CONTENTS

PREFACE

This book is a collection of procedures for the analysis of more than 390 pharmaceuticals using high-performance liquid chromatography (HPLC) and covers the literature up to the end of 2003. The current volume is a continuation of *HPLC Methods for Pharmaceutical Analysis*, published in four volumes from 1997 to 2000. The previous volumes described methods published in the literature through the middle of 1998.

The current work lists procedures for the analysis of drugs in three broad categories:

- Drugs that have been approved since the previous volumes were published.
- Drugs that were approved when the previous volumes were published but for which analytical methods were not then available in the literature.
- Drugs for which procedures allowing determination in a blood matrix have only become available since the previous volumes were published.

Please note that mention of a drug does not necessarily mean that it is currently approved for use in the United States or indeed in any country.

Despite the ready availability of computer-aided literature, searching this resource is not exploited as much as it might be. One reason for this reluctance is, of course, that a computer search merely produces a listing of possibly relevant references. Tedious and time-consuming searches in the library are necessary to find the most relevant reference that can be turned into a practical analytical procedure in the searcher's own laboratory. The reference finally chosen will, naturally, depend on the individual circumstances, such as the matrix in which the drug is present, availability of equipment, and so on. This book circumvents this lengthy process by providing a number of abstracted and evaluated procedures for the analysis of each drug. The analyst can rapidly identify a relevant procedure and put it into practice.

In addition to the analytical matrix, other factors may be important when choosing an analytical procedure. Accordingly, we have noted such features of the analytical procedures as sensitivity, mode of detection, other compounds that interfere with the analysis, other drugs that may be determined at the same time, and so on.

Readers familiar with our previous publications, *HPLC Methods for Pharmaceutical Analysis, Volumes 1–4* (George Lunn and Norman R. Schmuff, John Wiley, New York, 1997–2000) and *Handbook of Derivatization Reactions for HPLC* (George Lunn and Louise C. Hellwig, John Wiley, New York, 1998), will notice many similarities. The abstract structure is very similar, and the philosophy that the procedures

should be reproducible without reference to the original literature is unchanged. A new feature is that the retention times (in minutes) of other drugs that may be determined using the same system have been added in parentheses after the drug name. Other data, such as the limit of detection (LOD), may also be added. The retention time is the number without units. Unlike the previous volumes, this book is not available on a CD in an electronic form.

At the end of the book a Cumulative Index and a Cross-Index to Other Substances are provided. The Cumulative Index provides a comprehensive listing of the drugs covered in this book and the previous volumes. The Cross-Index lists the other compounds that may also be chromatographed under the conditions described in the monographs in this book. Using the information in the monographs it may be possible to develop chromatographic procedures for these compounds.

GEORGE LUNN

ACKNOWLEDGEMENTS

I am grateful for the use of the National Institutes of Health Library, the FDA Medical Library, and the National Library of Medicine and I would like to express my appreciation for the hard work of the staff of these libraries, particularly those diligent workers who reshelve the journal volumes after one of my forays. Although many people have helped with the preparation of this work the mistakes are my own. I would appreciate hearing from anyone who has corrections, comments, or suggestions. I can be reached at lunng@cder.fda.gov.

The content of this volume does not necessarily reflect the views or policies of the Food and Drug Administration, nor does the mention of trade names, commercial products, or organizations imply endorsement by the U.S. Government. Also, mention of a drug does not necessarily mean that it is currently approved for use in the United States or indeed in any country.

G.L.

ABOUT THIS BOOK

SCOPE

Newly approved drugs were identified from a variety of sources including the FDA's annual lists of drug approvals (available at www.fda.gov/cder) and *Annual Reports in Medicinal Chemistry* published by Elsevier/Academic Press.

The journals routinely surveyed for relevant articles are:

American Journal of Health-System Pharmacy
Analyst
Analytica Chimica Acta
Analytical Chemistry
Analytical Letters
Analytical Sciences
Antimicrobial Agents and Chemotherapy
Arzneimittelforschung
Biological and Pharmaceutical Bulletin
Biomedical Chromatography
Biopharmaceutics and Drug Disposition
Chemical and Pharmaceutical Bulletin
Chromatographia
Clinical Chemistry
Clinical Pharmacology and Therapeutics
Drug Metabolism and Disposition
Farmaco
Food Additives and Contaminants
Journal of Analytical Toxicology
Journal of AOAC International
Journal of Chromatographic Science
Journal of Chromatography, Part A and Part B
Journal of Clinical Pharmacology
Journal of Forensic Sciences

Journal of Liquid Chromatography & Related Technology
Journal of Pharmaceutical and Biomedical Analysis
Journal of Pharmaceutical Sciences
Journal of Pharmacology and Experimental Therapeutics
Pharmaceutical Research
Pharmazie
Therapeutic Drug Monitoring
Xenobiotica

Other journals were consulted when relevant articles were identified by computer searches.

The literature was surveyed from 1998 through the end of 2003, although methods from some older articles (and a few from 2004) are included.

NOMENCLATURE

Each chapter is headed by the name and structure of the target compound as well as other useful data such as the CAS Registry Number, molecular formula, molecular weight, and Merck Index number (from the 13th edition).[1] More useful information such as melting point, solubility, optical rotation, references to reviews, and so on can be found in the Merck Index.

In general, the United States Adopted Name (USAN)[2] is used throughout to identify each drug. Names of derivatives, such as esters, which would have different chromatographic properties, are identified by placing the derivative name in parentheses after the retention time.

Increasingly, drugs previously marketed as racemates are being marketed as a single enantiomer with the name changed to reflect the enantiomer. For example, levofloxacin is the levorotatory form of ofloxacin. For an achiral HPLC method, the chromatography of a single enantiomer is no different from that of the racemate. In general, in this work and the preceding works, we have listed HPLC procedures under the name of the racemate rather than the single enantiomer. The interested reader is referred to the USP Dictionary[2] (page 1208) for the naming conventions used. Generally:

Levo rotatory	S isomer	Prefix lev/levo-
Levo rotatory	R isomer	Prefix ar-
Dextro rotatory	R isomer	Prefix dex/dextro-
Dextro rotatory	S isomer	Prefix es-

For racemates, the rac- prefix is used.

In some cases, the chiral prefix is used. Thus, the following list shows the prefixes that are used in the different volumes:

Dexrazoxane in this volume
Dextromethorphan in Volume 2
Dextromoramide in Volume 2
Dextrothyroxine in Volume 2

Levallorphan in Volume 3
Levamisole in Volume 3
Levobunolol in Volume 3
Levodopa in Volume 3
Levonordefrin in Volume 3 and this volume
Levorphanol in Volume 3
Levosimendan in this volume
Levothyroxine in Volumes 1 and 3.

More generally, the name of the racemic compound is used. Thus,

For	Consult	Volume
Arformoterol	Formoterol	3, this volume
Dexamisole	Levamisole	3
Dexamphetamine	Amphetamine	2
Dexbrompheniramine	Brompheniramine	2
Dexbudesonide	Budesonide	2
Dexchlorpheniramine	Chlorpheniramine	2
Dexfenfluramine	Fenfluramine	3
Dexibuprofen	Ibuprofen	1, 4
Dexketoprofen	Ketoprofen	1, 4
Dexmedetomidine	Medetomidine	This volume
Dexmethylphenidate	Methylphenidate	1
Dexpropranolol	Propranolol	4
Dexsotalol	Sotalol	4
Dextroamphetamine	Amphetamine	2
Dextropropoxyphene	Propoxyphene	1, 4
Dexverapamil	Verapamil	1, 4
Esatenolol	Atenolol	1, 2
Escitalopram	Citalopram	2
Esflurbiprofen	Flurbiprofen	3
Esketamine	Ketamine	3
Esomeprazole	Omeprazole	1, 3
Esoxybutynin chloride	Oxybutynin chloride	3
Eszopiclone	Zopiclone	4
Levalbuterol	Albuterol	1, 2
Levamfetamine	Amphetamine	2
Levamphetamine	Amphetamine	2
Levcycloserine	Cycloserine	2
Levdobutamine	Dobutamine	2
Levmetamfetamine	Methamphetamine	3
Levobetaxolol	Betaxolol	2
Levobupivacaine	Bupivacaine	2
Levocarnitine	Carnitine	2
Levocetirizine	Cetirizine	2
Levodropropizine	Dropropizine	2, this volume

Levofenfluramine	Fenfluramine	3
Levofloxacin	Ofloxacin	1, 3
Levofuraltadone	Furaltadone	3
Levoleucovorin	Leucovorin	3
Levomenthol	Menthol	3, this volume
Levomethadone	Methadone	3
Levomoprolol	Moprolol	3
Levonorgestrel	Norgestrel	1
Levopropoxyphene	Propoxyphene	1, 4
Levopropylhexedrine	Propylhexedrine	4, this volume
Levosalbutamol	Albuterol	1, 2
Levosulpiride	Sulpiride	4
Racementhol	Menthol	3, this volume
Racemethorphan	Dextromethorphan	2
Racemetirosine	Metyrosine	This volume
Racemorphan	Levorphanol	3
Racephedrine	Ephedrine	3
Racepinephrine	Epinephrine	3

BIBLIOGRAPHIES

For reasons of space, it is not possible to abstract every relevant paper, and so at the end of some chapters an Annotated Bibliography lists other relevant papers. After the citation, a few features of the method that are not obvious from the title of the paper may be briefly mentioned to help the reader decide if this paper may be of use. For example, the limit of quantitation of the method may be cited. Unless otherwise mentioned, it may be assumed that a method involves liquid–liquid extraction of a biological fluid from a human and uses reversed-phase HPLC with UV detection. Thus, if a method uses solid-phase extraction (SPE) or fluorescence detection, this will be mentioned.

ABSTRACT STRUCTURE

The detailed procedures given normally contain the following sections. Of course, not all papers give full details, so some sections may be missing.

Matrix
Sample preparation
Guard column
Column
Mobile phase
Flow rate
Injection volume
Retention time
Detector

Internal standard
Column temperature
Extracted
Simultaneous
Also
Noninterfering
Interfering
Limit of detection
Limit of quantitation
Key words
Reference

ABSTRACT CONVENTIONS

Also	Compounds that can be analyzed at the same time. It is not specified whether they interfere, but they can be extracted. See also Extracted, Simultaneous.
Column	Dimensions are length (mm) × internal diameter (mm), and the material is stainless steel unless otherwise indicated.
Column temperature	If other than ambient (all temperatures are in degrees C).
Derivatization	Pre-column unless otherwise mentioned (in Key Words).
Detector	Wavelengths in nanometers
Extracted	Compounds that can be extracted from the matrix in question and analyzed at the same time and do not interfere. See also Also, Simultaneous.
Flow rates	In milliliters per minute.
Guard column	Dimensions are length (mm) × internal diameter (mm).
Injection volume	In microliters (μL). Injection volume may be either the volume actually injected or the volume of the injection loop. If it is the volume actually injected, this value is also given in the Sample preparation section. If the actual injection volume is not given in the Sample preparation section, the Injection volume given is that of the injection loop.
Interfering	Compounds that interfere with the analysis of the target compound. Compounds that interfere with the chromatography of the internal standard (IS) are listed under simultaneous (another IS can always be selected or an external standard procedure can be used).
Matrix	A controlled vocabulary is used (see below)
Mobile phase	Ratios are v/v and gradients are linear, unless otherwise noted. Times given when describing gradient elution and other procedures such as column switching are the times for each step, e.g., "MeOH:water 15:85 for 4 min, to 50:50 over 2 min, maintain at 50:50 for 4 min." If we were to include the cumulative times (t) in the example above it would read: "MeOH:water 15:85 for 4 min ($t = 4$), to 50:50 over 2 min ($t = 6$), maintain at 50:50 for 4 min ($t = 10$)."

Noninterfering	Compounds that do not interfere with the analysis for various reasons, e.g., they are not extracted, they are not detected.
Retention time	In minutes. This is frequently estimated from a reproduced chromatogram, and so the accuracy may not be great. When available, retention times are given for the analyte, the internal standard, and other compounds that may be chromatographed under the same conditions. For the internal standard and other compounds that may be chromatographed under the same conditions, the retention times are given in parentheses after the compound name.
Simultaneous	Compounds that can be analyzed at the same time and do not interfere. Note that the compound cannot necessarily be extracted from the matrix in question (although it may be). See also Also, Extracted.
SPE	For the sake of consistency, conditioning procedures for solid-phase extraction (SPE) cartridges are always described at the beginning of the sample preparation sections. Bear in mind, however, that the conditioning procedure should be carried out just prior to use. Thus, if sample preparation is a lengthy procedure, it may be necessary to delay SPE cartridge conditioning until the step requiring the cartridge.
Species	If other than human, noun is used instead of adjective, e.g., cow not bovine. In some cases, human may be specified. For example, if *both* human blood and rat blood are analyzed, *both* human and rat will be indicated (in Key Words).

MATRIX

To help with searching, a controlled vocabulary is used to limit the number of terms in the matrix section. For example, the terms raw material, drug substance, or API (active pharmaceutical ingredient) are not used; the term bulk is used instead. In a number of cases, the matrix is associated with various key words, which can be used to narrow the search. For example, the matrix term blood has the key words plasma, serum, and whole blood associated with it. Thus, if you are interested in the determination of the drug in blood in general, you should look in the matrix field for blood. If, however, you are specifically interested in finding the drug in plasma, you should look in the key words field for plasma.

Matrix	Associated Key Words
Bile	
Blood	Plasma, serum, whole blood
Bulk	
CSF	
Formulations	Capsules, creams, injections, ointment, tablets, etc.
Microsomal incubations	

Milk	
Perfusate	
Reaction mixtures	
Saliva	
Tissue	Brain, heart, kidney, liver, muscle, spleen, etc.
Urine	

ABBREVIATIONS

BHT	2,6-Di-tert-butyl-4-methylphenol, butylated hydroxytoluene
DMSO	Dimethyl sulfoxide
E	Electrochemical detection
em	Emission wavelength
EtOH	Ethanol
ex	Excitation wavelength
F	Fluorescence detection
GPC	Gel permeation chromatography
h	Hour
HPLC	High-performance liquid chromatography
ID	Internal diameter
IS	Internal standard
L	Liter
LOD	Limit of detection or some other description indicating that this is the smallest concentration or quantity that can be detected or analyzed for
LOQ	Lower limit of quantitation, either given as such in the paper or taken as the lower limit of the linear quantitation range
M	Molar (i.e., moles/L)
MeCN	Acetonitrile
MeOH	Methanol
min	Minutes
mL	Milliliter
mM	Millimolar (i.e., millimoles/L)
MS	Mass spectrometric detection
MSPD	Matrix solid phase dispersion
MTBE	Methyl tert-butyl ether
nM	Nanomolar (i.e., nanomoles/L)
psi	Pounds/sq. in. (1 psi = 6.89476 kPa)
s	Seconds
SEC	Size Exclusion Chromatography
SFC	Supercritical fluid chromatography
SFE	Supercritical fluid extraction
SPE	Solid phase extraction
Temp	Temperature
U	Units
UV	Ultraviolet detection
vol	Volume

PIC REAGENTS

These reagents are offered by Waters as buffered solutions containing the following compounds:

PIC A is tetrabutylammonium sulfate
PIC B5 is pentanesulfonic acid
PIC B7 is heptanesulfonic acid.

WORKING PRACTICES

In general, good working practice, for example, using high-grade materials is assumed. Solutions should be protected from light, and silanized glassware should be used unless you have good reason to believe that these precautions are not necessary. Details of solution preparation are generally not given. It should be remembered that the preparation of a dilute aqueous solution of a relatively water-insoluble compound can frequently be made by dissolving the compound in a small volume of a water-miscible organic solvent and diluting this solution with water. A number of excellent texts[3–9] discuss good working practices and procedures in HPLC. Please note that all the temperatures are in degrees C.

It is also assumed that safe working practices are observed. Organic solvents should only be evaporated in a properly functioning chemical fume hood, correct protective equipment should be worn when dealing with potentially hazardous biological materials, and waste solutions should be disposed of in accordance with all applicable regulations.

A number of solvents are particularly hazardous. For example, benzene is a human carcinogen;[10] chloroform,[11] dichloromethane,[12] dioxane,[13] and carbon tetrachloride [14] are carcinogenic in experimental animals; and DMF [15] and MTBE [16,17] may be carcinogenic. Organic solvents are, in general, flammable and toxic by inhalation, ingestion, and skin absorption. Sodium azide is carcinogenic and toxic and liberates explosive, volatile, toxic hydrazoic acid when mixed with acid. Sodium azide can form explosive heavy metal azides, for example, with plumbing fixtures, and so should not be discharged down the drain.[18] Disposal procedures have been described for a number of hazardous drugs and reagents,[18] and a procedure for the hydrolysis of acetonitrile in waste solvent to the much less toxic acetic acid and ammonia[19,20] has been described. *n*-Hexane is surprisingly toxic.[21]

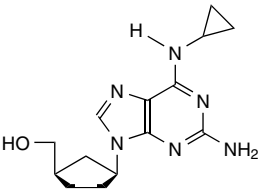
Abacavir



Molecular formula: $C_{14}H_{18}N_6O$
Molecular weight: 286.33
CAS Registry No: 136470-78-5 (base), 188062-50-2 (sulfate)
Merck Index: 13,1

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg Bond Elut-C SPE cartridge with 1 mL MeOH and 1 mL 100 mM pH 7.0 ammonium acetate buffer. Heat plasma at 58° for 1 h to inactivate HIV. Vortex 800 μL plasma with 300 μL 2 μg/mL hexobarbital in 25 mM pH 7.0 ammonium acetate buffer for 30 s and centrifuge at 18 000 g for 5 min. Add 1 mL of the supernatant to the SPE cartridge, wash with 1 mL 100 mM pH 7.0 ammonium acetate buffer, suck dry for 1 min, elute with 800 μL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40° and reconstitute the residue with 100 μL mobile phase. Vortex for 30 s, centrifuge at 18 000 g for 3 min, and inject an 80 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 3.9 5 μm Polarity dC18 (Waters)
Column: 150 × 3.9 5 μm Polarity dC18 (Waters)
Column temperature: 40
Mobile phase: Gradient. A was 10 mM pH 6.5 ammonium acetate buffer. B was 10 mM pH 6.5 ammonium acetate buffer:MeCN:MeOH 20:50:30. A:B 96:4 for 15 min, to 36:64 over 15 min, maintain at 36:64 for 3 min, re-equilibrate at initial conditions for 7 min.
Flow rate: 1.1
Injection volume: 80
Detector: UV 269 for 11 min, UV 250 for 3 min, UV 271 for 10 min, UV 230 for 9 min

CHROMATOGRAM

Retention time: 25.1
Internal standard: hexobarbital (30.6)
Limit of quantitation: 10.0 ng/mL

OTHER SUBSTANCES

Extracted: didanosine (13.6), lamivudine (8.6), nevirapine (27.3), stavudine (15.7), zalcitabine (5.9), zidovudine (23.8)
Noninterfering: tenofovir

SAMPLE

Matrix: blood
Sample preparation: Condition a 100 mg Dual Zone C18 SPE cartridge (Diazem) with 2 mL MeOH and 2 mL water. Dilute 500 μL serum with 1 mL water, add to the SPE cartridge, wash with 500 μL water, elute with 1 mL MeOH. Evaporate the eluate to

 ISBN: 0-471-66941-5

dryness with vortexing under reduced pressure at 40° and reconstitute the residue with 300 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: two 150 × 4.6 3 μm Luna C18 columns in series
Column temperature: 60
Mobile phase: Gradient. MeCN:water from 5:95 to 45:55 over 20 min.
Flow rate: 0.85
Injection volume: 10
Detector: UV 250

CHROMATOGRAM

Retention time: 17
Limit of detection: 75 ng/mL

OTHER SUBSTANCES

Extracted: didanosine (10.5, LOD 120 ng/mL), lamivudine (9.5, LOD 260 ng/mL), stavudine (11.5, LOD 40 ng/mL), zalcitabine (7.5, LOD 440 ng/mL), zidovudine (16, LOD 30 ng/mL)

SAMPLE

Matrix: blood
Sample preparation: Mix 300 μL plasma with 75 μL 20% perchloric acid for 30 s, centrifuge at 1300 g for 15 min, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 3.8 Symmetry C18 (Waters)
Column: 100 × 4.6 3.5 μm Symmetry C18 (Waters)
Column temperature: 41 ± 2
Mobile phase: MeCN:25 mM pH 7.0 phosphate buffer 15:85
Flow rate: 1
Injection volume: 100
Detector: UV 285

CHROMATOGRAM

Retention time: 4.8
Limit of quantitation: 20 ng/mL

OTHER SUBSTANCES

Simultaneous: didanosine, folic acid, ganciclovir, lamivudine, nevirapine, pyrazinamide, ranitidine, rifampin, stavudine, sulfamethoxazole, trimethoprim, zidovudine
Noninterfering: adefovir, amprenavir, delavirdine, efavirenz, fluconazole, indinavir, itraconazole, methadone, nelfinavir, oxazepam, pyrimethamine, rifampin, ritonavir, saquinavir, zalcitabine

KEY WORDS

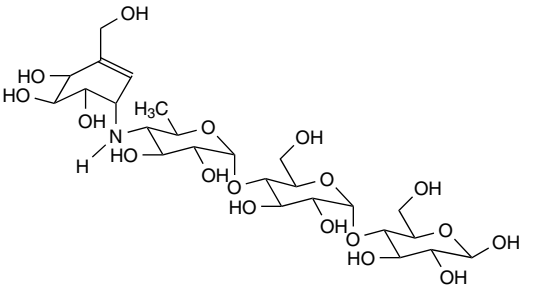
Acarbose

Molecular formula: $C_{25}H_{43}NO_{18}$
Molecular weight: 645.60
CAS Registry No: 56180-94-0
Merck Index: 13, 18



SAMPLE

Matrix: formulations
Sample preparation: Powder tablet, extract 3 times with 5 mL aliquots of water with sonication for 15 min with vortexing at 5 min intervals each time, centrifuge at 2750 g for 5 min, combine supernatants, make up to 20 mL with water. Dilute a 50 μL aliquot to 1 mL with MeOH, filter (0.2 μM), inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Nucleosil-NH2
Mobile phase: MeOH:dichloromethane 65:35
Flow rate: 1
Injection volume: 20
Detector: ELSD, nebulizing gas air at 2.5 bar and 4 L/min, solvent evaporated at 40°

CHROMATOGRAM

Retention time: 4.1
Limit of detection: 5 μg/mL
Limit of quantitation: 15 μg/mL

OTHER SUBSTANCES

Simultaneous: sucrose (3.5)

KEY WORDS

comparison with capillary electrophoresis; tablets

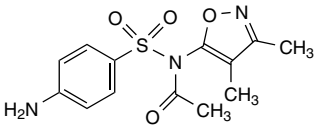
Acetyl sulfisoxazole



Molecular formula: $C_{13}H_{15}N_3O_4S$
Molecular weight: 309.35
CAS Registry No: 80-74-0
Merck Index: 13, 9041

SAMPLE

Matrix: formulations
Sample preparation: Extract 1 mL suspension with three 15 mL aliquots of chloroform (Caution! Chloroform is a carcinogen!), combine the organic layers and make up to 50 mL with chloroform, filter (0.45 μm silver membrane, Selas Corp.). Evaporate a 2 mL aliquot of the filtrate to dryness under a stream of nitrogen, reconstitute with 5 mL 330 μg/mL benzanilide in MeCN, inject a 5 μL aliquot.

HPLC VARIABLES

Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeCN:water 40:60
Flow rate: 1.5
Injection volume: 5
Detector: UV 254

CHROMATOGRAM

Retention time: 7
Internal standard: benzanilide (11)

OTHER SUBSTANCES

Simultaneous: sulfanilamide (2.5), sulfisoxazole (3)
Noninterfering: erythromycin ethylsuccinate

KEY WORDS

oral suspensions

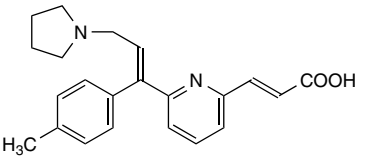
Acrivastine



Molecular formula: $C_{22}H_{24}N_2O_2$
Molecular weight: 348.44
CAS Registry No: 87848-99-5
Merck Index: 13, 129

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL whole blood with 20 μL 1 μg/mL dibenzepin in MeOH:water 50:50, add 300 μL pH 11 tris buffer, mix, add 500 μL butyl acetate, vortex for 2 min, centrifuge. Preserve the aqueous layer (A). Remove the organic layer and add it to 75 μL 10 mM ammonium acetate buffer containing 0.1% formic acid (pH 3.2), evaporate (?). Add 75 μL MeCN, sonicate for 5 min, centrifuge at 5000 rpm for 5 min, keep the extract as B. Add 20 μL 1 μg/mL enalapril in MeOH:water 50:50 and 120 mg NaCl to the aqueous layer (A), mix, add 500 μL pH 3 phosphate buffer, add 600 μL 8.5% phosphoric acid, add 5 mL dichloromethane:isopropanol 95:5, shake at 250 cycles/min in a bench-top shaker for 30 min, centrifuge at 5000 rpm for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 45°. Reconstitute the residue with 150 μL initial mobile phase, sonicate, centrifuge, combine with extract B, inject a 30 μL aliquot. (Sample preparation from Gergov,M.; Robson,J.N.; Ojanperä,I.; Heinonen,O.P.; Vuori,E. Simultaneous screening and quantitation of 18 antihistamine drugs in blood by liquid chromatography ionspray tandem mass spectrometry. *Forensic Sci.Inter.* **2001**, *121*, 108–115.)

HPLC VARIABLES

Guard column: 40 mm long 4 μm Purospher RP-18 LiChro Cart 4-4
Column: 100 × 2.1 4 μm Genesis C18 (Jones Chromatography)
Column temperature: 35
Mobile phase: Gradient. MeCN:buffer from 20:80 to 100:0 over 10 min, maintain at 0:100 for 3 min, re-equilibrate at initial conditions for 5 min. (Buffer was 10 mM ammonium acetate containing 0.1% formic acid (pH 3.2).
Flow rate: 0.2
Injection volume: 30
Detector: MS, PE Sciex API 365 triple stage quadrupole LC-MS-MS, PE Sciex Turbo Ion Spray interface, positive ion mode, needle voltage 5.2 kV, nebulizer gas air at 60 psi, curtain gas nitrogen at 40 psi, collision cell gas nitrogen at 40 psi, turbo ionspray heater 375°, heater gas flow 7 L/min

CHROMATOGRAM

Retention time: 5.7
Internal standard: dibenzepin, enalapril
Limit of detection: <20 ng/mL

OTHER SUBSTANCES

Extracted: acebutolol (3.8, LOD 0.1 μg/mL), acetaminophen (2.5, LOD <5 μg/mL), alprazolam (6.1, LOD <0.02 μg/mL), alprenolol (5.4, LOD 0.01 μg/mL), amantadine (3.4, LOD 0.1 μg/mL), amiloride (2.0, LOD 0.1 μg/mL), aminophenazone (2.8, LOD <5 μg/mL), amiodarone (10.2, LOD 0.05 μg/mL), amitriptyline (6.6, LOD <0.02 μg/mL), astemizole (5.8, LOD <0.02 μg/mL), atenolol (1.7, LOD 0.30 μg/mL), azacyclonol (5.1, LOD 0.02 μg/mL), benzhexol (6.6, LOD <0.02 μg/mL), benzoylecgonine (3.3, LOD 0.01 μg/mL), betaxolol (5.5, LOD 0.01 μg/mL), biperidine (6.2, LOD <0.02 μg/mL), bisoprolol (5.0, LOD <0.02 μg/mL), brompheniramine (5.3, LOD 0.002 μg/mL), bupivacaine (5.1, LOD <0.02 μg/mL), buprenorphine (5.9, LOD 0.01 μg/mL), buspirone (5.1, LOD 0.002 μg/mL), caffeine (2.8, LOD 1 μg/mL), carbamazepine

(6.1, LOD <0.02 μg/mL), carbinoxamine (5.1, LOD 0.002 μg/mL), carisoprodol (6.7, LOD <5 μg/mL), carvedilol (6.2, LOD <0.02 μg/mL), celiprolol (4.3, LOD 0.05 μg/mL), cetirizine (6.3, LOD 0.05 μg/mL), chlorcyclizine (6.6, LOD <0.02 μg/mL), chlordiazepoxide (5.7, LOD <0.02 μg/mL), chlormezanone (5.8, LOD <5 μg/mL), chloroquine (2.7, LOD 0.02 μg/mL), chlorpheniramine (5.1, LOD 0.002 μg/mL), chlorpromazine (7.0, LOD 0.02 μg/mL), chlorpropamide (6.7, LOD <5 μg/mL), chlorprothixene (7.0, LOD <0.02 μg/mL), cinnarizine (7.9, LOD <0.02 μg/mL), citalopram (5.7, LOD <0.02 μg/mL), clemastine (7.7, LOD 0.02 μg/mL), clobazam (7.3, LOD <0.02 μg/mL), clobutinol (5.3, LOD 0.02 μg/mL), clomethiazole (6.2, LOD 0.5 μg/mL), clomipramine (7.1, LOD <0.02 μg/mL), clonazepam (6.6, LOD <0.02 μg/mL), clonidine (2.8, LOD 0.1 μg/mL), clozapine (5.6, LOD <0.02 μg/mL), cocaine (4.6, LOD <0.02 μg/mL), codeine (2.5, LOD 0.1 μg/mL), coumatetralyl (8.4, LOD 0.05 μg/mL), cyclizine (5.8, LOD <0.02 μg/mL), dextropropoxyphene (6.6, LOD 0.05 μg/mL), demoxepam (5.8, LOD 0.02 μg/mL), dextromethorphan (5.5, LOD <0.02 μg/mL), diazepam (8.1, LOD 0.02 μg/mL), diltiazem (5.8, LOD <0.02 μg/mL), diphenhydramine (5.7, LOD <0.02 μg/mL), dipyridamole (5.4, LOD 0.005 μg/mL), disopyramine (4.4, LOD <0.02 μg/mL), dixyrazine (6.8, LOD 0.005 μg/mL), doxapram (4.8, LOD <0.02 μg/mL), doxepin (5.9, LOD <0.02 μg/mL), dronabinol (12.3, LOD 0.05 μg/mL), ebastine (9.6, LOD 0.005 μg/mL), embutramide (6.7, LOD 0.005 μg/mL), ergotamine (5.5, LOD 0.005 μg/mL), ethenzamide (5.0, LOD 0.05 μg/mL), ethylmorphine (3.2, LOD 0.05 μg/mL), ethylparathion (9.7, LOD <5 μg/mL), etodroxizine (6.4, LOD <0.02 μg/mL), felodipine (9.6, LOD 0.02 μg/mL), fenazepam (7.5, LOD <0.02 μg/mL), fenfluramine (5.3, LOD <0.02 μg/mL), fenkamfamine (5.1, LOD <0.02 μg/mL), fentanyl (5.5, LOD <0.02 μg/mL), fexofenadine (6.3, LOD <0.02 μg/mL), flecainide (5.9, LOD <0.02 μg/mL), fluconazole (4.0, LOD 0.1 μg/mL), flumazenil (5.2, LOD <0.02 μg/mL), flunitrazepam (7.1, LOD 0.002 μg/mL), fluoxetine (6.8, LOD 0.1 μg/mL), flupentixol (7.5, LOD 0.18 μg/mL), fluvoxamine (6.3, LOD 0.02 μg/mL), glibenclamide (8.5, LOD <0.02 μg/mL), glipizide (6.8, LOD <0.05 μg/mL), haloperidol (6.1, LOD <0.02 μg/mL), histapyrrodine (6.3, LOD 0.02 μg/mL), hydrocodone (3.0, LOD 0.05 μg/mL), hydroxychloroquine (2.4, LOD <0.3 μg/mL), hydroxyzine (6.3, LOD <0.02 μg/mL), imipramine (6.4, LOD 0.05 μg/mL), indomethacin (8.6, LOD 0.05 μg/mL), isoniazid (2.2, LOD 3 μg/mL), isradipine (8.6, LOD 0.05 μg/mL), ketamine (3.6, LOD <0.05 μg/mL), ketobemidone (3.3, LOD <0.05 μg/mL), ketoprofen (7.3, LOD 0.1 μg/mL), ketorolac (6.2, LOD 0.05 μg/mL), labetalol (4.9, LOD 0.05 μg/mL), lamotrigine (4.0, LOD 0.1 μg/mL), levocabastine (5.8, LOD 0.01 μg/mL), levomepromazine (6.5, LOD 0.02 μg/mL), lidocaine (3.7, LOD <0.05 μg/mL), loratadine (9.3, LOD 0.002 μg/mL), lorazepam (6.6, LOD 0.02 μg/mL), lormetazepam (7.4, LOD <0.02 μg/mL), LSD (4.7, LOD <0.02 μg/mL), malathion (8.9, LOD 10 μg/mL), maprotiline (6.4, LOD <0.02 μg/mL), MDMA (3.3, LOD 0.02 μg/mL), meclozine (8.5, LOD <0.02 μg/mL), medazepam (6.3, LOD <0.02 μg/mL), meloxicam (7.1, LOD 0.01 μg/mL), melperone (5.0, LOD <0.02 μg/mL), meperidine (4.7, LOD <0.02 μg/mL), mepivacaine (3.7, LOD <0.02 μg/mL), meprobamate (4.9, LOD 0.1 μg/mL), mesoridazine (5.4, LOD <0.02 μg/mL), methamphetamine (3.3, LOD 0.05 μg/mL), methadone (6.7, LOD <0.02 μg/mL), methylparathion (8.6, LOD 10 μg/mL), methylphenidate (4.2, LOD <0.02 μg/mL), metoclopramide (3.8, LOD <0.02 μg/mL), metoprolol (4.1, LOD 0.02 μg/mL), metronidazole (2.6, LOD 1 μg/mL), mexiletine (4.4, LOD 0.05 μg/mL), mianserin (5.7, LOD <0.02 μg/mL), midazolam (5.9, LOD <0.02 μg/mL), mirtazapine (4.4, LOD <0.02 μg/mL), mizolastine (5.5, LOD 0.01 μg/mL), moclobemide (3.7, LOD 0.05 μg/mL), molindone (4.0, LOD <0.02 μg/mL), monoacetylmorphine (2.7, LOD 0.1 μg/mL), morphine (2.0, LOD 0.1 μg/mL), nicotine (2.2, LOD 0.05 μg/mL), nifedipine (7.5, LOD 0.02 μg/mL), nikethamide (3.6, LOD <0.02 μg/mL), nitrazepam (6.5, LOD <0.02 μg/mL), nizatidine (1.7, LOD 1 μg/mL), nomifensine (4.6, LOD <0.02 μg/mL), nortriptyline (6.4, LOD <0.02 μg/mL), norverapamil (6.2, LOD 1 μg/mL), noscapine (5.0, LOD <0.02 μg/mL), olanzapine (3.0, LOD 0.05 μg/mL), ondansetron (4.6, LOD <0.02 μg/mL), orphenadrine (6.1, LOD <0.02 μg/mL), oxazepam (6.3, LOD <0.02 μg/mL), oxcarbazepine (5.3, LOD 0.02 μg/mL), oxprenolol (4.7, LOD 0.02 μg/mL), oxycodone (2.8, LOD 0.05 μg/mL), papaverine (4.8, LOD <0.02 μg/mL), paroxetine (6.2, LOD 0.02 μg/mL), pemoline (3.3, LOD 0.05 μg/mL), pentazocine (5.0, LOD <0.02 μg/mL), pentifylline (7.3, LOD <5 μg/mL), pentoxyverine (6.6, LOD <0.02 μg/mL), perphenazine (6.9, LOD 0.002 μg/mL), phenazone (3.9, LOD

0.05 μg/mL), phencyclidine (5.3, LOD 0.05 μg/mL), pheniramine (4.1, LOD 0.02 μg/mL), phenylbutazone (9.0, LOD <5 μg/mL), phenylpropanolamine (2.5, LOD 0.3 μg/mL), phenytoin (6.1, LOD 0.05 μg/mL), pindolol (3.3, LOD 0.05 μg/mL), piroxicam (6.6, LOD 0.02 μg/mL), pitofenone (5.4, LOD <0.02 μg/mL), pizotifen (6.5, LOD <0.02 μg/mL), practolol (1.8, LOD 0.1 μg/mL), prazosin (4.1, LOD 0.05 μg/mL), prilocaine (3.8, LOD <0.02 μg/mL), primidone (4.0, LOD <5 μg/mL), procainamide (2.2, LOD 0.05 μg/mL), prochlorperazine (7.5, LOD 0.02 μg/mL), promazine (6.2, LOD <0.02 μg/mL), promethazine (6.0, LOD 0.05 μg/mL), propafenone (6.3, LOD <0.02 μg/mL), propranolol (5.4, LOD 0.02 μg/mL), propyphenazone (6.6, LOD 0.50 μg/mL), pseudoephedrine (2.6, LOD 1 μg/mL), quinine (4.2, LOD 0.02 μg/mL), ranitidine (1.8, LOD 0.1 μg/mL), risperidone (4.9, LOD <0.02 μg/mL), rocurone (3.8, LOD 0.1 μg/mL), ropivacaine (4.6, LOD <0.02 μg/mL), salicylamide (4.2, LOD <5 μg/mL), selegiline (4.1, LOD 0.05 μg/mL), sertindole (7.2, LOD <0.02 μg/mL), sertraline (6.8, LOD 0.02 μg/mL), sulindac (6.5, LOD 0.02 μg/mL), simazine (6.0, LOD 0.1 μg/mL), sincocaine (6.5, LOD <0.02 μg/mL), sisapride (5.9, LOD <0.02 μg/mL), sotalol (2.1, LOD 0.1 μg/mL), strychnine (5.3, LOD 0.05 μg/mL), sulpiride (1.9, LOD 0.1 μg/mL), sulthiame (4.1, LOD 0.05 μg/mL), temazepam (7.2, LOD <0.02 μg/mL), terbutaline (2.3, LOD 0.1 μg/mL), terfenadine (8.1, LOD 0.002 μg/mL), terodiline (6.7, LOD <0.02 μg/mL), tetracaine (5.7, LOD <0.02 μg/mL), tetrahydrozoline (3.6, LOD 0.1 μg/mL), theobromine (2.3, LOD <5 μg/mL), theophylline (2.4, LOD <5 μg/mL), thioridazine (7.5, LOD 0.02 μg/mL), timolol (3.8, LOD 0.05 μg/mL), thiothixene (6.7, LOD 0.02 μg/mL), tolbutamide (7.1, LOD <5 μg/mL), toremifene (8.7, LOD 0.02 μg/mL), tramadol (4.2, LOD 0.02 μg/mL), trazodone (5.2, LOD <0.02 μg/mL), triamterene (3.2, LOD 0.1 μg/mL), triazolam (6.7, LOD 0.002 μg/mL), trimeprazine (6.4, LOD <0.02 μg/mL), trimethoprim (3.1, LOD 0.05 μg/mL), trimipramine (6.7, LOD <0.02 μg/mL), venlafaxine (4.9, LOD 0.02 μg/mL), verapamil (6.5, LOD <0.02 μg/mL), warfarin (7.9, LOD <0.02 μg/mL), yohimbine (4.5, LOD <0.02 μg/mL), zolpidem (4.7, LOD <0.02 μg/mL), zopiclone (4.0, LOD 0.1 μg/mL)

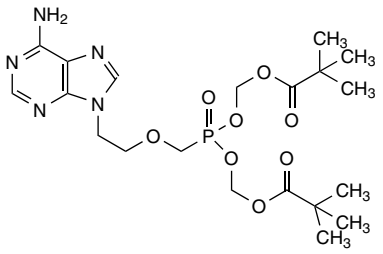
Adefovir dipivoxil



Molecular formula: $C_{20}H_{32}N_5O_8P$
Molecular weight: 501.47
CAS Registry No: 142340-99-6
Merck Index: 13, 151

SAMPLE

Matrix: blood
Sample preparation: Mix 100 μL plasma with 200 μL 0.1% trifluoroacetic acid in MeCN. Evaporate the supernatant to dryness under reduced pressure at room temperature. Reconstitute with 0.34% chloroacetaldehyde in 100 mM pH 4.5 sodium acetate, vortex, centrifuge. Heat the supernatant at 95° for 40 min, evaporate to dryness, reconstitute with 100 μL 25 mM pH 6.0 potassium phosphate buffer containing 5 mM tetrabutylammonium hydrogen phosphate, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 Brownlee RP-18 Newguard
Column: 150 × 4.6 Zorbax RX-C18
Column temperature: 35
Mobile phase: Gradient. A was MeCN:25 mM pH 6.0 potassium phosphate buffer containing 5 mM tetrabutylammonium hydrogen phosphate 2:98. B was MeCN:25 mM pH 6.0 potassium phosphate buffer containing 5 mM tetrabutylammonium hydrogen phosphate 65:35. A:B 100:0 for 2 min, to 0:100 over 13 min, re-equilibrate at initial conditions for 10 min. (Only adefovir is detected in blood. However, the method is reported to distinguish between adefovir and adefovir dipivoxil.)
Flow rate: 1.5
Injection volume: 50
Detector: F ex 236 em 420

KEY WORDS

derivatization; dog; pharmacokinetics; plasma

Adrenocorticotropic hormone

CAS Registry No: 9002-60-2
Merck Index: 13, 136

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL Analytichem weak cation-exchange (carboxymethylhydrogen form, CBA) SPE cartridge with 1 mL 1% trifluoroacetic acid in MeOH, 1 mL MeOH, and 2 mL water. Add 1 mL plasma to the SPE cartridge, rinse the tube with 1 mL water, add the rinse to the SPE cartridge, wash with 1 mL 1% trifluoroacetic acid in water, wash with 2 mL water, wash with 2 mL MeOH, elute with 2 mL 1% trifluoroacetic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH:buffer 50:50, inject a 5–75 μL aliquot. (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.) (The procedure was not necessarily validated for this compound.)

HPLC VARIABLES

Column: 250 × 2 5 μm Ultrasphere octyl
Column temperature: 60
Mobile phase: Gradient. A was MeOH containing 10 mM sodium octanesulfonate. B was buffer containing 10 mM sodium octanesulfonate. A:B from 45:55 to 70:30 over 30 min, maintain at 70:30 for 1 h. (The buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.)
Flow rate: 0.3
Injection volume: 5–75
Detector: F ex 390 em 470 following post-column reaction. The column effluent mixed with 400 mM NaOH pumped at 0.15 mL/min and 0.05% ninhydrin pumped at 0.05 mL/min and the mixture flowed through a 12 m ×0.33 mm ID reaction coil at 70° to the detector.

CHROMATOGRAM

Retention time: 45
Limit of detection: 100 fmole

OTHER SUBSTANCES

Simultaneous: angiotensin I, angiotensin II, angiotensin III, atrial natriuretic peptide, bombesin, bradykinin, gonadorelin (LHRH), somatoliberin, vasopressin

KEY WORDS

plasma; post-column reaction; SPE

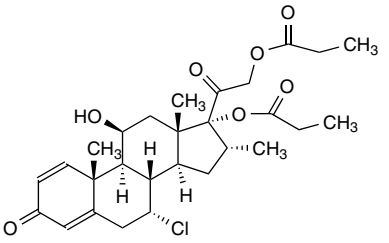
Alclometasone 17,21-dipropionate

Molecular formula: $C_{28}H_{37}ClO_7$
Molecular weight: 521.05
CAS Registry No: 66734-13-2
Merck Index: 13, 219



SAMPLE

Matrix: formulations

Sample preparation: Condition a 3 mL 500 mg Megabond MF C18 SPE cartridge (Varian) with 3 mL MeOH and 3 mL water. Sonicate 1 g cosmetic with 10 mL MeOH or MeOH:dichloromethane 10:90 (depending on what appears visually to give best solubility) at 40° for 10 min, centrifuge, collect the clear supernatant. Add 5 mL of the supernatant to the SPE cartridge, wash with 4 mL acetone:water 20:80, wash with 1 mL *n*-hexane, elute with 4 mL diethyl ether. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue with 5 mL (or more) MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm endcapped Purospher RP-18
Column temperature: 25
Mobile phase: Isocratic. MeCN:water 60:40. Gradient. MeCN:water from 25:75 to 90:10 over 30 min, maintain at 90:10 for 10 min.
Flow rate: 1
Injection volume: 10
Detector: UV 239

CHROMATOGRAM

Retention time: k′ 2.55 (isocratic); 21.0 min (gradient)
Limit of detection: 300 ng/mL

OTHER SUBSTANCES

Simultaneous: amcinonide (isocratic k′ 3.18; gradient retention time (min) 22.6; LOD 0.1 μg/mL), betamethasone (isocratic k′ 0.18; gradient retention time (min) 11.8; LOD 0.1 μg/mL), betamethasone-17-acetate (isocratic k′ 0.73; gradient retention time (min) 15.4; LOD 0.3 μg/mL), betamethasone-17-benzoate (isocratic k′ 2.04; gradient retention time (min) 20.6; LOD 0.3 μg/mL), betamethasone-17-propionate-21-stearate (isocratic k′ >13; gradient retention time (min) >35; LOD 0.5 μg/mL), betamethasone-17-propionate-21-butyrate (isocratic k′ 5.91; gradient retention time (min) 26.1; LOD 0.4 μg/mL), betamethasone-17-valerate-21-acetate (isocratic k′ 4.41; gradient retention time (min) 23.1; LOD 0.4 μg/mL), betamethasone-17-valerate (isocratic k′ 2.32; gradient retention time (min) 21.4; LOD 0.3 μg/mL), betamethasone-17,21-dipropionate (isocratic k′ 4.00; gradient retention time (min) 24.2; LOD 0.4 μg/mL), betamethasone-17,21-diacetate (isocratic k′ 1.81; gradient retention time (min) 20.5; LOD 0.3 μg/mL), betamethasone-17,21-divalerate (isocratic k′ 10.82; gradient retention time (min) 28.0; LOD 0.4 μg/mL), betamethasone-21-acetate (isocratic k′ 0.77; gradient retention time (min) 15.6; LOD 0.3 μg/mL), betamethasone propionate (isocratic k′ 0.82; gradient retention time (min) 17.1; LOD 0.3 μg/mL), clobetasol propionate (isocratic k′ 3.41; gradient retention time (min) 23.4; LOD 0.1 μg/mL), clobetasone butyrate (isocratic k′ 5.45; gradient retention time (min) 26.3; LOD 0.1 μg/mL), cortisone (isocratic k′ 0.18; gradient retention time

(min) 11.1; LOD 0.6 μg/mL), cortisone acetate (isocratic k′ 0.73; gradient retention time (min) 15.2; LOD 0.6 μg/mL), dehydrocorticosterone (isocratic k′ 4.27; gradient retention time (min) 22.3; LOD 0.5 μg/mL), deoxymethasone (isocratic k′ 0.64; gradient retention time (min) 14.2; LOD 0.2 μg/mL), dexamethasone (isocratic k′ 0.27; gradient retention time (min) 11.9; LOD 0.1 μg/mL), dexamethasone-21-acetate (isocratic k′ 0.91; gradient retention time (min) 16.1; LOD 0.2 μg/mL), dexamethasone isonicotinate (isocratic k′ 1.05; gradient retention time (min) 17.7; LOD 0.4 μg/mL), dexamethasone pivalate (isocratic k′ 3.45; gradient retention time (min) 24.1; LOD 0.3 μg/mL), dexamethasone valerate (isocratic k′ 3.00; gradient retention time (min) 21.6; LOD 0.3 μg/mL), diflucortolone valerate (isocratic k′ 4.73; gradient retention time (min) 23.3; LOD 0.3 μg/mL), fludrocortisone acetate (isocratic k′ 0.59; gradient retention time (min) 14.1; LOD 0.3 μg/mL), flumethasone pivalate (isocratic k′ 2.68; gradient retention time (min) 21.2; LOD 0.3 μg/mL), fluocinolone acetonide (isocratic k′ 0.91; gradient retention time (min) 13.4; LOD 0.3 μg/mL), fluocinonide (isocratic k′ 1.45; gradient retention time (min) 20.5; LOD 0.1 μg/mL), fluocortin butyl ester (isocratic k′ 5.59; gradient retention time (min) 24.6; LOD 0.3 μg/mL), fluocortolone caproate (isocratic k′ 6.59; gradient retention time (min) 25.1; LOD 0.3 μg/mL), fluocortolone pivalate (isocratic k′ 4.50; gradient retention time (min) 23.6; LOD 0.3 μg/mL), fluorometholone (isocratic k′ 0.59; gradient retention time (min) 14.4; LOD 0.1 μg/mL), 9-α-fluoroprednisolone (isocratic k′ 0.18; gradient retention time (min) 10.0; LOD 0.1 μg/mL), 9-α-fluoroprednisolone acetate (isocratic k′ 0.50; gradient retention time (min) 13.9; LOD 0.2 μg/mL), flurandrenolide (isocratic k′ 0.50; gradient retention time (min) 13.5; LOD 0.1 μg/mL), halcinonide (isocratic k′ 1.64; gradient retention time (min) 20.6; LOD 0.1 μg/mL), hydrocortisone (isocratic k′ 0.18; gradient retention time (min) 10.0; LOD 0.4 μg/mL), hydrocortisone-17-butyrate (isocratic k′ 1.09; gradient retention time (min) 17.7; LOD 0.6 μg/mL), hydrocortisone-21-acetate (isocratic k′ 0.77; gradient retention time (min) 15.3; LOD 0.6 μg/mL), hydrocortisone pivalate (isocratic k′ 2.27; gradient retention time (min) 20.4; LOD 0.8 μg/mL), methylprednisolone (isocratic k′ 0.55; gradient retention time (min) 13.5; LOD 0.1 μg/mL), mometasone furoate (isocratic k′ 3.05; gradient retention time (min) 22.0; LOD 0.2 μg/mL), prednisolone-21-acetate (isocratic k′ 0.60; gradient retention time (min) 13.6; LOD 0.2 μg/mL), prednisolone acetonide (isocratic k′ 0.50; gradient retention time (min) 13.0; LOD 0.3 μg/mL), prednisolone pivalate (isocratic k′ 2.05; gradient retention time (min) 19.7; LOD 0.3 μg/mL), triamcinolone (isocratic k′ 0.14; gradient retention time (min) 7.2; LOD 0.1 μg/mL), triamcinolone acetonide (isocratic k′ 0.50; gradient retention time (min) 13.9; LOD 0.2 μg/mL), triamcinolone diacetate (isocratic k′ 0.45; gradient retention time (min) 13.9; LOD 0.3 μg/mL)

Development of a tandem thin-layer chromatography-high-performance liquid chromatography method for the identification and determination of corticosteroids in cosmetic products, *Anal.Chim.Acta*, **2002**, *457*, 187–198.

SAMPLE

Matrix: formulations

Sample preparation: Mix 1 g of a topical product, 5 mL 100 mM pH 4 citrate buffer saturated with NaCl, and 10 mL ethyl acetate, shake vigorously by hand to ensure that no large clumps stick to the tube, mix with the tube on its side on an oscillating shaker for 15 min. Remove the upper ethyl acetate layer and wash with citrate buffer as before. Dry the ethyl acetate over anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in a mixture of 10 mL heptane and 5 mL MeCN:water 90:10. Remove the upper heptane layer and extract it with 2 mL MeCN:water 90:10. Combine the MeCN/water layers and evaporate them to dryness, dissolve the residue in 300 μL MeOH, filter (0.45 μm nylon), inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee NewGuard C18
Column: 75 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. MeCN:water 18:82 for 2 min, to 82:18 over 12 min, maintain at 82:18 for 3 min, re-equilibrate at initial conditions for 12 min.
Flow rate: 1
Injection volume: 5
Detector: UV 240

CHROMATOGRAM

Retention time: 10.93
Limit of detection: 0.001%

OTHER SUBSTANCES

Simultaneous: amcinonide (10.90), beclomethasone 17,21-dipropionate (11.90), betamethasone (6.52), betamethasone 21-acetate (8.47), betamethasone 17-benzoate (10.28), betamethasone 17,21-dipropionate (11.42), betamethasone 17-valerate (10.25), budesonide (8.55, 8.69 (epimers)), clobetasol 17-propionate (11.06), cortisone (5.62), cortisone 21-acetate (8.07), dexamethasone (6.57), dexamethasone 21-acetate (8.68), desonide (6.99), desoximetasone (7.60), desoxycorticosterone acetate (10.90), desoxycorticosterone pivalate (14.45), diflorasone 17,21-diacetate (9.81), fluocinolone acetonide (7.38), fluocinonide (9.79), flurandrenolide (7.36), fludrocortisone 21-acetate (7.77), fluorometholone (7.67), flumethasone 21-pivalate (11.20), flunisolide (7.14), fluprednisolone (5.46), fluticasone 17-propionate (11.19), halcinonide (10.72), halobetasol propionate (10.98), hydrocortisone (5.50), hydrocortisone 21-acetate (7.65), hydrocortisone 17-butyrate (8.66), hydrocortisone 21-cypionate (12.54), hydrocortisone 17-valerate (9.53), mometasone 17-furoate (11.24), methylprednisolone (6.31), methylprednisolone 21-acetate (8.34), meprednisone (6.55), prednisolone (5.37), prednisolone 21-acetate (7.47), prednisolone 21-tebuate (11.01), paramethasone 21-acetate (8.64), prednicarbate (10.72), prednisone (5.46), triamcinolone (4.15), triamcinolone acetonide (7.04), triamcinolone 16,21-diacetate (7.49), triamcinolone hexacetonide (13.12)

Dzerk, A.M.; Carlson, A.; Loewen, G.R.; Shirley, M.A.; Lee, J.W. A HPLC method for the determination of 9-cis retinoic acid (ALRT1057) and its 4-oxo metabolite in human plasma, *J.Pharm.Biomed.Anal.*, **1998**, *16*, 1013–1019.

SAMPLE

Matrix: blood, food, formulations, tissue
Sample preparation: Serum. Extract one volume (20–100 μL) serum with three volumes isopropanol:dichloromethane 2:1 containing about 6 nM IS and 1 mM butylated hydroxytoluene (BHT, antioxidant), add glacial acetic acid (1 μL/20 μL serum). Vortex for 30 s, centrifuge for 1 min, inject a 20–70 μL aliquot of the supernatant. Tissue, food. Homogenize 100–200 mg human or rat liver, 200 mg–2 g other tissues, or 2–5 g pulp of fruits and fresh vegetables with 3–5 mL isopropanol:dichloromethane 2:1, make up to 10 mL with isopropanol:dichloromethane 2:1. Vortex for 1 min, keep under argon

at −20° overnight, vortex for 1 min, return to the freezer. On the third day, vortex the mixture, centrifuge or filter. Evaporate the supernatant or filtrate to dryness in a rotary evaporator. Dissolve the residue in 200 μL isopropanol:dichloromethane 2:1, inject a 20–40 μL aliquot. Multivitamin tablets. Grind tablet to a powder, add 10 mL isopropanol:dichloromethane 2:1. Vortex for 1 min, keep under argon at −20° overnight, vortex for 1 min, return to the freezer. On the third day, vortex the mixture, centrifuge about 500 μL solution, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: C18 (Upchurch)
Column: 100 × 4.6 3 μm Microsorb MV
Mobile phase: Gradient. A was MeOH:water 75:25 containing 10 mM ammonium acetate. B was MeOH:dichloromethane 80:20. A:B from 100:0 to 0:100 over 15 min, maintain at 0:100 for 15–20 min, to 100:0 over 5 min, re-equilibrate at initial conditions for 10 min.

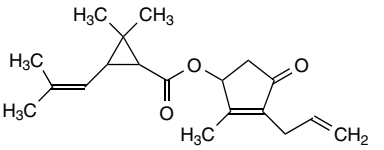
Allethrin



Molecular formula: $C_{19}H_{26}O_3$
Molecular weight: 302.41
CAS Registry No: 584-79-2
Merck Index: 13, 256

SAMPLE

Matrix: fruit, vegetables
Sample preparation: Prepare a cleanup column by placing 4 g Florisil, 1 g activated charcoal, and a 20 mm layer of anhydrous sodium sulfate in a 400 × 10 glass column, wash with 40 mL toluene, wash with 40 mL toluene:MeCN 99:1. Homogenize 25 g chopped fruit or vegetable with 70 mL MeOH at high speed for 3 min, filter, homogenize solid with 30 mL MeOH, and filter. Combine the filtrates and add them to 60 mL toluene and 300 mL 10% NaCl in water, shake well for 3 min, let layers separate. Dry the organic layer by passing it through 20 g anhydrous sodium sulfate in a 20 mm diameter column, concentrate to about 5 mL under reduced pressure at 80°, add to the cleanup column, elute with 40 mL toluene:MeCN 99:1. Evaporate the eluate just to dryness under reduced pressure at 80°, reconstitute with 1 mL MeOH, inject an aliquot. (Reflux activated charcoal (20–40 mesh) with 1 M HCl for 4 h, wash with water until the washings are neutral, dry at 95–100° (*J.Assoc.Off.Anal.Chem*. **1983**, *66*, 1013). Heat 60–100 mesh Florisil at 200° for 24 h, cool, add 4% water, mix thoroughly, store in a sealed jar (*J.Assoc.Off.Anal.Chem*. **1983**, *66*, 1003).)

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Column temperature: 50
Mobile phase: Gradient. MeCN:water from 62:38 to 78:22 over 32 min (Waters curve 6).
Flow rate: 1.5
Detector: UV 206

CHROMATOGRAM

Retention time: 11.55
Limit of detection: 50 ng/g

OTHER SUBSTANCES

Simultaneous: cypermethrin (21.05–22.08), permethrin (24.60, 27.01), tetramethrin (13.08)

KEY WORDS

apple, cabbage, cucumber; peach, pear, tomato, SPE

Development of a tandem thin-layer chromatography-high-performance liquid chromatography method for the identification and determination of corticosteroids in cosmetic products, *Anal.Chim.Acta*, **2002**, *457*, 187–198.

SAMPLE

Matrix: formulations

Sample preparation: Mix 1 g of a topical product, 5 mL 100 mM pH 4 citrate buffer saturated with NaCl, and 10 mL ethyl acetate, shake vigorously by hand to ensure that no large clumps stick to the tube, mix with the tube on its side on an oscillating shaker for 15 min. Remove the upper ethyl acetate layer and wash with citrate buffer as before. Dry the ethyl acetate over anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in a mixture of 10 mL heptane and 5 mL MeCN:water 90:10. Remove the upper heptane layer and extract it with 2 mL MeCN:water 90:10. Combine the MeCN/water layers and evaporate them to dryness, dissolve the residue in 300 μL MeOH, filter (0.45 μm nylon), inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee NewGuard C18

Column: 75 × 4.6 3.5 μm Symmetry C18 (Waters)

Mobile phase: Gradient. MeCN:water 18:82 for 2 min, to 82:18 over 12 min, maintain at 82:18 for 3 min, re-equilibrate at initial conditions for 12 min.
Flow rate: 1
Injection volume: 5
Detector: UV 240

CHROMATOGRAM

Retention time: 10.90
Limit of detection: 0.001%

SAMPLE

Matrix: blood, tissue
Sample preparation: Deproteinize plasma by adding perchloric acid to a final concentration of 800 mM. Neutralize the supernatant by adding solid sodium bicarbonate until a pH of ca. 7.6 is reached. Homogenize tissue with 3 volumes of 10 mM pH 7.2 HEPES buffer containing 250 mM sucrose and 500 mM EDTA, centrifuge at 800 g for 5 min. Mix 10 μL sample with 5 μL reagent and 35 μL water, let stand at room temperature for 1 min, inject a 20 μL aliquot. (Prepare the reagent by dissolving 27 mg *o*-phthalaldehyde in 500 μL MeOH, add 5 mL 100 mM sodium tetraborate, add 20 μL mercaptoethanol, mix.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm C18 (Waters)
Mobile phase: MeCN:50 mM pH 7.0 phosphate buffer 10:90 containing 2.4 mM EDTA
Flow rate: 1
Injection volume: 20
Detector: E, Shimadzu LECD 6A, glassy carbon working electrode at +0.45 V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 44.6
Limit of detection: 50 nM
Limit of quantitation: 100 nM

KEY WORDS

brain; derivatization; human; liver; plasma; rat

SAMPLE

Matrix: blood, urine
Sample preparation: 50 μL Plasma or urine + 3.5 mL reagent + 450 μL 10% formaldehyde, vortex for 3 s, heat at 100° for 10 min, cool in an ice bath, filter (0.8 μm, plasma samples only), inject a 10 (urine) or 20 (plasma) μL aliquot. (Prepare the reagent by mixing 15 mL acetylacetone, 10 mL EtOH, and 75 mL water.)

HPLC VARIABLES

Column: 150 × 4.6 Shim-pack CLC-ODS (Shimadzu)
Column temperature: 40
Mobile phase: MeOH:water:acetic acid 50:50:1
Flow rate: 0.7
Injection volume: 10–20
Detector: F ex 370 em 460

CHROMATOGRAM
Retention time: 6.1
Limit of detection: 3 ng/mL

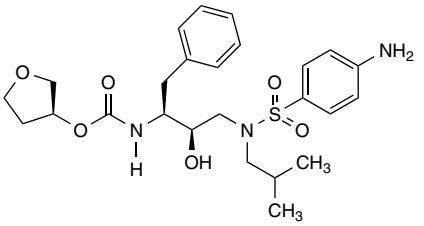
Amprenavir

Molecular formula: $C_{25}H_{35}N_3O_6S$
Molecular weight: 505.64
CAS Registry No: 161814-49-9
Merck Index: 13, 594



SAMPLE

Matrix: blood
Sample preparation: Condition a C18 SPE cartridge (Baker) with 3 mL MeOH and 3 mL water. Do not allow to run dry. Add 1 mL plasma to the SPE cartridge, wash with 2 mL water, suck dry for 1 min, elute with 2.6 mL MeOH. Evaporate a 1 mL aliquot of the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: GuardPak μBondapak C18
Column: 250 × 4.6 5 μm Symmetry C18
Column temperature: 37
Mobile phase: MeCN:40 mM disodium hydrogen phosphate containing 4% octanesulfonic acid 50:50. (At the end of each session, wash column with MeOH:water 50:50 and MeCN:water 80:20.)
Flow rate: 1.3
Injection volume: 100
Detector: UV 261 for 9 min, UV 241 for 11 min, UV 254 for 12 min

CHROMATOGRAM

Retention time: 5.6
Limit of quantitation: 25 ng/mL

OTHER SUBSTANCES

Extracted: efavirenz (15.2, LOQ 50 ng/mL), indinavir (4.8, LOQ 50 ng/mL), nelfinavir (19.2, LOQ 50 ng/mL), ritonavir (12.8, LOQ 50 ng/mL), saquinavir (16.8, LOQ 5 ng/mL)
Noninterfering: abacavir, acebutolol, acetaminophen, acetylcysteine, acyclovir, albendazole, alimemazine, alizapride, amikacin, amiodarone, amphotericin B, ampicillin, aspirin, bepridil, buprenorphine, butobarbital, caffeine, calcium folinate, captopril, carbamazepine, carbutamide, chloroquine, ciprofloxacin, clindamycin, clofazimine, clofibrate, clonazepam, clonidine, cloxacillin, clozapine, cocaine, codeine, cyamemazine, dantrolene, dexamethasone, dextropropoxyphene, diazepam, diclofenac, didanosine, digoxin, dihydroergotamine, diltiazem, doxycycline, ethambutol, flecainide, fluconazole, fluoxetine, fluvoxamine, foscarnet, furosemide, ganciclovir, gentamicin, glibenclamide, granisetron, halofantrine, haloperidol, hydrocortisone, imipramine, indomethacin, interferon alfa, isoniazid, itraconazole, josamycin, ketoconazole, lamivudine, levomepromazine, lidocaine, loperamide, loratadine, losartan, mefloquine, meprobamate, methadone, methylprednisolone, metoclopramide, metronidazole, mianserin, moclobemide, morphine, nevirapine, nifedipine, niflumic acid, nitrofurantoin, omeprazole, paroxetine, pentamidine, phenobarbital, phenytoin, piracetam, prazosin, prednisolone, prednisone, primidone, propranolol, quinidine, quinine, ranitidine, ribavirin, rifabutin, rifampin, roxithromycin, salicylic acid, simvastatin, stavudine, sulfadiazine, sulfamethoxazole, sulpiride, thalidomide, theophylline, trimethoprim, valproic acid, venlafaxine, vigabatrin, viloxazine, zidovudine, zolpidem, zopiclone
Interfering: delavirdine, flunitrazepam

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood
Sample preparation: Mix 250 μL plasma with 50 μL MeOH, add 100 μL 2 μg/mL IS in MeOH, add 250 μL 1 M NaOH, add 3 mL hexane:ethyl acetate 50:50, shake at high speed for 25 min, centrifuge at 3000 g for 15 min. Evaporate the organic layer to dryness under a stream of air, reconstitute the residue with 1 mL initial mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 2.1 Symmetry Shield
Column: 30 × 2.1 3.5 μm Symmetry C18
Mobile phase: Gradient. MeCN:5 mM pH 3.25 acetate buffer from 25:75 to 80:20 over 4 min using a nonlinear gradient (not specified).
Flow rate: 0.35
Injection volume: 20
Detector: MS, PE Sciex API 3000, turbo ionspray source, column effluent split 1:1 before entering source

CHROMATOGRAM
Retention time: 2.7
Internal standard: Abbott A-86093 (3.2)
Limit of detection: 380 pg/mL
Limit of quantitation: 16.3 ng/mL

OTHER SUBSTANCES
Extracted: indinavir (2.0, LOQ 16.3 ng/mL, LOD 1.5 ng/mL), lopinavir (3.1, LOQ 16.3 ng/mL, LOD 750 pg/mL), nelfinavir (2.5, LOQ 16.3 ng/mL, LOD 330 pg/mL), ritonavir (2.9, LOQ 51.2 ng/mL, LOD 650 pg/mL), saquinavir (2.4, LOQ 16.3 ng/mL, LOD 780 pg/mL)

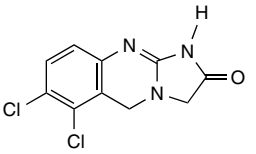
Anagrelide



Molecular formula: $C_{10}H_7Cl_2N_3O$
Molecular weight: 256.09
CAS Registry No: 68475-42-3
Merck Index: 13, 629

SAMPLE

Matrix: blood, urine
Sample preparation: Mix 2 mL plasma or urine with 2 mL 200 mM pH 7.0 phosphate buffer, extract twice with 10 mL portions of ethyl acetate. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 60 μL DMSO, mix, sonicate, inject a 40 μL aliquot.

HPLC VARIABLES

Guard column: 40 mm long μBondapak phenyl corasil
Column: 300 × 3.9 μBondapak phenyl
Mobile phase: MeCN:10 mM pH 4 sodium acetate buffer 25:75 for 10 min, DMSO for 8 min, return to original mobile phase
Flow rate: 2.5 for 13 min, 1 for 5 min, 2.5 for rest of the run
Injection volume: 40
Detector: UV 254; Radioactivity (^{14}C)

CHROMATOGRAM

Retention time: 6–8

KEY WORDS

plasma; radiolabeled

REFERENCE

Anakinra

Molecular weight: 17 000
CAS Registry No: 143090-92-0
Merck Index: 13, 5022

SAMPLE

Matrix: blood, tissue
Sample preparation: Inject a 50 μL aliquot of plasma or tissue homogenate supernatant.

HPLC VARIABLES

Guard column: 40 × 6 Spherogel TSK PWHR (Beckman)
Column: 300 × 7.8 5 μm Progel-TSK G2000 SWXL (Supelco)
Mobile phase: 10 mM pH 6.5 citrate buffer containing 140 mM NaCl and 0.5 mM EDTA
Flow rate: 0.5
Injection volume: 50
Detector: UV; Radioactivity (^{35}S); ELISA

CHROMATOGRAM

Retention time: 20

KEY WORDS

brain; gut; heart; kidney; liver; lung; muscle; plasma; rat; spleen

SAMPLE

Matrix: solutions
Sample preparation: Inject a 100 μL aliquot of a 2–5 mg/mL solution in 10 mM pH 6.5 citrate buffer containing 140 mM NaCl and 0.5 mM EDTA.

HPLC VARIABLES

Column: 75 × 7.5 Bio-Gel SP-5-PW (Bio-Rad)
Mobile phase: Gradient. A:B from 99:1 to 40:60 over 60 min. A was 20 mM pH 5.5 2-(*N*-morpholino)ethanesulfonic acid monohydrate. B was 20 mM pH 5.5 2-(*N*-morpholino)ethanesulfonic acid monohydrate containing 1.0 M NaCl.
Flow rate: 0.5
Injection volume: 100
Detector: UV 280

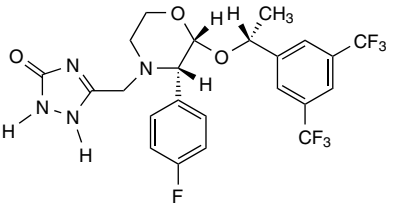
Aprepitant

Molecular formula: $C_{23}H_{21}F_7N_4O_3$
Molecular weight: 534.43
CAS Registry No: 170729-80-3



SAMPLE

Matrix: blood, tissue
Sample preparation: Mix 200 μL plasma with 20 ng IS and 1.7 mL water, add 500 μL MeCN, add to a 500 mg Bond Elut C18 SPE cartridge, wash with 6 mL water, elute with 3 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 300 μL mobile phase, inject an aliquot. Alternatively, mix 50 μL plasma or brain homogenate with 5 ng IS and 100 μL MeCN, vortex, centrifuge at 3000 g for 10 min, inject a 5–25 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 50 × 4.6 5 μm Spherisorb C8
Mobile phase: MeCN:10 mM ammonium acetate:formic acid 55:45:0.1
Flow rate: 1
Injection volume: 5–25
Detector: MS, Sciex API III+, heated nebulizer interface, dwell time 450 ms, m/z 535 to 179

CHROMATOGRAM

Retention time: 1.5
Internal standard: desfluoroaprepitant (m/z 535 to 161) (1.5)

KEY WORDS

brain; ferret; plasma; SPE

REFERENCE

SAMPLE

Matrix: blood, tissue
Sample preparation: Mix 3 mL plasma with 6 mL MeCN, centrifuge at 3000 g, evaporate the supernatant to dryness under a stream of nitrogen, reconstitute the residue with 1 mL MeOH:water 40:60, inject a 250–400 μL aliquot of the supernatant. Homogenize the brain with 3 volumes of water. Vortex 10 mL homogenate with 90 mL MeCN, sonicate for 5 min, centrifuge at 3000 g for 10 min, re-extract the pellet with 10 mL MeOH. Combine the organic layers and add to a Bond Elut C18 SPE cartridge equipped with an Acrodisc glass filter, elute with 5 mL MeOH:MeCN:water 50:25:25. Collect all the cartridge effluent and evaporate to dryness under a stream of nitrogen, reconstitute the residue with 5 mL MeOH, vortex, sonicate, centrifuge. Evaporate the supernatant to dryness under a stream of nitrogen, reconstitute the residue with 1 mL MeOH:water 40:60, inject a 400 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX-C8

Mobile phase: Gradient. A:B 65:35 to 20:80 over 40 min. A was 10 mM ammonium acetate. B was MeCN:MeOH 92.8:7.2 containing 7.2 mM ammonium acetate. (Alternatively, A 10 mM ammonium acetate in water containing 0.1% trifluoroacetic acid and B MeCN:MeOH 92.8:7.2 containing 7.2 mM ammonium acetate and 0.1% trifluoroacetic acid with the same gradient.)
Flow rate: 1
Injection volume: 250–400
Detector: Radioactivity (^{14}C)

CHROMATOGRAM
Retention time: 26
Internal standard: desfluoroaprepitant (m/z 535 to 161) (1.5)

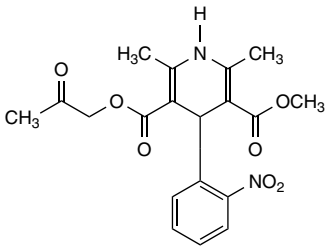
Aranidipine

Molecular formula: $C_{19}H_{20}N_2O_7$
Molecular weight: 388.37
CAS Registry No: 86780-90-7
Merck Index: 13, 772



SAMPLE

Matrix: blood
Sample preparation: Add 20 ng nifedipine and 500 μL 100 mM pH 9.0 borate buffer to 1 mL plasma, vortex for 10 s, add 6 mL toluene, shake mechanically for 10 min, centrifuge at 1000 g for 15 min. Evaporate the organic layer to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL mobile phase, inject a 50 μL aliquot. (Carry out all steps under yellow fluorescent lighting.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil ODS-2
Column temperature: 40
Mobile phase: MeOH:360 mM sodium perchlorate 45:55
Flow rate: 0.8
Injection volume: 50
Detector: E, BAS LC-4B/17AT, +0.92 V versus Ag/AgCl

CHROMATOGRAM

Retention time: 16
Internal standard: nifedipine (26)
Limit of quantitation: 2.5 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 4 mm SDB-RPS SPE disk cartridge (3M Empore) with 500 μL MeOH, 500 μL air, 500 μL water, and 1 mL air. Mix 1 mL serum with 50 μL perchloric acid, let stand for 10 min, mix, centrifuge at 16 000 g for 10 min. Add 800 μL to the cartridge followed by 2 mL air. Wash with 800 μL 0.5% phosphoric acid in MeOH:water 20:80, push through 1.5 mL air, wash with 700 μL water, push through 2 mL air, elute with 500 μL MeOH containing 1% ammonia, push through 1.2 mL air. Evaporate the eluate to dryness under a stream of air at 70° and reconstitute the residue with 50 μL mobile phase, inject a 40 μL aliquot.

HPLC VARIABLES

Column: 125 × 3 5 μm Nucleosil 50-5 endcapped RP-8

Column temperature: 35
Mobile phase: MeCN:buffer 12:88 (Buffer was 880 mL 20 mM potassium dihydrogen phosphate containing 500 μL phosphoric acid, pH 3.)
Flow rate: 1
Injection volume: 40
Detector: UV 274

CHROMATOGRAM
Retention time: 9.5
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: articainic acid (3.5)

KEY WORDS
serum; SPE

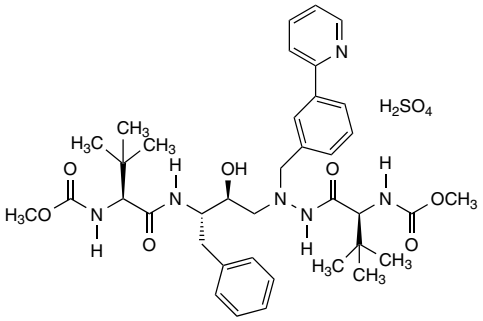
Atazanavir sulfate

Molecular formula: $C_{38}H_{52}N_6O_7.H_2O_4S$
Molecular weight: 802.93
CAS Registry No: 229975-97-7



SAMPLE

Matrix: blood

Sample preparation: Condition each well of a 3M Empore C2-SD 96 well plate with 250 μL MeOH and 500 μL 0.1% acetic acid, do not allow to go dry. Add 50 μL 200 ng/mL IS in MeOH:water 60:40 to 200 μL MeOH:water 60:40 containing 5 million cells, sonicate for 10 min, centrifuge at 2600 g for 10 min. Evaporate the supernatant to dryness, reconstitute with 50 μL MeOH, add 200 μL water, add 250 μL 0.1% acetic acid, mix, add to a well on the SPE plate, allow to pass through under vacuum over 2 min, wash with 500 μL 0.1% acetic acid, dry under vacuum for 2 min, elute twice with 200 μL portions of MeCN:MeOH 50:50, pulling to dryness after each portion. Evaporate the eluate to dryness under a stream of nitrogen at 60° over ca. 40 min, reconstitute the residue with 200 μL mobile phase, vortex, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 2 5 μm YMC Basic
Column: 50 × 2 5 μm YMC Basic
Mobile phase: MeCN:MeOH:water:88% formic acid 30:30:40:0.025
Flow rate: 0.25
Injection volume: 20
Detector: MS, Sciex API 3000 turbo ionspray, electrospray, positive mode at 400°, m/z 705 to 335, IonSpray 4600 V, declustering potential 56 V, entrance potential −10 V, focusing potential 220 V, TurboIon gas nitrogen 8 L/min, collision energy 42 V, collision cell exit potential 24 V, dwell time 500 ms, pause time 5 ms

CHROMATOGRAM

Retention time: <4
Internal standard: $^{13}C_6$-atazanavir
Limit of quantitation: 5 fmole/million cells

SAMPLE

Matrix: blood

Sample preparation: Condition each well of a10 mg Oasis HLB 96 well SPE plate with 1 mL MeOH and 1 mL 0.1% acetic acid. Add 40 μL 5 μg/mL IS in water and 300 μL 0.1%

acetic acid to 250 μL plasma, mix, add to a well of the SPE plate, wash with 500 μL 0.1% acetic acid, wash with 500 μL MeOH:water 20:80, elute with 300 μL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 500 μL MeCN:MeOH:10 mM pH 5.5 ammonium acetate 30:30:40, inject a 15 μL aliquot.

HPLC VARIABLES

Column: 33 × 4.6 3 μm Uptisphere HDO C18 (Interchim)
Mobile phase: Gradient. MeCN:5 mM ammonium acetate 50:50 for 0.5 min, to 60:40 over 0.1 min, maintain at 60:40 for 1.7 min, return to initial conditions over 0.1 min, re-equilibrate for 2.1 min.
Flow rate: 0.8
Injection volume: 15
Detector: MS, Micromass Quattro Ultima, atmospheric pressure electrospray ionization, column effluent split 1:20 before entering MS, positive ion mode, capillary sprayer voltage 3.2 kV, sample cone voltage 80 V, source temperature 100°, desolvation temperature 350°, nebulizing gas nitrogen, cone gas nitrogen at 37 L/h, desolvation gas nitrogen at 500 L/h, collision gas argon at 2.6 μbar, collision energy was set at 40 eV, resolution set at 0.7 mass units at half height for the first and third quadrupoles.

CHROMATOGRAM

Merck Index: 13, 1023

SAMPLE

Matrix: blood

Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH, 5 mL water, and 5 mL MeOH:water 30:70. Mix 1 mL plasma with 450 μL 3 μg/mL IS in MeOH, centrifuge at 1700 g for 10 min, add the supernatant to the SPE cartridge, wash with 5 mL MeOH:water 30:70, wash with 50 μL MeOH, suck dry under reduced pressure for 1 min, elute with 5 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue with 200 μL mobile phase, inject a 150 μL aliquot.

HPLC VARIABLES

Column: 250 × 4 LiChrosorb RP-Select B
Mobile phase: MeCN:20 mM potassium dihydrogen phosphate 20:80
Flow rate: 1
Injection volume: 150
Detector: UV 290

CHROMATOGRAM

Retention time: 11
Internal standard: levobunolol (13)
Limit of quantitation: 1 ng/mL

OTHER SUBSTANCES

Extracted: dihydrobefunolol (UV 245, LOQ 10 ng/mL) (10)

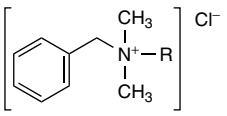
KEY WORDS

pharmacokinetics; plasma; rabbit

REFERENCE

Nozaki, Y.; Imai, T.; Goto, K.; Imamura, Y.; Underberg, W.J.M.; Otagiri, M. Simultaneous determination of befunolol and its major metabolite, dihydrobefunolol, in plasma by high performance liquid chromatography, *Anal.Sci.*, **1989**, *5*, 395–397.

Benzalkonium chloride



n = C_8H_{17} to $C_{18}H_{37}$

Molecular formula: $C_{21}H_{38}ClN$ (C12), $C_{23}H_{42}ClN$ (C14)
Molecular weight: 339.99 (C12), 368.04 (C14)
CAS Registry No: 8001-54-5
Merck Index: 13, 1058

SAMPLE

Matrix: blood
Sample preparation: Mix 2 mL plasma with 4 mL water, add to a 3 mL Baker C18 SPE cartridge, wash with three 3 mL portions of water, wash with two 3 mL portions of MeOH, wash with two 3 mL portions of ethyl acetate, elute with 4 mL MeOH:ethyl acetate 50:50 containing 0.01% ammonium chloride, and evaporate the eluate to dryness under a stream of nitrogen. Reconstitute the residue with 1 mL ethyl acetate, 1 mL 10% sodium carbonate, and 200 μL 0.1% bromophenol blue. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 50 μL mobile phase, and inject an aliquot. (The ammonium chloride is eliminated in the aqueous layer and the benzalkonium forms an ion pair with the bromophenol blue and goes into the organic layer.)

HPLC VARIABLES

Column: Spherisorb CN
Mobile phase: MeCN:buffer 90:10 (The buffer was a 161 mM pH 5.4 propionate buffer made by mixing 75 mL 10% sodium carbonate, 1.5 L water, and 12 mL propionic acid. Make up to 2 L with water.)
Flow rate: 2
Detector: UV 214, UV 254

CHROMATOGRAM

Retention time: 5.8 (C14), 6.2 (C12)
Limit of detection: 5 ng/mL (UV 214)

KEY WORDS

dog; human; plasma; SPE

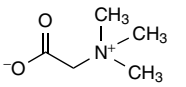
Betaine



Molecular formula: $C_5H_{11}NO_2$
Molecular weight: 117.15
CAS Registry No: 107-43-7
Merck Index: 13, 1182

SAMPLE

Matrix: blood, urine
Sample preparation: Dilute urine 10-fold with water. Mix 50 μL plasma or diluted urine with 50 μL 100 mM potassium dihydrogen phosphate, vortex, add 900 μL reagent, vortex, heat at 80° for 1 h, cool to room temperature, vortex, centrifuge at 1000 g, inject a 15 μL aliquot of the supernatant. (Prepare the reagent by dissolving 66 mg 18-crown-6 and 1.39 g 4-bromophenacyl bromide in 100 mL MeCN.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-SCX
Mobile phase: MeCN:water 90:10 containing 22 mM choline
Flow rate: 1.5
Injection volume: 15
Detector: UV 254

CHROMATOGRAM

Retention time: 14.8
Limit of detection: 5 μM

OTHER SUBSTANCES

Extracted: *N*,*N*-dimethylglycine (12.7)

KEY WORDS

derivatization; plasma

REFERENCE

Laryea, M.D.; Steinhagen, F.; Pawliczek, S.; Wendel, U. Simple method for the routine determination of betaine and *N*,*N*-dimethylglycine in blood and urine, *Clin.Chem.*, **1998**, *44*, 1937–1941.

SAMPLE

Matrix: blood, urine
Sample preparation: Vortex 100 μL plasma or urine with 1 mL MeCN:MeOH 90:10, add 300–400 mg drying mixture, mix thoroughly with occasional inversion for 1 h, centrifuge at 1000 g for 2 min. Remove a 200 μL portion of the supernatant and mix with 20 μL of a 10% suspension of magnesium oxide in water, vortex, add 50 μL 100 mM 4-bromophenacyl triflate in MeCN, continue mixing for 5 min, centrifuge at 1000 g for 2 min (Lever,M. et al. *Anal.Biochem.* **1992**, *205*, 14–21), add 10 μL of a suspension of Dowex 1 in the dichloroacetate form (to eliminate excess derivatization reagent), inject a 20 μL aliquot. (Drying mixture was 90% anhydrous disodium hydrogen phosphate and 10% argentous oxide. Prepare 4′-bromophenacyl trifluoromethanesulfonate as follows. Add 8.8 g *p*-bromobenzoyl chloride in 40 mL dry ether over 20–30 min to 100 mmol diazomethane stirred in an ice bath, stir in an ice bath for 8–9 h, let stand at room temperature for 3 h, evaporate the solvent under reduced pressure, recrystallize 4′-bromo-2-diazoacetophenone from ether/hexane (mp 123.5–124° d) (*J.Am.Chem.Soc.* **1951**, *73*, 5301). Condense 50 mL anhydrous sulfur dioxide in a flask fitted with a calcium sulfate drying tube, cool in a dry ice/acetone bath, add 2.25 g 4′-bromo-2-diazoacetophenone, stir for 5 min, add 900 μL anhydrous trifluoromethanesulfonic acid

from a freshly opened bottle in one portion, stir for 15 min, remove the cooling bath, after 30 min use an ice/water bath to evaporate the solvent. Dissolve the residue in 100 mL boiling dichloromethane, treat twice with 5 g portions of decolorizing carbon, filter, evaporate the filtrate, recrystallize the residue from pentane:dichloromethane 80:20 to give 4′-bromophenacyl trifluoromethanesulfonate as colorless plates (mp 137–8°) (*J.Chromatogr*. **1984**, *299*, 365.)

HPLC VARIABLES

Column: 250 × 4 5 μm silica (Merck)
Mobile phase: MeCN:dichloromethane:water 80:10:10 containing 9 mM triethylamine and 6 mM citric acid
Flow rate: 1
Injection volume: 20

KEY WORDS

normal phase; plasma

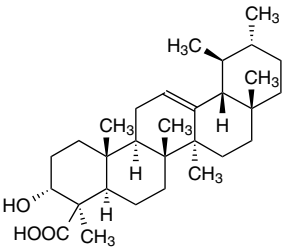
β-Boswellic acid



Molecular formula: $C_{30}H_{48}O_3$
Molecular weight: 456.70
CAS Registry No: 631-69-6
Merck Index: 13, 1343

SAMPLE

Matrix: blood
Sample preparation: Add 1 mL plasma to an Extrelut NT SPE cartridge, let stand for 15 min, elute with THF:hexane:ethyl acetate:isopropanol 32:32:32:3. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 80 μL DMSO, add this solution to a 4 mL 150 mg Carbograph SPE cartridge (Alltech, preconditioned with 6 mL MeOH). Rinse the vial twice with 1 mL portions of MeOH:isopropanol 95:5 and add the rinses to the Carbograph SPE cartridge, wash with 3 mL MeOH:isopropanol 95:5, apply a vacuum for 5 s, elute with 2.5 mL cyclohexane:acetone 50:50. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 80 μL DMSO, inject an aliquot.

HPLC VARIABLES

Column: 250 × 3 5 μm ReproSil-Pur 120 ODS-3 (Dr Maisch, Ammerbuch, Germany)
Column temperature: 28
Mobile phase: Gradient. A:B from 62:38 to 51:49 over 20 min, to 39:61 over 15 min, to 32:68 over 5 min, to 31:69 over 5 min, to 0:100 over 5 min, maintain at 0:100 for 10 min, re-equilibrate at initial conditions for 6 min. A was MeOH:water:acetic acid 80:20:0.2. B was MeOH:acetic acid 100:0.2.
Flow rate: 0.56 for 50 min, 0.9 for 10 min, 0.56 for 6 min
Detector: UV 210

CHROMATOGRAM

Retention time: 32

OTHER SUBSTANCES

Extracted: similar triterpenic acids

KEY WORDS

plasma; SPE

SAMPLE

Matrix: plant resin
Sample preparation: Sonicate 100–500 mg resin in 3 mL MeOH for 10 min, centrifuge, repeat extraction twice more. Combine the supernatants and make up to 10 mL with MeOH, filter (0.45 μm), inject a 10 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 4 μm Synergi MAX-RP 80 A (Phenomenex)
Column temperature: 60

Mobile phase: Gradient. A:B 65:35 for 7 min, to 90:10 over 21 min, maintain at 90:10 for 5 min, to 100:0 (step gradient), maintain at 100:0 for 5 min, re-equilibrate at initial conditions for 10 min. A was MeCN containing 0.05% phosphoric acid. B was water containing 0.05% phosphoric acid.
Flow rate: 1
Injection volume: 10
Detector: UV 210

CHROMATOGRAM

Retention time: 25
Limit of detection: 270 ng/mL

OTHER SUBSTANCES

Simultaneous: similar triterpenic acids

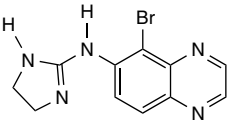
Brimonidine



Molecular formula: $C_{11}H_{10}BrN_5$
Molecular weight: 292.14
CAS Registry No: 59803-98-4
Merck Index: 13, 1361

SAMPLE

Matrix: aqueous humor, blood
Sample preparation: Mix 100–300 μL serum or aqueous humor with 2 vol buffer, centrifuge at 11 000 g for 10 min,, add the supernatant to a Sep-Pak C18 SPE cartridge, wash with 5 mL buffer, elute with 5 mL MeCN:buffer 50:50. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 100 μL mobile phase, inject a 10–20 μL aliquot. (The buffer was 10 mM triethylamine adjusted to pH 3.2 with phosphoric acid.)

HPLC VARIABLES

Guard column: 20 × 4.6 RP-18 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-18
Mobile phase: MeCN:buffer 10:90 (The buffer was 10 mM triethylamine adjusted to pH 3.2 with phosphoric acid.)
Flow rate: 1
Injection volume: 10–20
Detector: UV 248

CHROMATOGRAM

Retention time: 7
Limit of detection: 30 pg/mL

OTHER SUBSTANCES

Noninterfering: benzalkonium chloride, cyclopentolate, phenylephrine, tropicamide

KEY WORDS

serum; SPE

REFERENCE

SAMPLE

Matrix: tissue
Sample preparation: Vortex <3–25 mg ocular tissue with 200 μL MeOH for 3 min, centrifuge at 3000 g for 10 min. Mix a 35 μL aliquot of the supernatant with 65 μL 0.01% trifluoroacetic acid in water, inject the whole amount.

HPLC VARIABLES

Column: 300 × 3.9 15 μm Delta PAK C18 (Waters)
Mobile phase: MeOH:water:trifluoroacetic acid 35:65:0.01
Flow rate: 1
Injection volume: 100
Detector: UV 360

CHROMATOGRAM

Retention time: 3.5
Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Extracted: mitomycin C (6, LOD 10 ng/mL), timolol (10, LOD 50 ng/mL)

KEY WORDS

eye

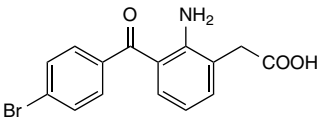
Bromfenac



Molecular formula: $C_{15}H_{12}BrNO_3$
Molecular weight: 334.17
CAS Registry No: 91714-94-2
Merck Index: 13, 1374

SAMPLE

Matrix: blood, urine
Sample preparation: Mix 1 mL plasma with 1 mL MeCN, filter (0.2 μm) by centrifuging at 800 g for 15 min, inject a 500 μL aliquot of the filtrate. Mix 1 mL urine with 1 mL 100 mM pH 5 ammonium acetate buffer and 100 μL Glusulase (40 000 units), heat at 37° for 16 h, centrifuge at 800 g for 15 min, inject a 500 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 150 × 4.6 5 μm HiChrom (Regis) (for electrospray negative ion MS (Finnigan-MAT TSQ 700) detection use 250 × 2 C18 DB (Supelco) column with the gradient below at 0.2 mL/min)
Mobile phase: Gradient. MeCN:100 mM pH 4.9 ammonium acetate buffer from 10:90 to 45:55 over 50 min, maintain at 45:55 for 10 min, re-equilibrate at initial conditions for 15 min.
Flow rate: 1
Injection volume: 500
Detector: UV 270

CHROMATOGRAM

Retention time: 42

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Mix 500 μL plasma with 200 μL 1 μg/mL IS in water, add 7 mL hexane, add 500 μL 5% ammonium hydroxide, shake rapidly on a reciprocating shaker for 10 min, centrifuge at 550 g for 5 min, discard the organic layer. Add 1 mL 2 M HCl to the aqueous layer, mix briefly, let stand for 20 min. Add 7 mL hexane, shake rapidly for 10 min, centrifuge at 550 g for 5 min. Evaporate the organic layer to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:THF:50 mM pH 6.5 sodium acetate buffer 39:6:55
Flow rate: 1.5
Injection volume: 100
Detector: UV 270

CHROMATOGRAM

Retention time: 9.5
Internal standard: 2-amino-3-(4-chlorobenzoyl)benzeneacetic acid (chloro analogue) (8.5)
Limit of quantitation: 30 ng/mL

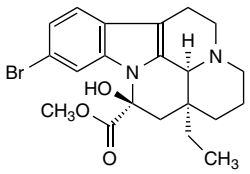
Brovincamine



Molecular formula: $C_{21}H_{25}BrN_2O_3$
Molecular weight: 433.35
CAS Registry No: 57475-17-9
Merck Index: 13, 1436

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 40 μL 10 μg/mL IS in MeCN, add 500 μL ammonia (0.88):water 1:10, mix, add 5 mL diethyl ether, rotate for 10 min, centrifuge at 2000 g for 10 min. Evaporate the organic layer to dryness under a stream of nitrogen at 37°, rinse the walls of the tube with ether, again evaporate to dryness, reconstitute the residue with 50 μL mobile phase, centrifuge at 2000 g for 10 min, inject an aliquot.

HPLC VARIABLES

Guard column: 70 × 2 25–37 μm Co:Pell ODS (Whatman)
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeCN:buffer 35:65 (The buffer was 0.1% sodium dihydrogen phosphate adjusted to pH 3.5 with phosphoric acid.)
Flow rate: 2
Detector: UV 232

CHROMATOGRAM

Retention time: 6.8
Internal standard: vincamine (3.6)
Limit of detection: 10 ng/mL

KEY WORDS

plasma

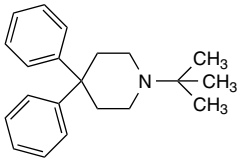
Budipine



Molecular formula: $C_{21}H_{27}N$
Molecular weight: 293.44
CAS Registry No: 57982-78-2
Merck Index: 13, 1455

SAMPLE

Matrix: urine

Sample preparation: Adjust pH of urine to 5.0 with acetic acid, add 1300 U/mL glusulase and 50 U/mL sulfatase, heat at 37° for 24 h, adjust pH to 9, pass through a column of Amberlite XAD-2 resin, wash with 3 vol of water, elute with MeOH. Evaporate the eluate to dryness, reconstitute the residue with water, adjust to pH 8, extract with ethyl acetate. Wash the ethyl acetate extract with one-tenth the volume of saturated NaCl, dry over anhydrous sodium sulfate, reconstitute with MeOH, inject an aliquot. Alternatively, adjust pH of urine to 5.0 with acetic acid, add glusulase/sulfatase, heat at 37°, adjust pH to 9, extract with dichloromethane:isopropanol 90:10. Evaporate the extract to dryness under reduced pressure, reconstitute, inject an aliquot. (Both the procedures are given.)

HPLC VARIABLES

Column: 10 μm Viosfer C8
Mobile phase: MeCN:water:isopropylamine 79.96:20:0.04
Detector: UV 220

OTHER SUBSTANCES

Extracted: metabolites

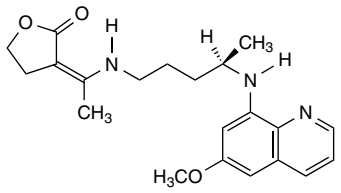
Bulaquine



Molecular formula: $C_{21}H_{27}N_3O_3$
Molecular weight: 369.46
CAS Registry No: 223661-25-4

SAMPLE

Matrix: formulations
Sample preparation: Extract capsule fill containing 5 mg bulaquine three times with 3 mL MeOH:dimethyloctylamine 99:1. Combine the extracts and make up to 10 mL with the same solvent, filter, dilute 500 μL of the filtrate to 25 mL with MeOH, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4 5 μm Lichrospher RP select-B C8
Mobile phase: MeCN:10 mM pH 5.6 sodium acetate buffer 55:45
Flow rate: 1
Injection volume: 20
Detector: UV 265

CHROMATOGRAM

Retention time: 17.26
Limit of detection: 400 ng/mL
Limit of quantitation: 2 μg/mL

OTHER SUBSTANCES

Simultaneous: chloroquine (4.22), primaquine (5.72)

KEY WORDS

capsules; comparison with HPTLC

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Mix 500 μL plasma with 50 μL 1 M KOH, add 25 μL 20 μg/mL IS in MeCN, add 3 mL extraction solvent, vortex for 1 min, centrifuge at 1000 g for 10 min, freeze the aqueous layer, remove the organic layer, repeat the extraction. Evaporate the combined organic layers to dryness under reduced pressure, reconstitute the residue with 200 μL MeCN:50 mM pH 7.0 ammonium acetate buffer 50:50, centrifuge, inject an aliquot of the supernatant. (Extraction solvent was *n*-hexane:isopropanol:dimethyloctylamine 98:2:0.1.)

HPLC VARIABLES

Guard column: 30 × 4.6 5 μm Spheri-5 cyano
Column: 220 × 4.6 5 μm Spheri-5 cyano
Mobile phase: Gradient. A:B from 55:45 to 90:10 over 15 min, maintain at 90:10 for 2 min, return to initial conditions over 2 min. A was MeCN:50 mM pH 6.0 ammonium acetate buffer 65:35. B was 50 mM pH 6.0 ammonium acetate buffer.

Flow rate: 1
Injection volume: 50
Detector: UV 261

CHROMATOGRAM

Retention time: 8
Internal standard: 3-bromoprimaquine diphosphate (13.5)
Limit of detection: 10 ng/mL
Limit of quantitation: 20 ng/mL

OTHER SUBSTANCES

Extracted: primaquine (11)

KEY WORDS

pharmacokinetics; plasma; rabbit

SAMPLE

Matrix: egg, tissue
Sample preparation: Condition an SDB (styrol-divinyl-benzene) SPE cartridge (Baker) with 3 mL MeOH and 3 mL water. Vortex 3 g muscle or liver with ? μL 10 μg/mL IS in MeOH, 1.5 g sodium sulfate, 500 μL 4 M potassium carbonate, and 5 mL ethyl acetate. Centrifuge at 2500 g for 5 min and remove the organic layer. Repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 50° or under reduced pressure. Add 5 mL *n*-hexane to the residue, shake to get a good mixture, add 1 mL EtOH/HCl, vortex, centrifuge at 1000 g for 2 min, discard the upper layer. Evaporate the lower layer to dryness under reduced pressure, reconstitute the residue with 500 μL 10 mM pH 5.5 ammonium acetate and 500 μL MeOH, add to the SPE cartridge, wash with 3 mL water, wash with two 3 mL portions of MeOH:water 50:50, dry under vacuum, elute with 3 mL MeOH:ethyl acetate 20:80. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue with 250 μL mobile phase, inject a 4 (ion spray) or 15 (turbo ion spray) μL aliquot. Preparation of egg samples is similar except that the mixture is vortexed for 10 s and sonicated for 15 min

 ISBN: 0-471-66941-5

after the addition of the ethyl acetate. (EtOH/HCl was made by mixing 66 mL EtOH with 33 mL 200 mM HCl.)

HPLC VARIABLES

Column: 150 × 2.1 5 μm Zorbax RX
Mobile phase: MeCN:10 mM ammonium acetate containing 0.5% acetic acid 60:40
Flow rate: 0.04 (ion spray), 0.2 (turbo ion spray)
Injection volume: 4–15
Detector: MS, Perkin-Elmer SCIEX API 365 tandem, ion spray or turbo ion spray, m/z 303–261

CHROMATOGRAM

Retention time: 1.9
Internal standard: 2-*n*-butylmercaptobenzimidazole (2.7) (m/z 207–151)
Limit of detection: 4 ng/g
Limit of quantitation: 6 ng/g

OTHER SUBSTANCES

Extracted: albendazole (2.5, m/z 266–233, LOD 19 ng/g, LOQ 305 ng/g), febantel (4, m/z 447–382, LOD 10 ng/g, LOQ 15 ng/g), fenbendazole (2.9, m/z 300–268, LOD 5 ng/g, LOQ 7 ng/g), flubendazole (2.1, m/z 314–281, LOD 3 ng/g, LOQ 5 ng/g), mebendazole (2, m/z 296–264, LOD 3 ng/g, LOQ 5 ng/g), oxfendazole (1.7, m/z 316–159, LOD 5 ng/g, LOQ 8 ng/g), oxibendazole (2.2, m/z 250–176, LOD 4 ng/g, LOQ 6 ng/g), thiabendazole (2, m/z 202–175, LOD 3 ng/g, LOQ 5 ng/g), triclabendazole (5.5, m/z 359–343, LOD 6 ng/g, LOQ 9 ng/g)

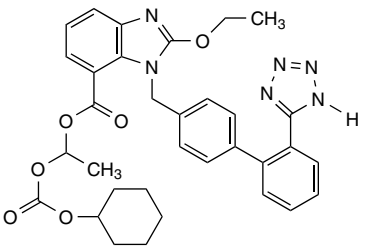
Candesartan cilexetil



Molecular formula: $C_{33}H_{34}N_6O_6$
Molecular weight: 610.66
CAS Registry No: 145040-37-5, 139481-59-7 (candesartan only)
Merck Index: 13, 1747

SAMPLE

Matrix: blood, formulations
Sample preparation: Mix 1 mL plasma with 2 mL MeCN, vortex briefly, let stand at room temperature for 5 min, centrifuge at 4000 g for 20 min, inject a 20 μL aliquot of the supernatant. Mechanically shake a pulverized tablet with 100 mL MeOH for 10 min, centrifuge an aliquot at 4000 rpm for 5 min, filter (0.45 μm), dilute, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Supelcosil C18
Mobile phase: MeCN:MeOH:10 mM potassium dihydrogen phosphate 18:80:2
Flow rate: 1
Injection volume: 20
Detector: UV 260

CHROMATOGRAM

Retention time: 3.5
Limit of detection: 2 ng/mL
Limit of quantitation: 11 ng/mL

OTHER SUBSTANCES

Extracted: hydrochlorothiazide (6.5, LOD 3.58 ng/mL, LOQ 6.75 ng/mL)
Simultaneous: benazepril (4.5), cilazapril (2.5), hydroflumethiazide (11), lisinopril (7.3)
Noninterfering: amiloride, losartan, valsartan

KEY WORDS

plasma; tablets

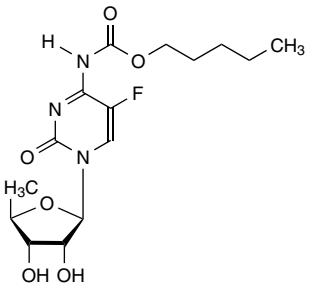
Capecitabine



Molecular formula: $C_{15}H_{22}FN_3O_6$
Molecular weight: 359.35
CAS Registry No: 154361-50-9
Merck Index: 13, 1759

SAMPLE

Matrix: blood

Sample preparation: Add 50 μL 50 μg/mL IS in MeOH to a tube, evaporate to dryness under reduced pressure at 30° for 20 min, add 500 μL plasma, add 500 μL 5 mM pH 6.8 ammonium acetate, vortex, let stand on ice for 15 min, centrifuge at 3000 g at 41° (sic) for 10 min. Inject a 20 μL aliquot of the supernatant onto column A and elute to waste with the mobile phase; after 0.8 min, divert the effluent from column A onto column B; after another 19.1 min, elute only column A to waste.

HPLC VARIABLES

Column: A 20 × 2.1 Oasis HLB (Waters); B SecurityGuard C18 (Phenomenex) + 150 × 2 5 μm YMC ODS-AQ

Column temperature: 30 (column B only)

Mobile phase: Gradient. MeCN:5 mM pH 6.8 ammonium acetate 0:100 for 2 min, to 10:90 over 0.2 min, to 30:70 over 7.8 min, to 70:30 over 2 min, maintain at 70:30 for 3 min, to 0:100 over 0.2 min, maintain at 0:100 for 4.8 min, to 95:5 over 0.2 min, maintain at 95:5 for 1 min, return to initial conditions over 0.2 min, re-equilibrate for 2.6 min.

Flow rate: 3 for 0.8 min, 0.2 for 19.2 min, then 3

Injection volume: 20

Detector: MS, electrospray, m/z 360, cone voltage 20 V, 33% of column effluent went to MS

CHROMATOGRAM

Retention time: 18

Internal standard: 5-chloro-2′-deoxyuridine (11.5, m/z 261, cone voltage 35 V)

Limit of quantitation: 1.4 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

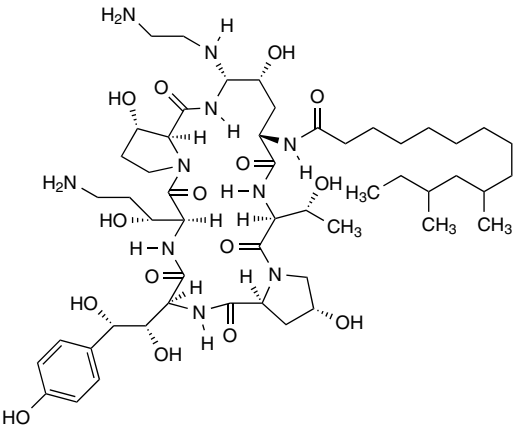
Caspofungin

Molecular formula: $C_{52}H_{88}N_{10}O_{15}$
Molecular weight: 1093.31
CAS Registry No: 162808-62-0
Merck Index: 13, 1899



SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL diol SPE cartridge (Baker) with 3 mL MeOH and 3 mL water. Mix 1 mL plasma with 10 μL 50 μg/mL IS in MeCN:0.1% trifluoroacetic acid adjusted to pH 3.0 with triethylamine 35:65 and 250 μL 1 M pH 4.9 potassium acetate buffer, add to SPE cartridge, wash with 3 mL water, wash with 3 mL MeOH, elute with 1 mL MeOH containing 250 mM ammonium hydroxide and 0.1% trifluoroacetic acid. Evaporate the eluate to dryness under reduced pressure at 50°, reconstitute the residue with 100 μL mobile phase, inject a 50 μL aliquot. (See also Schwartz,M. et al. *Anal.Chim.Acta* **1997**, *352*, 299–307.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Zorbax SB C80

Mobile phase: MeCN:buffer 35:65. After 5.5 min, wash column with MeCN:buffer 90:10 for 0.9 min, re-equilibrate at initial conditions for 5 min. (The buffer was 675 μL trifluoroacetic acid in 1 L water, adjusted to pH 3.0 with ammonium hydroxide.)

Flow rate: 1.2

Injection volume: 50

Detector: MS, PE Sciex API III plus triple quadrupole, ion spray, 5% of column effluent entered MS, m/z 1093.7

CHROMATOGRAM

Retention time: 5.5

Internal standard: isostere (oxygen replaces nitrogen at 5 position, m/z 1094.7) (6.8)

Limit of quantitation: 10 ng/mL (LOQ was 2.5 ng/mL using a 75 μL injection and turbo ion spray, but precision and accuracy was less good)

KEY WORDS

plasma; SPE

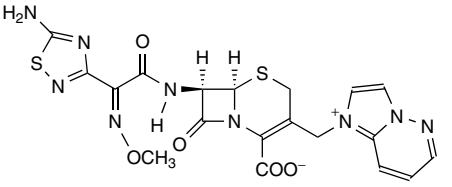
Cefozopran



Molecular formula: $C_{19}H_{17}N_9O_5S_2$
Molecular weight: 515.53
CAS Registry No: 113359-04-9
Merck Index: 13, 1950

SAMPLE

Matrix: blood, urine

Sample preparation: Serum. Mix 300 μL serum with 300 μL 5 mM pH 3.2 sodium phosphate buffer and 800 μL MeCN, shake mechanically for 2 min, centrifuge at 13000 g for 5 min. Remove 1.4 mL of the supernatant and add it to 2 mL dichloromethane, agitate for 1 min, centrifuge at 2000 g for 5 min. Remove a 300 μL aliquot of the supernatant and add it to 600 μL mobile phase, inject a 20 μL aliquot. Urine. Mix 100 μL urine with 900 μL of the aqueous portion of the mobile phase, inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 30 × 4 30–40 μm Perisorb RP18
Column: 125 × 4 5 μm Nucleosil 5C18
Mobile phase: MeCN:buffer 4.5:95.5 (Make mobile phase by adding 45 mL MeCN and 3 bottles of PIC B7 solution (15 M heptanesulfonic acid, pH 3.2 (Waters)) to water and making up to 1 L with water.)
Flow rate: 1.5
Injection volume: 5 (urine), 20 (serum)
Detector: UV 235

CHROMATOGRAM

Retention time: 5.3
Limit of detection: 600 ng/mL (serum), 3.5 μg/mL (urine)
Limit of quantitation: 1 μg/mL (serum), 5 μg/mL (urine)

KEY WORDS

serum

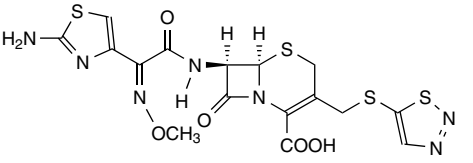
Cefuzonam



Molecular formula: $C_{16}H_{15}N_7O_5S_4$
Molecular weight: 513.60
CAS Registry No: 82219-78-1
Merck Index: 13, 1967

SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL 200 mg Bond Elut C18 SPE cartridge with two 3 mL portions of MeOH and two 3 mL portions of 5% acetic acid. Mix 500 μL serum with 500 μL 10% acetic acid, add to the SPE cartridge, wash with 3 mL water, elute with four 500 μL portions of MeOH:water 60:40. Evaporate the combined eluates to dryness under a stream of nitrogen, reconstitute the residue with 250 μL water, filter (0.22 μm). Inject a 100 μL aliquot onto column A and elute to waste with mobile phase A. After an unspecified time, backflush the contents of column A onto column B using mobile phase B. Monitor the effluent from column B. (Sato,K.; Kobayashi,K.; Moore,C.M.; Mizuno,Y.; Katsumata,Y. Semi-quantitative analysis of cefaclor in human serum by capillary high performance liquid chromatography/fast atom bombardment mass spectrometry. *Forensic Sci.Int.* **1993**, *59*, 71–77.)

HPLC VARIABLES

Column: A 30 × 0.5 10 μm Develosil PhA (phenethyl); B 150 × 0.5 5 μm Develosil PhA (phenethyl)

Mobile phase: A 10 mM ammonium acetate:glycerol 99.5:0.5, adjusted to pH 5 with acetic acid; B MeOH:water:acetic acid:glycerol 40:59:0.5:0.5 (pH ca .3)

Flow rate: A 0.05; B 0.004

Injection volume: 100

Detector: MS, JMS DX303 double focusing, xenon FAB ion source, gun current 10 mA, voltage 3 kV, positive ion mode

CHROMATOGRAM

Retention time: 32.0

Limit of detection: 200–1000 ng

OTHER SUBSTANCES

Extracted: cefaclor (14.4), cefamandole (31.0), cefazolin (19.7), cefbuperazone (20.8), cefixime (19.2), cefmenoxime (18.8), cefmetazole (21.4), cefoperazone (24.2), cefotaxime (16.1), cefotetan (16.8), cefotiam (11.7), cefpiramide (20.9), cefsulodin (12.2), ceftazidime (12.0), ceftizoxime (15.6), ceftriaxone (16.7), cefuroxime (16.9), cephalexin (14.8), cephaloglycine (15.7), cephaloridine (15.6), cephalothin (34.7), flomoxef (18.3), latamoxef (15.1)

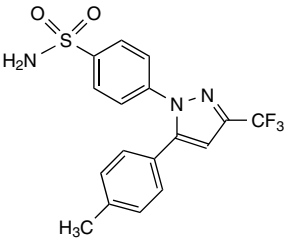
Celecoxib



Molecular formula: $C_{17}H_{14}F_3N_3O_2S$
Molecular weight: 381.38
CAS Registry No: 169590-42-5
Merck Index: 13, 1968

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg Chromabond C18 SPE cartridge with two 1 mL portions of MeCN and two 1 mL portions of water. Mix 200 μL plasma with 200 μL 100 mM pH 4.0 phosphate buffer and 25 μL 450 ng/mL IS in MeCN:water 50:50, add to the SPE cartridge, wash with two 1 mL portions of water, dry under vacuum for at least 5 min, elute with two 1 mL portions of dichloromethane. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL mobile phase, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 30 × 2 5 μm Nucleosil C18
Mobile phase: MeCN:water:25% ammonium hydroxide 85:15:0.1
Flow rate: 0.2
Injection volume: 10
Detector: MS, PE Sciex API 3000 triple quadrupole, turbo ion spray interface, negative ion mode at -3700 V and 400°, auxiliary gas nitrogen 4.5 L/min, nebulizer gas nitrogen 1.23 L/min, curtain gas nitrogen 1.08 L/min, collision gas nitrogen 2.92×10^{15} molecules/cm^2, m/z 380–316 (–32 eV)

CHROMATOGRAM

Retention time: 0.8
Internal standard: 4-[5-phenyl-3-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide (The IS is celecoxib lacking the methyl group. Preparation is as follows. Reflux 200 mL EtOH containing 16 mmol 4,4,4-trifluoro-1-phenyl-1,3-butadiene and 17.6 mmol 4-sulfonamidophenylhydrazine hydrochloride with stirring for 22 h, evaporate under reduced pressure. Take up the residue in ethyl acetate, wash with water, wash with saline, evaporate the organic solvent, recrystallize from *n*-hexane:ethyl acetate 50:50 to obtain the IS as white needles.) (m/z 366–302 (–30 eV)) (0.8)
Limit of quantitation: 0.25 ng/mL

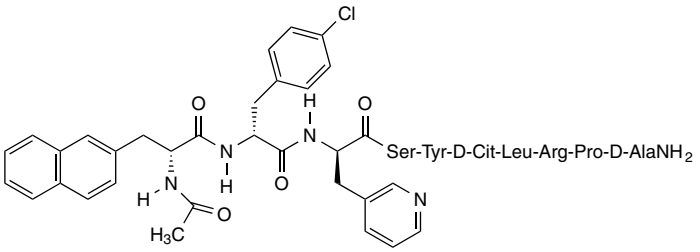
Cetrorelix

Molecular formula: $C_{70}H_{92}ClN_{17}O_{14}$
Molecular weight: 1431.06
CAS Registry No: 120287-85-6
Merck Index: 13, 2036



SAMPLE

Matrix: bile, feces, urine

Sample preparation: Bile. Dilute bile with 2 vol of 30% acetic acid, inject a 50–100 μL aliquot. After each run, regenerate column with a water injection. Feces. Homogenize feces with 1.5 vol of water. Extract 5 g homogenized feces three times with 5 mL aliquots of MeOH:ethyl acetate 2:1 using an ultra turrax (TP 18–10; IKA, Staufen, Germany) at about 10000 rpm with three 30 s applications, centrifuge at 10000 g for 15 min. Combine the supernatants, evaporate to dryness under reduced pressure at 40°, reconstitute the residue with 2 mL 30% acetic acid in water, filter (minisart GF and minisart NML, 0.8 μm, Sartorius), inject a 50–100 μL aliquot. Urine. Directly inject a 50–100 μL aliquot of urine.

HPLC VARIABLES

Guard column: 30 × 3 Merck
Column: 250 × 3 5 μm LiChrospher WP 300 RP-18
Mobile phase: Gradient. A:B from 95:5 to 20:80 over 180 min, to 0:100 over 2 min, maintain at 0:100 for 10 min, return to initial conditions over 3 min. A was 0.1% trifluoroacetic acid in water, adjusted to pH 2.0 with 1 M NaOH. B was MeCN:water:trifluoroacetic acid 90:10:0.1, adjusted to pH 2.0 with 1 M NaOH.
Flow rate: 0.5
Injection volume: 50–100
Detector: Radioactivity (^{14}C); UV 226

SAMPLE

Matrix: blood
Sample preparation: Mix 4 mL plasma with 200 μL 1 M HCl, add 100 μL 1 μg/mL IS in 10 mM acetic acid, add 9 mL ethyl acetate:1-butanol 90:10, extract on a Reax mixer for 15 min, centrifuge at 1000 g for 3 min, remove 5 mL of the organic layer, add 5 mL ethyl acetate:1-butanol 90:10, extract for 15 min, centrifuge at 1000 g for 3 min, remove 5 mL of the organic layer. Combine the organic layers and extract with 150 μL 10 mM HCl, centrifuge at 1000 g for 3 min, inject a 150 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 250 × 4 5 μm LiChrospher 60 RP-Select B
Mobile phase: MeCN:MeOH:50 mM pH 4 ammonium acetate buffer 25.5:25.5:49
Flow rate: 0.4
Injection volume: 150
Detector: F ex 227 em 340

CHROMATOGRAM

Retention time: 25
Internal standard: D-21740 (Ac-D-Nal^1-(*p*-Cl)-D-Phe^2-D-Pal^3-Ser^4-Tyr^5-D-Cit^6-Leu^7-Arg^8-Ala^9-D-Ala^{10}-NH_2 trifluoroacetate) (23)
Limit of quantitation: 2 ng/mL

Cetyl alcohol

$CH_3(CH_2)_{14}CH_2OH$

Molecular formula: $C_{16}H_{34}O$
Molecular weight: 242.44
CAS Registry No: 36653-82-4
Merck Index: 13, 2037

SAMPLE

Matrix: solutions

Sample preparation: Prepare a solution of the alcohol by dissolving 10 mg alcohol in 200 μL pyridine and diluting to 10 mL in MeCN. Mix 1 mL solution with 100 μL reagent and 100 μL 2% 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide perchlorate in MeCN, heat at 80° for 20 min, cool to room temperature, add 1 mL water, add 2 mL isopropanol:water 50:50, add to a Sep-Pak ODS SPE cartridge, rinse the tube with 3 mL isopropanol:water 50:50, add the rinse to the SPE cartridge, wash with 3 mL isopropanol:water 50:50, elute with 2 mL isopropanol, inject a 20 μL aliquot of the eluate. (The reagent was 10 mg 2-(4-carboxyphenyl)-5,6-dimethylbenzimidazole in 1 mL pyridine, add 700 mg 4-piperidinopyridine, dilute to 10 mL with MeCN. Prepare 2-(4-carboxyphenyl)-5,6-dimethylbenzimidazole as follows. Add 13 g 4-carboxybenzaldehyde (terephthalaldehydic acid) in 400 mL EtOH dropwise to 4,5-dimethyl-1,2-phenylenediamine in 400 mL EtOH in an ice bath, after 1 h reflux for 8 h, cool to room temperature, collect the precipitate, recrystallize three times from MeOH:water 50:50 to give 2-(4-carboxyphenyl)-5,6-dimethylbenzimidazole as a white amorphous product (mp >300°). 4-Piperidinopyridine is not commercially available but 4-dimethylaminopyridine or 4-pyrrolidinopyridine can be used instead although interferences are greater. Alternatively, 4-piperidinopyridine can be synthesized as follows. Add 200 mmol piperidine dropwise with stirring to 15 g phosphorus pentoxide and 9.51 g 4-hydroxypyridine, heat at 250° for 7 h, cautiously pour onto 200 g ice, add 400 mL 1 M NaOH, add 200 mL ether. Remove the ether layer and extract the aqueous layer three times with 100 mL portions of ether. Combine the organic layers and dry them over anhydrous potassium carbonate, evaporate, distill the residue, recrystallize from petroleum ether (bp 80–100°) to give 4-piperidinopyridine (bp 167–170°/11 mm Hg; mp 79–80°) (*Synthesis* **1978**, 844). Alternatively, add 1.94 g 4-bromopyridine hydrochloride to 5 mL 50% NaOH, add 5 mL piperidine, add 2.72 g benzyltriethylammonium bromide, heat at 100° for 5 h, remove excess piperidine by distillation, add 25 mL water, extract four times with 25 mL portions of benzene. Combine the organic layers and dry them over anhydrous sodium sulfate, boil the residue with petroleum ether to give 4-piperidinopyridine (mp 80°) (*Syn.Commun*. **1979**, *9*, 251). Prepare 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide perchlorate as follows. Stir 1.41 mol isopropylisocyanate in 750 mL dichloromethane at 5°, add 144 g 3-dimethylaminopropylamine (*N*,*N*-dimethyl-1,3-propanediamine) in 250 mL dichloromethane at such a rate that the temperature does not exceed 10°, add 500 mL triethylamine, add 300 g *p*-toluenesulfonyl chloride in 300 mL dichloromethane at such a rate that the temperature does not exceed 10°, reflux for 3 h, add 400 g anhydrous sodium carbonate, add 3.5 L ice water, stir vigorously for 30 min, remove the organic phase. Extract the aqueous phase three times with 500 mL portions of dichloromethane. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate under reduced pressure, distil the residue to give 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide (bp 91–92°/10 mm Hg (*Ber*. **1941**, 74*B*, 1285)) (cf. *Org.Syn*. **1973**, *Coll Vol. V*, 555). Prepare pyridine perchlorate from pyridine and 20% perchloric acid, crystallize from EtOH (*Ber*. **1926**, *59*, 446). Add 18 g pyridine perchlorate in portions to 100 mmol 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide stirred in 200 mL dichloromethane at 0°, let stand for 30 min, filter, add 200 mL anhydrous diethyl ether to the filtrate. Filter off the precipitate and recrystallize it from dichloromethane/diethyl ether to give 1-isopropyl-

3-(3-dimethylaminopropyl)carbodiimide perchlorate (mp 88–90°) (*Chem.Pharm.Bull*. **1985**, 33, 5375).)

HPLC VARIABLES

Guard column: 50 × 4.6 7 μm Zorbax ODS
Column: 250 × 4.6 7 μm Zorbax ODS
Mobile phase: MeOH:isopropanol 85:15
Flow rate: 1
Injection volume: 20
Detector: F ex 338 em 428

CHROMATOGRAM

Retention time: 9.4
Limit of detection: 10–20 pg/mL

OTHER SUBSTANCES

Simultaneous: dodecyl alcohol (6.2), tetradecyl alcohol (7.2), stearyl alcohol (12.5), eicosyl alcohol (16.5)

KEY WORDS

derivatization; SPE

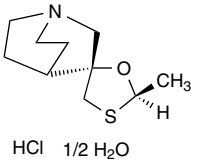
Cevimeline hydrochloride



Molecular formula: $C_{10}H_{17}NOS.HCl.1/2H_2O$
Molecular weight: 244.78
CAS Registry No: 153504-70-2, 107233-08-9 (free base)

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut Certify SPE cartridge with 3 mL MeOH and 3 mL 100 mM pH 6.0 phosphate buffer. Mix 1 mL plasma with 100 μL water, 100 μL 1 μg/mL IS, and 2 mL 100 mM pH 6.0 phosphate buffer, add to the SPE cartridge, wash with 4 mL 10 μM acetic acid, wash with 5 mL MeOH, elute with 6 mL dichloromethane:isopropanol 80:20 containing 2% ammonia water. Concentrate the eluate under a stream of nitrogen at 40° for 10 min, add 200 μL 0.02% DL-tartaric acid in MeOH, evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL MeOH, evaporate to dryness again, reconstitute the residue with 50 μL MeOH:water 20:80, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Capcell pak C18 UG120
Mobile phase: Gradient. MeCN:0.075% heptafluorobutyric acid in water from 5:95 to 25:75 over 25 min.
Detector: MS, JEOL AX-505 W, 1% glycerol in MeOH is added post-column at 0.3 mL/min, chamber temperature 60°, emission current 5 mA, collision gas xenon, FAB positive ion

CHROMATOGRAM

Limit of quantitation: 5 ng/mL

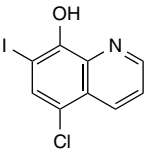
Clioquinol



Molecular formula: C_9H_5ClINO
Molecular weight: 305.50
CAS Registry No: 130-26-7
Merck Index: 13, 5053

SAMPLE

Matrix: bile, blood, tissue, urine

Sample preparation: Mix 200 μL plasma, bile, urine, or kidney with 20 μL IS in MeOH, 200 μL 200 mM disodium EDTA, and 800 μL water. Add 4 mL benzene:pyridine 90:10 (Caution! Benzene is a carcinogen!), shake vigorously for 1 min, centrifuge at 3500 g for 5 min. Evaporate the organic layer to dryness under reduced pressure, reconstitute the residue with 200 μL mobile phase, inject a 2–20 μL aliquot. This sample measures free clioquinol. To measure the glucuronide conjugate, wash the aqueous phase left over from the previous extraction twice with 6 mL portions of benzene. Discard the benzene. Add IS in MeOH, β-glucuronidase (final concentration 200 U/mL), and 150 μL 1 M pH 5 acetate buffer to the aqueous phase. Shake at 37° for 2 h. Add 4 mL benzene:pyridine 90:10, shake vigorously for 1 min, centrifuge at 3500 g for 5 min. Evaporate the organic layer to dryness under reduced pressure, reconstitute the residue with 200 μL mobile phase, inject a 2–20 μL aliquot. This sample measures clioquinol glucuronide. To measure the sulfate conjugate, wash the aqueous phase left over from the previous extraction twice with 6 mL portions of benzene. Discard the benzene. Add 6 M HCl to achieve an HCl concentration of 1 M, add IS, heat at 40° for 2 h, almost (sic) neutralize with 3 M NaOH, add 4 mL benzene:pyridine 90:10, shake vigorously for 1 min, centrifuge at 3500 g for 5 min. Evaporate the organic layer to dryness under reduced pressure, reconstitute the residue with 200 μL mobile phase, inject a 2–20 μL aliquot. This sample measures clioquinol sulfate.

HPLC VARIABLES

Column: 300 × 3 10 μm Iatrobeads 6cp-2010 (polystyrene-type porous polymer) in a Pyrex glass column
Column temperature: 37 ± 0.5
Mobile phase: MeOH:*n*-hexane:100 mM citric acid 86:6:8
Flow rate: 0.75
Injection volume: 2–20
Detector: UV 254

CHROMATOGRAM

Retention time: 9.6
Internal standard: 5,7-dichloro-8-hydroxyquinoline (6.8)
Limit of quantitation: 600 ng/mL

KEY WORDS

kidney; plasma; rabbit

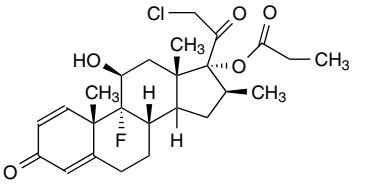
Clobetasol 17-propionate

Molecular formula: $C_{25}H_{32}ClFO_5$
Molecular weight: 466.98
CAS Registry No: 25122-46-7
Merck Index: 13, 2387



SAMPLE

Matrix: formulations
Sample preparation: Condition a 3 mL 500 mg Megabond MF C18 SPE cartridge (Varian) with 3 mL MeOH and 3 mL water. Sonicate 1 g cosmetic with 10 mL MeOH or MeOH:dichloromethane 10:90 (depending on what appears visually to give the best solubility) at 40° for 10 min, centrifuge, collect the clear supernatant. Add 5 mL of the supernatant to the SPE cartridge, wash with 4 mL acetone:water 20:80, wash with 1 mL *n*-hexane, elute with 4 mL diethyl ether. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue with 5 mL (or more) MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm endcapped Purospher RP-18
Column temperature: 25
Mobile phase: Isocratic.MeCN:water 60:40. Gradient. MeCN:water from 25:75 to 90:10 over 30 min, maintain at 90:10 for 10 min.
Flow rate: 1
Injection volume: 10
Detector: UV 239

CHROMATOGRAM

Retention time: k′ 3.41 (isocratic); 23.4 min (gradient)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Simultaneous: alclometasone dipropionate (isocratic k′ 2.55; gradient retention time (min) 21.0; LOD 0.3 μg/mL), amcinonide (isocratic k′ 3.18; gradient retention time (min) 22.6; LOD 0.1 μg/mL), betamethasone (isocratic k′ 0.18; gradient retention time (min) 11.8; LOD 0.1 μg/mL), betamethasone-17-acetate (isocratic k′ 0.73; gradient retention time (min) 15.4; LOD 0.3 μg/mL), betamethasone-17-benzoate (isocratic k′ 2.04; gradient retention time (min) 20.6; LOD 0.3 μg/mL), betamethasone-17-propionate-21-stearate (isocratic k′ >13; gradient retention time (min) >35; LOD 0.5 μg/mL), betamethasone-17-propionate-21-butyrate (isocratic k′ 5.91; gradient retention time (min) 26.1; LOD 0.4 μg/mL), betamethasone-17-valerate-21-acetate (isocratic k′ 4.41; gradient retention time (min) 23.1; LOD 0.4 μg/mL), betamethasone-17-valerate (isocratic k′ 2.32; gradient retention time (min) 21.4; LOD 0.3 μg/mL), betamethasone-17,21-dipropionate (isocratic k′ 4.00; gradient retention time (min) 24.2; LOD 0.4 μg/mL), betamethasone-17,21-diacetate (isocratic k′ 1.81; gradient retention time (min) 20.5; LOD 0.3 μg/mL), betamethasone-17,21-divalerate (isocratic k′ 10.82; gradient retention time (min) 28.0; LOD 0.4 μg/mL), betamethasone-21-acetate (isocratic k′ 0.77; gradient retention time (min) 15.6; LOD 0.3 μg/mL), betamethasone propionate (isocratic k′ 0.82; gradient retention time (min) 17.1; LOD 0.3 μg/mL), clobetasone butyrate (isocratic k′ 5.45; gradient retention time (min) 26.3; LOD 0.1 μg/mL), cortisone (isocratic k′ 0.18; gradient retention time (min) 11.1; LOD 0.6 μg/mL), cortisone acetate (isocratic k′ 0.73; gradient retention time (min) 15.2; LOD 0.6 μg/mL), dehydrocorticosterone (isocratic k′ 4.27; gradient

retention time (min) 22.3; LOD 0.5 μg/mL), deoxymethasone (isocratic k′ 0.64; gradient retention time (min) 14.2; LOD 0.2 μg/mL), dexamethasone (isocratic k′ 0.27; gradient retention time (min) 11.9; LOD 0.1 μg/mL), dexamethasone-21-acetate (isocratic k′ 0.91; gradient retention time (min) 16.1; LOD 0.2 μg/mL), dexamethasone isonicotinate (isocratic k′ 1.05; gradient retention time (min) 17.7; LOD 0.4 μg/mL), dexamethasone pivalate (isocratic k′ 3.45; gradient retention time (min) 24.1; LOD 0.3 μg/mL), dexamethasone valerate (isocratic k′ 3.00; gradient retention time (min) 21.6; LOD 0.3 μg/mL), diflucortolone valerate (isocratic k′ 4.73; gradient retention time (min) 23.3; LOD 0.3 μg/mL), fludrocortisone acetate (isocratic k′ 0.59; gradient retention time (min) 14.1; LOD 0.3 μg/mL), flumethasone pivalate (isocratic k′ 2.68; gradient retention time (min) 21.2; LOD 0.3 μg/mL), fluocinolone acetonide (isocratic k′ 0.91; gradient retention time (min) 13.4; LOD 0.3 μg/mL), fluocinonide (isocratic k′ 1.45; gradient retention time (min) 20.5; LOD 0.1 μg/mL), fluocortin butyl ester (isocratic k′ 5.59; gradient retention time (min) 24.6; LOD 0.3 μg/mL), fluocortolone caproate (isocratic k′ 6.59; gradient retention time (min) 25.1; LOD 0.3 μg/mL), fluocortolone pivalate (isocratic k′ 4.50; gradient retention time (min) 23.6; LOD 0.3 μg/mL), fluorometholone (isocratic k′ 0.59; gradient retention time (min) 14.4; LOD 0.1 μg/mL), 9-α-fluoroprednisolone (isocratic k′ 0.18; gradient retention time (min) 10.0; LOD 0.1 μg/mL), 9-α-fluoroprednisolone acetate (isocratic k′ 0.50; gradient retention time (min) 13.9; LOD 0.2 μg/mL), flurandrenolide (isocratic k′ 0.50; gradient retention time (min) 13.5; LOD 0.1 μg/mL), halcinonide (isocratic k′ 1.64; gradient retention time (min) 20.6; LOD 0.1 μg/mL), hydrocortisone (isocratic k′ 0.18; gradient retention time (min) 10.0; LOD 0.4 μg/mL), hydrocortisone-17-butyrate (isocratic k′ 1.09; gradient retention time (min) 17.7; LOD 0.6 μg/mL), hydrocortisone-21-acetate (isocratic k′ 0.77; gradient retention time (min) 15.3; LOD 0.6 μg/mL), hydrocortisone pivalate (isocratic k′ 2.27; gradient retention time (min) 20.4; LOD 0.8 μg/mL), methylprednisolone (isocratic k′ 0.55; gradient retention time (min) 13.5; LOD 0.1 μg/mL), mometasone furoate (isocratic k′ 3.05; gradient retention time (min) 22.0; LOD 0.2 μg/mL), prednisolone-21-acetate (isocratic k′ 0.60; gradient retention time (min) 13.6; LOD 0.2 μg/mL), prednisolone acetonide (isocratic k′ 0.50; gradient retention time (min) 13.0; LOD 0.3 μg/mL), prednisolone pivalate (isocratic k′ 2.05; gradient retention time (min) 19.7; LOD 0.3 μg/mL), triamcinolone (isocratic k′ 0.14; gradient retention time (min) 7.2; LOD 0.1 μg/mL), triamcinolone acetonide (isocratic k′ 0.50; gradient retention time (min) 13.9; LOD 0.2 μg/mL), triamcinolone diacetate (isocratic k′ 0.45; gradient retention time (min) 13.9; LOD 0.3 μg/mL)

Development of a tandem thin-layer chromatography-high-performance liquid chromatography method for the identification and determination of corticosteroids in cosmetic products, *Anal.Chim.Acta*, **2002**, *457*, 187–198.

SAMPLE
Matrix: formulations

Sample preparation: Mix 1 g of a topical product, 5 mL 100 mM pH 4 citrate buffer saturated with NaCl, and 10 mL ethyl acetate, shake vigorously by hand to ensure that no large clumps stick to the tube, mix with the tube on its side on an oscillating shaker for 15 min. Remove the upper ethyl acetate layer and wash with citrate buffer as before. Dry the ethyl acetate over anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in a mixture of 10 mL heptane and 5 mL MeCN:water 90:10. Remove the upper heptane layer and extract it with 2 mL MeCN:water 90:10. Combine the MeCN/water layers and evaporate them to dryness, dissolve the residue in 300 μL MeOH, filter (0.45 μm nylon), inject a 5 μL aliquot.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm Brownlee NewGuard C18

Column: 75 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. MeCN:water 18:82 for 2 min, to 82:18 over 12 min, maintain at 82:18 for 3 min, re-equilibrate at initial conditions for 12 min.
Flow rate: 1
Injection volume: 5
Detector: UV 240

CHROMATOGRAM

Retention time: 11.06
Limit of detection: 0.001%

SAMPLE

Matrix: tissue
Sample preparation: Fill a 400 × 20 glass tube fitted with a glass wool plug and a PTFE stopcock about a third full with MeOH, add 15 g neutral alumina (70–230 mesh), drain the solvent to the top of the column. Fill a 200 × 12 glass tube fitted with a glass wool plug and a PTFE stopcock with a slurry of Dowex 1-X8 anion-exchange resin (acetate form, 100–200 mesh) in MeOH to a bed height of 15 mm after settling, drain the solvent to the top of the bed. Place the alumina column on top of the Dowex column. Homogenize 10 g minced tissue, 20 g anhydrous sodium sulfate, and 50 mL MeCN at 10000 rpm for 2 min, add the supernatant to the alumina tube. Re-extract the residue with 50 mL MeCN, centrifuge, add to the columns, rinse the centrifuge tube with 20 mL MeOH, and add the rinse to the columns. Allow the liquid to flow through the columns at 3 mL/min. When the various solutions have passed through, discard the alumina column and elute the Dowex column with 20 mL 0.5% acetic acid in MeOH. Evaporate

the eluate to dryness under reduced pressure at 60°, reconstitute the residue with 1 mL MeOH, inject an aliquot.

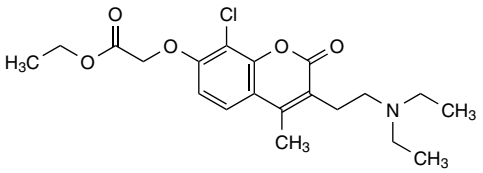
Cloricromen



Molecular formula: $C_{20}H_{26}ClNO_5$
Molecular weight: 395.88
CAS Registry No: 68206-94-0
Merck Index: 13, 2431

SAMPLE

Matrix: aqueous humor
Sample preparation: Vortex 100 μL aqueous humor with 100 μL 4.8 μg/mL IS in MeCN containing 0.6% perchloric acid for 1 min, centrifuge at 10000 g for 5 min, filter (0.2 μm) the supernatant, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 7.5 × 4.6 5 μm Hypersil ODS C18
Column: 150 × 4.6 5 μm Hypersil ODS C18
Column temperature: 25
Mobile phase: Gradient. MeCN:buffer from 10:90 to 53:47 over 13 min, return to initial conditions over 5 min, re-equilibrate for 3 min. (The buffer was 1% triethylamine adjusted to pH 3.5 with phosphoric acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 318

CHROMATOGRAM

Retention time: 11.25
Internal standard: timolol maleate (6.48)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES

Extracted: metabolite

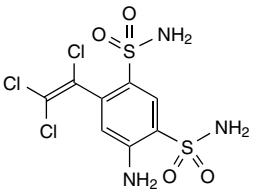
KEY WORDS

pharmacokinetics; rabbit

REFERENCE

Maltese, A.; Bucolo, C. Simultaneous determination of cloricromene and its active metabolite in rabbit aqueous humor by high-performance liquid chromatography, *J.Chromatogr.B*, **2002**, *767*, 153–158.

Clorsulon



Molecular formula: $C_8H_8Cl_3N_3O_4S_2$
Molecular weight: 380.66
CAS Registry No: 60200-06-8
Merck Index: 13, 2435

SAMPLE

Matrix: milk

Sample preparation: Matrix Solid-Phase Dispersion (MSPD) – Blend 500 μL milk with 2 g 40 μm Bondesil octadecylsilyl silica (Analytichem) in a mortar and pestle until a homogeneous mixture is obtained, place the mixture in the barrel of an 8 mL syringe fitted with a frit, compress the matrix using the syringe plunger, wash with 3 mL hexane; when all the hexane has eluted, place under vacuum for 5 s. Place this column on top of a 6 mL 1 g Supelclean LC-Florisil SPE cartridge (prewashed with diethyl ether), elute with three 3 mL portions of diethyl ether. Remove the C18 column and elute the Florisil with 2 mL ether. Combine all the ether eluates, evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 1 mL mobile phase, vortex, filter, inject a 200 μL aliquot. Solid-Phase Extraction (SPE) – Condition a 6 mL 1 g Mega Bond Elut cyclohexyl SPE cartridge with two 3 mL portions of MeOH and two 3 mL portions of water. Vortex 6 g milk with 6 mL 200 mg/mL hydroxylamine hydrochloride in water, add 4 mL MeOH, shake on a rotating shaker at 180 rpm for 30 min, centrifuge at 8000 rpm for 30 min. Add 10 mL of the supernatant to the SPE cartridge, elute at not more than 2 drops/s, discard the effluent, wash with two 4 mL portions of water, elute with two 4 mL portions of MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 1 mL mobile phase, vortex for 5 s, filter (0.2 μm PTFE), inject a 50 μL aliquot. (SPE method found in Schenck,F.J.; Wagner,R.; Bargo,W. Determination of clorsulon residues in milk using a solid-phase extraction cleanup and liquid chromatographic determination. *J.Liq.Chromatogr.* **1993**, *16*, 513–520, other details are identical.)

HPLC VARIABLES

Column: 150 × 4.6 3 μm Econosphere ODS
Mobile phase: MeCN:10 mM pH 7.0 potassium phosphate buffer 25:75
Flow rate: 1
Injection volume: 50–200
Detector: UV 265

CHROMATOGRAM

Retention time: 11.5
Limit of detection: 5 ng/g (SPE, S/N = 4)
Limit of quantitation: 50 ng/g (MSPD), 15 ng/g (SPE)

KEY WORDS

matrix solid-phase dispersion; SPE

Colistin

Molecular formula: $C_{58}H_{105}N_{16}Na_5O_{28}S_5$ (colistin A sodium methanesulfonate)

Molecular weight: 1749.82

CAS Registry No: 1066-17-7, 8068-28-8 (sodium methanesulfonate), 1264-72-8 (sulfate)

Merck Index: 13, 2503

SAMPLE

Matrix: blood

Sample preparation: Condition a 100 mg C18 SPE cartridge (Baker) with 1 mL MeOH and 1 mL carbonate buffer. Mix 20 μL 5 μg/mL IS in water with 250 μL plasma, add 50 μL MeOH:10% trichloroacetic acid 50:50, vortex for 1 min, centrifuge at 1000 g at 4° for 10 min. Remove the supernatant, add 10 μL 1 M NaOH, vortex for 1 min, add 250 μL MeOH:10 mM HCl 50:50, vortex for 1 min, add to the SPE cartridge, wash with 1 mL carbonate buffer, add 30 μL 100 mM 9-fluorenylmethyl chloroformate in MeCN, let stand for 10 min, dry by drawing air through the cartridge, elute with 900 μL acetone. Add the eluate to 600 μL 200 mM boric acid solution, vortex for 2 min, inject a 50 μL aliquot. (Prepare the carbonate buffer by adjusting the pH of 1% sodium bicarbonate solution to 10 with 10% NaOH.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere C18
Mobile phase: MeCN:THF:water 87:4:13
Flow rate: 1
Injection volume: 50
Detector: F ex 260 em 315

CHROMATOGRAM

Retention time: 21.8 (colistin B), 26.1 (colistin A)
Internal standard: netilmicin sulfate (17.1)
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES

Noninterfering: aztreonam, ceftazidime, ciprofloxacin, meropenem, piperacillin, ticarcillin, tobramycin

KEY WORDS

derivatization; plasma; SPE

REFERENCE

SAMPLE

Matrix: blood, sputum, urine

Sample preparation: Plasma, sputum. Add 1 mL plasma or sonicated sputum to 1.1 mL water and 200 μL 3 M perchloric acid, vortex for 10 s, centrifuge at 3000 g at 4° for 25 min. Remove 1.4 mL of the supernatant and add it to 200 μL 1.5 M KOH, vortex, add 200 μL 100 mM HCl, vortex, add 100 μL 9% sodium carbonate, vortex, add 400 μL 20 mg/mL dansyl chloride, vortex, heat at 54°; after 5 min, add 100 μL 150 mg/mL

proline, heat at 54° for another 55 min, vortex, heat at 54° for 1 h, cool. Remove a 2 mL aliquot and add it to 1 mL ethyl acetate, rotate for 10 min (Roto-torque Model 7637 setting #5), centrifuge at 3000 rpm for 10 min, inject an aliquot of the top layer. Urine. Dilute urine 0–20 fold with 100 mM pH 6.8 sodium phosphate buffer. Add 1 mL diluted urine to 1 mL water and 200 μL 3 M perchloric acid, vortex for 10 s. Remove 1.4 mL and add it to 200 μL 1.5 M KOH, vortex, add 200 μL 100 mM HCl, vortex, add 100 μL 9% sodium carbonate, vortex, add 400 μL 20 mg/mL dansyl chloride, vortex, heat at 57°; after 5 min, add 100 μL 300 mg/mL proline, heat at 57° for another 55 min, vortex, heat at 57° for 1 h, cool. Remove a 2 mL aliquot and add it to 1 mL ethyl acetate, rotate for 10 min (Roto-torque Model 7637 setting #5), centrifuge at 3000 rpm for 2 min, inject an aliquot of the top layer.

HPLC VARIABLES

Guard column: 40 μm Vydac pellicular resin
Column: 150 × 4.6 Eclipse XDB-C8
Mobile phase: Gradient. A:B from 40:60 to 80:20 over 15 min, maintain at 80:20 for 3 min. A was 0.1% trifluoroacetic acid in MeCN. B was 0.1% trifluoroacetic acid in water.
Flow rate: 1
Injection volume: 50
Detector: F ex 350 em 500

CHROMATOGRAM

Limit of quantitation: 5 μg/mL

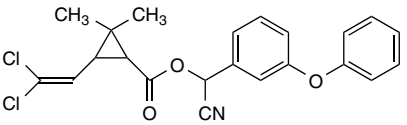
Cypermethrin



Molecular formula: $C_{22}H_{19}Cl_2NO_3$
Molecular weight: 416.30
CAS Registry No: 52315-07-8
Merck Index: 13, 2796

SAMPLE

Matrix: blood, milk

Sample preparation: Activate silica gel 60 in air at 130° for 5 h, hydrate by adding water equivalent to 10% of its weight, keep in a sealed container for 30 min before use. Prepare a chromatographic column with 4 g of this material and wash with 1 mL *n*-hexane:diethyl ether 90:10. Acidify 10 mL or 10 g whole blood or whole milk with 1.0 M HCl to approximately pH 4.0, add 50 mL MeCN, shake mechanically for 30 min, filter (Whatman paper No. 42 or 44). Add 25 mL MeCN to the residue, shake for 15 min, filter (Whatman paper No. 42 or 44). Combine the filtrates and add them to 15 mL *n*-hexane, shake for 1 min, repeat twice. Retain the acetonitrile phases. Add 45 mL MeCN to the hexane phases, shake for 1 min. Combine all the acetonitrile layers, evaporate to dryness under a stream of nitrogen at 50°. Dissolve the residue in 10 mL *n*-hexane. Add to the silica column, elute with 7 mL *n*-hexane:diethyl ether 90:10, evaporate the eluate to dryness at room temperature, dissolve the residue in 1.0 mL MeCN, filter (0.45 μm cellulose membrane), inject an aliquot of the filtrate. (All diethyl ether should be peroxide free.)

HPLC VARIABLES

Column: 250 × 4.6 Nucleosil 120-5 C18
Mobile phase: MeCN:water 80:20
Flow rate: 1
Injection volume: 20
Detector: UV 266

CHROMATOGRAM

Retention time: 8.6, 8.9
Limit of detection: 1 ng/g

OTHER SUBSTANCES

Extracted: cyhalothrin (7.7), deltamethrin (9.8), flumethrin (3.8, 4.1)

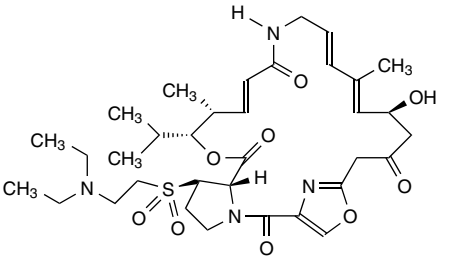
Dalfopristin

Molecular formula: $C_{34}H_{50}N_4O_9S$
Molecular weight: 690.86
CAS Registry No: 112362-50-2
Merck Index: 13, 2831



SAMPLE

Matrix: blood

Sample preparation: Condition a CN SPE cartridge (Lida-Interchim) with 1 mL MeOH, 1 mL water, and 1 mL buffer. Add 1 mL 3.8% sodium citrate and 2.5 mL 250 mM HCl to 10 mL whole blood. Shake gently by hand and centrifuge at 2000 g at 4° for 15 min. Add 1 mL buffer and 50 μL 100 μg/mL IS in MeOH to 1.35 mL acidified plasma. Vortex for a few seconds, centrifuge at 4000 g at 4° for 5 min. Add either supernatant to the SPE cartridge and dry the SPE cartridge with 3 mL air. Elute with 500 μL MeOH:water 70:30 containing 3.5 mM pentane sulfonic acid, inject an aliquot. (The buffer was a mixture of 85 mM pH 3.0 citric acid monohydrate containing 81 mM NaOH and 60 mM HCl.)

HPLC VARIABLES

Guard column: 10 μm μBondapak C18
Column: 125 × 4.6 5 μm Kromasil C18 (Higgins Analytical)
Mobile phase: Gradient. MeCN:buffer 30:70 for 11 min, then 32:68 for 4 min (step gradient), to 40:60 over 0.6 min, maintain at 40:60 for 0.4 min, at 38:62 for 18 min (step gradient), at 80:20 for 2 min (step gradient), re-equilibrate at 30:70 for 9 min. (Prepare buffer by adding 800 μL 70% perchloric acid to 1 L water.)
Flow rate: 0.5 for 11 min, 1 for 25 min, 0.5 for 9 min
Injection volume: 500
Detector: UV 235

CHROMATOGRAM

Retention time: 12.7
Internal standard: dimethylamino-3-propyl thiomethylene-5 virginiamycin S (31.0)
Limit of quantitation: 25 pg/mL

OTHER SUBSTANCES

Extracted: metabolites, pristinamycin II A (24.1), quinupristin (22.1)

KEY WORDS

plasma; SPE; whole blood

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL 200 mg Clean-Up C18 SPE cartridge (Worldwide Monitoring) with two 2 mL portions of MeOH and two 2 mL portions of water. Centrifuge plasma at 2000 rpm for 5 min prior to analysis. Mix 2 mL plasma with 20 μL 5 μg/mL IS in MeCN and 20 μL MeCN, add 1 mL water, vortex until homogeneous, add to the SPE cartridge, wash with two 2 mL portions of acetone:water 20:80, wash with 1 mL 50 mM pH 2.7 phosphate buffer, place under vacuum for 3 min, elute with two 2.5 mL portions of ethyl acetate. Evaporate the eluate to dryness under reduced pressure at 40°, reconstitute the residue with 75 μL mobile phase B, vortex, add 100 μL 50 mM pH 3 phosphate buffer, centrifuge at 5000 rpm for 5 min, inject a 145 μL aliquot.

HPLC VARIABLES

Column: 100 × 2 5 μm YMC Basic

Column temperature: 50
Mobile phase: Gradient. A:B 20:80 for 1 min, to 50:50 over 7 min, to 65:35 over 3 min, to 100:0 (step gradient), maintain at 100:0 for 1 min, return to initial conditions, re-equilibrate for 4 min. A was MeCN:50 mM pH 3.0 potassium dihydrogen phosphate buffer 50:50. B was MeOH:50 mM pH 3.0 potassium dihydrogen phosphate buffer 20:80.
Flow rate: 0.3
Injection volume: 145
Detector: UV 246

CHROMATOGRAM

Retention time: 13.8
Internal standard: fludrocortisone acetate (12.4)

OTHER SUBSTANCES

Extracted: 21-hydroxydeflazacort (10)
Simultaneous: cortisone, hydrocortisone

KEY WORDS

plasma; SPE; method validated for 21-hydroxydeflazacort rather than deflazacort

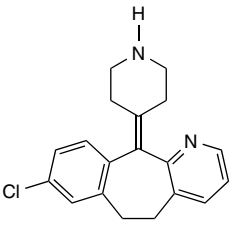
Desloratadine



Molecular formula: $C_{19}H_{19}ClN_2$
Molecular weight: 310.83
CAS Registry No: 100643-71-8
Merck Index: 13, 2939

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma, 100 μL MeOH, 50 μL MeOH containing 20 ng/mL d_3-loratadine and 100 ng/mL d_3-desloratadine, and 50 μL 0.1% ammonium hydroxide, vortex for 30 s, add 5 mL hexane, vortex for 2 min, centrifuge at 1200 g for 5 min, freeze in dry ice acetone. Evaporate the organic layer to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL 0.1% trifluoroacetic acid in MeCN, vortex for 2 min, inject a 35 μL aliquot.

HPLC VARIABLES

Column: 50 × 3 5 μm Betasil silica (Keystone)
Mobile phase: MeCN:water:trifluoroacetic acid 90:10:0.1
Flow rate: 0.5
Injection volume: 35
Detector: MS, PE Sciex API 3000 turbo ionspray, positive ion mode, ionspray needle 5 kV, turbo gas temperature 300°, auxiliary gas flow 8 L/min, m/z 311–259

CHROMATOGRAM

Retention time: 2
Internal standard: d_3-loratadine (m/z 388–342), d_3-desloratadine (m/z 316–262)
Limit of quantitation: 25 pg/mL

OTHER SUBSTANCES

Extracted: loratadine (LOQ 10 pg/mL, m/z 383–337) (1.2)
Noninterfering: acetaminophen, albuterol, aspirin, caffeine, clonidine, fentanyl, ibuprofen, naltrexone, ritonavir

KEY WORDS

plasma

REFERENCE

Naidong, W.; Addison, T.; Schneider, T.; Jiang, X.; Halls, T.D.J. A sensitive LC/MS/MS method using silica column and aqueous-organic mobile phase for the analysis of loratadine and descarboethoxyloratadine in human plasma, *J.Pharm.Biomed.Anal.*, **2003**, *32*, 609–617.

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 20 μL 7.5 μg/mL IS in MeOH:50 mM HCl 20:80 and 200 μL 1 M NaOH, vortex, add 3 mL toluene, shake for 20 min, centrifuge at 2000 g for 10 min, freeze, remove organic layer, repeat extraction. Combine the organic layers and evaporate to dryness under a stream of nitrogen at 50°, reconstitute the residue with 200 μL MeOH:50 mM HCl 20:80, vortex, mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 5 μm Symmetry C18 (Waters)

Column temperature: 35
Mobile phase: Gradient. MeCN:MeOH:50 mM pH 2.0 potassium phosphate buffer from 14:5:81 to 24:3:7.3 over 5.5 min, to 40:3:57 over 4.5 min, return to initial conditions over 4 min, re-equilibrate for 6 min.
Flow rate: 1.2
Injection volume: 100
Detector: F ex 290 em 480

CHROMATOGRAM

Retention time: 3.4
Internal standard: propranolol hydrochloride (8.6)
Limit of detection: 0.25 ng/mL
Limit of quantitation: 0.5 ng/mL

OTHER SUBSTANCES

Extracted: loratadine (11.2)

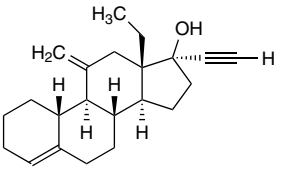
Desogestrel



Molecular formula: $C_{22}H_{30}O$
Molecular weight: 310.47
CAS Registry No: 54024-22-5
Merck Index: 13, 2943

SAMPLE

Matrix: blood
Sample preparation: Add plasma to a Bakerbond C18 SPE cartridge, wash with 100 mM pH 4.2 ammonium acetate buffer, elute with MeOH. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue with MeOH, inject an aliquot.

HPLC VARIABLES

Column: 300 × 3.9 μBondapak C18
Column temperature: 50
Mobile phase: Gradient. MeOH:100 mM pH 4.2 ammonium acetate from 10:90 to 90:10 over 30 min
Flow rate: 1.7
Detector: Radioactivity (^{3}H); UV 254

CHROMATOGRAM

Retention time: 32

OTHER SUBSTANCES

Extracted: metabolites

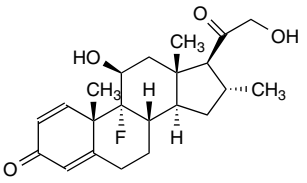
Desoximetasone



Molecular formula: $C_{22}H_{29}FO_4$
Molecular weight: 376.46
CAS Registry No: 382-67-2
Merck Index: 13, 2947

SAMPLE

Matrix: formulations
Sample preparation: Mix 1 g of a topical product, 5 mL 100 mM pH 4 citrate buffer saturated with NaCl, and 10 mL ethyl acetate, shake vigorously by hand to ensure that no large clumps stick to the tube, mix with the tube on its side on an oscillating shaker for 15 min. Remove the upper ethyl acetate layer and wash with citrate buffer as before. Dry the ethyl acetate over anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in a mixture of 10 mL heptane and 5 mL MeCN:water 90:10. Remove the upper heptane layer and extract it with 2 mL MeCN:water 90:10. Combine the MeCN/water layers and evaporate them to dryness, dissolve the residue in 300 μL MeOH, filter (0.45 μm nylon), inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee NewGuard C18
Column: 75 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. MeCN:water 18:82 for 2 min, to 82:18 over 12 min, maintain at 82:18 for 3 min, re-equilibrate at initial conditions for 12 min.
Flow rate: 1
Injection volume: 5
Detector: UV 240

CHROMATOGRAM

Retention time: 7.60
Limit of detection: 0.001%

OTHER SUBSTANCES

Simultaneous: alclometasone 17,21-dipropionate (10.93), amcinonide (10.90), beclomethasone 17,21-dipropionate (11.90), betamethasone (6.52), betamethasone 21-acetate (8.47), betamethasone 17-benzoate (10.28), betamethasone 17,21-dipropionate (11.42), betamethasone 17-valerate (10.25), budesonide (8.55, 8.69 (epimers)), clobetasol 17-propionate (11.06), cortisone (5.62), cortisone 21-acetate (8.07), dexamethasone (6.57), dexamethasone 21-acetate (8.68), desonide (6.99), desoximetasone (7.60), desoxycorticosterone acetate (10.90), desoxycorticosterone pivalate (14.45), diflorasone 17,21-diacetate (9.81), fluocinolone acetonide (7.38), fluocinonide (9.79), flurandrenolide (7.36), fludrocortisone 21-acetate (7.77), fluorometholone (7.67), flumethasone 21-pivalate (11.20), flunisolide (7.14), fluprednisolone (5.46), fluticasone 17-propionate (11.19), halcinonide (10.72), halobetasol propionate (10.98), hydrocortisone (5.50), hydrocortisone 21-acetate (7.65), hydrocortisone 17-butyrate (8.66), hydrocortisone 21-cypionate (12.54), hydrocortisone 17-valerate (9.53), mometasone 17-furoate (11.24), methylprednisolone (6.31), methylprednisolone 21-acetate (8.34), meprednisone (6.55), prednisolone (5.37), prednisolone 21-acetate (7.47), prednisolone 21-tebuate (11.01), paramethasone 21-acetate (8.64), prednicarbate (10.72), prednisone (5.46), triamcinolone (4.15), triamcinolone acetonide (7.04), triamcinolone 16,21-diacetate (7.49), triamcinolone hexacetonide (13.12)

SAMPLE

Matrix: urine

Sample preparation: Mix 5 mL urine with 100 ng IS and 400 μL 1 M pH 4.1 sodium acetate buffer, adjust pH to 5.0, add 600 μL β-glucuronidase solution (10800 U), heat at 65° for 3.5 h or at 37° overnight, cool, add 6 mL ethyl acetate, rotate for 10 min. Remove the organic layer and wash it with 3 mL 1 M NaOH containing 150 mM NaCl by rotating for 5 min, centrifuge at 1900 g for 30 s. Remove the organic layer and pass it through an anhydrous sodium sulfate drying column. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 30 μL MeOH, vortex, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 75 × 4.6 3 μm DB-8 (Supelco)

Column temperature: 25

Mobile phase: Gradient. MeOH:1% acetic acid from 0:100 to 100:0 over 15 min, maintain at 100:0 for 3 min.

Flow rate: 1

Injection volume: 10

Detector: MS, Finnigan MAT LCQ Classic, APCI, source 450°, capillary 150°, source +5 kV for positive ions and – 5 kV for negative ions, collision gas helium, m/z 377

CHROMATOGRAM

Retention time: 27.6

Internal standard: d_4-hydrocortisone (24.4)

Limit of detection: 5 ng/mL

OTHER SUBSTANCES

Extracted: beclomethasone (m/z 409) (26.4), betamethasone (m/z 393) (25.9), deoxycortone (m/z 331) (28.1), 21-deoxydexamethasone (m/z 377) (26.8), dexamethasone (m/z 393) (25.9), dichlorisone (m/z 413) (26.4), fluclorolone acetonide (m/z 487) (27.8), fludrocortisone (m/z 381) (24.2), flumethasone (m/z 411) (25.4), fluocinolone acetonide (m/z 453) (26.4), fluocinonide (m/z 495) (28.5), fluocortolone (m/z 377) (26.8), fluorometholone (m/z 3.77) (26.6), fluprednisolone (m/z 379) (23.9), flurandrenolide (m/z 437) (26.8), hydrocortisone (m/z 363) (24.4), isoflupredone (m/z 379) (23.9), methylprednisolone (m/z 375) (26.1), prednisolone (m/z 361) (24.4), prednisone (m/z 359) (23.4), triamcinolone (m/z 395) (19), triamcinolone acetonide (m/z 435) (29.3)

Dichloroacetic acid

$Cl_2CHCOOH$

Molecular formula: $C_2H_2Cl_2O_2$
Molecular weight: 128.94
CAS Registry No: 79-43-6
Merck Index: 13, 3075

SAMPLE

Matrix: blood
Sample preparation: Inject 15–25 μL serum directly.

HPLC VARIABLES

Column: Asahipak GS-320 gel permeation
Mobile phase: MeCN:10 mM pH 4.0 ammonium acetate buffer 10:90
Flow rate: 2
Injection volume: 15–25
Detector: UV 220

CHROMATOGRAM

Retention time: 12
Limit of detection: 5 μg/mL

KEY WORDS

pharmacokinetics; serum

REFERENCE

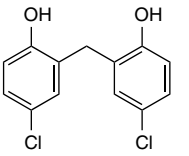
Dichlorophen



Molecular formula: $C_{13}H_{10}Cl_2O_2$
Molecular weight: 269.13
CAS Registry No: 97-23-4
Merck Index: 13, 3096

SAMPLE

Matrix: solutions
Sample preparation: Inject a 10–40 μL aliquot of a 500 μg/mL solution in MeOH.

HPLC VARIABLES

Column: Zorbax C8
Column temperature: 31
Mobile phase: Gradient. A:B from 0:100 to 100:0 over 30 min. A was MeCN:water:phosphoric acid 89.9:10:0.1. B was 0.1% phosphoric acid.
Flow rate: 2
Injection volume: 10–40
Detector: UV 230

CHROMATOGRAM

Retention time: 21.9

OTHER SUBSTANCES

Simultaneous: acetaminophen (8.2), acetophenetidine (14.6), aminophylline (8.8), amobarbital (15.5), antipyrine (12.9), aprobarbital (12.3), aspirin (13.6), barbital (9.4), benzoic acid (13.2), butabarbital (13.1), butethal (14.2), caffeine (10.2), chloramphenicol (14.4), chlorothiazide (9.1), chlorpropamide (17.7), colchicine (15.3), cortisone (15.0), coumarin (15.1), cyclothiazide (18.6), cyheptamide (17.8), danazol (19.3), danthron (22.3), dapsone (13.1), diethylstilbestrol (21.5), dronabinol (26.3), estradiol (19.4), estriol, 15.0), estrone (20.3), ethosuximide (9.8), eugenol (18.8), fenoprofen (19.2), fluorouracil, 3.0), fluoxymesterone (15.0), furosemide (17.0), gitoxigenin (16.0), glutethimide (16.3), guaiacol (11.4), hexobarbital (15.1), hippuric acid (9.6), hydrocortisone (14.4), hydroquinone (3.3), ibuprofen (22.4), indomethacin (22.00, isocarbostyril (11.8), mefenamic acid (23.7), methocarbamol (12.6), methyl salicylate (19.3), methyldopa (6.4), methylparaben (12.8), methyltestosterone (19.6), niacin (3.9), nitrofurantoin (11.2), normethsuximide (14.5), oxyphenbutazone (19.8), paraxanthine (8.7), pentobarbital (15.2), phenylbutazone (23.4), piperonyl butoxide (26.1), prednisolone (15.2), prednisone (15.5), primidone (11.3), probenecid (20.5), progesterone (21.8), propylparaben (18.3), pyrithydione (11.2), pyrocatechol (l4.6), reserpine (22.5), resorcinol (4.3), saccharin (8.0), salicylamide (11.0), salicylic acid (15.0), secobarbital (15.7), stanozolol (19.2), sulfacetamide (8.4), sulfadimethoxine (7.7), sulfaethidole (13.4), sulfamerazine (10.1), sulfamethazine (7.0), sulfamethizole (11.5), sulfamethoxazole (13.6), sulfanilamide (4.0), sulfapyridine (9.6), sulfisoxazole (14.2), sulindac (19.1), testosterone acetate (20.5), testosterone 17 β-cypionate (25.2), testosterone enanthate (25.0), testosterone propionate, 24.1), theobromine (8.3), thiobarbituric acid (2.4), thiosalicylic acid (15.4), tolbutamide, 18.8), tolmetin (18.7), triamcinolone (13.8), triamcinolone acetonide (17.8), warfarin (20.0)

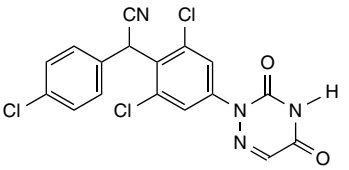
Diclazuril



Molecular formula: $C_{17}H_9Cl_3N_4O_2$
Molecular weight: 407.64
CAS Registry No: 101831-37-2
Merck Index: 13, 3106

SAMPLE

Matrix: blood
Sample preparation: Condition a Mega Bond Elut C18 SPE cartridge with 2 mL MeOH and 2 mL 100 mM pH 6.0 phosphate buffer. Mix 20 μL 100 μg/mL IS in DMF:water 50:50 with ? mL plasma, add 2 mL 100 mM pH 6.0 phosphate buffer, mix, adjust pH to 6.0, add to the SPE cartridge, allow to pass through taking at least 2 min, wash with 2 mL 100 mM pH 6.0 phosphate buffer, wash with 2 mL 1 M acetic acid, wash with 2 mL hexane (allow cartridge to dry for 5–10 min after each wash). Elute with 4 mL MeOH:conc. HCl 95:5. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 100 μL DMF, vortex, sonicate, add 100 μL water, vortex, sonicate, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: Alltech C18
Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:MeOH:buffer 20:43.2:36.8 (The buffer was 0.5% ammonium acetate containing 10 mM tetrabutylammonium hydrogen sulfate.)
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 13
Internal standard: R062646 (diclazuril with methyl α to cyano group, Janssen) (14.5)
Limit of detection: 10 ng/mL

KEY WORDS

horse; pharmacokinetics; plasma; SPE; use silanized glassware

REFERENCE

Diclazuril in the horse: its identification and detection and preliminary pharmacokinetics, *J.Vet.Pharmacol.Ther.*, **1999**, *22*, 374–379.

SAMPLE

Matrix: feed
Sample preparation: Mix 50 g ground feed with 1 mL 50 μg/mL IS in DMF and 200 mL acidified MeOH, stir overnight. Remove 20 mL of the supernatant and dilute with 20 mL water, add to a Mega Bond C18 SPE cartridge, wash with 25 mL acidified MeOH:water 65:35, elute with 25 mL acidified MeOH:water 80:20. Evaporate the eluate to dryness at 60°, reconstitute the residue with 1 mL DMF and 1.5 mL water, filter (0.45 μm), inject a 20 μL aliquot. (Acidified MeOH was 5 mL conc. HCl in 1 L MeOH.)

HPLC VARIABLES

Column: 100 × 4.6 3 μm Hypersil ODS or BDS
Mobile phase: Gradient. MeCN:MeOH:10 mM tetrabutylammonium hydrogen sulfate 20:20:60 for 10 min, to 20:35:45 over 30 min, flush column with MeCN for 10 min.

Flow rate: 2
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 24
Internal standard: R062646 (diclazuril with methyl α to cyano group, Janssen) (26)
Limit of quantitation: 1 μg/g

OTHER SUBSTANCES

Simultaneous: degradant

KEY WORDS

SPE

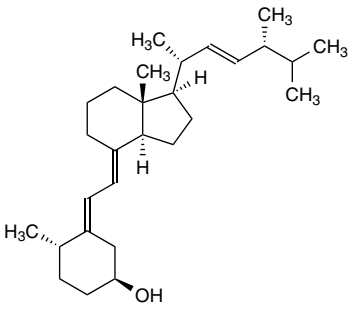
Dihydrotachysterol



Molecular formula: $C_{28}H_{46}O$
Molecular weight: 398.66
CAS Registry No: 67-96-9
Merck Index: 13, 3202

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL serum with 2 mL 50 ng/mL IS in EtOH, centrifuge at 1500 g for 15 min, add to an activated (by an unspecified method) Chromabond C18 ec SPE cartridge, wash with 3 mL EtOH:500 mM ammonium acetate 2:1, wash with 1 mL water, elute with 5 mL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 90 μL MeCN, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 250 × 3 Nucleosil 100-5 C18 AB
Mobile phase: MeCN:water:acetic acid 95:5:5
Flow rate: 0.75
Injection volume: 50
Detector: UV 252

CHROMATOGRAM

Retention time: 15.4
Internal standard: vitamin D_2 (17)
Limit of quantitation: 0.5 ng/mL

KEY WORDS

pharmacokinetics; serum

Dimethyl sulfoxide

$(CH_3)_2SO$

Molecular formula: C_2H_6OS
Molecular weight: 78.13
CAS Registry No: 67-68-5
Merck Index: 13, 3285

SAMPLE

Matrix: bulk
Sample preparation: Dissolve 40 mg bisnafide drug substance in 20 mL water with sonication and gentle heating, inject a 200 μL aliquot. (Dimethyl sulfoxide is determined as an impurity in bisnafide drug substance.)

HPLC VARIABLES

Column: Zorbax Rx C8
Column temperature: 45 ± 2
Mobile phase: Gradient. A:B 100:0 for 10 min, to 0:100 (step gradient) maintain at 0:100 for 5 min, 100:0 for 15 min. A was 10 mM NaCl containing 0.10% phosphoric acid. B was MeCN:10 mM NaCl containing 0.10% phosphoric acid 90:10.
Flow rate: 0.8
Injection volume: 200
Detector: UV 215

CHROMATOGRAM

Retention time: 7
Limit of detection: 51 ng/mL
Limit of quantitation: 219 ng/mL

REFERENCE

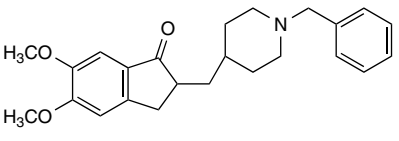
Donepezil



Molecular formula: $C_{24}H_{29}NO_3$
Molecular weight: 379.49
CAS Registry No: 120014-06-4
Merck Index: 13, 3453

SAMPLE

Matrix: blood
Sample preparation: Add 100 μL 200 ng/mL IS in 1 mM HCl and 5 mL *n*-hexane:isopropanol 97:3 to 1 mL plasma, shake for 5 min, centrifuge at 1800 g for 1 min. Remove the organic layer and add it to 200 μL 1 mM HCl, shake for 1 min, centrifuge at 1800 g for 1 min, inject a 75 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 150 × 2.1 5 μm Bioptick AV-1 (GL Sciences)
Mobile phase: MeOH:10 mM formic acid 25:75
Flow rate: 0.2
Injection volume: 75
Detector: MS, Finnigan MAT TSQ7000, source 4.5 kV, capillary 200°, sheath gas nitrogen 70 psi, auxiliary gas nitrogen, collision gas argon 1.5 mtorr 40 eV, m/z 380–91

CHROMATOGRAM

Retention time: 8 (R-enantiomer), 13 (S-enantiomer)
Internal standard: d_7-donepezil (m/z 387–98)
Limit of detection: 7.7 pg
Limit of quantitation: 20 pg/mL

KEY WORDS

chiral; pharmacokinetics; plasma

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Add 100 μL 3 μg/mL IS in 1 mM HCl and 500 μL 100 mM NaOH to 1 mL plasma, vortex for 10 s, add 4 mL *n*-hexane:isopropanol 97:3, shake for 10 min, centrifuge at 620 g at 4° for 10 min. Remove the organic layer and add it to 75 μL 100 mM HCl, mix at 100 cycles/min for 10 min, centrifuge at 1710 g at 4° for 5 min. Carefully remove the upper organic layer, then remove traces of organic solvent with a stream of air, inject a 50 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 150 × 4.6 5 μm STR ODS-II (Shinwa)
Column temperature: 30 (in body of paper) or 40 (in abstract)
Mobile phase: MeCN:20 mM pH 4.6 phosphate buffer:6 M perchloric acid 40:59.5:0.5
Flow rate: 1
Injection volume: 50
Detector: UV 315

CHROMATOGRAM

Retention time: 5.1
Internal standard: cisapride (7.1)
Limit of quantitation: 3 ng/mL

OTHER SUBSTANCES

Simultaneous: alprazolam, chlorpromazine, diazepam, levomepromazine, nitrazepam
Noninterfering: haloperidol, risperidone

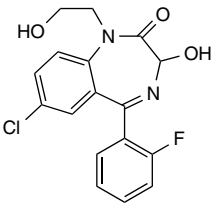
Doxefazepam



Molecular formula: $C_{17}H_{14}ClFN_2O_3$
Molecular weight: 348.76
CAS Registry No: 40762-15-0
Merck Index: 13, 3467

SAMPLE

Matrix: blood
Sample preparation: Condition a Supelclean LC-18 SPE cartridge with 1 mL MeOH and 2 mL water. Mix 1 mL plasma with 100 μL 2 μg/mL IS in MeOH, add to the SPE cartridge, wash with 2 column volumes of water, wash with 100 μL MeOH, elute with 400 μL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 200 μL mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 4 Supelguard C18
Column: 300 × 4 μBondapak C18
Mobile phase: MeOH:water 20:80
Flow rate: 2
Injection volume: 25
Detector: UV 280

CHROMATOGRAM

Retention time: 5.2
Internal standard: diazepam (3.1)
Limit of quantitation: 100 ng/mL

KEY WORDS

plasma; SPE

REFERENCE

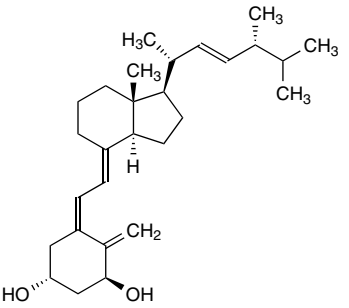
Doxercalciferol



Molecular formula: $C_{28}H_{44}O_2$
Molecular weight: 412.65
CAS Registry No: 54573-75-0
Merck Index: 13, 3470
[1α-Hydroxyergocalciferol]

SAMPLE

Matrix: blood

Sample preparation: Condition a 60 mg Oasis HLB SPE cartridge with 2 mL ethyl acetate, 2 mL MeOH, and 2 mL water. Condition a 500 mg Bond Elut silica SPE cartridge with 4 mL chloroform:MeOH 30:1 (Caution! Chloroform is a carcinogen!) and 4 mL chloroform. Mix 10 μL 40 ng/mL IS in EtOH with 1 mL plasma, let stand for 15 min, add this mixture to 1 mL MeCN in another tube, rinse the first tube with 250 μL MeCN and add it to the plasma/MeCN mixture. Vortex for 30 s, centrifuge at 1500 g for 10 min. Add 2 mL water to the supernatant and pass the mixture through the Oasis SPE cartridge. Wash with 2 mL water, wash with 2 mL MeOH:water 70:30, wash with 1 mL hexane, elute with 1 mL ethyl acetate. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with two 200 μL portions of chloroform. Add the chloroform layers to the silica SPE cartridge, wash with 3 mL chloroform, wash with 2.2 mL chloroform:MeOH 40:1, elute with 2 mL chloroform:MeOH 30:1. Evaporate the eluate to dryness, place the residue under reduced pressure for 10 min, reconstitute the residue with 25 μL 100 μg/mL DMEQTAD in ethyl acetate, let stand at room temperature for 30 min, add another 25 μL 100 μg/mL DMEQTAD in ethyl acetate, let stand at room temperature for 1 h, add 40 μL EtOH, evaporate to dryness, reconstitute with 10 μL acetic anhydride and 20 μL pyridine, heat at 50° for 1 h, add 40 μL EtOH, evaporate the solvent, dissolve the residue in 40 μL mobile phase, inject a 15 μL aliquot. (DMEQTAD is 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalyl)ethyl]-1,2,4-triazoline-3,5-dione and can be purchased from Wako.)

HPLC VARIABLES

Column: 150 × 4.6 4 μm YMC J'sphere ODS H-80
Column temperature: 40
Mobile phase: MeCN:water 92:8
Flow rate: 1
Injection volume: 15
Detector: MS, ThermoQuest LCQ, APCI, positive ion mode, collision gas helium, source current 5 μA, heated capillary 225°, vaporizer 475°, capillary 3 V, tube lens offset 15 V

CHROMATOGRAM

Retention time: 6.8
Internal standard: d_4-doxercalciferol (6.7)
Limit of detection: 6.3 fmol
Limit of quantitation: 25 pg/mL

KEY WORDS

derivatization; plasma; SPE; Doxercalciferol can be determined without derivatization using MeOH:water 95:5, retention time 5.4 min, LOD 200 pg/injection.

REFERENCE

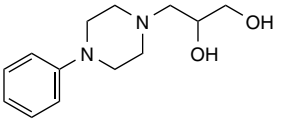
Dropropizine



Molecular formula: $C_{13}H_{20}N_2O_2$
Molecular weight: 236.31
CAS Registry No: 17692-31-8, 99291-24-4 (levodropropizine)
Merck Index: 13, 3486

SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL plasma or serum with 10 ng IS and 200 μL 100 mM pH 8.9 disodium hydrogen phosphate, add 5 mL chloroform:isopropanol 90:10 (Caution! Chloroform is a carcinogen!), vortex for 2 min, centrifuge at 700 g for 10 min. Evaporate 4 mL of the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 500 μL water, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Bio-Gel PRP 70-5 poly(styrene-divinylbenzene) (Bio-Rad)
Mobile phase: MeOH:THF:100 mM pH 3 potassium phosphate buffer 30:0.5:70
Flow rate: 0.5
Injection volume: 100
Detector: F ex 240 em 350 (slits 18 and 30 nm, respectively)

CHROMATOGRAM

Retention time: 10
Internal standard: *p*-methoxylevodropropizine (15)
Limit of detection: 1–2 ng/mL
Limit of quantitation: 3.1 ng/mL

OTHER SUBSTANCES

Noninterfering: acetaminophen, amitriptyline, amobarbital, amphetamine, aprobarbital, atropine, barbital, benzoylecgonine, benztropine, butabarbital, caffeine, carbamazepine, carisoprodol, chlorpheniramine, chlorpromazine, chlorprothixene, cimetidine, cocaine, codeine, dextromethorphan, diazepam, dihydrocodeine, diphenhydramine, diphenoxylate, diphenylhydantoin, disopyramide, doxepin, doxylamine, emetine, erythromycin, ethinamate, ethylmorphine, flurazepam, glutethimide, hydrocodone, hydrocortisone, hydromorphone, hydroxyzine, imipramine, lidocaine, loxapine, meperidine, meprobamate, methadone, methamphetamine, methapyrilene, methaqualone, methocarbamol, methylphenidate, morphine, naloxone, nicotine, nordiazepam, nortriptyline, orphenadrine, oxycodone, papaverine, pentazocine, pentobarbital, phenacetin, phencyclidine, phenmetrazine, phenobarbital, phenolphthalein, phentermine, phenylpropanolamine, phenytoin, phetidine, prazepam, procainamide, procaine, propoxyphene, propranolol, protriptyline, pseudoephedrine, pyrilamine, quinine, salicylamide, secobarbital, spironolactone, strychnine, terpin hydrate, thioridazine, thiothixene, triamterene, trifluperazine, triflupromazine, trihexyphenidyl, trimeprazine, trimethoprim, trimetobenzamide

Molecular formula: $C_{10}H_{16}N_2O_8$
Molecular weight: 292.24
CAS Registry No: 60-00-4
Merck Index: 13, 3546

SAMPLE

Matrix: blood
Sample preparation: Place 0.5 cm^2 of a dried blood stain in 50–100 μL 25 mM copper(II) sulfate, let stand for 3 h, vortex, centrifuge at 3000–9000 rpm for 10 min, filter (0.2 μm), inject a 25 μL aliquot. Alternatively, dilute 200 μL whole blood with 2 mL water, mix with an equal volume of 50 mM copper(II) sulfate, centrifuge for 7 min, inject an aliquot of the supernatant.

HPLC VARIABLES

Column: Hamilton PRP X-100
Mobile phase: MeOH:3 mM sulfuric acid 5:95
Flow rate: 2
Injection volume: 25
Detector: UV 243

CHROMATOGRAM

Retention time: 6
Limit of detection: 5 ppm

KEY WORDS

complexation; derivatization; dried blood; whole blood

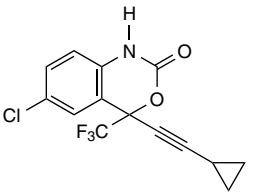
Efavirenz



Molecular formula: $C_{14}H_9ClF_3NO_2$
Molecular weight: 315.68
CAS Registry No: 154598-52-4
Merck Index: 13, 3552

SAMPLE

Matrix: blood
Sample preparation: Condition an Extrasep C18 SPE cartridge (Lida) with 2 mL MeOH and 2 mL water. Dilute 500 μL serum with 500 μL water, add to the SPE cartridge, wash with 500 μL water, elute with 1 mL MeOH. Evaporate the eluate to dryness with vortexing under reduced pressure at 40° and reconstitute the residue with 300 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: two 150 × 4.6 3 μm Luna C18 columns in series
Column temperature: 60
Mobile phase: Gradient. MeCN:4 mM sulfuric acid from 8:92 to 63:37 over 45 min, maintain at 63:37 for 5 min.
Flow rate: 0.85
Injection volume: 10
Detector: UV 265 for 31 min then UV 240

CHROMATOGRAM

Retention time: 51
Limit of detection: 62 ng/mL

OTHER SUBSTANCES

Extracted: delavirdine (25.5, LOD 110 ng/mL), indinavir (24.5, LOD 210 ng/mL), nelfinavir (33.5, LOD 400 ng/mL), nevirapine (23.5, LOD 84 ng/mL), ritonavir (50.5, LOD 510 ng/mL), saquinavir (35, LOD 100 ng/mL)

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 200 μL 10 μg/mL IS in water, add 200 μL 100 mM NaOH, mix, add 4 mL diethyl ether, shake for 5 min, centrifuge at 2500 rpm for 5 min. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 200 μL initial mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Stability RP18 (CIL, France)
Mobile phase: Gradient. MeCN:50 mM pH 5.65 phosphate buffer from 36:64 to 64:36 over 25 min, to 80:20 (step gradient), maintain at 80:20 for 10 min, re-equilibrate at initial conditions for 5 min.
Flow rate: 1.5

Injection volume: 100
Detector: UV 240 for 5 min, UV 215 for 22 min, UV 260 for rest of run

CHROMATOGRAM

Retention time: 19.9
Internal standard: JR051012 (Janssen Cilag) (28.2)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES

Extracted: amprenavir (11.2), indinavir (8.5), lopinavir (18.9), nelfinavir (24.1), nevirapine (3.3), ritonavir (17.6), saquinavir (16.7)
Noninterfering: acetaminophen, amineptine, amphotericin B, aspirin, bromazepam, buspirone, citalopram, clobazam, diazepam, didanosine, fluconazole, flunitrazepam, fluvoxamine, hydroxyitraconazole, isoniazid, itraconazole, lamivudine, loprazolam, lorazepam, metronidazole, minalcipram, nordiazepam, omeprazole, paroxetine, pyrimethamine, rifampin, sertraline, stavudine, sulfadiazine, trimethoprim, venlafaxine, zalcitabine, zidovudine, zolpidem, zopiclone

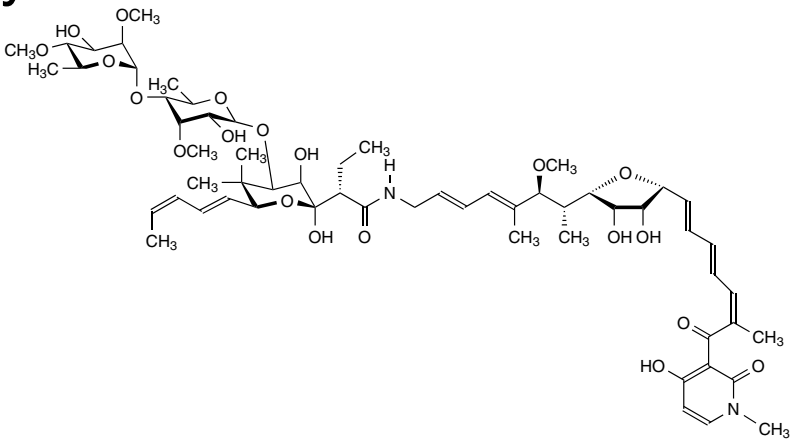
Efrotomycin

Molecular formula:
$C_{59}H_{88}N_2O_{20}$

Molecular weight:
1145.33

CAS Registry No:
56592-32-6

Merck Index:
13, 3556



SAMPLE

Matrix: feed

Sample preparation: Condition a 2.8 mL Bond-Elut NH_2 SPE cartridge with 1 mL MeCN:dichloromethane 50:50 saturated with 50 mM pH 7.5 potassium phosphate buffer. Shake 100 g blended homogenized feed with 320 mL 50 mM pH 7.5 potassium phosphate buffer in a 950 mL amber bottle for 30 min, add 280 mL MeCN, shake for 15 min, centrifuge a 30 mL aliquot at 2500 rpm for 10 min. Remove a 5 mL aliquot and add it to 10 mL dichloromethane and 20 mL MeCN:dichloromethane 50:50 saturated with 50 mM pH 7.5 potassium phosphate buffer, shake for 30 min, centrifuge at 2500 rpm for 10 min. Add 10 mL of the lower phase to the SPE cartridge, wash with 2 mL MeOH, wash with 2 mL ethyl acetate, wash with 2 mL hexane, draw air through the cartridge for 5 min, elute with 1 mL elution solvent, inject a 100 μL aliquot of the eluate. (The elution solvent was 250 mM pH 5 phosphate buffer containing 1.5 M LiCl saturated with MeCN. Prepare by mixing 500 mL of this aqueous phase with 250 mL MeCN.)

HPLC VARIABLES

Column: 150 × 4.6 Zorbax C8

Column temperature: 55

Mobile phase: MeCN:MeOH:water:85% phosphoric acid 32.5:22.5:57.5:1 (Adjust with MeCN or water to give a k' of 19–22.)

Flow rate: 2

Injection volume: 100

Detector: UV 335

CHROMATOGRAM

Retention time: 10

Limit of quantitation: 2 ppm

KEY WORDS

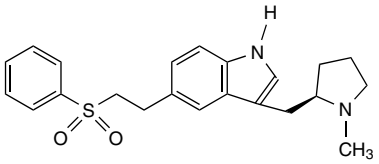
Eletriptan



Molecular formula: $C_{22}H_{26}N_2O_2S$
Molecular weight: 382.53
CAS Registry No: 143322-58-1
Merck Index: 13, 3577

SAMPLE

Matrix: blood, saliva
Sample preparation: Mix 570 μL plasma or saliva with 130 μL 1 (plasma) or 0.1 (saliva) M monochloroacetic acid containing 500 ng/mL IS. Place 690 μL of this mixture in the donor channel of a dialyzer fitted with a15 kDa cuprophan membrane (regenerated cellulose, Enka, Germany), pass 3500 μL recipient solvent in 500 μL pulsed bursts through the acceptor channel over 4 min, pass the recipient solvent through column A, wash column A with 200 μL MeCN:water 60:40, wash with 800 μL donor solvent, backflush the contents of column A onto column B with the mobile phase, monitor the effluent from column B. (The donor solvent was 10 mM pH 7.0 potassium phosphate buffer. Recipient solvent was MeOH:10 mM pH 7.0 potassium phosphate buffer 10:90. After each run, purge the donor channel with 1.5 mL donor solvent. Purge the HPLC system with 14 mL of donor and recipient solvent. Condition column A with 200 μL recipient solvent.)

HPLC VARIABLES

Column: A 5 × 4.6 10 μm Hypersil C1; B 100 × 4.6 5 μm Kromasil C1
Mobile phase: MeCN:500 mM pH 3.5 potassium phosphate buffer:water 30:6:64 (Add 20 mM diethylamine hydrochloride to the buffer/water mixture before adding the MeCN.)
Flow rate: 1
Detector: UV 225

CHROMATOGRAM

Retention time: 5
Internal standard: UK-136,509 (7)
Limit of quantitation: 0.5 ng/mL

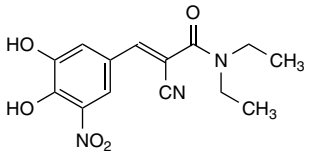
Entacapone



Molecular formula: $C_{14}H_{15}N_3O_5$
Molecular weight: 305.29
CAS Registry No: 130929-57-6
Merck Index: 13, 3626

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. Add 50 μL 50 mM pH 7.2 phosphate buffer to 1 mL plasma, vortex, add 100 μL 2 M HCl, add 6 mL *n*-hexane:ethyl acetate 50:50, vortex for 2 min, centrifuge at 3500 *g* for 5 min. Remove 5 mL of the organic layer, evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 500 μL DMSO, inject a 20 μL aliquot. Urine. Add 50 μL 50 mM pH 7.2 phosphate buffer to 1 mL urine, vortex, add 100 μL 2 M HCl, vortex, add 5 mL *n*-hexane:ethyl acetate 75:25, vortex for 2 min, centrifuge at 3500 g for 5 min. Remove 4 mL of the organic layer and add it to 1 mL 50 mM pH 7.2 phosphate buffer, vortex for 2 min, centrifuge at 3500 g for 5 min, inject a 30 μL aliquot of the aqueous layer. (Protect from light during preparation.)

HPLC VARIABLES

Guard column: μBondapak Guard-PAC C18
Column: 250 × 4 10 μm Lichrosorb C18
Column temperature: 35 (plasma), 28 (urine)
Mobile phase: MeOH:THF:buffer A 50:5:63 (plasma) or MeCN:THF:buffer B 50:5:125 (urine) (Buffer A was 50 mM sodium dihydrogen phosphate containing 20 mM citric acid and 0.25 mM EDTA, adjusted to pH 2.0 with phosphoric acid. Buffer B was 50 mM sodium dihydrogen phosphate containing 20 mM citric acid and 0.25 mM EDTA, adjusted to pH 3.0 with 10 M NaOH.)
Flow rate: 1.5
Injection volume: 20 (plasma), 30 (urine)
Detector: E, Bioanalytical Systems LC-4B, glassy carbon electrode 700 mV, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 7.5 (plasma), 10.7 (urine)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES

Extracted: Z-isomer (5.3 (plasma), 9.1 (urine))
Noninterfering: carbidopa, 3,4-dihydroxyphenylacetic acid, homovanillic acid, levodopa, 3-O-methyldopa

KEY WORDS

pharmacokinetics; plasma

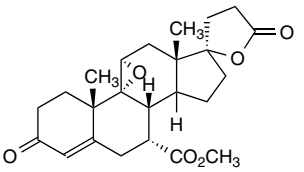
Eplerenone



Molecular formula: $C_{24}H_{30}O_6$
Molecular weight: 414.49
CAS Registry No: 107724-20-9

SAMPLE

Matrix: urine

Sample preparation: Urine. Condition a 1 mL 100 mg Bond Elut C18 SPE cartridge with 2 mL MeCN and 2 mL water. Vortex 500 μL urine and 500 μL 1 μg/mL IS in 20 mM pH 7.4 ammonium acetate, add to the SPE cartridge, wash with 3 mL water, elute with 250 μL MeCN. Vortex the eluate with 250 μL 20 mM pH 7.4 ammonium acetate buffer, inject a 20 μL aliquot. Plasma. Condition a 1 mL 100 mg Bond Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. Centrifuge plasma at 2000 g at 4° for 10 min. Vortex 400 μL of the supernatant and 400 μL 500 ng/mL IS in water, add to the SPE cartridge, wash with 2 mL water, elute with 500 μL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at room temperature, reconstitute the residue with 100 μL mobile phase, inject a 10 μL aliquot. (Plasma preparation from Zhang,J.Y.; Fast,D.M.; Breau,A.P. Development and validation of a liquid chromatography-tandem mass spectrometric assay for Eplerenone and its hydrolyzed metabolite in human plasma. *J.Chromatogr.B* **2003**, *787*, 333–344.)

HPLC VARIABLES

Column: 50 × 2.1 5 μm Zorbax XDB-C8
Mobile phase: MeCN:water 40:60 containing 10 mM ammonium acetate, pH 7.4
Flow rate: 0.1
Injection volume: 20 (urine), 10 (plasma)
Detector: MS, PE Sciex API-III Plus quadrupole, ionspray, positive ionization, ionspray interface 4400 V, orifice 67 V, nebulizer gas nitrogen at 60 psi, curtain gas nitrogen at 1.8 L/min, collision gas argon, m/z 415–163

CHROMATOGRAM

Retention time: 3.2
Internal standard: $^{13}C^2H_3$-eplerenone (m/z 419–163)
Limit of quantitation: 50 ng/mL (urine), 10 ng/mL (plasma)

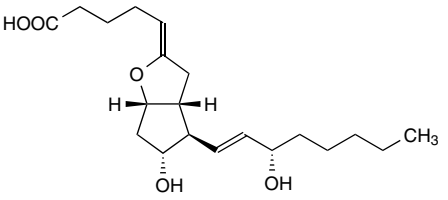
Epoprostenol



Molecular formula: $C_{20}H_{32}O_5$
Molecular weight: 352.46
CAS Registry No: 35121-78-9, 61849-14-7 (Na salt)
Merck Index: 13, 7967

SAMPLE

Matrix: blood

Sample preparation: Pack a polypropylene column with 1 g Hi-Flosil (80/100) C18 material (Applied Science) in an MeCN slurry, add 5 mL 10% dimethyldichlorosilane in toluene, wash with 15 mL toluene, wash with 15 mL MeCN. Just prior to use, equilibrate with 15 mL 2 mM sodium borate adjusted to pH 10 with NaOH. Mix 1 mL whole blood with 10 mg/mL sodium carbonate solution, keep on ice, centrifuge at 2000 g at 4° for 10 min, add a 500 μL aliquot to the SPE column, wash with two 3 mL portions of 2 mM pH 10 sodium borate, elute with three 3 mL portions of MeCN:2 mM pH 10 sodium borate 40:60. Collect the eluate in a container containing 200 μL 200 mM NaOH. Evaporate the eluate to dryness under reduced pressure at 40°, reconstitute the residue with 1 mL 2 mM pH 9.1 sodium borate, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4 MCH-10

Mobile phase: Gradient. MeCN:2 mM pH 9.1 sodium borate from 12:88 to 27:73 over 7 min.

Flow rate: 2

Injection volume: 100

Detector: UV 200; Radioactivity (^{3}H)

CHROMATOGRAM

Retention time: 6

SAMPLE

Matrix: blood

Sample preparation: Rotate 2 mL plasma and 5 mL diethyl ether for 30 min, centrifuge, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at room temperature, reconstitute the residue with 100 μL MeOH, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm silica Newguard
Column: 100 × 4.6 5 μm Spheri-5 silica
Mobile phase: MeOH:water:acetic acid:MeCN 40:2:10 (sic)
Flow rate: 1
Injection volume: 50
Detector: F ex 322 em 405

CHROMATOGRAM
Retention time: 7.5
Internal standard: ergotamine

OTHER SUBSTANCES
Extracted: lisuride (12)

KEY WORDS
ergotamine is IS in original paper; plasma; protect from light

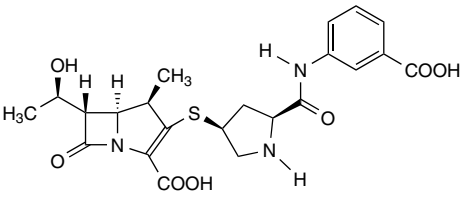
Ertapenem

Molecular formula: $C_{22}H_{25}N_3O_7S$
Molecular weight: 475.52
CAS Registry No: 153832-46-3
Merck Index: 13, 3706



SAMPLE

Matrix: blood

Sample preparation: Filter (Amicon Centrifree) 1 mL plasma while centrifuging at 1500 g for 15 min, mix an aliquot of the filtrate with an equal volume of buffer, inject a 50 μL aliquot. (Prepare the buffer by dissolving 15.5 g sodium 2-[*N*-morpholino]ethane sulfonate (MES) and 5.58 g 2-[*N*-morpholino]ethane sulfonic acid in 100 mL water. Dilute this stock solution 10-fold before use, pH 6.5.)

HPLC VARIABLES

Column: 100 × 4.6 5 μm Hypersil C18
Mobile phase: MeOH:25 mM phosphate buffer 10:90, apparent pH 6.5
Flow rate: 2
Injection volume: 50
Detector: UV 300

CHROMATOGRAM

Retention time: 5.6
Limit of quantitation: 250 ng/mL

KEY WORDS

pharmacokinetics; plasma; ultrafiltrate

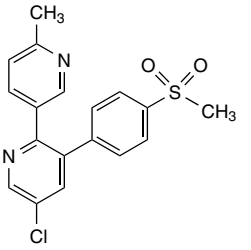
Etoricoxib

Molecular formula: $C_{18}H_{15}ClN_2O_2S$
Molecular weight: 358.84
CAS Registry No: 202409-33-4



SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 30 mg Oasis HLB SPE cartridge with 1 mL MeOH and 1 mL water. Mix 200 μL plasma with 20 μL 500 ng/mL IS in water, centrifuge at 12 000 g, add to the SPE cartridge, wash with 1 mL MeOH:water 5:95, dry under reduced pressure for 5 min, elute with 2 mL MeCN:ethyl acetate 50:50. Evaporate the eluate to dryness under reduced pressure at 45°, reconstitute the residue with 200 μL mobile phase, inject a 15 μL aliquot.

HPLC VARIABLES

Column: 30 × 2 5 μm Nucleodur C18
Mobile phase: MeCN:water 90:10
Flow rate: 0.3
Injection volume: 15
Detector: MS, PE Sciex API 3000 triple quadrupole, turbo ionspray, positive ion mode 5400 V and 400°, nebulizer gas nitrogen at 1.49 L/min, curtain gas nitrogen at 1.25 L/min, collision gas nitrogen, collision energy 43 eV, m/z 359.0–280.1

CHROMATOGRAM

Retention time: 0.5
Internal standard: phenazone (m/z 189.0–104.0, 33 eV) (0.5)
Limit of quantitation: 0.2 ng/mL

KEY WORDS

SAMPLE

Matrix: solutions
Sample preparation: Inject a 10 μL aliquot of a 100 μg/mL solution in MeCN:water 50:50.

HPLC VARIABLES

Column: 150 × 4.6 3 μm YMC AQ-ODS
Column temperature: 35
Mobile phase: Gradient. MeCN:buffer 28:72 for 11 min, to 70:30 over 19 min, to 90:10 over 5 min. (The buffer was 10 mM potassium dihydrogen phosphate adjusted to pH 3.1 with 2.2 mM phosphoric acid.)
Flow rate: 1
Injection volume: 10
Detector: UV 220

CHROMATOGRAM

Retention time: 12
Limit of detection: 0.02%
Limit of quantitation: 0.04%

OTHER SUBSTANCES

Simultaneous: degradants, impurities

KEY WORDS

stability-indicating; robust

SAMPLE

Matrix: formulations

Sample preparation: Extract tablets with MeOH, centrifuge, dilute the supernatant with mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Eclipse XDB C8

Mobile phase: MeCN:MeOH:buffer 20:20:60 (The buffer was 1% triethylamine adjusted to pH 3.7 with concentrated orthophosphoric acid.)

Flow rate: 1.2

Injection volume: 10

Detector: UV 210

CHROMATOGRAM

Retention time: 14

Internal standard: 5-methyl-2-nitrophenol (12)

Limit of detection: 0.12–0.18 μg/mL

Limit of quantitation: 0.5–0.6 μg/mL

OTHER SUBSTANCES

Simultaneous: impurities

KEY WORDS

robust; tablets; validated

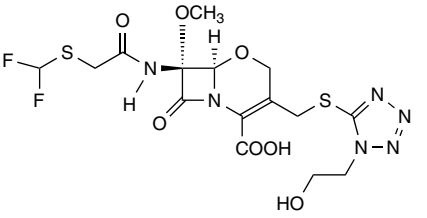
Flomoxef



Molecular formula: $C_{15}H_{18}F_2N_6O_7S_2$
Molecular weight: 496.47
CAS Registry No: 99665-00-6
Merck Index: 13, 4132

SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL 200 mg Bond-Elut C18 SPE cartridge with two 3 mL portions of MeOH and two 3 mL portions of 5% acetic acid. Mix 500 μL serum with 500 μL 10% acetic acid, add to the SPE cartridge, wash with 3 mL water, elute with four 500 μL portions of MeOH:water 60:40. Evaporate the combined eluates to dryness under a stream of nitrogen, reconstitute the residue with 250 μL water, filter (0.22 μm). Inject a 100 μL aliquot onto column A and elute to waste with mobile phase A. After an unspecified time, backflush the contents of column A onto column B using mobile phase B. Monitor the effluent from column B. (Sato,K.; Kobayashi,K.; Moore,C.M.; Mizuno,Y.; Katsumata,Y. Semi-quantitative analysis of cefaclor in human serum by capillary high performance liquid chromatography/fast atom bombardment mass spectrometry. *Forensic Sci.Int.* **1993**, *59*, 71–77.)

HPLC VARIABLES

Column: A 30 × 0.5 10 μm Develosil PhA (phenethyl); B 150 × 0.5 5 μm Develosil PhA (phenethyl)

Mobile phase: A 10 mM ammonium acetate:glycerol 99.5:0.5, adjusted to pH 5 with acetic acid; B MeOH:water:acetic acid:glycerol 40:59:0.5:0.5 (pH ca. 3)

Flow rate:: A 0.05; B 0.004

Injection volume: 100

Detector: MS, JMS DX303 double focusing, xenon FAB ion source, gun current 10 mA, voltage 3 kV, positive ion mode

CHROMATOGRAM

Retention time: 18.3

LIMIT OF DETECTION:

200–1000 ng

OTHER SUBSTANCES

Extracted: cefaclor (14.4), cefamandole (31.0), cefazolin (19.7), cefbuperazone (20.8), cefixime (19.2), cefmenoxime (18.8), cefmetazole (21.4), cefoperazone (24.2), cefotaxime (16.1), cefotetan (16.8), cefotiam (11.7), cefpiramide (20.9), cefsulodin (12.2), ceftazidime (12.0), ceftizoxime (15.6), ceftriaxone (16.7), cefuroxime (16.9), cefuzonam (32.0), cephalexin (14.8), cephaloglycine (15.7), cephaloridine (15.6), cephalothin (34.7), latamoxef (15.1)

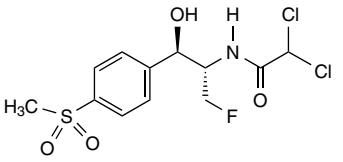
Florfenicol



Molecular formula: $C_{12}H_{14}Cl_2FNO_4S$
Molecular weight: 358.22
CAS Registry No: 73231-34-2
Merck Index: 13, 4135

SAMPLE

Matrix: blood, CSF
Sample preparation: Condition a 3 mL 500 mg Bond-Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. Mix 250 μL plasma or CSF with 750 μL water and 40 μL 8 μg/mL IS in MeOH:water 2:98 or 400 μg/mL IS in MeOH, vortex. Add to the SPE cartridge, wash with 2 mL MeCN:water 15:85, wash with 3 mL hexane, elute with 3 mL MeCN. Evaporate the eluate to dryness under reduced pressure. Dissolve the residue in 500 μL MeCN:water 22:78, filter (0.45 μm polyvinylidene difluoride), inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hypersil ODS
Column temperature: 40
Mobile phase: MeCN:50 mM ammonium acetate 22:78
Flow rate: 1.5
Injection volume: 100
Detector: UV 224

CHROMATOGRAM

Retention time: 6
Internal standard: chloramphenicol (7.50)
Limit of detection: 20 ng/mL
Limit of quantitation: 30 ng/mL

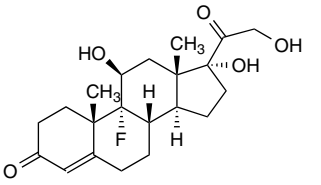
Fludrocortisone



Molecular formula: $C_{21}H_{29}FO_5$
Molecular weight: 380.45
CAS Registry No: 127-31-1, 514-36-3 (21-acetate)
Merck Index: 13, 4156

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL 500 mg Sep-Pak Vac C18 SPE cartridge with 3 mL MeOH and 3 mL water. Mix 500 μL 200 mM pH 3.85 acetate buffer with 1 mL serum, add 400 μL 2.5 μM IS in mobile phase, centrifuge, add to the SPE cartridge, wash with 3 mL acetone:water 20:80, wash with 3 mL water, wash with 3 mL hexane, elute with 3 mL diethyl ether. Vortex the eluate with 1 mL 200 mM NaOH, centrifuge. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 250 μL mobile phase, place on a rotary mixer for 5 min, inject a 60 μL aliquot. (Fludrocortisone is IS. Extraction from serum has not been strictly demonstrated.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherex C18 (Phenomenex)
Mobile phase: MeOH:THF:water 3:25:72
Flow rate: 1
Injection volume: 60
Detector: UV 254

CHROMATOGRAM

Retention time: 15.90
Internal standard: fludrocortisone (15.90)
Limit of detection: 5 nM
Limit of quantitation: 10 nM

OTHER SUBSTANCES

Extracted: 11-deoxycortisol (22.10), dexamethasone (29.85), hydrocortisone (12.85), methylprednisolone (21.00), prednisolone (12.00)

KEY WORDS

fludrocortisone is IS in original method; serum; SPE

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL 200 mg Clean-Up C18 SPE cartridge (Worldwide Monitoring) with two 2 mL portions of MeOH and two 2 mL portions of water. Centrifuge plasma at 2000 rpm for 5 min prior to analysis. Mix 2 mL plasma with 40 μL MeCN, add 1 mL water, vortex until homogeneous, add to the SPE cartridge, wash with two 2 mL portions of acetone:water 20:80, wash with 1 mL 50 mM pH 2.7 phosphate buffer, place under vacuum for 3 min, elute with two 2.5 mL portions of ethyl acetate. Evaporate the eluate to dryness under reduced pressure at 40°, reconstitute the residue with 75 μL mobile phase B, vortex, add 100 μL 50 mM pH 3 phosphate buffer, centrifuge at 5000 rpm for 5 min, inject a 145 μL aliquot.

HPLC VARIABLES

Column: 100 × 2 5 μm YMC Basic
Column temperature: 50
Mobile phase: Gradient. A:B 20:80 for 1 min, to 50:50 over 7 min, to 65:35 over 3 min, to 100:0 (step gradient), maintain at 100:0 for 1 min, return to initial conditions, re-equilibrate for 4 min. A was MeCN:50 mM pH 3.0 potassium dihydrogen phosphate buffer 50:50. B was MeOH:50 mM pH 3.0 potassium dihydrogen phosphate buffer 20:80.
Flow rate: 0.3
Injection volume: 145
Detector: UV 246

CHROMATOGRAM

Retention time: 12.4
Internal standard: fludrocortisone acetate

OTHER SUBSTANCES

Extracted: deflazacort (13.8), 21-hydroxydeflazacort (10)
Simultaneous: cortisone, hydrocortisone

KEY WORDS

fludrocortisone acetate is internal standard; plasma; SPE

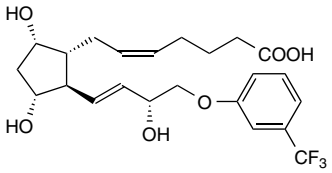
Fluprostenol



Molecular formula: $C_{23}H_{29}F_3O_6$
Molecular weight: 458.47
CAS Registry No: 40666-16-8
Merck Index: 13, 4220

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg IST Isolute ODS SPE cartridge (Jones Chromatography) with 1 mL MeOH and 1 mL MeOH:water:formic acid 3:97:0.1. Vortex 200 μL plasma with 200 pg IS for 30 s, add to the SPE cartridge, wash with 1 mL MeOH:water:formic acid 3:97:0.1, wash with 1 mL MeOH:water 25:75, elute with 1 mL MeOH:water 90:10. Evaporate the eluate to dryness under a stream of nitrogen at 35°, reconstitute the residue with 120 μL MeOH:water 30:70, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 10 × 2.1 3 μm Symmetry Sentry Guard C18 (Waters)
Mobile phase: MeOH:water:formic acid 38:62:0.1 containing 70 μg/mL ammonium acetate
Flow rate: 0.4
Injection volume: 25
Detector: MS, PE Sciex API-III Plus triple quadrupole, TurboIonSpray, positive ionization, ESI 3800 V, orifice 40 V, nebulizer gas nitrogen at 62 psi, TurboProbe 475°, TurboProbe nitrogen at 8 L/min, collision gas argon, m/z 476–279

CHROMATOGRAM

Retention time: 0.63
Internal standard: 3,3,4,4-$^2H_4$-fluprostenol (m/z 480–283) (0.63)
Limit of quantitation: 25 pg/mL

KEY WORDS

pharmacokinetics; plasma; rat; SPE

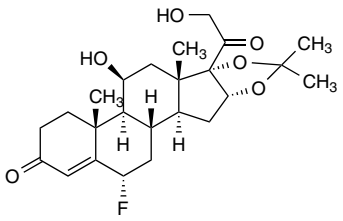
Flurandrenolide



Molecular formula: $C_{24}H_{33}FO_6$
Molecular weight: 436.51
CAS Registry No: 1524-88-5
Merck Index: 13, 4223

SAMPLE

Matrix: formulations

Sample preparation: Mix 1 g of a topical product, 5 mL 100 mM pH 4 citrate buffer saturated with NaCl, and 10 mL ethyl acetate, shake vigorously by hand to ensure that no large clumps stick to the tube, mix with the tube on its side on an oscillating shaker for 15 min. Remove the upper ethyl acetate layer and wash with citrate buffer as before. Dry the ethyl acetate over anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in a mixture of 10 mL heptane and 5 mL MeCN:water 90:10. Remove the upper heptane layer and extract it with 2 mL MeCN:water 90:10. Combine the MeCN/water layers and evaporate them to dryness, dissolve the residue in 300 μL MeOH, filter (0.45 μm nylon), inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee NewGuard C18
Column: 75 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. MeCN:water 18:82 for 2 min, to 82:18 over 12 min, maintain at 82:18 for 3 min, re-equilibrate at initial conditions for 12 min.
Flow rate: 1
Injection volume: 5
Detector: UV 240

CHROMATOGRAM

Retention time: 7.36
Limit of detection: 0.001%

OTHER SUBSTANCES

Simultaneous: alclometasone 17,21-dipropionate (10.93), amcinonide (10.90), beclomethasone 17,21-dipropionate (11.90), betamethasone (6.52), betamethasone 21-acetate (8.47), betamethasone 17-benzoate (10.28), betamethasone 17,21-dipropionate (11.42), betamethasone 17-valerate (10.25), budesonide (8.55, 8.69 (epimers)), clobetasol 17-propionate (11.06), cortisone (5.62), cortisone 21-acetate (8.07), dexamethasone (6.57), dexamethasone 21-acetate (8.68), desonide (6.99), desoximetasone (7.60), desoxycorticosterone acetate (10.90), desoxycorticosterone pivalate (14.45), diflorasone 17,21-diacetate (9.81), fluocinolone acetonide (7.38), fluocinonide (9.79), fludrocortisone 21-acetate (7.77), fluorometholone (7.67), flumethasone 21-pivalate (11.20), flunisolide (7.14), fluprednisolone (5.46), fluticasone 17-propionate (11.19), halcinonide (10.72), halobetasol propionate (10.98), hydrocortisone (5.50), hydrocortisone 21-acetate (7.65), hydrocortisone 17-butyrate (8.66), hydrocortisone 21-cypionate (12.54), hydrocortisone 17-valerate (9.53), mometasone 17-furoate (11.24), methylprednisolone (6.31), methylprednisolone 21-acetate (8.34), meprednisone (6.55), prednisolone (5.37), prednisolone 21-acetate (7.47), prednisolone 21-tebuate (11.01), paramethasone 21-acetate (8.64), prednicarbate (10.72), prednisone (5.46), triamcinolone (4.15), triamcinolone acetonide (7.04), triamcinolone 16,21-diacetate (7.49), triamcinolone hexacetonide (13.12)

SAMPLE

Matrix: urine

Sample preparation: Mix 5 mL urine with 100 ng IS and 400 μL 1 M pH 4.1 sodium acetate buffer, adjust pH to 5.0, add 600 μL β-glucuronidase solution (10800 U), heat at 65° for 3.5 h or at 37° overnight, cool, add 6 mL ethyl acetate, rotate for 10 min. Remove the organic layer and wash it with 3 mL 1 M NaOH containing 150 mM NaCl by rotating for 5 min, centrifuge at 1900 g for 30 s. Remove the organic layer and pass it through an anhydrous sodium sulfate drying column. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 30 μL MeOH, vortex, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 75 × 4.6 3 μm DB-8 (Supelco)

Column temperature: 25

Mobile phase: Gradient. MeOH:1% acetic acid from 0:100 to 100:0 over 15 min, maintain at 100:0 for 3 min.

Flow rate: 1

Injection volume: 10

Detector: MS, Finnigan MAT LCQ Classic, APCI, source 450°, capillary 150°, source +5 kV for positive ions and – 5 kV for negative ions, collision gas helium, m/z 437

CHROMATOGRAM

Retention time: 26.8

Internal standard: d_4-hydrocortisone (24.4)

Limit of detection: 5 ng/mL

OTHER SUBSTANCES

Extracted: beclomethasone (m/z 409) (26.4), betamethasone (m/z 393) (25.9), deoxycortone (m/z 331) (28.1), 21-deoxydexamethasone (m/z 377) (26.8), desoximetasone (m/z 377) (27.6), dexamethasone (m/z 393) (25.9), dichlorisone (m/z 413) (26.4), fluclorolone acetonide (m/z 487) (27.8), fludrocortisone (m/z 381) (24.2), flumethasone (m/z 411) (25.4), fluocinolone acetonide (m/z 453) (26.4), fluocinonide (m/z 495) (28.5), fluocortolone (m/z 377) (26.8), fluorometholone (m/z 3.77) (26.6), fluprednisolone (m/z 379) (23.9), hydrocortisone (m/z 363) (24.4), isoflupredone (m/z 379) (23.9), methylprednisolone (m/z 375) (26.1), prednisolone (m/z 361) (24.4), prednisone (m/z 359) (23.4), triamcinolone (m/z 395) (19), triamcinolone acetonide (m/z 435) (29.3)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 100 mg C18 SPE cartridge (Varian) with MeOH and 10 mM pH 8.5 Tris buffer. Fill a 22 mL vessel (from bottom to top) with 5 g alumina (dried at 120° for 48 h before use), 6 g anhydrous sodium sulfate, and 2 g melted (microwave) kidney fat. There is filter paper between the alumina and sodium sulfate. Pass hexane down through the layers at 60° at 1500 psi followed by MeCN at 50° at 1500 psi. Store the MeCN at – 20° for 30 min to precipitate fat, filter through a plug of glass wool, evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 2 mL MeOH, mix with 5 mL water, add to the SPE cartridge, wash with 2 mL 20 mM pH 8.5 Tris buffer, wash with 2 mL MeOH:water 40:60, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 75 μL MeCN, add 75 μL 0.5% formic acid, mix, inject a 75 μL aliquot. (The extraction is done in a Dionex ASE system (advanced solvent extraction).)

HPLC VARIABLES
Column: 150 × 3 5 μm Symmetry (Waters)
Column temperature: 40
Mobile phase: Gradient. A:B from 45:55 to 100:0 over 12 min. A was MeCN:water:formic acid 10:90:0.5. B was MeCN:water:formic acid 90:10:0.5.
Flow rate: 0.4
Injection volume: 75
Detector: MS, Micromass Quattro Ultima, positive electrospray, capillary 2.5 kV, cone 40 V, source 120°, cone gas 189 L/h, desolvation gas 652 L/h, m/z 407.2–267.4–225.4

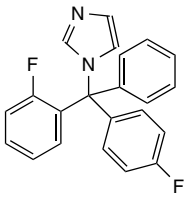
Flutrimazole



Molecular formula: $C_{22}H_{16}F_2N_2$
Molecular weight: 346.37
CAS Registry No: 119006-77-8
Merck Index: 13, 4241

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Mix 500 μL plasma or urine with 500 μL MeOH, shake, centrifuge, inject a 50 μL aliquot. Homogenize feces with an equal volume of MeOH, centrifuge at 5000 rpm for 20 min, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: μBondapak C18
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:5 mM pH 7 phosphate buffer 75:25
Flow rate: 1
Injection volume: 50–100
Detector: UV 225

CHROMATOGRAM

Retention time: 10

OTHER SUBSTANCES

Extracted: clotrimazole (11.2), imidazole (3.3)

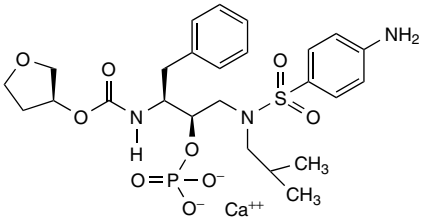
Fosamprenavir calcium

Molecular formula: $C_{25}H_{36}CaN_3O_9PS$
Molecular weight: 625.68
CAS Registry No: 226700-81-8



SAMPLE

Matrix: blood
Sample preparation: Vortex 100 μL plasma with 200 μL 1 μg/mL IS in MeCN, centrifuge. Mix a 100 μL aliquot of the supernatant with 100 μL 0.1% formic acid and 400 μL MeCN:water 50:50, inject a 10–20 μL aliquot.

HPLC VARIABLES

Column: 50 × 2 3 μm Phenomenex Aqua C18 or 30 × 2 3 μm Phenomenex Aqua C18
Mobile phase: Gradient. A was MeOH:10 mM pH 3.5 ammonium formate 1.5:98.5. B was MeCN. A:B 99:1 for 3 min, to 5:95 over 1.5 min, maintain at 5:95 for 1.4 min, return to initial conditions over 0.1 min, re-equilibrate for 3 min.
Flow rate: 0.325
Injection volume: 10–20
Detector: MS, PE Sciex API2000 turbo ion spray, electrospray ionization, positive ion mode

CHROMATOGRAM

Internal standard: $^{13}C_6$-amprenavir

OTHER SUBSTANCES

Extracted: amprenavir, nelfinavir

KEY WORDS

plasma

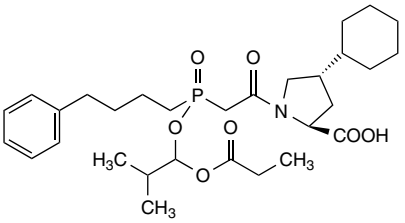
Fosinopril

Molecular formula: $C_{30}H_{46}NO_7P$
Molecular weight: 563.66
CAS Registry No: 98048-97-6
Merck Index: 13, 4279



SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL 200 mg Bond Elut cyclohexyl SPE cartridge with 3 mL MeOH and 3 mL 0.1 N phosphoric acid. Vortex 1 mL serum with 2 mL 0.2 N phosphoric acid and an aliquot of EtOH containing 1.5 μg/mL SQ-33055 and 1.5 μg/mL SQ-27133, add to the SPE cartridge, wash with 3 mL 0.1 N phosphoric acid, wash with 3 mL 10 mM pH 4.6 ammonium acetate buffer, dry under vacuum, elute with 1.5 mL MeOH containing 10 mM ammonium acetate. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 75 μL initial mobile phase, inject a 5 μL aliquot. (Use silanized glass or polypropylene containers. Silanize glass vials by immersing in Prosil-28 working solution (10 mL concentrate diluted to 1 L with water) for 10 min, rinsing with water several times, drying in air.)

HPLC VARIABLES

Column: 50 × 2 5 μm Asahipak ODP PVA-C18

Mobile phase: Gradient. A was 770 mg ammonium acetate in 750 mL water and 250 mL MeOH, adjusted to pH 5.5 with glacial acetic acid. B was 770 mg ammonium acetate in MeOH. A:B from 70:30 to 5:95 over 1 min, maintain at 5:95 for 2 min, return to initial conditions over 2 min, re-equilibrate for 5 min.

Flow rate: 0.2

Injection volume: 5

Detector: MS, PE Sciex API-III Plus triple quadrupole, turbo ion spray, positive ion, sprayer 4200 V, orifice 35 V, declustering 4 V, nebulizer gas nitrogen at 65 psi, curtain gas nitrogen at 1.2 L/min, turbo ion spray nitrogen 4 L/min, collision gas argon 23 eV, m/z 581.3–436.2

CHROMATOGRAM

Retention time: 4.2

Internal standard: SQ-33055 ((4*S*)-4-phenyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy) propoxy](4-phenylbutyl)phosphinyl]acetyl]-L-proline) (m/z 575.3–430.2) (4), SQ-27133 ((4*S*)-4-phenylthio-1-[[(*R*)-(4-phenylbutyl)phosphinyl]acetyl]-L-proline) (m/z 479.2–416.2) (3.3)

Limit of quantitation: 1.17 ng/mL

OTHER SUBSTANCES

Extracted: fosinoprilat (m/z 453.2–390.2) (3.5)

KEY WORDS

serum; SPE

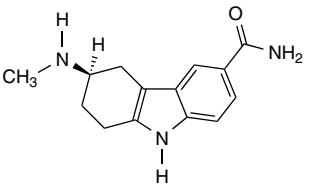
Frovatriptan



Molecular formula: $C_{14}H_{17}N_3O$
Molecular weight: 243.30
CAS Registry No: 158747-02-5, 158930-17-7 (succinate)

SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL blood with 40 μL 10 μg/mL IS and 100 μL 100 mM sodium carbonate, extract with 3 mL chloroform:isopropanol 50:50 (Caution! Chloroform is a carcinogen!). Evaporate the organic layer to dryness under a stream of nitrogen at 60°, reconstitute the residue with 150 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Guard column: 10 × 4.6 4 μm μBondapak C18
Column: 150 × 4.6 5 μm Hypersil BDS C18
Mobile phase: MeCN:10 mM ammonium acetate 6:94, adjusted to pH 4 with glacial acetic acid
Flow rate: 1
Detector: UV 244

CHROMATOGRAM

Retention time: 5.5
Internal standard: 5,6,7,8-Tetrahydro-6-(ethylamino)carbazole-3-carboxamide (8)
Limit of quantitation: 10 ng/mL

KEY WORDS

dog; mouse; rat; whole blood

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Human. Mix 1 mL blood with 100 μL 200 ng/mL IS and 2 mL MeCN, centrifuge. Evaporate the supernatant to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL mobile phase, inject an aliquot. Rabbit. Mix 250 μL blood with 100 μL 500 ng/mL IS and 2 mL MeCN, centrifuge. Evaporate the supernatant to dryness under a stream of nitrogen at 40°, reconstitute the residue with 250 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Guard column: 10 × 3.2 5 μm Kromasil C8
Column: 50 × 4.6 3 μm Hypersil BDS C8
Mobile phase: MeCN:10 mM pH 4 ammonium acetate buffer 13:87
Flow rate: 1
Injection volume:
Detector: MS, PE Sciex API-III, ionspray, 40 μL/min entered the detector, m/z 244.3–213.0

CHROMATOGRAM

Retention time: 1

Internal standard: 5,6,7,8-Tetrahydro-6-(ethylamino)carbazole-3-carboxamide (m/z 258.3–213.0) (1)
Limit of quantitation: 200 pg/mL (human), 10 ng/mL (rabbit)

KEY WORDS
human; rabbit; whole blood

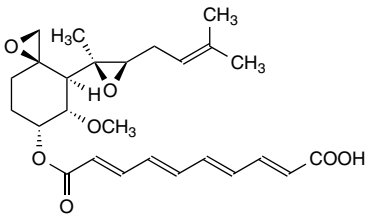
Fumagillin



Molecular formula: $C_{26}H_{34}O_7$
Molecular weight: 458.54
CAS Registry No: 23110-15-8
Merck Index: 13, 4307

SAMPLE

Matrix: formulations
Sample preparation: Mix 100 μL of a 70 μg/mL solution in 0.9% sodium chloride with 900 μL MeOH, vortex for 15 s, centrifuge for 10 min. Mix 100 μL of the supernatant with 900 μL MeOH, vortex for 15 s, centrifuge for 10 min, inject a 20 μL aliquot.

HPLC VARIABLES

Column: Zorbax C18
Mobile phase: MeCN:MeOH:water:phosphoric acid 50:20:30:0.1
Flow rate: 0.5
Injection volume: 20
Detector: UV 350

CHROMATOGRAM

Retention time: 3.7
Limit of quantitation: 200 ng/mL

KEY WORDS

ophthalmic solutions; stability-indicating

REFERENCE

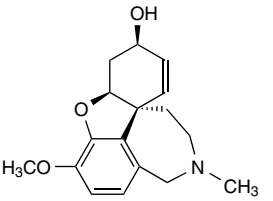
Galantamine



Molecular formula: $C_{17}H_{21}NO_3$
Molecular weight: 287.35
CAS Registry No: 357-70-0
Merck Index: 13, 4361

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL plasma with 100 μL 10 μg/mL IS in MeOH, 1 mL saturated KCl solution, and 100 μL 1 M NaOH, vortex, extract twice with 2.5 mL portions of toluene. Combine the organic layers and evaporate to dryness under a stream of nitrogen at 65°, reconstitute the residue with 100 μL MeOH:10 mM ammonium acetate:diethylamine 90:10:1, inject an aliquot.

HPLC VARIABLES

Column: 100 × 4.6 3 μm Hypersil C18 BDS
Mobile phase: MeCN:10 mM pH 7 ammonium acetate 15:85
Flow rate: 0.8
Detector: F ex 280 em 310

CHROMATOGRAM

Internal standard: codeine phosphate
Limit of quantitation: 2–10 ng/mL

OTHER SUBSTANCES

Extracted: norgalantamine

KEY WORDS

dog; mouse; pharmacokinetics; plasma; rabbit; rat

REFERENCE

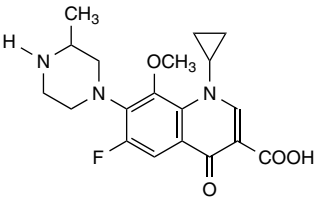
Gatifloxacin



Molecular formula: $C_{19}H_{22}FN_3O_4$
Molecular weight: 375.39
CAS Registry No: 112811-59-3
Merck Index: 13, 4388

SAMPLE

Matrix: blood, urine
Sample preparation: Serum. Mix 200 μL serum with 200 μL 500 μg/mL IS in MeCN: 100 mM phosphoric acid 90:10 and 400 μL MeCN, centrifuge. Mix 200 μL of the supernatant with 800 μL PIC A solution, inject a 20 μL aliquot. Urine. Dilute 10 μL urine with 990 μL PIC A solution, inject a 5 μL aliquot. (PIC A solution was 10 mM tetrabutylammonium phosphate (Waters PIC A) adjusted to pH 3.48.)

HPLC VARIABLES

Guard column: 30 × 4 30–40 μm Perisorb RP-18
Column: 125 × 4 5 μm Nucleosil-100 5C18
Mobile phase: MeCN:10 mM tetrabutylammonium phosphate (Waters PIC A) 17:83, adjusted to pH 3.48 with ca. 1.3 mL concentrated phosphoric acid.
Flow rate: 1
Injection volume: 5–20
Detector: F ex 295 em 480

CHROMATOGRAM

Retention time: 4.5
Internal standard: trovafloxacin (12.6)
Limit of detection: 30 ng/mL (serum), 1.7 μg/mL (urine)
Limit of quantitation: 60 ng/mL (serum), 3.5 μg/mL (urine)

OTHER SUBSTANCES

Simultaneous: ciprofloxacin (3.6), grepafloxacin (11.1), moxifloxacin (7.7), ofloxacin (2.7), salicylic acid (22.2), tryptophan (1.9)
Noninterfering: furosemide, sparfloxacin

KEY WORDS

pharmacokinetics; serum

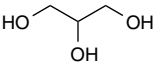
Glycerin



Molecular formula: $C_3H_8O_3$
Molecular weight: 92.09
CAS Registry No: 56-81-5
Merck Index: 13, 4497

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 2 mL 10% trichloroacetic acid, centrifuge at 2500 rpm for 20 min. Wash the clear supernatant several times with ether until the aqueous layer becomes neutral. Dry the aqueous layer under a stream of air, reconstitute with 50 μL water containing 5 μg ethylene glycol, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 20 × 7 5 μm IEX 215 cation-exchange (Toyo Soda)
Mobile phase: Gradient. MeCN:water 76:24 for 30 min, to 0:100 (time not specified)
Flow rate: 0.6
Injection volume: 25
Detector: F ex 412 em 475 following post-column reaction. The column effluent mixed with 25 mM periodic acid pumped at 0.1 mL/min and the resulting mixture flowed through an 0.4 mm ID reaction coil at 145° for 3 min. The effluent from this coil mixed with 8% acetylacetone in 2 M ammonium acetate (allowed to stand overnight before use) pumped at 0.2 mL/min and the mixture flowed through a similar coil at 64° to the detector.

CHROMATOGRAM

Retention time: 26

OTHER SUBSTANCES

Extracted: anhydroglucitol (29), dexteros (43), erythritol (32), ethylene glycol (20)

KEY WORDS

plasma; post-column reaction

REFERENCE

Akanuma, H.; Ogawa, K.; Lee, Y.; Akanuma, Y. Reduced levels of plasma 1,5-anhydroglucitol in diabetic patients, *J.Biochem.(Tokyo)*, **1981**, *90*, 157–162.

SAMPLE

Matrix: blood
Sample preparation: Add 2 mL of a slurry of an anion-exchange resin (AG1-X8, 200–400 mesh, hydroxide form, Bio-Rad) in an equal volume of water to an 80 × 10 column. Add 2 mL of a slurry of a cation-exchange resin (AG50-WX8, 200–400 mesh, hydrogen form, Bio-Rad) in an equal volume of water to an 80 × 10 column. Place the anion column on top of the cation column. Vortex 1 mL plasma briefly, add 1 mL 0.3 N barium hydroxide, add 1.1 mL 0.3 N zinc sulfate, vortex, centrifuge at 2000 rpm for 10 min. Add the supernatant to the columns, vortex the pellet with 1 mL water, centrifuge at 2000 rpm, add the supernatant to the columns, repeat the extraction of the pellet, add two 1 mL portions of water to the columns. Collect all the eluate from the columns, add 100 μL 100 mM sucrose, vortex, lyophilize at – 20° for 15 h. Add 5 drops 2,2-dimethoxypropane, mix, dry under air (it is critical that the sample be completely dry), add 1 mL 30 mg/mL 4-dimethylaminopyridine in pyridine, vortex, sonicate at 45° for 5 min (no longer than 5 min), add 100 μL 25% benzoyl peroxide in

butyl acetate, vortex until a white precipitate appears, heat at 45° for 15 min, cool to room temperature, add 50 μL MeOH, vortex at 45° for 5 min. Evaporate to dryness under a stream of air at 45° for 1 h, reconstitute the residue with 4 mL chloroform with vortexing and sonicating (Caution! Chloroform is a carcinogen!), add 2 mL 1 M HCl, vortex for 15 s, centrifuge at 2000 rpm for 5 min, discard the aqueous layer. Repeat the HCl wash. Evaporate the chloroform layer to dryness under a stream of air, reconstitute the residue with 172.8 μL MeCN and 67.2 μL water, vortex, centrifuge for 2 min, inject a 200 μL aliquot.

HPLC VARIABLES

Column: 250 mm long 5 μm Apex C18 (Jones)
Mobile phase: Gradient. MeCN:water 56:44 for 30 min, to 95:5 (step gradient), maintain at 95:5 for 10 min, re-equilibria at initial conditions for 20 min.
Flow rate: 1.3
Injection volume: 200
Detector: UV 254

CHROMATOGRAM

Retention time: 26

OTHER SUBSTANCES

Extracted: dextrose (28), sucrose (30)

KEY WORDS

derivatization; plasma; SPE

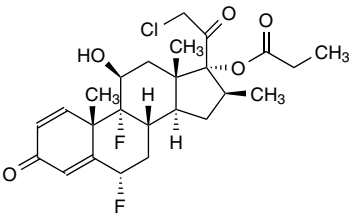
Halobetasol propionate

Molecular formula: $C_{25}H_{31}ClF_2O_5$
Molecular weight: 484.97
CAS Registry No: 66852-54-8
Merck Index: 13, 4608



SAMPLE

Matrix: formulations

Sample preparation: Mix 1 g of a topical product, 5 mL 100 mM pH 4 citrate buffer saturated with NaCl, and 10 mL ethyl acetate; shake vigorously by hand to ensure that no large clumps stick to the tube, mix with the tube on its side on an oscillating shaker for 15 min. Remove the upper ethyl acetate layer and wash with citrate buffer as before. Dry the ethyl acetate over anhydrous sodium sulfate and evaporate to dryness. Dissolve the residue in a mixture of 10 mL heptane and 5 mL MeCN:water 90:10. Remove the upper heptane layer and extract it with 2 mL MeCN:water 90:10. Combine the MeCN/water layers and evaporate them to dryness, dissolve the residue in 300 μL MeOH, filter (0.45 μm nylon), inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee NewGuard C18
Column: 75 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. MeCN:water 18:82 for 2 min, to 82:18 over 12 min, maintain at 82:18 for 3 min, re-equilibrate at initial conditions for 12 min.
Flow rate: 1
Injection volume: 5
Detector: UV 240

CHROMATOGRAM

Retention time: 10.98
Limit of detection: 0.001%

SAMPLE

Matrix: eggs, tissue
Sample preparation: Condition a 3 mL 60 mg Oasis HLB SPE cartridge with 3 mL MeOH, 3 mL water, and 3 mL 125 mM pH 4.9 ammonium acetate buffer. Mix 2 g minced liver or homogenized egg with 2 mL 25 mg/mL trypsin in water, vortex, adjust pH to 7–8 with 10% sodium carbonate, shake on an orbital shaker at 40° overnight, cool, add 1 mL 10% sodium carbonate, add 10 (liver) or 15 (eggs) mL ethyl acetate, shake on a mechanical shaker for 3 min, centrifuge at 600 g at 4° for 2 min, extract the aqueous layer again with 10 mL ethyl acetate. Combine the ethyl acetate layers and add to 5 mL 125 mM pH 4.9 ammonium acetate buffer, shake mechanically for 1 min. Shake the aqueous layer with 5 mL hexane for 20 s, discard the hexane layer. Add the aqueous layer to the SPE cartridge, wash with 2 mL toluene, push air through the SPE cartridge at 19 mL/min, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 500 μL 125 mM pH 4.9 ammonium acetate buffer, vortex for 30 s, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Prodigy C18 (Phenomenex)

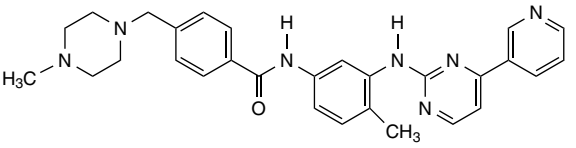
Imatinib



Molecular formula: $C_{29}H_{31}N_7O$
Molecular weight: 493.60
CAS Registry No: 152459-95-5, 220127-57-1 (mesylate)
Merck Index: 13, 4926

SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL plasma with 10 μL 10 μg/mL IS in MeOH, add 1 mL MeCN, vortex briefly, centrifuge at 12000 g for 5 min. Evaporate a 1 mL aliquot of the supernatant to dryness under a stream of nitrogen at 27°, reconstitute the residue with 100 μL MeOH:water 20:80, vortex briefly, inject a 3 μL aliquot.

HPLC VARIABLES

Column: 50 × 4.6 5 μm Phenomenex Luna C18(2)
Mobile phase: Gradient. MeOH:water:formic acid from 20:80:0.1 to 60:40:0.1 over 6 min, to 100:0:0.1 over 1 min, maintain at 100:0:0.1 for 2 min, return to initial conditions over 1 min, re-equilibrate for 4 min.
Flow rate: 1 for 6 min, to 2 over 1 min, maintain at 2 for 6 min, to 1 over 0.1 min, maintain at 1 for 0.9 min
Injection volume: 3
Detector: MS, ThermoFinnigan aQa, electrospray, positive single-ion, 10% of column effluent entered detector, insert probe 250°, ionspray 5000 V, orifice 10 V, nitrogen 75 psi, m/z 493.7

CHROMATOGRAM

Retention time: 4.0
Internal standard: d_8-imatinib (m/z 501.7) (3.9)
Limit of quantitation: 30 ng/mL

OTHER SUBSTANCES

Extracted: CGP 74588 (metabolite) (m/z 479.7) (3.7)

KEY WORDS

pharmacokinetics; plasma

SAMPLE

Matrix: formulations
Sample preparation: Dissolve capsules in MeOH:water 25:75 containing 40 μg/mL acetaminophen so as to achieve an imatinib concentration of 2 mg/mL, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm XTerra C18
Column temperature: 25
Mobile phase: MeOH:water:triethylamine 25:74:1 (Mix 740 mL water with 10 mL triethylamine, adjust pH to 2.4 with 85% phosphoric acid, add 250 mL MeOH, adjust pH to 2.6 with 85% phosphoric acid, if necessary.)

Flow rate: 1
Injection volume: 20
Detector: UV 267

CHROMATOGRAM

Retention time: 7.7
Internal standard: acetaminophen (2.9)
Limit of detection: 10 ng/mL
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES

Simultaneous: impurity STI 509-00

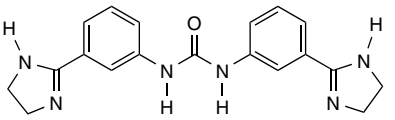
Imidocarb



Molecular formula: $C_{19}H_{20}N_6O$
Molecular weight: 348.40
CAS Registry No: 27885-92-3
Merck Index: 13, 4938

SAMPLE

Matrix: blood
Sample preparation: Condition a 100 mg Supelclean LC-18 SPE cartridge with 3 mL MeOH and 2 mL water. Vortex 1 mL plasma with 3 mL 50 mM disodium EDTA solution for 30 s, add to the SPE cartridge, wash with 2 mL MeOH:water 10:90, dry under vacuum for 5 min, elute with 3 mL MeCN:2% acetic acid in water containing 25 mM sodium octanesulfonate 90:10. Evaporate the eluate to dryness under reduced pressure at 40°, reconstitute the residue with 350 μL mobile phase, vortex, filter (0.45 μm), inject a 50 μL aliquot.

HPLC VARIABLES

Column: 100 × 8 4 μm Nova Pak C18 radial compression
Mobile phase: MeCN:buffer 30:70 (The buffer was 5 mM sodium octanesulfonate containing 0.1% triethylamine adjusted to pH 3.2 with glacial acetic acid.)
Flow rate: 1.5
Detector: UV 254

CHROMATOGRAM

Retention time: 5.4

OTHER SUBSTANCES

Extracted: diminazene (UV 370) (3.7)

KEY WORDS

cow; plasma; SPE; imidocarb is IS in original paper

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax) 10 g thinly sliced kidney with 2 mL 1 M sodium carbonate and 25 mL acetone for 2 min, sonicate for 3 min, centrifuge at 4 200 g for 5 min, extract the residue again with 2 mL 1 M sodium carbonate, 25 mL acetone, and 8 mL water. Combine the supernatants, add 50 mL chloroform (Caution! Chloroform is a carcinogen!), add 20 mL saturated aqueous NaCl, add 2 mL 40% NaOH, shake for 1 min. Filter the lower organic layer through anhydrous sodium sulfate and phase-separating filter paper (Whatman PS-1), evaporate to dryness under reduced pressure at 50°, reconstitute with three 3 mL portions of MeOH:10 mM pH 7 sodium acetate containing 10 mM sodium trifluoroacetate 80:20, centrifuge at 1860 g for 5 min, add the supernatant to a pre-washed (not otherwise described) Bond Elut CBA (carboxylic acid, weak cation exchange) SPE cartridge. Wash the residue with 1 mL MeOH:10 mM pH 7 sodium acetate containing 10 mM sodium trifluoroacetate 80:20 and add the supernatant to the SPE cartridge. Wash the SPE cartridge with 4 mL MeOH, elute with 5 mL MeOH:trifluoroacetic acid 95:5. Evaporate the eluate to dryness under

reduced pressure at 50°, reconstitute the residue with 500 μL mobile phase, vortex for 15 s, sonicate for 3 min, centrifuge at 1860 g for 5 min, filter (0.45 μm), inject a 50 μL aliquot. (Use silanized glassware.)

HPLC VARIABLES

Column: 100 × 4.6 3 μm Spherisorb S3W-C18

Mobile phase: Gradient. A was MeCN:10 mM pH 7 sodium acetate containing 10 mM sodium trifluoroacetate 15:85. B was MeCN:10 mM pH 2 sodium acetate containing 10 mM trifluoroacetic acid and 10 mM tetramethylammonium chloride 10:90. A:B 100:0 for 5 min, to 0:100 (step gradient), maintain at 0:100 for 15 min, return to initial conditions (step gradient), re-equilibrate for 10 min.

Flow rate: 1

Injection volume: 50

Detector: UV 260

CHROMATOGRAM

Retention time: 14

Limit of detection: 1–2 ng/g

KEY WORDS

SAMPLE

Matrix: blood
Sample preparation: Plasma. Condition a 1 mL 100 mg Bakerbond cyano SPE cartridge with 1 mL MeOH and 2 mL water. Add 500 μL plasma to the SPE cartridge, wash with 2 mL water, wash with 2 mL MeOH, elute with 1 mL 100 mM HCl in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL mobile phase, vortex for 15 s, centrifuge at 9 500 g for 2 min, inject a 100 μL aliquot. Whole blood. Condition a 1 mL 100 mg Bakerbond cyano SPE cartridge with 1 mL MeOH and 2 mL water, retaining 0.5 mL water above the sorbent. Place a 3 mL Bakerbond SPE filtration column above the SPE cartridge. Mix 500 μL whole blood with 1.5 mL water, add to the filtration column, wash with 1 mL water, remove the filtration column. Wash the SPE cartridge with 1 mL water, wash with 2 mL MeOH, elute with 1 mL 100 mM HCl in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL mobile phase, vortex for 15 s, centrifuge at 9 500 g for 2 min, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:25 mM pH 4.0 ammonium phosphate buffer 20:80
Flow rate: 1
Injection volume: 100
Detector: UV 254

Molecular formula: $C_{20}H_{30}BrNO_3$
Molecular weight: 412.37
CAS Registry No: 22254-24-6
Merck Index: 13, 5092

SAMPLE

Matrix: blood
Sample preparation: Inject 100 μL plasma onto column A and elute to waste with mobile phase A; after 10 min, backflush the contents of column A onto column B with mobile phase B; after 2 min, remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B, re-equilibrate column A with mobile phase A for 5 min.

HPLC VARIABLES

Column: A 25 × 4 25 μm LiChrospher 60 XDS (SO_3/diol); B 250 × 4 5 μm LiChrospher 60 RP-Select B
Column temperature: 25 ± 0.1
Mobile phase: A MeOH:2 mM lithium perchlorate adjusted to pH 3.0 with 1 M perchloric acid 3:97; B MeCN:50 mM pH 3.0 phosphate buffer containing 0.5 mM sodium butanesulfonate 20:80
Flow rate: 1
Injection volume: 100
Detector: UV 220

OTHER SUBSTANCES

Extracted: atropine (16)

KEY WORDS

column-switching; plasma

REFERENCE

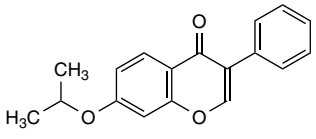
Ipriflavone



Molecular formula: $C_{18}H_{16}O_3$
Molecular weight: 280.32
CAS Registry No: 35212-22-7
Merck Index: 13, 5093

SAMPLE

Matrix: blood, tissue, urine
Sample preparation: Homogenize (Ultra-Turrax T25) tissue with 4 vol of water. Vortex 50 μL plasma, urine, or tissue homogenate with 125 μL 1 μg/mL IS in MeCN, centrifuge at 14 000 g for 1 min, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 10 μm LiChrosorb RP-18
Mobile phase: MeCN:MeOH:50 mM pH 3 acetate buffer 35:25:40
Flow rate: 1.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 12
Internal standard: testosterone (6)
Limit of detection: 20 ng/mL (plasma), 50 ng/mL (tissue), 100 ng/mL (urine)

KEY WORDS

brain; fat; heart; intestine; kidney; liver; lung; muscle; plasma; rat; spleen; stomach

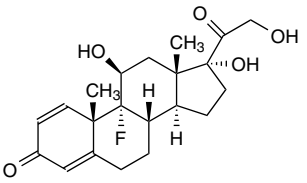
Isoflupredone



Molecular formula: $C_{21}H_{27}FO_5$
Molecular weight: 378.43
CAS Registry No: 338-95-4, 338-98-7 (21-acetate)
Merck Index: 13, 5192

SAMPLE

Matrix: blood, synovial fluid
Sample preparation: Mix 500 μL plasma or synovial fluid with 4 mL pH 4 potassium phosphate buffer and 5 mL dichloromethane, centrifuge at 3000 g. Evaporate the organic layer to dryness, reconstitute the residue with 1 mL mobile phase, inject a 70 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 CR-J01 C18 (Shimadzu)
Mobile phase: MeCN:50 mM pH 3.5 potassium phosphate buffer (ratio not given)
Flow rate: 0.5
Injection volume: 70
Detector: UV 240

CHROMATOGRAM

Limit of quantitation: 10 ng/mL

KEY WORDS

horse; plasma; for isoflupredone and isoflupredone acetate

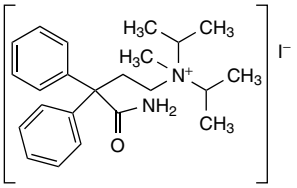
Isopropamide iodide



Molecular formula: $C_{23}H_{33}IN_2O$
Molecular weight: 480.42
CAS Registry No: 71-81-8
Merck Index: 13, 5222

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL diol SPE cartridge (Baker) with 2 mL MeOH and 2 mL water. Add 1 mL plasma to the SPE cartridge, wash with 2 mL water, wash with 2 mL MeOH, elute with 3 mL 60 mM KBr in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL mobile phase, inject an aliquot. (Prepare 60 mM KBr in MeOH by sonicating for 45 min.)

HPLC VARIABLES

Column: 250 × 4 LiChrosorb RP18
Mobile phase: MeOH:water 55:45 containing 4.325 g/L sodium octanesulfonate and 2 mL/L *N*,*N*-dimethyloctylamine, adjusted to pH 3.0 with phosphoric acid
Flow rate: 1
Detector: UV 220

CHROMATOGRAM

Retention time: 5

OTHER SUBSTANCES

Extracted: clidinium bromide (9.5), mepenzolate bromide (8)

KEY WORDS

plasma; SPE

REFERENCE

SAMPLE

Matrix: formulations
Sample preparation: Sonicate a tablet in 35 mL MeOH:water 45:55 and 10 mL 40 μg/mL IS in MeOH:water 45:55, make up to 50 mL with MeOH:water 45:55, centrifuge at 3020 g for 10 min, inject an aliquot of the supernatant. Mix 1 mL oral solution with 10 mL 40 μg/mL IS in MeOH:water 45:55, make up to 50 mL with MeOH:water 45:55, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.1 5 μm Rsil C18 (RSL, Belgium)
Column temperature: 25
Mobile phase: MeOH:water 55:45 containing 20 mM sodium 1-octanesulfonate and 10 mM *N*,*N*-dimethyloctylamine, adjusted to pH 3.0 with orthophosphoric acid
Flow rate: 1
Injection volume: 10
Detector: UV 220

CHROMATOGRAM
Retention time: 4
Internal standard: fenpiverinium bromide (6)

OTHER SUBSTANCES
Simultaneous: chlorpheniramine (10), glycopyrrolate (10), mepenzolate bromide (6), methyl paraben (2.5), pentienate bromide (7), phenylpropanolamine (3), tiemonium iodide (5)
Noninterfering: cinnarizine, haloperidol

KEY WORDS
tablets; oral solutions; stability-indicating

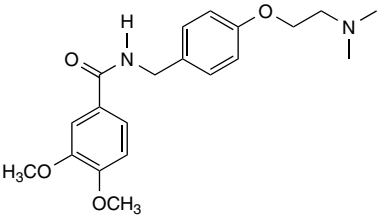
Itopride

Molecular formula: $C_{20}H_{26}N_2O_4$
Molecular weight: 358.43
CAS Registry No: 122898-67-3



SAMPLE

Matrix: blood, urine
Sample preparation: Inject 200 μL serum or urine onto column A and elute to waste with mobile phase A. After 4 min, backflush the contents of column A onto column B with mobile phase B; after 1 min, remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Re-equilibrate column A with mobile phase A.

HPLC VARIABLES

Column: A 10 × 4 25–40 μm Nucleosil CN (Macherey-Nagel); B 10 × 4.6 5 μm TSKgel ODS-80TM + 150 × 4.6 5 μm TSKgel ODS-80TM (Tosoh)
Mobile phase: A 100 mM pH 7.0 phosphate buffer; B MeCN:50 mM pH 5.5 phosphate buffer 20:80
Flow rate: 1
Injection volume: 200
Detector: F ex 308 em 344

CHROMATOGRAM

Retention time: 13
Limit of quantitation: 5 ng/mL (serum), 20 ng/mL (urine)

OTHER SUBSTANCES

Extracted: metabolites

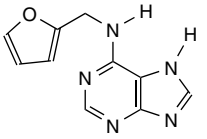
KEY WORDS

column-switching; pharmacokinetics; serum

REFERENCE

Simultaneous determination of a new gastrointestinal prokinetic agent (HSR-803) and its metabolites in human serum and urine by high-performance liquid chromatography using automated column-switching, *J.Chromatogr.*, **1992**, *576*, 174–178.

Kinetin



Molecular formula: $C_{10}H_9N_5O$
Molecular weight: 215.21
CAS Registry No: 525-79-1
Merck Index: 13, 5329

SAMPLE

Matrix: solutions
Sample preparation: Inject an aliquot of a solution in 200 mM HCl.

HPLC VARIABLES

Guard column: present but not specified
Column: 150 × 3.3 Vydac
Mobile phase: MeOH:buffer 4:96 (The buffer was 12.5 mM citric acid containing 25 mM sodium acetate, 30 mM NaOH, and 10 mM acetic acid.)
Detector: E, ESA Coulochem II, 650 mV; UV 260

CHROMATOGRAM

Retention time: 8

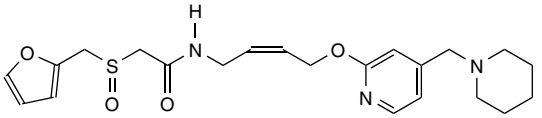
 ISBN: 0-471-66941-5

Lafutidine



Molecular formula: $C_{22}H_{29}N_3O_4S$
Molecular weight: 431.56
CAS Registry No: 118288-08-7
Merck Index: 13, 5362

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 500 μL 1 M NaOH, extract with 3 mL ethyl acetate. Evaporate the extract to dryness under reduced pressure, reconstitute the residue with 100 μL 100 mM HCl, wash with 1 mL ethyl acetate. Add 750 μL 100 mM NaOH to the aqueous layer, extract with 3 mL ethyl acetate containing 20 ng IS. Evaporate the organic layer to dryness, reconstitute the residue with 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Guard column: Guard-Pak
Column: Cosmosil 5C18-AR
Column temperature: 40
Mobile phase: MeCN:10 mM pH 5.9 phosphate buffer 20:80
Flow rate: 1
Detector: UV 230

CHROMATOGRAM

Internal standard: 4-amino-3-nitroanisole

KEY WORDS

plasma

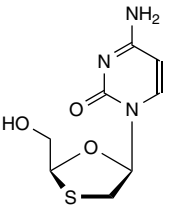
 ISBN: 0-471-66941-5

Lamivudine



Molecular formula: $C_8H_{11}N_3O_3S$
Molecular weight: 229.26
CAS Registry No: 134678-17-4
Merck Index: 13, 5367

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg Bond Elut-C SPE cartridge with 1 mL MeOH and 1 mL 100 mM pH 7.0 ammonium acetate buffer. Heat plasma at 58° for 1 h to inactivate HIV. Vortex 800 μL plasma with 300 μL 2 μg/mL hexobarbital in 25 mM pH 7.0 ammonium acetate buffer for 30 s and centrifuge at 18 000 g for 5 min. Add 1 mL of the supernatant to the SPE cartridge, wash with 1 mL 100 mM pH 7.0 ammonium acetate buffer, suck dry for 1 min, elute with 800 μL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40° and reconstitute the residue with 100 μL mobile phase. Vortex for 30 s, centrifuge at 18 000 g for 3 min, and inject an 80 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 3.9 5 μm Polarity dC18 (Waters)
Column: 150 × 3.9 5 μm Polarity dC18 (Waters)
Column temperature: 40
Mobile phase: Gradient. A was 10 mM pH 6.5 ammonium acetate buffer. B was 10 mM pH 6.5 ammonium acetate buffer:MeCN:MeOH 20:50:30. A:B 96:4 for 15 min, to 36:64 over 15 min, maintain at 36:64 for 3 min, re-equilibrate at initial conditions for 7 min.
Flow rate: 1.1
Injection volume: 80
Detector: UV 269 for 11 min, UV 250 for 3 min, UV 271 for 10 min, UV 230 for 9 min

CHROMATOGRAM

Retention time: 8.6
Internal standard: hexobarbital (30.6)
Limit of quantitation: 10.0 ng/mL

OTHER SUBSTANCES

Extracted: abacavir (25.1), didanosine (13.6), nevirapine (27.3), stavudine (15.7), zalcitabine (5.9), zidovudine (23.8)
Noninterfering: tenofovir

KEY WORDS

plasma; SPE

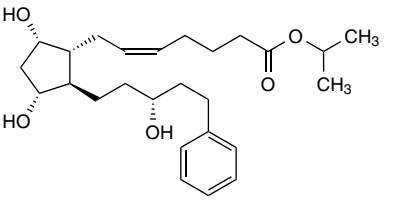
Latanoprost



Molecular formula: $C_{26}H_{40}O_5$
Molecular weight: 432.59
CAS Registry No: 130209-82-4
Merck Index: 13, 5391

SAMPLE

Matrix: aqueous humor, tissue
Sample preparation: Homogenize (Polytron) rabbit eye tissue with 3 mL EtOH, centrifuge, evaporate the supernatant under a stream of nitrogen, reconstitute with EtOH, inject an aliquot. Acidify aqueous humor to pH 3.4 with 1 M formic acid, extract with 3 mL ethyl acetate. Evaporate the ethyl acetate to dryness under a stream of nitrogen, reconstitute with EtOH, inject an aliquot.

HPLC VARIABLES

Column: 5 μm Nucleosil C18
Mobile phase: Gradient. MeCN:water:acetic acid 35:65:0.1 for 11 min, to 46:54:0.1 over 1 min, maintain at 46:54:0.1 for 6 min, return to initial conditions over 3 min, re-equilibrate for about 10 min. Alternatively, MeCN:water:acetic acid 25:75:0.1 for 15 min, to 40:60:0.1 over 10 min, return to initial conditions over 5 min, re-equilibrate for 5 min.
Flow rate: 1
Detector: Radioactivity (^{3}H)

CHROMATOGRAM

Retention time: 22

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Blood, urine. Condition a Sep-Pak C18 with 10 mL EtOH and 10 mL water. Centrifuge plasma or urine at 800 g for 10 min, acidify to pH 3.5–4.0 with 1 M HCl, add to the SPE cartridge, wash with 10 mL water, wash with 10 mL petroleum ether, elute with 10 mL methyl formate. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with EtOH, inject an aliquot. Homogenize feces with 3 volumes of EtOH, centrifuge at 800 g for 15 min, evaporate 2 mL of the supernatant to dryness, reconstitute with 200 μL EtOH, add 1.8 mL water, acidify to pH 3.5–4.0 with 1 M HCl, extract twice with 4 mL portions of ethyl acetate. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with EtOH, inject an aliquot.

HPLC VARIABLES

Guard column: 30 × 4 30–40 μm Presorb RP-18

Column: 125 × 4.6 5 μm Nucleosil C18
Mobile phase: Gradient. MeCN:water:acetic acid 20:80:0.1 for 20 min, to 40:60:0.1 over 20 min, return to initial conditions over 5 min, re-equilibrate for 10 min.
Flow rate: 1
Detector: Radioactivity (^{3}H)

CHROMATOGRAM
Retention time: 20

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
monkey; pharmacokinetics; plasma

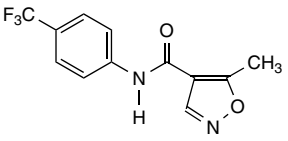
Leflunomide



Molecular formula: $C_{12}H_9F_3N_2O_2$
Molecular weight: 270.21
CAS Registry No: 75706-12-6
Merck Index: 13, 5451

SAMPLE

Matrix: blood
Sample preparation: Mix 75 μL plasma with 200 μL 50 ng/mL IS in MeCN, centrifuge, inject.

HPLC VARIABLES

Column: 150 × 4.6 Zorbax Eclipse XDB-C8
Mobile phase: Gradient. MeCN:10 mM ammonium formate containing 0.1% formic acid 0:100 for 3 min, to 90:10 over 17 min, return to initial conditions over 5 min.
Flow rate: 1
Detector: MS, PE Sciex API 2000 triple quadrupole, 50 μL/min entered the detector, negative ionization, ionspray interface 150°, ionspray 4.5 kV, orifice 30 eV, nebulizer gas nitrogen, m/z 269–82; UV 254

CHROMATOGRAM

Retention time: 16.5
Internal standard: indomethacin

OTHER SUBSTANCES

Extracted: metabolite A771726 (82) (12.7), 3-methylleflunomide (16.5)

KEY WORDS

human; plasma; rat

SAMPLE

Matrix: blood
Sample preparation: Mix 250 μL plasma, 500 μL 100 mM pH 5 sodium acetate buffer, and 100 μL 25 μg/mL IS in water, add 10 mL ethyl acetate, shake for 15 min, centrifuge at 4000 rpm for 5 min. Evaporate the organic layer to dryness under a stream of nitrogen at room temperature, reconstitute the residue with 200 μL mobile phase, vortex for 1 min, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: C18
Column: 125 × 3 Nucleosil 100-5C18
Column temperature: 21
Mobile phase: MeCN:water:formic acid 40:59.8:0.2
Flow rate: 0.5
Injection volume: 50
Detector: UV 261

CHROMATOGRAM

Retention time: 16.2
Internal standard: warfarin (12.2)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES

Extracted: metabolite A771726 (8.2)

KEY WORDS

plasma

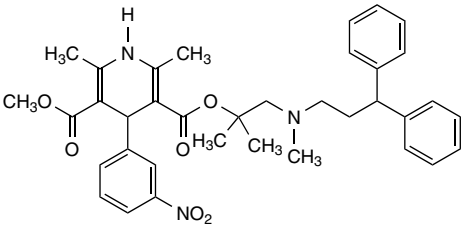
Lercanidipine



Molecular formula: $C_{36}H_{41}N_3O_6$
Molecular weight: 611.73
CAS Registry No: 100427-26-7
Merck Index: 13, 5465

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 25 μL 660 ng/mL IS in MeOH and 50 μL 100 mM NaOH, add 4.5 mL hexane:isopropanol 99:1, vortex for 2 min, centrifuge at 2000 g for 10 min. Evaporate the organic layer to dryness under reduced pressure at 25°, reconstitute the residue with 50 μL mobile phase, vortex for 20 s, inject a 20 μL aliquot. (Carry out all manipulations under yellow light.)

HPLC VARIABLES

Guard column: 4 × 4 5 μm 100 RP-18
Column: 250 × 4.6 10 μm Chiralpak AD
Column temperature: 30 ± 1
Mobile phase: Hexane:EtOH:diethylamine 95:5:0.1
Flow rate: 1.3
Injection volume: 20
Detector: MS, Micromass Quatro Micro LC triple quadrupole, electrospray interface, positive ion mode, capillary voltage 3.5 kV, source 100°, desolvation 150°, nebulizing gas nitrogen at 365 L/h, collision gas argon at 3.5 μbar, cone 40 V, collision energy 38.0 eV, m/z 612.40–100.10 (The make-up liquid was EtOH:10 mM ammonium acetate 95:5 pumped at 0.25 mL/min, which mixed with the column effluent. A splitter was used so that 0.2 mL/min entered the detector.)

CHROMATOGRAM

Retention time: 5.98 (S), 6.50 (R)
Internal standard: amiodarone (collision energy 30.0 eV) (m/z 646.30–100.30) (3.47)
Limit of quantitation: 25 pg/mL

KEY WORDS

chiral; pharmacokinetics; plasma

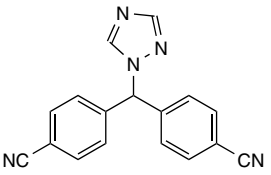
Letrozole



Molecular formula: $C_{17}H_{11}N_5$
Molecular weight: 285.30
CAS Registry No: 112809-51-5
Merck Index: 13, 5469

SAMPLE

Matrix: blood, urine
Sample preparation: Condition a 1 mL 100 mg Bond Elut C8 SPE cartridge with 1 mL MeOH and 1 mL 100 mM HCl. Dilute urine with an equal volume of water. Mix 1 mL plasma or diluted urine with 100 μL IS in water and 1 mL 100 mM HCl, add to the SPE cartridge, wash with 2 mL 10 mM pH 7 phosphate buffer, wash with 500 μL MeCN:10 mM pH 7 phosphate buffer 20:80, elute with 2 mL MeCN:10 mM pH 7 phosphate buffer 40:60, inject a 100 μL aliquot of the eluate.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Supelguard LC
Column: 250 × 4.6 5 μm ODS Hypersil C18
Mobile phase: MeCN:10 mM pH 7 phosphate buffer 30:70 (The buffer was 1.36 g potassium dihydrogen phosphate and 1.42 g disodium hydrogen phosphate in 1 L water.)
Flow rate: 1.5
Injection volume: 100
Detector: F ex 230 em 295

CHROMATOGRAM

Retention time: 11.3
Internal standard: CGP 47 645 (1-[bis(4-cyanophenyl)fluoromethyl]-1,2,4-triazole) (16.7)
Limit of quantitation: 1.40 nM (plasma), 2.80 nM (urine)

OTHER SUBSTANCES

Extracted: metabolite CGP 44 645 (12.3)

KEY WORDS

plasma; SPE

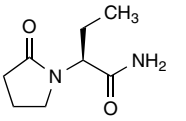
Levetiracetam



Molecular formula: $C_8H_{14}N_2O_2$
Molecular weight: 170.21
CAS Registry No: 102767-28-2
Merck Index: 13, 5482

SAMPLE

Matrix: blood
Sample preparation: Condition a 100 mg C18 SPE cartridge (Baker) with 2 mL MeOH and 2 mL water. Add 200 μL serum and 100 μL 20 μg/mL IS in MeOH:water 2:98 to the SPE cartridge, wash with 750 μL water, dry under vacuum for 3 min, elute with 1 mL MeOH:water 1:5, inject a 50 μL aliquot of the eluate.

HPLC VARIABLES

Column: 150 × 4.6 Spherisorb 3ODS2
Mobile phase: Gradient. MeCN:water from 6:94 to 20:80 over 5 min, to 40:60 over 1 min, maintain at 40:60 for 4 min, return to initial conditions over 1 min, re-equilibrate for 4 min.
Flow rate: 1
Injection volume: 150
Detector: UV 205

CHROMATOGRAM

Retention time: 6.4
Internal standard: G025 (α-methyl-5,5-dimethyl-2-oxo-1-pyrrolidine acetamide) (7.8)
Limit of quantitation: 360 ng/mL

OTHER SUBSTANCES

Noninterfering: carbamazepine, carbamazepine dihydrodiol, carbamazepine epoxide, *N*-desmethylsuximide, ethosuximide, lamotrigine, loreclezole, monohydroxycarbamazepine, phenobarbital, phenytoin, primidone, valproic acid, vigabatrin

KEY WORDS

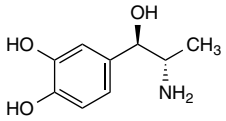
Levonordefrin



Molecular formula: $C_9H_{13}NO_3$
Molecular weight: 183.20
CAS Registry No: 829-74-3
Merck Index: 13, 6725

SAMPLE

Matrix: blood
Sample preparation: Prepare an SPE column by packing 50–100 mesh Bio-Rex 70 (Na^+) cation exchange resin (Bio-Rad) into a 40 × 10 polypropylene column and washing three times with 1 M HCl, three times with 1 M NaOH, once with 1 M pH 6.5 sodium acetate, and once with 0.01% disodium EDTA. Mix 2 mL plasma with 5 mL 0.1% disodium EDTA, 500 μL 1 M pH 6.5 sodium acetate, and 4 ng IS, add to the SPE column, wash with 10 mL water, elute with 1 mL 700 mM sulfuric acid and 3.5 mL 2 M ammonium sulfate containing 0.1% disodium EDTA. Adjust the pH of the eluate to 8.6 with 3 mL 1 M pH 8.6 Tris-HCl buffer containing 2% disodium EDTA, add 100 mg activated alumina, shake for 3 min. Centrifuge, discard the liquid, wash the alumina three times with 10 mL distilled water. Centrifuge to remove excess water, elute with 200 μL 300 mM perchloric acid, inject a 50–100 μL aliquot of the eluate.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Spherisorb ODS2
Mobile phase: 100 mM pH 5.0 sodium dihydrogen phosphate containing 2 mM sodium heptanesulfonate and 0.001% disodium EDTA
Flow rate: 1.5
Injection volume: 50–100
Detector: E, Bioanalytical Systems LC-4A, glassy carbon electrode +0.50 V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 12
Internal standard: 3,4-dihydroxybenzylamine (20)
Limit of detection: 50 pg/mL

OTHER SUBSTANCES

Extracted: epinephrine (14), norepinephrine (6)

KEY WORDS

human; plasma; rabbit; SPE

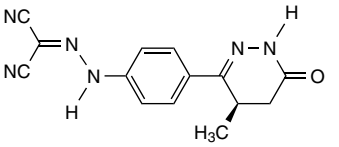
Levosimendan



Molecular formula: $C_{14}H_{12}N_6O$
Molecular weight: 280.28
CAS Registry No: 141505-33-1
Merck Index: 13, 5491

SAMPLE

Matrix: blood

Sample preparation: Mix 500 μL plasma with 25 μL 1.5 μg/mL IS in 50 mM pH 7.2 phosphate buffer. Using a Cuprophan cellulose membrane (cut-off 15 kDa) dialyze a 370 μL aliquot against 18 mL 40 mM pH 4.0 ammonium acetate buffer. Pump the buffer through a 650 μL recipient channel over 18 min and allow it to flow through column A. At the end of this time, backflush the contents of column A onto column B with the mobile phase, monitor the effluent from column B. (ASTED system. After use, flush the donor side with 10 mL 0.05% Triton X-100 in 0.86% NaCl solution. Flush the recipient side with 4 mL 40 mM pH 4.0 ammonium acetate buffer. Regenerate column A with 1 mL 40 mM pH 4.0 ammonium acetate buffer.)

HPLC VARIABLES

Column: A 5.8 × 4.6 10 μm Hypersil ODS; B 250 × 4 10 μm LiChrosorb RP-18
Mobile phase: MeOH:THF:32 mM sodium dihydrogen phosphate 65:1:45, adjusted to apparent pH 3.5 with phosphoric acid
Flow rate: 1
Detector: UV 380

CHROMATOGRAM

Retention time: 6.4
Internal standard: OR-1097 ([[4-(1,4,5,6-tetrahydro-6-oxo-3-pyridazinyl)phenyl]hydrazono]propanedinitrile) (5.4)
Limit of detection: 5 ng/mL (S/N = 3)

OTHER SUBSTANCES

Interfering: carbamazepine

Merck Index: 13, 5526

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg C2 SPE cartridge (Varian) with two 1 mL portions of MeCN and two 1 mL portions of water. Mix 50 μL plasma with 25 μL water and 1 mL 100 ng/mL IS in water, add to the SPE cartridge, wash with 1 mL MeCN:water 5:95, elute with 500 μL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Zorbax RXC8
Mobile phase: MeCN:water 20:80
Flow rate: 1
Injection volume: 100
Detector: UV 251

CHROMATOGRAM

Retention time: 11
Internal standard: PNU-101145 ((*S*)-*N*-[[3-[3-fluoro-4-[4-[(1-hydroxycyclopropyl)carbonyl]-1-piperazinyl]phenyl]- 2-oxo-5-oxazolidinyl]methyl]-acetamide) (9)
Limit of detection: 10 ng/mL

KEY WORDS

dog; mouse; plasma; rabbit; rat; SPE

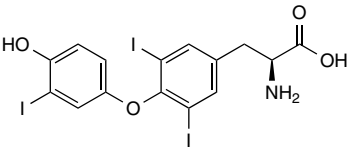
Liothyronine



Molecular formula: $C_{15}H_{12}I_3NO_4$
Molecular weight: 650.97
CAS Registry No: 6893-02-3
Merck Index: 13, 5532

SAMPLE

Matrix: blood, urine
Sample preparation: Condition a diol SPE cartridge with 3 mL MeOH and 3 mL water. Serum. Vortex 40 μL serum with 50 μL MeCN, dilute with 200 μL water, centrifuge at 3500 rpm for 15 min, remove organic solvents under a stream of nitrogen at 45°, add to the SPE cartridge, elute with 3 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 200 μL 1 μg/mL IS in water, inject a 20 μL aliquot. Urine. Add 100 μL urine to the SPE cartridge, elute with 3 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 200 μL 1 μg/mL IS in water, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.0 5 μm Inertsil ODS-3
Mobile phase: MeOH:2% acetic acid 65:35
Flow rate: 1
Injection volume: 20
Detector: UV 240

CHROMATOGRAM

Retention time: 3
Internal standard: anthraquinone (10.4)
Limit of detection: 1 ng

OTHER SUBSTANCES

Extracted: levothyroxine (LOD 2 ng) (4.7)

KEY WORDS

serum; SPE

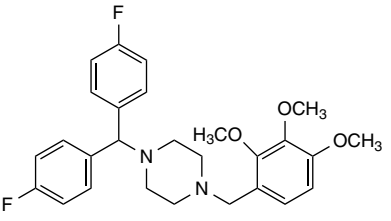
Lomerizine



Molecular formula: $C_{27}H_{30}F_2N_2O_3$
Molecular weight: 468.53
CAS Registry No: 101477-55-8, 101477-54-7 (di HCl)
Merck Index: 13, 5584

SAMPLE

Matrix: blood, tissue

Sample preparation: Plasma. Mix 100 μL plasma with 10 μL 1 μg/mL IS in MeOH and 90 μL MeOH, add 200 μL 2 M NaOH, shake for 5 min, vortex with 750 μL *n*-hexane, centrifuge at 1500 g for 5 min, repeat the extraction of the aqueous layer. Evaporate the combined extracts to dryness under a stream of nitrogen, reconstitute the residue with 2 mL MeOH:1 M HCl 90:10, add to a 5 × 5 44–88 μm SP-Toyopearl SPE column, wash with 1 mL MeOH:water 90:10, elute with 1 mL MeOH:1 M ammonia solution 90:10. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 50 μL MeCN:20 mM pH 5.5 phosphate buffer 70:30, inject a 5–20 μL aliquot. Tissue. Homogenize brain tissue with 320 mM sucrose, centrifuge at 1300 g for 3 min. remove the supernatant and centrifuge it at 17 000 g for 10 min to give the P2 fraction. Mix 400 μL of the P2 fraction with 20 μL 1 μg/mL IS in MeOH, add 800 μL 2 M NaOH, shake for 5 min, vortex with 3 mL *n*-hexane, centrifuge at 1500 g for 5 min, repeat the extraction of the aqueous layer. Evaporate the combined extracts to dryness under a stream of nitrogen, reconstitute the residue with 2 mL MeOH:1 M HCl 90:10, add to a 5 × 5 44–88 μm SP-Toyopearl SPE column, wash with 1 mL MeOH:water 90:10, elute with 1 mL MeOH:1 M ammonia solution 90:10. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 50 μL MeCN:20 mM pH 5.5 phosphate buffer 70:30, inject a 5–20 μL aliquot.

HPLC VARIABLES

Column: 200 × 2.1 5 μm Inertsil C8
Mobile phase: MeCN:20 mM pH 5.5 potassium phosphate buffer 69:31
Flow rate: 0.2
Injection volume: 5–20
Detector: UV 210

CHROMATOGRAM

Retention time: 7.7
Internal standard: cinnarizine (8.6)
Limit of detection: 100 pg

OTHER SUBSTANCES

Extracted: flunarizine (9.5)

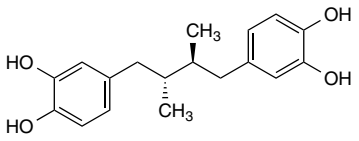
Masoprocol



Molecular formula: $C_{18}H_{22}O_4$
Molecular weight: 302.36
CAS Registry No: 500-38-9, 27686-84-6 (meso)
Merck Index: 13, 6726

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut C18 SPE cartridge with three 3 mL portions of MeOH and three 3 mL portions of water. Mix 500 μL serum with 2.5 μg IS, add to the SPE cartridge, wash with 3 mL water, elute with 300 μL 100 mM HCl in MeOH, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Adsorbosphere C18
Mobile phase: Gradient MeCN:water:trifluoroacetic acid from 30:70:0.1 to 70:30:0.1 over 15 min, maintain at 70:30:0.1 for 15 min.
Flow rate: 1.5
Injection volume: 100
Detector: UV (wavelength not specified)

CHROMATOGRAM

Retention time: 8
Internal standard: tetra-*O*-methylnordihydroguaiaretic acid (Prepare IS by dissolving 1 equiv masoprocol and 6 equiv potassium carbonate in acetone, add 4 equiv dimethyl sulfate (Caution! Dimethyl sulfate is highly toxic, particularly upon inhalation, and a carcinogen! Perform the reaction in a chemical fume hood!), reflux for 8 h, add 6 equiv 1 M HCl, evaporate the acetone under reduced pressure, extract three times with 100 mL portions of ethyl acetate. Combine the organic layers, wash three times with 100 mL portions of 100 mM HCl, wash three times with 100 mL portions of 1 M NaCl, evaporate the organic layer to dryness, recrystallize the product from dichloromethane.) (20)
Limit of detection: 500 ng/mL

KEY WORDS

mouse; pharmacokinetics; plasma; SPE

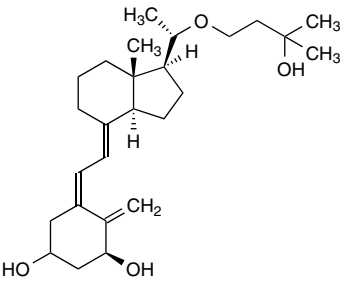
Maxacalcitol



Molecular formula: $C_{29}H_{42}O_4$
Molecular weight: 418.61
CAS Registry No: 103909-75-7
Merck Index: 13, 5783

SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL 200 mg Bond Elut C18 SPE cartridge with 3 mL MeOH:water 80:20, 2 mL water, and 2 mL 1 M HCl. Condition a 1 mL 100 mg Bond Elut NH2 SPE cartridge with 1 mL hexane:isopropanol 70:30 and 1 mL hexane:isopropanol 90:10. Mix 20 μL 16 ng/mL IS in EtOH with 1 mL serum, add 200 μL 1 M HCl, mix, add to the C18 SPE cartridge, wash with 2 mL water, wash with 3 mL MeOH:water 50:50, elute with 4 mL MeOH:water 80:20. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 100 μL hexane:isopropanol 90:10, add to the NH2 SPE cartridge, wash with 1 mL hexane:isopropanol 90:10, elute with 2 mL hexane:isopropanol 70:30. Evaporate the eluate to dryness, reconstitute the residue with 50 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 2 5 μm Capcell Pak C18 UG120
Mobile phase: MeOH:10 mM ammonium acetate 90:10
Flow rate: 0.2
Injection volume: 20
Detector: MS, Finnigan TSQ-700 triple quadrupole, electrospray 4.5 kV, positive ion, tube lens 120 V, collision gas argon 2.0 mtorr, collision energy -20 eV, (m/z 436–297)

CHROMATOGRAM

Retention time: 4.5
Internal standard: ED-94 ((5Z,7E,20S)-20α-(2-hydroxy-2-methylpropoxy)-9,10-seco-pregna-5,7,10(19)-trien-1α,3β-diol) (m/z 422–297) (4.5)
Limit of quantitation: 20 pg/mL

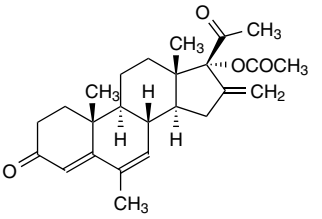
Melengestrol acetate



Molecular formula: $C_{25}H_{32}O_4$
Molecular weight: 396.52
CAS Registry No: 2919-66-6, 5633-18-1 (melengestrol only)
Merck Index: 13, 5840

SAMPLE

Matrix: tissue

Sample preparation: Condition a 3 mL 500 mg CN SPE cartridge with 3 mL ethyl acetate and 5 mL hexane. Cut about 10 g partially thawed fat into small pieces, place in a glass funnel with the outlet covered by glass wool, heat the fat in a microwave oven at high power for 2 or 3 min, collect the rendered fat in a beaker. Add 5 mL MeCN to 2 g liquid fat, heat at 60°, shake for 5 min on a reciprocating shaker at high speed, cool in an ice bath for 5 min, centrifuge at 3000 g for 5 min, decant the acetonitrile extract, repeat the extraction procedure, combine the extracts. Add 3 mL hexane to the combined extracts, vortex for 30 s, centrifuge at 1800 g for 5 min, discard the hexane, repeat the hexane wash. Dry the MeCN layer under a stream of nitrogen at 60°, dissolve the residue in 4 mL hexane, add 1 mL 100 mM NaOH, add 500 μL 1 M magnesium chloride, shake for 30 s, heat at 60° for 15 min, centrifuge at 1800 g for 5 min. Remove the hexane, add 4 mL hexane to the residue, shake for 30 s, centrifuge at 1800 g for 5 min. Combine the hexane extracts and evaporate to dryness under a stream of nitrogen at 60° (to remove any water), reconstitute with 1 mL hexane. Add the sample to the SPE cartridge, wash with 5 mL hexane, wash with 6 mL ethyl acetate:hexane 5:95, elute with three 1 mL and one 500 μL portions of ethyl acetate:hexane 20:80. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 1 mL MeCN:water 70:30, add 10 μL 10% HCl, shake, filter (0.22 μm), inject a 40 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm C18 end-capped with 20% carbon load
Column: 250 × 4.6 5 μm C18 end-capped with 20% carbon load
Mobile phase: MeCN:water 70:30
Flow rate: 1
Injection volume: 40
Detector: UV 291

CHROMATOGRAM

Retention time: 9.32
Limit of detection: 3 ppb
Limit of quantitation: 10 ppb

OTHER SUBSTANCES

Extracted: chlormadinone (8.57), megestrol (8.92)

KEY WORDS

cow; fat; pig; SPE

REFERENCE

SAMPLE

Matrix: tissue

Sample preparation: Condition a 100 mg C18 SPE cartridge (Varian) with MeOH and 10 mM pH 8.5 Tris buffer. Fill a 22 mL vessel (from bottom to top) with 5 g alumina (dried at 120° for 48 h before use), 6 g anhydrous sodium sulfate, and 2 g melted (microwave) kidney fat. There is filter paper between the alumina and sodium sulfate. Pass hexane down through the layers at 60° at 1500 psi followed by MeCN at 50° at 1500 psi. Store the MeCN at −20° for 30 min to precipitate fat, filter through a plug of glass wool, evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 2 mL MeOH, mix with 5 mL water, add to the SPE cartridge, wash with 2 mL 20 mM pH 8.5 Tris buffer, wash with 2 mL MeOH:water 40:60, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 75 μL MeCN, add 75 μL 0.5% formic acid, mix, inject a 75 μL aliquot. (The extraction is done in a Dionex ASE system (advanced solvent extraction).)

HPLC VARIABLES

Column: 150 × 3 5 μm Symmetry (Waters)
Column temperature: 40
Mobile phase: Gradient. A:B from 45:55 to 100:0 over 12 min. A was MeCN:water:formic acid 10:90:0.5. B was MeCN:water:formic acid 90:10:0.5.
Flow rate: 0.4
Injection volume: 75
Detector: MS, Micromass Quattro Ultima, positive electrospray, capillary 2.5 kV, cone 40 V, source 120°, cone gas 189 L/h, desolvation gas 652 L/h, m/z 397.2–279.3–279.3

CHROMATOGRAM

Retention time: 8.8
Limit of detection: <2 ng/g

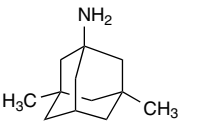
Memantine



Molecular formula: $C_{12}H_{21}N$
Molecular weight: 179.30
CAS Registry No: 19982-08-2
Merck Index: 13, 5851

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL plasma with 50 μL 1 μg/mL IS in 10 mM HCl, 1 mL 1 M NaOH, and 4 mL *n*-heptane:isoamyl alcohol 98.5:1.5 on a rocking platform at low speed for 10 min, centrifuge at 1500 g for 10 min. Add the organic supernatant to 150 μL 100 mM HCl, mix at moderate speed for 10 min, centrifuge at 1500 g for 10 min. Evaporate the aqueous layer to dryness under reduced pressure at 45° for 1 h, reconstitute the residue with 50 μL 1 M pH 10.3 carbonate buffer, add 25 μL 1% dansyl chloride in MeCN, vortex, let stand at room temperature for 45 min. Evaporate to dryness under reduced pressure at 45° for 30 min, reconstitute the residue with 125 μL MeCN:water 75:25, vortex briefly, centrifuge for 3–5 min, inject a 40 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-18

Mobile phase: MeCN:buffer 73:27 (Prepare mobile phase by mixing 730 mL MeCN, 270 mL 25 mM potassium dihydrogen phosphate, 500 μL orthophosphoric acid, and 600 μL *n*-butylamine.)

Flow rate: 1.8

Injection volume: 40

Detector: F ex 235 em 470

CHROMATOGRAM

Retention time: 12.1

Internal standard: amantadine (7.6)

Limit of quantitation: 3 ng/mL (S/N 20)

OTHER SUBSTANCES

Extracted: amoxapine (13.72), *m*-chlorophenylpiperazine (8.21), clovoxamine (8.45), desipramine (14.54), desmethylcitalopram (6.68), desmethylclomipramine (20.05), desmethyldoxepin (10.55), desmethylmaprotiline (9.56), desmethylmianserin (12.87), desmethylsertraline (15.41), desmethyltrimipramine (19.06), fenfluramine (10.02), fluoxetine (12.94), fluvoxamine (8.36), *trans*-10-hydroxynortriptyline (5.48), *cis*-10-hydroxynortriptyline (6.18), maprotiline (15.67), norclozapine (8.35), norfenfluramine (5.32), norfluoxetine (8.50), nortriptyline (17.45), paroxetine (10.15), propranolol (7.11), protriptyline (14.59), rimantadine (13.48), sertraline (31.70)

Noninterfering: amitriptyline, bupropion, citalopram, clomipramine, clozapine, doxepin, haloperidol, 2-hydroxydesipramine, 2-hydroxyimipramine, imipramine, loxapine, moclobemide, olanzapine, risperidone

KEY WORDS

derivatization; plasma

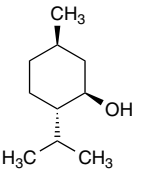
Menthol



Molecular formula: $C_{10}H_{20}O$
Molecular weight: 156.26
CAS Registry No: 89-78-1
Merck Index: 13, 5861

SAMPLE

Matrix: blood

Sample preparation: Heat 5 μL serum, 45 μL water, and 200 mM NaOH in EtOH:water 95:5 at 100° for 15 min, cool, add 1 mL water, add 3 mL hexane, vortex for 2 min, centrifuge at 3000 rpm for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 20 μL acetone, add 50 μL 5 mM 4-dimethylaminopyridine in acetone, mix well, add 100 μL 20 mM 3-(2-phthalimidyl)benzoyl azide in acetone, mix well, heat at 125° in a stoppered vial for 30 min, cool in a water bath, inject a 10 μL aliquot. (Omit 4-dimethylaminopyridine for cholesterol determinations. Synthesis of 3-(2-phthalimidyl)benzoyl azide is as follows. Mix 680 mg *m*-aminobenzoic acid in 50 mL diethyl ether with 670 mg *o*-phthalaldehyde in 100 mL diethyl ether, mix, stir at room temperature for 2 days, filter to obtain 3-(2-phthalimidyl)benzoic acid as a white solid. Dissolve 500 mg 3-(2-phthalimidyl)benzoic acid in 15 mL DMF, add 560 mg diphenylphosphoryl azide in 4 mL DMF, add 200 mg triethylamine, stir at 0° for 2 h, add 60 mL 5% sodium bicarbonate in water, add 100 mL diethyl ether, shake. Wash the organic layer twice with 100 mL portions of cold water. Collect the solid at the interface and combine it with the residue obtained when the organic layer is evaporated under reduced pressure. Take up the crude product in acetone, add water to precipitate pure product, repeat this procedure twice to obtain 3-(2-phthalimidyl)benzoyl azide as white needles (mp 123–126°).)

HPLC VARIABLES

Column: 100 × 6 ERC-ODS-1161 (Erma, Tokyo)
Mobile phase: MeCN:water 70:30
Flow rate: 1
Injection volume: 10
Detector: F ex 302 em 440

CHROMATOGRAM

Retention time: 12
Limit of detection: 100–400 fmol

OTHER SUBSTANCES

Extracted: decanol (21), nonanol (14), octanol (10),

KEY WORDS

derivatization; serum; serum extraction only validated for cholesterol

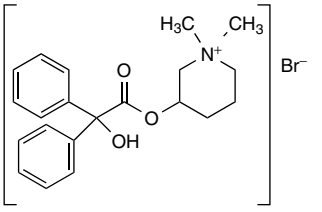
Mepenzolate bromide



Molecular formula: $C_{21}H_{26}BrNO_3$
Molecular weight: 420.35
CAS Registry No: 76-90-4
Merck Index: 13, 5873

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL diol SPE cartridge (Baker) with 2 mL MeOH and 2 mL water. Add 1 mL plasma to the SPE cartridge, wash with 2 mL water, wash with 2 mL MeOH, elute with 3 mL 60 mM KBr in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL mobile phase, inject an aliquot. (Prepare 60 mM KBr in MeOH by sonicating for 45 min.)

HPLC VARIABLES

Column: 250 × 4 LiChrosorb RP18
Mobile phase: MeOH:water 55:45 containing 4.325 g/L sodium octanesulfonate and 2 mL/L *N*,*N*-dimethyloctylamine, adjusted to pH 3.0 with phosphoric acid
Flow rate: 1
Detector: UV 220

CHROMATOGRAM

Retention time: 8

OTHER SUBSTANCES

Extracted: clidinium bromide (9.5), isopropamide iodide (5)

KEY WORDS

plasma; SPE

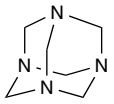
Methenamine



Molecular formula: $C_6H_{12}N_4$
Molecular weight: 140.19
CAS Registry No: 100-97-0
Merck Index: 13, 5994

SAMPLE

Matrix: air
Sample preparation: Pull air through a coated filter at 150 mL/min for 20 min, shake filter with 3 mL MeCN for 1 min, filter (Millex SR) the solution, inject a 10 μL aliquot. (Prepare filter as follows. Mix 300 mg 2,4-dinitrophenylhydrazine hydrochloride, 500 μL 85% phosphoric acid, 1.5 mL glycerol:EtOH 20:80, and 9 mL MeCN. Dip glass fiber filter in this solution for a few seconds, let dry on glass surface at room temperature for 2 h, store in a desiccator over saturated NaCl. Before use, recrystallize 2,4-dinitrophenylhydrazine hydrochloride twice from 4 M HCl. Methenamine is converted to formaldehyde on the filter and the formaldehyde 2,4-dinitrophenylhydrazone is detected by HPLC.)

HPLC VARIABLES

Column: 100 × 5 10 μm Waters Radial Pak A C18
Mobile phase: MeOH:water 40:60
Flow rate: 0.8
Injection volume: 10
Detector: UV 365

CHROMATOGRAM

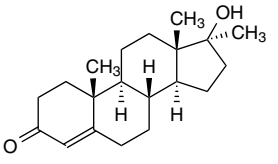
Methyltestosterone



Molecular formula: $C_{20}H_{30}O_2$
Molecular weight: 302.45
CAS Registry No: 58-18-4
Merck Index: 13, 6148

SAMPLE

Matrix: blood

Sample preparation: Condition a 1 mL 100 mg Bond Elut C1 SPE cartridge with 2 column vol of MeCN and 2 column vol of water. Mix 500 μL serum with 25 μL 1 μg/mL IS in MeCN, add 500 μL water, vortex for 5 s, add to the SPE cartridge, wash with 3 column vol of water, wash with 1 column vol of MeCN:water 20:80, air dry at high vacuum for 10 min. Elute with 1 mL hexane:chloroform 50:50 (Caution! Chloroform is a carcinogen!), evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute with 50 μL MeCN, vortex while adding 200 μL water, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 4.6 7 μm silica (Brownlee)
Column: 220 × 4.6 5 μm silica (Brownlee)
Column temperature: 50
Mobile phase: MeCN:50 mM pH 2.5 sodium phosphate buffer 21:79
Flow rate: 1
Injection volume: 50
Detector: UV 247

CHROMATOGRAM

Retention time: 5.8
Internal standard: testosterone propionate (9.1)
Limit of detection: 2 ng/mL

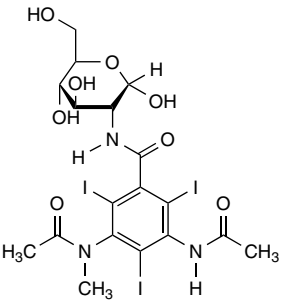
Metrizamide



Molecular formula: $C_{18}H_{22}I_3N_3O_8$
Molecular weight: 789.10
CAS Registry No: 31112-62-6
Merck Index: 13, 6176

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 50 μL 1.5 mg/mL IS and 200 μL 20% zinc sulfate in water, add 200 μL saturated aqueous barium hydroxide, mix, heat on a steam bath for 2 min, cool, centrifuge, inject a 25 μL aliquot.

HPLC VARIABLES

Guard column: 60 × 4 Corasil C18
Column: 250 × 4.6 Partisil 10 ODS
Mobile phase: MeOH:water:acetic acid 5:94.5:0.5
Flow rate: 2
Injection volume: 25
Detector: UV 244

CHROMATOGRAM

Retention time: 3.9
Internal standard: 3-dimethylaminomethyleneimino-2,4,6-triiodobenzoic acid (11.2)
Limit of detection: 720 ng/mL
Limit of quantitation: 2.5 μg/mL

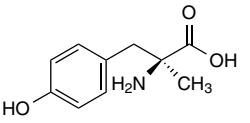
Metyrosine



Molecular formula: $C_{10}H_{13}NO_3$
Molecular weight: 195.21
CAS Registry No: 672-87-7
Merck Index: 13, 6183

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL Bond Elut SCX SPE cartridge with 2 mL MeOH and 2 mL 100 mM HCl. Vortex 1 mL serum with 20 μL 100 μg/mL IS in MeOH and 1 mL water for 2 min, add to the SPE cartridge, wash with 2 mL water, air dry for 3 min, elute with four 250 μL portions of buffer, inject a 100 μL aliquot. (The buffer was 1 M dipotassium hydrogen phosphate adjusted to pH 5.0 with 1 M phosphoric acid.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb ODS2
Mobile phase: MeCN:MeOH:buffer 5:2.5:92.5 (Prepare mobile phase by dissolving 30 mg sodium 1-heptanesulfonate hydrate, 1.379 g sodium dihydrogen phosphate monohydrate, 2.5 mL MeOH, and 5 mL MeCN in 100 mL water. Adjust pH to 3.0 with 100 mM phosphoric acid.)
Flow rate: 1
Injection volume: 100
Detector: F ex 282 em 370

CHROMATOGRAM

Retention time: 10.4
Internal standard: dopamine hydrochloride (8.9)
Limit of detection: 1 μg/mL

OTHER SUBSTANCES

Extracted: methyldopa (LOD 100 ng/mL) (6.2)

KEY WORDS

cow; serum; SPE

SAMPLE

Matrix: solutions
Sample preparation: Prepare metyrosine methyl esters by treatment of racemic metyrosine with absolute MeOH and concentrated sulfuric acid (*J.Am.Chem.Soc.* **1978**, 100, 6536). Dissolve 5 mg of the racemic metyrosine methyl esters in 5 mL MeCN:water 50:50 containing 0.5% v/v triethylamine. Heat a 50 μL aliquot of this solution at 45° for 15 min, add 10 μL 0.5% w/v 2,3,4,6-tetra-*O*-acetyl-β-D-glucopyranosyl isothiocyanate in MeCN, heat at 45° for 2 h, add 10 μL 0.5% v/v hydrazine in MeCN (Caution! Hydrazine is carcinogenic and toxic!), heat at 45° for 15 min. Evaporate the mixture under a stream of nitrogen, reconstitute the residue with 250 μL mobile phase, inject a 100 μL aliquot. (Prepare 2,3,4,6-tetra-*O*-acetyl-β-D-glucopyranosyl isothiocyanate solution and hydrazine solution fresh each day.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb ODS
Mobile phase: MeCN:water 35:65 containing 0.1% triethylamine, adjusted to pH 4.0 with trifluoroacetic acid
Flow rate: 1
Injection volume: 100
Detector: UV 250

CHROMATOGRAM

Retention time: 7.32 (L), 8.73 (D)

KEY WORDS

chiral; derivatization

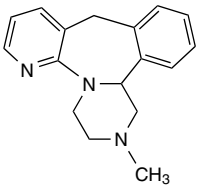
Mirtazapine



Molecular formula: $C_{17}H_{19}N_3$
Molecular weight: 265.35
CAS Registry No: 61337-67-5
Merck Index: 13, 6230

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL whole blood with 20 μL 1 μg/mL dibenzepin in MeOH:water 50:50, add 300 μL pH 11 Tris buffer, mix, add 500 μL butyl acetate, vortex for 2 min, centrifuge. Preserve the aqueous layer (A). Remove the organic layer and add it to 75 μL 10 mM ammonium acetate buffer containing 0.1% formic acid (pH 3.2), evaporate (?). Add 75 μL MeCN, sonicate for 5 min, centrifuge at 5000 rpm for 5 min, keep the extract as B. Add 20 μL 1 μg/mL enalapril in MeOH:water 50:50 and 120 mg NaCl to the aqueous layer (A), mix, add 500 μL pH 3 phosphate buffer, add 600 μL 8.5% phosphoric acid, add 5 mL dichloromethane:isopropanol 95:5, shake at 250 cycles/min in a bench-top shaker for 30 min, centrifuge at 5000 rpm for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 45°. Reconstitute the residue with 150 μL initial mobile phase, sonicate, centrifuge, combine with extract B, inject a 30 μL aliquot. (Sample preparation from Gergov,M.; Robson,J.N.; Ojanperä,I.; Heinonen,O.P.; Vuori,E. SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL 130 mg Bond Elut Certify SPE cartridge with 3 mL MeOH, 3 mL water, and 1 mL 100 mM pH 6.0 potassium phosphate buffer. Vortex 1 mL plasma, 2 mL 100 mM pH 6.0 potassium phosphate buffer, and 100 μL 1 μg/mL IS in EtOH, add to the SPE cartridge, wash with 3 mL water, wash with 1 mL 1 M acetic acid, wash with 3 mL MeOH, draw air through the column for 5 min, elute with 3 mL dichloromethane:isopropanol:ammonium hydroxide 78:20:2. Evaporate the eluate to dryness under a stream of air at 55°, reconstitute the residue with 120 μL mobile phase, inject a 80 μL aliquot.

HPLC VARIABLES

Guard column: 25 × 4.6 10 μm Chiralpak AD
Column: 50 × 4.6 10 μm Chiralpak AD
Mobile phase: Hexane:EtOH:isopropanol 98:1:1
Flow rate: 1.5
Injection volume: 80
Detector: UV 290

CHROMATOGRAM

Retention time: 12.5 (+), 15.0 (–)

Internal standard: imipramine (3.8)
Limit of quantitation: 10 ng/mL

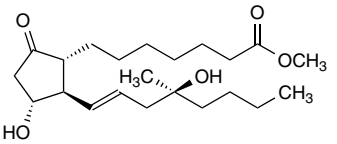
Misoprostol



Molecular formula: $C_{22}H_{38}O_5$
Molecular weight: 382.53
CAS Registry No: 59122-46-2
Merck Index: 13, 6232

SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL plasma with 200 μL 100 ppm 2-naphthoic acid and 300 μL MeCN, shake well, centrifuge for 10 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax C8
Mobile phase: MeCN:MeOH:20 mM pH 3.0 potassium phosphate buffer 30:24:46
Flow rate: 1.7
Injection volume: 20
Detector: UV 210; Radioactivity (^{3}H)

CHROMATOGRAM

Retention time: 18.5 (diastereomers not resolved)
Internal standard: 2-naphthoic acid (6)
Limit of quantitation: LOQ 1 μg (UV), 12 pg (radioactivity detector)

OTHER SUBSTANCES

Extracted: iloprost (LOQ 500 ng (UV), 42 pg (radioactivity detector)) (14.7, 15.9 (diastereomers))

KEY WORDS

plasma; rat

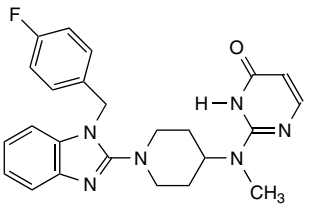
Mizolastine



Molecular formula: $C_{24}H_{25}FN_6O$
Molecular weight: 432.49
CAS Registry No: 108612-45-9
Merck Index: 13, 6242

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL whole blood with 20 μL 1 μg/mL dibenzepin in MeOH:water 50:50, add 300 μL pH 11 Tris buffer, mix, add 500 μL butyl acetate, vortex for 2 min, centrifuge. Preserve the aqueous layer (A). Remove the organic layer and add it to 75 μL 10 mM ammonium acetate buffer containing 0.1% formic acid (pH 3.2), evaporate (?). Add 75 μL MeCN, sonicate for 5 min, centrifuge at 5000 rpm for 5 min, keep the extract as B. Add 20 μL 1 μg/mL enalapril in MeOH:water 50:50 and 120 mg NaCl to the aqueous layer (A), mix, add 500 μL pH 3 phosphate buffer, add 600 μL 8.5% phosphoric acid, add 5 mL dichloromethane:isopropanol 95:5, shake at 250 cycles/min in a bench-top shaker for 30 min, centrifuge at 5000 rpm for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 45°. Reconstitute the residue with 150 μL initial mobile phase, sonicate, centrifuge, combine with extract B, inject a 30 μL aliquot. (Sample preparation from Gergov,M.; Robson,J.N.; Ojanperä,I.; Heinonen,O.P.; Vuori,E. Simultaneous screening and quantitation of 18 antihistamine drugs in blood by liquid chromatography ionspray tandem mass spectrometry. *Forensic Sci.Inter.* **2001**, *121*, 108–115.)

HPLC VARIABLES

Guard column: 40 mm long 4 μm Purospher RP-18 LiChro Cart 4-4
Column: 100 × 2.1 4 μm Genesis C18 (Jones Chromatography)
Column temperature: 35
Mobile phase: Gradient. MeCN:buffer from 20:80 to 100:0 over 10 min, maintain at 0:100 for 3 min, re-equilibrate at initial conditions for 5 min. (The buffer was 10 mM ammonium acetate containing 0.1% formic acid (pH 3.2).)
Flow rate: 0.2
Injection volume: 30
Detector: MS, PE Sciex API 365 triple-stage quadrupole LC-MS-MS, PE Sciex Turbo Ion Spray interface, positive ion mode, needle voltage 5.2 kV, nebulizer gas air at 60 psi, curtain gas nitrogen at 40 psi, collision cell gas nitrogen at 40 psi, turbo ionspray heater 375°, heater gas flow 7 L/min

CHROMATOGRAM

Retention time: 5.5
Internal standard: dibenzepin, enalapril
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Extracted: acebutolol (3.8, LOD 0.1 μg/mL), acrivastine (5.7, LOD <0.02 μg/mL), alprazolam (6.1, LOD <0.02 μg/mL), alprenolol (5.4, LOD 0.01 μg/mL), amantadine (3.4, LOD 0.1 μg/mL), amiloride (2.0, LOD 0.1 μg/mL), aminophenazone (2.8, LOD <5 μg/mL), amiodarone (10.2, LOD 0.05 μg/mL), amitriptyline (6.6, LOD <0.02 μg/mL), astemizole (5.8, LOD <0.02 μg/mL), atenolol (1.7, LOD 0.30 μg/mL), azacyclonol (5.1, LOD 0.02 μg/mL), benzhexol (6.6, LOD <0.02 μg/mL), benzoylecgonine (3.3, LOD 0.01 μg/mL), betaxolol (5.5, LOD 0.01 μg/mL), biperidine (6.2, LOD <0.02 μg/mL), bisoprolol (5.0, LOD <0.02 μg/mL), brompheniramine (5.3, LOD 0.002 μg/mL), bupivacaine (5.1, LOD <0.02 μg/mL), buprenorphine (5.9, LOD 0.01 μg/mL), buspirone (5.1, LOD 0.002 μg/mL), caffeine (2.8, LOD 1 μg/mL), carbamazepine

(6.1, LOD <0.02 μg/mL), carbinoxamine (5.1, LOD 0.002 μg/mL), carisoprodol (6.7, LOD <5 μg/mL), carvedilol (6.2, LOD <0.02 μg/mL), celiprolol (4.3, LOD 0.05 μg/mL), cetirizine (6.3, LOD 0.05 μg/mL), chlorcyclizine (6.6, LOD <0.02 μg/mL), chlordiazepoxide (5.7, LOD <0.02 μg/mL), chlormezanone (5.8, LOD <5 μg/mL), chloroquine (2.7, LOD 0.02 μg/mL), chlorpheniramine (5.1, LOD 0.002 μg/mL), chlorpromazine (7.0, LOD 0.02 μg/mL), chlorpropamide (6.7, LOD <5 μg/mL), chlorprothixene (7.0, LOD <0.02 μg/mL), cinnarizine (7.9, LOD <0.02 μg/mL), citalopram (5.7, LOD <0.02 μg/mL), clemastine (7.7, LOD 0.02 μg/mL), clobazam (7.3, LOD <0.02 μg/mL), clobutinol (5.3, LOD 0.02 μg/mL), clomethiazole (6.2, LOD 0.5 μg/mL), clomipramine (7.1, LOD <0.02 μg/mL), clonazepam (6.6, LOD <0.02 μg/mL), clonidine (2.8, LOD 0.1 μg/mL), clozapine (5.6, LOD <0.02 μg/mL), cocaine (4.6, LOD <0.02 μg/mL), codeine (2.5, LOD 0.1 μg/mL), coumatetralyl (8.4, LOD 0.05 μg/mL), cyclizine (5.8, LOD <0.02 μg/mL), dextropropoxyphene (6.6, LOD 0.05 μg/mL), demoxepam (5.8, LOD 0.02 μg/mL), dextromethorphan (5.5, LOD <0.02 μg/mL), diazepam (8.1, LOD 0.02 μg/mL), diltiazem (5.8, LOD <0.02 μg/mL), diphenhydramine (5.7, LOD <0.02 μg/mL), dipyridamole (5.4, LOD 0.005 μg/mL), disopyramine (4.4, LOD <0.02 μg/mL), dixyrazine (6.8, LOD 0.005 μg/mL), doxapram (4.8, LOD <0.02 μg/mL), doxepin (5.9, LOD <0.02 μg/mL), ebastine (9.6, LOD 0.005 μg/mL), embutramide (6.7, LOD 0.005 μg/mL), ergotamine (5.5, LOD 0.005 μg/mL), ethenzamide (5.0, LOD 0.05 μg/mL), ethylmorphine (3.2, LOD 0.05 μg/mL), ethylparathion (9.7, LOD <5 μg/mL), etodroxizine (6.4, LOD <0.02 μg/mL), felodipine (9.6, LOD 0.02 μg/mL), fenazepam (7.5, LOD <0.02 μg/mL), fenfluramine (5.3, LOD <0.02 μg/mL), fenkamfamine (5.1, LOD <0.02 μg/mL), fentanyl (5.5, LOD <0.02 μg/mL), fexofenadine (6.3, LOD <0.02 μg/mL), flecainide (5.9, LOD <0.02 μg/mL), fluconazole (4.0, LOD 0.1 μg/mL), flumazenil (5.2, LOD <0.02 μg/mL), flunitrazepam (7.1, LOD 0.002 μg/mL), fluoxetine (6.8, LOD 0.1 μg/mL), flupentixol (7.5, LOD 0.18 μg/mL), fluvoxamine (6.3, LOD 0.02 μg/mL), glibenclamide (8.5, LOD <0.02 μg/mL), glipizide (6.8, LOD <0.05 μg/mL), haloperidol (6.1, LOD <0.02 μg/mL), histapyrrodine (6.3, LOD 0.02 μg/mL), hydrocodone (3.0, LOD 0.05 μg/mL), hydroxychloroquine (2.4, LOD <0.3 μg/mL), hydroxyzine (6.3, LOD <0.02 μg/mL), imipramine (6.4, LOD 0.05 μg/mL), indomethacin (8.6, LOD 0.05 μg/mL), isoniazid (2.2, LOD 3 μg/mL), isradipine (8.6, LOD 0.05 μg/mL), ketamine (3.6, LOD <0.05 μg/mL), ketobemidone (3.3, LOD <0.05 μg/mL), ketoprofen (7.3, LOD 0.1 μg/mL), ketorolac (6.2, LOD 0.05 μg/mL), labetalol (4.9, LOD 0.05 μg/mL), lamotrigine (4.0, LOD 0.1 μg/mL), levocabastine (5.8, LOD 0.01 μg/mL), levomepromazine (6.5, LOD 0.02 μg/mL), lidocaine (3.7, LOD <0.05 μg/mL), loratadine (9.3, LOD 0.002 μg/mL), lorazepam (6.6, LOD 0.02 μg/mL), lormetazepam (7.4, LOD <0.02 μg/mL), LSD (4.7, LOD <0.02 μg/mL), malathion (8.9, LOD 10 μg/mL), maprotiline (6.4, LOD <0.02 μg/mL), MDMA (3.3, LOD 0.02 μg/mL), meclozine (8.5, LOD <0.02 μg/mL), medazepam (6.3, LOD <0.02 μg/mL), meloxicam (7.1, LOD 0.01 μg/mL), melperone (5.0, LOD <0.02 μg/mL), meperidine (4.7, LOD <0.02 μg/mL), mepivacaine (3.7, LOD <0.02 μg/mL), meprobamate (4.9, LOD 0.1 μg/mL), mesoridazine (5.4, LOD <0.02 μg/mL), methamphetamine (3.3, LOD 0.05 μg/mL), methadone (6.7, LOD <0.02 μg/mL), methylparathion (8.6, LOD 10 μg/mL), methylphenidate (4.2, LOD <0.02 μg/mL), metoclopramide (3.8, LOD <0.02 μg/mL), metoprolol (4.1, LOD 0.02 μg/mL), metronidazole (2.6, LOD 1 μg/mL), mexiletine (4.4, LOD 0.05 μg/mL), mianserin (5.7, LOD <0.02 μg/mL), midazolam (5.9, LOD <0.02 μg/mL), mirtazapine (4.4, LOD <0.02 μg/mL), moclobemide (3.7, LOD 0.05 μg/mL), molindone (4.0, LOD <0.02 μg/mL), monoacetylmorphine (2.7, LOD 0.1 μg/mL), morphine (2.0, LOD 0.1 μg/mL), nicotine (2.2, LOD 0.05 μg/mL), nifedipine (7.5, LOD 0.02 μg/mL), nikethamide (3.6, LOD <0.02 μg/mL), nitrazepam (6.5, LOD <0.02 μg/mL), nizatidine (1.7, LOD 1 μg/mL), nomifensine (4.6, LOD <0.02 μg/mL), nortriptyline (6.4, LOD <0.02 μg/mL), norverapamil (6.2, LOD 1 μg/mL), noscapine (5.0, LOD <0.02 μg/mL), olanzapine (3.0, LOD 0.05 μg/mL), ondansetron (4.6, LOD <0.02 μg/mL), orphenadrine (6.1, LOD <0.02 μg/mL), oxazepam (6.3, LOD <0.02 μg/mL), oxcarbazepine (5.3, LOD 0.02 μg/mL), oxprenolol (4.7, LOD 0.02 μg/mL), oxycodone (2.8, LOD 0.05 μg/mL), papaverine (4.8, LOD <0.02 μg/mL), acetaminophen (2.5, LOD <5 μg/mL), paroxetine (6.2, LOD 0.02 μg/mL), pemoline (3.3, LOD 0.05 μg/mL), pentazocine (5.0, LOD <0.02 μg/mL), pentifylline (7.3, LOD <5 μg/mL), pentoxyverine (6.6, LOD <0.02 μg/mL), perphenazine (6.9, LOD 0.002 μg/mL), phenazone (3.9, LOD 0.05 μg/mL), phencyclidine (5.3, LOD 0.05 μg/mL), pheniramine

(4.1, LOD 0.02 μg/mL), phenylbutazone (9.0, LOD <5 μg/mL), phenylpropanolamine (2.5, LOD 0.3 μg/mL), phenytoin (6.1, LOD 0.05 μg/mL), pindolol (3.3, LOD 0.05 μg/mL), piroxicam (6.6, LOD 0.02 μg/mL), pitofenone (5.4, LOD <0.02 μg/mL), pizotifen (6.5, LOD <0.02 μg/mL), practolol (1.8, LOD 0.1 μg/mL), prazosin (4.1, LOD 0.05 μg/mL), prilocaine (3.8, LOD <0.02 μg/mL), primidone (4.0, LOD <5 μg/mL), procainamide (2.2, LOD 0.05 μg/mL), prochlorperazine (7.5, LOD 0.02 μg/mL), promazine (6.2, LOD <0.02 μg/mL), promethazine (6.0, LOD 0.05 μg/mL), propafenone (6.3, LOD <0.02 μg/mL), propranolol (5.4, LOD 0.02 μg/mL), propyphenazone (6.6, LOD 0.50 μg/mL), pseudoephedrine (2.6, LOD 1 μg/mL), quinine (4.2, LOD 0.02 μg/mL), ranitidine (1.8, LOD 0.1 μg/mL), risperidone (4.9, LOD <0.02 μg/mL), rocurone (3.8, LOD 0.1 μg/mL), ropivacaine (4.6, LOD <0.02 μg/mL), salicylamide (4.2, LOD <5 μg/mL), selegiline (4.1, LOD 0.05 μg/mL), sertindole (7.2, LOD <0.02 μg/mL), sertraline (6.8, LOD 0.02 μg/mL), sulindac (6.5, LOD 0.02 μg/mL), simazine (6.0, LOD 0.1 μg/mL), sincocaine (6.5, LOD <0.02 μg/mL), sisapride (5.9, LOD <0.02 μg/mL), sotalol (2.1, LOD 0.1 μg/mL), strychnine (5.3, LOD 0.05 μg/mL), sulpiride (1.9, LOD 0.1 μg/mL), sulthiame (4.1, LOD 0.05 μg/mL), temazepam (7.2, LOD <0.02 μg/mL), terbutaline (2.3, LOD 0.1 μg/mL), terfenadine (8.1, LOD 0.002 μg/mL), terodiline (6.7, LOD <0.02 μg/mL), tetracaine (5.7, LOD <0.02 μg/mL), dronabinol (12.3, LOD 0.05 μg/mL), tetrahydrozoline (3.6, LOD 0.1 μg/mL), theobromine (2.3, LOD <5 μg/mL), theophylline (2.4, LOD <5 μg/mL), thioridazine (7.5, LOD 0.02 μg/mL), timolol (3.8, LOD 0.05 μg/mL), thiothixene (6.7, LOD 0.02 μg/mL), tolbutamide (7.1, LOD <5 μg/mL), toremifene (8.7, LOD 0.02 μg/mL), tramadol (4.2, LOD 0.02 μg/mL), trazodone (5.2, LOD <0.02 μg/mL), triamterene (3.2, LOD 0.1 μg/mL), triazolam (6.7, LOD 0.002 μg/mL), trimeprazine (6.4, LOD <0.02 μg/mL), trimethoprim (3.1, LOD 0.05 μg/mL), trimipramine (6.7, LOD <0.02 μg/mL), venlafaxine (4.9, LOD 0.02 μg/mL), verapamil (6.5, LOD <0.02 μg/mL), warfarin (7.9, LOD <0.02 μg/mL), yohimbine (4.5, LOD <0.02 μg/mL), zolpidem (4.7, LOD <0.02 μg/mL), zopiclone (4.0, LOD 0.1 μg/mL)

SAMPLE

Matrix: blood

Sample preparation: Mix 1 g plasma with 20 μL 15 μg/mL IS in MeOH, add 200 μL MeCN, vortex, centrifuge at 11 000 g for 4 min, inject a 200 μL aliquot onto column A and elute to waste with mobile phase A; after 2 min, backflush the contents of column A onto column B with mobile phase B; after 1.5 min, remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Backflush column A with MeCN:water 50:50, MeCN, MeOH:water 50:50, re-equilibrate with mobile phase A.

HPLC VARIABLES

Column: A 75 × 2.1 30–40 μm Perisorb C18; B 20 × 4.6 40 μm Pelliguard C18 (Supelchem) + 150 × 4.6 5 μm Hypersil BDS C8

Mobile phase: A MeCN:water 10:90; B MeCN:25 mM pH 4.5 phosphate buffer 40:60

Flow rate: 1

Injection volume: 200

Detector: UV 285

CHROMATOGRAM

Retention time: 6.6

Internal standard: SL 86.0116 (chloro analogue of mizolastine) (8.2)

Limit of quantitation: 2.5 ng/mL

KEY WORDS
column-switching; comparison with liquid–liquid extraction and SPE; plasma

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Mix 1 g plasma with 20 μL 15 μg/mL IS in MeOH, add 500 μL 700 mM pH 9 borate buffer, add 7 mL diethyl ether, shake on a tumble extractor at 40 rpm for 10 min, centrifuge at 2000 g at 5° for 5 min. Remove the organic layer and add it to 25 mM pH 2.6 phosphate buffer, shake on a tumble extractor at 20 rpm for 10 min. Discard the organic layer, remove traces of ether from the aqueous layer with a stream of nitrogen at 40°, inject a 150 μL aliquot. (Prepare 700 mM pH 9 borate buffer by dissolving 6.18 g boric acid and 7.46 g KCl in 100 mL water and adjusting to pH 9 with ca. 50 mL 1 M NaOH.)

HPLC VARIABLES
Guard column: 20 × 4.6 40 μm Pelliguard C18 (Supelchem)
Column: 150 × 4.6 5 μm Hypersil BDS C8
Mobile phase: MeCN:25 mM pH 2.5 phosphate buffer:triethylamine 35:65:0.1
Flow rate: 1
Injection volume: 150
Detector: UV 285

CHROMATOGRAM
Retention time: 3.6

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg 40 μm Bakerbond CN SPE cartridge with 1 mL MeOH saturated with ammonium dihydrogen phosphate and 2 mL water. Mix 1 mL plasma with 500 μL 200 ng/mL IS in MeCN:water, mix, add a 1.4 mL aliquot to the SPE cartridge, wash twice with 2 mL portions of water, wash twice with 1 mL portions of MeOH:water 30:70, dry, elute with 600 μL MeOH saturated with ammonium dihydrogen phosphate, mix the eluate (ca. 300 μL) with 400 μL 50 mM pH 4.6 phosphate buffer, inject a 650 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrabase C8
Mobile phase: MeCN:50 mM pH 4.6 phosphate buffer:triethylamine 45:55:0.1

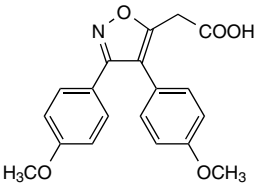
Mofezolac



Molecular formula: $C_{19}H_{17}NO_5$
Molecular weight: 339.34
CAS Registry No: 78967-07-4
Merck Index: 13, 6254

SAMPLE

Matrix: blood, urine
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 5 mL water. Plasma. Add 4 mL ice-cold MeCN to 500 μL plasma, vortex for 30 s, place on ice for 30 min, centrifuge refrigerated at 2000 g for 15 min. Evaporate the supernatant to dryness under a stream of nitrogen, reconstitute the residue with 2 mL water, add to the SPE cartridge, wash with 3 mL water, elute with 4 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 100 μL MeOH, inject a 20 μL aliquot. Urine. Mix 1 mL urine with 1 mL 10 mM pH 7.0 phosphate buffer, add to the SPE cartridge, wash with 3 mL water, elute with 4 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 200 μL MeOH:water 40:60, inject a 20 μL aliquot. (10 mM pH 7.0 Phosphate buffer was 35.81 g disodium hydrogen phosphate dodecahydrate and 13.61 g potassium dihydrogen phosphate in 1 L water, pH adjusted to 7.0 with NaOH or phosphoric acid.)

HPLC VARIABLES

Column: 150 × 6 5 μm Shimadzu Shim-pack CLC ODS
Column temperature: 35
Mobile phase: Gradient. MeOH:20 mM pH 6.4 potassium dihydrogen phosphate buffer from 0:100 to 100:0 over 33 min.
Flow rate: 1.5
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 23.9
Limit of detection: 10 ng/mL (plasma), 100 ng/mL (urine)

Merck Index: 13, 6289

SAMPLE

Matrix: abomasal fluid, blood, feces, intestinal fluid, ruminal fluid
Sample preparation: Add 100 μL 50 μg/mL IS to 5 mL plasma, abomasal fluid, intestinal fluid, ruminal fluid or 5 g feces, mix, add 10 mL 200 mM ammonium hydroxide, add 30 mL chloroform (Caution! Chloroform is a carcinogen!), shake mechanically for 30 min, centrifuge at 2000 *g* for 15 min, filter (Whatman 1 PS) the chloroform layer. Add 3 mL 1 M sulfuric acid to the filtrate, shake for 15 min, centrifuge at 2000 g for 5 min. Remove a 1 mL aliquot, neutralize with 2 drops concentrated ammonium hydroxide, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 10 μm Bondex C18 (Phenomenex)
Mobile phase: MeCN:pH 3.5 ammonium acetate buffer 28:72
Flow rate: 1.3
Injection volume: 50
Detector: UV 318

CHROMATOGRAM

Retention time: 5.64
Internal standard: pyrantel tartrate (3.97)
Limit of detection: 25 ng/mL (plasma, ruminal fluid), 20 ng/mL (abomasal fluid, intestinal fluid), 50 ng/g (feces)

KEY WORDS

cow; plasma

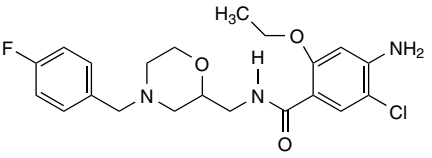
Mosapride



Molecular formula: $C_{21}H_{25}ClFN_3O_3$
Molecular weight: 421.90
CAS Registry No: 112885-41-3, 112885-42-4 (citrate)
Merck Index: 13, 6306

SAMPLE

Matrix: blood
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with two 3 mL portions of MeOH, two 3 mL portions of water, and two 2 mL portions of 20 mM pH 7.0 phosphate buffer. Mix 50 μL 100 μg/mL IS in water, 2 mL pH 7.0 sodium phosphate buffer, and 1 mL plasma, add to the SPE cartridge, wash with two 3 mL portions of water, elute with 2 mL MeOH, evaporate the eluate to dryness under reduced pressure at 50°, dissolve the residue in 400 μL MeOH:0.05% acetic acid 45:55, centrifuge at 5000 rpm for 10 min, inject a 180 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 9 μBondapak C18
Column: 150 × 4 5 μm Shim-pack CLC-ODS (Shimadzu)
Mobile phase: MeOH:0.05% acetic acid from 20:80 to 38.7:61.3 over 7 min, to 90:10 in 2 min, maintain at 90:10 for 4 min, from 90:10 to 20:80 in 0.5 min, maintain at 20:80 for 4.5 min.
Flow rate: 1.3
Injection volume: 180
Detector: F ex 314 em 354

CHROMATOGRAM

Retention time: 13
Internal standard: AD-9675 ((+)-4-amino-5-chloro-2-ethoxy-*N*-[[4-propyl-2-morpholinyl]methyl]benzamide citrate) (10.5)

OTHER SUBSTANCES

Extracted: metabolites

Molecular weight: 765.02
CAS Registry No: 55134-13-9
Merck Index: 13, 6445

SAMPLE

Matrix: blood
Sample preparation: Vortex 100 μL MeOH:water 80:20 and 400 μL trichloroacetic acid solution with 500 μL plasma, centrifuge at 4000 rpm for 4 min, filter (Spin-X) the supernatant, inject a 30 μL aliquot of the filtrate. (Prepare trichloroacetic acid solution as follows. Dissolve 85 g trichloroacetic acid in 15 mL water. Store this solution in the refrigerator. Dilute 150 μL of this solution with 100 mL acetone.)

HPLC VARIABLES

Guard column: C18
Column: 250 × 4.6 5 μm Supelco Discovery C18
Mobile phase: MeOH:10 mM ammonium acetate 85:15
Flow rate: 0.8 for 15 min, 1 for 10 min
Injection volume: 30
Detector: MS, PE Sciex API 100 single quadrupole, turbo ionspray, turbo probe 150°, air 6 L/min, 50 μL/min flowed into detector, m/z 693.7

CHROMATOGRAM

Retention time: 23
Limit of detection: 5 ng/mL
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES

Extracted: lasalocid (10), monensin (15), salinomycin (20)

KEY WORDS

chicken; plasma

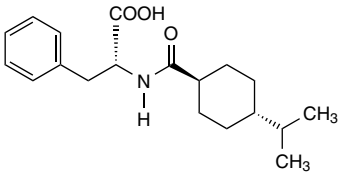
Nateglinide



Molecular formula: $C_{19}H_{27}NO_3$
Molecular weight: 317.42
CAS Registry No: 105816-04-4
Merck Index: 13, 6454

SAMPLE

Matrix: blood
Sample preparation: Mix 50 μL plasma with 10 μL 5 μg/mL IS in MeOH and 100 μL MeCN for 10 min, centrifuge at 3000 g for 10 min. Evaporate the supernatant to dryness under a stream of nitrogen at 50°, reconstitute the residue with 30 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: present but not specified
Column: 250 × 3 5 μm ProntoSIL 120-5-C18 AQ (Bischoff)
Column temperature: 50
Mobile phase: MeCN:MeOH:buffer 30:8:70 (The buffer was 100 mM potassium hydrogen phosphate (sic) adjusted to pH 4.0 with 30% KOH.)
Flow rate: 1
Injection volume: 20
Detector: UV 210

CHROMATOGRAM

Retention time: 14.1
Internal standard: carbamazepine (6.7)
Limit of quantitation: 100 pg/mL

KEY WORDS

pharmacokinetics; plasma

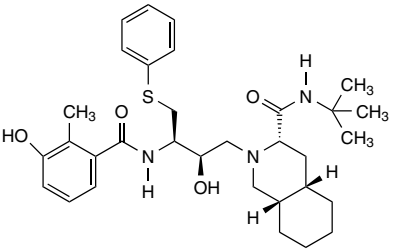
Nelfinavir

Molecular formula: $C_{32}H_{45}N_3O_4S$
Molecular weight: 567.79
CAS Registry No: 159989-64-7, 159989-65-8 (mesylate)
Merck Index: 13, 6471



SAMPLE

Matrix: blood
Sample preparation: Condition an Extrasep C18 SPE cartridge (Lida) with 2 mL MeOH and 2 mL water. Dilute 500 μL serum with 500 μL water, add to the SPE cartridge, wash with 500 μL water, elute with 1 mL MeOH. Evaporate the eluate to dryness with vortexing under reduced pressure at 40° and reconstitute the residue with 300 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: two 150 × 4.6 3 μm Luna C18 columns in series
Column temperature: 60
Mobile phase: Gradient. MeCN:4 mM sulfuric acid from 8:92 to 63:37 over 45 min, maintain at 63:37 for 5 min.
Flow rate: 0.85
Injection volume: 10
Detector: UV 265 for 31 min then UV 240

CHROMATOGRAM

Retention time: 33.5
Limit of detection: 400 ng/mL

OTHER SUBSTANCES

Extracted: delavirdine (25.5, LOD 110 ng/mL), efavirenz (51, LOD 62 ng/mL), indinavir (24.5, LOD 210 ng/mL), nelfinavir (33.5, LOD 400 ng/mL), nevirapine (23.5, LOD 84 ng/mL), ritonavir (50.5, LOD 510 ng/mL), saquinavir (35, LOD 100 ng/mL)

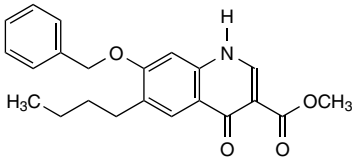
Nequinate



Molecular formula: $C_{22}H_{23}NO_4$
Molecular weight: 365.42
CAS Registry No: 13997-19-8
Merck Index: 13, 6498

SAMPLE

Matrix: feed

Sample preparation: Slurry 100 g 100–200 mesh Dowex 50 W-X8 (H^+) cation-exchange resin with 500 mL 10% HCl, heat to boiling with continuous stirring, cool, discard liquid, wash resin twice with 500 mL portions of water, wash with 250 mL MeOH, filter (Whatman No. 541 paper), rinse with 200 mL MeOH, air dry. Slurry 5 g resin with 50 mL 10% HCl, pour into a chromatography column, wash with water until the effluent is neutral to litmus, wash with 50 mL MeOH. Do not allow to go dry at any stage. Shake 20 g finely ground feed with 100 mL 2% methanesulfonic acid in MeOH for 30 min, filter (Whatman No. 541 paper). Add 25 mL filtrate to 100 mL 10% HCl and 100 mL dichloromethane, shake for 1 min, extract the aqueous phase twice with 40 mL portions of dichloromethane. Combine the organic layers and evaporate to dryness under reduced pressure at 40°, reconstitute the residue with 20–25 mL MeOH, add to the ion-exchange column, rinse flask with 10 mL MeOH, add the rinse to the column, wash the column with 50 mL MeOH, elute the column with 150 mL 2% methanesulfonic acid in MeOH. Mix the eluate with 300 mL 10% HCl and 130 mL dichloromethane, shake for 1 min, extract the aqueous layer twice with 70 mL portions of dichloromethane. Combine the organic layers and evaporate to dryness under reduced pressure at 40°, reconstitute the residue with 10 mL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 μBondapak C18
Mobile phase: MeOH:water 75:25
Flow rate: 1.5
Injection volume: 20
Detector: UV 265

CHROMATOGRAM

Retention time: 8
Limit of quantitation: 1 μg/g

OTHER SUBSTANCES

Noninterfering: clopidol

SAMPLE

Matrix: solutions
Sample preparation: Vortex 100 μL of an 80–500 μg/mL solution in water with 50 μL EtOH, 40 μL pyridine, 10 μL triethylamine, and 2 μL phenylisothiocyanate, heat at 80° for 5 min, evaporate under nitrogen at 80°, reconstitute with 1 mL water, wash twice with 2 mL portions of chloroform:1-pentanol 90:10 (Caution! Chloroform is a carcinogen!), inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 100 × 3 5 μm Chromspher C18
Mobile phase: MeCN:20 mM pH 7–8 phosphate buffer containing 5 mM tetraethylammonium hydroxide and 0.5 mM etidronate (adsorption suppressor) 3:97
Flow rate: 0.4
Injection volume: 20
Detector: UV 240

OTHER SUBSTANCES

Simultaneous: alendronate, pamidronate

KEY WORDS
derivatization

REFERENCE

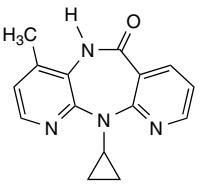
Nevirapine



Molecular formula: $C_{15}H_{14}N_4O$
Molecular weight: 266.30
CAS Registry No: 129618-40-2
Merck Index: 13, 6514

SAMPLE

Matrix: blood
Sample preparation: Condition an Extrasep C18 SPE cartridge (Lida) with 2 mL MeOH and 2 mL water. Dilute 500 μL serum with 500 μL water, add to the SPE cartridge, wash with 500 μL water, elute with 1 mL MeOH. Evaporate the eluate to dryness with vortexing under reduced pressure at 40° and reconstitute the residue with 300 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: two 150 × 4.6 3 μm Luna C18 columns in series
Column temperature: 60
Mobile phase: Gradient. MeCN:4 mM sulfuric acid from 8:92 to 63:37 over 45 min, maintain at 63:37 for 5 min.
Flow rate: 0.85
Injection volume: 10
Detector: UV 265 for 31 min then UV 240

CHROMATOGRAM

Retention time: 23.5
Limit of detection: 84 ng/mL

OTHER SUBSTANCES

Extracted: delavirdine (25.5, LOD 110 ng/mL), efavirenz (51, LOD 62 ng/mL), indinavir (24.5, LOD 210 ng/mL), nelfinavir (33.5, LOD 400 ng/mL), ritonavir (50.5, LOD 510 ng/mL), saquinavir (35, LOD 100 ng/mL)

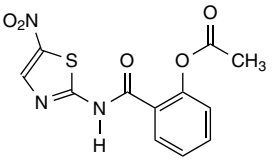
Nitazoxanide



Molecular formula: $C_{12}H_9N_3O_5S$
Molecular weight: 307.29
CAS Registry No: 55981-09-4
Merck Index: 13, 6595

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. Vortex 500 μL plasma and IS with 1 mL MeCN, centrifuge, inject a 20 μL aliquot of the supernatant. Urine. Mix 500 μL urine with 500 μL 1% Helix Pomatia juice (type H2, Sigma) in 100 mM pH 5 acetate buffer, heat at 37° overnight, inject an aliquot.

HPLC VARIABLES

Column: 100 × 4.6 5 μm Nucleosil C18

Mobile phase: Gradient. MeCN:20 mM pH 2.5 phosphate buffer from10:90 to 35:65 over 8 min.

Injection volume: 20

Detector: UV 360

CHROMATOGRAM

Internal standard: nifuroxazide

Limit of quantitation: 20 ng/mL (plasma), 200 ng/mL (urine)

KEY WORDS

only desacetylnitazoxanide is detected in plasma and urine; plasma

REFERENCE

Stockis, A.; Deroubaix, X.; Lins, R.; Jeanbaptiste, B.; Calderon, P.; Rossignol, J.F. Pharmacokinetics of nitazoxanide after single oral dose administration in 6 healthy volunteers, *Int.J.Clin.Pharmacol.Ther.*, **1996**, *34*, 349–351.

SAMPLE

Matrix: microsomal incubations, urine

Sample preparation: Urine. Mix 2 mL urine with 10 μL 100 U/mL β-glucuronidase, 5 μL arylsulfatase (Helix pomatia) (Boehringer Mannheim), and 200 μL 1 M pH 5.5 acetate buffer, heat at 37° for 3 h, add 200 μL 1 M formic acid, centrifuge, inject a 100 μL aliquot. Microsomal incubations. Mix 1 mL microsomal incubation with 100 μL 2 M formic acid, add 550 μL MeCN, mix, centrifuge, inject an aliquot. (This method is also said to work for plasma and feces, but there are no details.) (Only the deacylated compound tizanoxide is detected in biological fluids.)

HPLC VARIABLES

Column: Nucleosil 5C18

Mobile phase: Gradient. MeCN:10 mM formic acid from 10:90 to 90:10 over (?)

Injection volume: 100

Detector: MS, VG Quattro II

KEY WORDS
dog; human; liver; monkey; rat

REFERENCE

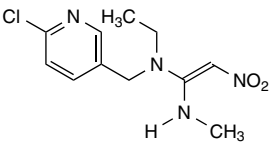
Nitenpyram



Molecular formula: $C_{11}H_{15}ClN_4O_2$
Molecular weight: 270.72
CAS Registry No: 150824-47-8
Merck Index: 13, 6596

SAMPLE

Matrix: fruit, vegetables
Sample preparation: Condition a 3 mL 500 mg Bond Elut PSA (weak anion-exchange) SPE cartridge with 10 mL acetone and 10 mL acetone:hexane 50:50. Condition a 6 mL 1 g Mega Bond Elut silica SPE cartridge with 10 mL acetone and 10 mL acetone:hexane 30:70. Blend (Polytron) 20 g sample with 100 mL MeCN for 2 min, filter (paper). Add 5 g NaCl to the filtrate and shake mechanically for 1 min. Evaporate 50 mL of the MeCN layer to near dryness, take up in 2 mL acetone, wash out flask with 2 mL acetone. Combine the acetone solutions with 4 mL hexane, add to the PSA SPE cartridge, elute with 5 mL acetone:hexane 50:50. Evaporate the eluates and dissolve in 2 mL acetone:hexane 30:70, add to the silica SPE cartridge, wash with 10 mL acetone:hexane 30:70. Discard all effluent from the silica SPE cartridge. Elute with 10 mL acetone:hexane 40:60 (for acetamiprid and imidacloprid) and 20 mL acetone (for nitenpyram). Evaporate each eluate to dryness, reconstitute the residue with 2 mL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 75 × 4.6 3 μm Cadenza CD-C18 (Imtakt, Kyoto)
Column temperature: 50
Mobile phase: Gradient. MeCN:50 mM potassium dihydrogen phosphate 3:97 for 3 min, to 40:60 over 7 min, maintain at 40:60 for 5 min, to 100:0 over 5 min, maintain at 100:0 for 5 min, to 5:95 over 5 min, maintain at 5:95 for 5 min.
Flow rate: 0.8
Injection volume: 10
Detector: UV 270

CHROMATOGRAM

Retention time: 11
Limit of detection: 20 ng/g

OTHER SUBSTANCES

Extracted: acetamiprid (UV 245; LOD 10 ng/g) (15), imidacloprid (LOD 10 ng/g) (14)

KEY WORDS

cucumber; eggplant; grape; Japanese radish; potato; SPE; tomato

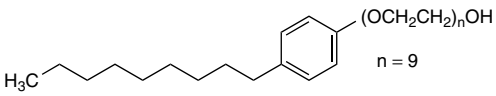
Nonoxynol-9



CAS Registry No: 26027-38-3
Merck Index: 13, 6711

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL whole blood with 1 g solid NaCl, grind (sic) for 5 min, extract twice with 4 mL portions of benzene (Caution! Benzene is a carcinogen!), centrifuge at 8000 rpm for 30 min. Combine the extracts and evaporate them to dryness under a stream of nitrogen, dry under vacuum at 50° for 1 h, reconstitute the residue with 100 μL MeOH, centrifuge, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 TSK-Gel C18
Mobile phase: MeOH:water (ratio not given)
Injection volume: 20
Detector: UV 221

CHROMATOGRAM

Retention time: 7.3
Limit of quantitation: 50 ng/mL

KEY WORDS

whole blood; also, using normal phase with a silica column and *n*-hexane at UV 276 gives numerous peaks for oligomers.

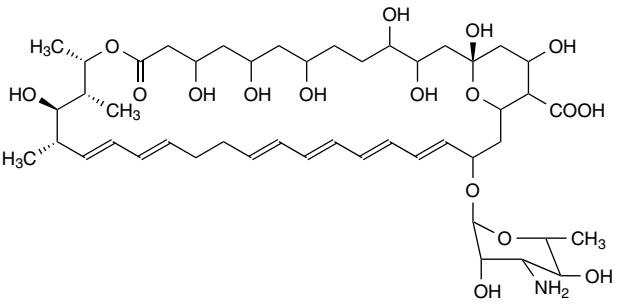
Nystatin

Molecular formula: $C_{47}H_{75}NO_{17}$ (A_1)
Molecular weight: 926.09 (A_1)
CAS Registry No: 1400-61-9, 34786-70-4 (A_1)
Merck Index: 13, 6770



SAMPLE

Matrix: blood, tissue
Sample preparation: Plasma. Mix 800 μL MeOH with 400 μL plasma, let stand at 4° for 30 min, centrifuge at 2000 g for 10 min, centrifuge the supernatant in a separate tube at 10 000 g for 4 min. Filter (Durapore 0.22 μm) 400 μL of the supernatant while centrifuging at 4000 g for 4 min, inject a 200 μL aliquot of the filtrate. Tissue. Homogenize (Tissuemizer 10 N head) tissue with 2 vol of ice-cold MeOH at 0°, let stand at 4° for 30 min, centrifuge at 2000 g for 10 min, centrifuge the supernatant in a separate tube at 10 000 g for 4 min. Filter (Durapore 0.22 μm) 400 μL of the supernatant while centrifuging at 4000 g for 4 min, inject a 200 μL aliquot of the filtrate.

HPLC VARIABLES

Guard column: 15 × 3.2 5 μm NewGuard RP-18
Column: 300 × 3.9 10 μm μBondapak C18
Column temperature: 30
Mobile phase: MeCN:MeOH:10 mM sodium phosphate buffer containing 1 mM EDTA 30:30:40, adjusted to pH 6.0 with 85% phosphoric acid
Flow rate: 2
Injection volume: 200
Detector: UV 305

CHROMATOGRAM

Retention time: 8.1, 10.0
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES

Noninterfering: acetaminophen, amikacin, amitriptyline, carbamazepine, ceftazidime, cyclosporine, digoxin, disopyramide, ethosuximide, gentamicin, lidocaine, lithium, methotrexate, phenobarbital, phenytoin, primidone, procainamide, propranolol, quinidine, salicylic acid, theophylline, tobramycin, valproic acid, vancomycin

KEY WORDS

human; pharmacokinetics; plasma; rabbit

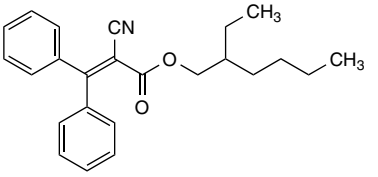
Octocrylene



Molecular formula: $C_{24}H_{27}NO_2$
Molecular weight: 361.48
CAS Registry No: 6197-30-4

SAMPLE

Matrix: sunscreen
Sample preparation: Heat 2 g sunscreen in 40 mL MeOH and 250 μL 2 M sulfuric acid at 60° for 5 min until a homogeneous solution develops, cool, make up to 50 mL with MeOH, dilute a 1 mL aliquot to 5 mL with initial mobile phase, inject a 5–50 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm PLRP-S (Polymer Labs)
Column temperature: 25
Mobile phase: Gradient. MeCN:THF:buffer 10:10:80 for 2.5 min, to 45:45:10 over 22.5 min, maintain at 45:45:10 for 10 min, return to initial conditions over 5 min, re-equilibrate for 5 min. (The buffer was 1.4 g/L citric acid monohydrate containing 6.8 g/L tetrabutylammonium hydroxide, adjusted to pH 9.0 with concentrated ammonia.)
Flow rate: 0.8 for 2.5 min, to 0.6 over 2.5 min, maintain at 0.6 for 10 min, return to 0.8 over 5 min, maintain at 0.8 for 5 min
Injection volume: 5–50
Detector: UV 302

CHROMATOGRAM

Retention time: 29.13
Limit of detection: 50–500 ppm

OTHER SUBSTANCES

Simultaneous: benzophenone-3 (25.93 min, UV 288), benzophenone-4 (12.47 min, UV 241), 3-benzylidene-*d*,*l*-camphor (26.47 min, UV 293), benzylidene camphor sulfonic acid (15.77 min, UV 297), butyl methoxydibenzoylmethane (29.71 min, UV 359), camphor benzalkonium methosulfate (6.178 min, UV 288), 3-(4′-ethylbenzylidene)-*d*,*l*-camphor (27.30 min, UV 297), homosalate (30.32 min, UV 241), isoamyl *p*-methoxycinnamate (26.93 min, UV 307), isopropyl dibenzoylmethane (29.86 min, UV 350), megasol (29.17 min, UV 241), octyl dimethyl PABA (28.83 min, UV 312), octyl methoxycinnamate (29.43 min, UV 307), octyl salicylate (30.03 min, UV 241), octyl triazone (33.72 min, UV 312), PEG–25 *p*-aminobenzoic acid (10.79 min, UV 307), phenylbenzimidazole sulfonic acid (8.898 min, UV 302), terephthalydiene dicamphor sulfonic acid (13.18 min, UV 340), urocanic acid (2.468 min, UV 278)

SAMPLE

Matrix: blood

Sample preparation: Vortex 5 μL serum, 5 μL EtOH, and 50 μL 4% pyridine in EtOH containing 20 mM HCl for 10 s, add 25 μL 50 mM reagent in DMF, add 15 μL

2 M 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide in water, heat at 37° for 10 min, centrifuge at 1000 g for 5 min, inject a 10 μL aliquot of the supernatant. (The reagent was 6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone-3-propionylcarboxylic acid hydrazide. Synthesis is as follows. Stir 483 g veratrole in 1.45 L acetic acid at 15°, add 683 g concentrated nitric acid (s.g. 1.05) over 1 h keeping the temperature below 40° (cool if necessary), add 2.127 L fuming nitric acid (s.g. 1.50) over 1 h keeping the temperature below 30°, allow to stand for 2 h, pour into a large volume of cold water, filter, wash the solid until it is free from acid, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5–130.5°) (*J.Am.Chem.Soc*. **1946**, *68*, 1536). Reflux 5 g 4,5-dinitroveratrole in 200 mL benzene (Caution! Benzene is a carcinogen!), add 100 g 60 mesh iron powder and 20 mL concentrated HCl in small portions over 1 h, reflux for 4 h, add 10 mL water, reflux for 2 h, cool, make alkaline with 2.5 M NaOH, extract several times with 200 mL portions of benzene. Combine the extracts and evaporate to dryness, add 10 mL concentrated HCl, recrystallize from EtOH to give 1,2-diamino-4,5-dimethoxybenzene hydrochloride as slightly pink needles (mp 240° d) (*Anal.Chim.Acta* **1982**, *134*, 39). Dissolve 2.5 mmol 1,2-diamino-4,5-dimethoxybenzene monohydrochloride and 2.4 mmol α-ketoglutaric acid in 30 mL 500 mM HCl, heat in a boiling water bath for 2 h, cool in ice, filter, wash the precipitate with water, dry under vacuum, recrystallize from MeOH:water 90:10 to give 6,7-dimethoxy-2(1H)-quinoxalinone-3-propionylcarboxylic acid as yellow needles (mp 240°) (*Chem.Pharm.Bull*. **1985**, *33*, 3493). Treat 1.5 g 6,7-dimethoxy-2(1H)-quinoxalinone-3-propionylcarboxylic acid in 100 mL MeOH with ethereal diazomethane, evaporate to dryness under reduced pressure, dissolve the residue in 30 mL chloroform (Caution! Chloroform is a carcinogen!), chromatograph on a 250 × 35 column of 70–230 mesh silica gel 60 (Merck) with hexane:ethyl acetate 50:50 to give methyl 6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone-3-propionylcarboxylate as colorless needles (mp 178–179°). Dissolve 900 mg methyl 6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone-3-propionylcarboxylate in 100 mL 45% hydrazine hydrate in water, heat at 100° for 1 h, recrystallize the precipitate from EtOH to give 6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone-3-propionylcarboxylic acid hydrazide as colorless needles (mp 205–206°) (*Analyst* **1990**, *115*, 1363).)

HPLC VARIABLES

Column: 250 × 4.6 10 μm YMC-Pack C8 (Yamamura, Kyoto)
Column temperature: 30 ± 0.2
Mobile phase: Gradient. MeCN:water 55:45 for 56 min, to 95:5 over 16 min, maintain at 95:5 for 4 min, re-equilibrate at initial conditions for 4 min.

SAMPLE

Matrix: blood

Sample preparation: Sonicate 10 μL serum, 44 μL MeOH, and 1 μL pyridine for 5 min, add 25 μL 100 mM reagent in DMF, add 20 μL 400 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide in MeOH, let stand at 25° for 2 h, centrifuge, inject an aliquot. (The reagent was 2-(5-hydrazinocarbonyl-2-furyl)-5,6-dimethoxybenzothiazole, which is synthesized as follows. Pass dry hydrogen chloride into a mixture of 12.6 g methyl 2-furoate, 4.5 g paraformaldehyde, and 3.4 g anhydrous zinc chloride in 50 mL dry chloroform for 3 h while holding the reaction temperature at 30° (Caution! Chloroform is a carcinogen!). After cooling, pour the contents of the flask into 100 mL

cold water, remove the chloroform layer, extract the aqueous layer with chloroform (cf *Coll.Czech.Chem.Commun.* **1960**, *25*, 1058). Combine the chloroform layers, neutralize, dry over anhydrous calcium chloride, evaporate, distil to give 5-chloromethyl furyl-2-carboxylic acid methyl ester (bp 108°/4 mm Hg). Reflux 10 g 5-chloromethyl furyl-2-carboxylic acid methyl ester and 25 g silver carbonate in 100 mL THF:water 70:30 for 5 h, filter through Celite, concentrate the filtrate under reduced pressure, chromatograph the product on silica gel with chloroform to give 5-hydroxymethyl furyl-2-carboxylic acid methyl ester as a light yellow oil. Add a solution of 2.9 g 5-hydroxymethyl furyl-2-carboxylic acid methyl ester in 30 mL dichloromethane to 12 g pyridinium chlorochromate in 100 mL dichloromethane, stir at room temperature for 4 h, evaporate to dryness under reduced pressure, chromatograph on silica with dichloromethane to give 5-formyl furyl-2-carboxylic acid methyl ester as a light yellow powder. Add 10 mL concentrated nitric acid dropwise to 20 g 4-bromoveratrole in 60 mL acetic acid while keeping the temperature at 10–30° with occasional cooling; when the addition is complete, pour the reaction mixture into ice water. Collect the precipitate and dissolve it in 500 mL hot EtOH, add activated charcoal, filter, add 40 mL water to the filtrate to give 4,5-dimethoxy-2-nitrobromobenzene as a light yellow crystalline solid (mp 121–122°). Prepare sodium sulfide by melting together 5 g sodium sulfide nonahydrate and 700 mg sulfur, add this mixture to 5 g 4,5-dimethoxy-2-nitrobromobenzene in 50 mL EtOH:water 95:5, reflux for 30 min, pour into ice water, collect the solid, recrystallize from dichloromethane to give di(4,5-dimethoxy-2-nitrophenyl)sulfide as yellow needles (mp 231–232°). Add 15 mL concentrated HCl dropwise to 1.5 g di(4,5-dimethoxy-2-nitrophenyl)sulfide and 4.5 g tin powder stirred at 40–50° in 150 mL EtOH, reflux for 1 h, cool to room temperature, filter, add 1.17 g 5-formyl furyl-2-carboxylic acid methyl ester to the filtrate, reflux for 1 h, cool, filter, chromatograph the solid on silica gel with dichloromethane, recrystallize from EtOH to give 5-(5′,6′-dimethoxybenzothiazolyl)-*N*-furan-2-carboxylic acid methyl ester as a yellow powder (mp 192–202°). Add 2 mL hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) to 800 mg 5-(5′,6′-dimethoxybenzothiazolyl)-*N*-furan-2-carboxylic acid methyl ester in 20 mL EtOH, reflux for 30 min, collect the solid, wash with MeOH, dry under vacuum over phosphorus pentoxide to give 2-(5-hydrazinocarbonyl-2-furyl)-5,6-dimethoxybenzothiazole as a light yellow solid (mp 226–228°).)

high-performance liquid chromatography and its application to the assay of fatty acids in human serum, *Anal.Sci.*, **1995**, *11*, 103–107.

SAMPLE

Matrix: blood

Sample preparation: Vortex 10 μL plasma, 200 μL 500 mM pH 6.5 phosphate buffer, 50 μL 20 μM IS in MeOH, and 2 mL *n*-heptane:chloroform 50:50 for 2 min (Caution! Chloroform is a carcinogen!), centrifuge at 1000 g for 10 min. Remove the lower organic layer and evaporate it to dryness, reconstitute the residue in two 100 μL aliquots of acetone. Evaporate the acetone solution to dryness, add 2–3 mg finely powdered potassium bicarbonate:sodium sulfate 50:50, add 50 μL 800 μM dibenzo-18-crown-6 in acetone, add 50 μL 2 mM 7-acetoxy-4-bromomethylcoumarin in acetone, heat at 50° in the dark for 30 min, inject a 50 μL aliquot. (7-Acetoxy-4-bromomethylcoumarin is available from TCI America or Tokyo Kasei, or it may be prepared as follows. Reflux 50 g 7-hydroxy-4-methylcoumarin (β-methylumbelliferone) and 100 mL acetic anhydride for 1 h, cool, pour into 500 mL cold water, filter, dry the solid, recrystallize from EtOH to give 4-methyl-7-acetoxycoumarin. Reflux 10 g 4-methyl-7-acetoxycoumarin, 9 g *N*-bromosuccinimide, a little 2,2′-(azobis(2-methylpropionitrile) (α,α′-azobisisobutyronitrile, Eastman), and 100 mL carbon tetrachloride for 20 h, cool, evaporate under reduced pressure to remove the solvent, wash the residue with water, filter, dry, recrystallize from ethyl acetate/cyclohexane to give 7-acetoxy-4-bromomethyl-coumarin (mp 184–185°) (*J.Chromatogr.* **1982**, *234*, 121).)

HPLC VARIABLES

Column: 250 × 4 5 μm LiChrosorb RP-18

Column temperature: 40

Mobile phase: Gradient. MeCN:MeOH:water from 35:35:30 to 0:90:10 over 70 min (convex gradient).

Flow rate: 1.2

Injection volume: 50

Detector: F ex 365 em 460 following post-column reaction. The column effluent mixed with 200 mM NaOH in MeOH:water 80:20 pumped at 0.4 mL/min and the mixture flowed through a 3.5 m ×0.5 mm ID stainless steel coil at 50° to the detector.

CHROMATOGRAM

Retention time: 51

Internal standard: margaric acid (57)

Limit of detection: 5 pmol

OTHER SUBSTANCES

Extracted: arachidonic acid (37), capric acid (17), caproic acid (6), caprylic acid (11), heptanoic acid (9), lauric acid (26), linoleic acid (42), linolenic acid (35), myristic acid (36), myristoleic acid (28), nonanoic acid (15), palmitic acid (50), palmitoleic acid (39), stearic acid (66), tridecanoic acid (30), undecanoic acid (21)

KEY WORDS

derivatization; plasma; post-column reaction

SAMPLE

Matrix: blood

Sample preparation: Vortex 50 μL plasma, 10 μL IS solution, and 450 μL micelle solution for 10 s, add 25 μL 28 mg/mL 9-bromomethylacridine in acetone, mix. Remove a 50 μL aliquot and heat it to 60° for 6 min, inject the whole amount through a 2 μm

stainless steel filter of 8 sq mm area onto column A, wash to waste with 400 μL mobile phase A, backflush the contents of column A onto column B with the mobile phase B, monitor the effluent from column B. After each injection, backflush the stainless steel filter with 1 mL buffer. (The micelle solution was 25 mM Arkopal N-130 (a polyoxyethylene(13)nonylphenol, Hoechst Holland, Amsterdam) in 10 mM pH 7.0 phosphate buffer containing 6 mM tetrakis(decyl)ammonium bromide. 9-Bromomethylacridine is available from TCI America or Tokyo Kasei, or it may be prepared as follows. Heat 10 g diphenylamine, 10 mL glacial acetic acid, and 40 g anhydrous zinc chloride to 220°, evaporate excess acetic acid with stirring, heat at 220–230° for 6 h, digest with hot 10% sulfuric acid, make strongly alkaline with 25% ammonia to dissolve the zinc chloride. Extract the insoluble residue with toluene. Extract the organic layer with 10% sulfuric acid, make the aqueous layer alkaline with aqueous ammonia. Collect the yellow precipitate that separates and recrystallize it twice from petroleum ether to give 9-methyl acridine as pale yellow needles (*Chromatographia* **1989**, *28*, 267). Reflux 560 mg 9-methylacridine, 445 mg *N*-bromosuccinimide, and 10 mg benzoyl peroxide in 30 mL carbon tetrachloride for more than 2 h, cool, chromatograph on silica gel with benzene:ethyl acetate 30:1 (Caution! Benzene is a carcinogen!) to obtain 9-bromomethylacridine as yellow crystals (mp 147–151°) (*Anal.Lett*. **1987**, *20*, 1581).)

HPLC VARIABLES

Column: A 10 × 2.1 40 μm Chromsep C18 (Chrompack); B 100 × 3 5 μm Chromspher C18 (Chrompack)
Mobile phase: A 10 mM pH 7.0 phosphate buffer; B Gradient. MeOH:water 75:25 for 3 min, to 100:0 over 12 min (concave gradient).
Injection volume: 50
Detector: UV 254; F ex 362 em 418

CHROMATOGRAM

Retention time: 10
Internal standard: heptadecanoic acid (13)
Limit of detection: 300 nM

OTHER SUBSTANCES

Extracted: arachidonic acid (7), linoleic acid (9), linolenic acid (6), myristic acid (8), palmitic acid (10.5), palmitoleic acid (7.5), stearic acid (13.5)

KEY WORDS

column-switching; derivatization; plasma

SAMPLE

Matrix: solutions
Sample preparation: Mix 100 μL of a solution in EtOH, EtOH/water, or water with 400 μL reagent solution and 200 μL 20 mM 2-nitrophenylhydrazine hydrochloride in water, heat at 60° for 20 min, add 100 μL 15% KOH in MeOH:water 80:20, heat at 60° for 15 min, cool, inject a 1–2 μL aliquot. (Prepare the reagent by mixing equal volumes of 3% pyridine in EtOH and 250 mM 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride in EtOH.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm YMC-C8 (Yamamuta Chemical Research, Kyoto)
Column temperature: 50

Mobile phase: MeOH:water 86:14 adjusted to pH 4.5 with 100 mM HCl
Flow rate: 1.2
Injection volume: 1–2
Detector: UV 230; UV 400

CHROMATOGRAM

Retention time: 10.7
Limit of detection: 2.5–5 pmol (UV 230), 10–15 pmol (UV 400)

OTHER SUBSTANCES

Simultaneous: capric acid (3), lauric acid (5), linoleic acid (8.5), linolenic acid (7), myristic acid (6.5), palmitic acid (10), palmitoleic acid (7.5), stearic acid (14)

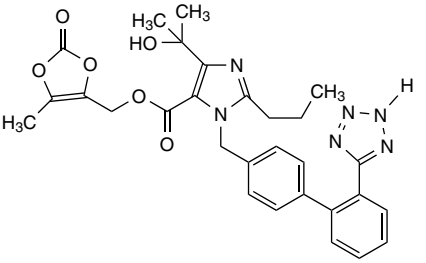
Olmesartan



Molecular formula: $C_{29}H_{30}N_6O_6$
Molecular weight: 558.58
CAS Registry No: 144689-63-4
Merck Index: 13, 6909

SAMPLE

Matrix: microsomal incubations
Sample preparation: Mix 100 μL microsomal incubation with 100 μL MeCN, centrifuge at 10 000 g for 3 min, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 150 × 6.9 YMC-Pack ODS-A-312 C18
Mobile phase: MeCN:water:PIC A 45:55:2.2
Flow rate: 1
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 6

KEY WORDS

human; intestine; liver; rat

REFERENCE

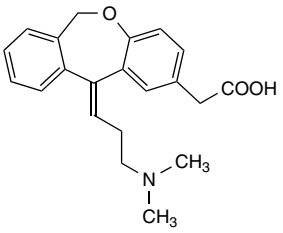
Olopatadine



Molecular formula: $C_{21}H_{23}NO_3$
Molecular weight: 337.41
CAS Registry No: 113806-05-6, 140462-76-6 (HCl)
Merck Index: 13, 6910

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut C18 SPE cartridge with 1 mL MeOH, 2 mL water, 2 mL 1% bovine serum albumin in water, and 5 mL water. Vortex 250 μL plasma, 50 μL 200 ng/mL IS in water, and 250 μL water, add to the SPE cartridge, wash with 2 mL water, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 50 μL mobile phase, filter (0.2 μm PTFE), inject a 10 μL aliquot.

HPLC VARIABLES

Column: 50 × 2 5 μm Develosil ODS HG-5
Mobile phase: MeOH:10 mM acetic acid 45:55
Flow rate: 0.1
Injection volume: 10
Detector: MS, Micromass Quattro, electrospray, ion source 120°, capillary 4.0 kV, counter current electrode 1.2 kV, cone 20 V, positive mode, collision gas argon 0.2 Pa, collision energy 20 eV, m/z 338–165

CHROMATOGRAM

Retention time: 2.5
Internal standard: KF11796 ((11*Z*)-11-[3-(dimethylamino)propylidene]-6,11-dihydrodibenz[*b*,*e*]oxepin-2-propionic acid) (m/z 352–247–179) (4)
Limit of quantitation: 1 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

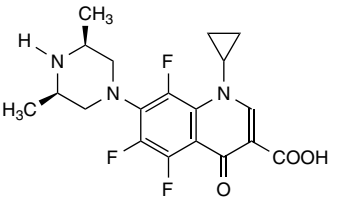
Orbifloxacin



Molecular formula: $C_{19}H_{20}F_3N_3O_3$
Molecular weight: 395.38
CAS Registry No: 113617-63-3

SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL plasma with 800 μL 1.5 μg/mL IS in 100 mM pH 7.4 phosphate buffer, add 6 mL chloroform (Caution! Chloroform is a carcinogen!), shake at 200 oscillations/min for 30 min, centrifuge at 13 000 g for 6 min. Evaporate the organic layer to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL phosphate-buffered saline, inject an aliquot.

HPLC VARIABLES

Guard column: Novapack C18 Guard-Pak
Column: 150 × 3.9 5 μm Novapack C18
Mobile phase: MeCN:buffer 20:80 (The buffer was 20 mM potassium dihydrogen phosphate containing 6 mM phosphoric acid and 12 mM tetraethylammonium bromide, pH adjusted to 3.0 with 2 M NaOH.)
Flow rate: 1
Detector: F ex 338 em 425

CHROMATOGRAM

Retention time: 3.09
Internal standard: norfloxacin (2.16)
Limit of detection: 9 ng/mL (sic)
Limit of quantitation: 4 ng/mL

OTHER SUBSTANCES

Simultaneous: ciprofloxacin (2.28), danofloxacin (2.80), difloxacin (4.52), enrofloxacin (3.30), marbofloxacin (2.20), sarafloxacin (4.40)

SAMPLE
Matrix: tissue

Sample preparation: Condition a 3 mL 250 mg Supelclean ENVI C18 SPE cartridge with 2 mL MeOH and 2 mL MeCN. Pack 250 mg 200–400 mesh AG MP-1 resin (Bio-Rad) between frits in an empty 3 mL tube, condition with MeOH, water, and 5 mL 8 mM NaOH. Add 5 mL MeCN to 1.5 g pureed fish, sonicate (Sonifier 450, 30% duty cycle, 40% power) for 3 min, rotate for 10 min, centrifuge at 3000 rpm for 5 min, repeat extraction with 5 mL MeCN. Combine the extracts and evaporate them to ca. 4 mL under a stream of nitrogen at 45°, add to the C18 SPE cartridge, elute with another 1 mL MeCN. Dilute all the eluates to 40 mL with 8 mM NaOH. Add this solution to the AG MP-1 cartridge, wash with 2 mL water, wash with 2 mL MeOH, dry with a stream of nitrogen, elute with 3 mL MeCN:2% formic acid 20:80, add 90 μL IS solution to the eluate, inject a 10 μL aliquot. (IS solution contained 500 ng/mL clenbuterol and 50 ng/mL penbutolol in MeCN:water 20:80.)

HPLC VARIABLES
Column: 150 × 2.1 5 μm Zorbax Extend C18

Column temperature: 30

Mobile phase: Gradient. MeCN:2% formic acid:water 20:10:70 for 3 min, to 55:10:35 over 0.1 min, maintain at 55:10:35 for 6.9 min, return to initial conditions over 0.1 min, re-equilibrate for 6.9 min.

Flow rate: 0.2

Injection volume: 10

Detector: MS, Micromass Quattro LC triple quadrupole, positive ion mode, nebulizer gas nitrogen 100 L/h, drying gas nitrogen 700 L/h, collision gas argon at 1 μbar, source block 110°, desolvation 350°, cone 32 V, collision energy 16 eV, m/z 396.36–352.11

CHROMATOGRAM
Retention time: 2.57

Internal standard: clenbuterol (m/z 277.00–203.00, cone 20 V, collision 15 eV) (3.13), penbutolol (m/z 292.27–236.13, cone 28 V, collision 16 eV) (8.53)

Limit of detection: 5 ng/g

OTHER SUBSTANCES
Extracted: ciprofloxacin (m/z 332.15–288.07, cone 40 V, collision 16 eV; LOD 10 ng/g) (2.17), danofloxacin (m/z 358.08–95.91, cone 38 V, collision 22 eV) (2.23), enrofloxacin (m/z 360.24–316.14, cone 40 V, collision 16 eV) (2.41), flumequine (m/z 262.14–202.03, cone 28 V, collision 34 eV) (9.31), nalidixic acid (m/z 233.09–187.05, cone 28 V, collision 28 eV) (9.14), oxolinic acid (m/z 262.12–160.02, cone 28 V, collision 40 eV) (8.11), piromidic acid (m/z 289.17–243.06, cone 34 V, collision 28 eV) (10.05), sarafloxacin (m/z 386.20–299.06, cone 40 V, collision 28 eV) (3.04)

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 3 mL 7 mm Empore Mixed Phase Cation-MPC SPE disc with 1 mL MeOH, three 3 mL portions of MeOH:50 mM ammonium acetate 90:10, and 1 mL 5 mM pH 3.5 ammonium acetate. Mix 100 μL plasma or urine with 50 μL IS solution and 1 mL 5 mM pH 3.5 ammonium acetate buffer, add to the SPE disc, wash with 1 mL water, wash with 1 mL MeOH, wash with 1 mL MeOH:water 90:10, dry under vacuum, elute with 1 mL MeOH:50 mM ammonium acetate 90:10. Evaporate the eluate to dryness under a stream of nitrogen at ca. 50°, reconstitute the residue with 150 μL water, centrifuge at >500 rpm, inject a 100 μL aliquot. (IS solution contained 50 ng/ml of d_3-oseltamivir and 2 μg/ml of d_3-GS4071 in water).

HPLC VARIABLES
Column: 100 × 5 4 μm Nova-Pak CN HP radial compression
Mobile phase: MeOH:80 mM pH 3 formic acid 50:50
Flow rate: 0.5
Injection volume: 100
Detector: MS, Finnigan TSQ 7000 tandem quadrupole, electrospray, collision gas argon, m/z 313–224

CHROMATOGRAM
Retention time: 5
Internal standard: d_3-oseltamivir (m/z 316–227); d_3-GS4071 (m/z 288–201)
Limit of quantitation: 1 ng/mL (plasma), 5 ng/mL (urine)

OTHER SUBSTANCES
Extracted: GS4071 (de-ethylated active metabolite) (LOQ 10 ng/mL (plasma), 30 ng/mL (urine); m/z 285–198) (3.5)

KEY WORDS
ferret; human; marmoset; mouse; plasma; rabbit; rat; SPE

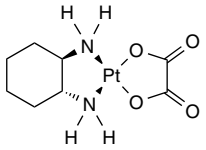
Oxaliplatin



Molecular formula: $C_8H_{14}N_2O_4Pt$
Molecular weight: 397.29
CAS Registry No: 61825-94-3
Merck Index: 13, 6981

SAMPLE

Matrix: blood
Sample preparation: Filter (Sartorius Centrisart I 10 000 MW cut-off) while centrifuging at 4000 g at 4° for 1 h, inject an aliquot of the ultrafiltrate.

HPLC VARIABLES

Column: 250 × 4 5 μm Hypercarb
Mobile phase: MeOH:250 mM pH 7.0 succinic acid buffer 90:10
Flow rate: 0.5
Injection volume: 25
Detector: UV 344 following post-column reaction. The column effluent mixed with 2.7 mM sodium *N*, *N*-diethyldithiocarbamate in MeOH pumped at 0.17 mL/min and the mixture flowed through a 2.3 m long 0.51 mm ID length of PTFE tubing to the detector. A 2 m length of the tubing was heated in a microwave field (ca. 130 W, Smithcreator, Personal Chemistry, Sweden) at about 110°.

CHROMATOGRAM

Retention time: 12
Limit of quantitation: 40 ng/mL (S/N 10)

KEY WORDS

pharmacokinetics; post-column reaction; ultrafiltrate; whole blood

REFERENCE

Ehrsson, H.; Wallin, I. Liquid chromatographic determination of oxaliplatin in blood using post-column derivatization in a microwave field followed by photometric detection, *J.Chromatogr.B*, **2003**, *795*, 291–294.

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. Filter (Amicon MPS-1 with a YMT membrane) while centrifuging at 4° at 3000 g for 15 min, inject an aliquot of the ultrafiltrate. Urine. Directly inject an aliquot of urine. (Protect from light.)

HPLC VARIABLES

Column: 250 × 4.6 Inertsil ODS-2
Column temperature: 40
Mobile phase: MeCN:10 mM pH 5.5 acetate buffer 5:95
Flow rate: 1
Injection volume: 100
Detector: UV 290 following post-column reaction. The column effluent mixed with the reagent (maintained at 0°) pumped at 0.3 mL/min and the mixture flowed through a 10 m ×0.5 mm ID PTFE coil at 60° to the detector. (The reagent was 10 mM pH 5.5 acetate buffer containing 40 mM sodium bisulfite.)

CHROMATOGRAM

Retention time: 11

Limit of detection: 60 nM

OTHER SUBSTANCES
Extracted: carboplatin (6.5), tetraplatin (8)

KEY WORDS
plasma; post-column reaction; rabbit

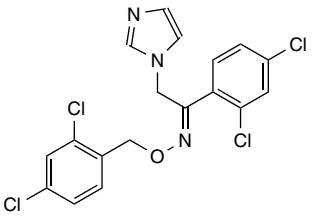
Oxiconazole



Molecular formula: $C_{18}H_{13}Cl_4N_3O$
Molecular weight: 492.14
CAS Registry No: 64211-45-6, 64211-46-7 (nitrate)
Merck Index: 13, 7006

SAMPLE

Matrix: formulations
Sample preparation: Dissolve lotion containing 50 mg oxiconazole in 50 mL MeOH, dilute a 5 mL aliquot to 50 mL with mobile phase, inject an aliquot. Shake cream containing 50 mg oxiconazole with 50 mL chloroform:MeOH 50:50 for 30 min (Caution! Chloroform is a carcinogen!), make up to 100 mL with MeOH, centrifuge at 4000 rpm at 4° for 15 min, filter, dilute fivefold with MeOH.

HPLC VARIABLES

Guard column: LiChrocart 4-4
Column: 125 × 4 5 μm LiChrocart C8
Mobile phase: MeOH:20 mM ammonium acetate buffer 85:15
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 2.7
Limit of detection: 1.2 μg/mL
Limit of quantitation: 3.75 μg/mL

OTHER SUBSTANCES

Noninterfering: benzyl alcohol

KEY WORDS

cream; lotion; stability-indicating

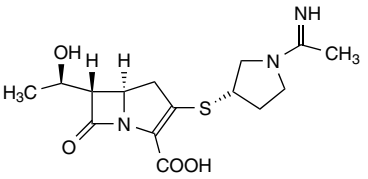
Panipenem



Molecular formula: $C_{15}H_{21}N_3O_4S$
Molecular weight: 339.42
CAS Registry No: 87726-17-8
Merck Index: 13, 7079

SAMPLE

Matrix: blood
Sample preparation: Vortex 10 μL plasma with 10 μL of 200 mM MOPS (3-(*N*-morpholino)propanesulfonic acid) solution, add 100 μL MeOH, mix, centrifuge at 12 000 rpm for 5 min, inject a 25 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil ODS-2
Mobile phase: MeOH:buffer 35:65 (The buffer was 5 mM pH 5.8 sodium dihydrogen phosphate containing 5 mM sodium *n*-dodecylsulfate.)
Flow rate: 0.8
Injection volume: 25
Detector: UV 300

CHROMATOGRAM

Retention time: 6
Limit of quantitation: 500 ng/mL

KEY WORDS

plasma

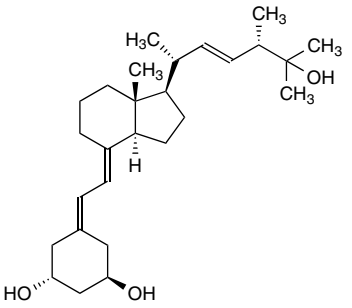
Paricalcitol



Molecular formula: $C_{27}H_{44}O_3$
Molecular weight: 416.63
CAS Registry No: 131918-61-1
Merck Index: 13, 7111

SAMPLE

Matrix: blood
Sample preparation: Extract plasma with ether, inject an aliquot onto column A and column B in series and elute with mobile phase. After 1.5 min, remove column A from the circuit. Continue to elute column B with mobile phase and collect fractions. Regenerate column A by backflushing with a stronger mobile phase

HPLC VARIABLES

Column: A 23 × 4 PVA-Sil; B 250 × 4.6 PVA-Sil
Mobile phase: MTBE:isopropanol 97.5:2.5
Detector: Radio receptor assay (after evaporation of fractions)

KEY WORDS

column-switching; normal phase; plasma

SAMPLE

Matrix: blood, urine

Sample preparation: Condition a 3 mL 130 mg Bond Elut Certify SPE cartridge with 3 mL MeOH and 3 mL 200 mM pH 6.0 phosphate buffer. Vortex 3 mL serum or urine with 3 mL 400 mM pH 6.0 phosphate buffer for 1 min, add to the SPE cartridge at 1 mL/min, wash with 3 mL MeOH:200 mM pH 6.0 phosphate buffer 5:95, pass air through the SPE cartridge for 10 s, elute with 750 μL MeOH:10% ammonia 100:20 at 0.5 mL/min. Add a few drops of 1 M HCl to the eluate and evaporate to dryness under a stream of nitrogen, reconstitute the residue with 150 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Guard column: 10 × 2.1 5 μm Hypersil C18
Column: 150 × 4.6 5 μm Hypersil C18
Column temperature: 45
Mobile phase: Gradient. A was MeCN:buffer 5:95. B was MeCN:buffer 50:50. A:B from 85:15 to 10:90 over 20 min, maintain at 10:90 for 5 min, return to initial conditions over 3 min, re-equilibrate for 6 min. (The buffer was 50 mM pH 3.0 phosphate buffer containing 375 mg/L sodium octyl sulfate and 3 mL/L triethylamine.)

Flow rate: 1
Detector: UV 240

CHROMATOGRAM

Retention time: 17.1

OTHER SUBSTANCES

Extracted: acebutolol (UV 326,235) (12.8), acetaminophen (UV 247) (2.7), *N*-acetylprocainamide (UV 268) (4.9), amineptine (UV 268) (19.3), amitriptyline (UV 240,211) (22.3), amobarbital (UV 211) (15.3), amoxapine (UV 296,211.5) (19.1), amphetamine (UV 254) (11.2), aprobarbital (14.7), atenolol (UV 275,230) (4.3), atropine (UV 260) (11.3), barbital (UV 212) (5.5), benzhexol (UV 260) (22.5), benztropine (UV 257,223) (22.9), benzoylecgonine (UV 278,235) (6.7), bromazepam (UV 235) (13.3), buprenorphine (UV 284,213) (19.4), buspirone (UV 302,239,211) (16.2), butabarbital (UV 211) (10.1), caffeine (UV 270) (3.5), carbamazepine (UV 283,215) (15.1), chloramphenicol (UV 277) (10.6), chlordiazepoxide (UV 303,245) (15.1), chlormethiazole (UV 252,211) (12.4), chlorpromazine (UV 310,255) (23.9), cimetidine (UV 219) (3.5), citalopram (UV 239) (19.0), clobazam (UV 292,231) (20.5), clomipramine (UV 250,211) (23.6), clonazepam (UV 310,240,211) (18.5), clonidine (UV 265) (6.9), cloperastine (UV 238) (26.2), cloxazolam (UV 340,265,239.5) (18.4), cocaine (UV 278,235) (14.7), codeine (UV 280,211) (5.0), desipramine (UV 250) (20.5), diazepam (UV 313,229) (22.6), dihydrocodeine (UV 282,211) (4.8), diltiazem (UV 242,211.5) (19.2), diphenhydramine (UV 258) (19.4), disopyramide (UV 260) (14.9), dothiepin (UV 303,263,231,211) (21.5), doxepin (UV 291) (19.1), ephedrine (UV 257) (6.2), erythromycin (UV 211) (23.3), fentanyl (UV 262) (18.4), flecainide (UV 299) (19.5), flumazenil (UV 250) (11.0), fluoxetine (UV 262,228) (22.6), fluphenazine (UV 310,257) (23.7), flupenthixol (UV 268,231) (27.2), flurazepam (UV 315,231) (20.6), fluvoxamine (UV 251) (20.8), furosemide (UV 344,275,235) (13.2), glutethimide (15.8), guaifenesin (UV 275,224) (6.7), haloperidol (UV 245,220) (19.6), hydralazine (UV 304,260,211) (3.5), hydroxyzine (UV 231) (21.2), ibuprofen (UV 263,219.5) (28.0), imipramine (UV 250,211) (21.6), indomethacin (UV 299,240) (27.9), ketamine (UV 270) (12.7), ketoconazole (UV 295,240) (20.8), labetalol (UV 303) (15.7), lidocaine (UV 266) (13.7), lorazepam (UV 318,231.5) (18.4), lormetazepam (UV 315,231) (20.5), loxapine (UV 295,250) (19.8), maprotiline (UV 272) (22.0), MDMA (UV 287,235) (13.0), methadone (23.0), methamphetamine (UV 254) (12.0), methaqualone (UV 308,267,227) (18.1), methylephedrine (UV 254) (7.7), methylphenidate (UV 260) (15.0), metoclopramide (UV 311,275,215) (13.0), metoprolol (UV 275,223) (13.8), mianserin (UV 280) (19.3), midazolam (UV 221) (19.3), moclobemide (UV 238) (14.1), molindone (UV 301,256,211) (13.6), morphine (UV 286,212) (2.7), nadolol (UV 272,219) (6.6), naloxone (UV 282,209) (5.0), naproxen (UV 270,231.5) (20.2), nifedipine (UV 335,235) (20.8), nitrazepam (UV 310,260,219) (16.3), nordiazepam (UV 310,231) (19.7), norfluoxetine (UV 262,228) (21.4), nortriptyline (UV 240) (21.0), ofloxacin (UV 327,295.5,230) (9.5), oxycodone (UV 280) (9.9), oxymorphone (UV 280) (6.7), paroxetine (UV 295,235) (19.8), pentobarbital (UV 211) (14.9), pericyazine (UV 269,232) (19.6), perphenazine (UV 320,255,210) (22.2), pethidine (15.5), phenazopyridine (UV 240) (17.1), phencyclidine (UV 265) (17.8), pheniramine (UV 260) (13.0), phenobarbital (9.9), phentermine (UV 254) (12.5), phenylephrine (UV 302,259,219) (9.2), phenylpropanolamine (UV 258) (4.9), phenyltoloxamine (UV 272) (20.6), phenytoin (15.3), pholcodine (UV 284,211.5) (4.0), pimozide (UV 280) (25.3), pinazepam (UV 310,227.5) (25.5), piroxicam (UV 248) (15.9), prazepam (UV 311,231.5) (25.1), primidone (6.2), procainamide (UV 280,210) (3.6), promethazine (UV 297,250) (21.7), propoxyphene (UV 259) (21.8), protriptyline (UV 290,211) (21.4), pseudoephedrine (UV 257) (6.2), quinidine (UV 330,240,212) (13.8), ranitidine (UV 315,227) (4.6), salicylic acid (UV 300,234) (6.5), secobarbital (UV 211) (16.0), sertraline (UV 273) (23.2), spironolactone (UV 240) (24.5), sulfamethoxazole (UV 269.5,211.5) (8.0), sulpiride (UV 293,213) (4.0), temazepam (UV 231.5,312) (19.5), terfenadine (UV 260,219) (27.4), theophylline (UV 270) (2.5), thiopentone (UV 288,238) (18.7), thioridazine (UV 314,265) (24.5), thiothixene (UV 308,259,231) (22.0), tocainide (UV 276) (8.8), tolbutamide (UV 228) (18.9), trazodone (UV 250) (14.9), triazolam (UV 223) (19.3), trifluprom azine (UV

308,257) (25.8), trimeprazine (UV 250) (26.9), trimethoprim (UV 272) (10.9), trimipramine (UV 250,211) (23.9), verapamil (UV 280,230) (21.6), zopiclone (UV 305,218) (12.3), zuclopenthixol (UV 325,267,227) (22.0)

Interfering: alprazolam (UV 225) (17.5), brompheniramine (UV 227, UV 263) (17.2), chlorpheniramine (UV 263, UV 223) (17.3), clozapine (UV 211, UV 290) (17.0), fenfluramine (UV 263) (17.2), flunitrazepam (UV 220, UV 253, UV 313) (17.5), mesoridazine (UV 220, UV 273) (17.2), oxazepam (UV 229, UV 310) (17.5), oxazolam (UV 234) (17.0), pentazocine (UV 280) (16.7), phenolphthalein (UV 231, UV 278) (16.8), propranolol (UV215, UV 230, UV 290) (17.2), propyphenazone (UV 249, UV 274) (17.0), risperidone (UV 236, UV 276) (16.7)

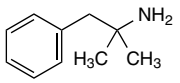
Phentermine



Molecular formula: $C_{10}H_{15}N$
Molecular weight: 149.23
CAS Registry No: 122-09-8, 1197-21-3 (HCl)
Merck Index: 13, 7346

SAMPLE

Matrix: blood
Sample preparation: Condition a 200 mg Bond Elut C18 SPE cartridge with 1 mL MeOH, 1 mL water, and 2 mL 10 mM pH 9.3 ammonium carbonate buffer. Centrifuge serum, whole blood, or urine at 14 000 g for 5 min. Vortex 0.2–1 mL aliquots of the supernatant with 2 mL 10 mM pH 9.3 ammonium carbonate buffer and IS, centrifuge at 5000 g for 10 min, add 2 mL of the supernatant to the SPE cartridge, wash with 2 mL 10 mM pH 9.3 ammonium carbonate buffer, dry SPE cartridge under vacuum for 5 min, elute with 500 μL MeOH:500 mM acetic acid 90:10. Add 10 μL 1 mM HCl to the eluate, evaporate to dryness under a stream of nitrogen, reconstitute the residue with 100 μL mobile phase, centrifuge at 14 000 g for 4 min, inject a 5–20 μL aliquot.

HPLC VARIABLES

Column: 125 × 3 Superspher RP 18
Mobile phase: MeCN:50 mM pH 3.0 ammonium formate buffer 25:75
Flow rate: 0.3
Injection volume: 5–20
Detector: MS, Finnigan MAT SSQ 7000, APCI, positive ion mode, sheath gas nitrogen 70 psi, auxiliary gas nitrogen 20 mL/min, capillary 190°, vaporizer 450°, corona current 5 μA

CHROMATOGRAM

Retention time: 4.3
Internal standard: d_{10}-methamphetamine
Limit of detection: 1 ng/mL

OTHER SUBSTANCES

Extracted: amphetamine (3.4), cathinone (2.6), ephedrine (3.1), fenfluramine (7.0), MDA (3.5), MDEA (5.2), MDMA (4.2), methamphetamine (4.1), norfenfluramine (4.2), phenylpropanolamine (2.5)

SAMPLE

Matrix: blood
Sample preparation: Mix 100 μL plasma with 10 μL 2 μM IS in water, add 200 μL 100 mM pH 10.6 borate buffer, add 750 μL ethyl acetate, vortex for 1 min, centrifuge at 1700 g at 4° for 10 min. Add 10 μL acetic acid to the organic layer, evaporate to dryness under reduced pressure at 45° over 15 min. Vortex the residue with 75 μL 4.7 mM dansyl chloride in MeCN and 25 μL 20 mM pH 9.0 carbonate buffer, heat at 45° for 30 min, add 3 μL MeCN:methylamine 80:20, let stand for 10 min, add 4 μL 3 M HCl, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Diasopak SP-120-5-ODS (Daiso, Osaka)
Mobile phase: Gradient. A was MeOH:100 mM acetic acid 60:40. B was MeCN. A:B 80:20 for 20 min, to 45:55 over 2 min, maintain at 45:55 for 17 min, return to initial conditions.
Flow rate: 1
Injection volume: 20
Detector: F ex 325 em 530

CHROMATOGRAM

Retention time: 31
Internal standard: fluoxetine (45)
Limit of quantitation: 5 nM

OTHER SUBSTANCES

Extracted: 4-bromo-2,5-dimethoxyphenylethylamine (30), epinephrine (21), fenfluramine (39), norepinephrine (16), 2-phenylethylamine (25)

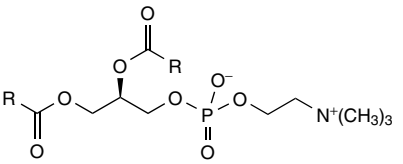
Phosphatidylcholine

CAS Registry No: 8002-43-5
Merck Index: 13, 5447



R = fatty acid

SAMPLE

Matrix: blood
Sample preparation: Shake 2 mL blood, 4 mL chloroform (Caution! Chloroform is a carcinogen!), and 2 mL MeOH vigorously for 2 min, cool in ice, centrifuge at 800 g. Evaporate the lower chloroform layer to dryness under a stream of nitrogen, reconstitute the residue with chloroform:MeOH 2:1, inject an aliquot.

HPLC VARIABLES

Guard column: 60 × 4.6 5 μm SI 60 (Merck)
Column: 250 × 4.6 5 μm Lichrosorb Diol
Column temperature: 55
Mobile phase: Gradient. A was MeCN. B was MeCN:water 80:20. A:B 88:12 for 5 min, to 77:23 over 3 min, to 30:70 over 4 min, to 25:75 over 1 min, maintain at 25:75 for 5 min, return to initial conditions over 1 min.
Flow rate: 2.5
Detector: UV 201

CHROMATOGRAM

Retention time: 14

OTHER SUBSTANCES

Extracted: phosphatidylethanolamine (13), sphingomyelin (16)

KEY WORDS

whole blood

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Sonicate 300 μL whole blood, 600 μL water, and 5 mL MeOH containing 0.01% BHT for 1 min, add 10 mL chloroform (Caution! Chloroform is a carcinogen!), sonicate for 1 min, vortex for 30 s, let stand at room temperature for 1 h, add 5 mL water, mix for 5 s, centrifuge at 2600 g for 10 min. Evaporate the lower organic layer to dryness under a stream of nitrogen, reconstitute the residue with 300 μL chloroform:MeOH 95:5, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 2 5 μm LiChrospher 100 diol
Column: 250 × 2 5 μm LiChrospher 100 diol
Column temperature: 30
Mobile phase: Gradient. A was chloroform. B was MeOH:formic acid 99.9:0.1 with ammonia added to pH 5.3 (ca. 0.05% ammonia) and 0.05% triethylamine. A:B from 95:5

to 70:30 over 11 min, to 20:80 over 3 min, maintain at 20:80 for 4 min, return to initial conditions over 2 min, re-equilibrate for 10 min.
Flow rate: 0.3
Injection volume: 10
Detector: MS, Finnigan LCQ, electrospray, ionization needle 4.5 kV, capillary 230°, sheath gas flow 90 units

CHROMATOGRAM

Retention time: 7.07 (m/z 878.5; C18:0, C22:6), 7.28 (m/z 826.5; C16:0, C20:4), 7.84 (m/z 778.5; C16:0, C16:0)
Limit of detection: 0.1–5 ng

OTHER SUBSTANCES

Extracted: phosphatidylethanolamine (10), phosphatidylglycerol (6), phosphatidylinositol (13), phosphatidylserine (17)

KEY WORDS

whole blood

SAMPLE

Matrix: lung lavage fluid
Sample preparation: Centrifuge lung lavage fluid at 4° at 450 g for 10 min. Shake 10 mL supernatant and 40 mL chloroform:MeOH 2:1 at 4° for 3 min (Caution! Chloroform is a carcinogen!). Remove the lower organic phase and wash it with 2 mL 50 mM NaCl, centrifuge, dry under a stream of nitrogen at 45°, reconstitute with 500 μL mobile phase, vortex at 4° for 1 min, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 2.1 5 μm Encapharm 100 spherical silica gel (Molnar, Berlin)
Column: 120 × 4.6 5 μm Encapharm 100 spherical silica gel (Molnar, Berlin)
Column temperature: 30
Mobile phase: Gradient. A was chloroform:MeOH:ammonium hydroxide 80:19.5:0.5. B was chloroform:MeOH:water:ammonium hydroxide 60:34:5.5:0.5. A:B from 100:0 to 0:100 over 14 min, return to initial conditions over 7 min, re-equilibrate for 10 min.
Flow rate: 1
Injection volume: 100
Detector: Evaporative Light-Scattering Detector, SEDERE Sedex-45, evaporation temperature 50°, nebulization gas nitrogen, pressure 200 kPa, flow 6 L/min, response is nonlinear but proportional to the power 1.7 of the mass and must be calibrated for each compound

CHROMATOGRAM

Retention time: 13.11
Limit of detection: 100 ng

OTHER SUBSTANCES

Extracted: diarachidoylphosphatidylcholine (12.75), dilinoleylphosphatidylcholine (12.69), diphosphatidylglycerol (6.30), lysophosphatidylcholine (18.46, 18.81), phosphatidic acid (13.78), phosphatidylethanolamine (9.00), phosphatidylglycerol (5.37), phosphatidylinositol (10.75), phosphatidylserine (11.81), sphingomyelin (15.24, 15.72)

Bünger, H.; Pison, U. Quantitative analysis of pulmonary surfactant phospholipids by high-performance liquid chromatography and light-scattering detection, *J.Chromatogr.B*, **1995**, *672*, 25–31.

SAMPLE

Matrix: tissue

Sample preparation: Homogenize (Potter-Elvehjem) liver or lung with 20 volumes chloroform:MeOH 2:1, filter (paper), wash with a volume of 50 mM NaCl equal to one-fifth the volume of extract, centrifuge (*J.Biol.Chem*. **1957**, *226*, 497). Remove the lower organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute with chloroform:MeOH 25:75, inject an aliquot. (Caution! Chloroform is a carcinogen!)

HPLC VARIABLES

Guard column: 10 × 4.6 5 μm Nucleosil 5 NH2

Column: 50 × 4.6 5 μm Nucleosil 5 NH2 + 175 × 4.6 5 μm Nucleosil 5 NH2

Column temperature: 50

Mobile phase: MeCN:MeOH:water:50% methylphosphonic acid in water 73:25:1.5:0.03, adjusted to pH 3 with 25% ammonium hydroxide in water

Flow rate: 1

Detector: F ex 340 em 460 following post-column derivatization. The column effluent mixed with the reagent pumped at 4.5 mL/min and the mixture flowed through a 2 m ×0.8 mm ID coil of PTFE tubing at 50° to the detector. (The reagent was 1 L water to which was added 250 μL Brij 35 (30% w/v), 50 mg sodium azide, and 150 μL 3 mM diphenylhexatriene in MeCN.)

CHROMATOGRAM

Retention time: 22

OTHER SUBSTANCES

Extracted: dipalmitolyphosphatidylcholine

KEY WORDS

gastric mucosa; liver; lung; pig; post-column reaction

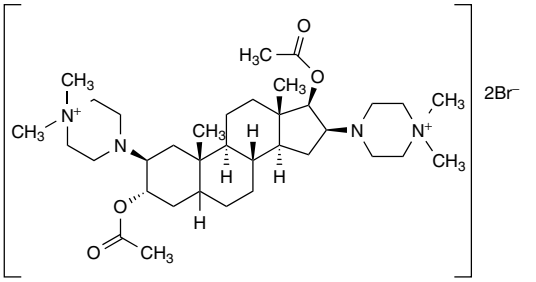
Pipercuronium bromide

Molecular formula: $C_{35}H_{62}Br_2N_4O_4$
Molecular weight: 762.71
CAS Registry No: 52212-02-9
Merck Index: 13, 7540



SAMPLE

Matrix: blood

Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 1 mL MeOH:MeCN 2:1 and 1 mL water. Acidify 1 mL plasma with 150 μL 1 M sodium dihydrogen phosphate. Add 20–200 ng IS to 1 mL acidified plasma, add to the SPE cartridge, wash with 1 mL water, wash with 1 mL 100 mM pH 3 sodium dihydrogen phosphate, elute with 400 μL mobile phase, discard first 100 μL eluate, inject a 200 μL aliquot of the remaining eluate. (Although the original method was only validated for vecuronium, it can also be used to determine pipecuronium; see: D'Honneur,G.; Khalil,M.; Dominique,C.; Haberer,J.P.; Kleef,U.W.; Duvaldestin,P. Pharmacokinetics and pharmacodynamics of pipecuronium in patients with cirrhosis. *Anesth.Analg*. **1993**, *77*, 1203–1206.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak C18

Mobile phase: Dioxane:water 20:80 containing 100 mM sodium dihydrogen phosphate and 0.44 mM 9,10-dimethoxyanthracene-2-sulfonate, pH adjusted to 3 with phosphoric acid. (Caution! Dioxane is a carcinogen!) (After each series of analyses, flush column with 200 mL MeOH and then re-equilibrate with 120 mL mobile phase.)

Flow rate: 1

Injection volume: 200

Detector: F ex 380 em 452 following post-column extraction. The column effluent mixed with dichloroethane pumped at 1.6 mL/min and the mixture flowed through a 1 m ×0.25 mm ID stainless steel coil to a phase separator (*Anal.Chim.Acta* **1987**, *192*, 267) and then the organic phase flowed through the detector.

CHROMATOGRAM

Internal standard: 1-(3α,17β-diacetoxy-2β-piperidino-5α-androstan-16β,5α-yl)piperidine (16)

Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Extracted: vecuronium (LOD 5 ng/mL) (13)

KEY WORDS

pharmacokinetics; SPE

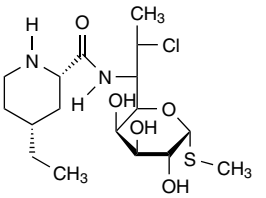
Pirlimycin



Molecular formula: $C_{17}H_{31}ClN_2O_5S$
Molecular weight: 410.96
CAS Registry No: 79548-73-5, 78822-40-9 (HCl)
Merck Index: 13, 7583

SAMPLE

Matrix: milk
Sample preparation: Shake 3 mL extracting solution and 1 mL milk for 30 s, centrifuge at 1000 g for 4 min. Remove the supernatant and add 2 mL extracting solution to the pellet. Shake for 30 s and centrifuge at 1000 g for 4 min. Combine the supernatants, add 6 mL 1-chlorobutane, add 500 μL water, shake for 30 s, centrifuge at 1000 g for 4 min. Remove the lower aqueous phase and add 2 mL water to the organic layer. Shake for 30 s and centrifuge at 1000 g for 4 min. Combine the aqueous layers, evaporate to 2 mL under nitrogen at 55–60°, add 1 mL 15% ammonia, mix. Within 30 s, add 15 mL dichloromethane and shake for 30 s. (Caution! Wear gloves and eye protection, ammonia may escape under pressure!) Centrifuge at 1000 g for 4 min. Remove the water layer and evaporate the organic layer to dryness under nitrogen at 60°. Add 500 μL 250 μM NaOH, vortex for 10 s, add 500 μL 100 μg/mL 9-fluorenylmethyl chloroformate in MeCN, vortex for 10 s, let stand for 1 h, vortex for 10 s, let stand at room temperature for at least another 2 h. Inject a 50 μL aliquot. (The extracting solution was 125 μL concentrated HCl in 100 mL MeCN.)

HPLC VARIABLES

Column: 100 × 2.1 5 μm Hypersil ODS
Column temperature: 35
Mobile phase: MeOH:MeCN:1% acetic acid 30:30:40
Flow rate: 0.6
Injection volume: 50
Detector: UV 264

CHROMATOGRAM

Retention time: 8.8
Limit of quantitation: 100 ppb

SAMPLE

Matrix: tissue
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 5 mL water. Homogenize kidney with a kitchen grinder. Weigh out a 5 g sample and add 20 mL MeCN with continuous gentle mixing, mix vigorously on a vibromixer at 1500 rpm for 30 s, sonicate for 2 min, centrifuge at 4000 g for 5 min. Mix 7.5 mL sample extract and 40 mL 10% NaCl and add to SPE cartridge, wash with 1 mL 10 mM sulfuric acid, wash with 2 mL air, elute with 2 mL acidic MeCN. Place eluate in a washed tube and evaporate to 300 μL at 70° under a stream of nitrogen, mix gently, add 1 mL *n*-hexane, mix on a vibromixer for 30 s, centrifuge at 2000 g, inject a 50 μL aliquot of the aqueous phase. (Acidic MeCN was 1 mL 50 mM sulfuric acid and 100 mL MeCN. The washed tube was prepared by rinsing with concentrated ammonia, water, and acetone and drying under a stream of nitrogen.)

HPLC VARIABLES

Guard column: 10 × 2.1 37–50 μm Bondapak C18
Column: 300 × 3.9 Bondapak C18
Mobile phase: MeCN:water 55:45 containing 2.46 g/L anhydrous sodium acetate, pH adjusted to 6.5 with acetic acid
Flow rate: 1.2

Injection volume: 50
Detector: UV 240

CHROMATOGRAM
Retention time: 18
Limit of detection: 4 ng/g

OTHER SUBSTANCES
Extracted: acepromazine (13), azaperol (Fex 246 em 351) (5), azaperone (8), carazolol (5), haloperidol (8.5), chlorpromazine (25), xylazine (7)

KEY WORDS
kidney; pig; SPE

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Cut pig kidney or liver into small pieces and homogenize. 5 g Homogenate + 10 mL MeCN, shake, vortex for 30 s, sonicate for 3 min, vortex for 30 s, sonicate for 3 min, centrifuge at 10000 g for 20 min. Add 7.5 mL supernatant and 40 mL 10% NaCl to the SPE cartridge at about 1 mL/min, do not allow cartridge to dry out, wash with 850 μL 10 mM sulfuric acid, dry with air, elute with 3.5 mL acidic MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 μL 10 mM sulfuric acid, vortex briefly, add 1 mL hexane, vortex for 30 s, centrifuge at 2000 g for 5 min, inject an aliquot of the aqueous layer. (Acidic MeCN was 1 mL 50 mM sulfuric acid in 100 mL MeCN.)

HPLC VARIABLES
Guard column: Hypersil 5 μm SAS C1
Column: 250 mm long 5 μm Hypersil SAS C1
Mobile phase: MeCN:water 50:50 containing 0.77 g/L ammonium acetate
Flow rate: 2
Detector: E, ESA Model 5100A Coulochem, first electrode +0.4 V, second electrode (which was monitored) +0.7 V, Model 5020 guard cell after pump but before injector at +0.75 V

CHROMATOGRAM
Retention time: 25
Limit of detection: 2 ng/g

OTHER SUBSTANCES
Extracted: acepromazine (18), azaperol (5), azaperone (6.5), carazolol (9), chlorpromazine (32), haloperidol (12.5), xylazine (10)

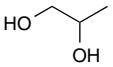
Propylene glycol



Molecular formula: $C_3H_8O_2$
Molecular weight: 76.09
CAS Registry No: 57-55-6
Merck Index: 13, 7947

SAMPLE

Matrix: blood, tissue
Sample preparation: Plasma. Mix 50 μL plasma with 10 μL 50 μg/mL IS and 50 μL 4 M NaOH, add 1 mL benzoyl chloride solution, vortex for 30 min, add 25 μL 1% glycine, vortex for 15 min, let stand at room temperature for 45 min, centrifuge at 4000 rpm for 5 min. Remove a 100 μL aliquot of the pentane layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 1 mL MeOH, inject a 10 μL aliquot. Tissue. Homogenize rat lung tissue with 4 vol of water. Mix 100 μL homogenate with 10 μL 100 μg/mL IS, let stand at room temperature for 30 min, vortex thoroughly, centrifuge at 4000 rpm for 10 min. Mix 50 μL of the supernatant with 50 μL 4 M NaOH, add 1 mL benzoyl chloride solution, vortex for 30 min, add 25 μL 1% glycine, vortex for 15 min, let stand at room temperature for 45 min, centrifuge at 4000 rpm for 5 min. Remove a 100 μL aliquot of the pentane layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL MeOH, inject a 10 μL aliquot. (Prepare benzoyl chloride solution by mixing 125 μL benzoyl chloride with 10 mL pentane.)

HPLC VARIABLES

Column: 100 × 2.1 3.5 μm Symmetry Shield RP-18 (Waters)
Mobile phase: MeOH:water:formic acid 78:22:0.1
Flow rate: 0.25
Injection volume: 10
Detector: MS, Applied Biosystems API365, APCI, ionspray 4500 V, declustering potential 1 V, focusing potential 120 V, entrance potential -2.5 V, collision entrance potential 8.57 V, collision energy 13 V, collision exit potential 16 V, probe 450°, turbo gas flow 7 L/min, m/z 285.1–163.2

CHROMATOGRAM

Retention time: 3.5
Internal standard: 1,4-butanediol (m/z 299.0–177.2) (4.4)

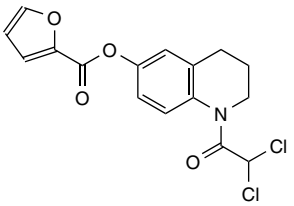
Quinfamide



Molecular formula: $C_{16}H_{13}Cl_2NO_4$
Molecular weight: 354.19
CAS Registry No: 62265-68-3
Merck Index: 13, 8147

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 2 mL MeOH, 1 mL 5 μg/mL diazepam in MeOH (sic), and 2 mL water. Dissolve 10 mg lyophilized feces in 10 mL MeCN. Add 1 mL plasma, urine, or feces solution to the SPE cartridge, wash with 12 mL water, elute with 1 mL MeCN, vortex the eluate, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax SB-CN
Mobile phase: MeCN:MeOH:water 10:50:40
Flow rate: 0.7
Injection volume: 20
Detector: UV 269

CHROMATOGRAM

Retention time: 9.7
Internal standard: diazepam (8.5)
Limit of quantitation: 80 ng/mL

OTHER SUBSTANCES

Extracted: 1-(dichloroacetyl)-1,2,3,4-tetrahydro-6-quinolol (metabolite) (6.5)

KEY WORDS

plasma; SPE

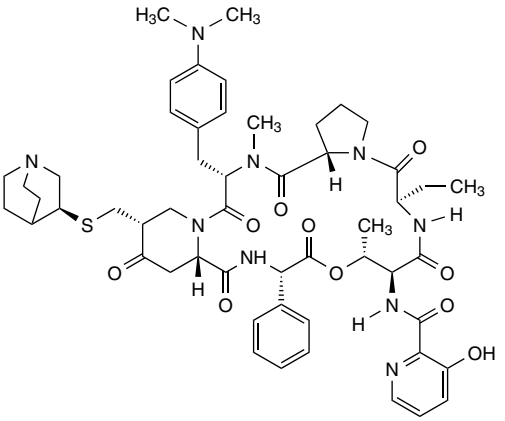
Quinupristin

Molecular formula: $C_{53}H_{67}N_9O_{10}S$
Molecular weight: 1022.24
CAS Registry No: 120138-50-3
Merck Index: 13, 8176



SAMPLE

Matrix: blood

Sample preparation: Condition a CN SPE cartridge (Lida-Interchim) with 1 mL MeOH, 1 mL water, and 1 mL buffer. Add 1 mL 3.8% sodium citrate and 2.5 mL 250 mM HCl to 10 mL whole blood. Shake gently by hand and centrifuge at 2000 g at 4° for 15 min. Add 1 mL buffer and 50 μL 100 μg/mL IS in MeOH to 1.35 mL acidified plasma. Vortex for a few seconds, centrifuge at 4000 g at 4° for 5 min. Add either supernatant to the SPE cartridge and dry the SPE cartridge with 3 mL air. Elute with 500 μL MeOH:water 70:30 containing 3.5 mM pentane sulfonic acid, inject an aliquot. (The buffer was a mixture of 85 mM pH 3.0 citric acid monohydrate containing 81 mM NaOH and 60 mM HCl.)

HPLC VARIABLES

Guard column: 10 μm μBondapak C18
Column: 125 × 4.6 5 μm Kromasil C18 (Higgins Analytical)
Mobile phase: Gradient. MeCN:buffer 30:70 for 11 min, then 32:68 for 4 min (step gradient), to 40:60 over 0.6 min, maintain at 40:60 for 0.4 min, at 38:62 for 18 min (step gradient), at 80:20 for 2 min (step gradient), re-equilibrate at 30:70 for 9 min. (Prepare buffer by adding 800 μL 70% perchloric acid to 1 L water.)
Flow rate: 0.5 for 11 min, 1 for 25 min, 0.5 for 9 min
Injection volume: 500
Detector: UV 235

CHROMATOGRAM

Retention time: 22.1
Internal standard: dimethylamino-3-propyl thiomethylene-5 virginiamycin S (31.0)
Limit of quantitation: 25 pg/mL

OTHER SUBSTANCES

Extracted: metabolites, dalfopristin (12.7), pristinamycin II A (24.1)

KEY WORDS

plasma; SPE; whole blood

SAMPLE

Matrix: tissue, urine
Sample preparation: Condition a ChromP SPE cartridge (Supelco) with 6 mL ethyl acetate, 6 mL MeOH, and 6 mL water. Condition a Screen DAU SPE cartridge (Supelco) with 2 mL MeOH, 2 mL water, and 2 mL 100 mM pH 6 phosphate buffer. Freeze-dry and grind 15 g tissue or 200–500 mg retina, add 12 mL MeOH, add 15 mL 2 M pH 5.2 acetate buffer, stir for 30 min, centrifuge at 2000 g for 15 min. Remove the supernatant and evaporate the MeOH. Mix 10 mL urine with 2 mL 2 M pH 5.2 acetate buffer. Add the tissue or urine preparations to 400 μL Helix pomatia preparation containing 25 U/μL (Sigma), heat at 60° for 15 h, centrifuge, add the supernatant to the ChromP SPE cartridge, wash with 5 mL hexane, wash with 12 mL hexane:diethyl ether 70:30, elute with 24 mL diethyl ether. Evaporate the eluate to dryness, reconstitute with 6 mL 100 mM pH 6 phosphate buffer, add to the DAU SPE cartridge, wash with 1 mL 1 M acetic acid, wash with 6 mL MeOH, elute with 6 mL ethyl acetate:32% ammonium hydroxide 97:3. Evaporate the eluate to dryness, reconstitute the residue with 50 μL MeOH:water:acetic acid 5:95:0.5, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 2 5 μm Nucleosil C18AB
Column: 50 × 2 5 μm Nucleosil C18AB
Mobile phase: Gradient. MeOH:0.5% acetic acid from 95:5 to 50:50 over 10 min, to 10:90 over 10 min, maintain at 10:90 for 10 min (?), re-equilibrate at initial conditions for 10 min. (sic).
Flow rate: 0.22
Injection volume: 10
Detector: MS, Micromass QuattroLC, triple quadrupole, nebulizing gas nitrogen 90 L/h, desolvation gas nitrogen 600 L/h, source 120°, desolvation 350°, capillary 3.5 kV, sampling cone 25 V, collision gas argon 0.4 μbar, collision energy 15–25 V, m/z 302–284–150

CHROMATOGRAM

Retention time: 8.58
Internal standard: isoxsuprine (m/z 302–284–164–136–121–107–91) (10.35)
Limit of detection: 10 ng/kg
Limit of quantitation: 30 ng/kg

Sample preparation: Caution! The method as described is applied to and validated for rocuronium. However, Wierda et al. (Wierda,J.M.K.H.; Beaufort,A.M.; Kleef,U.W.; Smeulers,N.J.; Agoston,S. Preliminary investigations of the clinical pharmacology of three short-acting non-depolarizing neuromuscular blocking agents, Org 9453, Org 9489 and Org 9487. *Can.J.Anaesth.* **1994**, *41*, 213–220.) state that "the compounds were determined by means of the HPLC method described for rocuronium bromide, which was modified and validated for ... Org 9487" [rapacuronium]. Homogenize (Ultra-Turrax) 1 g tissue with 9 mL 1 M sodium dihydrogen phosphate for 10 min. Acidify 1 mL plasma, urine, or bile with 200 μL 1 M sodium dihydrogen phosphate. Homogenize 1 mL stoma fluid with 200 μL 1 M sodium dihydrogen phosphate. Make up 50–1000 μL plasma, 200–1000 μL urine, 5–200 μL bile, 1000 μL stoma fluid, or 100–1000 μL tissue homogenate to 2 mL with water, add 1 mL buffer, add 150 ng IS, add 7 mL dichloromethane, vortex for 15 s, centrifuge at 740 g for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 37°, reconstitute the residue in 200 μL mobile phase, inject a 100 μL aliquot (or less). (The buffer was prepared by mixing 6 mL of an aqueous solution containing 7.505 mg/mL glycine and 5.85 mg/mL NaCl, with 4 mL 100 mM NaOH and 6.2 g KI.)

HPLC VARIABLES

Guard column: 4 × 6 μBondapak C18

Column: 150 × 3.9 5 μm Lichrospher 100-RP18

Mobile phase: Dioxane:buffer 16:84 (Caution! Dioxane is a carcinogen!) (The buffer was 100 mM sodium dihydrogen phosphate containing 0.11 mM 9,10-dimethoxyanthracene-2-sulfonate and 0.11 mM 1-heptanesulfonic acid, pH adjusted to 3.0 with orthophosphoric acid. After each series of analyses, flush column with 15 mL water and 75 mL MeOH.)

Flow rate: 1

Injection volume: 100

Detector: F ex 385 em 452 following post-column extraction. The column effluent mixed with dichloroethane pumped at 1 mL/min and the mixture flowed through a 1 m × 0.25 mm ID stainless steel coil to a phase separator (Organon International) and then the organic phase flowed through the detector (*J.Chromatogr.* **1987**, *421*, 327; *Anal.Chim.Acta* **1987**, *192*, 267).

CHROMATOGRAM

Retention time: 9 (for rocuronium)

Internal standard: 1-(3α,17β-dihydroxy-2β-morpholino-5α-androstan-16β-yl)-1-methylpiperidinium bromide (Org 7402, Organon) (21)

Limit of detection: 3 ng (plasma), 4 ng (urine, bile), 5 ng (tissue)

Limit of quantitation: 10 ng/mL (plasma), 25 ng/mL (urine), 100 ng/mL (bile), 20 ng/mL (stoma fluid)

OTHER SUBSTANCES

Simultaneous: cefotaxime, ceftazidime, ceftriaxone, cefuroxime, cefamandole, cephradine, dixyrazine, meperidine, metocurine, metoprolol, sulfamethoxazole, trimethoprim

Interfering: alizapride, atracurium, ketamine, ketogan, lidocaine, metoclopramide, nimodipine, prochlorperazine, tubocurarine

Noninterfering: alfentanil, aprotinin, atropine, bupivacaine, chlorpromazine, dalteparin, dexamethasone, diazepam, dopamine, droperidol, etomidate, fentanyl, furosemide, gallamine, haloperidol, midazolam, morphine, neostigmine, nitroglycerin, nitroprusside, oxytocin, pancuronium, pentobarbital, phenylephrine, phenytoin, pipecuronium, piperacillin, promethazine, propofol, ranitidine, succinylcholine, sufentanil, terbutaline, thiopental, vecuronium, verapamil

KEY WORDS

human; dog; plasma; liver; lung

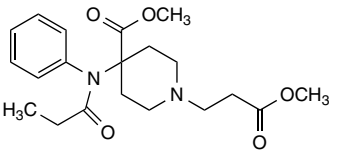
Remifentanil



Molecular formula: $C_{20}H_{28}N_2O_5$
Molecular weight: 376.45
CAS Registry No: 132875-61-7
Merck Index: 13, 8216

SAMPLE

Matrix: blood
Sample preparation: Mix 500 μL whole blood with 10 μL 50% citric acid and 25 μL 500 ng/mL IS in 1 mM HCl, add 500 μL 100 mM pH 7.4 phosphate buffer, vortex until homogeneous, add 2 mL dichloromethane, shake mechanically for 10 min, centrifuge at 13 000 rpm for 10 min. Evaporate the lower dichloromethane layer to dryness under a stream of nitrogen at room temperature, reconstitute the residue with 125 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 33 × 4.6 Pecosphere C18 (Perkin-Elmer)
Mobile phase: MeCN:chloroform 50:50 containing 2 mM ammonium acetate (Caution! Chloroform is a carcinogen!)
Flow rate: 0.3
Injection volume: 20
Detector: MS, PE Sciex API-III Plus triple quadrupole, turbo ionspray, positive ion mode, turbo 200°, orifice 60 V, auxiliary gas nitrogen at 4 L/min, curtain gas at 1.2 L/min, m/z 377–228

CHROMATOGRAM

Retention time: 1.3
Internal standard: d_4-remifentanil (381–232)
Limit of quantitation: 0.1 ng/mL

KEY WORDS

whole blood

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut phenyl SPE cartridge with 1 mL MeOH and 1 mL 50 mM pH 3 potassium phosphate buffer. Add 500 μL plasma and 750 μL 800 ng/mL IS in 50 mM pH 3 potassium phosphate buffer to the SPE cartridge, wash with 1 mL 50 mM pH 3 potassium phosphate buffer, wash with 1 mL MeCN, elute with 1 mL MeOH. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue with 200 μL mobile phase, inject a 50–100 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 3 C1
Column: 150 × 4.6 5 μm Spherisorb C1
Mobile phase: MeCN:MeOH:50 mM pH 3 potassium phosphate buffer:water 18:12:4.8:65.2
Flow rate: 1.5

Injection volume: 50–100
Detector: UV 210

CHROMATOGRAM

Retention time: 9
Internal standard: GI97559 (ethyl 3-{4-methoxycarbonyl-4-[(1-oxopropyl)-phenylamino]-1-piperidine}propanoate) (10.5)
Limit of detection: 0.5 ng/mL
Limit of quantitation: 8 ng/mL

OTHER SUBSTANCES

Extracted: demethoxyremifentanil (metabolite) (4)

KEY WORDS

dog; pharmacokinetics; plasma; SPE

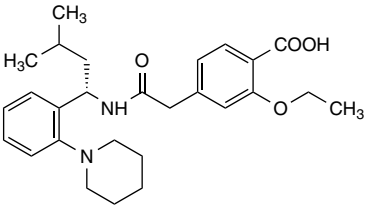
Repaglinide



Molecular formula: $C_{27}H_{36}N_2O_4$
Molecular weight: 452.58
CAS Registry No: 135062-02-1
Merck Index: 13, 8220

SAMPLE

Matrix: blood
Sample preparation: Centrifuge plasma at 13 000 g for 2 min and dilute with 2 vol of 200 mM HCl, inject a 160 μL aliquot onto column A and elute to waste with water; after 3 min, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. At the end of the separation, wash column A with MeCN:MeOH:dioxane 24:68:8. (Caution! Dioxane is a carcinogen!)

HPLC VARIABLES

Column: A 17 × 2.9 30–40 μm Perisorb RP-2 (Merck); B 17 × 4.6 5 μm ODS-Hypersil + 125 × 4 5 μm LiChrospher 100 RP-18
Mobile phase: MeCN:MeOH:dioxane:buffer 18.24:51.68:6.08:24 (Caution! Dioxane is a carcinogen!) (The buffer was 3 g potassium dihydrogen phosphate and 0.5 g lithium perchlorate in 1 L water, adjusted to pH 2.7 with orthophosphoric acid.)
Flow rate: 1
Injection volume: 160
Detector: E, Waters 460, 1.04 V (to prevent contamination, column effluent passes through the detector only from 7.5–13.8 min)

CHROMATOGRAM

Retention time: 9
Limit of detection: 5 ng/mL

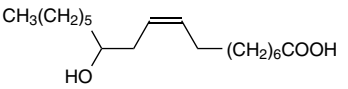
Ricinoleic acid



Molecular formula: $C_{18}H_{34}O_3$
Molecular weight: 289.46
CAS Registry No: 141-22-0
Merck Index: 13, 8295

SAMPLE

Matrix: blood

Sample preparation: Vortex 20 μL plasma, 10 μL 2 mg/mL margaric acid in MeOH, and 200 μL 500 mM KOH in EtOH for 30 s, centrifuge at 2500 g for 10 min. Remove the supernatant and heat it at 100° for 30 min, cool, add 200 μL 1 M HCl, add 2 mL chloroform (Caution! Chloroform is a carcinogen!), mix vigorously for 5 min, centrifuge at 460 g for 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure at 43°, reconstitute the residue in 500 μL benzene (Caution! Benzene is a carcinogen!), sonicate for 1 min, add 500 μL 2% oxalyl chloride in benzene, heat at 70° for 30 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL benzene, add 100 μL 40 mM 1-naphthylamine (Caution! 1-Naphthylamine is a carcinogen!) in benzene, vortex for 30 s, heat at 37° for 30 min, evaporate to dryness, reconstitute with MeOH:MeCN:water 72:13:15, vortex for 20 s, inject a 20 μL aliquot. (This method was developed for Cremophor EL, which is saponified to ricinoleic acid and then derivatized with 1-naphthylamine. However, the method should work for ricinoleic acid in plasma.)

HPLC VARIABLES

Column: two 100 × 3 5 μm Spherisorb ODS-I glass columns in series
Mobile phase: MeCN:MeOH:10 mM pH 7.0 potassium phosphate buffer 13:72:15
Flow rate: 0.4
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 10.0
Internal standard: margaric acid (27.8)
Limit of detection: 0.005%
Limit of quantitation: 0.01%

OTHER SUBSTANCES

Simultaneous: arachidonic acid, linoleic acid, linolenic acid, myristic acid, oleic acid, palmitic acid, palmitoleic acid, stearic acid

KEY WORDS

derivatization; human; mouse; plasma

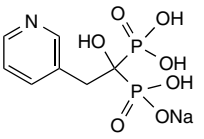
Risedronate sodium



Molecular formula: $C_7H_{10}NNaO_7P_2$
Molecular weight: 305.09
CAS Registry No: 115436-72-1, 105462-24-6 (free acid)
Merck Index: 13, 8315

SAMPLE

Matrix: urine

Sample preparation: Condition a 1 mL 30 mg HLB SPE cartridge (Waters) with 2 mL MeOH, 1 mL water, and 1 mL 10 mM mM 1-octyltriethylammonium phosphate. Immediately upon collection, add 25 μL 6 M HCl to each 1 mL urine, freeze at – 20° until ready to analyze. Mix 5 mL urine with 25 μL 125 μg/mL IS in water, add 50 μL 1.25 M calcium chloride solution, add 65 μL 30% NaOH, vortex; if no precipitate is observed, add 10 μL aliquots of 30% NaOH until a visible precipitate forms, centrifuge at 5020 g for 10 min, discard the supernatant, dissolve the precipitate in 50 μL 1 M HCl; if necessary, add 25 μL aliquots of 1 M HCl until the precipitate is completely dissolved, dilute with 5 mL water, add 50 μL NaOH to produce a second precipitate, centrifuge, discard the aqueous layer. Repeat the process. Dissolve the third precipitate in 500 μL 50 mM ethylene glycol-bis(β-aminoethyl ether)-*N*,*N*,*N*′,*N*′-tetraacetic acid (EGTA), sonicate for 5 min, vortex, add 4.5 mL water, add 100 μL 500 mM 1-octyltriethylammonium phosphate, vortex for 10 s, add to the SPE cartridge at 0.3–0.5 mL/min, wash with 1 mL water, wash with 1 mL MeOH:water 5:95, elute with 1 mL MeOH by centrifuging at 70 g for 5 min. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue with 500 μL 10 mM pH 6.25 sodium phosphate containing 1 mM etidronate, inject a 100 μL aliquot onto column A and elute to waste with mobile phase A; after 3.5 min, divert the effluent from column A onto column B and continue to elute with mobile phase A; after another 3 min, remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B.

HPLC VARIABLES

Column: A 50 × 4.6 3.5 μm X-Terra RP 18 (Waters); B 150 × 4.6 4 μm Synergi Polar RP (Phenomenex)
Column temperature: 30 (A and B)
Mobile phase: A MeCN:10 mM sodium phosphate containing 5 mM 1-octyltriethylammonium phosphate and 1 mM etidronate 8:92, apparent pH 6.25; B MeCN:11 mM sodium phosphate containing 5 mM 1-octyltriethylammonium phosphate and 1.1 mM etidronate 13:87, apparent pH 6.25
Flow rate: 1
Injection volume: 100
Detector: UV 262

CHROMATOGRAM

Retention time: 18.5
Internal standard: 2-(3-pyridinyl)oxy-1-hydroxymethane diphosphonic acid tetraammonium salt (23)
Limit of quantitation: 7.5 ng/mL

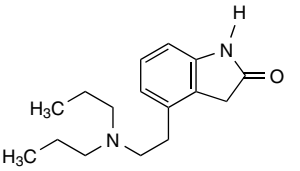
Ropinirole



Molecular formula: $C_{16}H_{24}N_2O$
Molecular weight: 260.37
CAS Registry No: 91374-21-9, 91374-20-8 (HCl)
Merck Index: 13, 8338

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL low displacement C18 SPE cartridge (Baker) with 3 column vol of MeOH and 3 column vol of water. Mix 1 mL plasma with 50 μL 2 μg/mL IS in water, add to the SPE cartridge, wash with 10 mL water, wash with 10 mL MeCN, elute with 3.5 mL MeCN:water:ammonium hydroxide 100:2:0.5. Evaporate the eluate to dryness under a stream of nitrogen at 35°, immediately reconstitute the residue with 300 μL mobile phase, mix vigorously, inject a 10–100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:70 mM pH 3.8 ammonium formate buffer 25:75 containing 0.3% EDTA and 0.005% sodium octyl sulfate
Flow rate: 1
Injection volume: 10–100
Detector: UV 250

CHROMATOGRAM

Retention time: 9.4
Internal standard: 4-(2-di-*N*,*N*-propylaminoethyl)-7-methoxy-2-(3H)-indoline HCl (11.5)
Limit of detection: 5 ng/mL
Limit of quantitation: 10 ng/mL

KEY WORDS

dog; human; pharmacokinetics; plasma; rat; SPE

REFERENCE

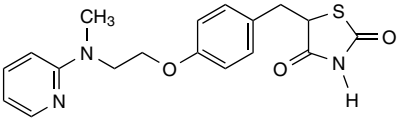
Rosiglitazone



Molecular formula: $C_{18}H_{19}N_3O_3S$
Molecular weight: 357.43
CAS Registry No: 122320-73-4, 155141-29-0 (maleate)
Merck Index: 13, 8346

SAMPLE

Matrix: blood
Sample preparation: Vortex 1 mL plasma with 50 μL 10 μg/mL IS in pH 2.3 buffer for 1 min, add 200 μL 20 mM pH 9.3 disodium tetraborate solution, vortex for 1 min, add 5 mL dichloromethane, shake horizontally for 10 min, centrifuge at 735 g for 10 min. Evaporate the organic layer to dryness under a stream of nitrogen at room temperature, reconstitute the residue with 5 mL *n*-hexane:dichloromethane 80:20, vortex for 30 s, add 350 μL pH 2.3 buffer, vortex for 2 min, centrifuge at 735 g for 10 min, inject a 100 μL aliquot. (Prepare pH 2.3 buffer by dissolving 0.136 g of potassium dihydrogen phosphate in 800 ml of water, adjusting to pH 2.3 with 10% HCl, and diluting to 1 L with water.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Zorbax SB C18
Column temperature: 30
Mobile phase: MeOH:buffer 30:70 (Prepare the buffer by dissolving 1.41 g of disodium hydrogen phosphate and 1.56 g of sodium dihydrogen phosphate in 800 ml water, adjusting to pH 2.6 with orthophosphoric acid and diluting to 1 L with water.)
Flow rate: 1.2
Injection volume: 100
Detector: UV 245

CHROMATOGRAM

Retention time: 8.3
Internal standard: pioglitazone (18.0)
Limit of quantitation: 5 ng/mL

KEY WORDS

plasma

SAMPLE

Matrix: blood
Sample preparation: Mix 250 μL plasma with 10 μg IS for 15 s, add 3 mL ethyl acetate, vortex for 1 min, centrifuge at 2000 rpm for 10 min. Evaporate the organic layer to dryness under a stream of nitrogen at 40°, reconstitute the residue with 750 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hichrom KR100-5C18-250A
Mobile phase: MeCN:MeOH:10 mM potassium dihydrogen phosphate 50:10:40, adjusted to pH 6.5 with triethylamine

Flow rate: 1
Injection volume: 50
Detector: F ex 247 em 367

CHROMATOGRAM

Retention time: 8
Internal standard: celecoxib (16)
Limit of quantitation: 5 ng/mL

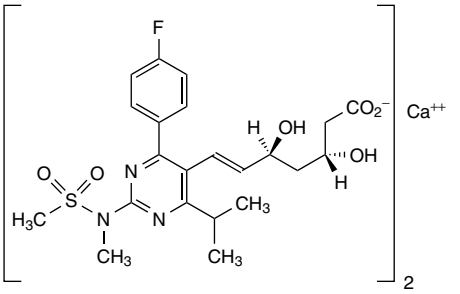
Rosuvastatin calcium

Molecular formula: $2C_{22}H_{27}FN_3O_6S.Ca$
Molecular weight: 1001.14
CAS Registry No: 147098-20-2



SAMPLE

Matrix: blood
Sample preparation: Condition a 30 mg Oasis HLB SPE cartridge (in 96 well plate) with 1 mL MeOH and 1 mL 0.5% acetic acid. Mix 500 μL plasma with 500 μL 100 mM pH 4 acetate buffer, 50 μL 150 ng/mL IS in MeOH:1 M acetic acid 50:50, and 750 μL 1 M acetic acid, vortex for 2 s, centrifuge at 738 g for 7 min, add 1.7 mL of the supernatant to the SPE cartridge, wash with 1 mL MeOH:0.5% acetic acid 30:70, elute with 1 mL 0.5% acetic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 130 μL 0.5% acetic acid, centrifuge at 1700 or 9500 g for 10 min, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Luna C18(2)
Mobile phase: MeOH:0.2% formic acid 70:30 (divert first 2 min of run to waste)
Flow rate: 1
Injection volume: 100
Detector: MS, PE Sciex API 365, TurboIonspray 450°, 0.2 mL/min entered detector, positive ion mode, ionspray 3000 V, ring 160 V, orifice 44 V, nebulizer gas nitrogen at 14 units, TurboIonspray gas nitrogen at 7 L/min, collision gas nitrogen 4 units, curtain gas nitrogen 8 units, deflector −250 V, electron multiplier 2900 V, collision energy −47.5 V, m/z 482.2−258.2

CHROMATOGRAM

Retention time: 3.6
Internal standard: d_6-rosuvastatin (m/z 488.2−264.2)
Limit of quantitation: 100 pg/mL

KEY WORDS

plasma; SPE

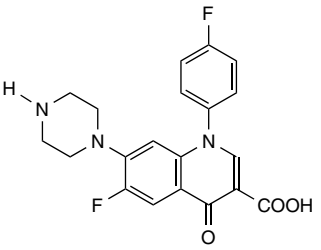
Sarafloxacin

Molecular formula: $C_{20}H_{17}F_2N_3O_3$
Molecular weight: 385.36
CAS Registry No: 98105-99-8, 91296-87-6 (HCl)
Merck Index: 13, 8447



SAMPLE

Matrix: blood

Sample preparation: Mix 200 μL plasma with 800 μL 750 ng/mL IS in 100 mM pH 7.4 phosphate buffer, add 6 mL chloroform (Caution! Chloroform is a carcinogen!), shake at 200 oscillations/min for 30 min, centrifuge at 13 000 g for 6 min. Evaporate the organic layer to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL phosphate-buffered saline, inject a 10–80 μL aliquot.

HPLC VARIABLES

Guard column: Guard-Pak Novapak C18
Column: 150 × 3.9 5 μm Novapak C18
Mobile phase: MeCN:buffer 18:82 (The buffer was 20 mM potassium dihydrogen phosphate containing 6 mM phosphoric acid and 12 mM tetraethylammonium bromide adjusted to pH 3.0 with 2 M NaOH.)
Flow rate: 1
Injection volume: 10–80
Detector: F ex 338 em 425

CHROMATOGRAM

Retention time: 5.6
Internal standard: norfloxacin (2.2)
Limit of detection: 6 ng/mL
Limit of quantitation: 12 ng/mL

SAMPLE

Matrix: blood
Sample preparation: Condition a 25 mg Certify mixed-mode SPE cartridge in a 96 well plate (Varian) with 500 μL MeOH and 500 μL 5% acetic acid. Mix 350 μL plasma with 20 μL 500 ng/mL IS in MeOH:water 50:50 and 350 μL 5% acetic acid, add to the SPE cartridge, wash with 500 μL 5% acetic acid, wash with 500 μL MeOH, dry for 3 min, elute with two 350 μL portions of MeCN:ammonium hydroxide 98:2. Evaporate the eluate to dryness, reconstitute the residue with 200 μL 0.05% trifluoroacetic acid in MeCN, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 50 × 3 5 μm Betasil silica (Keystone)
Mobile phase: Unspecified. However, in similar analyses, the authors have reported MeCN:water:trifluoroacetic acid 90:10:0.1 (*J.Pharm.Biomed.Anal.* **2003**, *32*, 609), MeCN:water:formic acid 90:10:0.1 (*J.Chromatogr.B* **1999**, *735*, 255), and MeCN:water:trifluoroacetic acid 95:5:0.05 (*J.Chromatogr.B* **2001**, *754*, 387)
Flow rate: 0.4
Injection volume: 10
Detector: MS, PE Sciex API 3000, electrospray, positive ion mode, ionspray needle 5000 V, turbo gas 400°, auxiliary gas 8 L/min, nebulizer gas 12 units, curtain gas 8 units, collision gas 4 units, declustering 46 V, focusing 200 V, collision energy 77 V, m/z 475–283

CHROMATOGRAM

Retention time: 1.7
Internal standard: 1-[[3-(7-methoxy-1-methyl-3-propyl-1*H*-pyrazolo[4,3-d]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl]-4-methylpiperazine (m/z 489–297) (1.6)
Limit of quantitation: 1 ng/mL

OTHER SUBSTANCES

Extracted: desmethylsildenafil (metabolite) (m/z 461–283) (1.6)

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood
Sample preparation: Vortex 1 mL plasma with 100 μL 20 μg/mL IS in MeOH and 100 μL 1 M NaOH for 5 s, add 3 mL ethyl acetate, vortex for 5 min, centrifuge at 2950 g

for 10 min. Evaporate the organic layer to dryness under a stream of nitrogen at 40°, reconstitute the residue with 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil 5 ODS-2
Mobile phase: MeCN:buffer 55:45 (The buffer was 30 mM potassium dihydrogen phosphate adjusted to pH 6.0 with 1 M NaOH.)
Flow rate: 0.5
Injection volume: 100
Detector: UV 230

CHROMATOGRAM

Retention time: 7.5
Internal standard: butylparaben (12)
Limit of quantitation: 10 ng/mL

KEY WORDS

pharmacokinetics; plasma

Simethicone

CAS Registry No: 8050-81-5

Merck Index: 13, 3241

SAMPLE

Matrix: formulations

Sample preparation: Add formulation (oral liquid or crushed tablet) to 25 mL dichloromethane and 25 mL diluted HCl (2:1), shake vigorously for 5 min, let stand for 1 h. Dry 5 mL of the lower organic layer over 500 mg anhydrous sodium sulfate, filter (0.45 μm nylon), inject an aliquot of the filtrate.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Alltima C8

Mobile phase: Gradient. MeCN:chloroform from 45:55 to 15:85 over 5 min, return to initial conditions over 5 min, re-equilibrate for 5 min. (Caution! Chloroform is a carcinogen!)

Flow rate: 1

Detector: Evaporative Light Scattering Detector, Alltech model 500, drift tube 95°, nebulizer 2 L/min

CHROMATOGRAM

Retention time: 9.2

KEY WORDS

crushed tablet; oral liquid

Sodium oxybate

Molecular formula: $C_4H_7NaO_3$
Molecular weight: 126.09
CAS Registry No: 502-85-2, 591-81-1 (free acid)
Merck Index: 13, 4840

SAMPLE

Matrix: solutions
Sample preparation: Mix 200 μL of a solution in MeOH:water 10:90 with 150 μL 20 mM 0.5 mM tetrakis(decyl)ammonium bromide in 5 mM pH 7.0 phosphate buffer and 100 μL 4.2 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, stir at 70° for 65 min, add 150 μL 80 μg/mL IS in MeCN, sonicate for 1 min, inject a 50 μL aliquot. (Preparation of 2-bromoacetyl-6-methoxynaphthalene is given in *Organic Syntheses*, Collective Volume 6, page 175; available free of cost at www.orgsyn.org.)

HPLC VARIABLES

Column: 250 × 4.5 Hypersil 5 ODS
Column temperature: 35
Mobile phase: MeCN:MeOH:25 mM pH 4.5 phosphate buffer 18.7:15.3:66
Flow rate: 1.7
Injection volume: 50
Detector: F ex 300 em 460

CHROMATOGRAM

Retention time: 35
Internal standard: 4-(6-methoxy-2-naphthyl)-4-oxobutanoic acid (Synthesis of 4-(6-methoxy-2-naphthyl)-4-oxobutanoic acid is as follows. Dissolve 5 g 2-acetyl-6-methoxynaphthalene (6′-methoxy-2′-acetonaphthone) in the minimum amount of warm glacial acetic acid, add 2.5 g glyoxylic acid, reflux for 24 h, evaporate to dryness under reduced pressure, dissolve the residue in chloroform, extract three times with 5% sodium carbonate solution (Caution! Chloroform is a carcinogen!). Combine the extracts and acidify them with concentrated HCl, filter to recover the product, recrystallize from MeOH/water to obtain 4-(6-methoxy-2-naphthyl)-4-oxo-2-butenoic acid (mp 165–168°). Dissolve 4 g 4-(6-methoxy-2-naphthyl)-4-oxo-2-butenoic acid in the minimum amount of THF, add palladium on charcoal, hydrogenate until 450 mL hydrogen are absorbed, filter, evaporate to dryness under reduced pressure, recrystallize from acetic acid to obtain 4-(6-methoxy-2-naphthyl)-4-oxobutanoic acid as a white solid (mp 148°) (*Farmaco Ed.Sci*. **1982**, *37*, 171).) Somatropin

Molecular formula: $C_{990}H_{1529}N_{263}O_{299}S_7$

Molecular weight: 22124.12

CAS Registry No: 9002-72-6, 12629-01-5 (human)

Merck Index: 13, 8789

SAMPLE

Matrix: blood

Sample preparation: Prepare an immunoaffinity chromatography column by circulating 5 mL 500 μg/mL polyclonal antibodies raised against porcine somatotropin in 200 mM pH 8.3 sodium bicarbonate containing 500 mM NaCl through a 1 mL Hitrap NHS-activated immunoaffinity chromatography column (Amersham Pharmacia) for 12 h. Wash and deactivate the column by passing in sequence three times 6 mL 500 mM pH 8.3 ethanolamine containing 500 mM NaCl and 6 mL 100 mM pH 4 sodium acetate containing 500 mM NaCl. Slowly pass 10 mL serum (0.5 drop/s) through the column, wash with 5 mL 200 mM pH 8.3 sodium bicarbonate containing 500 mM NaCl, elute with 5 mL EtOH:water 70:30, concentrate with a diafiltration device (MW cut-off 10 000 Da, Vivasciences) while centrifuging at 6000 g for 30 min, inject a 25 μL aliquot of the residue. Alternatively, dissolve 1 g urea in 10 mL plasma, filter with a diafiltration device (MW cut-off 30 000 Da, Vivasciences) while centrifuging at 6000 g for 30 min, pass 5 mL through a Hiload 26/60 Superdex 75 pg GPC column (Amersham Pharmacia), concentrate the appropriate fraction with a diafiltration device (MW cut-off 10 000 Da, Vivasciences) while centrifuging at 6000 g for 30 min, inject a 25 μL aliquot of the residue.

HPLC VARIABLES

Column: 50 × 1 3.5 μm Zorbax Extend-C18

Mobile phase: Gradient. MeCN:1% acetic acid from 10:90 to 90:10 over 5 min

Flow rate: 0.06

Injection volume: 25

Detector: MS, Agilent 1100 MSD, electrospray, positive ion, nebulizer 20 psi, capillary 5000 V, drying gas 7 L/min at 350°, voltage applied to capillary 190 V, m/z 1279.2–1359.1 (natural porcine), m/z 1270.5–1349.5 (recombinant porcine)

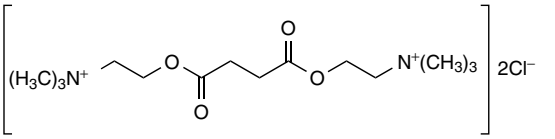
Molecular formula: $C_{14}H_{30}Cl_2N_2O_4$
Molecular weight: 361.31
CAS Registry No: 71-27-2, 55-94-7 (bromide), 541-19-5 (iodide)
Merck Index: 13, 8959 (chloride), 8958 (bromide), 8960 (iodide)



SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut C2 SPE cartridge with 3 mL TMAH buffer and 3 mL water. Mix 1 mL plasma with 1 mL water and 100 μL 100 ng/mL IS in 100 mM pH 5.0 phosphate buffer, add to the SPE cartridge, wash with 3 mL water, wash with 3 mL MeCN, wash with 3 mL MeOH, elute with two 250 μL portions of TMAH buffer, inject a 150 μL aliquot of the eluate. (Prepare TMAH buffer by dissolving 275.6 mg tetramethylammonium chloride in 1 mL water and adding 240 mL MeOH, adjust to apparent pH 3.0 with 100 mM HCl, make up to 250 mL with MeOH.)

HPLC VARIABLES

Column: 125 × 4.6 5 μm Spherisorb CN
Column temperature: 35
Mobile phase: MeCN:MeOH:30 mM phosphoric acid 35:25:45, adjusted to apparent pH 5.00 with concentrated ammonium hydroxide
Flow rate: 2
Injection volume: 150
Detector: E, ESA Coulochem II, 5010 analytical cell, detector 1 450 mV (screen), detector 2 750 mV (monitored)

CHROMATOGRAM

Retention time: 9.2
Internal standard: pipecuronium (19.8)
Limit of quantitation: 250 ng/mL

OTHER SUBSTANCES

Simultaneous: mivacurium (21), rocuronium (18), vecuronium (21)

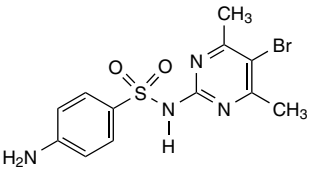
Sulfabromomethazine



Molecular formula: $C_{12}H_{13}BrN_4O_2S$
Molecular weight: 357.23
CAS Registry No: 116-45-0
Merck Index: 13, 8983

SAMPLE

Matrix: tissue

Sample preparation: Cut 20 g tissue into small pieces and add to 25 mL dichloromethane, let stand for 20–30 min with frequent stirring with a glass rod, filter through glass wool, repeat extraction twice more. Combine the dichloromethane layers and shake with 10 mL 1.5 M sulfuric acid for 15 min. Remove the aqueous phase and add it to 10 mL dichloromethane, shake for 10 min, discard the organic phase, repeat the wash, add 1 mL 10% dipotassium hydrogen phosphate to the aqueous phase, add 3 mL 40% NaOH, mix well, allow to cool, adjust pH to 5–6 with 1.5 M sulfuric acid or 40% NaOH, add 5 mL dichloromethane, extract for 15 min, repeat the extraction. Pass the organic layers through anhydrous sodium sulfate, evaporate to 1 g on a hot plate at 60–70° (in a hood!), inject a 10 μL aliquot. For confirmation of sulfabromomethazine, add 1 mL MeOH to the extract, add 2 drops acetic anhydride, heat at 80–90° on a hot plate until acetic acid fumes are no longer seen, reconstitute with 1 g dichloromethane, inject a 10 μL aliquot. (Note: Extraction from the sample matrix is only demonstrated for sulfamethazine, but it should work for sulfabromomethazine.)

HPLC VARIABLES

Column: 250 mm long MicroPak CN-10
Mobile phase: Isooctane:chloroform:MeOH:acetic acid 30.5:65:4:0.5 (Caution! Chloroform is a carcinogen!)
Flow rate: 0.33
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 3.56 (4.16 for acetyl sulfabromomethazine)
Limit of detection: 20 ppb (for sulfamethazine)

OTHER SUBSTANCES

Extracted: acetylsulfachlorpyridazine (6.68), acetylsulfadiazine (6.78), acetylsulfadimethoxine (4.70), acetylsulfaethoxypyridazine (5.23), acetylsulfamethazine (5.34), sulfachlorpyridazine (5.60), sulfadiazine (5.55), sulfadimethoxine (3.99), sulfaethoxypyridazine (4.60), sulfamethazine (4.34)
Noninterfering: sulfamerazine, sulfathiazole, sulfanilamide, sulfapyridine, sulfaquinoline

KEY WORDS

SAMPLE

Matrix: tissue
Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allow to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2–3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one-tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge, moist pH paper should turn blue), elute with 3 mL MeOH at 1–2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 μL initial mobile phase, centrifuge, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 125 × 4 5 μm LiChrospher 100 RP-18
Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 0.8
Injection volume: 50
Detector: UV 270; F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 μL mercaptoethanol. The buffer was 20 mM sodium dihydrogen phosphate adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM

Retention time: 22
Limit of detection: 0.5–5 ppb

SAMPLE

Matrix: tissue
Sample preparation: Prepare a 30 × 6 column of 80–200 mesh neutral alumina (Brockman Activity I) and wash with two 2 mL portions of chloroform:ethyl acetate 50:50 (Caution! Chloroform is a carcinogen!). Blend (Polytron) 2.5 g partially frozen tissue with 20 mL chloroform:ethyl acetate:DMSO 50:50:0.8 at medium speed for 45 s, centrifuge at 3500 rpm for 5 min (10 min for liver), pass the organic layer through a plug of glass wool. Pass 15 mL filtrate through the alumina column, wash with three 1 mL portions of chloroform, wash with 3 mL chloroform, force remaining chloroform out with air pressure until dry, pass air through the column for an additional 5 min, elute with MeOH:50 mM pH 6.0 potassium phosphate buffer 50:50, collect first 2 mL eluate, inject a 50 μL aliquot. (Protect from light.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-18
Mobile phase: MeOH:buffer 42.5:57.5 (The buffer was 50 mM potassium dihydrogen phosphate containing 1 mM EDTA, adjusted to pH 6.0 with 1 M NaOH.)
Flow rate: 1
Injection volume: 50

Detector: E, Bioanalytical Systems BAS Model LC-4B, glassy carbon electrode −0.8V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 13.2
Limit of detection: <6 ng/g

OTHER SUBSTANCES

Extracted: aklomide (5.3), furazolidone (4.0), nitrofurazone (4.1), nitromide (6.7), zoalene (6.2)

KEY WORDS

chicken; liver; muscle; SPE

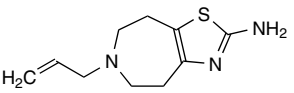
Talipexole



Molecular formula: $C_{10}H_{15}N_3S$
Molecular weight: 209.32
CAS Registry No: 101626-70-4, 36085-73-1 (di HCl)
Merck Index: 13, 9129

SAMPLE

Matrix: blood, urine
Sample preparation: Vortex 1 mL urine or plasma with 50 μL 1% acetic acid, 100 μL 1 M NaOH, and 6 mL diethyl ether for 5 min, centrifuge at 2500 g for 5 min, freeze in dry ice/acetone. Add the organic layer to 100 (plasma) or 200 (urine) μL buffer, mix, freeze in dry ice/acetone, discard the organic layer, remove traces of organic solvent with a stream of nitrogen, thaw, inject a 50 μL aliquot. (Prepare the buffer by dissolving 1.7 g potassium dihydrogen phosphate, 1.7 g sodium acetate, and 0.5 g sodium heptanesulfonate in 500 mL water, adjust pH to 3.5 with acetic acid. Use only polypropylene containers.)

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee RP-8
Column: 250 × 4.6 5 μm Zorbax Rx C8
Mobile phase: MeCN:buffer 13:87 (Prepare mobile phase by dissolving 10.2 g potassium dihydrogen phosphate, 10.2 g sodium acetate, and 4.5 g sodium heptanesulfonate in 3 L water, adjust pH to 3.5 with acetic acid, add 450 mL MeCN.)
Flow rate: 1.2
Injection volume: 50
Detector: E, ESA 5100A detector, 5020 guard cell 0.65 V, 5011 analytical cell, electrode 1 0.2 V (impurity screening), electrode 2 0.6 V (monitored); UV 286

CHROMATOGRAM

Retention time: 10
Limit of quantitation: 50 pg/mL (plasma, E), 10 ng/mL (urine, UV) (for pramipexole)

OTHER SUBSTANCES

Extracted: pramipexole (15)

KEY WORDS

plasma; method is validated for pramipexole and talipexole is IS; recovery of talipexole from plasma is 98.2% and from urine is 95.1%

REFERENCE

Lau, Y.Y.; Hanson, G.D.; Ichhpurani, N. Determination of pramipexole (U-98,528) in human plasma and urine by high-performance liquid chromatography with electrochemical and ultraviolet detection. *J.Chromatogr.B*, **1996**, *683*, 217–223.

SAMPLE

Matrix: blood
Sample preparation: Vortex 1 mL plasma with 50 μL 1% acetic acid, 100 μL 1 M NaOH, and 6 mL MTBE for 5 min, centrifuge at 630 g for 5 min, freeze in dry ice/acetone. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 100 μL MeOH:water 95:5, inject a 70 μL aliquot. (Use only polypropylene containers.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Zorbax SB CN
Mobile phase: MeOH:water:100 mM ammonium acetate 80:15:5
Flow rate: 1.2
Injection volume: 70
Detector: MS, PE Sciex API-III triple quadrupole, nebulizer 470°, gas-phase chemical ionization, positive ion mode, Corona discharge 3 μA, nebulizer gas at 550 kPa, auxiliary gas 1.5 L/min, orifice 45 V, m/z 210–141

CHROMATOGRAM

Retention time: 2.2
Limit of quantitation: 50 pg/mL (for pramipexole)

OTHER SUBSTANCES

Extracted: pramipexole (m/z 212–153) (3.4)

KEY WORDS

plasma; method is validated for pramipexole, and talipexole is IS; recovery of talipexole is 85.4%

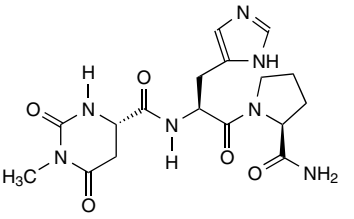
Taltirelin

Molecular formula: $C_{17}H_{23}N_7O_5$
Molecular weight: 405.41
CAS Registry No: 103300-74-9, 201677-75-0 (tetrahydrate)
Merck Index: 13, 9135



SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL 60 mg Oasis HLB divinylbenzene-*N*-vinylpyrrolidone SPE cartridge with 1 mL MeOH, 1 mL water, and 1 mL 200 mM sodium carbonate. Mix 500 μL plasma with 50 μL mobile phase A and 1 mL 200 mM sodium carbonate, add to the SPE cartridge, wash with 2 mL water, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 250 μL 50 ng/mL IS in mobile phase A, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 150 × 2 5 μm Daisopak SP-120-30DS-BP (Daiso, Osaka)
Column temperature: 40
Mobile phase: Gradient. A was MeOH:0.1% formic acid 7.5:92.5. B was MeOH:0.1% formic acid 90:10. A:B 100:0 for 3 min, to 0:100 over 1 min, maintain at 0:100 for 3 min, return to initial conditions over 0.1 min, re-equilibrate for 12.9 min.
Flow rate: 0.2
Injection volume: 25
Detector: MS, PE Sciex API 3000, TurboIonSpray, positive ionization, source 475°, source flow rate 7 L/min, ionspray 5000 V, nebulizer gas air at 14 units, curtain gas nitrogen at 12 units, collision gas nitrogen at 4 units, collision energy – 80 eV, m/z 406–264

CHROMATOGRAM

Retention time: 3.1
Internal standard: *N*-[(*S*)-hexahydro-1-methyl-2,6-dioxo-4-pyrimidinylcarbonyl]-L-histidine (m/z 310–264) (2.7)
Limit of quantitation: 17 pg/mL

OTHER SUBSTANCES

Extracted: taltirelin acid-type (4.9)

KEY WORDS

plasma; SPE

REFERENCE

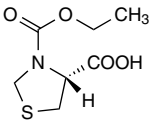
Telmesteine



Molecular formula: $C_7H_{11}NO_4S$
Molecular weight: 205.23
CAS Registry No: 122946-43-4

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Plasma. Mix 300 μL plasma with 600 μL MeCN, centrifuge at 1000 g for 10 min. Evaporate the supernatant to dryness under a stream of nitrogen, reconstitute the residue with 50 μL initial mobile phase, inject a 30 μL aliquot. Urine, bile. Add 1 mL urine or bile to an activated Sep-Pak C18 SPE cartridge, wash with two 1 mL portions of water, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 100 μL initial mobile phase, inject a 30 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm YMC-Pak C8
Mobile phase: Gradient. MeCN:0.1% acetic acid from 20:80 to 40:60 over 25 min, maintain at 40:60 for 5 min
Flow rate: 1
Injection volume: 30
Detector: Radioactivity (^{14}C); MS, Agilent LC-MSD Trap, 10% of column effluent entered MS detector

CHROMATOGRAM

Retention time: 21.1

OTHER SUBSTANCES

Extracted: glucuronide conjugate (15.8)

KEY WORDS

pharmacokinetics; plasma; rat; SPE

REFERENCE

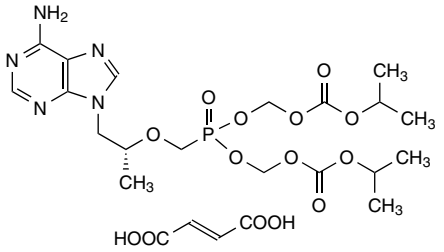
Tenofovir disoproxil fumarate

Molecular formula: $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$
Molecular weight: 635.51
CAS Registry No: 202138-50-9, 147127-20-6 (tenofovir only)
Merck Index: 13, 9223



SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL plasma with 20 μL 2.5 μg/mL IS in water, add 600 μL MeOH, vortex for 30 s, centrifuge at 2200 g for 10 min. Evaporate the supernatant to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL reagent, heat at 80° for 40 min, cool at – 20° for 10 min, inject a 40–80 μL aliquot. (The reagent was 0.34% chloroacetaldehyde in 100 mM pH 4.5 acetate buffer, prepared just before use.)

HPLC VARIABLES

Guard column: 15 × 3 (Cluzeau)
Column: 250 × 3 5 μm C8 plus satisfaction (Cluzeau, France)
Column temperature: 35
Mobile phase: MeCN:5 mM pH 6 phosphate buffer containing 5 mM tetrabutylammonium chloride 15:85
Flow rate: 0.5
Injection volume: 40–80
Detector: F ex 236 em 420

CHROMATOGRAM

Retention time: 11.7 (of tenofovir)
Internal standard: adefovir (9.5)
Limit of quantitation: 5 ng/mL

KEY WORDS

derivatization; plasma

REFERENCE

Jullien, V.; Tréluyer, J.-M.; Pons, G.; Rey, E. Determination of tenofovir in human plasma by high-performance liquid chromatography with spectrofluorimetric detection, *J.Chromatogr.B*, **2003**, *785*, 377–381.

SAMPLE

Matrix: blood
Sample preparation: Mix 200 μL plasma with 1 μg/mL IS and 400 μL 0.1% trifluoroacetic acid in MeCN, centrifuge. Evaporate the supernatant to dryness under reduced pressure at room temperature, reconstitute the residue with 200 μL 0.34% chloroacetaldehyde in 100 mM pH 4.5 sodium acetate buffer, vortex, centrifuge. Heat the supernatant at 95° for 40 min, evaporate to dryness, reconstitute with 200 μL mobile phase A, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 Brownlee RP-18 Newguard
Column: 150 × 4.6 Zorbax RX-C18
Column temperature: 35
Mobile phase: Gradient. A was MeCN:buffer 5:95. B was MeCN:buffer 65:35. A:B 100:0 for 8 min, to 0:100 for 10 min, return to initial conditions (step gradient), re-equilibrate for 8 min. (The buffer was 20 mM pH 6.0 phosphate buffer containing 5 mM tetrabutylammonium hydrogen phosphate.)
Flow rate: 1.5
Injection volume: 20
Detector: F ex 236 em 420

CHROMATOGRAM

Internal standard: 9-[2-(phosphonomethoxy)ethyl]adenine (PMEA)

KEY WORDS

derivatization; dog; plasma; method validated for tenofovir only

REFERENCE

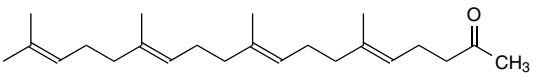
Teprenone

Molecular formula: $C_{23}H_{38}O$
Molecular weight: 330.55
CAS Registry No: 6809-52-5
Merck Index: 13, 9228



SAMPLE

Matrix: blood

Sample preparation: Condition a 200 mg Bond Elut C18 SPE cartridge with 1 column vol of MeOH and 2 column vol of water. Vortex 1 mL plasma, 100 μL 10 μg/mL IS in MeOH, and 1 mL water, add 1 mL EtOH, add 100 μL 50% KOH solution, heat in a boiling water bath for 10 min, cool, add 3 mL hexane, shake for 10 min, centrifuge at 1670 g for 5 min, repeat extraction twice more. Combine the organic layers, evaporate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 200 μL 0.5% HCl in isopropanol, add 200 μL 0.2% dansylhydrazine in isopropanol, heat at 35° for 60 min, add 1 mL water, add to the SPE cartridge, wash twice with 3 mL portions of water, wash with 1 mL MeCN, elute with three 500 μL portions of MeOH:chloroform 50:50 (Caution! Chloroform is a carcinogen!). Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 200 μL EtOH, sonicate, centrifuge at 1670 g for 5 min, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 150 × 6 5 μm YMC-A312 C18
Column temperature: 30
Mobile phase: MeCN:water:triethylamine 92.5:7.5:0.015
Flow rate: 1.8
Injection volume: 50
Detector: F ex 365 em 515

CHROMATOGRAM

Retention time: 9 (cis-5, syn), 10 (trans-5, syn), 13 (cis-5, anti), 14 (trans-5, anti)
Internal standard: 7,11,15,19-tetramethyl-6,10,14,18-eicosatetraen-3-one (15, 16 (syn/anti))
Limit of quantitation: 8 ng/mL (cis), 12 ng/mL (trans)

KEY WORDS

derivatization; pharmacokinetics; plasma; SPE; teprenone is a cis:trans (39.8:60.2) mixture at the 5-double bond and produces syn and anti derivatives at the ketone

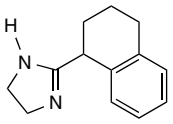
Tetrahydrozoline



Molecular formula: $C_{13}H_{16}N_2$
Molecular weight: 200.28
CAS Registry No: 84-22-0, 522-48-5 (HCl)
Merck Index: 13, 9292

SAMPLE

Matrix: blood

Sample preparation: Mix 1 mL whole blood with 20 μL 1 μg/mL dibenzepin in MeOH:water 50:50, add 300 μL pH 11 Tris buffer, mix, add 500 μL butyl acetate, vortex for 2 min, centrifuge. Preserve the aqueous layer (A). Remove the organic layer and add it to 75 μL 10 mM ammonium acetate buffer containing 0.1% formic acid (pH 3.2), evaporate (?). Add 75 μL MeCN, sonicate for 5 min, centrifuge at 5000 rpm for 5 min, keep the extract as B. Add 20 μL 1 μg/mL enalapril in MeOH:water 50:50 and 120 mg NaCl to the aqueous layer (A), mix, add 500 μL pH 3 phosphate buffer, add 600 μL 8.5% phosphoric acid, add 5 mL dichloromethane:isopropanol 95:5, shake at 250 cycles/min in a bench-top shaker for 30 min, centrifuge at 5000 rpm for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 45°. Reconstitute the residue with 150 μL initial mobile phase, sonicate, centrifuge, combine with extract B, inject a 30 μL aliquot. (Sample preparation from Gergov,M.; Robson,J.N.; Ojanperä,I.; Heinonen,O.P.; Vuori,E. Simultaneous screening and quantitation of 18 antihistamine drugs in blood by liquid chromatography ionspray tandem mass spectrometry. *Forensic Sci.Inter.* **2001**, 121, 108–115.)

HPLC VARIABLES

Guard column: 40 mm long 4 μm Purospher RP-18 LiChro Cart 4-4
Column: 100 × 2.1 4 μm Genesis C18 (Jones Chromatography)
Column temperature: 35
Mobile phase: Gradient. MeCN:buffer from 20:80 to 100:0 over 10 min, maintain at 0:100 for 3 min, re-equilibrate at initial conditions for 5 min. (The buffer was 10 mM ammonium acetate containing 0.1% formic acid (pH 3.2).)
Flow rate: 0.2
Injection volume: 30
Detector: MS, PE Sciex API 365 triple-stage quadrupole LC-MS-MS, PE Sciex TurboIonSpray interface, positive ion mode, needle voltage 5.2 kV, nebulizer gas air at 60 psi, curtain gas nitrogen at 40 psi, collision cell gas nitrogen at 40 psi, turbo ionspray heater 375°, heater gas flow 7 L/min

CHROMATOGRAM

Retention time: 3.6
Internal standard: dibenzepin, enalapril
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Extracted: acebutolol (3.8, LOD 0.1 μg/mL), acetaminophen (2.5, LOD <5 μg/mL), acrivastine (5.7, LOD <0.02 μg/mL), alprazolam (6.1, LOD <0.02 μg/mL), alprenolol (5.4, LOD 0.01 μg/mL), amantadine (3.4, LOD 0.1 μg/mL), amiloride (2.0, LOD 0.1 μg/mL), aminophenazone (2.8, LOD <5 μg/mL), amiodarone (10.2, LOD 0.05 μg/mL), amitriptyline (6.6, LOD <0.02 μg/mL), astemizole (5.8, LOD <0.02 μg/mL), atenolol (1.7, LOD 0.30 μg/mL), azacyclonol (5.1, LOD 0.02 μg/mL), benzhexol (6.6, LOD <0.02 μg/mL), benzoylecgonine (3.3, LOD 0.01 μg/mL), betaxolol (5.5, LOD 0.01 μg/mL), biperidine (6.2, LOD <0.02 μg/mL), bisoprolol (5.0, LOD <0.02 μg/mL), brompheniramine (5.3, LOD 0.002 μg/mL), bupivacaine (5.1, LOD <0.02 μg/mL), buprenorphine (5.9, LOD 0.01 μg/mL), buspirone (5.1, LOD 0.002 μg/mL), caffeine (2.8, LOD 1 μg/mL), carbamazepine

(6.1, LOD <0.02 μg/mL), carbinoxamine (5.1, LOD 0.002 μg/mL), carisoprodol (6.7, LOD <5 μg/mL), carvedilol (6.2, LOD <0.02 μg/mL), celiprolol (4.3, LOD 0.05 μg/mL), cetirizine (6.3, LOD 0.05 μg/mL), chlorcyclizine (6.6, LOD <0.02 μg/mL), chlordiazepoxide (5.7, LOD <0.02 μg/mL), chlormezanone (5.8, LOD <5 μg/mL), chloroquine (2.7, LOD 0.02 μg/mL), chlorpheniramine (5.1, LOD 0.002 μg/mL), chlorpromazine (7.0, LOD 0.02 μg/mL), chlorpropamide (6.7, LOD <5 μg/mL), chlorprothixene (7.0, LOD <0.02 μg/mL), cinnarizine (7.9, LOD <0.02 μg/mL), citalopram (5.7, LOD <0.02 μg/mL), clemastine (7.7, LOD 0.02 μg/mL), clobazam (7.3, LOD <0.02 μg/mL), clobutinol (5.3, LOD 0.02 μg/mL), clomethiazole (6.2, LOD 0.5 μg/mL), clomipramine (7.1, LOD <0.02 μg/mL), clonazepam (6.6, LOD <0.02 μg/mL), clonidine (2.8, LOD 0.1 μg/mL), clozapine (5.6, LOD <0.02 μg/mL), cocaine (4.6, LOD <0.02 μg/mL), codeine (2.5, LOD 0.1 μg/mL), coumatetralyl (8.4, LOD 0.05 μg/mL), cyclizine (5.8, LOD <0.02 μg/mL), dextropropoxyphene (6.6, LOD 0.05 μg/mL), demoxepam (5.8, LOD 0.02 μg/mL), dextromethorphan (5.5, LOD <0.02 μg/mL), diazepam (8.1, LOD 0.02 μg/mL), diltiazem (5.8, LOD <0.02 μg/mL), diphenhydramine (5.7, LOD <0.02 μg/mL), dipyridamole (5.4, LOD 0.005 μg/mL), disopyramine (4.4, LOD <0.02 μg/mL), dixyrazine (6.8, LOD 0.005 μg/mL), doxapram (4.8, LOD <0.02 μg/mL), doxepin (5.9, LOD <0.02 μg/mL), dronabinol (12.3, LOD 0.05 μg/mL), ebastine (9.6, LOD 0.005 μg/mL), embutramide (6.7, LOD 0.005 μg/mL), ergotamine (5.5, LOD 0.005 μg/mL), ethenzamide (5.0, LOD 0.05 μg/mL), ethylmorphine (3.2, LOD 0.05 μg/mL), ethylparathion (9.7, LOD <5 μg/mL), etodroxizine (6.4, LOD <0.02 μg/mL), felodipine (9.6, LOD 0.02 μg/mL), fenazepam (7.5, LOD <0.02 μg/mL), fenfluramine (5.3, LOD <0.02 μg/mL), fenkamfamine (5.1, LOD <0.02 μg/mL), fentanyl (5.5, LOD <0.02 μg/mL), fexofenadine (6.3, LOD <0.02 μg/mL), flecainide (5.9, LOD <0.02 μg/mL), fluconazole (4.0, LOD 0.1 μg/mL), flumazenil (5.2, LOD <0.02 μg/mL), flunitrazepam (7.1, LOD 0.002 μg/mL), fluoxetine (6.8, LOD 0.1 μg/mL), flupentixol (7.5, LOD 0.18 μg/mL), fluvoxamine (6.3, LOD 0.02 μg/mL), glibenclamide (8.5, LOD <0.02 μg/mL), glipizide (6.8, LOD <0.05 μg/mL), haloperidol (6.1, LOD <0.02 μg/mL), histapyrrodine (6.3, LOD 0.02 μg/mL), hydrocodone (3.0, LOD 0.05 μg/mL), hydroxychloroquine (2.4, LOD <0.3 μg/mL), hydroxyzine (6.3, LOD <0.02 μg/mL), imipramine (6.4, LOD 0.05 μg/mL), indomethacin (8.6, LOD 0.05 μg/mL), isoniazid (2.2, LOD 3 μg/mL), isradipine (8.6, LOD 0.05 μg/mL), ketamine (3.6, LOD <0.05 μg/mL), ketobemidone (3.3, LOD <0.05 μg/mL), ketoprofen (7.3, LOD 0.1 μg/mL), ketorolac (6.2, LOD 0.05 μg/mL), labetalol (4.9, LOD 0.05 μg/mL), lamotrigine (4.0, LOD 0.1 μg/mL), levocabastine (5.8, LOD 0.01 μg/mL), levomepromazine (6.5, LOD 0.02 μg/mL), lidocaine (3.7, LOD <0.05 μg/mL), loratadine (9.3, LOD 0.002 μg/mL), lorazepam (6.6, LOD 0.02 μg/mL), lormetazepam (7.4, LOD <0.02 μg/mL), LSD (4.7, LOD <0.02 μg/mL), malathion (8.9, LOD 10 μg/mL), maprotiline (6.4, LOD <0.02 μg/mL), MDMA (3.3, LOD 0.02 μg/mL), meclozine (8.5, LOD <0.02 μg/mL), medazepam (6.3, LOD <0.02 μg/mL), meloxicam (7.1, LOD 0.01 μg/mL), melperone (5.0, LOD <0.02 μg/mL), meperidine (4.7, LOD <0.02 μg/mL), mepivacaine (3.7, LOD <0.02 μg/mL), meprobamate (4.9, LOD 0.1 μg/mL), mesoridazine (5.4, LOD <0.02 μg/mL), methamphetamine (3.3, LOD 0.05 μg/mL), methadone (6.7, LOD <0.02 μg/mL), methylparathion (8.6, LOD 10 μg/mL), methylphenidate (4.2, LOD <0.02 μg/mL), metoclopramide (3.8, LOD <0.02 μg/mL), metoprolol (4.1, LOD 0.02 μg/mL), metronidazole (2.6, LOD 1 μg/mL), mexiletine (4.4, LOD 0.05 μg/mL), mianserin (5.7, LOD <0.02 μg/mL), midazolam (5.9, LOD <0.02 μg/mL), mirtazapine (4.4, LOD <0.02 μg/mL), mizolastine (5.5, LOD 0.01 μg/mL), moclobemide (3.7, LOD 0.05 μg/mL), molindone (4.0, LOD <0.02 μg/mL), monoacetylmorphine (2.7, LOD 0.1 μg/mL), morphine (2.0, LOD 0.1 μg/mL), nicotine (2.2, LOD 0.05 μg/mL), nifedipine (7.5, LOD 0.02 μg/mL), nikethamide (3.6, LOD <0.02 μg/mL), nitrazepam (6.5, LOD <0.02 μg/mL), nizatidine (1.7, LOD 1 μg/mL), nomifensine (4.6, LOD <0.02 μg/mL), nortriptyline (6.4, LOD <0.02 μg/mL), norverapamil (6.2, LOD 1 μg/mL), noscapine (5.0, LOD <0.02 μg/mL), olanzapine (3.0, LOD 0.05 μg/mL), ondansetron (4.6, LOD <0.02 μg/mL), orphenadrine (6.1, LOD <0.02 μg/mL), oxazepam (6.3, LOD <0.02 μg/mL), oxcarbazepine (5.3, LOD 0.02 μg/mL), oxprenolol (4.7, LOD 0.02 μg/mL), oxycodone (2.8, LOD 0.05 μg/mL), papaverine (4.8, LOD <0.02 μg/mL), paroxetine (6.2, LOD 0.02 μg/mL), pemoline (3.3, LOD 0.05 μg/mL), pentazocine (5.0, LOD <0.02 μg/mL), pentifylline (7.3, LOD <5 μg/mL), pentoxyverine (6.6, LOD <0.02 μg/mL), perphenazine (6.9, LOD 0.002 μg/mL), phenazone (3.9, LOD 0.05 μg/mL), phencyclidine (5.3, LOD 0.05 μg/mL), pheniramine (4.1, LOD 0.02 μg/mL), phenylbutazone (9.0, LOD <5 μg/mL), phenylpropanolamine (2.5, LOD 0.3 μg/mL), phenytoin (6.1,

LOD 0.05 μg/mL), pindolol (3.3, LOD 0.05 μg/mL), piroxicam (6.6, LOD 0.02 μg/mL), pitofenone (5.4, LOD <0.02 μg/mL), pizotifen (6.5, LOD <0.02 μg/mL), practolol (1.8, LOD 0.1 μg/mL), prazosin (4.1, LOD 0.05 μg/mL), prilocaine (3.8, LOD <0.02 μg/mL), primidone (4.0, LOD <5 μg/mL), procainamide (2.2, LOD 0.05 μg/mL), prochlorperazine (7.5, LOD 0.02 μg/mL), promazine (6.2, LOD <0.02 μg/mL), promethazine (6.0, LOD 0.05 μg/mL), propafenone (6.3, LOD <0.02 μg/mL), propranolol (5.4, LOD 0.02 μg/mL), propyphenazone (6.6, LOD 0.50 μg/mL), pseudoephedrine (2.6, LOD 1 μg/mL), quinine (4.2, LOD 0.02 μg/mL), ranitidine (1.8, LOD 0.1 μg/mL), risperidone (4.9, LOD <0.02 μg/mL), rocurone (3.8, LOD 0.1 μg/mL), ropivacaine (4.6, LOD <0.02 μg/mL), salicylamide (4.2, LOD <5 μg/mL), selegiline (4.1, LOD 0.05 μg/mL), sertindole (7.2, LOD <0.02 μg/mL), sertraline (6.8, LOD 0.02 μg/mL), sulindac (6.5, LOD 0.02 μg/mL), simazine (6.0, LOD 0.1 μg/mL), sincocaine (6.5, LOD <0.02 μg/mL), sisapride (5.9, LOD <0.02 μg/mL), sotalol (2.1, LOD 0.1 μg/mL), strychnine (5.3, LOD 0.05 μg/mL), sulpiride (1.9, LOD 0.1 μg/mL), sulthiame (4.1, LOD 0.05 μg/mL), temazepam (7.2, LOD <0.02 μg/mL), terbutaline (2.3, LOD 0.1 μg/mL), terfenadine (8.1, LOD 0.002 μg/mL), terodiline (6.7, LOD <0.02 μg/mL), tetracaine (5.7, LOD <0.02 μg/mL), theobromine (2.3, LOD <5 μg/mL), theophylline (2.4, LOD <5 μg/mL), thioridazine (7.5, LOD 0.02 μg/mL), timolol (3.8, LOD 0.05 μg/mL), thiothixene (6.7, LOD 0.02 μg/mL), tolbutamide (7.1, LOD <5 μg/mL), toremifene (8.7, LOD 0.02 μg/mL), tramadol (4.2, LOD 0.02 μg/mL), trazodone (5.2, LOD <0.02 μg/mL), triamterene (3.2, LOD 0.1 μg/mL), triazolam (6.7, LOD 0.002 μg/mL), trimeprazine (6.4, LOD <0.02 μg/mL), trimethoprim (3.1, LOD 0.05 μg/mL), trimipramine (6.7, LOD <0.02 μg/mL), venlafaxine (4.9, LOD 0.02 μg/mL), verapamil (6.5, LOD <0.02 μg/mL), warfarin (7.9, LOD <0.02 μg/mL), yohimbine (4.5, LOD <0.02 μg/mL), zolpidem (4.7, LOD <0.02 μg/mL), zopiclone (4.0, LOD 0.1 μg/mL)

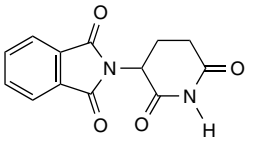
Thalidomide



Molecular formula: $C_{13}H_{10}N_2O_4$
Molecular weight: 258.23
CAS Registry No: 50-35-1
Merck Index: 13, 9326

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg C18 SPE cartridge (Varian) with 1 column vol of MeOH and one column volume of water. Vortex 1 mL 25 mM pH 2.5 phosphate buffer with 1 mL plasma, add 100 μL 100 μg/mL labetalol in MeOH, vortex, add to the SPE cartridge, wash with 2 column vol of water, dry under vacuum, elute with 1 mL anhydrous diethyl ether, evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 130 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: Bioptic AV-1 (Meta Chem Technologies, Torrance CA)
Column: 150 × 4.5 Bioptic AV-1 (Meta Chem Technologies, Torrance CA)
Mobile phase: Isopropanol:100 mM pH 4 phosphate buffer 2:98
Flow rate: 0.6
Injection volume: 50
Detector: UV 300

CHROMATOGRAM

Retention time: 8.4 (*S*-(−)), 10.5 (*R*-(+))
Internal standard: labetalol (6.7)
Limit of detection: 50 ng/mL
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

chiral; plasma; SPE

SAMPLE

Matrix: blood
Sample preparation: Mix 500 μL serum with 20 μL 250 μg/mL IS in MeOH, add 500 μL 10% trichloroacetic acid solution with constant vortexing for 30 s, centrifuge at 2700 g for 5 min, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 4.6 Discovery C18 (Supelco)
Column: 125 × 4.6 5 μm Discovery C18 (Supelco)
Mobile phase: MeOH:buffer 75:25 (The buffer was 10 mM potassium dihydrogen phosphate adjusted to pH 3.0 with 43% phosphoric acid.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 220

CHROMATOGRAM

Retention time: 7.9
Internal standard: phenacetin (15.0)
Limit of quantitation: 222 ng/mL

OTHER SUBSTANCES

Simultaneous: clofazimine (8.3), dapsone (3.5), indinavir (4.0), isoniazid (2.1), lamivudine (2.2), nevirapine (15.0), rifampin (2.5), saquinavir (2.5), stavudine (2.1), trimethoprim (4.8), ritonavir (2.2), zidovudine (4.0)
Noninterfering: cyclosporine, rifabutin, sulfamethoxazole, prednisolone

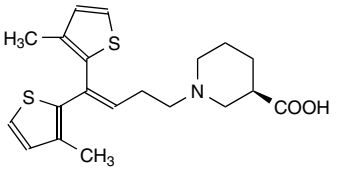
Tiagabine



Molecular formula: $C_{20}H_{25}NO_2S_2$
Molecular weight: 375.56
CAS Registry No: 115103-54-3, 145821-59-6 (HCl)
Merck Index: 13, 9493

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL Bond Elut C8 SPE cartridge with 5 mL MeOH and 2 mL water. Mix 1 mL plasma with 200 μL water and 200 μL 1 μg/mL IS in MeOH:water 50:50, centrifuge at 1000 g for 15 min, add the supernatant to the SPE cartridge, wash with 2 mL water, wash with 2 mL MeOH:water 5:95, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of air at 40°, reconstitute the residue with 200 μL mobile phase, inject a 50–60 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS C18
Mobile phase: MeCN:MeOH:water 37:10:53 containing 10 mM sodium dihydrogen phosphate and 5 mM sodium octanesulfonate
Flow rate: 1.2
Injection volume: 50–60
Detector: E, Environmental Sciences Coulochem Model 5100A, porous graphite electrode – 0.50 V (screen), porous graphite electrode +0.76 V (monitored), guard cell +0.95 V (before injector)

CHROMATOGRAM

Retention time: 16
Internal standard: (R)-*N*-(4-(3-methyl-2-thienyl)-4-(2-thienyl)but-3-enyl)nipecotic acid (12)
Limit of quantitation: 2 ng/mL

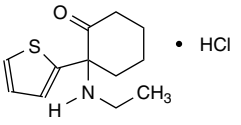
Tiletamine hydrochloride

Molecular formula: $C_{12}H_{17}NOS.HCl$
Molecular weight: 259.80
CAS Registry No: 14176-50-2



SAMPLE

Matrix: blood, tissue
Sample preparation: Add IS to serum or tissue, make alkaline with pH 9.5 borate buffer, extract with ethyl acetate. Extract the organic layer with 1 mL 100 mM HCl. Basify the aqueous layer with 100 mg sodium borate, extract with ethyl acetate. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with MeCN:water 25:75 (serum) or mobile phase (tissue), inject a 70 μL aliquot.

HPLC VARIABLES

Column: 250 × 4 5 μm LiChrospher 60 RP-select B C8
Mobile phase: MeCN:50 mM pH 6.8 phosphate buffer 26:74
Flow rate: 1
Injection volume: 70
Detector: UV 233

CHROMATOGRAM

Retention time: 18.9
Internal standard: pindolol (9.7)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES

Extracted: zolazepam (LOQ 2 ng/mL) (12.5)

KEY WORDS

bear; muscle; serum

SAMPLE

Matrix: blood, urine
Sample preparation: Mix 1 mL pH 7 buffer with 5 mL whole blood or urine, add 1 μg IS1, add 6 μg IS2, add 7 mL hexane:toluene:isoamyl alcohol 90:5:5, vortex, centrifuge, remove the organic layer. Add 1 mL pH 9.5 buffer to the aqueous layer, extract with 6 mL hexane:isoamyl alcohol 99:1. Combine the organic layers, evaporate to dryness under a stream of nitrogen, reconstitute the residue with 250 μL MeCN:water:trifluoroacetic acid 45:55:0.05, evaporate to half volume to remove MeCN, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 5 μm Altima C18
Column: 20 × 2.1 5 μm Altima C18
Column temperature: 40
Mobile phase: Gradient. A was MeCN:water:trifluoroacetic acid 10:90:0.05. B was MeCN:water:trifluoroacetic acid 80:20:0.05. A:B 100:0 for 5 min, to 0:100 over 50 min, re-equilibrate at initial conditions for 15 min.

Flow rate: 0.25
Injection volume: 50
Detector: MS, HP 5989B, electron impact; UV 205; UV 290

CHROMATOGRAM
Internal standard: SKF-525 A (IS1), 5-ethyl-5-*p*-tolylbarbituric acid (IS2)

OTHER SUBSTANCES
Extracted: zolazepam

Cording, C.J.; Deluca, R.; Camporese, T.; Spratt, E. A fatality related to the veterinary anesthetic Telazol, *J.Anal.Toxicol.*, **1999**, *23*, 552–555.

SAMPLE
Matrix: tissue
Sample preparation: Homogenize 1.5 g tissue with 300 μL 1 μg/mL IS in water and 6 mL 500 mM pH 9.5 sodium borate buffer, add 10 mL ethyl acetate, vortex for 20 min, repeat the extraction. Combine the organic layers and extract twice with 2 mL portions of 100 mM HCl. Combine the aqueous layers and make basic with 200 mg sodium borate, extract with 12 mL ethyl acetate. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with 200 μL MeCN:water 20:80, inject a 70 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm LiChrospher 60 RP-select B C8
Mobile phase: MeCN:50 mM pH 5.5 sodium phosphate buffer 16:84
Flow rate: 1
Injection volume: 70
Detector: UV 233

CHROMATOGRAM
Retention time: 45
Internal standard: ripazapam (51.5)

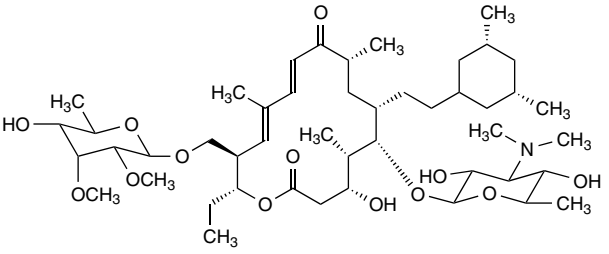
OTHER SUBSTANCES
Extracted: tiletamine metabolite CI-398 (23.5), zolazepam (58), zolazepam metabolites

KEY WORDS
bear; fat; kidney; muscle

REFERENCE
Semple, H.A.; Gorecki, D.K.J.; Farley, S.D.; Ramsay, M.A. Pharmacokinetics and tissue residues of Telazol in free-ranging polar bears, *J.Wildlife Dis.*, **2000**, *36*, 653–662.

Tilmicosin

Molecular formula: $C_{46}H_{80}N_2O_{13}$
Molecular weight: 869.13
CAS Registry No: 108050-54-0
Merck Index: 13, 9516



SAMPLE

Matrix: blood

Sample preparation: Condition a 500 mg Bond Elut C18 SPE cartridge with MeOH and water. Add 2 mL serum to the SPE cartridge, wash with water, wash with 5% ammonium hydroxide, wash with water, elute with 2 mL MeOH:acetic acid 5:95. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 1 mL diluent, inject an aliquot. (The diluent was MeOH:water:1 M dibutylammonium phosphate 50:47.5:2.5.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hi-Chrom Reversible phenyl (Regis)

Mobile phase: Gradient. A was MeCN:water 50:50 adjusted to pH 2.5 with orthophosphoric acid. B was water adjusted to pH 2.5 with orthophosphoric acid. C was 168 mL dibutylamine in 700 mL water, adjust to pH 2.5 with orthophosphoric acid, make up to 1 L with water. A:B:C 100:0:0 for 3 min, to 55:30:15 over 1 min, maintain at 55:30:15 for 7 min, return to initial conditions over 1 min, re-equilibrate for 8 min.

Flow rate: 1.5

Injection volume: 50

Detector: UV 280

CHROMATOGRAM

Retention time: 11

Limit of detection: 2.6 ng/mL

Limit of quantitation: 50 mg/mL

KEY WORDS

cow; pharmacokinetics; serum; sheep

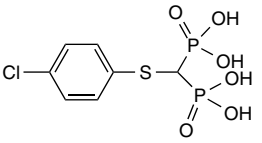
Tiludronic acid



Molecular formula: $C_7H_9ClO_6P_2S$

Molecular weight: 318.61

CAS Registry No: 89987-06-4, 149845-07-8 (Na salt), 155453-10-4 (Na salt hemihydrate)

Merck Index: 13, 9518

SAMPLE

Matrix: blood, urine

Sample preparation: Mix 200 μL plasma or urine with 400 μL 5 μg/mL IS in water, add 100 μL 1 M NaOH, add 100 μL 180 mM calcium chloride, add 1 mL water, vortex, centrifuge at 11 600 *g*. Discard the liquid phase and dissolve the residue in 100 μL 1 M HCl, add 200 μL 1 M NaOH, add 100 μL 180 mM calcium chloride (only for plasma samples), add 1 mL water, vortex, centrifuge at 11 600 *g*. Discard the liquid phase and vortex the residue with 200 μL mobile phase containing 100 mM disodium EDTA until dissolution is complete, inject a 20–100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.1 5 μm PRP-1 (Hamilton)

Column temperature: 22

Mobile phase: MeCN:buffer 13:87 (The buffer was 50 mM pH 11.8 disodium hydrogen phosphate containing 5 mM tetrabutylammonium phosphate.)

Flow rate: 1

Injection volume: 20–100

Detector: UV 280

CHROMATOGRAM

Retention time: 3

Internal standard: (3-trifluoromethyl)-thiomethylene bisphosphonic acid (4)

Limit of quantitation: 50 ng/mL

KEY WORDS

baboon; human; monkey; mouse; plasma

REFERENCE

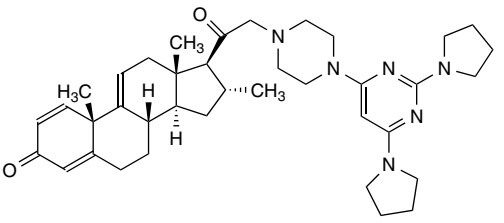
Tirilazad

Molecular formula: $C_{38}H_{52}N_6O_2$
Molecular weight: 624.86
CAS Registry No: 110101-66-1
Merck Index: 13, 9540



SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg Bond Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. Vortex 500 μL plasma with 500 μL 5 μg/mL IS in MeCN for 1 min, centrifuge at 1500 g at 4°, add 800 μL of the supernatant to the SPE cartridge, wash with two 1 mL portions of MeCN:water 50:50, elute with two 1 mL portions of MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue with 350 μL MeCN, vortex for 1 min, dilute with 150 μL water, inject an aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm NewGuard RP-8 (Brownlee)
Column: 250 × 4.6 5 μm Suplecosil LC-8
Mobile phase: MeCN:buffer 75:25 (The buffer was 22 mM triethylamine adjusted to pH 5.0 with glacial acetic acid.)
Flow rate: 1
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 10.5
Internal standard: 21-[4-(2,6-di-1-pyrrolidinyl-4-pyrimidinyl)-1-piperazinyl]-3α-hydroxy-16α-methyl-5α-pregna-20-one (16)
Limit of quantitation: 12 ng/mL (S/N 10)

KEY WORDS

plasma; rat

Cox, J.W.; Pullen, R.H. High-performance liquid chromatographic determination of a 21-aminosteroid antioxidant in plasma, *J.Chromatogr.*, **1988**, *424*, 293–302.

SAMPLE

Matrix: blood
Sample preparation: Add 150 μL water and 300 μL IS in MeCN to 100 μL plasma, centrifuge, add 450 μL of the supernatant to a conditioned (unspecified) Advanced Automated Sample Processor C8 SPE cartridge containing 0.5 mL water (?), wash with 500 μL MeCN:water 25:75, elute the contents directly onto column A in series with column B using mobile phase, remove column A from the circuit, continue to elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 15 × 3.2 7 μm Brownlee New Guard C18; B 250 × 4.6 Supelco LC8
Mobile phase: MeCN:water:triethylamine:acetic acid 80:20:0.1:0.2
Flow rate: 1.5
Detector: UV 254

CHROMATOGRAM
Retention time: 8
Internal standard: (16α)-21-[4-(2,6-di-1-pyrrolidinyl-4-pyrimidinyl)-1-piperazinyl]-16-methylpregna-3-ol-20-one (PNU-76824) (15)
Limit of quantitation: 5.4 ng/mL

KEY WORDS
column-switching; pharmacokinetics; plasma; rat

SAMPLE
Matrix: microsomal incubations
Sample preparation: Vortex 500 μL microsomal incubation with 500 μL MeCN for 20 s, centrifuge at 2100 g at 4° for 25 min, inject an aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Kromasil C18
Mobile phase: Gradient. MeCN:100 mM ammonium acetate from 10:90 to 100:0 in 60 min, maintain at 100:0 for 40 min
Flow rate: 0.5
Detector: MS, Finnigan 4021 quadrupole, thermal pneumatic nebulizer with momentum separator, positive ion CI mode with ammonia as moderating gas, tip 180°, expansion region 80°, helium 150 psi with a 360 × 75 μm fused silica capillary; Radioactivity (^{14}C)

CHROMATOGRAM
Retention time: 80

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
human; liver

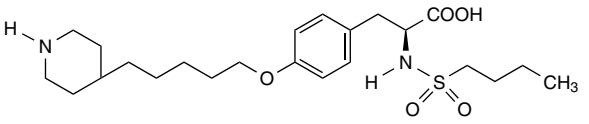
Tirofiban



Molecular formula: $C_{22}H_{36}N_2O_5S$
Molecular weight: 440.60
CAS Registry No: 144494-65-5, 150915-40-5 (HCl monohydrate)
Merck Index: 13, 9541

SAMPLE

Matrix: blood

Sample preparation: Vortex 500 μL plasma with 50 μL 100 ng/mL IS and 500 μL 100 mM perchloric acid briefly, add 5 mL 1-chlorobutane, shake for 10 min, centrifuge, extract the aqueous layer twice more with 5 mL portions of ethyl acetate. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue with 250 μL EtOH:toluene 50:50, evaporate to dryness under a stream of nitrogen at 40°, add 400 μL 10 mM dimethylaminopyridine in MeCN, add 40 μL trifluoroacetic anhydride, heat at 40° for 30 min, remove excess reagents with a stream of nitrogen, reconstitute the residue with 150 μL mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax RX-C18
Mobile phase: MeCN:1 mM ammonium acetate 41.5:58.5, pH 6.0
Injection volume: 25
Detector: MS, Sciex Model API-III triple-quadrupole, API, negative ion mode, orifice potential – 60 V, electron multiplier +4.4 kV, interface 50°, nebulizer 500°, nebulizer air 1 L/min, curtain gas 700 mL/min, m/z 535

CHROMATOGRAM

Retention time: 5.2
Internal standard: *N*-phenylsulfonyl-*O*-[4-(butane-4-piperidinyl]-L-tyrosine (L-702, 128) (5.1)
Limit of quantitation: 400 pg/mL

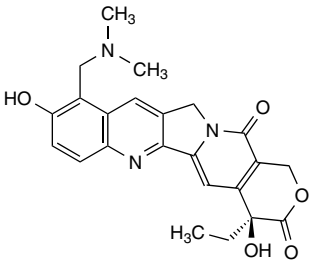
Topotecan



Molecular formula: $C_{23}H_{23}N_3O_5$
Molecular weight: 421.44
CAS Registry No: 123948-87-8, 119413-54-6 (HCl)
Merck Index: 13, 9626

SAMPLE

Matrix: blood
Sample preparation: Vortex 200 μL plasma with 800 μL cold (dry ice) MeOH for 10 s, centrifuge at 7000 g for 2 min. Dilute 2 vol of supernatant with 1 vol of water (to measure lactone form) or 1.5% phosphoric acid (to measure total amount), inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 3 ChromGuard RP SS (Varian)
Column: 150 × 3 3.5 μm SB-C18 (Agilent)
Column temperature: 50
Mobile phase: MeOH:buffer 27:73 (The buffer was 75 mM potassium dihydrogen phosphate containing 0.2% triethylamine, adjusted to pH 6.5 with KOH.)
Flow rate: 0.8
Injection volume: 20
Detector: F ex 376 em 530

CHROMATOGRAM

Retention time: 13.7
Limit of quantitation: 250 pg/mL

OTHER SUBSTANCES

Extracted: *N*-desmethyltopotecan (LOQ 50 pg/mL) (7.6)

KEY WORDS

plasma

Determination of plasma topotecan and its metabolite *N*-desmethyl topotecan as both lactone and total form by reversed-phase liquid chromatography with fluorescence detection, *J.Chromatogr.B*, **2003**, *784*, 225–232.

SAMPLE

Matrix: blood
Sample preparation: Vortex 900 μL plasma with 100 μL buffer for 20 s. Add a 200 μL aliquot to 800 μL cold (−40°) MeOH, vortex for 20 s, centrifuge for 2 min. Mix a 500 μL aliquot of the supernatant with 500 μL buffer, inject a 200 μL aliquot. (The buffer was 8 mM disodium hydrogen phosphate containing 1 mM potassium dihydrogen phosphate, 137 mM NaCl, and 3 mM KCl and was adjusted to pH 2.0 for lactone or pH 11.0 for carboxylate forms.)

HPLC VARIABLES

Guard column: Guard-Pak C18 NovaPak
Column: 150 × 3.9 4 μm NovaPak C18

Mobile phase: MeCN:buffer 12:88 (The buffer was 3% triethylamine adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 1
Injection volume: 200
Detector: F (tunable) ex 390 em 520, F (filter) ex 350–470 em 510–650

CHROMATOGRAM

Retention time: 2.5 (carboxylate), 5.2 (lactone)
Limit of detection: 300 pg/mL (lactone, filter F), 260 pg/mL (lactone, tunable F), 150 pg/mL (carboxylate, filter F), 100 pg/mL (carboxylate, tunable F)
Limit of quantitation: 750 pg/mL (lactone, filter F), 500 pg/mL (lactone, tunable F), 500 pg/mL (carboxylate, filter F), 250 pg/mL (carboxylate, tunable F)

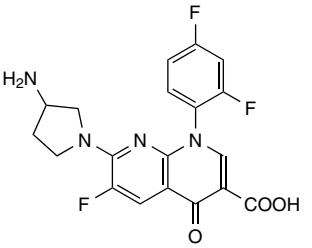
Tosufloxacin



Molecular formula: $C_{19}H_{15}F_3N_4O_3$
Molecular weight: 404.34
CAS Registry No: 100490-36-6. 104051-69-6 (HCl), 115964-29-9 (tosylate)
Merck Index: 13, 9632

SAMPLE

Matrix: bile, blood, urine

Sample preparation: Dilute urine 1:20. Dilute bile 1:10. Vortex 500 μL serum, diluted urine, or diluted bile with 3.2 mL dichloromethane, rotate at 20 rpm for 10 min, centrifuge at 1000 g for 10 min. Remove 3 mL of the lower organic phase and add it to 200 μL pH 2.5 acetic acid, rotate at 20 rpm for 10 min, centrifuge at 1000 g for 10 min, inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Ultrasphere C18

Mobile phase: MeCN:buffer 18:82, pH adjusted to 2 with 14.6 M phosphoric acid (The buffer was 10 mM sodium dihydrogen phosphate containing 5 mM tetrabutylammonium bromide.)

Flow rate: 2

Injection volume: 20

Detector: F ex 265 em 433

CHROMATOGRAM

Retention time: 2

Limit of detection: 20 ng/mL (serum), 500 ng/mL (urine), 250 ng/mL (bile)

OTHER SUBSTANCES

SAMPLE

Matrix: wastewater

Sample preparation: Condition a mixed-phase (C8 and benzenesulfonate) cation-exchange SPE disc (Varian) with 2 mL MeOH and 2 mL water at pH 3. Adjust pH of wastewater to 3, pass 50–150 mL through the SPE disc at 1 mL/min, dry under vacuum for 5 min, elute with 2.5 mL 5% ammonia in MeOH:water 15:85. Neutralize the eluate with 500 μL 85% phosphoric acid, inject a 200 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 3 5 μm Discovery RP-AmideC16 (Supelco)
Column: 250 × 3 5 μm Discovery RP-AmideC16 (Supelco)
Column temperature: 50
Mobile phase: Gradient. MeCN:25 mM pH 2.4 orthophosphoric acid from 5:95 to 7:93 over 17 min, maintain at 7:93 for 5 min, to 17:83 over 13 min, to 85:15 (step gradient), maintain at 85:15 for 5 min, return to initial conditions over 2 min, re-equilibrate for 10 min.
Flow rate: 0.7
Injection volume: 200
Detector: F ex 278 em 445

CHROMATOGRAM

Retention time: 35

OTHER SUBSTANCES

Extracted: ciprofloxacin (19.5), danofloxacin (23), difloxacin (28), enrofloxacin (22.5), fleroxacin (14), lomefloxacin (21), norfloxacin (18), ofloxacin (15.5), pipemidic acid (6),

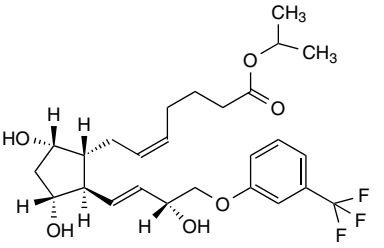
Travoprost

Molecular formula: $C_{26}H_{35}F_3O_6$
Molecular weight: 500.55
CAS Registry No: 157283-68-6



SAMPLE

Matrix: blood

Sample preparation: Condition a SPEC 3 mL 15 mg MP1 nonpolar reversed-phase/strong cation-exchange SPE Cartridge (Ansys) with 500 μL MeOH and 500 μL 40 mM formic acid. Mix 1 mL plasma with 50 μL 400 IU/mL rabbit liver esterase (Sigma) in buffered saline, heat at 37° for 45 min. (This hydrolyzes travoprost to the free acid.) Mix 1 mL plasma with 15 μL 20 ng/mL IS and 1 mL 100 mM formic acid, add to the SPE cartridge, rinse tube with 0.5–1 mL water, add rinse to the SPE cartridge, wash with 500 μL water, dry under vacuum, wash with two 500 μL portions of toluene:dichloromethane 60:40, dry under vacuum, elute with 600 μL toluene:methylformate 20:80. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue with 125 μL MeOH:water 50:50, inject a 35 μL aliquot.

HPLC VARIABLES

Column: 150 × 2 5 μm Phenomenex Columbus C18
Mobile phase: MeOH:5 mM pH 6.3 ammonium formate 70:30
Flow rate: 0.2
Injection volume: 35
Detector: MS, Micromass Quattro LC, electrospray, capillary 3.0 kV, sample cone 40 V, extraction cone 2 V, RF lens 0.3 V, source temperature 125°, drying gas 250°, MS1 parameters LM resolution 14, HM resolution 14, ion energy 1.2 V, entrance and exit set to 0 and 1, collision energy 30 eV, MS2 parameters LM resolution 15.0, HM resolution 15.0, ion energy 1.2 V, multiplier 650 V, nebulizing gas 75 L/h, drying gas 570 L/h, collision gas argon, m/z 457–161

CHROMATOGRAM

Retention time: 5.3 (as travoprost free acid)
Internal standard: AL-5848X (tetradeutero travoprost free acid) (m/z 461–161)
Limit of quantitation: 10 pg/mL

KEY WORDS

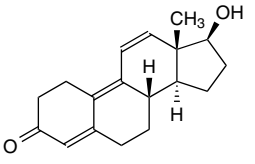
Trenbolone



Molecular formula: $C_{18}H_{22}O_2$
Molecular weight: 270.37
CAS Registry No: 10161-33-8, 10161-34-9 (acetate), 23454-33-3 (cyclohexylmethylcarbonate)
Merck Index: 13, 9659

SAMPLE

Matrix: blood
Sample preparation: Serum. Condition a 3 mL Oasis HLB SPE cartridge with 3 mL MeOH and 3 mL water. Add 1 mL serum containing 100 ng IS to the SPE cartridge, wash with 3 mL water, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 100 μL MeOH:water 50:50, inject a 5 μL aliquot. Urine. Condition a 360 mg Sep-Pak C18 SPE cartridge with 5 mL MeOH and 10 mL water. Adjust the pH of 5 mL urine containing 100 ng IS to 5.5 with acetate buffer, add 50 μL β-glucuronidase-aryl sulfatase (Type H-2 Helix Pomatia, Boehringer Mannheim), heat at 37° overnight, cool, add to the SPE cartridge, wash with 5 mL water, elute with 3 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue with 100 μL MeOH:water 50:50, inject a 5 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 2 Phenomenex C18
Column: 250 × 2.1 5 μm Hypersil C18
Mobile phase: MeOH:2.88 mM ammonium formate 65:35
Flow rate: 0.15
Injection volume: 5
Detector: MS, PE Sciex API 365, turbo ionspray, positive mode, source 4000 V, orifice 30 V, ring 250 V, nebulizer gas nitrogen at 8 units, curtain gas nitrogen at 8 units, collision gas nitrogen at 3 units, collision energy – 42 eV, vaporizer 450°, m/z 271.2–253.3–227.2–199.2

CHROMATOGRAM

Retention time: 13.8
Internal standard: methyltestosterone (m/z 303.1–109.1–97.0) (22.9)
Limit of detection: 350 pg/mL

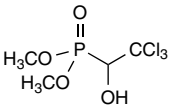
Trichlorfon



Molecular formula: $C_4H_8Cl_3O_4P$
Molecular weight: 257.44
CAS Registry No: 52-68-6
Merck Index: 13, 9696

SAMPLE

Matrix: blood

Sample preparation: Vortex 1 mL plasma and 5 mL chloroform for 15 s, centrifuge at 800 g at 0–5° for 15 min (Caution! Chloroform is a carcinogen!). Remove a 4.5 mL aliquot of the organic layer and add it to 3.5 mL 5 M HCl, vortex for 15 s, centrifuge at 800 g at 0–5° for 15 min. Remove a 4 mL aliquot of the chloroform layer and add it to 200 mg anhydrous calcium sulfate, vortex, centrifuge at 800 g at 0–5° for 5 min. Evaporate the chloroform layer to dryness in an acid-washed vial under a stream of nitrogen at room temperature, reconstitute the residue with 120 μL water, vortex, centrifuge at 11 000 g at 0–5° for 5 min, inject a 100 μL aliquot. (However, Aden Abdi et al. claim that substantial base-catalyzed conversion of trichlorfon to dichlorvos can occur under these conditions and plasma should be acidified with phosphoric acid before extraction. (Aden Abdi,Y.; Villén,T.; Gustafsson,L.L.; Ericsson,O.; Sjöqvist,F. Methodological commentary on the analysis of metrifonate and dichlorvos in biological samples. *J.Chromatogr.* **1993**, *612*, 336–337.) These workers recommend mixing blood with an equal volume of 740 mM phosphoric acid immediately upon collection. Trichlorfon can still be extracted from the acidified sample. (Aden Abdi,Y.; Villén,T. Pharmacokinetics of metrifonate and its rearrangement product dichlorvos in whole blood. *Pharmacol.Toxicol.* **1991**, *68*, 137–139.))

HPLC VARIABLES

Guard column: 37–50 μm C18/Corasil
Column: 300 × 3.9 10 μm C18
Mobile phase: MeOH:THF:1 mM pH 3.0 sodium octanesulfonate 10:0.1:89.9

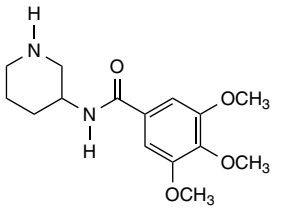
Troxipide



Molecular formula: $C_{15}H_{22}N_2O_4$
Molecular weight: 294.35
CAS Registry No: 99777-81-8
Merck Index: 13, 9860

SAMPLE

Matrix: tissue
Sample preparation: Homogenize 5–30 mg gastric mucosal tissue with 1.2 mL 20 mM pH 7.4 phosphate buffer, centrifuge at 3000 rpm for 10 min. Mix 1 mL of the supernatant with 100 μL IS solution and 1.5 mL MeCN, let stand at 5–6° for 1 h, centrifuge at 3000 rpm at 4° for 10 min. Dry 2 mL of the supernatant, reconstitute with 1 mL EtOH, dry, reconstitute with 120 μL injection solvent (unspecified), inject a 60 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 4 5 μm Capcell Pak C18 UG 120
Column: 50 × 4.6 3 μm Capcell Pak C18 UG 120
Mobile phase: MeCN:50 mM pH 5.0 acetate buffer containing 0.08% sodium 1-hexanesulfonate (ratio not given)
Flow rate: 0.6
Injection volume: 60
Detector: UV 260

CHROMATOGRAM

Internal standard: 3-amino-1-[3,4,5-trimethoxybenzoyl]piperidine HCl

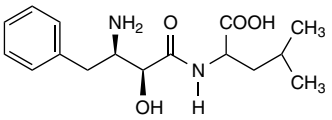
KEY WORDS

gastric mucosa

REFERENCE

Kusugami, K.; Ina, K.; Hosokawa, T.; Kobayashi, F.; Kusajima, H.; Momo, K.; Nishio, Y. Troxipide, a novel antiulcer compound, has inhibitory effects on human neutrophil migration and activation induced by various stimulants, *Dig.Liver Dis.*, **2000**, *32*, 305–311.

Ubenimex



Molecular formula: $C_{16}H_{24}N_2O_4$
Molecular weight: 308.37
CAS Registry No: 58970-76-6
Merck Index: 13, 9910

SAMPLE

Matrix: blood
Sample preparation: Mix 20 μL serum with 20 μL water and 200 μL 4.2 mM acetic acid, heat in a boiling water bath for 5 min, centrifuge at 1000 g for 5 min. Mix 100 μL of the supernatant with 50 μL 1.5 M ammonium hydroxide and 25 μL 3 mM sodium periodate, let stand at room temperature for 20 min, add 25 μL 12 mM sodium sulfite to decompose excess periodate, add 200 μL DDB solution, heat at 37° for 50 min, add 50 μL 1 M NaOH, inject a 100 μL aliquot. (Prepare DDB solution by dissolving 26.5 mg 4,5-dimethoxy-1,2-diaminobenzene monohydrochloride in 100 mL 300 mM HCl, use within 3 h. Dihydrochloride available from Molecular Probes or Dojindo Laboratories)

HPLC VARIABLES

Column: 150 × 4 5 μm LiChrosorb RP-18
Mobile phase: MeCN:100 mM pH 8.7 tris-HCl buffer 25:75
Flow rate: 0.8
Injection volume: 100
Detector: F ex 320 em 390

CHROMATOGRAM

Retention time: 4.5
Limit of detection: 200 ng/mL

OTHER SUBSTANCES

Extracted: *p*-hydroxybestatin (10.5)

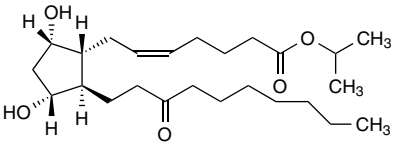
Unoprostone isopropyl ester

Molecular formula: $C_{25}H_{44}O_5$
Molecular weight: 424.61
CAS Registry No: 120373-24-2, 120373-36-6 (free acid)
Merck Index: 13, 9917



SAMPLE

Matrix: aqueous humor, tissue
Sample preparation: Inject a 50 μL aliquot of aqueous humor directly. Homogenize eye tissue with MeCN:0.1% acetate 20:80 at 4°, centrifuge at 15000 rpm at 4° for 30 min. Filter (Millipore Ultra-Free CL, 300 000 cut-off) while centrifuging at 15 000 rpm at 4° for 30 min, inject an aliquot of the ultrafiltrate

HPLC VARIABLES

Column: 150 × 4.6 C18-5A (Shodex)
Mobile phase: Gradient. MeCN:water:acetic acid from 20:80:0.1 to 100:0:0.1 over 40 min
Injection volume: 50
Detector: Radioactivity (^{3}H)

CHROMATOGRAM

Retention time: 30

OTHER SUBSTANCES

Extracted: metabolites

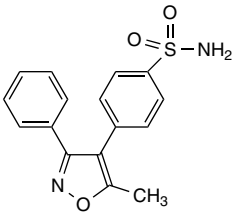
Valdecoxib



Molecular formula: $C_{16}H_{14}N_2O_3S$
Molecular weight: 314.36
CAS Registry No: 181695-72-7

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg Bond Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. Centrifuge plasma at 2000 g at 4° for 5 min, vortex 400 μL of the supernatant with 400 μL 100 ng/mL IS in water, add to the SPE cartridge, wash with 2 mL water, elute with 250 μL MeCN. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 50 × 2.1 5 μm Zorbax XDB-C8
Mobile phase: MeCN:water 50:50 containing 10 mM ammonium acetate
Flow rate: 0.1
Injection volume: 20
Detector: MS, PE Sciex API-III Plus quadrupole, electrospray, negative ion mode, electrospray interface – 3700 V, orifice – 62 V, nebulizer gas nitrogen at 50 psi, curtain gas nitrogen at 1.8 L/min, collision gas argon, collision offset energy 25 eV, m/z 313–118

CHROMATOGRAM

Retention time: 3
Internal standard: 4-(5-methyl-3-(3-fluorophenyl)-isoxazol-4-yl)benzenesulfonamide (m/z 331–118) (3.5)
Limit of quantitation: 0.5 ng/mL

OTHER SUBSTANCES

Extracted: metabolite (4-(5-hydroxymethyl-3-phenylisoxazol-4-yl)benzenesulfonamide) (m/z 329–196) (2)

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Blood. Extract plasma or red blood cells three times with MeCN. Combine the supernatants and evaporate to dryness under a stream of nitrogen, reconstitute the residue with mobile phase A, inject an aliquot. Urine. Centrifuge urine at 2000 g for 5 min, inject an aliquot. Feces. Homogenize feces three times with MeCN and twice with mobile phase A.

HPLC VARIABLES

Column: 150 × 3.9 4 μm Novapak C8

Mobile phase: Gradient. A was MeCN:MeOH:25 mM pH 4 ammonium acetate buffer 3:6:81. B was MeCN:MeOH:25 mM pH 4 ammonium acetate buffer 20:40:60. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min, return to initial conditions over 2 min, re-equilibrate for 8 min.
Flow rate: 1
Detector: UV 240; Radioactivity (^{14}C); MS, PE Sciex API-III Plus triple quadrupole, negative electrospray, capillary – 3700 V, orifice – 65 V, nebulizer gas at 50 psi, curtain gas nitrogen at 1.8 L/min, auxiliary gas nitrogen at 2 L/min, collision gas argon, collision energy 30 eV, turbo ionspray 400°, 0.2 mL/min of column effluent entered the detector

Matrix: microsomal incubations
Sample preparation: Mix microsomal incubation with 1 M pH 4.5 acetate buffer and dichloromethane, add IS, centrifuge at 2000 g for 10 min. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with mobile phase, inject an aliquot.

HPLC VARIABLES

Guard column: 10 × 4 Capcell Pak C18 UG120 (Shiseido)
Column: 250 × 4.6 Capcell Pak C18 UG120 (Shiseido)
Column temperature: 35
Mobile phase: MeCN:buffer 30:70 (The buffer was 65 mM sodium dihydrogen phosphate containing 5 mM tetrabutylammonium chloride, adjusted to pH 6.0 with triethylamine.)
Flow rate: 1
Detector: UV 270

CHROMATOGRAM

Retention time: 24
Internal standard: methyl paraben (8)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
human; liver

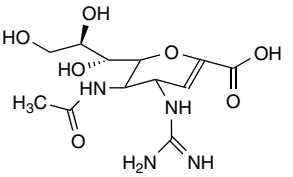
Zanamivir



Molecular formula: $C_{12}H_{20}N_4O_7$
Molecular weight: 332.31
CAS Registry No: 139110-80-8
Merck Index: 13, 10167

SAMPLE

Matrix: blood

Sample preparation: Condition a 1 mL 50 mg isolute SCX SPE cartridge with 500 μL MeOH and 500 μL 10% acetic acid water. Vortex 200 μL serum with 100 μL 5 μg/mL IS in water, 500 μL MeCN, and 100 μL 3% acetic acid in water, let stand at room temperature for 5 min, centrifuge at 1400 g for 10 min, add the supernatant to the SPE cartridge, elute with two 500 μL portions of 10% triethylamine in MeOH:water 50:50. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL mobile phase, vortex for 10 s, centrifuge at 5000 g for 5 min, inject a 20–200 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 5 μm Hypersil SAS C1
Mobile phase: MeCN:water:acetic acid 50:50:1
Flow rate: 1
Injection volume: 20–200
Detector: MS, PE Sciex API 300 triple quadrupole, TurboIonSpray, positive ion mode, 20% of column effluent entered the detector, collision gas nitrogen, collision energy 28 eV, m/z 333–60

CHROMATOGRAM

Retention time: 4
Internal standard: $^{13}C,^{15}N_2$-zanamivir (m/z 336–63)
Limit of quantitation: 10 ng/mL

KEY WORDS

serum; SPE

SAMPLE

Matrix: blood

Sample preparation: Condition a Bond Elut SCX SPE cartridge with 2 mL MeOH and 2 mL 10% formic acid. Mix 1 mL serum with 1 mL 10% formic acid, add to the SPE cartridge, wash with 2 mL 1% trifluoroacetic acid in MeOH, wash with 2 mL water, elute with four 500 μL portions of 10% triethylamine in MeOH:water 50:50. Evaporate the eluate to dryness under a stream of nitrogen at 70°, reconstitute the residue with 75 μL 4 mM benzoin in ethylene glycol, add 150 μL reagent, vortex, heat at 100° for 3 min, cool, inject a 100 μL aliquot. (Prepare the reagent by diluting 750 μL β-mercaptoethanol, 2.52 g sodium sulfite, and 10 mL 5 M KOH to 100 mL with water.)

HPLC VARIABLES

Column: 100 × 4.6 Hypersil ODS

Mobile phase: Gradient. MeCN:buffer 20:80 for 12 min, to 80:20 (step gradient), maintain at 80:20 for 5 min, re-equilibrate at initial conditions for 10 min. (Prepare the buffer by adding 100 mL 1 M tris(hydroxymethyl)methylamine (Tris) and 29.4 mL 1 M HCl to water and making up to 2 L with water (50 mM pH 8.5).)
Flow rate: 1
Injection volume: 100
Detector: F ex 325 em 442

CHROMATOGRAM

Retention time: 14
Limit of quantitation: 10 ng/mL

KEY WORDS

derivatization; serum; SPE

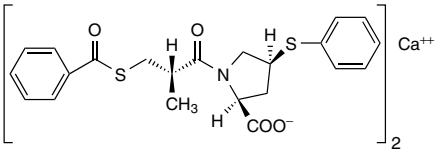
Zofenopril calcium



Molecular formula: $C_{44}H_{44}CaN_2O_8S_4$
Molecular weight: 897.17
CAS Registry No: 81938-43-4, 81872-10-8 (free acid)

SAMPLE

Matrix: blood
Sample preparation: Collect 10 mL whole blood in a heparinized tube containing 20 mg *N*-ethylmaleimide, centrifuge. Shake 1 mL plasma with 20 μL MeOH containing 10 μg/mL IS1 and 15 μg/mL IS2, 1 mL 2 M phosphoric acid containing 2% tetrabutylammonium hydrogen sulfate, and 7 mL toluene in a PTFE-lined tube on a rotating mixer at 32 rpm for 15 min, centrifuge at 1500 g for 5 min. Evaporate the organic layer to dryness under a stream of nitrogen at 60°, reconstitute the residue with 200 μL MeOH:water 50:50, inject an aliquot.

HPLC VARIABLES

Guard column: 10 × 3.2 5 μm C18 (Hichrom)
Column: 75 × 4.6 3 μm Luna C18
Mobile phase: Gradient. MeCN:26 mM pH 4.5 ammonium acetate buffer 20:80 for 0.5 min, to 80:20 over 2.5 min, maintain at 80:20 for 3 min, re-equilibrate at initial conditions for 3 min.
Flow rate: 0.4
Detector: MS, PE Sciex API 365 triple quadrupole, TurboIonSpray, probe 450°, negative ion mode, orifice – 35 V, ring – 200 V, nebulizer gas nitrogen at 10 units, curtain gas nitrogen at 12 units, auxiliary gas air, collision gas nitrogen at 2 units, m/z 428–137

CHROMATOGRAM

Retention time: 6
Internal standard: IS1 (*N*-[3-mercapto-2-methylpropionyl]-4-(4-fluorophenylthio)-L-proline benzoate) (m/z 446–137) (6), IS2 (m/z 467–308) (Prepare a solution of IS2 by reacting 7 mg *N*-[3-mercapto-2-methylpropionyl]-4-(4-fluorophenylthio)-L-proline with 1.75 mL of a 25 mg/mL solution of *N*-ethylmaleimide in 60 mM pH 7 buffer in the dark at room temperature for 1 h, make up to 10 mL with acetone.) (5.3)
Limit of detection: 50 pg/mL (S/N 3)
Limit of quantitation: 1 ng/mL

OTHER SUBSTANCES

Extracted: zofenoprilat (*N*-[3-mercapto-2-methylpropionyl]-4-(phenylthio)-L-proline) (m/z 449–290 (as derivative)) (LOQ 2 ng/mL, LOD 100 pg/mL) (5.3)

KEY WORDS

derivatization; pharmacokinetics; plasma; whole blood

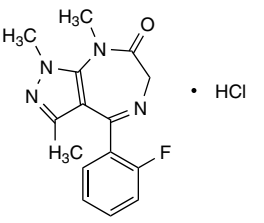
Zolazepam hydrochloride



Molecular formula: $C_{15}H_{15}FN_4O.HCl$
Molecular weight: 322.77
CAS Registry No: 33754-49-3, 31352-82-6 (free base)

SAMPLE

Matrix: blood, tissue
Sample preparation: Add IS to serum or tissue, make alkaline with pH 9.5 borate buffer, extract with ethyl acetate. Extract the organic layer with 1 mL 100 mM HCl. Basify the aqueous layer with 100 mg sodium borate, extract with ethyl acetate. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute the residue with MeCN:water 25:75 (serum) or mobile phase (tissue), inject a 70 μL aliquot.

HPLC VARIABLES

Column: 250 × 4 5 μm LiChrospher 60 RP-select B C8
Mobile phase: MeCN:50 mM pH 6.8 phosphate buffer 26:74
Flow rate: 1
Injection volume: 70
Detector: UV 233

CHROMATOGRAM

Retention time: 12.5
Internal standard: pindolol (9.7)
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES

Extracted: tiletamine (LOQ 10 ng/mL) (18.9)

KEY WORDS

bear; muscle; serum

SAMPLE

Matrix: blood, urine
Sample preparation: Mix 1 mL pH 7 buffer with 5 mL whole blood or urine, add 1 μg IS1, add 6 μg IS2, add 7 mL hexane:toluene:isoamyl alcohol 90:5:5, vortex, centrifuge, remove the organic layer. Add 1 mL pH 9.5 buffer to the aqueous layer, extract with 6 mL hexane:isoamyl alcohol 99:1. Combine the organic layers, evaporate to dryness under a stream of nitrogen, reconstitute the residue with 250 μL MeCN:water:trifluoroacetic acid 45:55:0.05, evaporate to half volume to remove MeCN, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 5 μm Altima C18
Column: 20 × 2.1 5 μm Altima C18
Column temperature: 40

Mobile phase: Gradient. A was MeCN:water:trifluoroacetic acid 10:90:0.05. B was MeCN:water:trifluoroacetic acid 80:20:0.05. A:B 100:0 for 5 min, to 0:100 over 50 min, re-equilibrate at initial conditions for 15 min.
Flow rate: 0.25
Injection volume: 50
Detector: MS, HP 5989B, electron impact; UV 205; UV 290

CHROMATOGRAM
Internal standard: SKF-525 A (IS1), 5-ethyl-5-*p*-tolylbarbituric acid (IS2)

OTHER SUBSTANCES
Extracted: tiletamine

KEY WORDS
whole blood

CUMULATIVE INDEX

This index provides a comprehensive listing of the drugs for which analytical methods have been described in this volume and in earlier volumes in the series (available from John Wiley & Sons, Inc.). These volumes are designated as follows:

I	HPLC Methods for Pharmaceutical Analysis
II	HPLC Methods for Pharmaceutical Analysis, Volume 2
III	HPLC Methods for Pharmaceutical Analysis, Volume 3
IV	HPLC Methods for Pharmaceutical Analysis, Volume 4
V	HPLC Methods for Recently Approved Pharmaceuticals (this volume)
CE	Capillary Electrophoresis Methods for Pharmaceutical Analysis

(For obvious reasons non-interfering compounds are not listed in this index.)

 ISBN: 0-471-66941-5

CROSS-INDEX TO OTHER SUBSTANCES

In many cases other compounds may be chromatographed under the conditions described in the monographs in this book. Using the information in the monographs it may be possible to develop chromatographic procedures for these compounds. The compounds fall into the following categories:

AL	Also chromatographed	Compounds which can be analyzed at the same time. It is not specified whether or not they interfere but they can be extracted.
EX	Extracted	Compounds which can be extracted from the matrix in question and analyzed at the same time and do not interfere.
IN	Interfering	Compounds which interfere with the analysis of the target compound.
IS	Internal Standard	A compound added at some time during the sample preparation procedure to act as a standard.
SI	Simultaneous	Compounds which can be analyzed at the same time and do not interfere. Note that the compound may or may not be extracted from the matrix in question.

(For obvious reasons non-interfering compounds are not listed in this index.)
