation: An Interdisciplinary Approach* American Society of Appraisers (Washington, DC: International Valuation Sciences Institute, 1987).

DIMINISHING MARGINAL UTILITY OF INCOME

A concept stating that the more compensation that an individual makes, the less the amount of utility he or she would derive from each successive amount of compensation received.

Principles of Economics, *8th ed., by Alfred Marshall (New York: Macmillan, 1948), pp. 92–96.*

Specifically, the *economic value* analysis for determining FMV should be focused on the *economic benefits reasonably expected to be derived* from the *use* or *utility* of the services *in the future*, bounded by the *cost of an equally desirable substitute*, or one of *equal utility*, for each of the elements of *economic benefit* (or *utility*) to be derived from the *right to control* the services to be performed.

15.5.1 Valuation of Clinical-Related Services

The *economic principles* of *substitution* and *utility* are determinants of the *economic value* that is inherent in *compensation arrangements* related to goods or services, including *clinical related services*, such as those provided by physicians and mid-level providers.

In developing the valuation analysis in regard to *clinical-related services*, the valuation analyst will need to obtain the requisite documents related to the proposed compensation arrangement(s), including:

1. The proposed agreement(s) for *clinical-related services* (including a detailed description of all *tasks*, *duties*, *responsibilities*, *and accountabilities* related to the services to be performed);
2. The time requirements, for example, the *number of hours* or *number of shifts* per week anticipated under the proposed agreement;
3. The *curriculum vitae for* the provider performing the clinical services;
4. *Documentation* as to the *board certification*, *qualifications*, *and tenure* of those providers performing the services;
5. *Medical staff bylaws* and *roster*;
6. *Agreements for other similar positions* at the employer entity, including the *scope of services to be performed* under each of those agreements; and

7. *Documentation* of *historical clinical productivity*, measured in *work RVUs*, *gross charges*, *net revenue*, or *count by CPT code* for an applicable time period to establish a relevant trend for forecasting purposes, typically the last two years or more, depending on the facts and circumstances.

Developing the valuation of the compensation arrangement uses this data to identify and classify the types and the amount of *tasks and duties*, along with the level of r*esponsibility and accountability*, associated with the subject agreement for services. It should be noted that there are a wide variety of compensation arrangements for providing remuneration to providers for the utility derived from their *clinical-related services*. Accordingly, the valuation analysis should include a detailed review of the subject compensation arrangement and each of the elements of the services being provided under the compensation plan being proposed. Two examples of the application of the valuation of clinical-related services can be found online at http://www.wiley.com/go/healthcarevaluation.

15.5.1.1 Types of Compensation Plans for Clinical-Related Services The various types of compensation plans for *clinical-related services* may include, but are not limited to, combinations of the following elements:

1. *Base salary*, that is, equal compensation paid to each physician;
2. *Productivity-based* compensation (e.g., cap compensation and a given productivity percentile by specialty);
3. Compensation based on a *per wRVU* method;
4. *Incentive bonus* based on *productivity*;[35]
5. An *annual stipend* for performance of *administrative services*, for example, medical directorships, departmental management, and oversight;
6. *Incentive payments* based on *achieving quality* of *patient and beneficial outcomes* gauged by agreed-on measures and benchmarks;
7. *Incentive payments* based on *specified legally permissible gainsharing arrangements*, for example, *achieving certain cost savings and efficiencies*; and
8. *Incentive payments* based on the *contributions* and *economic input* of the employed physician(s) to achieve *specified enhancement of the performance of the enterprise*, for example, development of a "Center of

[35] It should be noted the compensation based on productivity (wRVUs), even if not directly tied to an "incentive bonus," may be viewed by the IRS as an "incentive compensation arrangement" as it can vary based on performance (see Section 3.2.2.5, "Prohibition against Excess Benefit Transactions and 'Inurement of Private Benefit'," in Chapter 3, "Regulatory Environment").

Excellence."[36] Two examples of the application of types of compensation plans for clinical related services can be found online at http://www.wiley.com/go/healthcarevaluation.

It should be noted that when considering elements of a compensation arrangement that are *productivity-based*, careful attention should be paid to whether the compensation is based on a (1) *percentage of collections*, (2) *percentage of gross charges*, or (3) *per wRVU basis*. While compensation based on gross charges has the benefit of not being based on the *patient payor mix*, the employer's gross charges may not necessarily be aligned with collections, and the physician's compensation may fluctuate significantly, depending on the employer's increase or decrease in gross charges.[37] However, if compensation is based on an employer's *collections*, there may be a high incentive for physicians to treat patients with higher-paying payors, in contrast to treating Medicaid or indigent patients, which may result in a misalignment with the objectives and stated purpose of the organization.[38] In those compensation arrangements where compensation is based on a *per wRVU basis*, there is the benefit of the compensation being based on the *physician's productivity*, that is, *work effort*, regardless of the employer's *payor mix* or *collection rate*.

In the event that the compensation plan is based on a *per wRVU basis*, special caution should be taken to ensure that the amount of *compensation per wRVU* reflects an amount that is solely related to the production of wRVUs. The production of non-wRVU services may be present and desired by a potential purchaser, for example, medical directorship services and/or profit from ASTC revenue streams; however, these activities are *separate* and *distinct services* from the production of wRVUs, and, therefore, the remuneration for these non-wRVU producing activities should not be disguised as an increased wRVU compensation rate.

Similarly, when a compensation plan proposes paying above the indicated, most probable price set forth by applicable benchmark survey data (even after the *homogenous badges of economic contribution* composing the subject services have been identified and separated from one another), an appropriate justification should be documented, supported, and explained. Recall that the *mean* or *median* compensation metric observed in a survey data population typically sets forth the most probable payment amount for the specific type of service. Those "*special circumstances*" that typically warrant paying above the most probable payment rate for the particular service may include

---

[36] Robert A. Wade, Esq., and Marcie Rose Levine, Esq., *Fair Market Value: Analysis and Tools to Comply With Stark and Anti-Kickback Rules*, audio conference, HC Pro, Inc. (March 19, 2008), p. 61.

[37] Ibid., pp. 13–15.

[38] Ibid., p. 58.

(1) the unique and, accordingly, scarce skill set of the particular provider; (2) additional *tasks*, *duties*, *responsibilities*, and *accountabilities* required of the subject provider, above those of the typical providers in comparable positions, reported in the benchmark survey data; (3) the *quality of the wRVU* generated by a particular provider *is higher* in relation to the wRVUs generated by the providers included in the benchmark survey data; (4) the provider produces a similar quality wRVU but at a lower cost per unit; or (5) other special circumstances regarding the wRVUs produced by a particular provider.

Of note, since the publication of the Tuomey case some legal counsel have interpreted the guidance provided by the various depositions and reports in that case, related to the range of legally permissible physician compensation levels, and some have asserted that the compensation arrangements that propose paying the employed physician an amount above the 75th percentile level of compensation, established by applicable, normative industry benchmarking sources, may fail to meet the regulatory thresholds of *FMV* and *commercial reasonableness* (see Section 3.3.3.9, "Relevant Case Law Interpretations of Fair Market Value and Commercial Reasonableness," both in Chapter 3, "Regulatory Environment").[39] However, as mentioned

SPECIAL CIRCUMSTANCES JUSTIFYING PRODUCTIVITY-BASED COMPENSATION SET ABOVE THE POINT OF CENTRAL TENDENCY

Physicians with unique or scarce abilities, additional responsibilities (above the most probable amount of responsibilities), and other specialized tasks and duties, as compared to the benchmark tasks and duties, may be paid above the most probable amount for a particular set of services, but compensation for unlike services (e.g., comparing clinical services to teaching) should be bifurcated from the specific service under consideration.

Factoid

Benchmarking compensation should be done between homogenous badges of comparability.

[39] *U.S. ex rel. Drakeford v. Tuomey Healthcare System, Inc.*, 3:05–CV–02858–MJP (D.C.S.C), July 13, 2010. It should be noted that this ruling was appealed on March 30, 2012; see *U.S. ex rel. Drakeford v. Tuomey Healthcare System, Inc.*, 675 F.3d 394, 4th Cir.(S.C.), March 30, 2012.

earlier, there may be "*special circumstances*" that warrant paying above the 75th percentile level of compensation.

In addition, compensation plans that include remuneration based on the ability of the provider to produce services at a progressively lower cost per unit can be considered gainsharing arrangements, and the proposed compensation plan may need review by legal counsel to ensure that it meets legal permissibility thresholds. "*Gainsharing*" is defined by CMS to be an arrangement "under which a hospital gives physicians a share of the reduction in the hospital's costs (that is, the hospital's cost savings) attributable in part to the physician's efforts."[40] The most common form of gainsharing arrangement often relates to services furnished within a single clinical specialty.

Historically, gainsharing arrangements have sometimes been found to have violated the Civil Monetary Penalty Statute (prohibiting a hospital from knowingly making a payment directly or indirectly to a physician as an inducement to reduce or limit items or services furnished to Medicare of Medicaid beneficiaries, and a physician from knowingly accepting such payment) and the Anti-Kickback Statute (if one purpose of the cost-savings payment is to influence referrals of federal healthcare program business), despite potential cost-saving benefits of well-structured arrangements.[41] By 2005, however, the OIG began to approve gainsharing arrangements in light of their cost-saving and quality-improving potential. In arrangements it approved, the OIG looked for three types of safeguards: (1) measures that promote accountability and transparency, (2) adequate quality controls, and (3) controls on payments related to referrals.[42]

More recently, in the CY 2009 Physician Fee Schedule Proposed Rule, CMS proposed a new exception to Stark for certain incentive payments to physicians (Pay for Performance) and shared savings programs, including gainsharing arrangements. Despite the CMS's concern that "improperly designed or implemented programs pose [a high risk of program or patient abuse]," and that "additional risk is posed by shared [gainsharing arrangements] that reward physicians based on overall cost savings without accountability for specific cost reduction measures," CMS recognized the fact that "successful programs often result in improved quality outcomes or cost savings (or both) for the hospital sponsoring the program."[43]

[41] Ibid.

[42] Ibid. p. 23693.

[43] *Federal Register* 73 (July 7, 2008): 38548, 38550.

15.5.1.2 Tiered Compensation for Clinical-Related Services Another notable issue regarding *productivity-based compensation plans* relates to paying a *variable rate* based on "*tiered*" structures, for example, paying a specific rate for productivity amounts in a certain range (or tier) and then paying a higher rate for productivity amounts that are in a higher "*tier*." The anticipated response to paying an increased rate for higher provider productivity is increased reimbursement received by the employer of the provider. As mentioned in previous chapters, *economic operating income* has two (2) distinct types of cost burdens associated with its production: an *economic operating cost burden* and an *economic capital cost burden*. Further, the *economic operating cost burden* is split between fixed and variable expenses. As productivity increases, thereby causing an increase in *economic operating income* (which also may be increased by reimbursement yield increases), the *fixed portion* of the *economic operating cost* stays the same, while the *variable portion* increases in an incremental amount proportionate to the amount of increase in productivity; in essence, the revenue produced is done so by a *smaller percentage of economic operating cost*. Since the employer of the provider would benefit from reduced *economic operating costs per unit of productivity*, structuring the compensation plan in "*tiers*" can be construed as a *gainsharing arrangement*. Due to this potential contravening factor, legal counsel should be consulted to ensure that a compensation plan that includes a "*tiered*" structure is in compliance with the various regulatory requirements of the healthcare services industry (which are more fully discussed in Chapter 3, "Regulatory Environment").

It should be noted that from an *economic perspective*, compensation plans that include a "*tiered*" structure methodology may seem to violate the principle that a productivity unit of a healthcare service (e.g., a work RVU) should be treated as a fungible commodity and that each unit should command the same price (as discussed in Section 4.6.3, "Commoditization of Healthcare," in Chapter 4, "Competition"). However, recall that according to the economic principle of the *Diminishing Marginal Utility of Income* (see Section 15.5.1.4.1, "Time"), the more compensation that an individual makes, the less the amount of utility he or she would derive from each successive amount of compensation received.[44] Therefore, the inherent incentive of a *productivity-based* compensation model (i.e., the higher the rate of productivity, the more compensation received) may need to be supplemented with an *additional incentive* (e.g., a higher compensation rate for services provided above a certain threshold amount), in order to induce the service provider to *increase* his or her productivity above a certain rate. Potential

[44] Alfred Marshall, *Principles of Economics*, 8th ed. (New York: Macmillan, 1948), pp. 92–96.

Tiered Productivity–Based Compensation

Paying a specific rate for productivity amounts in a certain range (or tier) and then paying a different rate for productivity amounts that are in a higher tier.

issues associated with the "*tiered*" structure model are in the determination of the productivity "*tiers*," where additional incentives would be warranted to generate sufficient motivation to increase productivity, as well as whether the "*tiers*" should or would change over time.

15.5.1.3 POD Compensation Plan Example Another noteworthy compensation arrangement that may be used by certain physician "*group practices*" is the "*POD compensation model*." While FMV is a requirement for the *compensation-related exceptions* under *Stark*, FMV is *not* a requirement for compensation paid to "*group practices*" under the "*ancillary services exception*," which is one of the *general exceptions* to the *Stark Law*. This is an important distinction, as compensation paid to a "*group practice*" under the "*ancillary services exception*" has fewer regulatory restrictions related to distributing compensation to members of the "*group practice*." (See Section 3.3.2.1, "Stark Law Exceptions," in Chapter 3, "Regulatory Environment.") The *Stark Law* defines a "*group practice*" as:

> *a group of 2 or more physicians legally organized as a partnership, professional corporation, foundation, not-for-profit corporation, faculty practice plan, or similar association—*
>
> i. in which each physician who is a member of the group provides substantially the full range of services which the physician routinely provides . . . [;]
>
> ii. in which substantially all of the services of the physicians who are members of the group are provided through the group and are billed under a billing number assigned to the group . . . [;]
>
> iii. in which the overhead expenses of and the income from the practice are distributed in accordance with methods previously determined[;]
>
> iv. in which no physician who is a member of the group directly or indirectly receives compensation based on the volume or value of referrals by the physician[;]

> v. in which members of the group personally conduct no less than 75 percent of the physician-patient encounters of the group practice [; and]
>
> vi. in which meets such other standards as the Secretary may impose by regulation.[45]

As specified in the regulations promulgated to enforce *Stark*, CMS, stated that a "*group practice*" must be:

> *a* unified business *having at least the following features: (i) Centralized decision-making by a body representative of the group practice that* maintains effective control *over the group's assets and liabilities (including, but not limited to, budgets, compensation, and salaries); and (ii)* Consolidated billing, accounting, and financial reporting. *[Emphasis added]*[46]

The *Stark* regulations related to compensation arrangements within a "*group practice*," which include elements of *profit sharing* among members of the "*group practice*," state,

> *Overall profits should be divided in a reasonable and verifiable manner that is* ***not directly related to the volume or value*** *of the physician's referrals of DHS.[*[47]*]The share of overall profits will be* **deemed** ***not to relate directly to the volume or value of referrals*** *if* ***one*** *of the following conditions is met: (i) The group's profits are divided per capita (for example, per member of the group or per physician in the group). (ii) Revenues derived from DHS are distributed based on the distribution of the group practice's revenues attributed to services that are not DHS payable by any Federal health care program or private payer. (iii) Revenues derived from DHS constitute less than 5 percent of the group practice's total revenues, and the allocated portion of those revenues to each physician in the group practice constitutes 5 percent or less of his or her total compensation from the group. [Emphasis added]*[48]

---

[45] 42 USC §1395nn(h)(4)(A).

[46] 42 CFR §411.352(f)(1).

[47] Defined by the Stark Law as "the group's entire profits derived from DHS payable by Medicare or Medicaid or the profits derived from DHS payable by Medicare or Medicaid of any component of the group practice that consists of at least five physicians." 42 CFR §411.352(h)(2).

[48] 42 CFR §411.352(h)(2).

In addition, the "*overall profits*" of a "*group practice*" may be allocated among "any component of the group practice that consists of at least five physicians," based on several other methodologies (e.g., location, specialty/subspecialty, productivity levels, and so on).[49] This ***subset*** of "*at least five physicians*" of the "*group practice*" has commonly been referred to as "*pools*," "*pools of doctors,*" or, most commonly in the healthcare industry, as "*PODs.*"[50] Significantly, however, while there may be *greater flexibility* in regard to regulatory scrutiny under *Stark* and *Anti-Kickback* related to compensation arrangements with physicians who are members of a

Inurement of Private Benefits

An exempt organization is organized or operated for the benefit of private interests. The IRS has stated that "[n]o part of the net earnings of a section 501(c)(3) organization may inure to the benefit of any private shareholder or individual[, whereby] a private shareholder or individual is a person having a personal and private interest in the activities of the organization."

"Inurement/Private Benefit—Charitable Organizations," Internal Revenue Services, February 2, 2012, http://www.irs.gov/charities/charitable/article/0,,id=123297,00.html (accessed August 7, 2012); "Exemption from Tax on Corporations, Certain Trusts, etc.," 26 USC §501(c)(3) (2012).

[49] Ibid.; Alice G. Gosfield, *Medicare and Medicaid Fraud and Abuse*, 2012 Edition (St. Paul, MN: West, 2012) p. §3:9.; Alice G. Gosfield, Esq., "Physician Compensation: Stark and the New Quality, Value Environment," *Compliance Today*, Health Care Compliance Association, September 2012, pp. 24–29.

[50] American Medical Association, "The Stark Law Rules of the Road" (2011), p. 30; Peter R. Kongstvedt, *Essentials of Managed Health Care*, 6th ed. (Burlington, MA: Jones & Bartlett Learning, 2013), p. 665. Alice G. Gosfield, Esq., "Physician Compensation: Stark and the New Quality, Value Environment," *Compliance Today*, Health Care Compliance Association, September 2012, pp. 24–29. For the purposes of this book, the utilization of the acronym "POD" refers to the distribution of overall profits of a group practice to a subset of at least five physicians of the group practice, as set forth in the Stark Law (see 42 CFR §411.352[h][2]). It should be noted that the acronym "POD" is also used to describe "Physician Owned Distributors," which refers to physicians who have an ownership interest in a medical device entity that provides medical devices to their physician practice. For more information regarding the recent scrutiny of "Physician Owned Distributors," see the June 2011 Inquiry by the Senate Finance Committee Minority Staff on the subject.

"*POD*," those "*PODs*" that distribute compensation derived from a *tax-exempt organization* must nevertheless also comply with the I.R.C. 501(c)(3) requirements related to the prohibitions against *excess benefit transactions* and *inurement of private benefit*, in order to avoid *intermediate sanctions* or a *loss of exempt status*.

A summary example of one type of "*POD*" *compensation structure*, whereby a *Captive Professional Corporation* is formed in order to compensate newly integrated physicians into the "*POD*," is set forth in Exhibit 15.2.

Note that as discussed earlier and set forth in the Stark Law, the "*POD*" *must contain* ***at least five physicians*** in order to share the "*overall profits*" of the "*group practice*" that is the *Captive Professional Corporation* in this example). The professional corporation typically bills for the physicians' professional services, and the reimbursement collected from third-party payors is funneled into a *pool* or *fund* to be distributed among the "*POD*" *physicians*.

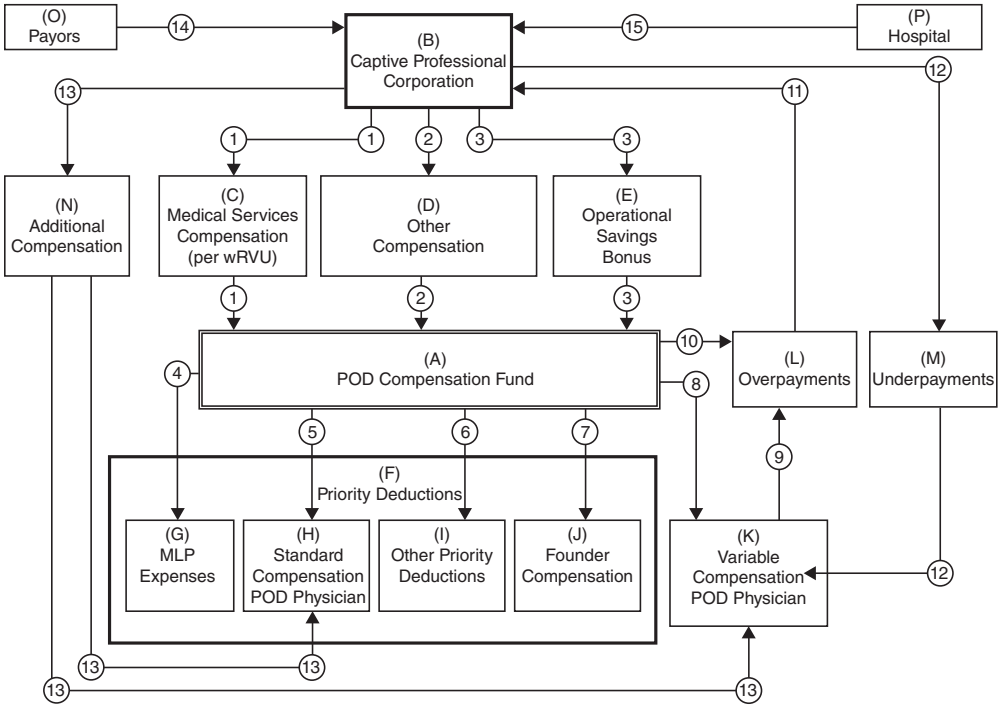

EXHIBIT 15.2 POD Compensation Flow of Funds Schematic

Parties and Entities

(A) **POD Compensation Fund.** POD Compensation for a *Service Period* means the sum of (1) FMV $ per wRVU multiplied by each wRVU that a *POD Physician* generates performing *Patient Services* for the *Captive Professional Corporation* during that *Service Period*, (2) other compensation that the *Captive Professional Corporation* pays to a *POD Physician* (e.g., directorship fees) that a *Physician Employment Agreement* or *other agreement* directs the *Captive Professional Corporation* to pay to the *POD Compensation Fund* related to that *Service Period*, and (3) a *Savings Bonus* with respect to that *Service Period*.

(B) **The Captive Professional Corporation.**

(C) **Medical Services** are reimbursed at the FMV $ per wRVU for each wRVU that a *POD Physician* generates performing *Medical Services* for the *Captive Professional Corporation* during the *Service Period*.

(D) **Other compensation** that the *Captive Professional Corporation* pays to a *POD Physician* (e.g., directorship fees) that a *Physician Employment Agreement* or *other agreement* directs the *Captive Professional Corporation* to pay to the *POD Compensation Fund* related to that *Service Period*.

(E) **Medical Practice Operational Savings Bonus.** For example, the *Captive Professional Corporation* shall pay to the *POD Compensation Fund* an annual bonus of 50 percent of the operational savings of the *POD* from the annual costs of the *POD* prior to the *Effective Date*.

(F) **Other payment** the *Captive Professional Corporation* is obligated to pay a *POD Physician* that pursuant to the *Physician Employment Agreement* with that *POD Physician* is to be deducted from the *POD Compensation Fund*.

(G) **"MLP Expenses" for a Service Period** means the expenses the *Captive Professional Corporation* incurs related to that *Service Period* that generated *compensable wRVUs* for a *POD Physician* arising from the *Captive Professional Corporation's* billing (at the direction of a POD Physician) of the *midlevel provider's services* on an *incident-to basis*.

(H) **The Standard-Compensated POD Physicians will be paid their *fixed compensation* for that *Service Period*.** This compensation is paid out of the *POD Compensation Fund* prior to the *Variably Compensated POD Physician* compensation.

(I) Any other priority deductions the *Captive Professional Corporation* is obligated to pay a *POD Physician* that is to be deducted from the *POD Compensation Fund*

(J) **Founder Compensation** is the *annual*, *fixed amount* paid to the *identified founder physicians*. This payment is made from the *POD Compensation Fund* as a *Priority Deduction*.

(K) **Each Variably Compensated POD Physician shall be paid out of the *POD Compensation Fund*** his or her "***Actual Variable Compensation***." A *Variably Compensated POD Physician*'s "***Actual Variable Compensation***" for *Services* performed during a *Service Period* shall be equal to the actual amount of the *POD Compensation Fund* minus the *Priority Deductions* for that *Service Period*, and then multiplied by the decimal representing such *Variably Compensated POD Physician's Member Percentage* for that *Service Period*.

(L) If a *Variably Compensated POD Physician's Actual Variable Compensation* for a calendar quarter is less than the aggregate amount of *Estimated Quarterly Variable Physician Compensation* for that calendar quarter, then the *difference* (the "***Overpayment***"), if undisputed, shall be reconciled by:

1. **Offset.** If the *Employment Term* for that *Variably Compensated POD Physician* has not expired or terminated *as of the date* of the reconciliation and the *Estimated Variable Physician Quarterly Compensation* for the succeeding calendar quarter equals, or exceeds, the undisputed *Overpayment*, then the *Estimated Quarterly Variable Physician Compensation* and the Actual Variable Compensation for that *Variably Compensated POD Physician* for the succeeding calendar quarter shall both be decreased by the amount of the undisputed *Overpayment*; or
2. **Repayment.** If the *Employment Term* for that *Variably Compensated POD Physician* has expired or terminated *as of the date* of the reconciliation or the amount of *Estimated Quarterly Variable Physician Compensation* for the succeeding calendar quarter is less than the undisputed *Overpayment*, then that *Variably Compensated POD Physician* shall pay the *Captive Professional Corporation* the amount of the *Overpayment* (adjusted to reflect prior withholding) within ten (10) days after the *Captive Professional Corporation* delivers notice to that *Variably Compensated POD Physician* identifying the undisputed *Overpayment* and the undisputed adjustments.

(M) In the event that the advancements paid to the Variable Compensation POD Physician are less than the Actual Variable Compensation for that period, the Capitve Professional Corporation shall pay difference to the Variable Compensation POD Physician

(N) **Additional Compensation for Outreach, Administrative Duties, Teaching, and Research.** For specific circumstances, a *Voting Super-Majority of the Captive Professional Corporation Board* may award additional compensation in the form of wRVUs, or otherwise, to the *Physician* for *outreach, administrative duties, teaching, and research* performed for the

Captive Professional Corporation, at the *Captive Professional Corporation's* request, that have a material adverse effect on the *Physician's* ability to provide *Patient Services*. The *additional wRVUs* shall reflect the amount of *time, effort, and lost wRVU-generating opportunities* associated with the provision of these other services.

(O) **Payors pay the Captive Professional Corporation** for the *professional component* of medical services provided by the *POD Physicians*.

(P) **The Hospital will provide support payments** to the *Captive Professional Corporation*, in the event that the *Captive Professional Corporation* is *insolvent*. *Hospital* will also provide the *funds necessary* to *purchase other assets* (tangible or intangible) owned by the *Physician's practice*.

Flow of Funds

1. The Captive Professional Corporation will pay into the POD Compensation Fund for Medical Services performed by POD Physicians at a rate of FMV $ per wRVU for wRVUs generated by a POD Physician.
2. At the election of the POD Physician, other compensation that the Hospital or the Captive Professional Corporation is obligated to pay to a POD Physician (e.g., directorship fees) related to that Service Period will be paid by the Captive Professional Corporation into the POD Compensation Fund.
3. The Captive Professional Corporation will pay into the POD Compensation Fund the Operational Savings Bonus.
4. In each Service Period, the Captive Professional Corporation shall pay midlevel provider expenses related to incident-to billing supervised by a POD Physician.
5. In each Service Period, the Captive Professional Corporation shall pay the prorated portion of the annual compensation of the Standard-Compensated POD Physician.
6. Other payment the Captive Professional Corporation is obligated to pay a POD Physician that is to be deducted from the POD Compensation Fund.
7. In each Service Period, the Captive Professional Corporation shall pay the Founder Compensation applicable to the Service Period.
8. The Variably Compensated POD Physicians will be paid their estimated quarterly variable compensation out of the POD. This compensation is paid after the MLP Expenses, the Standard-Compensated POD Physicians and other payment the Captive Professional Corporation is obligated to pay a POD Physician. It is a residual payment.
9. If an Overpayment results from the estimated quarterly variable compensation, the Variably Compensated POD Physician can make a direct payment to the Captive Professional Corporation.

10. If an Overpayment results from the estimated quarterly variable compensation, the Variably Compensated POD Physician can offset the overpayment with a reduction in the flow of funds to the POD Compensation Fund.
11. The Captive Professional Corporation will receive the overpayments.
12. The Captive Professional Corporation will pay the Variably Compensated POD Physician for underpayments resulting from the estimated quarterly variable compensation.
13. The Captive Professional Corporation can pay additional compensation to a physician based on a super-majority vote of the Board of Directors.
14. Payors pay the Captive Professional Corporation for the professional component of medical services provided by the POD Physicians.
15. The Hospital will provide support payments to the Captive Professional Corporation in the event that the Captive Professional Corporation is insolvent. The Hospital will also provide the funds necessary to purchase other assets (tangible or intangible) owned by the physician's practice.

Regardless of the type of compensation plan being used, compensation for *clinical-related services* will vary, based on (1) *the provider's specialty,* (2) *the method of valuing productivity* (e.g., percentage of collections, percentage of gross charges, or per RVU), (3) the *hourly rate* (if applicable), and (4) *full-time equivalency* (FTE) status.

Once the requisite documents and information have been gathered, and the proposed compensation arrangement has been specified, consideration of the *most probable* remuneration for the services provided should include an analysis of the pertinent *value drivers*, that is, the underlying elements of *clinical productivity.*

15.5.1.4 Value Drivers of Clinical Productivity The value of services rendered should consider the four provider-specific *drivers of clinical productivity*, that is, (1) *time*, (2) *efficiency*, (3) *volume*, and (4) *quality performance*, which are used in the benchmarking process, either in comparison to internal sources or outside industry normative data, in developing the FMV analysis.[51]

15.5.1.4.1 Time The amount of *time* a provider dedicates to clinical activity will work to establish the *bounds* of that provider's *volume* of clinical productivity. In so much as in accordance with the *Principle of*

[51] Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies*, Medical Group Management Association, 2006.

VALUE DRIVERS OF CLINICAL PRODUCTIVITY

The value of services rendered should consider the four practitioner-specific drivers of clinical productivity: time, efficiency, volume, and quality performance, which are particularly useful benchmarks when determining FMV.

Physician Compensation Plans: State-of-the-Art Strategies*, by Bruce A. Johnson and Deborah Walker Keegan, Medical Group Management Association, 2006.*

Substitution, the provider has a finite limitation on both the number of hours and the volume of *clinical-related services* per hour he or she can provide. As typically much of *external benchmarking* for clinical productivity is performed using *normative industry data*, on the basis of a *full-time equivalent* "*norm*," regardless of what other *measures* of *work* and *effort* are taken into consideration when establishing a method of compensation, the *amount of time* worked will, inevitably, affect how a provider is compensated.[52] However, a growing emphasis is being placed on *academic*, *administrative*, *executive*, *volunteer,* and *other nonclinical activities* in measuring a provider's performance and compensating providers for the work performed.[53] Because *time* is a *depleting resource*, the amount of time contributed to these various other tasks directly affects the amount of time available for clinical activities. Further, the *Principle of Diminishing Marginal Utility of Income* (a corollary of the *Principle of Investment Limits*) provides the conceptual framework that physicians and other clinical providers, as the sellers of services, will perceive a *diminishing level of value* for the units of time expended performing *clinical-related services*,

[52] M. Catherine Higgins and Theresa M. Raczak, "Designing an Effective Physician Compensation Program," in Kenneth M. Hekman, *Physician Compensation: Models for Aligning Financial Goals and Incentives* (Dubuque, IA: Kendall/ Hunt Publishing Company , 2000), p. 86.

[53] Daniel K. Zismer and David A. Kaplan, "The Effects of Consolidation on Physician Compensation: Expectations and Future Challenges," in Daniel K. Zismer, *Physician Compensation Arrangements* (Gaithersburg, MD: Aspen Publishers, 1999), pp. 6–8; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies* (Englewood, CO: Medical Group Management Association, 2006), pp. 114–115.

beyond that horizon that *separates* the perceived utility derived from the financial gain of performing additional clinical productivity from the perceived utility to be gained from the time expended on other pursuits, for example, family or leisure activities.

15.5.1.4.2 Efficiency The *level of efficiency* in providing clinical services will also contribute to a provider's *level of productivity* and, accordingly, her level of compensation, that is, the amount of time spent performing clinical tasks is not the only factor in determining the *total amount of clinical throughput*—the *volume produced per unit of time* should also be taken into consideration.[54] Variances in the *level of provider efficiency* typically account for *differences in total volume* once adjustments for the incongruity introduced by *nonclinical time worked*, as well as for the variability introduced by *less hours worked by part-time providers*, have been accounted for. The valuation analyst should also consider the implications of the *degree/type* of *provider specialization*, as well as the degree of difficulty and/or type of work that each specialty entails, when comparing and contrasting the services performed by various providers.[55] In addition to *time*, the provider's level of experience may also have a positive or negative impact on his or her efficiency, which would affect the volume of clinical productivity produced, for example, wRVUs.[56]

15.5.1.4.3 Volume *Volume*, that is, the amount of clinical productivity possible, may be limited by the *time* spent on *nonclinical activities*, in a

[54] Paul M. Schyve, MD, "The Joint Commission's Perspective," in Stephen C. Schoenbaum, *Measuring Clinical Care: A Guide for Physician Executives* (Tampa, FL: American College of Physician Executives, 1995), p. 57; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies* (Englewood, CO: Medical Group Management Association, 2006), pp. 114–115.

[55] J. Gray Tuttle, "Fee-for-Service Models," in Kenneth M. Hekman, *Physician Compensation: Models for Aligning Financial Goals and Incentives* (Dubuque, IA: Kendall/Hunt Publishing Company, 2000), pp. 49–50; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies* (Englewood, CO: Medical Group Management Association, 2006), pp. 114–115.

[56] Norman (Chip) Harbaugh Jr., "Pay for Performance: Quality- and Value-Based Reimbursement," *Pediatric Clinics of North America* 56, no. 4 (2009): 997–998; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies* (Englewood, CO: Medical Group Management Association, 2006), pp. 114–115.

manner similar to that of *time* and *efficiency*. Therefore, the extent to which *volume* of clinical production is limited should be taken into consideration when calculating *productivity*. Also, as with *efficiency*, the *specialization* of the provider will likely have an impact on the *volume* of patient throughput, as more complex areas of practice will require more *time* and therefore may appear on their face less "*efficient*."[57]

15.5.1.4.4 Quality The fourth—and final—*value driver of clinical productivity* is the *quality of care* administered to a patient. *Quality metrics* are playing an increasingly important role in measuring a provider's performance for purposes of determining FMV compensation.[58] The rise in the importance of the *quality metric* as a *value driver of clinical productivity* is manifested in the movement toward *value-based reimbursement* (*VBR*), set forth in the provisions of the recently enacted ACA. This new paradigm of healthcare value metrics, that is, *value equals cost plus quality*, is a foundation of current healthcare reform efforts (for more information regarding *quality metrics* having an increased impact on compensation for healthcare services, see Section 2.7, "Emerging Reimbursement Trends and the Impact of Healthcare Reform," in Chapter 2, "Reimbursement Environment," and for more information regarding the quality initiatives included in the recent efforts for healthcare reform, see Section 6.7, "Conclusion: Future of U.S. Healthcare Delivery in an Era of Reform," in Chapter 6, "Healthcare Reform").

15.5.1.5 Importance of Including Benefits in Compensation Analysis Another component of a compensation plan that should be considered by the valuation analyst when assessing the FMV of the *total compensation* to be paid for a particular set of healthcare services is the amount of *benefits* included within the *total compensation arrangement*. As set forth in the definitions of the Stark Law, *any remuneration*, whether in *cash* or *in kind*, is considered

---

[57] Daniel K. Zismer, "The Broad Perspective—Physician Compensation Issues across Different Practice Settings," in Daniel K. Zismer, *Physician Compensation Arrangements* (Gaithersburg, MD: Aspen Publishers, 1999), pp. 20–21; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies* (Englewood, CO: Medical Group Management Association, 2006), pp. 114–115.

[58] Norman (Chip) Harbaugh Jr., "Pay for Performance: Quality- and Value-Based Reimbursement," *Pediatric Clinics of North America* 56, no. 4 (2009): 997–998; Bruce A. Johnson and Deborah Walker Keegan, "Measuring Physician Work and Effort," in *Physician Compensation Plans: State-of-the-Art Strategies* (Englewood, CO: Medical Group Management Association, 2006), pp. 114–115.

to be *compensation* for the purpose of determining *FMV* and *commercial reasonableness*.[59]

Types of *benefit*s that are often part of a compensation arrangement include (1) *contributions to retirement plans*, (2) *payment* of *automobile expenses*, (3) *compensation* for *continuing medical education*, (4) *reimbursement* for *business-related travel and entertainment*, and (5) *payment of malpractice insurance coverage*. The valuation analyst should compare the *level of benefits* in the compensation package to those of *applicable*, normative benchmark industry survey data, and if the *amount of benefits to be provided* is *significantly above* those reported by the benchmark surveys, an *adjustment* should be made to add the *excess benefit amount* as *cash compensation* being paid to the *provider*. Note that in this event, the excess benefit amounts have the potential to cause the *level of cash compensation* to *exceed* either the threshold of *FMV* or *commercial reasonableness*. One often overlooked benefit that should be considered in the determination of *FMV* and *commercial reasonableness* of a compensation arrangement is the payment of not only malpractice insurance coverage by the purchaser of the subject services, but the agreement that would require the employer to be liable for *prior claims* from services rendered by the physician during the malpractice insurance premium period from previous employment, referred to as "*prior acts coverage*."

The *economic cost burden* (i.e., the *insurance premium*) related to *prior acts professional liability insurance coverage* (commonly referred to as "*nose*" *coverage*) is most often *incurred* (paid) in a *subsequent period* from which the *reimbursement* for the *provision* of the given medical service (i.e., the *malpractice expense component* of the *total Relative Value Unit*) is realized. As such, there may be an *economic revenue/expense mismatch* between the *premium cost* associated with the coverage and the *reimbursement* received for the services rendered. The *economic cost burden* associated with *malpractice claims* that may be brought against a provider in the *future* for *services rendered after his current employment has terminated* is referred to as *tail risk*. *Occurrence malpractice insurance* coverage protects against *tail risk*; however, "*claims made*" *policies* cover the provider from the risk of malpractice lawsuits *only during the coverage period*. Therefore, a provider with *claims made insurance*, who becomes an employee of another provider, may have *liability risk* from *prior acts* that would require an additional *nose coverage* policy.

Since *payment of prior acts insurance coverage* by an outside party would relieve the provider from incurring the *cost burden* associated with

[59] 42 CFR §411.351.

Tail/Nose Coverage

Professional liability insurance coverage related to future services rendered after employment has terminated, or covering prior acts, respectively.

protecting against the legal liability of malpractice claims from *prior acts*, for which underlying service he was already paid for by the malpractice RVU, it should be classified as an *economic benefit accruing to the physician* and, as such, should be included in the amount of *total compensation* received when determining whether the total consideration paid to the provider is within the range of *FMV* and is *commercially reasonable*. Several of the significant differences between *nose coverage* and *tail coverage* are set forth in Table 15.3.

15.5.1.6 Clinical-Related Services Compensation Benchmarking Once the four *value drivers of clinical productivity* have been assessed (see Section 15.5.1.2, "Tiered Compensation for Clinical-Related Services," for further discussion of the *value drivers of clinical productivity*, that is, *time*, *efficiency*, *volume*,

and quality), the proposed compensation arrangement (including the level of benefits to be included) should be compared to applicable, normative benchmark industry sources reflecting similar TDRAs, in order to determine whether the compensation arrangement meets the regulatory thresholds of FMV and commercial reasonableness. This "*benchmarking analysis*" should include the following steps to ensure that the most relevant external benchmarking data is used for comparison purposes:[60]

1. Determination of the arrangement specific characteristics, including, but not necessarily limited to,
   a. Specialty/subspecialty of the provider;
   b. Applicable job training and education level of the provider, relevant to the position;
   c. Amount of experience of the provider;
   d. Site of service (e.g., hospital-based practice, office-based practice, etc.);
   e. Geographic location where the subject services are to be provided; and
   f. Nature of the revenue stream that produces the income available for *clinical-related services* compensation (e.g., determination of whether ancillary services and technical component (ASTC) data is included/excluded in the subject services, determination of whether Nonphysician Provider data is included/excluded in the subject services, etc.).
2. Establish the *homogenous units of economic contribution* to be used as the *metric(s) of comparability*, which may include the following:
   a. Productivity components, for example, charges, collections, RVU, and so on; and/or
   b. Time components, such as annual, monthly, hourly, full-time equivalent, and so on.
3. Development of the range of applicable, normative benchmark industry data, which should include *measures within the range*, (e.g., 10th percentile, 25th percentile, 75th percentile, 90th percentile, etc.), as well as *measures of central tendency*, (e.g., mean, median, etc.) and *measures of dispersion* (e.g., standard deviation). The *range of normative benchmark industry data* is typically compiled by taking a weighted average of the selected external benchmark data sources that report the specified *metric(s) of comparability.* The percentage of consideration assigned to each data source used to compile the *range of normative benchmark*

[60] Robert A. Wade, Esq., and Marcie Rose Levine, Esq., *Fair Market Value: Analysis and Tools to Comply with Stark and Anti-Kickback Rules*, audio conference, HC Pro, Inc. (March 19, 2008), p. 55.

industry data should include contemplation of the following statistical and descriptive survey characteristics:

a. *Size* of the data population sample included in the external benchmark survey;

b. *Dispersion* of the data; it should be noted that a useful metric for comparing the relative dispersion between data sets for the purposes of determining an applicable weight of consideration in calculating a range of applicable, normative benchmark industry data is the *coefficient of variation* (calculated as the sample set mean divided by the sample set standard deviation);

c. *Geographic proximity* in relation to the area in which the subject services will be provided; and

d. Other elements of comparability between the external benchmark data sources and the subject services (e.g., whether the external benchmark data source includes information specific to the specialty/subspecialty of the provider, the date the external benchmark data was compiled in relation to the valuation as of date, etc.).

A listing of typical compensation surveys used for benchmarking *clinical-related services* compensation can be found in Table 15.4. An example of the application of clinical-related services compensation benchmarking can be found online at http://www.wiley.com/go/healthcarevaluation.

While normative benchmark industry survey data can be used to establish FMV compensation rates, further analysis should be performed in order to meet the related threshold of *commercial reasonableness*. Typically, the following factors outlined by the IRS serve as a guide in determining whether compensation for *clinical-related services* is commercially reasonable:[61]

1. The specialized training, reputation, and experience of the provider of the services;
2. The nature of duties performed and the amount of responsibility;
3. Actual time spent performing tasks and duties;
4. Size of the organization;
5. The level of interdependence between an organization and the performance of the subject services that enable the organization to fulfill its mission and/or obtain stated goals;
6. National and local economic conditions;

[61] Daniel K. Zismer, *Physician Compensation Arrangements*, (Gaithersburg, MD: Aspen Publishers, 1999), p. 204; Charles F. Kaiser, Phyllis D. Haney, and T. J. Sullivan, "Integrated Delivery Systems and Joint Venture Dissolutions Update," *1995 EO CPE Text*, Internal Revenue Service, 1995.

7. Time of year when compensation is determined;
8. Whether compensation is in part or in whole payment for services provided; and
9. Compensation ranges for equally qualified providers.

These factors set the foundation for whether the purchaser of healthcare services is entering into a transaction exhibiting sound business judgment in light of the organization's size, its mission, the number of patients treated, and the medical needs of those patients.[62]

[62] *U.S. v. SCCI Hospital Ventures, Inc.*: Plaintiff U.S., Designation of Expert Witness, Civil Action No. H-99-1031 (July 12, 2005).

Another element of the transaction that should be considered in regard to the *commercial reasonableness* of the compensation arrangement is whether the purchaser could have obtained the same services from nonreferral providers at a less expensive rate or under more favorable terms (for more information pertaining to the commercial reasonableness threshold, see Section 15.3.2, "Commercial Reasonableness," and also Section 3.3.3.8, "Commercial Reasonableness as Defined by Fraud and Abuse Laws," in Chapter 3, "Regulatory Environment").

15.5.1.7 Valuation of Physician On-Call Services Similar to the valuation of other *clinical-related services*, the *economic value* analysis for determining FMV for *physician on-call services* should be focused on the *economic benefits* reasonably expected to be derived from the *use* or *utility* of the services *in the future*, bounded by the *cost* of an *equally desirable substitute*, or one of *equal utility*, for *each of the elements* of *economic benefit* (or *utility*) to be derived from the *right to control* the services to be performed.

As set forth in the May 2009 Advisory Opinion by the Office of the Inspector General, compensation for *physician on-call services* should be based on *services actually rendered.*[63] Furthermore, reliance on the physician's "lost opportunity cost" as the sole basis for determining *physician on-call services* compensation may not be considered an efficacious methodology for determining whether a compensation arrangement meets the regulatory thresholds of FMV and commercial reasonableness (for further discussion of the regulatory scrutiny of compensation arrangements related to *physician on-call services*, see Section 3.3.3.9.8, "OIG Guidance Regarding Coverage and Call Compensation," in Chapter 3, "Regulatory Environment").

In developing the valuation analysis related to *physician on-call services,* the valuation analyst will need to obtain the requisite documents related to the proposed compensation arrangement(s), including:

1. **The proposed agreement(s)** for on-call services (including a detailed description of all TDRAs related to the services to be performed);
2. **The time requirements**, for example, the *number of hours* or *number of shifts* per week anticipated under the proposed agreement;
3. **Number of times** the current (specialty specific) on-call physician was (a) *paged* and (b) *required to be present* at the hospital for the last two years;
4. **The curriculum vitae for the physician** performing the on-call services;

[63] "OIG Advisory Opinion No. 09-05," May 14, 2009, p. 9.

5. **Documentation** as to the *board certification*, *qualifications*, and *tenure* of those providers performing *on-call services* under similar agreements;
6. **Medical staff bylaws** and roster;
7. **Agreements for other similar positions** at the employer entity, including the *scope of services* to be performed under each of those agreements;
8. **Size of the employer**, *number of patients*, *acuity levels of patients*, and the *specific needs* related to the organization; and
9. **Documentation of historical clinical productivity**, measured in *wRVUs*, *gross charges*, *net revenue*, or *count by CPT code* for an applicable time period to establish a relevant trend for forecasting purposes, typically the last two years or more, depending on the facts and circumstances.

Developing the valuation analysis of the compensation arrangement uses this data and to identify and classify the types and amount of tasks and duties, along with the level of responsibility and accountability, associated with the subject agreement for services.

15.5.1.7.1 Physician On-Call Compensation Benchmarking Similar to *clinical-related services*, once the TDRAs for the *physician on-call services* to be provided are established, the proposed compensation arrangement should be compared to applicable, external benchmarking sources reflecting similar TDRAs, in order to assess whether the compensation arrangement meets the regulatory thresholds of FMV and commercial reasonableness. This "*benchmarking analysis*" for *physician on-call services* should include the following steps to ensure the most relevant external benchmarking data is used for comparison purposes:

1. Determine the arrangement specific characteristics, including but not necessarily limited to,
   a. Specialty/subspecialty of the provider;
   b. Applicable job training and education level of the provider, relevant to the position;
   c. Number of years of experience and reputation of the provider;
   d. Site of service (e.g., hospital emergency department, hospital obstetrical department, etc.); and
   e. Geographic location where the subject services are to be provided;
2. Establish the *homogenous units of economic contribution* to be used as the *metric(s) of comparability.* Typically, compensation arrangements for *on-call services* are based on time metrics, such as annual, monthly, hourly, and so on; and
3. Develop the range of applicable, normative benchmark industry data, which should include *measures within the range* (e.g., 10th percentile,

25th percentile, 75th percentile, 90th percentile, etc.), as well as *measures of central tendency* (e.g., mean, median, etc.) and *measures of dispersion* (e.g., standard deviation). The *range of normative benchmark industry data* is typically compiled by taking a weighted average of the selected external benchmark data sources that report the specified *metric(s) of comparability.* The percentage of consideration assigned to each data source, used to compile the *range of normative benchmark industry data*, should include contemplation of the following statistical and descriptive survey characteristics:

a. **Size** of the data population sample included in the external benchmark survey;
b. **Dispersion** of the data; it should be noted that a useful metric for comparing the relative dispersion between data sets for the purposes of determining an applicable weight of consideration in calculating a range of applicable, normative benchmark industry data is the *coefficient of variation* (calculated as the sample set mean divided by the sample set standard deviation);
c. **Geographic proximity** in relation to the area in which the subject services will be provided; and
d. **Other areas of comparability** between the external benchmark data source and the subject services (e.g., whether the external benchmark data source includes elements of compensation not present in the subject *on-call services*, the date the external benchmark data was compiled, etc.). An example of the application of physician on-call compensation benchmarking can be found online at http://www.wiley.com/go/healthcarevaluation.

As alluded to earlier, it should be noted that some compensation arrangements for *on-call services* allow the physician to be compensated for the *on-call services* provided, as well as to *bill and collect for* the *professional clinical services provided* while "*on-call*." Other compensation arrangements for *on-call services* compensate the physician *only* for the *on-call services component*, while the *entity location bills and collects for the professional services*. This may be particularly true of *hospital-employed physicians* (e.g., *radiologists*, *anesthesiologists*, *pathologists*, *emergency room department providers*, and *hospitalists*) who do not receive compensation based on a productivity formula. Because some industry benchmark survey data reports compensation levels based on the ability of the physician *to bill and collect* for his or her professional services while performing *on-call services*, adjustments may be necessary to the benchmark data when comparing on-call arrangements where the physician is not entitled to collect for the professional services provided.

Salary Profile Report	American Association of Physician Assistants
Survey of Exempt and Nonexempt On-Call Pay Practices	N.E. Fried & Associates

Table 15.5 sets forth various industry benchmark sources that may be used to determine FMV compensation for *physician on-call services*.

While normative benchmark industry survey data can be used to establish FMV compensation rates, further analysis should be performed in order to meet the related threshold of *commercial reasonableness*. Additional elements that should be considered when determining whether an arrangement meets the threshold of *commercial reasonableness* are set forth in Section 15.3.2, "Commercial Reasonableness," and are also in Section 3.3.3.8, "Commercial Reasonableness as Defined by Fraud and Abuse Laws," in Chapter 3, "Regulatory Environment."

15.5.2 Valuation of Nonclinical-Related Services

The economic value analysis for determining the *FMV* of *administrative*, *management*, *and executive services* is governed by the *economic principles* of *Utility* and *Substitution*.

Similar to compensation arrangements that include *physician on-call services*, in the past, compensation for *administrative*, *management*, *and executive services* performed by physicians may have been based on the physician's *historical clinical practice earnings*.[64] However, there is increasing concern that compensating physician administrators based on a lost "*opportunity cost*" may not meet regulatory scrutiny under the *Stark Law* and rather should be based on the *actual services performed* (for further information regarding the implications of the fraud and abuse laws, including recent case law regarding the legal permissibility of

[64] Peter R. Kongstvedt, MD, *The Managed Health Care Handbook*, 3rd ed. (Gaithersburg, MD: Aspen Publishers, 1996), p. 159.

OPPORTUNITY COST

The cost of acquiring an asset (i.e., accepting an employment position) measured by the value of an alternate investment that is forgone (i.e., an alternate position).

Black's Law Dictionary, *9th ed., edited by Bryan A. Garner (St. Paul, MN: West, 2009), p. 398.*

compensation for *nonclinical-related services*, see Chapter 3, "Regulatory Environment").[65]

While in most circumstances the *opportunity cost* of a physician provider of *clinical-related services* should not serve as the *sole* basis for determining physician executive compensation for the performance of *administrative*, *management*, *and/or executive services*, it is nevertheless important for the valuation analyst providing an opinion as to the FMV and commercial reasonableness of an *administrative*, *management*, *and/or executive* compensation arrangement to appropriately apply the *economic concepts* found in the *Principle of Substitution* and the *Principle of Utility* in performing the analysis. It should be noted that compensation for *nonclinical-related* services performed by nonphysicians should also be based on the *actual services performed* (which are distinguished by the TDRAs related to each position).

PRINCIPLE OF UTILITY

A concept stating that "An object can have no value unless it has utility."

Principles of Economics, *by Frank W. Taussig (New York: Macmillan, 1918), p. 120.*

[65] Michael W. Paddock, "Beyond Anti-Mark-Up: 'Stand in the Shoes' and Other Practical Implications," Crowell & Moring LLP, February 2008, http://www.crowell.com/documents/Stark-Phase-III_Anti-Markup-Rules_Mike-Paddock.pdf (October 14, 2008); Hanesboone, "Health Law: 2007 Highlights and Reminders for 2008," *Health Care Alert*, 2008, p. 3.

In developing the certified opinion of value related to *nonclinical-related services*, the requisite documents related to the proposed compensation arrangement(s) should be obtained, including:

1. **The proposed agreement(s) for administrative, management, and executive services** (including a detailed description of all *tasks*, *duties*, *responsibilities*, *and accountabilities* related to the services to be performed);
2. **Agreements for other similar positions** at the employer entity, including the *scope of services* to be performed under each of those agreements;
3. **Documentation as to the board certification, qualifications, and tenure** of those individuals performing the services *under similar agreements*;
4. **Documentation of offers** made to *previous* (*or other, current*) *professionals/executives* for similar positions;
5. **Documentation as to the medical staff's need for administrative direction** (based on the scope of the organization's activities, research efforts, community outreach programs, etc.);
6. **Employer's medical staff bylaws and roster**;
7. **Employer's administrative/management/executive agreement(s)**, with *annual hour requirements* and *annual compensation* paid to each professional/executive;
8. **Time sheet records** documenting the *actual time spent* and *actual work performed* by the individual on each administrative function and service subject to the position;
9. **Size of the employer**, *number of patients*, *acuity levels of patients*, and the *specific needs* related to the organization;
10. **Number of committees/meetings** that require the professional/executive's involvement and/or attendance, as well as the average *frequency* and *duration* of each committee/meeting;
11. **Documentation that the employer (at least) annually assesses** the *effectiveness* of the professional/executive in performing the specified *tasks*, *duties, responsibilities, and accountabilities*; and
12. **Description of quality programs**, including *Centers of Excellence* and "*Never Event*" *Committees* that the individual may participate in.[66]

[66] As reported by a May 18, 2006, media release titled "Eliminating Serious, Preventable and Costly Medical Errors—Never Events," CMS, http://www.cms.hhs.gov/apps/media/press/release.asp?Counter=1863 (accessed August 20, 2007). "Never events" are errors in medical care that are clearly identifiable, preventable, and serious in their consequences for patients, thereby indicating a serious problem in the safety and credibility of the healthcare provider. In addition, CMS indicated that such "never events like surgery on the wrong body part or mismatched blood transfusion, cause serious injury or death to beneficiaries, and result in increased costs to the Medicare program to treat the consequences of the error."

Once the requisite documentation is collected, a detailed examination of the *attributes* of the subject *nonclinical position* should be undertaken, with each element of the attributes of the role first *identified* as to their *existence* and then *classified* as to the *specific factors* and *traits* (i.e., the *tasks*, *duties*, *responsibilities*, and *accountabilities*) related to each attribute. This classification would exhibit the means by which the subject services would reasonably be expected to provide *utility* to the hospital contracting for the professional/executive services to be performed *going forward*. An example of the application of the valuation of nonclinical-related services can be found online at http://www.wiley.com/go/healthcarevaluation.

15.5.2.1 Nonclinical-Related Services Compensation Benchmarking After the *administrative*, *management*, *and/or executive* TDRAs to be provided are established, the *proposed compensation arrangement* should be compared to applicable, external benchmarking sources reflecting similar TDRAs, in order to determine whether the compensation arrangement meets the regulatory thresholds of FMV and commercial reasonableness. This "*benchmarking analysis*" for *nonclinical-related services* should include the following steps to ensure that the most relevant external benchmarking data is used for comparison:

1. Determine the arrangement specific characteristics, including but not necessarily limited to:
   a. Applicable job training and education level of the professional/executive that is relevant to the position;
   b. Number of years of experience and reputation of the provider;
   c. Size of the organization (e.g., revenue, number of employees, etc.);
   d. Site of service (e.g., hospital, office-based physician practice, hospital service line, *ambulatory surgery center*, etc.); and
   e. Geographic location where the subject services are to be provided.
2. Establish the *homogenous units of economic contribution* to be used as the *metric(s) of comparability*, for example, annual, monthly, hourly, per employee, per dollar of revenue, and so on.
3. Develop the range of applicable, normative benchmark industry data, which should include *measures within the range*, (e.g., 10th percentile, 25th percentile, 75th percentile, 90th percentile, etc.), as well as *measures of central tendency* (e.g., mean, median, etc.) and *measures of dispersion* (e.g., standard deviation). The *range of normative benchmark industry data* is typically compiled by taking a weighted average of the selected external benchmark data sources that report the specified *metric(s) of comparability*. The percentage of consideration assigned to each data source, used to compile the *range of normative benchmark*

industry data, should include contemplation of the following statistical and descriptive survey characteristics:

a. **Size** of the data population sample included in the external benchmark survey;
b. **Dispersion** of the data; it should be noted that a useful metric for comparing the relative dispersion between data sets for the purposes of determining an applicable weight of consideration in calculating a range of applicable, normative benchmark industry data is the *coefficient of variation* (calculated as the sample set mean divided by the sample set standard deviation);
c. **Geographic proximity** in relation to the area in which the subject services will be provided; and
d. **Other areas of comparability** between the external benchmark data source and the subject services (e.g., whether the external benchmark data source includes/excludes information specific to the subject *nonclinical-related services* position, the date the external benchmark data was compiled, etc.). An example of the application of nonclinical-related services compensation benchmarking can be found online at http://www.wiley.com/go/healthcarevaluation.

Table 15.6 sets forth various industry benchmark sources that may be used to determine FMV compensation for administrative, management, and/or executive services.

As previously discussed, while normative benchmark industry survey data can be used to establish FMV compensation rates, further analysis should be performed in order to meet the related threshold of *commercial reasonableness* (see Section 15.3.2, "Commercial Reasonableness"). Significantly, even though a proposed compensation amount for *administrative*, *management*, *and/or executive services* may be deemed to be within the range of FMV, the related *administrative*, *management*, *and/or executive* TDRAs should be analyzed to determine whether they are duplicate or redundant. *Duplicate* TDRAs are those that are *exactly* the same as TDRAs already being provided to the organization, the presence of which may *not* meet the threshold of being *commercially reasonable*. *Redundant* TDRAs are those that may be *similar* to TDRAs already being provided to the organization, *but may be justified* in those circumstances in which the *size* and *scope* of the organization require that *higher level* of service. Other factors that should be considered when determining whether an arrangement meets the threshold of *commercial reasonableness* are set forth in Section 15.3.2, "Commercial Reasonableness," and are also in Section 3.3.3.8, "Commercial Reasonableness as Defined by Fraud and Abuse Laws," in Chapter 3, "Regulatory Environment."

Factoid

Depending on the size and scope of an organization, redundancy in services may be necessary; however, duplication of exact services is not tolerable.

15.6 CONCLUSION

A certified opinion as to whether the proposed compensation is both within the range of FMV and *commercially reasonable*, prepared by an *independent*, certified valuation professional, working with competent healthcare legal counsel as to the pertinent regulatory thresholds, and supported by adequate due diligence and documentation, will significantly enhance the efforts of healthcare providers to establish a defensible position that the proposed compensation arrangement is in compliance. This is particularly important in the heightened and ever-changing regulatory environment in which healthcare providers operate, with the potential severity of penalties, as well as related business consequences for entering into transactions and arrangements that may subsequently be found to be legally impermissible.

CHAPTER 16

The Threshold of Commercial Reasonableness

For decades, with the enactment of tax code provisions for exempt organizations in 1954 and the enactment of Anti-Kickback Statutes in 1972, the valuation standard of *Fair Market Value* has been an important threshold of regulatory scrutiny of healthcare transactions.[1] Accordingly, valuation professionals have been called to develop appraisals and render opinions as to the *Fair Market Value* of healthcare enterprises, assets, and services.

Beginning in the late 1980s with the promulgation of the *Stark I* laws, a second threshold, referred to as *Commercial Reasonableness*, emerged as a focus of regulatory scrutiny for healthcare transactions, an activity

[1] "Exemption form Tax on Corporations, Certain Trusts, etc.," 26 Code of Federal Regulations 501(s), (1954); "Exclusion of Certain Individuals and Entities from Participation in Medicare and State Health Care Programs," 42 USC 1320a-7 (January 3, 2012).

Fair Market Value

The most probable price that the subject interest should bring if exposed for sale on the open market, as of the valuation date, but exclusive of any element of value arising from the accomplishment or expectation of the sale.

that has recently seen significant growth.[2] Consequently, the development and rendering of *Commercial Reasonableness* opinions are an increasingly important service offered by healthcare valuation professionals. Rendering a *Commercial Reasonableness* opinion requires that a specific set of *core competencies* be mastered by the valuation analyst, *apart from*, but *related to*, the more traditional *knowledge*, *skill set*, and *experience* required in providing the more traditional appraisal activity of rendering *fair market value* opinions related to the appraisal of the *enterprises, assets*, and/or *services* being transacted.

Factoid

Stark I laws were initially enacted in 1989, after the OIG reported that physician-owned clinical labs received 45 percent more lab referrals than clinical labs in general.

CRS Report for Congress: Medicare: Physician Self-Referral, *by Jennifer O'Sullivan, to Members and Committees of Congress, Washington, DC, Congressional Research Service, September 27, 2007, p. 2.*

[2]The *Stark I* laws were promulgated in the *Omnibus Budget Reconciliation Act of 1989* and, at the onset, applied only to physician self-referrals to clinical laboratories. Currently, under *Stark II, Phase IV* there are 35 exceptions that apply to physician referrals for designated health services (DHS). See Section 3.3.2, "Stark Law," in Chapter 3, "Regulatory Environment," for a detailed discussion on the *Stark Law*. Jennifer O'Sullivan, "Medicare: Physician Self-Referral ('Stark I and II')," Congressional Research Service, September 27, 2007, p. 1; "Exclusions from Medicare and Limitations on Medicare Payment," 42 Code of Federal Regulations 411.355-411.357 (October 1, 2012). See Chapter 9, "Costs and Sources of Capital," Chapter 12, "The Valuation of Outpatient Enterprises," and Chapter 13, "The Valuation of Other Healthcare-Related Enterprises," for in-depth discussions on the growth of the healthcare transactions.

16.1 DEFINITION OF COMMERCIAL REASONABLENESS

A healthcare *Commercial Reasonableness* opinion has been likened to an activity more widely known in the *financial community* as a *fairness opinion*. Since the 1985 Delaware Supreme Court Case of *Smith v. Van Gorkom*, valuation professionals have been called on to express *fairness opinions*, which state "a view as to whether the consideration offered in a deal is within the range of what would be considered 'fair.'"[3] The healthcare *Commercial Reasonableness* opinion, which has been an evolving concept during the last two decades, has several similarities to the more traditional financial *fairness opinion*, for example, each contains a description of "the necessary qualifications of persons . . . and, the process . . . [used in] the valuation analysis."[4] However, *fairness opinions*, the content of which is derived from decades of case law and the performance of which is informed by securities statutes, are distinct from the concept of healthcare *Commercial Reasonableness* thresholds, which are informed by the evolving guidance derived from *healthcare-related statutes*, *rules*, and *regulatory pronouncements*, as well as some minimal indications, to date, from pertinent *case law* (see Table 16.1 and Table 16.2).[5]

The Department of Health and Human Services (HHS) has interpreted the term *commercially reasonable* to mean that an arrangement that appears to be "a sensible, prudent business agreement, from the perspective of the

---

[3] *Smith v. Van Gorkom*, 1985 Delaware Lexis 421, Supreme Court of Delaware 488 A.2d 858, January 29, 1985; "Self-Regulatory Organizations: National Association of Securities Dealers, Inc. (n/k/a Financial Industry Regulatory Authority, Inc.): Notice of Filing of Amendment Number 4 and Order Granting Accelerated Approval of Proposed Rule Change as Modified by Amendment Numbers 1, 2, 3, and 4, Relating to Fairness Opinions," *Federal Register* 72 (October 19, 2007): 59318.

[4] Financial Industry Regulatory Authority, "Regulatory Notice 07-54: Fairness Opinions," November 2007, p. 7.

[5] For example, see *Smith v. Van Gorkom*, 1985 Delaware Lexis 421, Supreme Court of Delaware 488 A.2d 858, January 29, 1985; *In re Netsmart Technologies, Inc., Shareholders Litigation*, Court of Chancery of Delaware, 924 A.2d 171, March 14, 2007; *In re Checkfree Corporation Shareholders Litigation*, 2007 Westlaw 3262188, Court of Chancery of Delaware 3193-CC, November 1, 2007; "Regulatory Notice 07-54: Fairness Opinions," Financial Industry Regulatory Authority, November 2007, p. 7. Some limited guidance from case law is given at present (e.g., *U.S. v. SCCI Hospital Houston Central*—see Table 16.2). Further guidance from case law is expected as the regulatory enforcement of the *Commercial Reasonableness* threshold evolves.

Fairness Opinion

A view as to whether the consideration offered in a deal is within the range of what would be considered "fair."

"Self-Regulatory Organizations: National Association of Securities Dealers, Inc. (n/k/a Financial Industry Regulatory Authority, Inc.): Notice of Filing of Amendment Number 4 and Order Granting Accelerated Approval of Proposed Rule Change as Modified by Amendment Numbers 1, 2, 3, and 4, Relating to Fairness Opinions," Federal Register *72 (October 19, 2007): 59318.*

particular parties involved, even in the absence of any potential referrals" is *Commercially Reasonable* (see Section 3.3.6 , "Racketeer Influenced and Corrupt Organizations Act [RICO]," in Chapter 3, "Regulatory Environment").[6]

The *Stark II, Phase II* commentary also suggests that "An arrangement will be considered 'commercially reasonable' in the absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential DHS referrals."[7]

Some guidance in defining *Commercial Reasonableness* may be derived from IRS pronouncements on *reasonable compensation*, including:

1. The *1993 Exempt Organizations Continuing Professional Education* text titled "Reasonable Compensation," which states "reasonable compensation is . . . the amount that would ordinarily be paid for like services by like organizations in like circumstances."[8]
2. Chapter 2, titled "Employees' Pay," of Publication 535, titled *Business Expenses*, which states "reasonable pay is the amount that a similar business would pay for the same or similar services."[9]
3. Section 53.4958-4 of the Internal Revenue Code, containing the federal regulations on "Excess Benefit Transactions," which states, "reasonable

[6] "Medicare and Medicaid Programs: Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," *Federal Register* 63 (January 9, 1998): 1700.

[7] "Medicare Program: Physicians' Referrals to Healthcare Entities with which They Have Financial Relationships (Phase II)," *Federal Register* 69 (March 26, 2004): 16093.

[8] Jean Wright and Jay H. Rotz, "Reasonable Compensation," Exempt Organizations Continuing Professional Education (1993), p. 3, http://www.irs.gov/pub/irs-tege/eotopici93.pdf (accessed September 4, 2012).

[9] Internal Revenue Service, Publication 535—*Business Expenses*, March 4, 2013, p. 6, http://www.irs.gov/pub/irs-pdf/p535.pdf (accessed April 1, 2013).

> compensation [is] . . . the amount that would ordinarily be paid for like services by like enterprises (whether taxable or tax-exempt) under like circumstances."[10]

Excess Benefit Transactions

> As defined by the IRS, an excess benefit transaction is one in which the value of the economic benefit provided exceeds the value of the consideration received for providing the benefit.
>
> *"Excess Benefit Transaction," 26 CFR §53.4958–4(a)(1) (2012).*

While none of the IRS pronouncements that were set forth for addressing *reasonable compensation* specifically address *Commercial Reasonableness* in the healthcare industry, these factors provide indications as to the manner of assessing *Commercial Reasonableness* thresholds in an anticipated healthcare transaction.

Additionally, although there is no single, universally accepted definition for *Commercial Reasonableness*, guidance in defining this threshold may be found in statutory and regulatory sources, including those listed in Table 16.1.

In addition to the *statutory* and *regulatory* sources noted earlier, guidance as to the application of the *Commercial Reasonableness* threshold in healthcare transactions may also be found in relevant case law, including that listed in Table 16.2.

Further guidance as to the healthcare *Commercial Reasonableness* threshold may also be found in other sources, for example, commentary published by the 2006 American Law Institute, to which:

> *Each financial and contractual connection between hospitals and physicians should be scrutinized to ensure that goods or services changing hands are being provided at fair market value, and at* a level no more than necessary for the business purposes of the arrangement.[11] *[Emphasis added]*

---

[10] "Excess Benefit Transaction," 26 CFR Section 53.4958-4(ii) (2012). It should be noted that, in making a determination as to the "reasonableness" of compensation, compensation based on productivity (wRVUs), even if not directly tied to an "incentive bonus," may be viewed by the IRS as an "incentive compensation arrangement" as it can vary based on performance (see Section 3.2.2.5, "Prohibition against Excess Benefit Transactions and 'Inurement of Private Benefit'," in Chapter 3, "Regulatory Environment").

September 27, 2007	OIG Advisory Opinion 07-10	"OIG Advisory Opinion Number 07-10," Office of Inspector General, September 27, 2007, p. 6.	Commercially Reasonable	*"the aggregate services contracted for do not exceed those which are reasonably necessary to accomplish the commercially reasonable business purpose of the services."*

Note: "Commonly referred to as" column obtained from *CRS Report for Congress: Medicare: Physician Self-Referral*, by Jennifer O'Sullivan, to Members and Committees of Congress, Washington, DC, Congressional Research Service, September 27, 2007, pp. 10–11.

TABLE 16.2 Case Law Guidance Related to Commercial Reasonableness

Date	Case Name	Source	Key Points
July 11, 2005	*U.S. ex rel. Kaczmarczyk, et. Al. v. SCCI Hospital Houston Central, et al.*; Designation of Expert Witness Report	"Fair Market Valuation of Medical Director of Program Director Services," by Kathy McNamara, Mayer Hoffman McCann PC, 7/12/05, in *United States ex rel. Kaczmarczyk, et. al. v. SCCI Hospital Houston Central, et al.*	An analyst *"generally considers . . . (1) size of facility, number of patients, patient activity levels, and patient needs; (2) the quality of medical staff; (3) the number of regular committees and meetings; and (4) the quality of management and interdisciplinary coordination"* in determining whether a lessee or purchaser needs medical director services. Lessees or purchasers should *"conduct a regular assessment of the duties performed by the medical director . . . [that make it] clear how effective[ly] the medical director is doing his assigned job and if there is a need for continuing the services."* *"The responsibilities of the medical director should not be part of his/her customary duties as a treating physician nor should they mirror the required responsibilities outlines in the hospital's medical staff bylaws."*
January 4, 2001	*U.S. v. Joseph Campbell, MD*—Motion for Summary Judgment	*US v. Joseph Campbell, MD—Motion for Summary Judgment*, 2011 Lexis 1707, p. 7.	Healthcare entities should monitor employees to ensure they *"actually perform the duties outlined in their contract."*
January 21, 2009	*U.S. ex rel. Ted Kosenske, MD, v. Carlisle HMA, Inc., and Health Managements Associates, Inc.*	*U.S. ex rel. Ted Kosenske, MD, v. Carlisle HMA, Inc., and Health Managements Associates, Inc.*, 07–4616 US District Court 05-cv-02184, January 21, 2009, p. 18.	Healthcare entities should monitor whether the current *"consideration given and received [is paid] under materially different circumstances"* than when the contract was entered.

While s*eparate* and *distinct* from the *regulatory* threshold related to the standard of *Fair Market Value*, the threshold of *Commercial Reasonableness* is *critical* to establish the legal permissibility of a subject healthcare transaction and may be subject to a similar level of scrutiny by the IRS and the OIG. Significantly, the *Commercial Reasonableness* threshold applies (in most cases) to both *discrete elements* (i.e., property interest related to an individual enterprise, asset, or service) and to *all elements,* which comprise the *overall* structure of the *entire* healthcare integration transaction *in the aggregate.* Healthcare valuation professionals seeking guidance for this duality should review (1) the *Stark II, Phase I, Final Rule* commentary, which states that the analyst must provide "evidence that the compensation is comparable to what is ordinarily paid for **an** item or service," and (2) the OIG commentary that states a determination should be made that:

> *(1) "[T]he* **aggregate** *space, equipment, or services contracted for not exceed that which is reasonable to accomplish the commercially reasonable business purpose of the party renting the space or equipment or purchasing the services"*[12] *and if (2) "in the* **aggregate***, the items or services provided by all [employees] exceed the hospital's actual needs (apart from generating business).*"[13] *[Emphasis added]*

Further guidance indicating that above and beyond the *individual transaction elements*, the *entirety* of a *subject transaction* should be reviewed in the *aggregate* (inclusive of *all elements* for which consideration is given), may be found in the *Personal Services* exception of the *Stark Law*, which requires that "The aggregate services contracted for do not exceed those that are reasonable and necessary for the legitimate business purposes of the arrangement(s)."[14]

Commonly referred to as a "*wrap around*" *Commercial Reasonableness* opinion, this type of analysis includes and considers *all elements* of the integration transaction in the *aggregate*, subsequent to the determination that

---

[13] "OIG Supplemental Compliance Program Guidance for Hospitals," *Federal Register* 70 (January 31, 2005): 4866.

[14] "Exclusions from Medicare and Limitations on Medicare Payment," 42 CFR §411.357(d)(1)(iii), (October 1, 2012).

each discrete, individual element of the transaction meets the thresholds of the standard of *Fair Market Value* and *Commercial Reasonableness*. With complex acquisitions involving multiple property interests, a "*wrap around*" *Commercial Reasonableness* analysis provides a foundation on which to establish and defend that the healthcare transaction is legally permissible and will withstand government scrutiny.

16.1.1 Relationship of the Threshold of Commercial Reasonableness to the Standard of Fair Market Value

While the analysis of the threshold of *Commercial Reasonableness* is separate and distinct from the development of a *Fair Market Value* analysis, requiring consideration of different aspects of the property interest included in the transaction, they are *related* thresholds, and the consideration and analysis of one threshold does *not* preclude the analysis of the other threshold. For example, a necessary condition in order for an anticipated transaction to be *Commercially Reasonable* is that each element of that transaction must not exceed *Fair Market Value*. However, even in the event that each element of an anticipated transaction does not exceed *Fair Market Value* and meets that threshold, the anticipated transaction may still *not* be *Commercially Reasonable*, in that it does not meet the remaining analytical hurdles (see Exhibit 16.1). Note that

EXHIBIT 16.1 The Commercial Reasonableness Opinion: Hurdling the Analytical Thresholds

a finding that an enterprise, an asset or a service meets the *Fair Market Value* threshold is not, in and of itself, *sufficient* to establish *Commercial Reasonableness*.

A further distinction between a *Commercial Reasonableness* analysis and the development of a *Fair Market Value* opinion is that the *Commercial Reasonableness* thresholds include consideration of the "value to the entity paying for" the enterprise, assets, or services being transacted, while the *Fair Market Value* opinion requires that a *universe of hypothetical buyers*, *sellers*, *owners*, and *investors* be considered (see Section 16.2.1.2, "Business Purpose," and Section 16.2.1.3, "Necessity of the Property Interest").[15] For example, consider the acquisition of 10 linear accelerators by a purchaser. If the purchaser has need of only 1 linear accelerator, the purchase of 10 linear accelerators, even at a *Fair Market Value* price, would not meet the *necessity of the assets purchased* threshold of the *Commercial Reasonableness* analysis.

16.2 COMMERCIAL REASONABLENESS ANALYSIS

A *Commercial Reasonableness* analysis should contain both a *qualitative* and a *quantitative* analysis of the elements of the anticipated transaction of the subject enterprise, asset, or service. It should be noted that the *qualitative* and *quantitative* factors described next are not intended to be considered in *isolation*; rather, the valuation analyst should consider both the *individual merits* of each factor and the *interaction* between the factors in assessing the *Commercial Reasonableness* of the anticipated transaction. As illustrated in Exhibit 16.1, the thresholds of the *Commercial Reasonableness* analysis are analogous to hurdles that the anticipated transaction must overcome before reaching the finish line, that is, being deemed *Commercially Reasonable*. An example of the application of a commercial reasonableness analysis can be found online at http://www.wiley.com/go/healthcarevaluation.

16.2.1 Qualitative Analysis

A qualitative analysis is undertaken to better understand the facts and circumstances pertinent to the anticipated transaction. A process for analyzing the various *qualitative* factors related to the *Commercial Reasonableness* threshold is illustrated in Exhibit 16.2.

[15] "Medicare and State Health Care Programs: Fraud and Abuse: Clarifications of the Initial OIG Safe Harbor Provisions and Establishment of Additional Safe Harbor Provisions Under the Anti-Kickback Statute," *Federal Register* 64 (November 19, 1999): 63526.

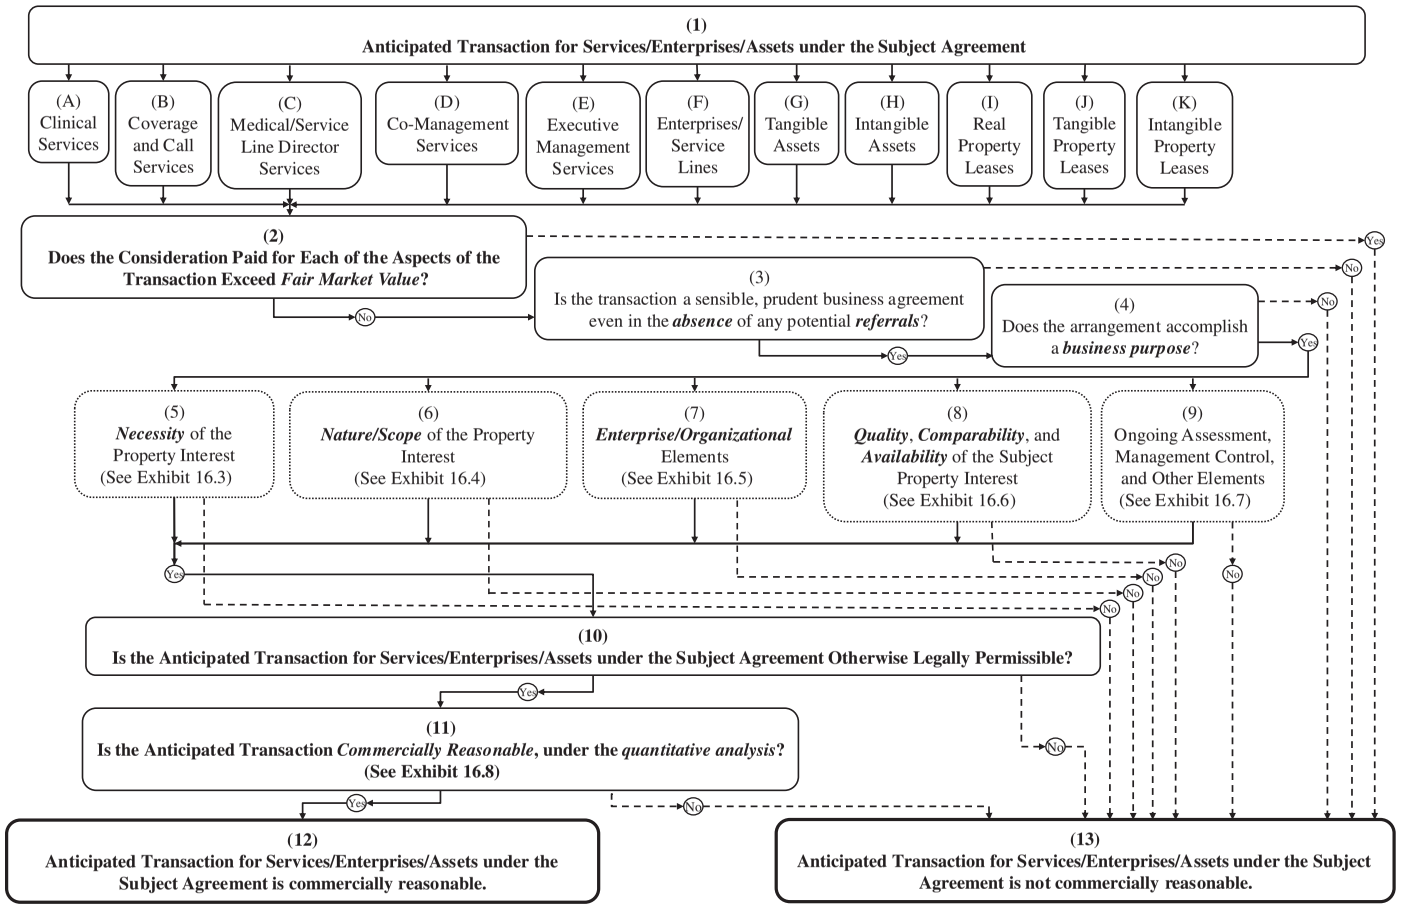

EXHIBIT 16.2 Qualitative Analytical Steps in the Commercial Reasonableness Threshold

16.2.1.1 Sensible, Prudent Business Agreement in the Absence of Referrals One of the first of these analytical *Commercial Reasonableness* hurdles that must be surmounted is the determination of whether the anticipated transaction is "a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals."[16] Under the Stark II Statutes (see Section 3.3.2.1.1, "Ownership/Investment Interests and Compensation Arrangement Exceptions," and Section 3.3.2.1.3, "Compensation Arrangement Exceptions," in Chapter 3, "Regulatory Environment"), Congress explicitly states that the *Commercial Reasonableness* statute applies "in the absence of referrals" to the following types of transactions involving physicians:

1. Rental of office space;
2. Rental of equipment;
3. Bona fide employment relationships;
4. Personal service arrangements;
5. Physician incentive plans;
6. Physician recruitment;
7. Isolated transactions, such as a one-time sale of property; and
8. Certain group practice arrangements.[17]

The Office of the Inspector General (OIG) has interpreted this statute to include any financial arrangement that may induce a physician to change his or her referral pattern, such as:

1. Arrangements [to] promote overutilization and . . . unnecessarily lengthy stays," (e.g., "per patient, per click, [or] per order arrangements).[18]
2. Payments to induce physicians . . . to reduce or limit services to . . . patients (e.g., "gainsharing arrangements").[19]

Accordingly, a transaction that considers "the value or volume of referrals" will not meet the regulatory thresholds of a *Commercial Reasonableness* analysis.[20]

---

[16] "Medicare and Medicaid Programs: Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," *Federal Register* 63 (January 9, 1998): 1700.

[17] Charles Oppenheim, "Stark Law Update," Hooper Lundy & Bookman, May 13, 2009; "Limitation on Certain Physician Referrals," 42 USC 1395nn (January 3, 2012).

[20] "Limitation on Certain Physician Referrals," 42 USC 1395nn (January 3, 2012).

16.2.1.2 Business Purpose Once a determination has been made that the anticipated transaction does not (1) exceed *Fair Market Value* and (2) take into consideration "the value or volume of referrals," the valuation analyst must then further determine whether the transaction is "a sensible, prudent business agreement," in that it fulfills a "business purpose" for the purchaser or lessee.[21] This concept has been expressed within certain rules and regulations published by the OIG and the IRS, including:

1. The commentary for the Anti-Kickback Regulations considers transactions to have a business purpose if they can be "reasonably calculated to further the business of the lessee or acquirer."[22]
2. The IRS defines business activities as those "carried on for the production of income from the sale of goods or the performance of services."[23]

A transaction that does not meet a *business purpose* fails to meet the regulatory threshold of a *Commercial Reasonableness* analysis.

16.2.1.2.1 For-Profit Organizations While there is no single factor that defines a sensible, prudent business arrangement, one element is the anticipated profitability resulting from the enterprise, assets, and/or services acquired or leased. The primary purpose of for-profit enterprises is to generate positive net economic benefits that accrue to the owners/investors in the subject enterprise. Examples of some metrics of positive net economic benefits include "net operating profits, net income before tax, net income after tax, operating cash flow, cash flow before tax, cash flow after tax, or net cash flow available for distribution to owners (e.g., dividends)."[24] This aspect of the Commercial Reasonableness analysis may be quantified in a post-transaction financial feasibility analysis, as discussed in Section 16.2.2, "Quantitative Analysis."

HIGHEST AND BEST USE

That use among possible alternatives which is legally permissible, socially acceptable, physically possible, and financially feasible, resulting in the highest economic return.

"The Principles and Concepts of Valuation: Theory of Utility and Value, Value Influences, and Value Concepts," by Richard Rickert, Appraisal and Valuation: An Interdisciplinary Approach, Volume I *(Washington, DC: American Society of Appraisers, 1987), p. 55.*

It should be noted that while the historical performance of the enterprise, assets, or services may not have provided sufficient economic benefit to support the invested capital of the subject property interest, the enterprise, assets, or services included in the anticipated transaction may not have, historically, been put to their highest and best use (see Section 7.2.2.2, "Highest and Best Use," in Chapter 7, "Basic Valuation Tenets"), which in this instance, may be for the existing owner to exchange the assets for a different property interest (e.g., cash) or service.[25] The valuation analyst should consider this concept of highest and best use when assessing the historical performance of a subject enterprise, asset, or service during a Commercial Reasonableness analysis.

Note that the *net economic benefits* generated from the *invested capital* of the business may not be the sole *business purpose* of the anticipated transaction. Additional considerations may include:

1. Expansion into new geographic areas.[26]
2. Expansion into new business lines.[27]
3. Augmenting existing service lines (e.g., orthopedic practices and physical therapy clinics).[28]

[25] Richard Rickert, "Chapter 3—Principles, Influences, and Concepts of Value," in *Appraisal and Valuation: An Interdisciplinary Approach, Volume I* (Washington, DC: American Society of Appraisers, 1987), p. 7.

[28] Kenneth Marks, et al., *Middle Market M&A: Handbook for Investment Banking and Business Consulting* (Hoboken, NJ: John Wiley & Sons, 2012), p. 28.

4. Diversification benefits (e.g., diversifying payor mix, geographically, etc.).[29]
5. Avoiding costs of "establishing offices and facilities, management, and other resources, in place" "(as an alternative to a 'greenfield investment' or in-house start-up)."[30]
6. Operating expense reductions (e.g., *economies of scale and scope*).[31]
7. Increased asset utilization.[32]
8. Reduced cost of capital and greater access to capital.[33]
9. Horizontal integration (e.g., hospital outpatient departments acquiring an ASC).[34]
10. Vertical integration (e.g., hospital acquiring an SNF).[35]
11. Management and care protocols.[36]
12. Increased access to technology and innovation.[37]
13. Improved research and development.[38]
14. Tax motivation (e.g., loss carryforwards, unused tax credits, etc.).[39]

These *synergistic* gains to a specific *owner* or *investor*, which would likely not be considered when performing a *fair market value* analysis, may be significant in establishing that a transaction is *Commercially Reasonable*.

16.2.1.2.2 Not-for-Profit Organizations/Charitable Mission A tax-exempt 501(c)(3) organization must be "organized and operated exclusively for an exempt purpose," such as "charitable, religious, educational, scientific,… [or] public safety" objective.[40] The IRS further clarified Section 501(c)(3) of the IRC, in Revenue Ruling 69–545, as it relates to healthcare enterprises, stating, "In the general law of charity, the promotion of health is considered to be a charitable purpose. […] A nonprofit organization whose purpose and activity are providing hospital care is promoting health and may, therefore, qualify as organized and operated in furtherance of a charitable purpose."[41]

This charitable mission provides the basis for the healthcare enterprise's *tax-exempt* status. Presumably, in *lieu* of a *financial return benefit*, the *tax-exempt* organization will, in the service of its *stated charitable mission*, generate a *social benefit* for the community it serves. For example, a *tax-exempt* hospital may, in performing its *charitable mission*, provide *indigent care* to the community in which it operates. This provision of *indigent care* may provide the *social benefit* of improved public health, a benefit that accrues to all members of the community. Designating an enterprise with *tax-exempt status* is a method that governments may be willing to use in subsidizing and supporting the generation of this *social benefit*. Another method might be direct transfer payments, which may be equally effective but would require the tax collection and wealth distribution costs that are avoided by using the *tax-exempt status* method.

In addition, *tax-exempt, not-for-profit* entities may also, in the accomplishment of their charitable mission, provide *nonmonetary* benefits to the "*owners/investors*" in the charitable organization, that is, taxpayers who act as the *charitable benefactors*, in paying higher taxes as a type of subsidy to finance the *tax-exempt* enterprise's operations. As such, it is likely that in furtherance of their *charitable mission*, these *tax-exempt, not-for-profit* organizations may generate ongoing *financial losses*, which losses may be offset by the *nonmonetary economic benefits* accruing to the community provided by the *tax-exempt, not-for-profit* organizations.

[40] Exemption Requirements–Section 501(c)(3) Organizations, http://www.irs.gov/charities/charitable/article/0,,id=96099,00.html (accessed February 9, 2012); "Exempt Purposes," Internal Revenue Code Section 501(c)(3), http://www.irs.gov/charities/charitable/article/0,,id=175418,00.html (accessed February 9, 2012).

[41] "Exemption from Tax on Corporations, Certain Trusts, etc.," 26 USC 501(c)(3), (1954); IRS Revenue Ruling 69-545, 1969-2 C.B. 117.

Tax-Exempt, Not-for-Profit Organization

An exempt organization is organized or operated for the benefit of private interests. The IRS has stated that "[n]o part of the net earnings of a section 501(c)(3) organization may inure to the benefit of any private shareholder or individual [,whereby] a private shareholder or individual is a person having a personal and private interest in the activities of the organization."[42]

"Medicare and Medicaid Programs; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships," 42 CFR § 411,42463 Federal Register *1700 (January 9, 1998); "Medicare Program; Physicians' Referrals to Health Care Entities with Which They Have Financial Relationships (Phase II)," 42 CFR § 411 and 424 (March 26, 2004).*

These *financial losses* may be the result of the *tax-exempt*, *not-for-profit* organization choosing a patient mix (e.g., providing greater levels of *indigent* and *Medicaid care*) that is less profitable than would be selected in the absence of the *charitable mission*. The *net economic benefit* accruing to those individuals and organizations who underwrite the charitable mission of the *tax-exempt*, *not-for-profit* organization is not measured in *dollars*, but in the *utility* generated by the accomplishment of their *stated charitable mission*. Therefore, the financial reports of that *tax-exempt*, *not-for-profit* organization, as related to the results of the subject transaction, may fail to capture the entirety of the *net economic benefits* that are generated by the enterprise.

In the event that the healthcare enterprise is a *tax-exempt*, *not-for-profit* organization, the financial *profits* generated by the enterprise or the assets or services purchased or leased may have reduced importance in the determination of whether the arrangement serves a *commercially reasonable business purpose*. Nonetheless, in tax-exempt healthcare organizations, as prescribed in the well-known healthcare aphorism, the directive remains, "*No margin, no mission.*"[43]

[43] Monica Langley, "Money Order: Nuns' Zeal for Profits Shapes Hospital Chain, Wins Wall Street Fans—But as Daughters of Charity Builds $2 Billion Reserve, Some Question Its Goals," *Wall Street Journal*, January 7, 1998, p. A1.

16.2.1.3 Necessity of the Property Interest The next hurdle that must be overcome in performing a *Commercial Reasonableness* analysis is a determination as to whether "the items and services obtained . . . [are] necessary to achieve a legitimate business purpose of the [employer] (apart from obtaining referrals)."[44] The IRS requires that the analyst make a determination as to whether the consideration paid for the subject property interest is "*ordinary*," i.e., "*common and accepted in trade or business*;" and "*necessary*," i.e., "*helpful and appropriate [to the purshaser or lessesee] for the trade or business*" in light of the "*volume of business handled*" by the organization. For example, considerations related to the "*volume of business*" might include the number of "*beds, admissions, or outpatient visits*;" "*the complexities of the business*;" and/or, the "*size of the organization*."[45]

A process for analyzing the *necessity* of the various elements of the subject transaction, for example, the services to be provided and the assets and enterprises to be acquired, is illustrated in Exhibit 16.3.

The *Federal Public Health Code*, Title 42 of the Code of Federal Regulations, requires that analysts consider whether the transaction elements are "pertinent to the operation and sound conduct of the institution."[46]

In the *U.S. v. SCCI Hospital Houston* case, the government's expert witness stated that an analyst "generally considers . . . size of facility, number of patients, patient acuity levels, and patient needs" in determining whether a purchaser or lessee needs the property interest being acquired (see Section 3.3.3.9.5, "*U.S. v. SCCI Hospital Houston*," in Chapter 3, "Regulatory Environment").[47]

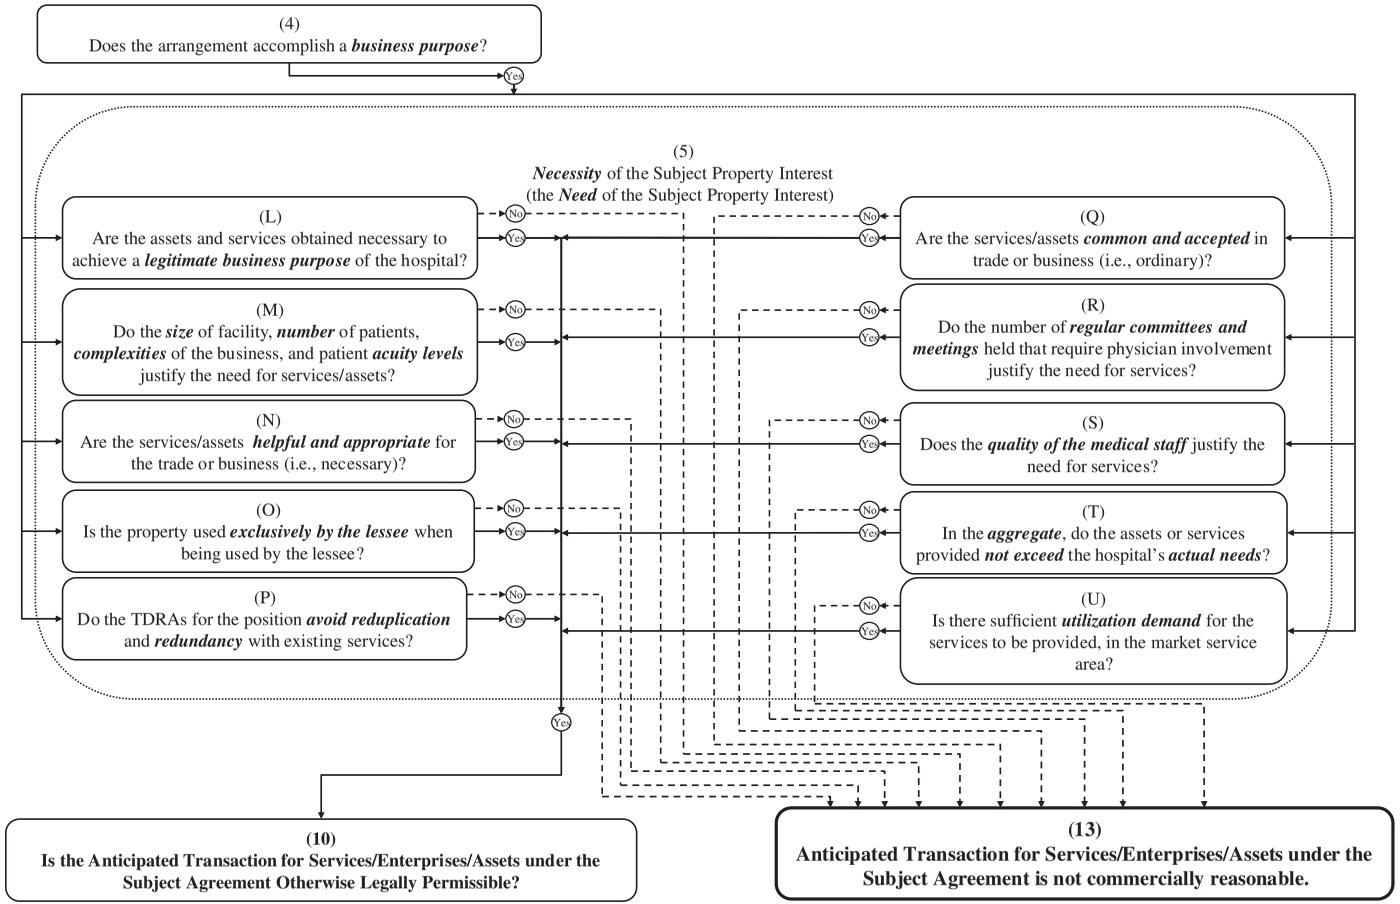

EXHIBIT 16.3 Analytical Processes for Assessing the Necessity of the Subject Property Interest

Further guidance, from the *Federal Public Health Code*, suggests that the analyst specifically consider whether:

1. The space rented or leased does not exceed that which is reasonable and necessary for the legitimate business purposes of the lease or rental and is used exclusively by the lessee;
2. The equipment rented or leased does not exceed that which is reasonable and necessary for the legitimate business purposes of the lease or rental and is used exclusively by the lessee when being used by the lessee; and
3. The aggregate services contracted for do not exceed those that are reasonable and necessary for the legitimate business purposes of the arrangement.[48]

As described earlier (in Section 16.1, "Definition of Commercial Reasonableness"), in addition to considering each element of the transaction in isolation, the OIG advises analysts to determine that

1. The **aggregate** space, equipment, or services contracted for not exceed that which is reasonable to accomplish the commercially reasonable business purpose of the party renting the space or equipment or purchasing the services.[49]
2. Whether "in the **aggregate**, the items or services provided by all [employees] exceed the hospital's actual needs (apart from generating business)."[50]

In addition, the *Personal Services* exemption requires that *all* services in the *aggregate* must be *Commercially Reasonable*, above and beyond the consideration of *each individual transaction element* (see Section 16.1, "Definition of Commercial Reasonableness").

Certain service transactions (e.g., *medical directorships*, *management agreements*, etc.) should be further scrutinized to determine *necessity* based on:

1. The number of regular committees and meetings held that require physician involvement.[51]
2. The quality of the medical staff.[52]

3. To ensure that "the duties performed by the employee . . . [do not] overlap with the duties" performed by other employees.[53]

REDUPLICATION

The occurrence of a duplicate instance of the same thing or system.

"Duplication," Dictionary.com, 2013, http://dictionary.reference.com/browse/duplication (accessed March 19, 2013).

This overlap concern can be separated into two analytical categories, related to the tasks, duties, responsibilities, and accountabilities (TDRAs) of a medical directorship: (1) *reduplication*, the occurrence of a duplicate instance of the same TDRA, and (2) *redundancy*, characterized by a superabundance of medical directorships providing similar TDRAs (see Section 15.5.2.1, "Nonclinical-Related Services Compensation Benchmarking," in Chapter 15, "Healthcare Services").[54] A careful analysis of the *nature*, *size*, and *scope* of services, the *organizational structure*, the *span of management*, and other elements for which the medical directorship services will be rendered are *essential* to the analysis in addressing this overlap concern. *Utilization demand*, based on the market service area's demographic profile, as well as its incidence and prevalence of specific disease groups, may further speak to a healthcare enterprise's capacity to meet or exceed its needs as part of the *Commercial Reasonableness* analysis.[55]

REDUNDANCY

Characterized by a superabundance of similar things or systems.

"Redundancy," Dictionary.com, 2013, http://dictionary.reference.com/browse/redundancy?s=t (accessed March 19, 2013).

[53] "OIG Advisory Opinion Number 06-02," Office of the Inspector General, March 21, 2006.

[54] "Duplication," Dictionary.com, 2013, http://dictionary.reference.com/browse/duplication (accessed March 19, 2013); "Redundancy," Dictionary.com, 2013, http://dictionary.reference.com/browse/redundancy?s=t (accessed March 19, 2013).

[55] Demographic profiles are "based on factors such as family income, age, sex, race [occupation], and [level of education] that explain difference in . . . consumption of different" healthcare services. Luis Pareras, *Innovation and Entrepreneurship in the Healthcare Sector: From Idea to Funding to Launch* (Phoenix, MD: Greenbranch Publishing, 2011), p. 347.

Task, Duties, Responsibilities, and Accountabilities

The specific tasks and duties to be performed by a person and the area of the organization or processes for which that person is responsible and accountable to management.

16.2.1.4 Nature and Scope of the Property Interest The analyst must make a determination as to whether the *nature* and *scope* of the subject services, assets, or enterprises meet the *needs* of the purchaser or the lessee. The IRS has advised that the *nature* and *scope* of services provided should be analyzed to determine whether their cost is: (1) a "cost of carrying on a trade or business," (2) undertaken "for the production of income from the sale of goods or the performance of services," (3) "paid or incurred during the taxable year" (i.e., the same year as the anticipated transaction), (4) "reasonable in terms of the responsibilities and activities . . . assumed under the contract," and (5) "reasonable in relation to the total services received."[56] Further guidance from the OIG commentary on the Anti-Kickback Statute suggests that analysts determine how the "space, equipment, or services" meet the "lessee or purchaser needs, intents to utilize, and . . . commercially reasonable business objectives."[57]

A process for analyzing the *nature* and *scope* of the various elements of the subject transaction, for example, the services to be provided and the assets and enterprises to be acquired, is illustrated in Exhibit 16.4.

In addition, when analyzing the *nature* and *scope* of services to be provided for a *Commercial Reasonableness* threshold, the IRS pronouncements on *reasonable compensation* for tax purposes offer some guidance as to

[56] "Deducting Business Expenses," Internal Revenue Service, January 2, 2013, http://www.irs.gov/Businesses/Small-Businesses-&-Self-Employed/Deducting-Business-Expenses (accessed February 26, 2013); "Unrelated Trade or Business," in "Taxation of Business Income of Certain Exempt Organizations," 26 USC Section 513 (January 3, 2012); "Trade or Business Expenses for Itemized Deductions for Individuals and Corporations for the Computation of Taxable Income for Normal Taxes and Surtaxes," 26 USC Section 162 (January 3, 2012); "IRS Revenue Ruling 69-383, 1969-2 CB 113," Internal Revenue Service, 1969; Janet Gitterman and Marvin Friedlander, *Health Care Provider Reference Guide*, Internal Revenue Service, 2004, p. 19.

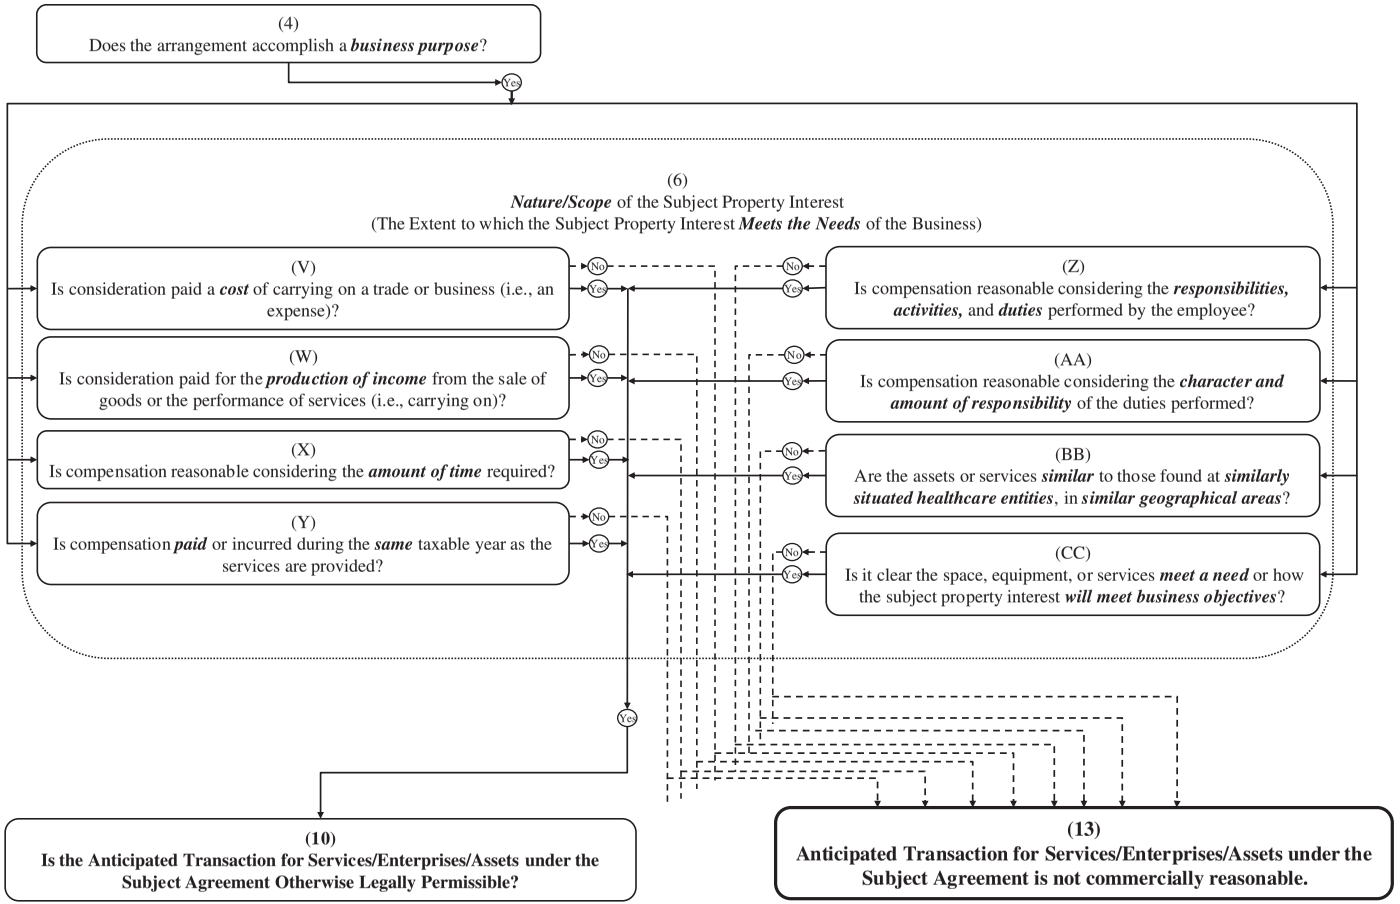

EXHIBIT 16.4 Analytical Processes for Assessing the Nature and Scope of the Subject Property Interest

(1) "the amount of time required" for the services to be rendered, (2) "the duties performed by the employee," (3) "the character and amount of responsibility" of the position, and (4) the similarity "to contracts of other organizations providing similar services at similarly situated health care entities."[58] The Code of Federal Regulations requires analysts to consider "the number of hours of services furnished . . . in the geographical area in which the services are furnished."[59] The types of services provided to healthcare enterprises and the *tasks*, *duties*, *responsibilities*, and *accountabilities* (TDRAs) associated with them are discussed further in Chapter 15, "Healthcare Services."

16.2.1.5 Enterprise and Organizational Elements The IRS pronouncements on *reasonable compensation* for tax purposes offer analysts guidance that a determination should be made as to whether the *consideration paid* for the subject property interest is "a sensible, prudent business agreement" within the context of (1) "the pay compared with the gross and net income of the business"; (2) "business policy regarding pay for all employees"; and (3) "the cost of living in the locality," based on an analysis of the "national and local economic conditions," including whether the acquirer or lessee is located in a "rural, suburban, or urban" area.[60]

In addition, the analyst should make a determination as to whether the tax status of the acquirer or lessee affects the *Commercial Reasonableness* of the anticipated transaction (see Section 16.2.1.2, "Business Purpose").

A process for analyzing the *enterprise* and *organizational* elements of the anticipated transaction is described in Exhibit 16.5.

16.2.1.6 Quality, Comparability, and Availability of the Subject Property Interest Based on the *nature* and *scope* of the services provided, the analyst should

[58] Internal Revenue Service, Publication 535—*Business Expenses*, 2011, http://www.irs.gov/publications/p535/ch02.html (accessed February 25, 2013); Janet Gitterman and Marvin Friedlander, *Health Care Provider Reference Guide*, Internal Revenue Service, 2004, p. 28.

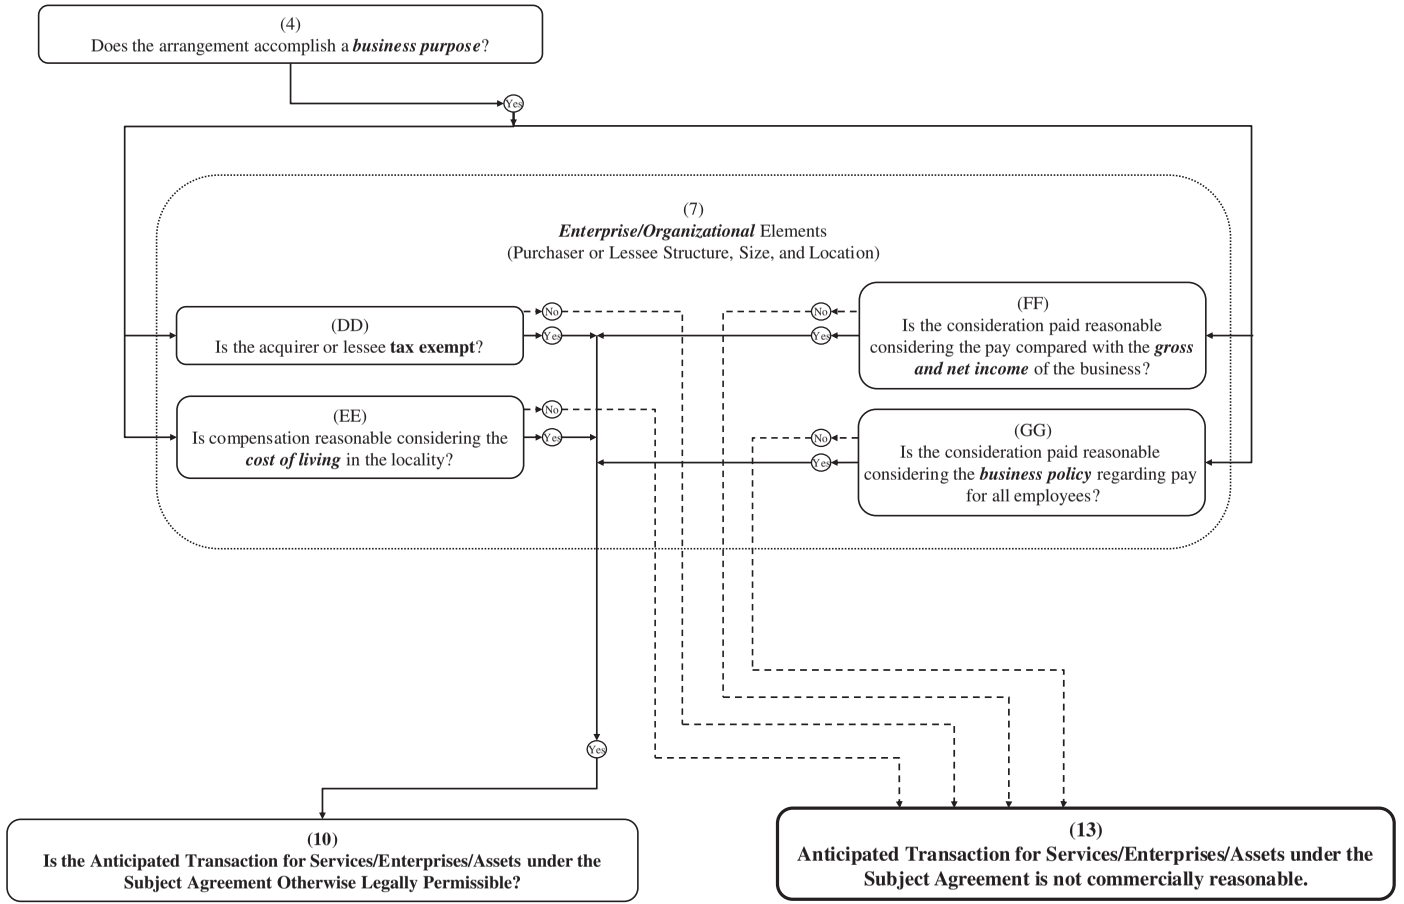

EXHIBIT 16.5 Analytical Processes for Assessing the Enterprise and Organizational Elements Availability of the Subject Property Interest

determine those attributes that speak to the *nature* and *quality* of the services, assets, and enterprises included in the anticipated transaction. The IRS pronouncements on *reasonable compensation* for tax purposes advise analysts to consider "the ability and achievements of the individual performing the service," including "education," "specialized training and experience of the" individual, "the history of pay for the employee," and "the availability of similar services in the geographic area."[61] The OIG advises that analysts consider "the skill level and experience reasonably necessary to perform the contracted services," especially if "the services [could be obtained] from a non-referral source at a cheaper rate or under more favorable terms."[62] The Code of Federal Regulations specifies that analysts should consider "the type, expected life, condition…and market conditions in the area…[for] facilities or equipment," as well as whether "adequate alternative facilities or equipment that would serve the purpose are not or were not available at lower costs."[63] The OIG echoed the "reasonably necessary" requirement in a subsequent Advisory Opinion stating, *"the aggregate services contracted for do not exceed those which are reasonably necessary to accomplish the commercially reasonable business purpose of the services."*[64]

A process for analyzing the *nature* and *quality* of the various elements of the subject transaction, for example, the *service provider* and the *assets* to be acquired, is illustrated in Exhibit 16.6.

It should be noted that as discussed in Chapter 5, "Technology," the healthcare industry's technology is constantly and quickly evolving. This could *potentially* lead to the creation and availability of *adequate alternative facilities or equipment that would serve the purpose* at a lower cost, either through a *lower price per unit* or *higher productivity.* The existence and availability of new technology related to the subject property interest, which may cause

---

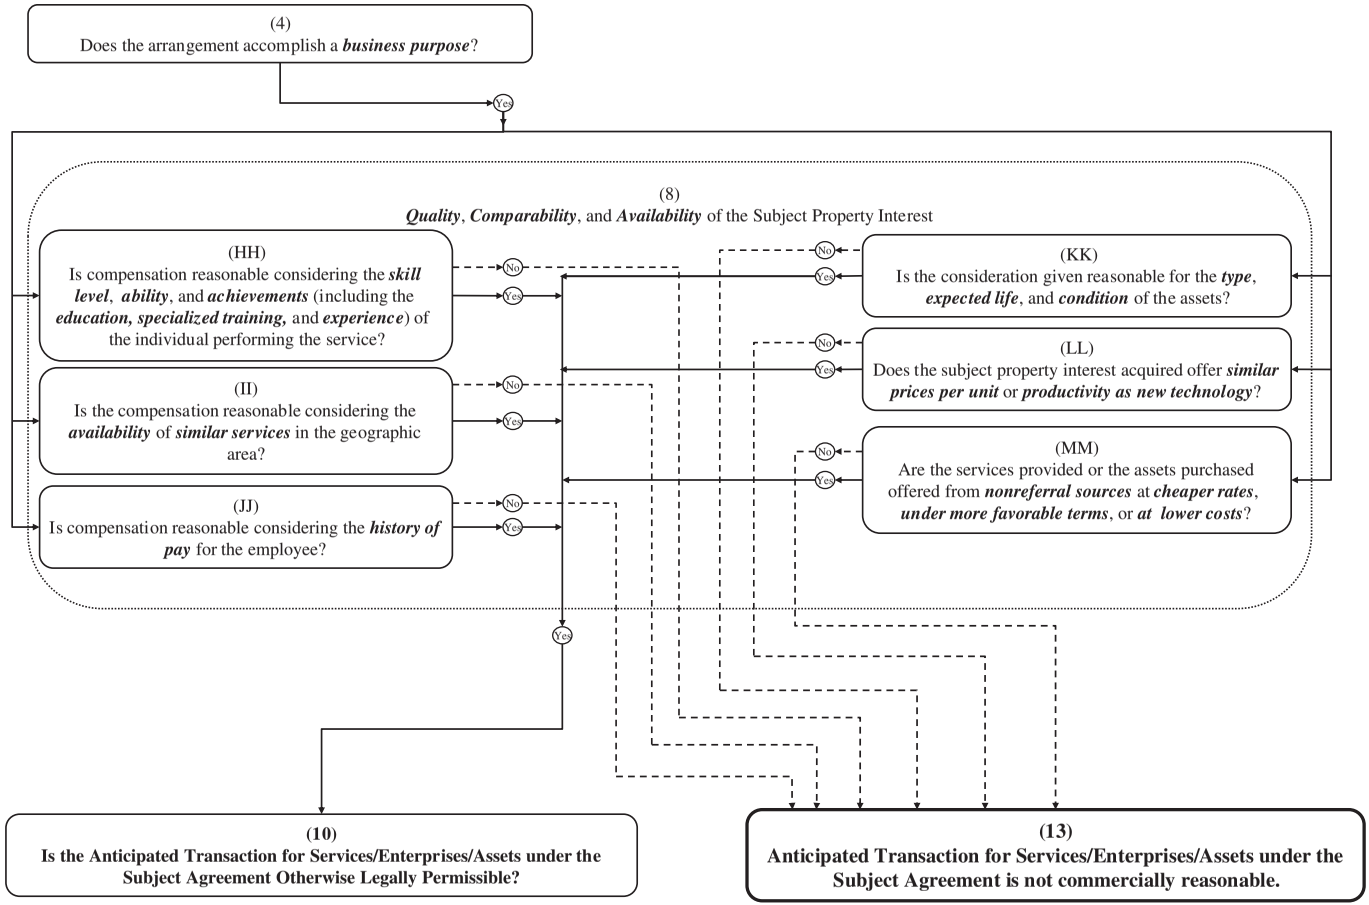

EXHIBIT 16.6 Analytical Processes for Assessing the *Quality*, *Comparability*, and *Availability* of the Subject Property Interest

older technology to be become *obsolete* or certain employees to be become *redundant*, should be considered in any *Commercial Reasonableness* analysis. In this scenario, the purchase of the obsolete equipment or the hiring/retention of the redundant employees would ***not*** be *Commercially Reasonable.*

The anticipated transaction may require that healthcare entities purchasing physician services to compensate those physicians at *a higher rate per unit of productivity* (e.g., per wRVU) than the physicians *historically* earned in their private practice for providing the same services. Recall that as discussed in more detail in Section 15.3.2, "Commercial Reasonableness" (in Chapter 15, "Healthcare Services"), a physician's compensation per unit of productivity in private practice may be lower than market survey data–derived measures of *Fair Market Value* for several reasons, including:

1. According to the theory of *utility maximization*, physicians would only pursue compensation levels above the amount they were able to generate from their own practice in *maximizing* their *individual compensation*, *wealth*, or *other measure of utility.* Further, those physicians receiving compensation for their services above the market survey–derived measures of *Fair Market Value* would not be acting in their own *rational economic self-interest* by pursuing a transaction where they would be *paid less* for their services than what they are able to generate from their private practice.
2. Under the economic *principle of substitution*, a potential *purchaser* of healthcare services would be *willing to pay up to the price* of a *desirable substitute*, and normative industry benchmark survey data can be used to determine the *most probable price* that the purchaser would *likely* expend for *substitute services*.
3. The *historical level of return* on the subject services is strictly reflective of the outcome of the economic factors affecting the *operational performance* and *financial condition* of the use of that property interest in the physician's *prior practice*, which may not be reflective of the market as a whole.
4. Purchasers or lessees of physician services, *bound* by *Fair Market Value* as a *ceiling price*, act to maximize their profit by acquiring at the *lowest total cost*, while sellers, *bound* by the *floor* set by the level of income they generated for their services from their prior physician practice, act to maximize their profit by selling the subject property interest at the *highest total price*. The point where both parties will choose to transact would fall between the *ceiling* set forth by the regulatory restriction of *Fair Market Value* and the *floor* set forth by the historical earnings of the physician from their prior practice. The degree by which the final negotiated price is closer to the *point of utility maximization* for the *buyer* (i.e., the lowest total cost) or to that of the *seller* (i.e., the highest total price) is determined, in great part, by the trade-off between

leverage and *negotiating skill* between the two parties (see Exhibit 15.1 in Chapter 15, "Healthcare Services").

5. In addition to maximizing their financial benefits, physicians may derive utility from *intrinsic* sources, such as the personal autonomy afforded to a physician owner of a practice, in contrast to an employed physician.
6. The equivalency of knowledge between buyers and sellers may not be fully reflected in the bargain, as physicians, more typically highly trained in clinical subjects than in financial economics, may use and rely more heavily on *their past personal experiences*, which are not necessarily reflective of *future economic market realities*, in decision making.

16.2.1.6 Management Control, Ongoing Assessment, and Other Elements Analysts should consider certain other elements of the transaction that may not fit neatly into the previously discussed categories, for example, (1) the *necessity* of the property interest, (2) the *nature* and *scope* of the property interest, (3) the *enterprise* and *organizational* elements, and (4) the *nature* and *quality* of the property interest. For example, in assessing the *Commercial Reasonableness* of certain medical directorships, the government's expert witness, in the *U.S. v. SCCI Hospital Houston* case, considered the "quality of management and interdisciplinary coordination" (see Section 3.3.3.9.5, "*U.S. v. SCCI Hospital Houston*," in Chapter 3, "Regulatory Environment").[65] In addition to assessing the needs at the beginning of the contract, the government's expert witness report suggested that healthcare entities should conduct "a regular assessment of the actual duties performed by the [employee] . . . [and] it should be clear how effective the [employee] is doing his assigned job and if there is a bona fide need for continuing the services."[66]

A process for analyzing the *management control*, the *ongoing assessment*, and other elements of the subject transaction is illustrated in Exhibit 16.7.

Further guidance from case law on this topic was provided in the *U.S. v. Joseph Campbell, MD*, case, where Judge Susan Wigenton ruled that healthcare entities should monitor employees to ensure they "actually perform the duties outlined in their contract," "conform to written policies, are properly recorded, [continue to] reflect reasonable payments for goods and services, [and continue to] further the corporation's . . . purposes."[67]

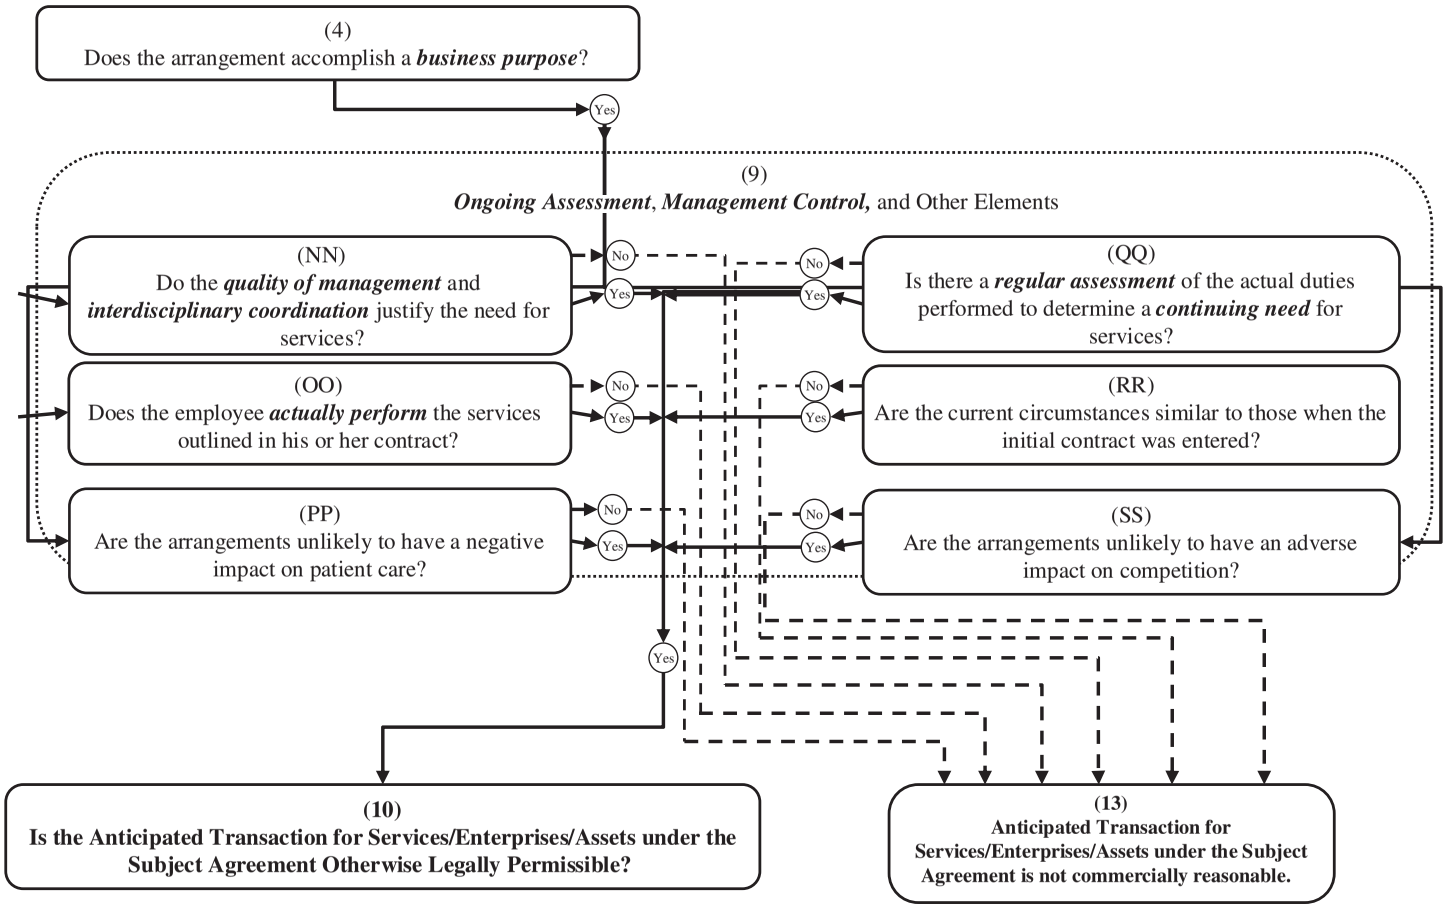

EXHIBIT 16.7 Analytical Processes for Assessing the Ongoing Assessment, the Management Control, and Other Elements

In the *U.S. v. Carlisle HMA, Inc.*, case, Judge Christopher Conner ruled that healthcare entities need to make a determination as to whether the current "consideration given and received [is paid] under materially different circumstances" than when the contract was entered.[68] Finally, the OIG advises consultants to review anticipated transactions to determine if:

1. The arrangements flow from an open, competitive request for proposal process.
2. The risk that the arrangements will result in an appropriate utilization is low.
3. The arrangements are . . . likely to have a negative effect on patient care.
4. The arrangements . . . have an adverse impact on competition.[69]

16.2.1.6.1 Antitrust Considerations Additional factors to consider when assessing the *legal permissibility* of the anticipated transaction may be found in antitrust pronouncements by the Federal Trade Commission (FTC), which advise:

1. The anticipated transaction "is likely to produce significant efficiencies."[70]
2. "These efficiencies include the provision of services at a lower cost or the provision of services that would not have been provided absent" the anticipated transaction.[71]
3. The efficiencies achieved as a result of the anticipated transaction "will benefit consumers."[72]
4. The anticipated transaction will help "monitor and control costs . . . while assuring quality of care."[73]
5. The anticipated transaction "appears likely, on the balance, to be pro-competitive or competitively neutral."[74]

[74] Ibid.

6. The anticipated transaction "would not increase the likelihood of the exercise of market power . . . because of the existence of the post-[transaction] of strong competitors."[75]

16.2.1.6.2 Certificate of Need *Certificate of Need* (*CON*) laws represent some of the most significant market entrance barriers that have an impact on the U.S. healthcare delivery system.[76] Currently, 37 states retain some sort of CON program, in which a state government agency determines where, when, and how *capital expenditures* will be made for *public healthcare facilities*, *services* and *major equipment* (see Section 3.4.3, "Certificate of Need," in Chapter 3, "Regulatory Environment").[77] CON requirements are based on the highly contested theory that in an *unregulated market*, healthcare providers will purchase the newest, most costly technology and equipment, regardless of *duplication* or *need*.[78] The existence or absence of a CON related to a *healthcare facility*, a *service*, or *major equipment* may have a significant impact on

CERTIFICATE OF NEED

Permits granted by state governmental agencies to allow capital expenditures for healthcare facilities, services, or equipment purchases.

"Certificate of Need: State Health Laws and Programs," by National Conference of State Legislatures, April 30, 2009, http://www.ncsl.org/IssuesResearch/Health/CONCertificateofNeedStateLaws/tabid/14373/Default.aspx (accessed June 24, 2009).

[78] Chapter 8: Miscellaneous Subjects," in *Improving Health Care: A Dose of Competition*, A Report by the Federal Trade Commission and Department of Justice, July 2004, p. 2.

the *Commercial Reasonableness* analysis of the anticipated transaction. For example, if the anticipated transaction involves a hospital giving consideration to a medical director for launching a cardiovascular service line, the transaction would not be *Commercially Reasonable* in the absence of a CON permitting the hospital to establish that service line. Also, the CON typically requires an application process that is replete with documented evidence, which is pertinent to establishing the *need* in meeting the *necessity of the property interest* threshold (see Section 16.2.1.3, "Necessity of the Property Interest"), as to the *utilization demand* and *financial feasibility* of the proposed services.

16.2.1.6.3 Other State and Local Regulations Separate and aside from *Certificates of Need*, various states have established commissions and committees to "ensure the regional and local supply of . . . [healthcare] facilities is best configured to appropriately respond to community needs for high-quality, affordable and accessible care, with meaningful efficiencies in delivery and financing that promote infrastructure stability."[79] For example, in 2006, the *New York State Commission on Health Care Facilities in the 21st Century* closed 20 hospitals in New York.[80] In Virginia, 21 planning district commissions "analyze regional opportunities . . . in planning and implementing public policies and services."[81] The valuation analyst should carefully consider the impact of state initiatives in determining whether the anticipated transaction is *Commercially Reasonable*.

16.2.2 Quantitative Analysis

In addition to the types of *qualitative* analysis described earlier, the analyst should also undertake a *quantitative* analysis as part of the determination of the *Commercial Reasonableness* of both the *discrete* elements and the *entirety* of the anticipated transaction. This analysis, which is referred to as a *post-transaction financial feasibility analysis*, takes into account all consideration to be paid by purchasers and lessees to sellers and lessors. This *post-transaction financial feasibility analysis* should be performed

POST-TRANSACTION FINANCIAL FEASIBILITY ANALYSIS

An analytical financial analysis of the revenue stream, operating expense burden, and capital expense burden associated with the anticipated transaction.

within the context of the *qualitative* analysis, in assessing the *Commercial Reasonableness* of the anticipated transaction. The *elements* of the *post-transaction financial feasibility analysis* are not intended to be considered in isolation; rather, the analyst should consider both the *individual merits* of each analytical technique and the *relationships* between the analytical techniques employed. While there are numerous techniques an analyst may use, four of the most prevalent techniques are discussed below: (1) *payback period* and *discounted payback period*, (2) *net present value analysis*, (3) *internal rate of return*, and (4) *average accounting rate of return.*

In approaching any of these *quantitative* techniques, analysts should note that *tax-exempt*, *not-for-profit healthcare organizations* operate in service to their *stated charitable mission* and, in lieu of taxes, provide a *social benefit.*[82] Accordingly, while the *post-transaction financial feasibility analysis* may reflect a financial loss, the transaction may still be *Commercially Reasonable* when the *nonmonetary social benefits* are taken into consideration (see Section 9.1.2.2.1, "Internal Financing," in Chapter 9, "Costs and Sources of Capital"). The analytical techniques discussed below and used in the *post-transaction financial feasibility analysis* include consideration of the *financial return benefits* without consideration of the *nonmonetary social benefits*, which may vary between healthcare organizations in accordance with several factors, for example, (1) patient *demographics*, (2) *incidence* and *prevalence* of disease, and (3) *geographic location.* The financial costs for achieving these *nonmonetary social benefits* are significant and, according to one recent study, may account for as much as one-third of a *not-for-profit's* operating cost.[83]

A process for quantifying the various elements of the subject transaction, for example, the services to be provided and the assets and enterprises to be acquired, is illustrated in Exhibit 16.8.

---

[82] For a more detailed discussion on this topic, see Section 9.1.2.2.1, "Internal Financing," in Chapter 9, "Costs and Sources of Capital."

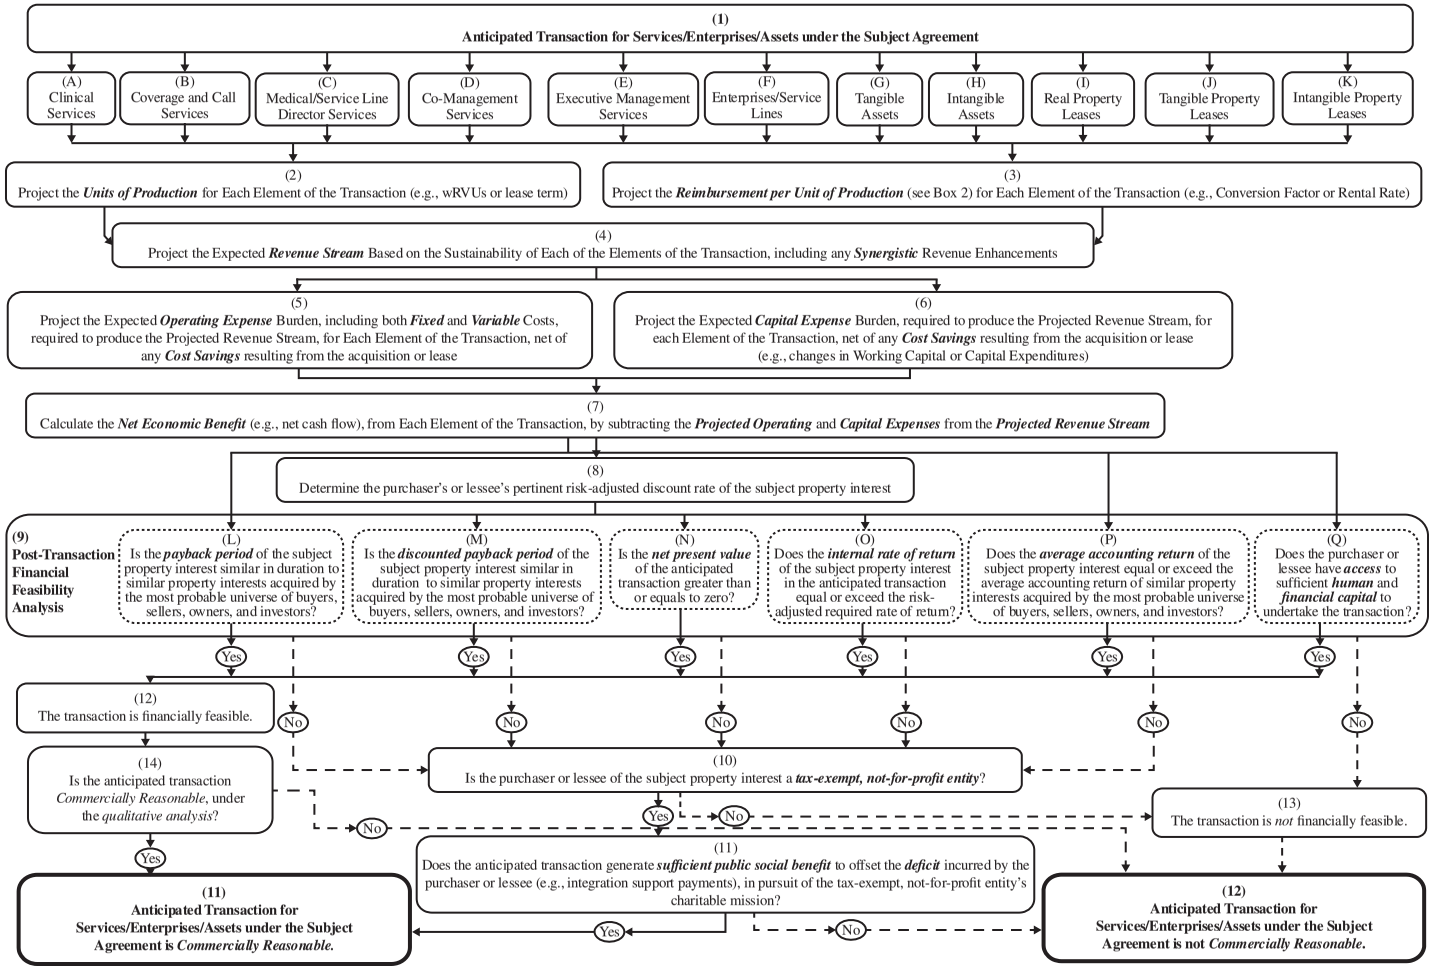

EXHIBIT 16.8 Analytical Process for the Quantitative Analysis

16.2.2.1 Payback Period and Discounted Payback Period Analysis The *payback period* is an analytical technique in a *post-transaction financial feasibility analysis* that is undertaken to determine the number of discrete periods "it takes before the cumulative forecasted [undiscounted] cash flow equals the initial investment."[84] It should be noted that, while a *payback period analysis* should consider the *sustainability* of each element of the transaction, it does not adjust for the risk associated with the *expected future net economic benefits* to be received and assumes that similar investments in similar assets produce similar cash flows.[85] Unlike the other quantitative analytical techniques discussed in this chapter, the payback period should *explicitly* include the cost of debt (e.g., interest expense) in the *projected expense burden*, because this technique does not *implicitly* account for this cost in the *discount rate*. A detailed illustration of a *payback period* analysis can be found online at http://www.wiley.com/go/healthcarevaluation.

The *discounted payback period* in a *post-transaction financial feasibility analysis* is the number of periods "until the sum of the **discounted** cash flow is equal to the initial investment."[86] If the valuation analyst determines that the required *payback period* is of a duration similar to the *investment horizon* expected by the universe of typical *buyers*, *sellers*, *owners*, and *investors* in the enterprise, assets, or services similar to the property interest exchanged in the subject transaction, then the valuation analyst may consider the anticipated transaction to be financially *feasible*.[87] However, the determination that an anticipated transaction is *financially feasible* does not, in and of itself, determine its *Commercial Reasonableness*. Recall that a *tax exempt*,

Payback Period

An analytical technique that determines the number of discrete periods "it takes before the cumulative forecasted [undiscounted] cash flow equals the initial investment."

Principles of Corporate Finance*, 9th ed., by Richard Brealey, et al. (New York: McGraw-Hill Irwin, 2008), p. 120.*

[84] Richard Brealey, et al., *Principles of Corporate Finance*, 9th ed. (New York: McGraw-Hill Irwin, 2008), p. 120.

[85] Ibid., pp. 120–121.

[86] Stephen Ross, et al., *Fundamentals of Corporate Finance*, 2nd ed. (Boston: Irwin, 1993), p. 228.

[87] Analysts may wish to consider various scenarios of 5, 10, and 15 years.

Discounted Payback Period

An analytical technique that determines the number of discrete periods "until the sum of the discounted cash flow is equal to the initial investment."

Fundamentals of Corporate Finance, *2nd ed., by Stephen Ross, et al. (Boston: Irwin, 1993), p. 228.*

not-for-profit organization may enter into transactions for certain property interests that, while resulting in (at least short-term) *financial losses*, generate significant *social benefits*, for example, the integration and coordination of care in the community, in pursuit of its *charitable mission* (see Section 16.2.1.2.2, "Not-for-Profit Organizations/Charitable Mission").

Within this context, the *payback period* analysis may result in a negative *financial* indicator, but the transaction may still be *Commercially Reasonable* in the context of the *social benefits* provided by the transaction, in consideration of the *qualitative* analyses. It should be noted that both the *payback period* and the *discounted payback period* technique appear biased toward more liquid projects, in other words, those projects that quickly return the initial investment, to the detriment of longer-term investments that may have an enhanced value impact for the enterprise. Accordingly, the *Commercial Reasonableness* analysis should consider *all cash flows* associated with the anticipated transaction, including any support payments made by a parent organization to a subsidiary company, and the *timing* and the *risk* associated with actually achieving those projected future cash flows. A detailed illustration of a *discounted payback period* analysis can be found online at http://www.wiley.com/go/healthcarevaluation.

16.2.2.2 Net Present Value Analysis The *net present value* is an analytical technique that examines the anticipated transaction and consists of determining the difference between the total *initial economic expense burdens* (e.g., initial cash outlays) and the total *expected risk-adjusted future net economic benefits* (e.g., present value of the future net cash flows).[88] Recall that the *relevant net economic benefits* associated with a *net present value analysis* may be different than the *economic benefits* associated with a *Fair Market Value* analysis, because the *net present value analysis* considers the

[88] Stephen Ross, et al., *Fundamentals of Corporate Finance*, 2nd ed. (Boston: Irwin, 1993), p. 220.

Net Present Value

An analytical technique that determines the difference between the total initial economic expense burdens (e.g., initial cash outlays) and the total expected risk-adjusted future net economic benefits (e.g., present value of the future net cash flows).

Fundamentals of Corporate Finance, *2nd ed., by Stephen Ross, et al. (Boston: Irwin, 1993), p. 220.*

net cash flow to a *particular buyer*, *owner*, or *investor* "in the absence of referrals,"[89] in contrast to considering the net cash flow to the most probable *universe of typical buyers*, *sellers*, *owners*, and *investors* in the subject property interest, which consideration is a definitional requirement of the valuation standard of *Fair Market Value.* For instance, when valuing a physician practice, a *Fair Market Value* analysis would not consider:

1. Any *synergistic* revenue enhancements (e.g., the hospital outpatient department (HOPD) enhanced reimbursement differential under the hospital outpatient prospective payment system (HOPPS), which provides that only hospitals can receive the benefits of approximately 1.7 to 2.2 times the Medicare physician fee schedule (MPFS); or
2. *Cost savings* (e.g., the hospital's eliminating the practice's billing and collection department or eliminating the redundant information technology systems) that might result from the merger of a physician practice with a hospital.

However, a *net present value analysis,* for the purposes of assessing the *Commercial Reasonableness* of a transaction to a *particular investor* would consider **all** *relevant costs and net economic benefits* related to the merger, of course, exclusive of the consideration of any potential benefits arising from the physician referral relationship with the hospital.[90]

In the event that the *net present value* calculated is *greater than or equal to zero*, a *net present value* analysis may indicate that the anticipated transaction represents a *financially feasible* arrangement.[91] However, as with the payback period, the determination that an anticipated transaction is *financially*

[89] "Limitation on Certain Physician Referrals," 42 USC 1395nn (January 3, 2012).

[90] Stephen Ross, et al., *Fundamentals of Corporate Finance*, 2nd ed. (Boston: Irwin, 1993), p. 256.

[91] Ibid., p. 222.

feasible does not, in and of itself, determine its *Commercial Reasonableness*, and a negative *net present value* may still be *Commercially Reasonable* for a *tax-exempt*, *not-for-profit organization*, if the anticipated transaction helps further that organization's *charitable mission* (see Section 16.2.1.2.2, "Not-for-Profit Organizations/Charitable Mission"). For a more in-depth discussion of the *net present value technique*, see Section 8.2.5, "Net Present Value Analysis," in Chapter 8, "Valuation Approaches and Methods."

16.2.2.3 Internal Rate of Return The *internal rate of return* is an analytical technique that relies on determining the *discount rate*, which, when applied to the *expected net economic benefits* of the subject property interest, results in a **zero** *net present value* (see Section 16.2.2.1, "Payback Period and Discounted Payback Period Analysis").[92] In the event that the calculated *internal rate of return* is *greater than* or *equal* to the *risk adjusted* ***required*** *rate of return*, as determined using the methods discussed in Chapter 9, "Costs and Sources of Capital," an *internal rate of return analysis* may indicate that the anticipated transaction is *financially feasible* for the subject property interest.[93] However, the determination that an anticipated transaction is *financially feasible* does not, in and of itself, determine its *Commercial Reasonableness*. Some *tax-exempt*, *not-for-profit organizations* may engage in transactions that *do not* exceed their *risk-adjusted* ***required*** *rate of return*. In this instance, the *internal rate of return* analysis may be a *negative indicator*, but the transaction may still be *Commercially Reasonable*, in consideration of the *qualitative analysis,* and within the context of the *social benefits* provided by the transaction that further the *charitable mission* of the organization (see Section 16.2.1.2.2, "Not-for-Profit Organizations/Charitable Mission"). It should be noted that when the *net present value* of an anticipated transaction is greater than or equal to zero, the *internal rate of return* will always exceed the *risk-adjusted required rate of return*.

Internal Rate of Return

An analytical technique that determines discount rate, which, when applied to the expected net economic benefits of the subject property interest, results in a zero net present value.

Principles of Corporate Finance*, 9th ed., by Richard Brealey, et al. (New York: McGraw-Hill Irwin, 2008), p. 122.*

[92]Richard Brealey, et al., *Principles of Corporate Finance*, 9th ed. (New York: McGraw-Hill Irwin, 2008), p. 122.

[93]Ibid., p. 123.

16.2.2.4 Average Accounting Return The *average accounting return* is an analytical technique that seeks to determine the average of the *net income* arising from the assets or services to be acquired in the anticipated transaction *for each discrete accounting period* divided by the book value of those subject property interest(s) acquired *for each of the corresponding accounting periods*.[94]

It should be noted that the *average accounting return* (1) is based on accounting values, which may or may not *accurately* reflect the *economic benefits and expenses* associated with the subject property interest(s); (2) ignores the *risk* associated with any *anticipated economic benefits*; and (3) ignores the *time horizon* associated with any *anticipated net economic benefits*.[95]

If the valuation analyst determines that the required *average accounting return* is similar to the *average accounting return* expected by a *universe of typical buyers*, *sellers*, *owners*, and *investors* in enterprises, assets, or services similar to the subject property interest(s), then the valuation analyst may consider the anticipated transaction to be *financially feasible*. However, the determination that an anticipated transaction is *financially feasible* does not, in and of itself, determine its *Commercial Reasonableness*. In the instance that *tax-exempt*, *not-for-profit organizations* engage in transactions where *average account returns* are below the required threshold, that transaction may still be *Commercially Reasonable* within the context of the *social benefits* provided by the transaction, which further the *charitable mission* of the organization (see Section 16.2.1.2.2, "Not-for-Profit Organizations/ Charitable Mission"), and in consideration of the *qualitative* analysis.

Average Accounting Return

An analytical technique that determines the average of the net income arising from the assets or services to be acquired in the anticipated transaction for each discrete accounting period divided by the book value of those subject property interest(s) acquired for each of the corresponding accounting periods.

Fundamentals of Corporate Finance, *2nd ed., by Stephen Ross, et al. (Boston: Irwin, 1993), p. 231.*

[94] Stephen Ross, et al., *Fundamentals of Corporate Finance*, 2nd ed. (Boston: Irwin, 1993), p. 231.

[95] Ibid., p. 233.

16.2.2.5 Capital Considerations Beyond employing one or more of the quantitative analytical techniques, the *post-transaction financial feasibility analysis* should also consider the *human* and *financial capital factors* associated with completing the transaction. For example, if the management of an enterprise lacks sufficient *human capital* to manage both the transaction and the post-transaction integration process, then the analyst should consider both the *explicit* (e.g., the consulting contracts or cost of hiring additional management resources) and the *implicit* (e.g., the *opportunity* cost of time spent improving the enterprise's current management through education and training) costs of acquiring this additional expertise in the *post-transaction financial feasibility analysis*.

The analyst should consider the relative impact of whether the anticipated transaction may be funded through *equity*, *debt*, or a *mix* of both. A *Commercial Reasonableness* analysis should consider whether the acquiring enterprise has the ability to gain *access to funding* (e.g., capital markets, either equity or debt; private lending sources; and cash on hand) necessary to complete the anticipated transaction. The analyst should also consider any *implicit capital cost* related to the level of funding required by the anticipated transaction, which *may act to alter* the *capital structure* of the purchaser or the lessee in a manner that detracts from the *optimal ratio* of debt to equity, causing the enterprise to incur additional *financial distress costs* (e.g., higher interest rates, loss of trade credit, and fewer donations, thereby altering the enterprise-wide *weighted average cost of capital* and potentially reducing the *net present value* of any potential future project(s). Consideration of these additional expenses, if any, should be included in the *post-transaction financial feasibility analysis*.

16.3 CONCLUSION

While there is no single, universally accepted definition for the term *Commercial Reasonableness*, guidance in defining this regulatory threshold may be found in:

1. Statutory and regulatory sources, including pronouncements from both the OIG and the IRS, the *Stark Laws*, and the *Anti-Kickback* Statute; and
2. Relevant case law, including (1) *U.S. v. SCCI Hospital Houston*, (2) *U.S. v. Joseph Campbell*, and (3) *U.S. ex rel. Ted Kosenske, MD, v. Carlisle HMA, Inc., and Health Management Associates, Inc.*

This type of analysis addresses a regulatory threshold that is *separate* and *distinct* from, yet equally important as, the regulatory threshold related to the valuation standard of *Fair Market Value*.

"WRAP AROUND" COMMERCIAL REASONABLENESS OPINION

An opinion as to whether all elements of a transaction, both individually and in the aggregate, meet the threshold of commercial reasonableness.

In developing and rendering a *Commercial Reasonableness* opinion, the valuation professional should employ a rigorous analytical process that considers both *qualitative* and *quantitative* factors related to the several thresholds, analogous to *hurdles* that the elements of the anticipated transaction must overcome. A "*wrap around*" *Commercial Reasonableness* considers not only the *individual elements* of a transaction involving consideration paid for an enterprise(s), an asset(s), or a service(s); it also applies to the *entirety* of the integration transaction, including *all* property interest(s) in the aggregate, for which consideration is paid.

The *Commercial Reasonableness* analysis has evolved as a significant focus of regulatory scrutiny for health care transactions and, accordingly, is an increasingly important service offered by healthcare valuation professionals.

DHS	Designated Health Services
HOPD	Hospital Patient Outpatient Department
NPV	Net Present Value
FTC	Federal Trade Commission
IRR	Internal Rate of Return

Epilogue

It is quite clear that economists rather generally recognize the need for a dynamic theory of economics. The reasons for this attitude are to be found in the nature of economic phenomena, which are always changing, ever in a state of Flux.[1]

—Charles Fredrick Roos

As this text goes to print, the U.S. healthcare delivery system is experiencing continuing uncertainty affecting *providers*, *payors*, and *suppliers* alike, who are attempting to navigate through the turbulence of healthcare reform, challenging economic conditions, and volatile capital markets. This "*perfect storm*" of circumstances, in turn, has an impact on the transactional marketplace in which these healthcare industry players operate. On the *reimbursement* side, there continues to be a movement from *procedure volume–driven reimbursement* to *value-based purchasing* (VBP), with an increased focus on reimbursing providers based on *quality* over *quantity*, or *value* over *volume*. These changes represent a paradigm shift in U.S. healthcare delivery, with an increasing dependence on the value metrics derived from evidence-based medicine. However, there is continued uncertainty related to whether currently proposed mechanisms for implementing this new paradigm, for example, Accountable Care Organizations (ACOs), will be able to achieve the objectives of VBP, that is, high quality and beneficial outcomes in pursuit of lower overall costs.

At the same time, increased *regulatory* scrutiny regarding potential *anti-kickback* and other fraud and abuse violations will likely only continue to grow. The perceived success of the federal government's recovery of $4.2 billion in fraud and abuse violations in 2013 and more than 20 self-disclosures having been achieved through the *Stark Self-Disclosure Protocol* program, the most recent of which involved Intermountain Health System settling with the U.S. government for $25.5 million in False Claims Act

[1] Charles Fredrick Roos, *Dynamic Economics: Theoretical and Statistical Studies of Demand* (Bloomington, IN: Principia Press, 1934), p. 4.

violations, is acting to incentivize the size, scope, and intensity of concern and attention to the regulatory environment in which healthcare transactions occur.[2]

The *competitive* landscape for the healthcare industry will continue to traverse unchartered waters, with the advent of ACOs. the emergence of health insurance exchanges, and the looming *physician manpower shortage* in the face of growing demand from both: the anticipated influx of the new insureds under the ACA's *individual mandate* and the aging *baby boomer demographic*. The small to mid-size community hospital market is consolidating at an accelerating pace, and the number of physicians becoming employed by hospitals and health systems is expanding. These trends, together with the *corporatization* and *Walmartization* of medicine, have led to a dynamic by which the very nature of healthcare competition is being reformed, likely fueled in greater degrees by patient outcomes and coordinated care efforts across specialties and facility types.

While advancements in both *clinical* and *process technology* are developing at exponential rates, there are significant concerns regarding capital funding of these technologies and the appropriate value metrics to be used in assessing their efficacy and return on investment in an era of more limited federal and state government resources in the aftermath of the *Great Recession*, and the future uncertainty regarding the ultimate impact of the *Sequester*.[3]

Within this changing paradigm of U.S. healthcare delivery system transformation, new analytical techniques, research methods, and scholarship are evolving in the valuation profession. In light of the complexities, persistent vicissitudes, and relentless exigencies of the healthcare industry, the "*holy grail*" for the valuation profession is to achieve some sense of clarity as to the *reimbursement*, *regulatory*, *competitive*, and *technological environments* (*Four Pillars*) of the healthcare industry, as well as from the identification of those value drivers that may be observed from the transactional marketplace resulting from these four market forces. For those in

Pays U.S. $25.5 Million to Settle False Claims Act Allegations," http://www.justice.gov/opa/pr/2013/April/13-civ-378.html, April 3, 2013 (accessed April 14, 2013).

[3] Required the federal government to cut spending by $85 billion in fiscal years 2013.

the healthcare industry, especially those in the healthcare valuation profession who are seeking simplicity or easily obtainable and instantaneously available answers, the best advice, perhaps, is encompassed in the words of Alexander Dumas:

> *Until the day when God shall deign to reveal the future to man, all human wisdom is summed up in these two words*—"Wait *and* hope."[4]

In the meantime, life goes on; inexorable change occurs; transactions will take place; financial appraisal guidance will be sought; and valuation opinions, rendered. Accordingly, until that day arrives, we must endeavor to perform *now*, the highest quality financial appraisals, using the best data, research, scholarship, and analytical techniques available, in producing the most efficacious guidance possible as to the expectation of future *economic* benefit (i.e., *value*) to be derived from the ownership and/or control of *healthcare enterprises*, *assets*, *and services*.

Glossary

501(c)(3) Exemption Healthcare providers may qualify for a federal tax exemption if they meet the Internal Revenue Service (IRS) requirements for charitable organizations under section 501(c)(3) of the Internal Revenue Code (IRC), if the enterprise is "organized and operated exclusively for exempt purposes," and none of its earnings are allocated to private shareholders or individuals. Exempt purposes include those that are charitable, religious, educational, and scientific.

Accountable Care Organization (ACO) Healthcare organization in which a set of providers, usually physicians and hospitals, is held accountable under a contract with a payor(s) (i.e., Medicare for federal ACOs and any number of commercial payors for commercial ACOs) for the cost and quality of care delivered to a specific local population.

Accreditation Accreditation is a process in which private organizations assess participating institutions and programs and issue accreditation certificates to those that meet their requirements. Ensuring the quality and safety of services is the focus of most accreditation standards; however, many also include documentation and other requirements.

ACO Participant "An individual or group of ACO provider(s)/supplier(s), that is identified by a Medicare-enrolled TIN, that alone or together with one or more other ACO participants comprise(s) an ACO, and that is included on the list of ACO participants that is required under [42 CFR] § 425.204(c)(5)."

ACO Professional "An ACO provider/supplier who is either of the following: (1) A physician legally authorized to practice medicine and surgery by the State in which he performs such function or action; (2) A practitioner who is one of the following: (i) A physician assistant (as defined at [42 CFR] § 410.74[a][2]); (ii) A nurse practitioner (as defined at [42 CFR] § 410.75[b]); (iii) A clinical nurse specialist (as defined at [42 CFR] § 410.76[b])."

ACO Provider/Supplier "An individual or entity that (1) is a provider (as defined at 42 CFR § 400.202) or a supplier (as defined at [42 CFR] § 400.202); (2) is enrolled in Medicare; (3) bills for items and services it furnishes to Medicare fee-for-service beneficiaries under a Medicare billing number assigned to the TIN of an ACO participant in accordance with applicable Medicare regulations; and (4) is included on the list of ACO providers/suppliers that is required under [42 CFR] § 425.204(c)(5)."

Activity Ratios Ratios that indicate how efficiently the organization uses its resources or assets, including cash, accounts receivable, salaries, inventory, property, plant, and equipment.

Ad Valorem Tax A tax that is generally determined to be a fixed or calculated proportion of the value of the property as assessed or appraised on a regular basis.

Adverse Drug Effect (ADE) An injury caused by drugs, typically in the form of an allergic reaction or adverse physiological responses to a certain combination of medications. Preventable ADEs are injuries that are caused by human error.

Alert Fatigue CPOE error caused by a combination of critical medical alerts and a high volume of marginally medically consequential alerts.

Allied Health Professionals Providers who practice "parallel" to physicians but provide a scope of services that is distinctly different from physicians, representing 60 percent of the U.S. healthcare workforce, providing diagnostic, technical, and therapeutic services both incident to (supporting) or in lieu of (replacing) physicians.

Allopathic "A method of healing founded on a scientific basis."

Allopathy The traditional form of medicine, whereby interventions and remedies are used to treat various illnesses or conditions.

Ambulatory Surgery Center (ASC) A freestanding facility that is certified by Medicare that performs certain types of same-day procedures on an outpatient basis without hospitalization.

Ancillary Services and Technical Component (ASTC) Professional charges for patient services that are delivered in conjunction with the principal practitioner who diagnoses and treats the patient. The technical component of billing, with its own CPT codes, includes equipment, supplies, and facilities.

The Anti-Kickback Statute The federal Anti-Kickback Statute makes it a felony for any person to "knowingly and willfully" solicit or receive or to offer or pay any "remuneration" directly or indirectly in exchange for the referral of a patient for a healthcare service paid for by a federal healthcare program.

Antitrust A body of law charged with combating anticompetitive behavior that would impair the ability of free markets to function properly. Antitrust involves the regulation of mergers and acquisitions, as well as scrutiny of behavior between competitors that may restrain trade.

Any Willing Provider Laws Laws that require managed care plans to contract with all healthcare providers that meet their terms and conditions.

Appraisal Consulting The development and reporting of a recommendation, analysis, or opinion to solve a problem.

Appraisal Report The development and reporting of an opinion of value of a business enterprise or equity interest in a business entity.

Appraisal Review The development and reporting of an opinion regarding the quality of an appraisal report.

Arithmetic Mean The average value of historical data used as a measure of central tendency.

Assisted Living A type of living arrangement in which meals, shelter, transportation, and the activities of daily living are provided either in-home or in a centralized location.

Average Sales Price (ASP) A way of calculating a benchmark, from which Medicare reimbursement for drugs may be determined, based on average manufacturer prices supplied by pharmaceutical companies.

Average Wholesale Price (AWP) A way of calculating a benchmark from which pharmacy contracting and Medicare reimbursement for drugs may be determined, based on the average price a drug wholesaler sells a particular drug.

Avoided Costs A quantifiable amount of a future necessary economic operating expense that a purchaser will not have to pay on purchasing certain intangible assets, for example, a trained and assembled workforce.

Benchmark A reference point derived from similar processes or services in an industry, among competitors, or in an internal organization, in order to set a level of care as a goal to be attained.

Beta Estimation A regression technique that measures the marginal sensitivity of the selected publicly traded entity's returns to changes in the returns of the market as a whole or a suitable proxy for the market.

Biobank/Biorepository A "warehouse" that collects, catalogs, and stores samples of bodily substances and reference materials, which may then be used to identify unknown samples in furtherance of scientific research and development.

Biologics Therapeutic products that are developed using living sources; examples of biologics include vaccines, blood and blood products, and allergenic extracts and tissues.

Biomarkers An important tool for diagnosing and monitoring cancer; however, some critics believe biomarkers, as a clinical treatment process, were a failure.

Biopharmaceuticals A pharmaceutical product manufactured by biotechnology methods (involving live organisms or bioprocessing).

Biosimilar Production The redevelopment of new generation biologics.

Blockage Discount A price concession that will typically be accepted by a controlling interest holder of a freely traded company when selling a large block of stock at one time.

BlueCross BlueShield BlueCross provides beneficiaries with health insurance to cover hospital expenses, while BlueShield provides insurance to cover expenses associated with physician services. Together, they form BlueCross BlueShield, and the BlueCross Blue Shield Association (BCBSA) works to coordinate the nationwide plans by establishing standards for new plans and programs; assisting local plans with enrollment activities, national advertising, public education, professional relations, and statistical and research activities; and serving as the primary contractor for processing Medicare hospital, hospice, and home health claims.

Bond Issue The underwriting of the bond issuance by an investment bank, often referred to as "floating" the bond, which is then auctioned to the market, and the required return is inferred from the price information provided by actual transactions in that specific debt offering.

Brachytherapy A cancer treatment that allows for higher doses of radiation to treat a smaller area in a shorter time by placing radiopharmaceuticals directly inside or next to the tumor. Brachytherapy can be temporary or permanent, with variable administration rates and doses.

Brownfield Site An abandoned, idled, or underused industrial or commercial site that is difficult to expand or redevelop because of environmental contamination.

Bundling A form of reimbursement that combines institutional and professional charges into a single payment, including all staff for preoperative and

postoperative care. Bundled payment schemes generally include outlier provisions for cases that become catastrophic.

Butler-Pinkerton Method A valuation calculator that attempts to measure total cost of equity and public company–specific risk.

Caduceus Double serpent winding around a staff; a symbol for medicine.

Cancer Treatment Center A facility that provides treatment for the chronic condition and focuses on disease management; often provides chemotherapy and radiation therapy.

Capital Asset Pricing Method A technique that defines the riskiness of an investment relative to the overall riskiness of the market, resulting in the assumption that all things being equal, investors will require greater compensation for greater risk.

Capitation Capitation is a prepaid reimbursement method that pays a provider a set price for providing medical services to a defined population for a defined set of services, regardless of service utilization. Providers must manage the financial risk of providing adequate care by calculating the expected volume of referrals, the average cost, and their ability to control utilization.

Cash Flow The reported net income of a corporation, plus amounts charged off for depreciation, depletion, amortization, and extraordinary charges to reserve accounts for the particular year under consideration.

C-Corporation A taxable entity where earnings given to shareholders are subject to double taxation as corporate earnings and as personal dividends.

Centers for Medicare and Medicaid Services (CMS) An agency within the U.S. Department of Health and Human Services responsible for the administration of Medicare, Medicaid, and other programs.

Certificate of Need (CON) The formal justification of capital expenditures from a governmental healthcare agency, especially for a new specialty hospital, outpatient center, medical clinic, and so forth.

Charge Capture Charge capture entails the transfer of the provider's coding and documentation to the actual bill. Providers are tasked with recording the appropriate procedure and diagnosis codes on an encounter form, and the business staff is responsible for ensuring that the encounter form is accurate and then using it to bill patients and third-party insurers.

Children's Health Insurance Program (CHIP) CHIP is a state-federal partnership that provides assistance to children and pregnant women in families whose income is above the threshold for Medicaid. It was formerly known as the State Children's Health Insurance Program (SCHIP).

Chiropractic A form of alternative medicine originating from the belief that vertebral lining would serve to remedy diseases.

Chiropractors Chiropractic treatment focuses on spinal manipulation (referred to as spinal adjustment) and the body's natural power to heal itself without relying on drugs or surgery. Chiropractors use various forms of therapy, including massage, ultrasound, electric, acupuncture, or heat, and various supports (e.g., braces) in providing patient care.

Civil Monetary Penalty Financial penalties levied against parties found guilty of violating the Anti-Kickback Statute or submitting false claims for government reimbursement.

Civilian Health and Medical Program of the Department of Veteran Affairs (CHAMPVA) The Civilian Health and Medical Program of the Department of Veteran Affairs is the Department of Veterans Affairs' (VA) healthcare program for the spouses and the children of veterans who meet certain eligibility requirements.

Civilian Health and Medical Program of the Uniformed Services (CHAMPUS) CHAMPUS is the former name for TRICARE.

Clearinghouses Companies that assesses provider claims for errors and securely forward the bill to the correct payor.

Clinical Decision Support (CDS) Clinical decision support is a technology that provides clinicians with real-time feedback about a wide range of diagnostic and treatment-related information as they are entering electronic orders.

Clinical Laboratory Services provided at these sites involve the collection and examination of bodily materials for the purpose of diagnosing, preventing, treating, and assessing an illness or condition.

Co-Management Arrangements A Co-Management Arrangement is formed between a hospital and a group of physicians for the purpose of the physicians providing "co-management" services for a portion of the hospital's business, typically a service line related to the specialty of the participating physicians.

Commercial Reasonableness The Department of Health and Human Services has interpreted *commercially reasonable* to mean that an arrangement appears to be "a sensible, prudent business agreement, from the perspective of the particular parties involved, even in the absence of any potential referrals." The Stark II, Phase II, commentary also suggests that "an arrangement will be considered 'commercially reasonable' in the absence of referrals if the arrangement would make commercial sense if entered into by a reasonable entity of similar type and size and a reasonable physician of similar scope and specialty, even if there were no potential DHS referrals."

Complementary and Alternative Medicine Healthcare services that fall outside the scope of conventional allopathic and osteopathic medical practice.

Computerized Physician Order Entry A computer system that permits clinical providers to electronically order laboratory, pharmacy, and radiology services.

Conditional Mean Predictive models that condition their expected value based on the time path of the endogenous variable and/or the level (or changes) in certain exogenous variables.

Congregate Care A combination of "private living quarters with centralized dining services, shared living spaces, and access to social and recreational activities," as well as "transportation services, personal care services, rehabilitative services, spiritual programs, and other support services," but that are not licensed to provide healthcare services.

Control Interest An ownership interest with the authority to alter the strategic financial and economic operations and goals of the firm.

Cosmetic and Aesthetic Medicine Centers These centers provide outpatient surgical services related to the elective enhancement of an individual's appearance.

Cosmetic Surgery The elective enhancement of an individual's appearance and self-esteem through fundamental medical and surgical knowledge and expertise.

Cost of Capital A key component of the income-based valuation approaches is the determination of the appropriate discount rate to apply to the expected future economic benefit to be derived from the ownership of the subject entity.

C-suite A slang term used to describe the top tier of decision makers within an enterprise, based off the first letter of their title, for example, CEO, CMO, COO, and so on.

CT Scanning The process of making a computed tomography image.

Current Procedural Terminology (CPT) A system developed by the AMA that is used by providers to report information to patients and insurers about services and procedures provided to patients.

Customary Prevailing and Reasonable (CPR) The historically implemented methodology that based Medicare-allowed amounts on past payments for the service.

Debt All monies, notes, and bonds owed by an enterprise.

Degrees of Freedom The number of possible rotations that can be made by a robotic "hand."

Dental HMOs Capitation plans in which a dental provider is paid a fixed amount per patient, regardless of the number of dental services actually provided for that patient.

Depreciation The continuous decline in value of an asset (including buildings, instruments, and equipment) in the course of its operations.

Designated Health Professional Shortage Area Areas designated by the Health Resources and Services Administration (HRSA) as having shortages of primary medical care, dental, or mental health providers and may be geographic (a county or service area), demographic (low-income population), or institutional (comprehensive health center, federally qualified health center, or other public facility).

Designated Health Service "Categories of healthcare entities subject to the Stark Law: (1) Clinical lab services; (2) Physical therapy, occupational therapy, and speech-language pathology services; (3) Radiology and other imaging services (including nuclear medicine as of January 1, 2007); (4) Radiation therapy services and supplies; (5) Durable medical equipment and supplies; (6) Prosthetics, orthotics, and prosthetic devices and supplies; (7) Home health services; (8) Outpatient prescription drugs; (9) Inpatient hospital services; (10) Outpatient hospital services; and (11) Parental and enteral nutrients, associated equipment, and supplies."

Diagnostic Imaging Centers An outpatient service center that provides CTs, PETs, MRIs, X-rays, and other imaging procedures.

Diagnostic Related Groups (DRG) A classification system of patients by surgical procedure or diagnosis into major diagnostic categories for the purpose of Medicare reimbursement of hospitalization costs.

Dialysis Centers Centers that provide in-center hemodialysis, hemofiltration, peritoneal dialysis, pharmacy, and lab services, as well as home hemodialysis and home peritoneal dialysis training and services.

Discount The percentage or dollar amount below net asset value at which an entity is sold.

Discount for Lack of Marketability The reduction in price demanded by investors as compensation for the perceived difficulty in converting an asset into cash or its equivalents, relative to a similar, more easily converted asset.

Discounted Payback Period An analytical technique that determines the number of discrete periods "until the sum of the discounted cash flow is equal to the initial investment."

Discounting The reduction in value caused by uncertainty.

Disproportionate Share Hospital (DSH) Payments A form of additional reimbursement under Medicaid for hospitals that care for a large number of Medicaid and uninsured patients. DSH payments are allotments from the federal government that augment basic Medicaid reimbursement, and under federal law, states are required to supplement disproportionate share hospitals in order to receive this additional Medicaid funding.

Distributor In the supply chain, a distributor is a company that acts as middleman between the manufacturer and the seller.

Dual Eligibles Those beneficiaries who are eligible for benefits under both the Medicare and Medicaid programs, traditionally consisting of older, poor, costly patients with lower health status.

Durable Medical Equipment (DME) Medical equipment designed to improve the quality of life of patients with illnesses or injuries and must be able to withstand repeated use, primarily serve a medical purpose, and generally not be useful to a person lacking an injury or illness.

Easement An interest in land owned by another person, consisting in the right to use or control the land, or an area above or below it, for a specific limited purpose.

Eclectic Medicine A school of medicine that uses herbal medicines and remedies to treat pathologic conditions; among less threatening therapies, eclectics were branded for their use of arsenic and mercury treatments.

Electronic Health Record (EHR) "An electronic record of health-related information on an individual that comes to nationally recognized interoperability stands and that can be created, managed, and consulted by authorized clinicians and staff across more than one health care organization."

Electronic Medical Record (EMR) "An electronic record of health-related information on an individual that can be created, gathered, managed, and consulted by authorized clinicians and staff within one health care organization."

Emerging Healthcare Organization (EHO) Physicians, hospitals, healthcare systems, clinics, and payors who are innovating, integrating, or merging because of the constant competitive influx of the healthcare industry.

End Stage Renal Disease The final stage of kidney failure, marked by the complete or nearly complete irreversible loss of renal function, where the body retains fluid and harmful waste build-up.

Enteral Into the digestive system.

Epidural Into the membranes surrounding the spinal cord.

Episode-Based Payment A form of Episode of Care payment that is synonymous with bundling.

e-Prescribing Submitting drug prescriptions to pharmacies via an electronic system.

Equity The money value of property, or interest in property, after all claims have been deducted.

Essential Coverage A federally mandated minimum level of coverage that every U.S. citizen must obtain unless an exemption applies. Coverage includes government-sponsored programs, eligible employer-sponsored programs, plans in the individual market, and grandfathered group health plans, as well as some other types of coverage.

Exam Lane Refers to the area where optometrists assess the patient's visual acuity, eyes, and systemic health, in determining the appropriate prescription and/or course of treatment required by the patient.

Excess Benefit Transactions A transaction in which an economic benefit is provided by an applicable tax-exempt organization, directly or indirectly, to or for the use of a disqualified person, and the value of the economic benefit provided by the organization exceeds the value of the consideration received by the organization.

Excess Capacity The actual output of a firm, an industry, or an economy is below the rate at which all resources are fully employed.

Exclusive Provider Organization A managed care plan in which patients must use a participating, in-network provider for nonemergency services or receive no insurance reimbursement and have to self-pay.

External Beam Radiation Therapy (EBT) Involves the administration of high-energy X-ray beams to kill cancer cells and treat tumors. Often, some X-ray, ultrasound, or CT imaging is used prior to the delivery to ensure that the path of the beam will align with the target area.

Extraordinary Collection Actions Actions taken by a hospital facility against an individual related to obtaining payment of a bill for care covered under the hospital facility's FAP that (1) require a legal or judicial process, (2) involve selling an individual's debt to another party, or (3) require reporting adverse information to consumer credit reporting agencies or credit bureaus.

Fair Market Value (FMV) The value in arm's-length transactions, consistent with general market value, without taking into account any ability between parties to refer business to each other.

Fair Value The price that would be received to sell an asset or paid to transfer a liability (an exit price) in an orderly transaction between market participants at the measurement date.

Fairness Opinion "[A] view as to whether the consideration offered in a deal is within the range of what would be considered 'fair.'"

False Claims Act (FCA) Creates civil liability for knowingly presenting false or fraudulent claims for reimbursement to the federal government. Amended in 1986, it has become one of the primary weapons used to combat healthcare fraud. Under the statute's qui tam (whistleblower) provisions, any private citizen can enforce the FCA by filing a complaint alleging fraud against the federal government. The incentive is the potential to share in the recovery of any ill-gotten funds.

Fee-for-Service A payment policy under which providers receive a fee for each service provided (e.g., an office visit, test, procedure, etc.).

Fee Schedule A fee schedule is a payment system under which the fees for procedures are explicitly laid out and the physician agrees to accept those fees as full payment, unless the discounted charges are less than the fee schedule, in which case the plan pays the lesser of the two.

Financial Relationship An ownership or investment interest in the DHS entity, or a compensation arrangement between the DHS entity and the referring physician or a member of his immediate family. The law further describes "ownership/investment interest" to include debt, equity, or other means. The term also includes an interest in an entity that holds an ownership or investment interest in any entity providing DHS services.

Financial/Revenue Stream–Related Intangible Assets Includes office share arrangements, management service agreements, and financing agreements, including options.

Follow-On Biologics New generation biologics.

Full-Time Employees Employees who work, on average, at least 30 hours of service per week.

Functional Obsolescence The loss of utility resulting from the inefficiencies of the asset, as compared to a more efficient or less costly replacement asset.

Fundamental (Intrinsic) Value A representation of an analytical judgment of value based on the perceived characteristics inherent in the investment, not tempered by characteristics peculiar to any one investor, but rather tempered by how these perceived characteristics are interpreted by one analyst versus another.

Fungible Commodity A good whose units are freely exchangeable and interchangeable.

Gainsharing An arrangement "under which a hospital gives physicians a share of the reduction in the hospital's costs (that is, the hospital's cost savings) attributable in part to the physician's efforts."

Gamma Knife A therapy that employs computerized robotic technology to move patients at submillimeter increments during treatment.

Gene Therapy Molecular means of cancer treatment.

General Data General industry research and information relative to the economic, demographic, industry, competition, healthcare industry and medical specialty trends, and the managed care environment surrounding the subject entities, as well as transactional data, investment risk/return information, and market environment reports.

General Research General industry research and information relative to the general economic and demographic trends, competition, general healthcare industry trends, specialty trends, and managed care environment, specific to the subject property interest.

Genomics The evaluation of the hereditary information provided by an organism's DNA and the application of research findings to the fields of genetic engineering and enhancement, cloning, stem cell research, and eugenics.

Goodwill An intangible asset arising as a result of name, reputation, customer loyalty, location, products, and similar factors not separately identified.

Governance/Legal Structure–Related Intangible Assets Organizational documents, income distribution plans, and covenants not to compete.

The Great Recession An 18-month global economic recession lasting from December 2007 to July 2009, in which industrial production fell 16 percent in the United States.

Gross Domestic Product (GDP) A measure of the total flow of goods and services produced by the economy over a specified time period (e.g., one year), calculated using an aggregate value of the output of goods and services used for final consumption or investment.

Group Purchasing Organization (GPO) An organization that leverages the buying power of a group of healthcare organizations to obtain contracted discounts from vendors.

Health Information Technology (HIT) A technology that improves "the health of individuals and the performance of providers, yielding improved quality, cost savings, and greater engagement by patients in their own health care."

Health Insurance Exchange (HIE) "Public markets" for health insurance plans available within a state.

Health Maintenance Organization (HMO) Any organization that, through an organized system of healthcare, provides or ensures the delivery of an agreed-on set of comprehensive health maintenance and treatment services for an enrolled group of persons, commonly under a capitation or prepaid fixed sum arrangement.

Health Savings Account (HSA) Special accounts into which employers and employees both contribute, and from which the employee can draw funds to pay for health services. If the employer contributes, the value of those contributions is not taxable to the employee. Similarly, if the employee makes contributions, they count as "above-the-line" deductions.

Hemodialysis The process of filtering blood through an artificial membrane, known as a dialyzer, to remove wastes and excess fluids, which is most often provided in a dialysis facility three times a week for three to four hours per treatment.

Hemofiltration A technique for the treatment of ESRD patients that removes fluid, electrolytes, and other toxic substances from the blood by filtration.

High Deductible Health Plan (HDHP) A type of "catastrophic coverage" health insurance coverage with lower premiums and higher deductibles than traditional plans; it is a requirement for having an HSA. Defined by the IRS as a "health plan with an annual deductible that is not less than $1,200 for self-only coverage or $2,400 for family coverage, and the annual out-of pocket expenses (deductibles, co-payments, and other amounts, but not premiums) do not exceed $6,050 for self-only coverage or $12,100 for family coverage."

Home Health Healthcare services that are offered to patients in their homes, including (1) home healthcare enterprises, which provide medical and supportive care; (2) home care aide enterprises, which provide nonmedical care or custodial care; and (3) hospice enterprises, which provide end-of-life care.

Homeopathic Medicine CAM whole medical system centered on the belief that "like cures like," in which small, diluted medicinal remedies are given to cure symptoms that, in high concentrations, these substances would actually induce.

Homogeneous Enterprise An enterprise that is similar or uniform in structure and quality to a subject enterprise.

Hospital Outpatient Department A department that typically offers many of the same services provided by freestanding outpatient enterprises, has access to the market leverage maintained by the parent hospital organization, and is reimbursed under the OPPS.

Hospitals Institutions where the sick or the injured are given medical or surgical care.

Human Capital–Related Intangible Assets Staff/employee and provider employment agreements, trained and assembled workforce in place, policies and procedures, and depth of management.

Independent Laboratory A laboratory that receives samples from a hospital or a physician practice for diagnostic or pathologic testing; does not collect specimens from patients directly.

Independent Practice Association (IPA) An IPA is an association of independent physicians who maintain their own private practices but have joined together to enter into an agreement to treat the plan's enrollees.

Individual Mandate An ACA requirement that U.S. citizens and legal residents maintain minimum amounts of health insurance coverage, that is, "essential coverage."

Industrial Hygiene "The science of keeping people safe at work and in their communities. Industrial hygienists (IHs) are professionals dedicated to the health and well-being of workers. Originally, industrial hygienists worked primarily in factories and other industrial settings but as our society has changed, so has the definition of industrial hygiene. Today, IHs can be found in almost every type of work setting. Industrial hygienists also use the term OEHS or occupational and environmental health and safety to refer to the work that they do."

Industrial Medicine Casualty insurance for laborers that delineated between medical care for work-related injuries and that for work-acquired diseases.

Initial Public Offer (IPO) The first time a business, which was previously a privately held firm, issues publicly traded shares of stock.

Intangible Assets Nonphysical business assets that grant certain rights and privileges, including copyrights, trade names, services marks, brand names, and so on.

Integrated Delivery System An organized system of healthcare providers spanning a broad range of health services, optimizing costs and outcomes, and accepting and managing financial arrangements to deliver care to a defined population.

Integrated Outpatient Facility A center that involves a multidisciplinary program whereby a team of medical specialists provides services to patients at the same location, allowing for a true multidisciplinary assessment of the patient's condition and the development of a cohesive and integrated plan of care.

Intellectual Property–Related Intangible Assets Practice protocols, treatment plans, procedure manuals, technical and specialty research, patents and patent applications, copyrights, trade names, and trade secrets.

Intensity Modulated Radiation Therapy (IMRT) An advanced form of radiation therapy using three-dimensional (3D) imaging and treatment delivery.

Internal Rate of Return An analytical technique that determines discount rate, which, when applied to the expected net economic benefits of the subject property interest, results in a zero net present value.

International Classification of Diseases, Ninth Revision (ICD-9) The ICD-9 system has codes that supply the payor with information regarding both the patient diagnosis and the procedures performed in treating the diagnosis. HIPAA requires all healthcare providers to use the ICD-9 codes when reporting diagnosis information to payors. In addition, HIPAA requires that hospitals use the ICD-9 procedural codes when reporting information to payors detailing the treatment of hospital inpatients.

International Classification of Diseases, Tenth Revision (ICD-10) In early 2009, the United States Department of Health and Human Services (HHS) announced a final rule that called for the replacement of the current ICD-9 code set used to report healthcare diagnoses and procedures with the ICD-10 code set by October 1, 2013. The adoption of the new system offers several benefits, including the facilitation of quality data reporting, support for pay for performance payment methodologies, improved billing accuracy, and allowances for international comparison of the incidence and spread of disease.

Intravenous Through the bloodstream.

Inurement of Private Benefits An exempt organization is organized or operated for the benefit of private interests. The IRS has stated that "[n]o part of the net earnings of a section 501(c)(3) organization may inure to the benefit of any private shareholder or individual[, whereby] a private shareholder or individual is a person having a personal and private interest in the activities of the organization."

Investment Value The specific value of an investment to a particular investor or class of investors based on individual investment requirements, distinguished from market value, which is impersonal and detached.

Key Person Discounts A reduction in the ownership value of an entity due to the actual or real loss of an owner or a key person.

Kickback Remuneration received in return for referring an individual to a person for the furnishing of any item or service for which payment may be made under a federal health care program, or remuneration received in return for purchasing, leasing, ordering, or arranging for or recommending purchasing, leasing, or ordering any good, facility, service, or item for which payment may be made under a federal health care program.

Laboratories Facilities that provide an isolated setting in which samples of tissues, fluids, and other bodily substances can be tested and/or stored; may be located within an inpatient or outpatient facility or may operate as a freestanding facility.

Land Improvements Relatively permanent structures built on, or physical changes made to, a property to increase its utility and value.

Laparoscopy Minimally invasive surgery that involves the insertion of a slender tubular endoscope through the abdomen wall. A laparoscopy involves the use of surgical instruments that the practitioner controls and fiberoptic technology for visual navigation.

Legal Medicine A branch of medicine also referred to as medical jurisprudence; involves the implementation of medical expertise for legal and judicial purposes.

Length of Stay (LOS) The number of consecutive days a patient is hospitalized.

Leverage Ratios Ratios used to illustrate the proportion of funds, or capital, provided by shareholders (owners) and creditors to aid analysts in assessing the appropriateness of an organization's current level of debt.

Licensure Licensure is a governmental body's process of issuing a license, or a federal or state charter granting its holder the right to practice a profession, such as medicine, podiatry, dentistry, law, and so on.

Linear Accelerator (LINAC) A cancer treatment that delivers uniform doses of high-energy X-rays to the localized area of the patient's tumor, while sparing the surrounding normal tissue. It is the device most commonly used for EBT treatments for patients with cancer.

Liquidity Ratios Ratios that measure the ability of an organization to meet cash obligations as they become due, that is, to support operational goals.

Lockboxes Instead of handling the collection and processing of payments themselves, providers may decide to use a lockbox service. For a fee, lockbox services open a provider's mail, collect payments, and deposit the money into the provider's account.

Long-Term Care Ongoing health and social services provided for individuals who need assistance on a continuing basis because of a physical or mental disability; can be hospital-, home-, or community-based and involve formal and informal care by friends, family, or professionals.

Long-Term Care Hospital A Medicare term for a hospital whose average length of stay (LOS) is more than 25 days and is not otherwise a mental health or rehabilitation hospital.

Managed Care Managed care plans integrate the financing (i.e., insurance) and provision of health services under the administration of one organization in an effort to contain costs.

Management Service Organization A corporation owned by the hospital or by a physician-hospital joint venture that provides management services to one or more medical group practices.

The Market Approach The approach to value where recent sales and offering prices of similar property are analyzed to arrive at an indication of the most probable selling price of the property being appraised.

Market Basket A varied combination of healthcare products, goods, and services.

Market Basket Index An index of the annual change in the prices of goods and services providers used to produce health or other goods and services. There are separate market baskets for prospective payment systems (PPSs), hospital operating input and capital input, skilled nursing facilities (SNFs), and outpatient services and facilities.

Marketing and Business Development–Related Intangible Assets Advertising, franchise/licensing agreements, and joint ventures/alliances.

Median of the Historical Data A measure of central tendency that establishes the value of a data set with an equal number of greater and lesser values within the dataset and is resistant to the effects of outliers.

Medicaid Medicaid is a means-tested, state-administered health insurance program for individuals below certain income thresholds predetermined by the state in which they reside. The federal government establishes coverage requirement

guidelines for the categorically needy (e.g., children, pregnant women), medically needy (e.g., individuals with income above the threshold but who have a large amount of medical bills), and special groups. Although the federal government determines the medical services that will be covered and paid for by the federal portion of the program, Medicaid programs vary widely from state to state, as the state governments are free to add additional services or expand eligibility to additional groups.

Medical Imaging A "non-invasive process used to obtain pictures of the internal anatomy or function of the anatomy using one of many different types of imaging equipment and media for creating the image."

Medical Laboratory A facility that offers isolated conditions for which samples of tissues, fluids, and other bodily substances can be tested or housed.

Medical Loss Ratio (MLR) The relationship of medical insurance premiums paid out for claims, comparing the cost of providing services to the amount paid for that service.

Medicare Medicare is an entitlement program available to individuals over the age of 65 and individuals with End Stage Renal Disease (ESRD). Medicare is divided into four parts: (1) Part A, which covers inpatient hospital care; (2) Part B, which covers outpatient visits; (3) Part C, which people can choose as a managed care replacement of Part A and B; and (4) Part D, which covers prescription drug benefits.

Medicare Part A "The Democratic plan for a compulsory hospital insurance program under Social Security."

Medicare Part B "The revised Republican program of government-subsidized voluntary insurance to cover physicians' bills."

Metropolitan Statistical Area Typically, a geographic area that includes one city with at least 50,000 inhabitants.

Midlevel Provider Health practitioners who must hold a license to practice medicine and may (in some capacity) practice independently.

Minimum Essential Coverage Level of coverage that includes insurance offered in the individual market (such as a qualified health plan enrolled in through an Affordable Insurance Exchange), an eligible employer-sponsored plan, or government-sponsored coverage, such as Medicare, Medicaid, the Children's Health Insurance Program, TRICARE, or veteran's health.

Minority Interest An ownership interest that lacks the aspects of control necessary to direct the economic and financial strategies employed by the firm, that is, anything less than a majority interest in a firm.

Modifier A code that is added to a base code (e.g., DRG or CPT) to take into account a circumstance that may affect the cost of care.

Monopsony "A single purchaser in a healthcare market without rivals."

National Center for Human Genome Research Institute (NCHGRI) A research institute composed of more than 50 researchers who are each dedicated to specific facets of genetic and genomic research and contribute accordingly to one of seven branches of the NCHGRI.

National Committee on Quality Assurance (NCQA) A not-for-profit organization that works to improve the quality of healthcare through the accreditation of

managed care plans. NCQA performs this duty, much as do other accrediting bodies, through the setting of standards and the collection of outcome and performance data.

Naturopathic Medicine A school of medicine that uses natural elements (such as water, heat, and massage) in its therapies.

Naturopathy A whole medical system centered on the belief that the body's healing power is responsible for sustaining, maintaining, and restoring health.

Net Present Value An analytical technique that determines the difference between the total initial economic expense burdens (e.g., initial cash outlays) and the total expected risk-adjusted future net economic benefits (e.g., present value of the future net cash flow).

Niche Providers Providers who focus on a section or a group of buyers, a segment of a product line, or a specific area of a geographic market. What specific area niche providers focus on will change, based on who is creating the definition.

NightHawk Radiology Services The nation's first nighthawk company. The company was acquired by Virtual Radiologic in September 2010.

Nonparenteral Drug Delivery A means of drug delivery where the distribution is through a method other than a digestive one.

Nonparticipating Provider Nonparticipating providers are providers that have not agreed to accept the Medicare reimbursement amount for every claim. Yet nonparticipating providers are allowed to accept Medicare assignment on a claim-by-claim basis, if they agree certain conditions. However, it should be noted that even though they have not accepted Medicare's fee as payment in full, nonparticipating providers are subject to a "limiting charge," which dictates what they may charge Medicare beneficiaries for covered services.

Normalized Earnings Amount The single dollar amount, derived from the adjusted earning of the subject entity over a number of years, which best represents the earnings capacity of the subject entity, based on the historical performance.

North American Industry Classification System (NAICS) Adopted in 1997 to replace the SIC code system, the one- to six-digit NAICS codes have become the primary standard for industry classification for U.S. statistical purposes.

Nurse Licensure Compact An interstate license for nurses created in 2000 by the National Council of State Boards of Nursing.

Omnibus Budget Reconciliation Acts Acts that make changes to taxes and other various payment systems, including fraud and abuse, that affect healthcare delivery.

One-Sided Model "A model under which the ACO may share savings with the Medicare program, if it meets the requirements for doing so, but is not liable for sharing any losses incurred under subpart G of this part."

Operations-Related Intangible Assets Computerized management information systems that produce customized reports on the financial, operating, and patient outcome performance of the subject enterprise to aid in future management decision making and strategic planning.

Operatory The space and equipment used in the provision of professional dental services.

Optometrists Optometrists are the primary providers of eye and vision-related care, providing primary eye care to two-thirds of U.S. patients. Optometrists are

trained to examine patients' eyes to determine the nature and degree of vision problem and to diagnose, treat, and manage diseases, injuries, and disorders of the visual system, including a patient's eyes and associated structures.

Osteopathic A school of medicine that involves the assessment of overall health and environment, not just symptoms.

Osteopathy A "whole person" approach to medicine, whereby physicians examine the whole body under the philosophy that health systems, for example, the musculoskeletal system, assist the body's natural ability to heal.

Outliers Data points included within the data set that appear to be significantly different than the other members.

Pain Management Center A center offering services that focus on the diagnosis and management of chronic pain, generally through the use of a multidisciplinary approach. Multidisciplinary pain centers typically include physicians, psychologists, nurses, and physical and occupational therapists.

Participating Provider A participating provider is one who has agreed to accept the reimbursement amount set by the Medicare Fee Schedule as payment in full for every claim. The physician may bill the patient for his or her share of the coinsurance and the deductible, but the physician cannot balance bill the patient, (i.e. attempt to collect the difference between his or her usual fee and Medicare's lower allowed charge).

Pasteurization Widely used today in the preservation of perishable products, pasteurization involves the strategic application of heat to kill microbes without injuring the quality of its media (i.e., wine, beer, etc.).

Patient-Centered Medical Home (PCMH) A model of healthcare delivery that approaches the delivery of services through coordinated, centralized patient care, with an emphasis on the primary care physician as the manager of a beneficiary's care.

Patient Protection and Affordable Care Act (ACA) Landmark U.S. healthcare reform legislation passed on March 23, 2010.

Payback Period An analytical technique that determines the number of discrete periods "it takes before the cumulative forecasted [undiscounted] cash flow equals the initial investment."

Pay-for-Performance (P4P) Pay-for-performance (P4P) is a remuneration system in which part of the payment is dependent on performance as measured against a defined set of criteria. Although a P4P system can be structured in several ways, the common elements to all systems are (1) a set of targets or objectives that define what will be evaluated; (2) measures and performance standards for establishing the target criteria; and (3) rewards—typically, financial incentives—that are at risk, including the amount and the method for allocating the payments among those who meet or exceed the reward threshold.

Payor Mix The allocation of reimbursement sources for a medical facility, clinic, or provider.

Personal Health Record (PHR) "An electronic record of health-related information on an individual that conforms to nationally recognized standards and that can be drawn from multiple source while being managed, shared, and controlled by the individual."

Personalized Medicine The fusion of molecular diagnostics and therapeutic measures for specialized screening and treatment plans.

Pharmaceutical Benefit Management (PBM) Generally, a private firm that contracts with pharmacies to provide drug administration services, particularly claims processing and administrative functions.

Physician Hospital Organization (PHO) Organizations that unite a hospital, or a group of hospitals, and a physician organization through a contractual relationship for the purpose of contracting with managed care organizations.

Physician Practices Management Company (PPMC) Management firms that specialize in the management of large group practices or independent practice associations through ownership, management agreements, or both.

Physician Preference Items (PPI) Expensive medical devices, such as orthopedic implants, heart valves, bone products, balloons, and wires.

Physiotherapy A term used to describe various kinds of medical therapy, including hydrotherapy, massage, mechanotherapy, electrotherapy, and heat therapy.

Picture Archives and Communications Systems (PACS) Systems that connect digital X-rays and other imaging modalities. Has become a must for efficient imaging services, as it provides improved access to images with reduced delays.

Podiatrists Podiatrists are the only medical professionals trained exclusively to provide total care of the foot. Podiatric treatment can include a multitude of invasive and noninvasive therapies. Treatments can include the prescription of medication and/or orthotics, surgical procedures, the establishment of the therapeutic programs for patients, and the application of appliances to feet or footwear.

Podiatry A health profession concerned with medical and surgical treatment of disorders of the foot, the ankle, and related structures of the leg.

Point-of-Care Technology New Technologies that help manage patient treatment plans.

Point-of-Service Plans (POS) POS plans combine many of the elements of HMOs and PPOs. POS plans are usually an addition to an HMO product that allows members the benefit of seeking care from nonparticipating providers. As with an HMO, when members seek care from in-network providers, they typically pay no deductible or coinsurance. However, similar to a PPO, members are free to seek services outside the network, subject to higher cost sharing in the form of deductibles and coinsurance.

Preferred Provider Organization (PPO) The PPO, a hybrid of an HMO and a traditional health insurance plan, is a managed care plan that allows members to choose from an array of healthcare providers that have contracted with the plan to provide services on a discounted basis.

Primary Care Physician (PCP) A physician who provides general treatment for routine illness and injuries; his or her practice focus includes internal medicine, preventive medicine, family or general practice, OB/Gyn, and pediatrics.

Private Equity Any nonpublic source of equity.

Profitability An indication of the overall net effect of managerial efficiency of the enterprise.

Prospective Payment System (PPS) A system used by Medicare to pay medical providers, hospitals, and clinics a set amount of money per diagnostic related group (DRG).

Protected Health Information Protected health information is individually identifiable health information that is transmitted by, or maintained in, electronic media or any other form or medium. This information must relate to (1) the past, present, or future physical or mental health or condition of an individual; (2) the provision of healthcare to an individual; or (3) the payment for the provision of healthcare to an individual.

Provider-Sponsored Organization A cooperative venture of group providers who control an integrated provider system engaged in both delivery and financing of healthcare services.

Provider-Based Status The relationship between a main provider and a provider-based entity or a department of a provider, a remote location of a hospital, or a satellite facility that complies with the provisions of the provider-based rule.

Psychologists Psychologists conduct psychological and neuropsychological testing, make clinical diagnoses, and design treatment plans for patients.

Public Health An area of healthcare centered around "community health point of view" that considers "the means of defense(s) against disease a social problem."

Purchase Option The right, but not the obligation, to purchase an asset, an enterprise, or a service at a predetermined point or within a predetermined period in the future, typically for a predetermined price.

Quality Review The final review of a valuation report checking for errors in the assemblage of the final reports, including printing errors, page layout errors, and quality assurance of the materials used.

Qui Tam Action Also known as a whistleblower suit, a qui tam action is an action brought under the False Claims Act or a similar statute that allows a private person (e.g., employees, former employees, competitors, subcontractors) to sue for a penalty, part of which the government or some specified public institution will receive.

Radiation Therapies A cancer treatment that uses high-energy light beams or charged particles to stunt tumor cell proliferation.

Real Estate The physical land and all appurtenances affixed to the land, such as structures.

Real Estate Investment Trusts (REITs) A method of financing that involves investment in a wider portfolio of real estate assets than simply acquiring a single property (typically, real property). The owner of the premises may obtain REIT financing by agreeing to sell his or her real estate assets to the trust and subsequently leasing back the property, thereby acquiring cash to invest in its core healthcare functions.

Real Property Land and anything growing on, attached to, or erected on it, excluding anything that may be severed without injury to the land. Can be either corporeal or incorporeal, including all interests, benefits, and rights inherent in the ownership of real estate.

Reasonable Compensation The amount that would ordinarily be paid for like services by the enterprises (whether taxable or tax-exempt) under like circumstances.

Reciprocal (Limited) Licensure An interstate license for use by telemedicine practitioners, applied for through a simple application process and reduced licensing fees. This license is solely used for telemedicine and may not be used to physically practice in another state.

Regulatory/Legal–Related Intangible Assets Facility licenses, medical licenses, permits, litigation awards and liquidated damages, certificate of need, Medicare certification, and other certifications and accreditations.

Rehabilitative Therapy Centers Centers that focus on an interdisciplinary approach to treatment, due to the scope of the conditions treated, as well as the wide range of providers who typically work together in developing and executing a patient's treatment plan.

Relative Value Units (RVUs) Fungible units of physician clinical services composed of three components: work RVUS, practice expense RVUs, and malpractice RVUs.

Reparative Medicine Therapies that heal the body's natural tissue.

Resource-Based Relative Value Scale (RBRVS) The RBRVS is the scale on which Medicare bases its standardized physician payment schedule. The RBRVS determines payments based on the value of the resources necessary to provide a particular service.

Restricted Stock Publicly traded stocks that are prohibited from being traded for a designated period of time (e.g., six months, one year, or two years).

Retail Clinics Those facilities owned by, and operated within, retail grocery stores or department stores, offering walk-in services for basic treatment and care.

Revenue The product of price and quantity.

Revenue Cycle The process by which a provider practice schedules patients, diagnoses conditions, documents diagnoses, bills payors, and collects billable charges from the payor and the patient to recover revenue for the services provided.

Risk Uncertainty, or the assignment of outcomes and their associated probabilities of occurring.

Risk-Adjusted Rate of Return Net income expressed as a percentage of total equity adjusted for financial risk.

Safe Harbor Specific regulatory criteria that must be met to shield an arrangement from liability, which are meant to protect practices that are unlikely to result in fraud or abuse.

Safety-Net Hospital A hospital, often an academic hospital, that provides care to low-income, uninsured, or vulnerable patient populations.

S-corporation A flow-through taxable entity where earnings are taxed only once they are paid out to shareholders.

Secondary Equity Offering (SEO) Shares of stock that are purchased from publicly traded firms.

Self-Insurance Self-insuring employers make a conscious choice to undertake the risks associated with the cost of healthcare and set aside money to pay these costs as they arise. Often, a self-insurer will hire a commercial insurer or a third-party administrator to run the firm's medical benefits program and adjudicate claims.

Self-Referral The practice of referring a patient for a designated health service (DHS) to an entity in which the referring physician (or a member of his immediate family) has an ownership or investment interest.

Shared Losses "A portion of the ACO's performance year Medicare fee-for-service Parts A and B expenditures, above the applicable benchmark, it must repay to CMS. An ACO's eligibility for shared losses will be determined for each performance year. For an ACO requesting interim payment, shared losses may result from the interim payment calculation."

Shared Savings "A portion of the ACO's performance year Medicare fee-for-service Parts A and B expenditures, below the applicable benchmark, it is eligible to receive payment for from CMS. An ACO's eligibility for shared savings will be determined for each performance year. For an ACO requesting interim payment, shared savings may result from the interim payment system calculation."

Short-Term Acute Care Hospital A short-term hospital that has facilities, medical staff, and all necessary personnel to provide diagnoses, care, and treatment of a wide range of acute conditions, including injuries.

Skilled Nursing Facility (SNF) An institution that has a transfer agreement with one or more hospitals to provide 24-hour skilled nursing and rehabilitative care on an inpatient basis.

Small Business Health Option Programs (SHOPs) Programs enacted as part of the ACA that are designed to assist qualified employers in the state who are small employers in facilitating the enrollment of their employees in qualified health plans offered in the small group market in the state.

Sole Community Hospital (SCH) Short-term acute care hospitals that are located at least 35 miles from like hospitals in rural areas, located 25 miles from other similar hospitals and have fewer than 25 percent of its patients admitted to similar hospitals, located 25 miles from other similar hospitals and fewer than 50 beds, or are at least 45 minutes from the nearest like hospital.

Specialty Hospital A hospital that limits its focus and scope of services to provide treatment for a single medical specialty or cluster of specialties (e.g., surgical, pediatric, or women's care).

Specialty Service Hospital (SSH) A hospital that limits its focus and scope of services to provide treatment for a single medical specialty or cluster of specialties (e.g., surgical, pediatric, or women's care).

Specific Data Data specific to, and obtained from, the subject entities. Specific data includes, but is not limited to: financial statements, tax returns, productivity reports, supplies inventory, accounts receivable schedules, fixed asset schedules, prior valuation or consulting reports, budgets and projections, and documentation on transactions involving the subject entity.

Specific Research Data specific to, and obtained from, the sources at each subject enterprise. Specific research may include, but is not limited to: financial statements, tax returns, productivity reports, supplies inventory, accounts receivable schedules, fixed asset schedules, prior valuation or consulting reports, budgets and projections, and documentation on transactions involving the subject entity.

Standard Industrial Classification (SIC) Codes Originally developed in the 1930s, SIC codes are one to four digits in length and employed for classifying the type of industry under which a business primarily operates. They are currently still used by the U.S. Securities and Exchange Commission (SEC).

Stark Law A federal law prohibiting physicians from referring Medicare or Medicaid patients to an entity for designated health services if the physician or an immediate family member has a financial relationship with that entity.

State Health Benefit Exchange A state-established marketplace through which low- and moderate-income individuals and families and employees of small businesses will receive premium and cost-sharing subsidies in an effort to make private health insurance coverage more affordable.

Stem Cells Unspecialized cells capable of (1) renewing themselves through cell division, sometimes after long periods of inactivity, and (2) specializing to a certain type of tissue or organ under the proper conditions.

Stereotactic Radiosurgery A highly precise procedure involving the single, high-dose delivery of precisely targeted gamma-ray or X-ray beams that is used in different parts of the body, but most frequently to treat brain tumors.

Store and Forward The transfer of digital images between locations, most commonly seen in teleradiology and telepathology.

Studia Generalia Universities in the Roman Empire where law, theology, and philosophy were taught, in addition to medicine.

Subcutaneous Under the skin.

Superbills and Charge Tickets Another name for a patient encounter form.

Supplier A provider of healthcare services, other than a practitioner, that is permitted to bill under Medicare Part B, including for DME, prosthetics, orthotics, X-rays, and so on.

Supply Chain A complex and dynamic system through which information and supplies flow upstream and downstream between manufacturers, distributors, purchasers, providers, and consumers.

Sustainable Growth Rate (SGR) "The SGR is the current mechanism for updating payment rates for physicians' services and has two key components: an expenditures target level (measured both annually and cumulatively), and a method for adjusting payment rates over time in an attempt to bring expenditures in line with the target level."

Tail/Nose Coverage Professional liability insurance coverage related to future services rendered after employment has terminated, or covering prior acts, respectively.

Tangible Assets Physical assets, including cash, accounts receivable, inventory, property, plant and equipment, and so on.

Tangible Personal Property Tangible things capable of ownership not classed as realty, such as furniture, fixtures, equipment, machinery, inventories, vessels, precious metals, vehicles, gems, evidences of debt, and money.

Tasks, Duties, Responsibilities, and Accountabilities The specific tasks and duties to be performed by a person and an area of the organization or processes for which that person is responsible and accountable to management.

Tax-Exempt, Not-for-Profit Organization An exempt organization is organized or operated for the benefit of private interests. The IRS has stated that "[n]o part

of the net earnings of a section 501(c)(3) organization may inure to the benefit of any private shareholder or individual[, whereby] a private shareholder or individual is a person having a personal and private interest in the activities of the organization."

Taxpayer Identification Number (TIN) "A federal taxpayer identification number or employer identification number as defined by the IRS in 26 CFR 301.6109–1."

Technicians and Paraprofessionals Nonphysician practitioners who work as physician extenders, providing physical and technological manpower support during the provision of physician services, and who are unauthorized to independently bill for services.

Technological Obsolescence The loss of utility resulting from the differences in capabilities between the old asset and the replacement asset.

Technology-Related Intangible Assets Computer software/network integration, technical/software documentation, and maintenance/support agreements.

Telehealth Closely related to telemedicine and is used to describe the broader definition of remote healthcare that does not always involve clinical services, although the two terms are often used interchangeably.

Telemedicine The transfer of electronic medical data (high-resolution images, sounds, live video, and patient records) from one location to another, in order to enhance the quality and efficiency of patient comfort and care.

Teleradiology Electronic transfer and storage of electronic imaging data.

Tick and Tie A correction of any errors in a report's narrative, schedules, or appendices.

Tiered Productivity–Based Compensation Paying a specific rate for productivity amounts in a certain range (or tier) and then paying a different rate for productivity amounts that are in a higher tier.

Treble Damages Damages equal to three times the amount of the illegal remuneration, in violation of the Anti-Kickback Statute.

TRICARE The Department of Defense's healthcare program for active-duty military personnel, members of the National Guard and Reserves, retirees, and their dependents, survivors, and certain former spouses. The program uses military healthcare as the main provider of services, supplemented by civilian healthcare providers, facilities, pharmacies, and suppliers. TRICARE covers approximately 9.7 million beneficiaries worldwide through a variety of plans.

Trimmed Mean An arithmetic mean with certain extreme values eliminated from the data set prior to calculation.

Two-Sided Model "A model under which the ACO may share savings with the Medicare program, if it meets the requirements for doing so, and is also liable for sharing any losses incurred under subpart G of this part."

Two-Way Interactive Television (IATV) A treatment approach that uses telemedicine for face-to-face consultations.

Upcoding The practice of improperly assigning a diagnosis code to a patient discharge that is not supported by the medical record for the purpose of obtaining a higher level of reimbursement from Medicare for that hospital discharge than the hospital would otherwise receive.

Urgent Care Healthcare that is delivered on a walk-in basis, with no appointment, for acute illness.

Utility An abstract concept that encompasses not only the satisfaction that an individual enjoys from the ownership or use of a good, but also the satisfaction received from a reduction in pain or discomfort.

Valuation Date The date specified for when an indication of value will be reported. The valuation date limits the information available to the analyst to that which would have been available prior to the valuation date.

Value "The present worth of all the rights to future benefits arising from ownership of the thing valued" (i.e., the expectation of future benefit).

Value in Use The premise of value that assumes that the assets will continue to be used as part of an ongoing business enterprise, producing an economic benefit of ownership of a going concern.

Venture Capital A subset of private equity financing that focuses on smaller emerging companies.

Walk-In Clinics Centers that provide treatment of nonacute illnesses and conditions after hours and on weekends.

Weighted Average Cost of Capital (WACC) A blend of the cost of an enterprise's various capital components, including the cost of debt capital and the cost of equity capital of the enterprise, representing the expected return demanded by the blend of both debt and equity investors in the subject entity and the capital cost to the entity for financing future projects.

Wellness Programs Plans offered to employees by employers that encourage healthier living habits, such as weight loss initiatives and assistance in quitting smoking.

Wound Treatment Centers Facilities that treat chronic wounds; they may be freestanding or affiliated with a hospital or a health system.

About the Companion Website

This book includes a companion website, which can be found at http:// www .wiley.com/go/healthcarevaluation (password: cimasi234). The companion website contains five comprehensive bibliographies to serve as a useful reference of sources related to healthcare valuation on the topics of healthcare reform; regulatory pronouncements; economics; revenue and expense considerations; and general trends related to healthcare enterprises, assets, and services. Also included is a compendium of professional tools and practice aids, including over 50 sample valuation schedule templates; various process diagrams and flowcharts; engagement checklists; illustrative valuation methodology schematics; and detailed examples of tables of contents for various types of valuation reports.
