Fourth edition 2009

Notice
No responsibility is assumed by the publisher for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions or ideas contained in the material herein.

Medicine is an ever-changing field. Standard safety precautions must be followed, but as new research and clinical experience broaden our knowledge, changes in treatment and drug therapy may become necessary or appropriate. Readers are advised to check the most current product information provided by the manufacturer of each drug to be administered to verify the recommended dose, the method and duration of administrations, and contraindications. It is the responsibility of the treating physician, relying on experience and knowledge of the patient, to determine dosages and the best treatment for each individual patient. Neither the publisher nor the authors assume any liability for any injury and/or damage to persons or property arising from this publication.

The Editor-in-Chief's work on this fourth edition of Information Resources in Toxicology was undertaken as a private citizen, not as a government employee. No official support or endorsement by the US National Library of Medicine or any other agency of the US Federal Government was provided or should be inferred. The views expressed are strictly his own and in no way represent those of the government.

For my parents, Yetty and Will,
my son, Jake,
and Nancy,
with love, appreciation, and respect

and in loving memory
of my pets,
Chi-Chi and Hercules

Concerning the oft forgotten wherefore of toxicology:

And even in our times it is said, venomous animals poison the water after the setting of the sun, so that the good animals cannot drink of it, but in the morning after the sunrise, comes the unicorn and dips his horn into the stream driving away the poison from it . . . this I have seen for myself.

—John of Hesse

Concerning the difficulty of coherently structuring information:

One day the devil and a friend were taking a stroll when they saw a man bend down and pick up something from the ground. He looked at it carefully and put it away in his pocket. The friend asked the devil, 'What did that man pick up?' 'He picked up a piece of the Truth,' answered the devil. 'That is unfortunate for you,' said his friend. 'On the contrary,' the devil replied, 'I am going to let him organize it.'

—Paraphrased from a talk given by Krishnamurti

Foreword

Toxicology, like other sciences, has developed in phases. Toxicologists, however, claim that the initial phase of our discipline preceded that of most other biological sciences since it involved recognition by primitive man of the safe and dangerous agents in his environment. The next phase (antiquity and the Middle Ages) was characterized by the use of this information for good (therapeutics) and evil (poisoning). It was during the Renaissance that Paracelsus recognized the importance of the dose–response paradigm, and this marked the beginning of modern toxicology. Today toxicology is focused on molecular mechanisms, and using the Internet to store and exchange this and other information is becoming a key part in the evolution of toxicology. A major problem with using the Internet in toxicology is that the amount of information is overwhelming and that it varies greatly in quality. *Information Resources in Toxicology* addresses this problem by providing a roadmap for today's online enthusiast, and an annotated bibliography for other information sources in toxicology. This book is a gold mine for those of us who make lists of our favorite toxicology and regulatory websites, and will be invaluable to everyone who wants to know where to find general and specific information in all areas of toxicology and risk assessment in the US and around the world.

The fourth edition of *Information Resources in Toxicology* reflects the exponential growth of our discipline. Despite the book's increased size, it is easier to navigate because its many chapters have been logically clustered into relatively few sections. Each chapter in the global arena and subject categorization sections has been written by a well-recognized expert to insure that it is both authoritative and current. Similarly, the chapters on the Internet and Digital Tools and Special Topics (legal, education, funding, etc.) provide a pragmatic hands-on approach that will be of immense value to scientific researchers not well versed in such ancillary concerns. The section on Other Resources offers chapters on print media (journals, newsletters, bibliographies and similar collections, agency and organization documents and reports, etc.), as well as a delightful chapter on General Interest and Popular Works which nicely supplements the chapters on Scientific Principles and History in the introductory section.

John Doull, MD, PhD
University of Kansas Medical Center
Kansas City, Kansas

Preface

It has been 26 years since the first edition of this work was published. Toxicology, at the time, although not quite a fledgling science, still had not reached its maturity. The evolution of its experimental and theoretical underpinnings was gradual and continues to be refined, although its standing as a peer of other scientific disciplines is now assured.

The societal impact of toxicology lends it a layer of practical relevance that not every science can lay claim to. Given that we cannot avoid interacting with xenobiotics on a daily basis, toxicology plays a significant role in our lives. News of toxicological incidents continues to fascinate, be it melamine-tainted pet food, toothpaste containing traces of diethylene glycol, the recall of toys contaminated with lead-based paint, an assassination attempt on the President of Ukraine with dioxins, or the murder of a former Soviet agent with radioactive polonium 210.

While piecemeal efforts are being made globally to limit greenhouse gas emissions and otherwise rein in chemical releases, chemicals are still adamant in their refusal to respect geographic boundaries. Developing countries with bourgeoning economies are fueling much of this pollution, compromising the health of their citizens and people at a distance. And yet asking the developing world to eschew rapid economic progress in favor of a paced and sustainable approach for the benefit of the Earth and future generations, requires discussion, diplomacy, and compromise. Much work remains to be done.

The current edition's overall structure and goals adhere fairly well to those established in the last three editions. The intent remains to provide an extensive annotated bibliography and sourcebook to information in toxicology, a compilation of references to key documents, organizations, and other resources. What has changed is the extent to which digital versions of these resources, either complementing or replacing traditional paper formats, now predominate. It becomes an ever greater challenge to encompass the diversity, and multiple nodes of toxicology within the confines of, ironically, a single print publication, which is the format this book takes. However, the editors felt that despite the pervasiveness of information on the Internet, its search capabilities and free availability, there were still significant advantages to a highly structured hardcopy compendium, avoiding much of the extraneous web-based information and focusing on the relevant, either digital or other. Further, this edition's planned availability on Elsevier's Science Direct will give readers more comfortable with the digital environment, the option of also navigating and searching the book's content in an online environment.

The dual stream of advances in the science of toxicology itself and in the information technology to assist in its research and deliver its results has resulted in an array of new tools for generating, capturing, organizing, and disseminating data. These web tools and resources, exclusive of devices integrated with laboratory instrumentation, have been extensively covered in this new edition.

Toxicology's forward scientific march has resulted in the blossoming of a host of new areas ripe for further investigation. Emerging subjects, such as – 'omics, nanotechnology, high-throughput screening, etc., are joined with new perspectives on issues rooted in the past (e.g. chemical and biological warfare, animal welfare, effects of mixtures, risk assessment). The emphasis on the chemical-based orientation of toxicology persists and is reflected in the focus of this book, but biological and physical agents, particularly radiation, have not been neglected since their potentially hazardous effects are part and parcel of the science.

The online web environment, of course, is now an inevitable part of the professional and personal lives of most of us in the developed world, and remote and

economically deprived regions are catching up quickly. Google, Wikipedia, blogs, online social networking, virtual environments, and PDAs, have become part and parcel of our daily vocabulary and lives, and offer ever novel approaches to make sense of raw, sprawling information, and offer ways to make it easier to use whenever, wherever. Toxicology has benefited from these technologies.

This edition is much more of a collaborative endeavor than the previous three. Individual experts were solicited for virtually every chapter to assure the best selection of resources. We have also embraced the global nature of toxicology, both via contributors from different countries, and discussion of toxicology activities around the world. Transportation and communication technologies have hastened this globalism, and increasing cooperation on the economic and governmental fronts (the European Union being one example) are signs that no matter how well established toxicology may be in a single country, we cannot afford to be provincial and risk excluding the research and investigations of other countries. Thus, chapters here include compilations of toxicology resources in selected countries outside the United States, as well as a chapter devoted to international activities and the many multilateral conventions and initiatives relevant to the science.

Thanks are due, foremost, to my three Associate Editors, Steve Gilbert, Bert Hakkinen, and Asish Mohapatra. Their unparalleled knowledge of the science and significance of toxicology and its information infrastructure proved invaluable. Their overlapping networks of proficient colleagues from whose ranks they drew chapter contributors, and their ability to work smoothly together and with me, made the creation of this book an efficient and enjoyable process. Fred Stoss, our informal informatics advisor, brought to our project a broad grasp of the public health implications of toxicology and environmental health, and well-honed and respected skills in library and information science. And, of course, our many contributors, among whom the above editors are also included, form both the backbone of the book and the cement which holds it together.

Additional acknowledgment and praise is due to Keri Witman, Cindy Minor, Renske van Dijk, Rebecca Garay, Kirsten Chrisman, and Claire Hutchins, of Elsevier, our Acquisitions, Production, and Developmental Editors respectively, for recognizing the value of a fourth edition, nudging it through its insubstantial, preliminary, and partial stages, with sensible guidance, and ultimately molding a coherent and useful product in a handsome package.

Philip Wexler

Preface to the Third Edition

The goal of this revised third edition is to provide an up-to-date selective guide to sources of information in all aspects of toxicology and ancillary fields, such as environmental and occupational health and risk analysis. The core of this reference work is an extensive annotated bibliography of books categorized by subject. This is joined by listings of journals, organizations, audiovisuals, popular works, and many other areas. Perhaps the most obvious change in access to toxicology information in the 10 years since the second edition has been the growth of electronic sources of information and digital technologies to access it, sparked by the pervasiveness of personal computers in office and home and the still burgeoning Internet. It is, in fact, ironic that despite this phenomenal transition in scientific information-seeking behavior, we nonetheless have a need for and joy in old-fashioned information rich paper products, such as books. That said, I continue to harbor the hope that this book will one day be joined, but not replaced, by an electronic version.

The scope of toxicology has widened and its areas of focus have shifted significantly in the last decade. Whereas the subject breakdown of books is similar to that in the second edition, there are an increasing number devoted to biochemical, cellular, molecular, and genetic aspects and more of an emphasis on both mechanisms of action and risk assessment. There will always be a chemical or topic of the hour, be it Agent Orange or endocrine disruptors, to which it may seem a disproportionate amount of attention is paid. We have tried to include resources covering such subjects if their significance is likely to endure.

It has become considerably more difficult to know how to categorize items. There used to be a common understanding of what the words "book," "journal," or "newsletter" meant, but with these formats and others, as understood traditionally, being replaced or complemented by electronic versions, we in the information fields find ourselves groping for the right word to describe a resource. A database used to be a collection of information accessed directly over standard phone lines. It still may be, although we now have the much more multifaceted and versatile World Wide Web and Internet. Databases can be PC-resident, networked, on CD-ROMs, packaged with software that "does"something with or to the data and allows new data to be imported (e.g., modeling, structure–activity), etc. Words such as "book," "journal," or "newsletter," though not likely to vanish any time soon, will probably become much more nuanced and ambiguous, requiring clarification, perhaps, about whether one is talking about content in hard-copy print or digital form. We have thus, for want of good substitutes, used many of the same format types from earlier editions. There are many more cross-references, though, to Web sites.

Each chapter retained from the second edition, some renamed, has been considerably enlarged, and a number of new chapters have been added. The new chapters cover publishers, grants and other funding opportunities, assessment of physical hazards, patent literature, technical reports, an overview of international activities, and the IUPAC glossary. Also contributed were new chapters describing toxicological activities in Russia and Paraguay. The addition of three Associate Editors, each well versed in the intersection of toxicology and information, has energized and brought a fresh perspective to the text.

Many thanks to Tari Paschall, Destiny Irons, Kay Sasser, and Joanna Dinsmore of Academic Press. Their combined editorial and production skills have transformed a loose jumble of chapters into a coherent and logical whole.

Disclaimer

I wrote this book in my capacity as a private citizen, not as a government employee. The views expressed are strictly my own. No official support or endorsement by the U.S. National Library of Medicine or any other agency of the U.S. Federal Government was provided or should be inferred.

Philip Wexler

Preface to the Second Edition

Since the first edition of this book five years ago, the field of toxicology has continued to grow unabated. This younger sibling of the more established sciences is crossing more and more disciplinary boundaries while gradually refining its scientific basis. Much fundamental research is still necessary. The excitement of toxicology is based, in large measure, on the difficulty of making predictions about the response of biological systems to exogenous agents. Its challenge is to balance technological and product innovation with the guarantee for a reasonably safe and healthy environment.

This book considers toxicology primarily from the perspective of the harmful effects of chemicals on biological systems. "Harmful," of course, is a highly problematic word. "Harmful" may be on a clinical, pathological, or biochemical level. It may change over time in relation to advances in analytical instrumentation. The Congress, regulatory agencies at all levels of government, the courts, and the public all have their own ideas about what such words as "harmful," "hazardous," "poisonous," "toxic," and "adverse" mean. I will leave debate over these fine distinctions to others and consider all the terms as roughly synonymous for the purposes of this book.

Nonchemical concerns of toxicology relate to the effects of certain physical agents (e.g., radiation) and complex biotoxins (e.g., snake venoms, aflatoxins) on biological systems. Chemical, physical, and biological agents may act not only upon living organisms but upon atmospheric, terrestrial, and aquatic environments. Certain subjects are just beginning to gain a foothold in the realm of the toxicological sciences. Biotechnology, an explosively fertile field in its own right, meets toxicology when studies of the adverse effects of genetically engineered microorganisms are considered. The animal rights movement has made its presence strongly felt, and therefore alternatives to animal testing must be seriously examined by responsible toxicologists. The sophistication of new computer systems is allowing studies in such areas as structure-activity relationships. Indeed, computers in general are aiding experiments in direct measurement and analysis, as well as data capture, manipulation, and retrieval.

Areas of toxicology that this book has not stressed are management of hazardous wastes, aspects of pollution control, and engineering equipment considerations. Abuse of drugs, alcohol, and tobacco, while also within the broad scope of toxicology, have generally not been treated here.

This book of "information resources" is addressed to anyone who has a need to know where to look for toxicology information. A library cataloger may describe it as an annotated bibliography and directory. I prefer to think of it as a sourcebook, a kind of "Whole Toxicology Catalog." The current edition is an expanded and updated version of the first. The scope has been widened as indicated above, and there has been a finer subdivision of categories within toxicology. This remains a selective list with no attempt made to cover exhaustively all available materials. A selective list always assumes a certain presumptuousness on the author's part in judging some books more deserving than others. I have further risked charges of audacity by highlighting the books that I deem especially noteworthy with an asterisk (*). I have no concrete criteria for these judgments other than my personal opinion in examining the texts. Nonasterisked books may be just as, or more, valuable for certain applications and no slight is intended toward any of the authors. All quoted passages within annotations are taken from the item cited or from promotional literature. Book prefaces and the "Information for Authors" section of periodicals were typical sources

for such quotations. This edition includes many new books and new editions of older works. Thus, there has been a considerable increase in scope, size, and currency.

The other major change is the international coverage of the current edition. The inclusion of countries outside the English-speaking world was necessary to make this a thorough compendium. Unfortunately, I was unable to obtain contributions from all of the countries I would have liked to include, and I regret these omissions. Contributed chapters on the history of toxicology and on regulatory information were supplied. Also included are a variety of supplemental lists and directories, such as the directory of mutagenicity testing laboratories in the United States.

The organization of the book, an issue I struggled with in the first edition, continued to plague me here. The widely disparate nature of the form of material (book, series, monographic series, handbook, book in parts, etc.) and the interdisciplinary nature of the field itself have made it difficult to impose a wholly coherent and justifiable order on the work. It has not been easy to reconcile the following two seemingly contradictory facts: (a) organization of a combined directory/bibliography is critical in providing efficient access to the information contained therein; and (b) there is no perfect way to organize such a book. In the end, I hope the organization selected, along with the indexes and cross-references, will prove at least reasonable and convenient to use. The very best way to access information in a book of this nature is to create an online searchable computer version which should definitely be considered if future editions are contemplated. The other frustration an online version would eliminate is the difficulty of keeping up with new and changing information. As the manuscript for this book leaves my hands and makes it way to publication, over months, new toxicology resources will come to light.

I am indebted to many individuals for their assistance with this book. Certainly a sourcebook of this magnitude would not have been possible without all the fine contributions by my U.S. and international colleagues. Dr. Jose Alberto Castro, of Argentina, was particularly helpful in directing me to other international contributors and sharing with me his keen insight into toxicological information in developing countries. I would like to extend special thanks to Drs. Henry Kissman and George Cosmides for their many helpful suggestions and to Mr. Bruno Vasta for his encouragement of this project. I am equally grateful to Mrs. Aurora K. Reich for her continued interest and guidance. The valuable advice and good spirits of Elsevier' s Yale Altman cannot be underestimated as important factors in the successful completion of this book. Christine Hastings, the book's Desk Editor, miraculously transformed the dishabille of my manuscript into an elegantly tailored book. Finally, I am thankful to my friends, parents, Yetty and Will, and my wife, Susan, for more than I can express.

Disclaimer

I wrote this book in my capacity as a private citizen, not a government employee. The views expressed are strictly my own. No official support or endorsement by the U.S. National Library of Medicine or any other agency of the U.S. Federal Government was provided or should be inferred.

Philip Wexler

Preface to the First Edition

Although literature in toxicology is proliferating at a phenomenal rate, and access to this literature by use of computer data bases and other tools is fairly adequate, there has as yet been no succinct guide directing devotees of toxicology to the major sources of information in the field. This guide is an attempt to fill this void. It is a selective and annotated list of information resources. I have tried to select material that is or has the potential of being widely and frequently used and is exceptional in its content and presentation. In addition, I have included material that may not necessarily be of reference use but that is representative of a subject or format. Both relatively broad areas of toxicology and more specific fields of interest have been covered.

Toxicology deals with chemical, physical, and biological (i.e., plant and animal toxins) hazards to man. Chemicals have unavoidably been emphasized. The large number of potentially dangerous commercial chemicals and the large populations exposed to them has resulted in a focus of attention on chemical hazards in research, regulations, and press coverage. I have tried to balance this emphasis by including substantial resources on physical and biological hazards.

For the purposes of this guide, the following areas are within the scope of toxicology: industrial and household chemicals and substances, food, drugs, cosmetics, gases, radiation and radioactive substances, sound, heat light, laser, microwave, metals, minerals, trace elements, biotoxins (mushrooms, plants, insect stings, snake and marine life venoms), environmental pollutants, pesticides, industrial hygiene and occupational medicine, analytical techniques, chemical and forensic toxicology, epidemiology, contamination of water and air, carcinogenesis, mutagenesis, teratogenesis and reproductive toxicology, behavioral toxicology, toxicity testing, legislation, regulations, and societal issues, veterinary toxicology, and target systems toxicology. The concentration is that of health effects. Therefore, topics such as management and storage of wastes and waste disposal; engineering, equipment, and monitoring aspects; mechanical aspects of pollution, and ecology and environmental impact where man is not considered a key component of the biosphere are peripheral to the scope of this guide. In addition, the following topics have not been emphasized: alcohol and tobacco, drug abuse, allergy and hypersensitivity, and mechanical and traffic hazards.

The materials chosen are in English and the organizations are primarily within the United States. One chapter provides a glimpse into international activities.

The chapter divisions devised for this guide are somewhat arbitrary, although not indiscriminate. Some of the materials in both the periodicals and books sections, for instance, could have been merged into a chapter on handbooks (e.g., RTECS, TaSCA Inventory, etc.). Then, the associated problem of how to categorize items that were partially handbooks of data and partially expository prose, would have arisen. Directories, on the other hand, for which there is a separate chapter, could have been dispersed among the serials and books. After much thought, I have settled on the organization that follows.

The guide has been organized in a manner that should be most convenient for scanning as well as for accessing a particular item or class of items. The overall organization, along with the indexes, should provide sufficient access. I have avoided creating too many categories and chapters as this tends to confound matters and create an extremely disjointed product in a field where there is great overlap in subdisciplines.

There was a great temptation to make this guide much larger than it is, since there is no shortage of material. This, however, would have become unwieldy

and defeated the purpose of providing a core list of the most necessary and useful information.

All quoted passages within the annotations are taken from the item cited – for serials this information usually appears as scope notes or information for authors; for books, the quoted sections have usually been extracted from the preface.

This guide was compiled with the assistance of many individuals and organizations. Holdings lists of libraries, individual specialists' recommendations, reading lists for classes in toxicology, compilations of materials used in the creation of data bases, and library card catalogs were all consulted. The outstanding facilities of the National Library of Medicine, the Library of Congress, the National Institutes of Health Library, as well as those of other Washington area libraries, were utilized to examine virtually all of the items.

Special thanks are owed to the following individuals who provided valuable guidance and support throughout this project: Arthur Wykes, Mel Spann, Aurora K. Reich, Pat O'Brien, and Sally Moulton.

Since a guide such as this quickly becomes outdated it is essential that revised editions be published periodically. Comments and suggestions from readers regarding the content and organization of the guide as it exists, items omitted, those that seem unnecessary, or alternate ways of presenting the material would be greatly appreciated, as they will result in future editions of even greater value to the toxicologist.

The views expressed in this book are the personal opinions of the author and should not be taken to represent the views of any organization with which he is or has been associated.

Philip Wexler

ANNEX

1

Some Toxicological Abbreviations Used in This Book

ADI	Acceptable daily intake
ALARA(P)	As low as reasonably achievable (practicable) In the United Kingdom, regulations relating to worker exposure. In the United States, the goal of risk management (USNRC regulations).
ATP	Adenosine triphosphate
BAL	British anti-Lewisite
BATNEEC	Best available technology not entailing excessive cost
BPEO	Best practicable environmental option (United Kingdom)
bw	Body weight
ChemG	German Chemicals Act
DNn	See *NDn*
EC	Enzyme classification number or effective concentration
EC_n	Median effective concentration to *n*% of a population
EDI	Estimated daily intake
EDn	Median effective dose to *n*% of a population
EEC	Estimated exposure concentration
EED	Estimated exposure dose
EEL	Environmental exposure level
EMDI	Estimated maximum daily intake
EQO	Environmental quality objective
EQS	Environmental quality standard
ERL	Extraneous residue limit
ETS	Environmental tobacco smoke
GAP	Good agricultural practice
GLP	Good laboratory practice
GMP	Good manufacturing practice
HQ	Hazard quotient
HSG	Health and Safety Guide (IPCS)
IC	Inhibitory concentration
IDLHC	Immediately dangerous to life or health concentration
im	Intramuscular
inhl	By inhalation
ip	Intraperitoneal
IPD	Individual protective devices
I-TEF	International toxicity equivalency factor
iv	Intravenous
Koc	Organic carbon partition coefficient
Kow	Octanol-water partition coefficient
LC_n	Median concentration lethal to *n*% of a test population
LD*n*	Median dose lethal to *n*% of a test population
LEL	Lowest effect level, same as LOEL
LOEL	Lowest-observed-effect-level
LOAEL	Lowest-observed-adverse-effect-level
LTn	Median time for death of *n*% of a test population
LV	Limit value
MAC	Maximum allowable concentration
MCL	Maximum contaminant level (United States: Safe Drinking Water Act)
MCLG	Maximum contaminant level goal (United States: Safe Drinking Water Act)
MEL	Maximum exposure limit
MF	Modifying factor
MOE	Margin of exposure
MRL	Maximum residue limit
mRNA	Messenger ribonucleic acid
MSDS	Material safety data sheet

MTC	Maximum tolerable concentration
MTD	Maximum tolerable dose; maximum tolerated dose
MTEL	Maximum tolerable exposure level
NADP(H)	Nicotinamide adenine dinucleotide phosphate (reduced)
NDn	Median dose narcotic to *n*% of a population
NEL	No effect level, same as NOEL
NOAEL	No-observed-adverse-effect-level
NOEL	No-observed-effect-level
OEL	Occupational exposure limit
OES	Occupational exposure standard
pc	*Per cutim* (Latin) = through the skin
PEL	Permissible exposure limit
PMR	Proportionate mortality rate, ratio
po	*Per* os (Latin) = by mouth
Pow	Octanol-water partition coefficient
PPD	Personal protective device
PPE	Personal protective equipment
PSS	Poison Severity Score
PTWI	Provisional tolerable weekly intake
QSAR	Quantitative structure-activity relationship
RD	Rate difference
RfC	Reference concentration
RfD	Reference dose
RME	Reasonable maximum exposure (USEPA)
RNA	Ribonucleic acid
RR	Rate ratio
SAR	Structure-activity relationship
SC	Subcutaneous
SCE	Sister chromatid exchange
SMR	Standard mortality ratio
SNARL	Suggested-no-adverse-response-level
STEL	Short-term exposure limit
$\mathbf{t}_{1/2}$	Half-life
TCDD	2,3,7,8- Tetrachlorodibenzo-p-dioxin
TDI	Tolerable daily intake
TEF	Toxicity equivalency factor
TEQ	Toxicity equivalent
TLn	See LTn
TLV	Threshold limit value
TMDI	Theoretical maximum daily intake
TSEL	Tentative safe exposure level
TWA	Time-weighted average
TWAC	Time-weighted average concentration
TWAE	Time-weighted average exposure
UF	Uncertainty factor

ANNEX

2

Abbreviations of Some National and International Organizations and Miscellaneous Terms

ACGIH	American Conference of Governmental Industrial Hygienists
ACTS	HSE Advisory Committee on Toxic Substances (United Kingdom)
ASHRAE	American Society of Heating, Refrigerating, and Air-Conditioning Engineers (United States)
BCR	Bureau Communautaire de Reference (Bruxelles)
BIBRA	British Industrial Biological Research Association
CCFA	Codex Committee on Food Additives
CCOHS	Canadian Centre for Occupational Health and Safety
CCPR	Codex Committee on Pesticide Residues
CDC	Cancer Detection Centre
CEC	Commission of the European Communities
CERCLA	Comprehensive Environmental Response, Compensation, and Liability (United States)
CFR	Code of Federal Regulations
CHIP	Classification, Hazard Information and Packaging (United Kingdom)
COC	Committee on Carcinogenicity (United Kingdom)
COM	Committee on Mutagenicity (United Kingdom)
COPR	Control of Pesticides Regulations (United Kingdom)
COSHH	Control of Substances Hazardous to Health (United Kingdom)
COT	Committee on Toxicity (United Kingdom)
CPL	Classification, Packaging and Labeling
CRISP	Computer Retrieval of Information on Scientific Projects
CSM	Committee on Safety of Medicines (United Kingdom)
DART	Developmental and Reproductive Toxicology
DEA	Drug Enforcement Agency
DOD	Department of Defense
EC	European Community, European Commission
ECETOC	European Chemical Industry Ecology and Toxicology Centre
EEC	European Economic Community
EIA	Environmental Impact Assessment
EINECS	European Inventory of Existing Chemical Substances
EIS	Environmental Impact Statement
EPA	Environmental Protection Agency (United States); same as USEPA
FAC	MAFF Foods Advisory Committee (United Kingdom)
FAO	Food and Agricultural Organization
FDA	Food and Drug Administration (United States)
FEMA	Federal Emergency Management Agency; also, Flavour and Extract Manufacturers Association
FONSI	Finding of No Significant Impact (United States)
FSC	Food Safety Council, Washington, DC
GEMS	Global Environmental Monitoring System
HSC	Health and Safety Commission (United Kingdom)

HSE Health and Safety Executive (United Kingdom)
IAEA International Atomic Energy Agency
IARC International Agency for Research on Cancer
ICRP International Commission on Radiological Protection
ICSU International Council of Scientific Unions
IFCC International Federation of Clinical Chemists
ILO International Labour Office
IPCS International Programme on Chemical Safety
IRIS Integrated Risk Information System
IRPTC International Register of Potentially Toxic Chemicals
ISO International Organization for Standardization
IUPAC International Union of Pure and Applied Chemistry
IUTOX International Union for Toxicology
JECFA Joint FAO/WHO Expert Committee on Food Additives
JMPR Joint FAO/WHO Meeting on Pesticide Residues
MAFF Ministry of Agriculture, Fisheries and Food (United Kingdom)
MARC Monitoring and Risk Assessment Centre (United Kingdom)

PART

I

The Discipline of Toxicology

CHAPTER

1

Toxicology: A Primer

A. WALLACE HAYES

Toxicology is the science of poisons or the study of the untoward effects of chemicals or physical agents on biological systems. It has evolved over the centuries from the trial and error skills of the hunter-gatherer in finding 'safe' food to the applied art of poisoning enemies to a highly sophisticated science of mechanisms that is built upon numerous biomedical disciplines, including molecular genetics and molecular biology. The study of the deleterious interactions between an agent and a biological system also falls within the scope of toxicology. Yet toxicology remains a paradox – 'All substances are poisons; there is none which is not a poison. The right dose differentiates a poison and a remedy'. So stated, presciently, Philippus Theophrastus Aureolus Bombastus von Hohenheim (Paracelsus), a 16th century German-Swiss physician and alchemist.

From the beginning of civilization, man, in his quest for food, learned the ironic fact that certain potential foods produced varying degrees of illness or even death, and he soon was able to differentiate between the harmful and beneficial consequences associated with taking such materials into his body. Substances were, perhaps too readily, assigned a tag either of 'safe' or 'toxic', a dichotomy that in some ways has persisted to the present day. However, it is impossible to describe such a clear line of demarcation between strictly beneficial chemicals and harmful ones. The degree of harm or safety for any chemical is not always clear, though, because as Paracelsus noted, the dose makes the poison. All chemicals, including therapeutic drugs, can cause harmful effects in sufficiently large amounts. For example, both botulinum toxin (a natural neurotoxin protein produced by the bacterium *Clostridium botulinum* and one of the most poisonous natural toxicants known) and thalidomide (a synthetic chemical that caused severe birth defects in the offspring of mothers taking the sedative during pregnancy) are now FDA-approved for selected treatments in humans.

Many of the earliest practitioners of toxicology were women. For example, Lucrezia Borgia, the daughter of Rodrigo Lenzuoli Borgia or Pope Alexander VI, who specialized in faith-based poisoning, was an early Italian who helped develop poisoning into a simple but fine art. It is said that the Borgias selected and laid down rare poisons in their cellars with as much thought as they gave to their vintage wines. Catherine de Medici of Florence and Queen Consort of France tested and carefully studied the effects of various toxic concoctions on the poor and sick, noting the onset of action and symptoms that occurred. Marquise de Brinvillers poisoned her father, two brothers and her sister for their inheritance. Catherine Deshayes or 'La Voisin', who traded in selling poisons to wives who wished to rid themselves of their husbands, was later burned at the stake. One of the most prolific arsenic-poisoners in history was Goeie Mie ('Good Mary') of Leiden, The Netherlands, who lived in the 19th century. She poisoned at least 102 friends and relatives (27 died) between 1867 and 1884, distributing arsenic trioxide in hot milk to her victims after opening life insurance policies in their names.

History is filled with toxic events, such as Cleopatra's voluntary suicide by an asp (a venomous snake) or Socrates' mandated suicide by hemlock

(the poisonous plant, *Conium maculatum*, a common European herb that was probably the state poison of Ancient Greece). Adding arsenic or hellebore (a herb that is a cardiac poison) to wine was discreet, nearly undetectable and considerably less messy than a gun or a knife. Little has changed in the ensuing years. Poisons, as the solution to delicate political problems, became an art form not unlike painting or sculpture during the Renaissance period. Claims have been made that members of the Politburo allegedly gave Stalin warfarin (a synthetic derivative of coumarin, a chemical found naturally in many plants and used as an anticoagulant medication) and that the CIA, using botulinum-laced pills, made attempts on the life of Cuban Dictator Fidel Castro. Evidence seems to suggest that Ukrainian President Viktor Yushchenko was poisoned with dioxin (the common name for the group of compounds classified as polychlorinated dibenzodioxins) in an attempt to remove him from office as recently as 2006.

The first biological weapon described in Western literature may be the poison from a many-headed serpent, the Hydra, to poison Hercules' arrows. This led to the term toxic (from toxikon, Greek for poison arrow). The Romans used a variety of biological weapons as did Hannibal who had his sailors catapult pots full of venomous snakes onto the decks of opposing fleets. Other biological weapons have included: (1) the use of bellows in 4th century BC China to pump smoke from mustard and other noxious vegetable matter into tunnels dug by besieging armies; (2) smallpox-infected blankets that the British sent to the American Indians during the French and Indian Wars; (3) animal carcasses thrown by Confederate forces into wells during the Civil War; and (4) sharp bamboo stakes smeared with human feces by the Vietcong during the Vietnam War.

More modern toxic weaponry includes: chlorine gas, the first lethal chemical used in modern warfare, phosgene, hydrogen cyanide, mustards, tear gas and zyklon B (crystallized hydrogen cyanide). Chemical agents (mustard, sarin and tabun) were used in the Iran–Iraq War between 1983 and 1985 during which it was reported that as many as 7000 people were killed by these gases. Sarin gas contained in lunch boxes was released in the Tokyo subway system in 1995 killing 12 people. This attack was followed by the deaths of five people in the United States in 2001 by anthrax-laced letters. And one should not forget the cyanide-laced grape punch that Jim Jones forced his followers to consume killing the entire congregation of 912 people, including 276 children, or the more recent incident in New Sweden, Maine, where one person died from consuming coffee laced with arsenic. Because of its potency and its frequent use among the ruling class, arsenic is often referred to both as 'The King of Poisons' and 'The Poisons of Kings'.

Poisons may be found naturally in our foods. These natural toxicants include: fungal toxins such as aflatoxin, shellfish toxins, bacterial toxins and algal poisons. The world is full of toxins produced by a variety of plants and animals. Man has added to the list of poisons arising from his ability to chemically synthesize a large number of useful but potentially harmful materials. Environmental and workplace pollutants, arising from natural and man-made chemicals, are another cause of concern to the toxicologist.

Ultimately, the purposes of toxicology are: (1) to protect individual and public health, and the environment; (2) to provide information about the nature and severity of potentially harmful effects on human and animal health and the environment; (3) to ensure safe working conditions; (4) to ensure that products including our food, water and air are safe; and (5) to mitigate damage to natural habitats while at the same time allowing humankind to enjoy the benefits of a modern society. To achieve these goals, toxicology borrows freely from the basic sciences.

The multidisciplinary nature of toxicology is its greatest strength. By incorporating the capabilities and techniques of the biomedical sciences, including epidemiology and statistics, toxicologists utilize a wide range of expertise to investigate issues of critical concern to society.

Toxicology can be subdivided in a number of ways. One such division is based on the disciplines involved: (1) environmental; (2) economic; and (3) medical. Environmental toxicology includes the roles that engineers, environmental scientists, and chemical specialists play in the identification and quantification of both natural and synthetic pollutants, and the transfer of chemicals between and within air, soil and water. Economic toxicology involves biologists, chemists and basic medical scientists who identify and quantify the chemicals responsible for toxicological problems in industry, in foods, in consumer products, and in drugs. Medical toxicology utilizes the capabilities of physicians and veterinarians for the diagnosis and therapy of chemical intoxications, including the forensic aspects of clinical toxicology.

The consequences of the adverse effects of chemicals can be divided into one of two broad categories: (1) irreversible damage such as mutagenicity, carcinogenicity, teratogenicity or death and (2) reversible damage provided the initial insult does not totally overwhelm the exposed organism. Reversible effects may include, for example, organ damage (liver enlargement, gastrointestinal erosion) and functional damage (enzyme induction, respiratory depression).

There are at least four basic principles that are generally applicable to all chemical-induced biological effects of toxicological interest:

1. The chemical must reach a receptor site in a biological system before an effect can be produced. The pharmacokinetics (i.e., how the body acts on the chemical) and pharmacodynamics (how the chemical acts on the body) of the chemical in the biological system are essential in understanding how a chemical reaches the receptor.
2. Not all chemically induced effects are harmful (the basis for drug therapy).
3. The occurrence, intensity and frequency of chemically induced biological effects are dose-related (remember our old friend, Paracelsus).
4. Effects of chemicals on animals, if properly qualified, are generally applicable to humans. The physiology, biochemistry and anatomy must be evaluated and correlated between the test species and the human; generally, when the pharmacokinetics and pharmacodynamics of two species operate in a similar fashion, these two species will respond similarly to the same chemical.

How do we determine these untoward or adverse effects? There are sufficient data to indicate that every chemical is capable, under some conditions, of producing an effect on a biological system. These conditions vary greatly; from being practically unattainable under ordinary circumstances to being so readily attained that exposure of living tissue to minute doses of certain chemicals destroys cells. Effects vary from insignificance (i.e., the cell is able to carry on its normal function) to deleterious, and even lethal, effects resulting from extremely small amounts of some chemicals.

Most of the toxicological test methods that have been developed are the results of the practical need to obtain as much information as possible about the effects of chemicals on humans and the environment. Human experimentation is generally not part of a toxicology testing protocol because of moral, ethical and legal restrictions. Exceptions include testing of therapeutic agents and to a much more limited extent, some consumer products and pesticides where stringent human protocols may be employed. Testing methods in toxicology, therefore, most often involve the use of animals based on the hypothesis that results of toxicity studies in suitable animal models may be extrapolated to humans. That is, one may infer, to some extent, human response based upon the response of an appropriate animal model. Today, more and more toxicity testing procedures include the use of non-mammalian species, cell cultures and individual cells.

Over the years, certain types of toxicity testing procedures have been designed, modified and improved so that they are generally acceptable by most toxicologists. In fact a number of such protocols have been harmonized and accepted by governmental agencies around the world based upon acceptance of the protocol established by the Organization for Economic Co-operation and Development (OECD). OECD is an international organization helping governments tackle the economic, social and governance challenges of a globalized economy. Thirty countries now comprise the OECD and these countries have agreed to accept toxicology studies undertaken using OECD protocol guidelines.

Toxicological tests are designed to define the conditions that must be present when a biological cell is affected by a given chemical entity, and the nature of the effect produced. The result is manifested as an effect on the function and in many cases the structure, of the biological system. Toxicity tests are conducted not only for the purpose of demonstrating the existence of toxic effects but also to estimate the limits of safety associated with the use of a chemical. In any attempt to establish a concentration of a chemical in any toxicological test procedure, it is important to define what is meant by 'effect' and the confidence that can be placed on the results of the test. Essentially, certain measurable detrimental changes must take place within the animal, and within a reasonable amount of time after exposure.

In a properly conducted toxicity test, a control is run in parallel to the assay to ensure the viability and validity of the test system. Except for the omission of the test chemical, a negative control is run under exactly the same conditions as the test assay, including any vehicle (or solvent). The test outcome (cell growth, death, tumor incidence) must be statistically different from the negative control for the test to be considered positive. Ideally, there will also be a positive control (i.e. an agent that is known to give a positive result in the test assay). This is important because, in the event that the test results are negative, the positive control will demonstrate that it is at least possible to elicit the toxicity under investigation in the same species and using the same assay system. Otherwise, it is not known if the species or assay system is at all capable of showing the type of toxicity under investigation.

The extent to which a chemical compound is studied in the toxicology laboratory is largely dependent on the intended use of the compound. Those compounds that are intended for introduction into humans, such as drugs or food additives, require extensive toxicological testing. If the chemical (i.e., a drug) is to be used for only short periods, the extent of the toxicological testing is different than that for chemicals that are

to be used over long periods of time. Any chemical that is incorporated into hundreds of household or consumer products requires extensive toxicological testing even though the material may not be intended for direct consumption by humans.

Extensive toxicological testing means that the chemical or product is subjected to a series of individual tests that are designed to detect specific types of toxicity. If the chemical or product eventually will become an environmental pollutant, the extent of testing may well involve insects, fish, wildfowl and the species of interest. Thus in modern society, no chemical or product should be made available for human exposure (use or potential misuse) without appropriate toxicological evaluation by accepted methodology.

Toxicology testing protocols include the following types of tests: in situ (to examine the phenomenon exactly in place where it occurs; examining a cell within a whole organ intact and under perfusion); in silico (i.e. computer-simulated), in vitro and in vivo procedures. A list of the various types of animal toxicological tests is found in Table 1.1. Details of the tests summarized in Table 1.1 as well as the importance of care and maintenance of experimental animals can be found in Hayes (2007).

Notes on Table 1.1:

Acute testing takes place during relatively short periods of time in relation to an animal's lifespan. Chronic testing takes place during relatively long periods of time in relation to an animal's lifespan. Subchronic testing falls somewhere in between.

The LD_{50} (lethal dosage 50) is the amount of a chemical that is lethal to 50% of the experimental animals exposed to it, when ingested. LC_{50} (lethal concentration 50) is a similar type of lethality expressed as a function of concentration, usually when animals are exposed to the chemical via inhalation.

Toxicological tests are necessary to assess the harm or safety of medicines, consumer products, pesticides, household products, and industrial chemicals. Traditionally, these methods have used animals; however, in recent years, there has been increasing interest in developing alternative methods that reduce or replace animal use and that refine animal use to lessen or eliminate pain and distress.

Russell and Burch (1959) were the first to describe the concept of alternative methods. Commonly referred to as the '3R', this concept involves *reducing* the number of animals needed for a test, *replacing* animals with non-animal systems and approaches, and *refining* animal use to lessen or avoid pain and distress. Laws have been passed in the United States and around the globe requiring consideration of alternative methods prior to the use of animals in biomedical research. Following centuries of trial and error and detailed scientific investigation in more recent times, three axioms have emerged that are central to toxicology. These axioms, as posited by Mitchell et al are: (1) people differ; (2) dose matters; and (3) things change.

People differ: Individual differences are due to a number of factors including individual genetic makeup (polymorphisms), age (fetus, neonate, children, adults, elderly), gender (male, female, pregnant female), inherent drug metabolism, life style factors (smoking, alcohol use, previous exposures), health status including various diseases, and pre-existing or simultaneous exposure to environmental agents, household products, or therapeutic agents. Classic examples of the fact that people differ include allergies to food (e.g., peanuts and shellfish) and to drugs (e.g., penicillin).

Even more striking are the differences in the effects of the same chemical on a single individual that may be observed during various stages of life (in utero,

TABLE 1.1 Animal toxicological tests

- Single dose or acute tests
  - LD_{50} determination (24-hour test; survivors followed for 7–14 days)

  Not generally required by most regulatory agencies
  - LC_{50} determination (similar to LD_{50} but generally 4 or 8 hours exposure)
  - Topical effects; generally evaluated at 24 hours and at 7 days
- Repeat dose or prolonged tests (generally daily doses)
  - Subchronic testing

  Two species (usually rat and dog) for 90 days at 3–4 dose levels. Route of administration should be according to intended route of use or exposure

  Evaluation includes weekly body weight and physical examination, daily feed consumption and observation, ophthalmology examination (before and at termination) and blood chemistry, urinalysis, and hematology, at a minimum at termination

  All animals subjected to complete necropsy including histology of all organ systems at termination
  - Sensitization testing
  - Chronic testing (generally daily doses)

  Selected from results of subchronic tests, pharmacokinetic studies in several species of animals, in vitro metabolism in the liver of several species of animals including human

  Generally two species for 2–7 years depending on the species with a minimum of two dose levels

  Route of administration according to intended route of use or exposure

  Evaluation same as for subchronic testing (see above)
- Special tests
  - For potentiation with other chemicals or drugs
  - For effects on reproduction including teratogenicity
  - For mutagenicity
  - For carcinogenicity
  - For skin and eye effects
  - For behavioral effects
  - For immune effects

neonate, young adult, elderly). Table 1.2 illustrates how much more sensitive newborn rats are than older rats to DDT.

Dose matters: A good starting point for understanding toxicology is the postulate that all substances have the potential to be toxic. Sodium chloride (table salt) used in moderation is fine in the human diet, but consuming half a cup of salt a day causes electrolyte and kidney problems and eventually death. A small amount of another salt, potassium cyanide, can kill a human. Knowledge of the relative toxicity (potency) of a chemical and its potential benefits helps determine whether the material is acceptable for a particular use and, if so, in what dose. Table 1.3 shows examples of typically safe daily doses of some common chemicals and their respective lethal doses.

We are exposed to a myriad of chemicals, both natural and man-made, at work, home, and play every day – chemicals that we voluntarily consume in the foods we eat, in the drugs we ingest, in the water we drink, and in the air we breathe. We are also exposed to chemicals in the various personal care products that we apply to our skin. Fortunately, when a potentially hazardous material is distributed widely enough over an area, it is usually innocuous. For toxicity problems to arise, relatively high concentrations of the chemical are usually required (*Botulinum* toxin is one counter example where even a tiny amount results in adverse effects). We also need to remember that natural is not the same as safe. Depending upon a host of conditions, both synthetic and natural products may be safe or hazardous.

As Paracelsus articulated, the relationship between the dose of a chemical and its toxicity is fundamental to toxicology. Although we cannot always measure it, there is a dose at which there is no untoward or adverse effect (threshold) or, indeed, a beneficial effect, as with drugs. Similarly, there is an upper dose yielding a maximal response. Elucidation of this threshold phenomenon depends upon which parameters of toxicity or response are measured because there are different dose concentrations for different types of toxicity, ranging from measures of morbidity (elevated enzymes) to mortality. Consider Figure 1.1, showing a safe and therapeutic dose of aspirin at about 100 mg/kg and the variety of effects that occur as the dose increases.

A threshold, or concentration, below which no adverse effect is observed, depending upon a variety of factors and circumstances, is deemed to be safe following certain adjustments. Hence, such designations as: (1) threshold limit values (TLVs) for workplace exposure; (2) No Observable Effect Level (NOEL) for industrial chemicals; and (3) No Observable Adverse Effect Level (NOAEL) for pesticides, have been developed and accepted by regulatory agencies around the world.

The concept of a threshold for non-carcinogenic chemicals is for the most part universally accepted; however, controversy exists as to whether a threshold exists for carcinogenic chemicals. Establishing a threshold for such chemicals poses serious challenges. However, intuitively, human exposure to low doses of known or suspected cancer-causing agents, without ill effect, suggests that carcinogenic thresholds, at least for some such chemicals, must exist. Consider – sunlight (ultraviolet, or UV, radiation), certain consumer products containing formaldehyde or formaldehyde-releasing chemicals as a preservative, and grilled and fried goods (containing benzo-a-pyrene and/or acrylamide) as examples of cancer-causing chemicals that have thresholds.

The overall toxicity profile of a chemical depends on a number of factors including but not limited to the following: dose, intake route (ingestion, inhalation, dermal), exposure period (single or multiple dose), and whether or not the effect is reversible or nonreversible. For example, although vitamins are essential for continued health, it is possible to overdose on vitamins such as vitamin A and D since, among other reasons, they are retained within the body for long periods of time. The graph of Figure 1.2 illustrates effects of increasing dose of essential nutrients and non-nutritive toxicants.

TABLE 1.2 DDT LD_{50} in male rats of various ages

Age	LD_{50} (mg/kg)
Newborn	>4000
10 days	728
2 weeks	437
1 month	355
2 months	250
4 months	194
Adult	225

TABLE 1.3 Doses of common chemicals

Chemical	Daily use	Lethal dose	Safety ratio
Water	1.5 quarts	15 quarts	10×
Salt	1/3 ounce	7 ounces	21×
Caffeine	2 cups coffee	75 cups	38×
Ethanol	2 ounces	64 ounces	32×
Sugar	2 ounces	80 ounces	40×
Aspirin	2 tablets	90 tablets	45×

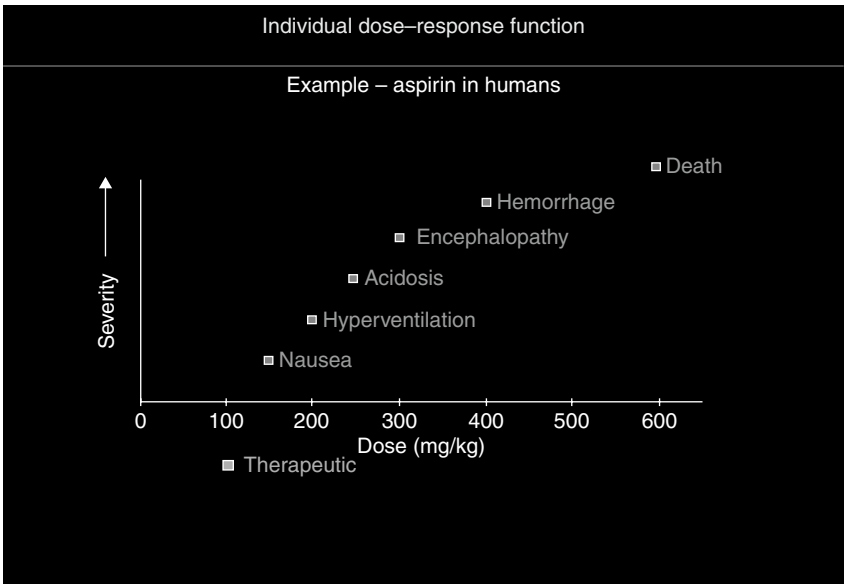

FIGURE 1.1 Individual dose–response relationship

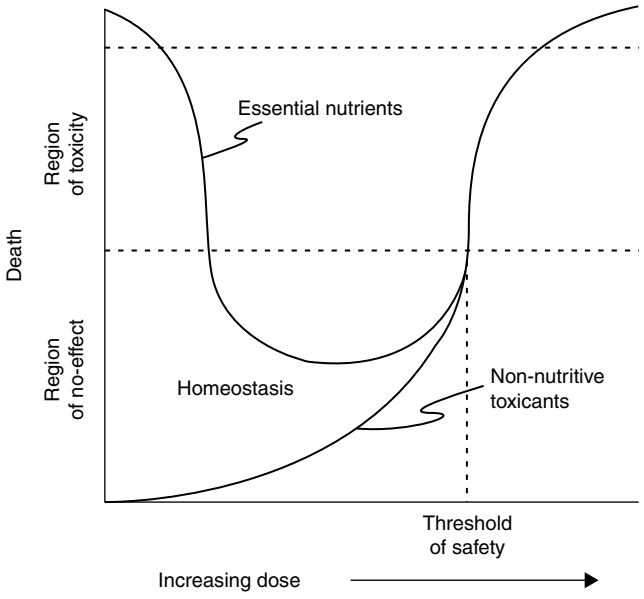

FIGURE 1.2 Examples of dose–response curves for essential nutrients and non-nutritive toxicants showing both a threshold and homeostasis

Thus, it can be seen that insufficient nutrients and excess nutrients can result in toxicity. At the extremes, an absence of nutrients or an extreme excess will result in death. For non-nutritive toxicants (i.e., toxic chemicals without any nutritional value), increasing the dose will result in increasing toxicity and ultimately death. Homeostasis is that region of the graph where the dose is low enough so that the body is able to compensate for the toxic insult and keep itself in balance.

Things change: Sometimes the host (i.e., the organism that is exposed to the chemical) plays a critical role in the outcome of toxicity. The process by which this occurs is called biotransformation and involves a chemical reaction within the organism in which one chemical is changed to another. Chemicals can enter the body and be absorbed by the body by a variety of means such as ingestion, inhalation, and dermal. They are distributed through many bodily compartments and finally excreted. What happens in between entry and exit, though, plays a key role in toxicity. Figure 1.3 is a generalized schematic of the fate of chemicals in the body.

As a chemical passes through the body, it will encounter a number of proteins known as enzymes that are present in all living systems. These enzymes accelerate chemical reactions (intermediary metabolism) that are necessary for growth, maintenance of integrity, and continuance of life. Distinctive microenvironments exist at the active sites of each enzyme to assist chemical inter-conversions. It is, therefore, not unexpected that a chemical undergoes chemical alteration(s) as it traverses a living system. What is eliminated from the biological system is not always the same as what entered the system originally.

Biotransformation usually decreases the ability, and in turn, the likelihood, of a molecule interacting with a biological system. The probability of potential damage is offset or lowered. Usually, but not always, the process makes the molecule more polar (frequently acidic) and thus more water-soluble. As such, the

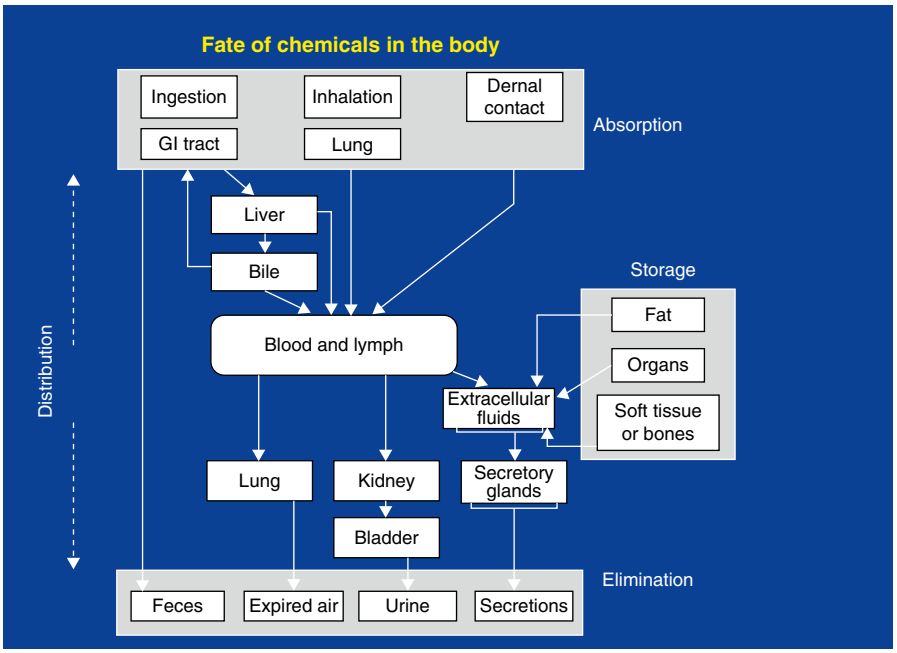

FIGURE 1.3 Fate of chemicals in the body

system can more easily remove the molecule via the kidneys (urine) or liver (bile). Figure 1.4 shows the enzyme epoxide hydrolase converting ethylene oxide, a chemical with genotoxic and other chronic toxic properties, into the somewhat less toxic ethylene glycol. On occasions, the chemical may be activated and converted into a more dangerous species whereby the body inadvertently poisons itself (see Figure 1.5). Phosgene is a poisonous gas used as a chemical weapon in World War I.

These three axioms (people differ, dose matters, and things change (chemicals transform)) help explain why humans respond in varied and often unpredictable ways to a common chemical insult.

Although the ultimate extreme in toxicity resulting from a chemical insult is manifested as a lethal effect, it is apparent that sublethal and even reversible effects of chemicals may be harmful or undesirable, and therefore should be considered in any evaluation of chemicals with regard to their degree of harm or safety. Safety implies the reciprocal of harm. The real question then for the toxicologist is 'Is It Safe?' (www.toxedfoundation.org) and under what exposure conditions. In order for the toxicologist to answer these questions, sufficient and appropriate information (data) is needed in two broad areas: (1) the toxicity or hazard profile of the chemical itself and (2) the exposure details regarding the individual or population under consideration.

CHAPTER

2

History of Toxicology

KATHERINE D. WATSON AND PHILIP WEXLER

All substances are poisons; there is none which is not a poison. The right dose differentiates a poison and a remedy.

(Paracelsus)

HIGHLIGHTS IN THE HISTORY OF TOXICOLOGY

The science dealing with the harmful effects of chemical agents on biological systems is called toxicology, from the Greek word *toxikon*, a bow (to shoot poisoned arrows) or a poison in which to dip arrowheads (Oxford English Dictionary 1989). A poison, for which it has long been surprisingly difficult to give an exact definition (Stevenson 1885, Stevenson 1959), may generally be taken to be a substance that is capable of destroying life or causing illness when introduced into, or absorbed by, a living system in small quantities. Toxicology is often considered to be a modern science as, since 1900, it has undergone continuous expansion and development by assimilating knowledge and techniques from most branches of the physical and biological sciences (Gallo 2001). Its origins, however, lie in the earliest history of poisons and poisoning. Historically, attempts to both kill and cure with chemically active preparations (poisons and drugs) have led to the evolution of toxicology, so that today it is a discipline of diverse application and widespread importance.

It is likely that the history of toxicology is as old as the history of the human race: early man must have learned 'to discriminate between things which were good to eat and those that were not' (Smith 1952). In exploring his environment and searching for food, he would have observed the healing or harmful effects of plants and minerals, and that the bites of certain insects and reptiles caused illness or death. It would have been a natural progression to use injurious substances for hunting, against enemies in warfare, and for homicide (Decker 1987). Arrow poisons were developed by ancient peoples in all parts of the world (with the possible exception of Australia and New Zealand), and many are still in use (Bisset 1989). Among the best known are the 'calabash curares' (derived mainly from varieties of *Strychnos* in South America), reptile poisons (venoms) from toads and salamanders in Central and South America, and ouabain, from African varieties of *Acocanthera* and *Strophanthus* (Paterson 1996). The science of pharmacology (which deals with the preparation, uses, and effects of drugs) has benefited from knowledge of these poisons, and some of the active agents derived from them are now used therapeutically in Western medicine.

The earliest use of arrow poisons probably occurred during the Mesolithic age, when arrows first began to appear. The archeological evidence does not permit firm conclusions to be drawn, but it is possible that Masai hunters who lived in Kenya 18 000 years ago may have used poison. Other sites in Africa indicate later use (3000–1700 BC), and in ancient Egypt and Nubia poisoned arrows appear to have been used during the period 3100–300 BC (Bisset 1989).

In China, arrow poisons have been known to the Han and other peoples for at least 2500 years. They were used for both hunting and warfare, and

documentary evidence indicates that the principal source of poison was *Aconitum*, the tubers of which yield aconitine (Bisset 1979). The same poison was also used in ancient India, where it was called visha and derived from a plant known as Bish. In Sanskrit literature, we find the term *visha-kanya*, or poison girl (maidens who had slowly developed a tolerance for aconitine, so that certain death would result from their embrace). The legend of using young girls as instruments of death originated in India and later spread into medieval European literature via Greek and Arabic writings (Copley & Boswell 1944). The hymns of the *Rig Veda* and *Atharva Veda* (1200–900 BC) show that poisoned arrows were used in war, and that the tubers of *Aconitum* were the major poison source. Later Buddhist and Sanskrit writings indicate the continued use of poisoned arrows (for hunting, warfare, and clandestine purposes) and reveal that a second source of poison was obtained from decomposing snakes; the latter is confirmed by Diodorus Siculus in his account of Alexander the Great's campaign (325 BC) in western India (Bisset & Mazars 1984).

Among the peoples of the ancient Middle and Near East, the Egyptians, Assyrians, Sumerians, and Hebrews all had some knowledge of poisons, from which they developed a primitive pharmacology. Much of their experience was bound up with mysticism and the supernatural, and many details remain unclear. However, where it has been possible to identify individual items of the ancient pharmacopeia, modern practice indicates that some remedies could have been extremely effective (Mann 1984). The Bible, where most references are to venoms (as in the Midrash and Talmud), does not contain a list of poisons or allude to their deliberate use (Borzelleca 2001). In all likelihood, the Hebrew people acquired much of their information about poisons in Egypt, where they not only endured a captivity near the end of the second millenium, but are also known to have established a vibrant community after the destruction of Jerusalem in the sixth century BC.

Egyptian knowledge of poisons appears to have been highly advanced (Nunn 1996). Originally divided into two kingdoms, Upper and Lower Egypt, the land was united under the first pharaoh (or king), Menes, in about 3000 BC. He is said to have cultivated and studied poisonous and medicinal plants, but there is no detailed description of his activities (Smith 1952, Borzelleca 2001). Following his reign, much information about animal, vegetable, and mineral poisons was accumulated in Egypt, and the discovery in 1872 of a complete medical text showed the extent of Egyptian learning. Named in honor of its discoverer, the German Egyptologist Georg Ebers (1837–1898), the Papyrus Ebers, written about 1550 BC, is a compilation of medical prescriptions derived from a number of much earlier sources. There are in total 829 prescriptions, of which 72% are quantified and a few are duplicated; spells and incantations are included throughout. The text lists many possibly active drugs, including (Mann 1984):

> Sulfate, oxide, and other salts of lead used as astringents and demulcents; pomegranate and acanthus pith as vermifuges; sulfate and acetate of copper; magnesia, lime, soda, iron, and nitre; oxide of antimony, sulfide of mercury; peppermint, fennel, absinth, thyme, cassia, coriander, carraway, juniper, cedar wood oil, turpentine, and many other essential oils; gentian and other bitters; mandrake, hyoscyamus, opium with other hypnotics and anodynes; linseed, castor oil, squills, colchicum, mustard, onion, nasturtium, tamarisk, frankincense, myrrh, and yeast.

Of the vegetable and mineral substances cited, some were, clearly, poisonous. Another papyrus provides an early record of the preparation of a poison, as it records the following warning:

> Pronounce not the name of I.A.O. under the penalty of the peach.

C.J.S. Thompson suggests that the Egyptians may have been able to distill a weak solution of hydrocyanic acid from peach kernels; I.A.O. is, possibly, a representation of the ancient Hebrew name for God (Thompson 1931).

The literature of ancient Greece contains many references to poisons and their use (Touwaide 1992), none more famous than Plato's account of the death of Socrates. Condemned to death for impiety and corruption of youth, the Athenian philosopher swallowed a fatal dose of hemlock in 399 BC. This was the state method of execution, the poison being derived from the tubers of *Conium maculatum* (the 'spotted hemlock' or 'poison hemlock'); for quicker effect, it may have been mixed with opium (Daugherty 1995). Other poisonous plants known to the Greeks were mentioned in the ninth (probably spurious) book of the *De Historia Plantarum* of Theophrastus (371–287 BC), and included aconite, hellebore, mandrake, and henbane (Wax 1994). The writings attributed to Hippocrates (460–c.377 BC), the 'father of medicine,' mentioned (among other things) about 400 drugs of mainly plant origin and suggested methods for the management of poisoned patients that relied primarily on limiting the absorption of toxic agents (Borzelleca 2001). During the reign of Attalus III, the last king of Pergamon in Asia Minor (reigned 138–133 BC), poisonous plants were cultivated and experiments made on condemned prisoners by Attalus and, probably, others in his court. Rulers lived in fear of poison, and Mithridates VI Eupator, king of Pontus

(reigned 120–63 BC), spent years searching for a universal antidote to all poisons; he has been called the first experimental toxicologist (Griffin 1995, Borzelleca 2001). After investigating individual venoms, poisons, and antidotes, he combined all of the effective substances into one antidote, which he took daily to obtain, reportedly successfully, immunity to poison. His formula, called Mithridatium, underwent considerable revision but survived in various forms until the nineteenth century. A variant derived from poisonous reptiles became known as theriac, and was equally long-lived in European pharmacopeias (Watson 1966, Wax 2006).

Theriac – a term derived from the word *theria* (dangerous or poisonous beasts) – became famous as a result of its association with the earliest extant work on poisonous animals, the *Theriaca* of Nicander of Colophon (fl. c. 197–130 BC). Also author of a shorter poem, the *Alexipharmaca*, Nicander is the best cohesive source for classical toxicology (Scarborough 1977). His poems describe venomous animals (snakes, scorpions, spiders, insects, and myriapods) and their bites and prescribe specific remedies; poisonous plants are also treated (Scarborough 1979). Working in the intellectual atmosphere created by Attalus III, Nicander was a poet of nature who was, quite possibly, ignorant of his subject: he has been traditionally considered to have taken his information directly from a lost work of Apollodorus of Alexandria, the *Peri therion* (*On Poisonous Animals*), of the third century BC (Scarborough 1979). Despite varying opinion on the originality of Nicander's work, it seems that he was widely influential (Touwaide 1997). Successive Greek and Roman authors (including Scribonius Largus, Celsus, Pliny, Galen, Philumenus, and Oribasius) took much of their information on toxicology from him; he was read and cited for many centuries (Knoefel & Covi 1991).

Following the work of Nicander, in which lay the beginnings of a scheme for identifying toxic agents by means of the symptoms they produce in human victims, a system of toxicology based on this principle developed between the second century BC and the first century AD (Touwaide 1991). The Roman naturalist and historian Pliny the Elder (23/24–79 AD), a great compiler of information, described the biological effects of poisonous plants and animals in his *Historia Naturalis*. In the works attributed to his contemporary, Pedanius Dioscorides (40–90 AD), there is a classification of poisons based on their origin (animal, vegetable, mineral) that remains convenient to this day (Touwaide 1984, Gallo 2001). Known as the father of materia medica, Dioscorides is generally thought to have been a physician in the service of the Roman legions. He studied the medicinal properties of plants and minerals, and provided descriptions of about 600 plants and 1000 simple drugs, with the diseases they might cure, in his *Materia Medica*, the leading text in pharmacology for 16 centuries. Later Greek and Byzantine physicians transmitted the established information, the last being Paul of Aegina (625–690 AD): Book 5 of his *Epitome* deals with toxicology, specifically bites and wounds of venomous animals (Borzelleca 2001).

Mineral poisons were also well known in the ancient world. In particular, the ores and compounds of arsenic, antimony, copper, mercury, and lead were familiar to many cultures. Pseudo-Dioscorides detailed the poisonous effects of arsenic (meaning sometimes the sulfide, sometimes the white oxide), litharge (red lead or lead oxide), cinnabar (mercuric sulfide), and white lead (lead acetate) (Decker 1987). Hippocrates, Nicander, Dioscorides, Galen, and Paul of Aegina wrote clinical accounts of lead poisoning, of which there were occasional epidemics (Nriagu 1983, Scarborough 1984), and miners were known to be at risk from the fumes created by smelting processes (Waldron 1973). After the third century AD and the synthesis by Galen (Touwaide 1994), few if any additions were made to the information presented by Pseudo-Dioscorides (Touwaide 1984), and a passage from Galen suggests that it would have been imprudent to do so because of the risk of encouraging crime (Decker 1987).

The chronicles of ancient Greece contain few references to cases of criminal poisoning, but the fact that Hippocrates required his students to swear that they would 'give no deadly medicine to any one if asked, nor suggest any such counsel' (Ackerknecht 1982) implies that it was a problem. Suicide by poison was fairly common; the state would give permission and provide a lethal dose of hemlock (Decker 1987, van Hooff 1990). In the Roman Republic, however, criminal poisoning reached epidemic proportions. In his *History of Rome*, Livy (59 BC–17 AD) recorded the details of an event that was supposed to have occurred in 331 BC: a series of deaths initially attributed to pestilence were found to be the result of poisoning. A slave informed the authorities that leading citizens who had all died of the same mysterious malady had in fact been poisoned by a group of matrons. A search of the women's houses yielded concoctions which they declared to be medicines; when required to drink the potions to prove their claim, they all perished. Further investigation disclosed 170 accomplices, who were tried and found guilty. According to Livy, there had never before been a trial for poisoning in Rome (Livy 1948).

At the time of the civil wars in Rome, poisoning had become so common that the dictator Sulla issued the *Lex Cornelia* in 82 BC. This was the first legislative attempt to prevent poisoning, and it carried harsh penalties: banishment and confiscation of property if an offender was of noble birth, exposure to wild animals if of low status. Later interpretations made the law applicable to careless preparers of drugs (Decker 1987). Despite this edict, however, homicidal poisoning continued to plague Rome, where according to Tacitus, Juvenal, and Suetonius, a class of professional poisoners arose and practiced their skills with impunity (Blyth & Blyth 1920). During the first century AD, the worst offenders were members of the ruling family, particularly Nero and his mother Agrippina, who used poison as a political tool. Both employed a Gallic woman named Locusta, who had been convicted of poisoning but pardoned and taken into imperial service. She used a variety of poisons, probably aconite, henbane, belladonna, arsenic, and poisonous fungi, and is reputed to have performed experiments on slaves supplied for the purpose (Smith 1952, Decker 1987, Wax 2006).

The death of Galen circa 216 AD marked the beginning of a long period of transition in Western (i.e., Greek) medicine, during which what is usually called monastic medicine gradually emerged. From about 500 to 1130, medical practice and writing resided in the hands of monks, where it was merely complementary to their divine mission (Ackerknecht 1982). The study of toxicology as a system of knowledge came to a halt in the Christian world and was not taken up again until after the rise of the school of Salerno in 12th century Italy (Niyogi 1981). It was no coincidence that Salerno was close to Arab Sicily because, following the rise of Islam in the seventh century, scholarship shifted to Muslim centers, where Arab and Persian physicians dominated medical learning. They discovered Greek medicine through translations made from Byzantine manuscripts and contributed their own original observations to the subject. Similarly, medical texts written in India were made available in translation.

Several Indian medical texts containing information about poisons, together with the works of Greek authors, became key sources of information for Arab toxicologists. The most important Indian works were those of Charaka (second century AD), Susruta (about 500 AD), and Shanaq (slightly later). The most complete Arabic works on toxicology still extant are the *Book on Poisons* of ibn Jabir (ninth century), the *Paradise of Wisdom* of al-Tabari (born c. 810), and the *Book on Poisons* of ibn Wahshiya (fl. late ninth century). Portions of the *Liber continens* of al-Razi (860–932) and the *Canon Medicinae* of ibn Sina (or Avicenna, 980–1037) consider poisons. There were in addition numerous other medical texts on poisons and poisoning, but many are now lost (Levey 1966). The *Canon* of ibn Sina and the *Treatise on Poisons and Their Antidotes* of Moses Maimonides (1135–1204) were particularly well known in medieval European universities and medical schools, where works written in Greek and Arabic were made available in Latin translation after the eleventh century.

The few new contributions made to knowledge of poisons during the Middle Ages came primarily from the physicians and alchemists of the Islamic world. They were the first to note the toxic properties of corrosive sublimate (mercuric chloride), and ibn Sina described the foul odor exhaled by victims of mercury poisoning. The replacement of arsenic trisulfide by white arsenic (arsenic trioxide) in poisonous preparations had a profound influence on the history of toxicology, as it became one of the most versatile and widely used poisons ever known (Niyogi 1981, Decker 1987, Borzelleca 2001). The medical works of Maimonides, a Jewish philosopher and physician in the service of the Sultan of Egypt, are still seen as modern in their approach to illness; his book on poisons contained original experiments, treatments, and views. The first part of the book discussed the bites of snakes and other animals, while the second considered poisoning with vegetable and mineral substances. For the former, he advised drawing the poison from the wound (sucking, cupping glasses, plasters) and antidotes (including theriac and Mithridatium); for the latter, vomiting and purging by means of various agents. Some of his suggestions – suitable diet, keeping the patient awake, sedatives applied to the affected spot or taken internally – hold true today; so, too, the composition of some of his medicinal recipes and their use according to the age of the patient (Maimonides 1966).

One century later, the professor of medicine at the University of Padua, Petrus of Abano (c. 1250–1316), wrote a book on poisons that was based upon his reading of Greek and Arabic works. His *De Venenis* classified poisons as vegetable, mineral, and animal, and listed all known poisonous agents with their symptoms and treatment. It also suggested methods for avoiding the ingestion of poison and for neutralizing it if taken (Brown 1924). This may explain the wide popularity of the book, which went through 14 editions after its first printing in 1472: the later Middle Ages and Renaissance were, in Italy, periods in which poison was frequently used to accomplish murder and political assassination. Schools of poisoning arose in Rome, Naples, and Florence and flourished until

the beginning of the eighteenth century. In Venice, poison was recognized officially as a means of furthering policy: the records of the infamous Council of Ten (a branch of the city's government) list, among other information, intended victims and the fees paid to poisoners for their services. By the seventeenth century, the activities of Italian poisoners had been redirected towards social, marital, and financial objectives. In Naples, Giulia Toffana (c. 1635–1719) sold arsenical solutions under the name of *Acquetta di Napoli* and is supposed to have poisoned over 600 people; in Rome, Hieronyma Spara conducted a similarly lucrative business (c. 1659), her clients being primarily young married women (Blyth & Blyth 1920, Smith 1952, Decker 1987). Both were executed for their crimes.

Italian refinements to the 'art' of poisoning are said to have been introduced to France by Catherine de Medici in the sixteenth century. Favored poisons included arsenic mixed with the decomposition products of an animal to which it had been administered (corrosive sublimate was sometimes substituted), cantharides, and mixtures of arsenic, aconite, belladonna, and opium. Poisoning became a public menace, and in 1662 Louis XIV issued a decree forbidding apothecaries to sell poisons to anyone unknown to them and requiring purchasers to sign a register. Professional poisoners thus had more incentive to ply their trade, but a series of scandals soon brought about their downfall. In 1676, the Marquise de Brinvilliers was executed for the murders of her father, brothers, and husband; she had been aided by a poisoner named Sainte-Croix, who was rumoured (incorrectly) to have died as a result of one of his own experiments. In 1679, the Chambre Ardente was appointed to investigate suspected poisoning cases, and within three years it had brought charges against 442 people. Many of the worst offenders were influential enough to escape trial; others were less fortunate. Of those executed, the most notorious was Catherine Deshayes, known as La Voisin: she was convicted of many murders, including those of 2000 infants. When it was revealed that she had sold poisons to the king's mistress, Madame Montespan, the court was summarily dismissed (Anon 1900, Decker 1987, Somerset 2003).

The 'Affaire des Poisons' represented the culmination of the period of professional poisoners in France, but the fact that the crimes were brought to light owed more to the use of torture to extract confessions than to the ability of doctors or chemists to detect and identify poisons. It was not until the nineteenth century that experimental toxicology became sufficiently developed to make such practices far more risky for the poisoner, but the foundations of this progress were laid much earlier, during the sixteenth century. The key figure at the time when traditional lore began to give way to objective investigation in science and medicine was Paracelsus (1493–1541), a controversial but influential physician, alchemist, and scientist. Despite the fact that his science was mixed with mysticism and astrology, his contributions to medicine were revolutionary. Paracelsus rejected the medical theories perpetuated by the Greco-Arabic classics, insisted on the value of experimentation (including the use of animal tests), and developed the idea that minerals and chemicals could have medicinal applications (iatrochemistry). His use of mercury preparations in the treatment of syphilis led to accusations of poisoning, to which Paracelsus replied by writing the *Third Defense*. It contains the following important statement:

> What is there that is not poison? All things are poison and nothing (is) without poison. Solely the dose determines that a thing is not a poison.

Consequently, toxicologists give credit to Paracelsus for stating one of the basic concepts in toxicology, that of dose dependency (Deichmann et al 1986). Paracelsus was the first to express the view that drugs and chemicals have effects on specific organs of the body (target organ toxicity), a concept which was further developed in the work of Felice Fontana (1730–1805) (Borzelleca 2001). In his experimental studies of the venom of the European viper and its effects on animals, Fontana discovered that the symptoms of poisoning caused by a bite were attributable to the direct action of venom on the blood (Hawgood 1995). His findings contributed to the ongoing debate about whether drugs and poisons acted through the nerves or by a process of absorption and transport in the blood. This question arose during the seventeenth century, when iatrochemists attempted to explain physiological and pathological phenomena in chemical terms. The debate stimulated chemical and physiological research throughout the seventeenth and eighteenth centuries, while the advances made in chemistry near the end of the eighteenth century inspired increasingly sophisticated analyses of animal and plant substances. These factors, together with a mounting acceptance of animal experimentation, led to the development of experimental toxicology as a distinct scientific discipline during the nineteenth century (Earles 1962).

The contribution made by physiology to toxicology is exemplified by the work of François Magendie (1783–1855), the first great experimental physiologist of the nineteenth century. He laid the foundation for the systematic study of the mechanisms by which poisons act in the body with his investigation of the

Javanese arrow poison *Upas tieuté*, which was later shown to contain strychnine (Earles 1961). His pupil and successor at the Collège de France, Claude Bernard (1813–1878), studied the nature of the action of curare on neuromuscular transmissions, effectively using a poison as an instrument for resolving important physiological problems (Thomas 1964). In addition, Bernard suggested that carbon monoxide poisoning occurs as a result of tissue asphyxiation caused by an irreversible combination with hemoglobin, which prevents the effective transport of oxygen to body tissues (Decker 1987). Another of Magendie's students, James Blake (1815–1893), found that there is often a relationship between the chemical structure of a drug and its biological activity, thus implying the concept of target organ toxicity (Leake 1975). There was subsequently a great deal of British research in the area of structure–activity relationships, perhaps the most sophisticated being that of Alexander Crum Brown (1838–1922) and Thomas Fraser (1841–1920) on organic alkaloids (Bynum 1970, Parascandola 1971). The successes of the experimental method in physiology, combined with notable advances in analytical chemistry, stimulated the development of pharmacology (Ackerknecht 1982). The complementary nature of toxicological and pharmacological research during the nineteenth century was embodied in the work of the Germans Rudolf Kobert (1854–1918), who studied the digitalis glycosides and the ergot alkaloids, and Louis Lewin (1850–1929), who became an expert on narcotics, alcohols, poisonous gases, and arrow poisons (Macht 1931).

The chemical approach to the study of poisons was pioneered by the work of a man who has long been considered the founder of modern toxicology, Mathieu Joseph Bonaventura Orfila (1787–1853) (Beeson 1930, Bertomeu-Sánchez & Nieto-Galan 2006). A Spaniard who made his career in Paris, Orfila established toxicology on a firm quantitative basis by introducing new, primarily chemical, experimental methods for proving lethal intoxications; diagnoses of that kind had previously been made solely on the basis of observed features. A trained chemist and physician, he performed experiments on thousands of dogs to gather the necessary data, and in 1814–15 he published a monumental work in two volumes: *Traité des poisons tirés des règnes minéral, végétal et animal, ou toxicologie générale, considérée sous les rapports de la physiologie, de la pathologie et de la médecine légale* (Paris: Crochard). The book examined the physiological and pathological effects of poisons, the symptoms of poisoning, antidotes, the chemical properties of poisons, and analytical methods for detecting them (Dall'Olio & Galzigna 1993). This was the first systematic attempt to correlate chemical and biological information concerning known poisons and was unique in combining the use of postmortem examination with analytical chemistry (Doull & Bruce 1986, Borzelleca 2001).

As the leading medicolegal expert of his time, Orfila made considerable contributions to legal (forensic) medicine. He made the important discovery that poisons are absorbed from the gastrointestinal tract and then accumulate in tissues specific to each poison, a finding that did much to further the progress of forensic toxicology. Previously, a chemist or a physician who found nothing in the stomach would not have troubled to examine the other organs of the body (Blyth & Blyth 1920). In Britain, the development of forensic toxicology was stimulated by the work of (Sir) Robert Christison (1797–1882), a native of Edinburgh who became professor of medical jurisprudence and of materia medica at the university there. His *A Treatise on Poisons in relation to medical jurisprudence, physiology and the practice of physic* (Edinburgh: A. Black, 1829) was the first textbook of its kind to be written in English. He regarded toxicology as the principal branch of medical jurisprudence, its object being to unite evidence from four sources (pathology, chemistry, physiology, and visible symptoms) in order to detect crime (Adam 1990, Crowther 2006).

The works of Orfila and Christison, which were widely read and translated, laid the foundation for the development of forensic toxicology during the nineteenth century. At a time when arsenic was easily available and widely used in criminal poisonings, Orfila was the first (1839) to extract it from human organs other than gastrointestinal tissue; in 1840, his analysis of organ samples resulted in the conviction of Marie Lafarge for the murder of her husband. The method used was a variation of that devised by James Marsh (1794–1846) in 1836, which was based upon Scheele's discovery (1775) that when zinc and acid act on arsenic salts, a gaseous compound (arsine) is evolved, that, when burned, deposits metallic arsenic. This test, which gave only qualitative results, marked the beginning of important stages in the development of chemical toxicology (Gettler 1956). A modification introduced by Berzelius in 1837 allowed quantitative evaluation by ensuring that the mirrors of arsenic formed by reduction were deposited in a glass tube. The device that he used became known as the Marsh-Berzelius apparatus. A further refinement was made in 1841 by Hugo Reinsch (1809–1884), who deposited arsenic on copper foil from solutions of hydrochloric acid; the test was useful for its easy manipulation and quick results (Campbell 1965). Three years later, Fresenius and von Babo devised a method for the

systematic search for all mineral poisons, using wet ashing with chlorine (a technique described by Duflos in 1838) (Niyogi 1981, Decker 1987). The first quantitative determination of metals in organs began about 1850, when they were weighed as a sulfate or oxide; electrolytic deposition was introduced in 1862.

New and precise methods of chemical analysis permitted the isolation of the major alkaloids from crude drug preparations (Lesch 1981). By 1833, aconitine, atropine, codeine, hyoscyamine, morphine, nicotine, and strychnine had been isolated from plants by methods which were later (1850) modified by the Belgian chemist J.S. Stas (1813–1891) to achieve their isolation from human tissue samples. His process was adapted in 1856 by F.J. Otto, who was able to obtain a purer alkaloidal residue and to remove more organic impurities. The modification became known as the Stas Otto method. In 1874, Selmi discovered the first cadaveric alkaloid, a morphine-like ptomaine. Color tests for alkaloids were developed between 1861 and 1882; by 1890 quantitative methods for analyzing them had come into use. Physiological tests for alkaloids, particularly strychnine, were first used in 1856 and continued to be recommended well into the 20th century (Willcox 1938). Tests for alcohol were devised by Lieben (iodoform crystal test, 1870) and others (chromic acid reduction method, 1852–1883), and later perfected to allow the quantitative analysis of alcohol in body fluids and tissues. Qualitative tests for carbon monoxide in the blood originated in the work of Hoppe Seyler (spectroscopic), Salkowski (alkali), and Stopczanski (dilution and tannic acid precipitation) between 1865 and 1889. In 1880, Fodor's palladium chloride reduction method allowed the quantitation of carbon monoxide in blood (Gettler 1956, Niyogi 1981, Decker 1987).

Textbooks of forensic medicine and toxicology proliferated throughout the nineteenth century. In Britain, the work of Christison was complemented by that of Alfred Swaine Taylor (1806–1880), an eminent medicolegal expert who wrote extensively on medical jurisprudence and toxicology. His books, which were based on his own experiences and incorporated legal precedents and judicial rulings, became standard texts which passed through numerous editions; the most recent (the thirteenth edition of *A Manual of Medical Jurisprudence*) appeared in 1984 (Coley 1991). A.W. Blyth's *Poisons: Their Effects and Detection* (1884) represented a valuable addition to the literature on analytical toxicology. In the United States, the first book pertaining to the symptoms and treatment of poisoning appeared in 1848: *A Practical Treatise on Poisons*, by O.H. Costill. In 1867, Theodore Wormley (1826–1897) published the first American text devoted exclusively to the experimental detection of poisons in organic mixtures, *The Micro-chemistry of Poisons*, which included the results of his original research. Within a few years, the professor of medical jurisprudence at the University of Pennsylvania, John Reese, produced a similar book (*Manual of Toxicology*, 1874), which he followed up a decade later with *A Text Book of Medical Jurisprudence and Toxicology* (1884) (Niyogi 1981, Wax 1994, Borzelleca 2001). During the later decades of the nineteenth century and those of the early twentieth century, a great amount of toxicological data was presented in the thorough textbooks of German scientists, particularly Kobert (*Compendium der praktischen Toxikologie*, 1887) and Lewin (*Gifte und Vergiftungen*, 1929) (Holmstedt & Liljestrand 1963). The latter is today especially remembered as the author of a toxicologist's view of world history: *Die Gifte in der Weltgeschichte* (1920).

The early part of the twentieth century is generally considered to mark the beginning of the development of the modern science of toxicology. However, the most rapid growth of the discipline occurred after World War II, as the production of organic molecules for use as drugs, pesticides, and industrial chemicals began to increase at an exponential rate (Gallo 1988). Today, toxicology is concerned with the many chemicals (there are now about 100 000 substances to which people could be exposed) that may be responsible for household, environmental, or industrial poisoning. While forensic and analytical toxicology continue to occupy an important position within the wider discipline, more and more attention has in recent years been paid to the biochemistry of toxin action, in an attempt to develop specific chemical antidotes. Modern toxicology utilizes skills and knowledge derived from pathology, pharmacology, physiology, biochemistry, chemistry, and statistics in order to study the quantitative effects of chemicals on living tissue (Oehme 1970, Loomis & Hayes 1996).

Research on anesthetic gases during the nineteenth century facilitated the development and use of poisonous war gases in the 20th (Leake 1975). Consequently, attempts to counteract the effects of chemical warfare agents and other toxic compounds – particularly arsenicals, introduced by Paul Ehrlich (1854–1915) for the treatment of syphilis – stimulated toxicological research after World War I. This resulted in the synthesis of the first specific chemical antidote, British anti-Lewisite (BAL), which was developed in 1945 by R. A. Peters, L. A. Stocken, and R. H. S. Thompson in Oxford. In a related development, the mechanistic studies which led to a better understanding of how chemicals exert toxic effects proved to be the basis for the synthesis of effective insecticides. During the 1940s,

the Swiss chemist Paul Müller discovered a compound, now known as DDT, which poisons insects when they come into direct contact with it. Some of the organophosphorus compounds developed for use as insecticides by Willy Lange and Gerhard Schrader during the 1930s and 1940s were so toxic that they are now classed as chemical warfare agents (Holmstedt & Liljestrand 1963, Marrs et al 1996).

With the use of increasingly powerful drugs and chemicals in the workplace and in therapeutics, it became clear that toxicology had an important role to play in public health: workers and consumers required protection from the adverse effects of chemical exposure, from food additives, and from other potentially toxic products. In Britain, the systematic application of scientific techniques to the detection and control of food and drug adulteration arose largely as a result of the work of the Society of Public Analysts, founded in 1874 (Stieb 1966). In the United States, concerns about adulteration were subject to congressional consideration for some three decades before the first American Food and Drug Act was passed in 1906 (Young 1989). This law was created under the impetus of Harvey W. Wiley (1844–1930), the head of the Bureau of Chemistry of the U.S. Department of Agriculture, and later influenced food safety legislation worldwide (Borzelleca 2001). There have since been a series of laws established, in the United States and elsewhere, that are designed to minimize public and, more recently, environmental encounters with harmful chemicals. Toxicologists are therefore required to provide accurate safety assessments when new chemicals of any kind are developed; the dose–response relationship for any adverse effect is particularly important (Doull & Bruce 1986).

The principal method used for assessing the safety of drugs, pesticides, food additives, and other chemicals prior to use is animal testing (bioassay), which can usually reveal the worst possible effects of a new substance. The 'toxicology database' is compiled by means of a set of 'testing protocol guidelines', which have been developed over the years (Doull & Bruce 1986). However, the thalidomide catastrophe of 1961 showed what the possible shortcomings of the system may be: studies do not always establish the full toxicity of the test agent, and most risk-extrapolation models that use the results of animal tests cannot allow for the fact that the test and target species are biologically different. This is one of the reasons why there is now an increasing social disquiet in regard to animal testing requirements and animal welfare. These concerns have led to the development of alternative methods in toxicology, particularly in vitro assays (Parascandola 1991), which are useful for prioritizing chemicals and for studying mechanisms of action. More recently, computer methods of predicting toxicity ('in silico' approaches) and the 'threshold of toxicological concern' concept have been incorporated into toxicity testing. Such methods do not presently satisfy the standards set by regulatory authorities, but they do allow reductions in animal numbers (Anderson & Russell 1995, Guengerich 2004, Kroes et al 2005). (Note: In vitro protocols are beginning to make inroads into regulatory agency acceptance. A good place to find out more about alternatives to animal testing is Johns Hopkins University's ALTWEB site, http://altweb.jhsph.edu/.)

Modern toxicology may be divided into six principal areas of application: regulatory, occupational, environmental, clinical, forensic, and analytical. In the United States, the eminent regulatory toxicologist Arnold J. Lehman (1900–1979) was instrumental in strengthening the commitment of the Food and Drug Administration (FDA) to toxicology. In 1955, he and his staff at the FDA published *Appraisal of the Safety of Chemicals in Foods, Drugs and Cosmetics*, the first attempt by the agency to provide guidelines for toxicological studies. Lehman's statement that 'anyone can become a toxicologist in two easy lessons, each of which takes ten years', has achieved the status of an adage among practicing scientists. Since then, significant contributions to the understanding of the mechanisms of action of various substances and to the establishing of safe exposure conditions (for humans and, where necessary, domestic and wild animals and plants) have been made by his successors at the FDA and other government agencies and by colleagues around the world (Borzelleca 2001). Regulatory toxicology will continue to have a vital role to play in setting standards, and is now beginning to adopt the interdisciplinary approach that will allow it to further evolve. For example, biological, computational, and statistical models must all be taken into consideration in assessing the risks associated with mixtures of different chemicals and with non-constant exposure patterns (Ryan 2000, Monosson 2005).

Occupational and environmental toxicologists study and monitor the causes, conditions, effects, and safety limits of exposure to workplace and environmental contaminants (Loomis & Hayes 1996). In many instances, there are clear links between industrial and environmental toxins: lead, for example, has long been a focus of debate, together with other heavy metals (Rosner & Markowitz 1987). During the nineteenth century, the use of arsenical insecticides led directly to the deaths of millions of bees and caused ill-health in humans and animals. This marked the beginning of public awareness of the fact that some substances can

be beneficial in one way but harmful in another (Whorton 1974). Similar problems occurred as a result of the introduction of DDT during and after World War II (Dunlap 1981). In 1962, the author of *Silent Spring*, Rachel Carson, touched off a heated debate about the links between industrialization and pollution when she claimed that 'we have put poisonous and biologically potent chemicals indiscriminately into the hands of persons largely or wholly ignorant of their potentials for harm' (Carson 1962). Although highly controversial, the book stimulated an organized approach to the study of chemical effects on ecosystems (Marco et al 1987, Davis 2001).

When cases of intoxication occur, the need for clinical toxicology becomes apparent: physicians are expected to make a correct diagnosis and implement appropriate treatment, which may involve delaying the absorption of the poison and/or enhancing its elimination (Flanagan & Jones 2001). Today, accidental and intentional self-poisoning contributes significantly to morbidity and mortality in many countries, most caused by household chemicals, drugs, pesticides, solvents, and carbon monoxide (Writer 1993). The establishing of poison control centers, the first of which opened in Chicago in 1953, has facilitated the compilation of information on the ingredients of pharmaceuticals and other industrial products and their toxicity, and has led to the creation of sophisticated information distribution systems. The ultimate aim is to quickly and accurately supply information to aid the diagnosis, treatment, and prevention of poisoning. Following an initial period of expansion, the introduction of national standards of service in the United States has led to a consolidation of the number of regional poison centers (62 in 2005), further encouraged (since 2000) by federal funding. Similar centers have been set up in many other countries; in Europe, the system has always been centralized (Tichy 1977, Wax 2006).

Since poisons continue to be significant causes of death and disease, forensic and analytical toxicology remain important sciences. Both employ the same methods and techniques but apply them to different ends. Forensic toxicology is concerned with intentional and accidental poisonings in relation to the law, while analytical toxicology deals with the detection, identification, and measurement of poisons and their metabolites in biological specimens (often for the purposes of screening patients, employees, athletes, etc., for drugs of abuse). Before the advent of spectroscopic and chromatographic methods in the early 1950s, chemical techniques for separating and identifying the increasing number of organic drugs were time-consuming and lacking in sensitivity. A steady process of technological development has made it possible to conduct rapid tests for a variety of compounds: gas and high-performance liquid chromatography, together with immunoassay techniques, now allow quantitation of most organic drugs, and electronic innovations continue to improve the sensitivity and specificity of analytical techniques (Fenton 2002). The detection of toxic metals in cases of chronic poisoning is achieved by mass spectrometric, electrochemical, radiochemical, and spectrophotometric methods; in acute cases, some chemical tests (e.g., Reinsch) remain relevant (Niyogi 1980, 1981, Decker 1987, Flanagan et al 1988). Although homicidal poisoning is now relatively infrequent (and often associated with healthcare professionals), recent serial (Harold Shipman, Michael Swango) and political cases (Viktor Yushchenko (2004), Alexander Litvinenko (2006)) serve as reminders that it has not gone away (Kinnell 2000, Wax 2006, Woods et al 2006).

During the past three decades, toxicological research has been increasingly devoted to a quantitative assessment of the probable health risks posed by chemicals to which humans might be exposed. Society is no longer willing to defer appropriate control until serious injuries have appeared (Lu 1996), and toxicological information is thus heavily relied upon by regulatory agencies responsible for prioritizing environmental health problems and policy (Fan & Chang 1996). Risk assessment and environmental regulations have, in effect, become the driving force behind how much of toxicology is now practiced in the United States. In the European Union, directives detail the requirements for toxicity and ecotoxicity testing necessary to comply with laws relating to the classification, packaging, and labeling of dangerous substances. Toxicity testing requirements are in fact remarkably similar across international boundaries (e.g. U.S., E.U., Japan, and Canada) (Woodward 1996).

Risk assessment is built upon a growing foundation of scientific knowledge that is mainly related to the recent advances made in our understanding of toxicology at the molecular level. This has followed directly upon the explosive growth of the science of molecular biology since methods for the sequencing of nucleic acids were developed in the mid-1970s. Together with biochemical (enzyme-oriented) approaches to the study of the metabolism of drugs and environmental toxicants, molecular toxicology has contributed to a better understanding of the nature, site, and mechanism of action of toxicants. Once the mechanism of toxicity of a compound is understood, it may be possible to design a replacement chemical that retains desirable properties but is less or non-toxic. The role played by genes in

metabolic activation and detoxification constitutes another leading area of research in modern toxicology (Josephy 1997), and the intelligent prediction of the genotoxicity of chemicals in simple systems today constitutes one of the major achievements in mechanistic toxicology (Guengerich 2005).

The molecularization of the life sciences has led directly to two new areas of toxicology: toxicogenetics (or genetic toxicology) and toxicogenomics. Genetic toxicology is an environmental health science concerned with the causes, effects, and long-term consequences of the genetic and chromosomal changes induced by exogenous agents (mutagens). These may be physical (e.g. radiation), biological (e.g. viruses), or chemical (on which the bulk of research to date has focused). It is both a laboratory and a regulatory science utilizing basic and applied approaches to achieve two aims: the determination of the impact of genotoxic agents found in the environment on the integrity of the human gene pool; and the application of genetic test methods to the detection and mechanistic understanding of carcinogenic processes (Frickel 2000, Brusick 2001). Toxicogenomics (the first paper using the term was published in 1999) developed as a deliberate combination of the fields of toxicology and genomics, and focuses on changes in gene expression resulting from exposure to xenobiotics; it thus is also of growing importance in health risk assessment. Gene expression profiles are seen as a means of enhancing knowledge of mechanisms of toxicity, classifying toxicants, and predicting toxicity and genetic susceptibility (Shostak 2005). It is the predictive capacity of toxicology in general that tends today to be seen as its most important future contribution to science, in drug development (Guengerich 2004, 2005), the effective extrapolation from animal to human models (Ryan 2000), in determining the genetic effects of chemicals (Monosson 2005), distinguishing between safe and toxic doses (Calabrese 2005), and more widely in risk assessment and risk management (Henry 2003).

It is clear that the development of toxicology as a recognized scientific discipline has proceeded at a rapid pace since the end of World War II, and its growth is likely to continue along interdisciplinary lines in the future. One of the most important consequences has been the establishing of training programs and the founding of scientific journals and societies (Borzelleca 2001, Gallo 2001). Graduate education in North America and Western Europe reflects the multidisciplinary nature of toxicology, as it is administered by a variety of university departments, including medicine (human and veterinary), pharmacy, pharmacology, chemistry, and public health. The modern toxicologist is thus a specialist in one or more branches of the field, as it becomes increasingly difficult for one individual to be qualified in all aspects of the science (Oehme 1970, Loomis & Hayes 1996). This specialization is mirrored in the hundreds of national and international organizations and journals that are dedicated to toxicology and related subjects. Toxicologists remain united, however, in their ultimate objective, which is the reduction of morbidity and mortality that occurs in humans and other living systems as a result of exposure to toxic substances. As the numbers and variety of potentially toxic chemicals continue to expand, so too does the science of toxicology.

Key Figures and Documents

Georgius Agricola (original in Latin, 1556)
De Re Metallica
HC Hoover, LH Hoover, Trans. (1912)
London: Mining Magazine. A new edition was published in 1950 (Dover, New York).

At the time of its publication, this was the most exhaustive textbook ever written on mining and metallurgy, as well as on the workers in these fields. Entirely based on personal experience and observation, the book devotes a short section to the maladies of miners (Book 6, pp. 214–217): 'some affect the joints, others attack the lungs, some the eyes, and finally some are fatal to men'. The author recognized that arsenical poisoning can occur in shafts where the rock had been broken by fire and described the 'pernicious pests' (insects and 'demons') that inhabited mines.

Adrien Albert (1960)
Selective Toxicity, 2nd edition
New York: John Wiley & Sons.

This now familiar term was introduced to toxicology and pharmacology during a series of lectures delivered in London during 1948–49 and published in 1951. The second edition broadened coverage from chemotherapy to a wide variety of biochemical systems, and thus to a range of scientific disciplines in which chemical substances might effectively be used to injure some kinds of cells but not others with which they might be in close proximity.

Bernardino Ramazzini (original (2nd edition.) in Latin, 1713)
De Morbis Artificum Diatriba
WC Wright, Trans. (1940)
Chicago, IL: University of Chicago Press.

Ramazzini is regarded as the father of occupational medicine. His treatise describes the diseases of, among others, miners, gilders, chemists, tinsmiths, painters, sulfur-workers, mirror-makers, apothecaries, and tobacco-workers, and suggests methods of prevention and some remedies. He classified diseases as being caused firstly by the injurious character of the materials handled by workers, which emit noxious vapors; secondly, by unnatural postures of the body. Ramazzini was the first to recommend that physicians should enquire first of all as to a new patient's occupation.

Claude Bernard (and J. Pelouze) (1850). Recherches sur le curare

Comptes Rendus Hebdomadaires de l'Académie des Sciences 31: 533–537

Bernard and Pelouze studied the chemical and physical properties of curare and found that it kills without producing convulsions. They were able to explain the fact that the poison is relatively harmless when swallowed but fatal when injected by showing that the gastrointestinal mucous membrane does not permit its absorption into the bloodstream. They noted that the mode of action of curare is analogous to that of viper venom (cf. Fontana).

Claude Bernard (1857)

Leçons sur les Effets des Substances Toxiques et Médicamenteuses

Paris, France: Ballière.

Bernard used poisons as physiological instruments for the experimental study of the anatomical properties and functions of living organisms. This book considers the effects of, among others, nicotine, curare, potassium thiocyanate, carbon dioxide, carbon monoxide, and strychnine.

Robert Christison (1829)

A Treatise on Poisons, in Relation to Medical Jurisprudence, Physiology, and the Practice of Physic

Edinburgh, UK: Adam Black.

This is the first original and systematic English-language textbook of toxicology of the 19th century. Drawing together information gathered from French, German, and British periodicals, Christison intended his book to be an aid to the medical jurist who was faced with a case of suspected poisoning. He focused primarily on poisons commonly encountered in Britain and detailed the facts relating to their symptoms, pathology, physiology, and chemistry. His work contained many novel elements, including the idea that in many cases the aim must be to establish clearly the impossibility of poisoning.

EGC Clarke (ed.) (1969 and 1975)

***Isolation and Identification of Drugs in Pharmaceuticals, Body Fluids and Post-mortem Material*, 2 vols**

London: Pharmaceutical Press.

This book provides a reliable source of analytical data for drugs and other potentially poisonous substances, and it has therefore become a standard reference text for those concerned with the identification of poisons. Methods and techniques relevant to a wide variety of situations are included, so that the book is equally useful to forensic toxicologists, hospital biochemists, research workers, chemists, etc. Instructions for the use of the book are given in four languages and indicate the screening procedure to be followed when: the case is an emergency; there is evidence of the identity of the drug under investigation; there is no clue to the identity of the drug.

Papyrus Ebers (about 1550 BC)

B Ebbell, Trans. (1937)

Copenhagen, Denmark: Levin & Munksgaard.

Of the ancient Egyptian medical papyri, this is the longest and most complete. It consists, for the greater part, of recipes (many of which contain effective chemical substances) designed to treat various diseases and symptoms. The contents are much older than the date of writing and in later times were incorporated into the Greek materia medica, suggesting that this may be the first known pharmacopeia.

Felice Fontana (original in French, 1781)

Treatise on the Venom of the Viper; on the American Poisons; and on the Cherry Laurel and some other Vegetable Poisons

J Skinner, Trans. (1787)

London: J. Murray.

This is considered the first modern text of toxicology. Fontana identified fundamental questions and followed a rigorous experimental method in his research on the venom of the European viper, and he also studied curare and cherry laurel (hydrocyanic acid). He made important contributions to the fields of physiology, pharmacology, botany, chemistry, and anatomy.

François Magendie (and A. Raffeneau-Delile) (1809). Examen de l'action de quelques végétaux sur la moelle épinière

Nouveau Bulletin Scientifique de la Société Philomatique 1: 368–405

In a series of experiments on various animals, Magendie studied the toxic action of upas tieuté, nux vomica, St. Ignatius's bean, and other drugs of vegetable origin, thus marking the beginning of modern experimental pharmacology. He was able to show that upas and nux vomica (later shown to contain strychnine, a fact he had suspected) act on the spinal marrow, and was therefore able to conclude that drugs and poisons act solely by direct contact with target organs. Physiologists were thereby stimulated to further study the absorption and transport of drugs and poisons in living organisms.

Louis Lewin (1929)

Gifte und Vergiftungen

Berlin, Germany: Stilke.

In a single volume of nearly 1100 pages, Lewin summarized his own wide-ranging research and that of

others in the field of toxicology. His diverse interests allowed him to address the study of poisons and poisoning from an interdisciplinary point of view: he considered the historical, statistical, pharmacological, clinical, pathological, and sociological aspects of his subject. Toxicology is today a multidisciplinary field that attempts to extend this approach to scientific research.

Moses Maimonides (original in Arabic, 1198)
Treatise on Poisons and Their Antidotes
F Rosner (ed.) and Trans. (1984)
Haifa, Israel: Maimonides Research Institute.

The text is divided into an introduction (which praises the author's patron, the Vizier Al Fadhil) and two main sections. The first section deals with the bites of snakes and mad dogs and the stings of scorpions, bees, wasps, and spiders, with suggested treatment and remedies. The second section describes vegetable and mineral poisons and their antidotes. This treatise was translated into a number of languages soon after its appearance and served as a textbook of toxicology during the Middle Ages.

Nicander of Colophon (second century BC)
The Poems and Poetical Fragments
ASF Gow, AF Scholfield (eds.) and Trans (1953)
Cambridge, UK: Cambridge University Press.

Nicander was the author of two poems, *Theriaca* and *Alexipharmaca*, which provide the best cohesive sources for classical Greek toxicology. Both were based on the lost works of Apollodorus (third century BC), who wrote the first treatises devoted to the study of poisons. The *Theriaca* discusses the venoms and stings of snakes, spiders, scorpions, insects, lizards, and fish, and suggests remedies (mainly herbal, with some derived from animals). The *Alexipharmaca* describes vegetable poisons such as aconite, hemlock, henbane, and arrow poison, plus some others (blister beetles, fungi, salamanders, white lead); effects and antidotes are suggested throughout.

Paracelsus (original in German, 1567)
On the miners' sickness and other miners' diseases (G Rosen, Trans.)
In ***Four Treatises of Theophrastus von Hohenheim Called Paracelsus*** (1941)
HE Sigerist (ed.) Baltimore, MD: John Hopkins Press, pp. 43–126. A new edition was published in 1979 (New York: Arno Press).

Written in the 1530s but not published until long after the author's death, this monograph is entirely devoted to the occupational diseases of miners, particularly pulmonary ailments and mercury poisoning. The poisonous effects of various metals and the difference between acute and chronic toxicity are recognized. Influenced by his experience of mining and miners, Paracelsus developed generalized ideas about pathology and etiology which he used to explain the facts that he observed and the therapeutic remedies that he advocated.

Percival Pott (1775)
Cancer Scroti in Chirurgical Observations Relative to the Cataract, the Polypus of the Nose, the Cancer of the Scrotum, the Different Kinds of Ruptures, and the Mortification of the Toes and Feet
London: Hawes, Clark, and Collins.

Pott linked the occupation of chimney sweeps with cancer of the scrotum. This observation that chimney sweeps in 18th-century England suffered from a higher than expected incidence of scrotal cancer is a landmark in occupational disease, carcinogenesis, and epidemiology. '. . . every body is acquainted with the disorders to which painters, plummers, glaziers, and the workers in white lead, are liable: but there is a disease as peculiar to a certain set of people which has not, at least to my knowledge, been publickly noticed; I mean the chimney-sweepers' cancer'.

CHAPTER

3

Development of Toxicoinformatics

STEPHANIE HOLMGREN

INTRODUCTION

Toxicology information systems have evolved swiftly from early, library-based bibliographic tools to advanced packages utilizing sophisticated computer and telecommunication technologies. These systems have evolved concurrently with the rapid expansion of the science of toxicology itself. Bibliographic files such as TOXLINE represent first attempts to handle the toxicology literature through online retrieval. Subsequent approaches applied the use of computers to provide literature-derived data, as in the HSDB or RTECS databanks, or to capture data directly from the laboratory. More advanced systems are utilizing computational and analytical approaches to extract knowledge from the laboratory data to predict outcomes. Societal concerns about hazardous substances, manifested in legislation and regulations, have been responsible for the generation of much toxicity information and the impetus to systematically collect and disseminate these data. Scientific progress in molecular biology, chemistry, and bioinformatics combined with advances in information technologies are also impacting the supply of toxicology information. The amount of information has risen dramatically over the years and it is more accessible and current than ever before. However, in order to derive meaning from the mounds of data and information, the field must rise to the challenge of fostering data accessibility, promoting data standards, and ensuring data quality.

THE REALM OF TOXICOLOGY INFORMATION

The field of toxicology has witnessed an unprecedented growth within the past 30 years. This explosion in subject matter, stemming largely from social concerns and matched by equally rapid technological innovation as well as scientific progress, has resulted in a serendipitous marriage between toxicology information and advanced systems to organize, analyze, and disseminate this information. This section will briefly define toxicology and describe the three influences on the growth of toxicology information.

As an applied science, toxicology seeks to protect biological systems against the unwanted effects from exposure to potentially harmful agents. Prior to the 1960s, toxicology was considered a sub-discipline of pharmacology and focused its attention on the safety of existing and proposed pharmaceutical and consumer products. However, environmental disasters throughout the 1950s and 1960s, such as the mercury poisonings in Minamata and 'killer fog' in London (Kovarik, 2006) edged toxicology closer to the forefront of environmental issues. A 1960 conference entitled 'Problems in Toxicology' (Coon 1960) brought together distinguished scientists to address not only food, drug, and cosmetic control but environmental chemicals, pesticides, industrial chemicals, radioactive materials, and more. The conference theme was that 'toxicity is suddenly upon us as a social problem' (Coon & Maynard 1960).

It took two more years with the 1962 publication of *Silent Spring* (Carson 1962) for the public to be jolted into an awareness of the dangers associated with the uncontrolled production and use of thousands of chemicals. Toxicology became caught up in the tide of the environmental movement. It moved out from under pharmacology's shadow and began to develop into a full-scale discipline of its own.

One of the key characteristics of toxicology is its multidisciplinary nature – drawing upon advances in chemistry, biology, genetics, statistics, and other sciences. As well, toxicology has spawned numerous subspecialties of its own; e.g., ecotoxicology, forensic toxicology, veterinary toxicology, clinical toxicology, to name a few.

As the discipline has grown, so too has the demand for and supply of toxicology information. Numerous and diverse groups have need for toxicology information, from research scientists and pharmaceutical drug developers to occupational hygienists and members of the public. How toxicology information is used is as varied as the type of users:

- to enhance understanding of how environmental agents affect biological, chemical, and genetic mechanisms
- to assess the risk of a chemical exposure
- to support regulatory decision-making
- to ensure effective and safe drug development
- to minimize or eliminate public and occupational exposures to hazardous substances.

Each application drives the type of information needed. Therefore, toxicological information takes many forms:

- Raw laboratory data (quantitative, qualitative, and descriptive) related to chemical properties, physical properties, toxic endpoints, etc.
- Field data that capture incidence statistics, exposure data, hazard monitoring, accidental release levels, etc.
- Visual images in the form of pathology slides, gene expression data, histochemical profiles, etc.
- Textual content from statutes/regulatory information, articles, technical reports, etc.

The demand for and supply of toxicology information has been powered by the interplay among three influential forces – regulatory measures, scientific progress, and technological advances.

Regulatory measures

In the early history of toxicology, regulatory and legislative efforts served as the impetus for the development of toxicology information systems. Prior to the mid-1970s, few toxicology-specific information resources existed. The environmental movement of the 1970s and societal concern regarding chemical hazards were translated into legislation and regulation mandating information dissemination of public and environmental health threats. The subsequent development of toxicology information systems to track and manage the requisite data can be attributed to these legislative efforts.

One of the earliest regulatory measures was the 1938 Food, Drug and Cosmetic Act which required an assessment of drug safety before marketing. The thalidomide birth defect scare in Europe prompted the Act to be amended in 1962. These amendments strengthened reporting requirements, resulting in increased generation of data related to efficacy, safety, and clinical experience; the maintenance of records; and the creation of corporate systems to handle these data.

The Occupational Safety and Health Act of 1970 called for the publication of 'a list of all known toxic substances by generic family or other useful groupings and the contractions at which such toxicity is known to occur' (Section 20(a)(6)). In compliance with this directive, the Toxic Substances List was published in 1971. This was the forerunner of RTECS. Other databases, such as IRIS, Genetox, DART, and others, have all been made possible under the EPA mandates for public dissemination of toxicity information on chemicals in general use.

The landmark 1976 Toxic Substances Control Act (TSCA) attempts to control the introduction, production, distribution, or use in commerce of any chemical that presents an unreasonable risk of injury to health or the environment. In response to the information-gathering requirements, the TSCA Chemical Substances Inventory was created to track chemicals in commerce. Requirements for the extensive testing of chemical substances developed after 1976, as well as for the reporting and retention of information by manufacturers, have resulted in the creation of numerous corporate information systems (Kraska 1995) and both internal and public EPA files.

The Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA, also known as the Superfund Act), authorized liability, compensation, cleanup, and emergency response for hazardous substances released into the environment and the cleanup of inactive hazardous waste disposal sites. It mandates the establishment of the Agency for Toxic Substances and Disease Registry, whose administrator will 'establish and maintain an inventory of literature, research, and studies on the health effects of toxic substances' (Section

104(I)(2)). Title III of the Superfund Amendments and Reauthorization Act (SARA) was directly responsible for the creation of the Toxic Chemicals Release Inventory (TRI).

The Hazard Communication (or Right-to-Know) rules first issued by the U.S. Department of Labor in 1983, and similar laws enacted by many states and municipalities, require that workers be informed by their employers about chemicals to which they are being exposed in the workplace. Among other requirements, the rules mandate written hazard communication programs, labels as hazard warnings, and extensive development of material safety data sheets (MSDS). Compliance with this law has made available to workers, customers, and the general public a considerable amount of toxicological data only previously available through internal company files (Kraska 1995).

Similar hazard communication initiatives have been implemented at national, regional, and international levels, resulting in a cacophony of hazard classification definitions and labeling systems. Accordingly, the same chemical may have multiple labels as well as safety data sheets in order to be sold both within the U.S. and worldwide. In 1992, the United Nations Conference on the Environment and Development (UNCED) identified the need for a globally harmonized system of classification and labeling of chemicals (GHS). The intent of the GHS is to create a united approach to defining and classifying chemical hazards and to communicating such hazards through labeling and safety data sheets (Silk 2003). Officially adopted by the United Nations in 2002, the goal is to have countries implement the GHS by 2008. In the short-term, companies and governments will need to modify their existing regulatory and information systems to capture the changes in hazard classification, chemical property information, pictograms, as well as new safety data sheet elements. In addition, database systems that aggregate hazard communication information will also need to be altered. The benefits in the long-run are that companies will not have to maintain multiple labeling and data sheets for every chemical they produce and workers, consumers, emergency responders, and transport workers will no longer be confused by a myriad of different schema.

The laws listed above and others – such as the Clean Air Act (1963) and Amendments (1997), the Consumer Product Safety Act (1972), the Federal Insecticide, Fungicide and Rodenticide Act (1972), the Resource Conservation and Recovery Act (1976), and the Safe Drinking Water Act (1977) – have been responsible for many of the currently available governmental and private information systems (Merrill 1996).

Information disclosure as part of regulatory directives is not just an American phenomenon. The accidental exposure of a population in Seveso, Italy to high levels of dioxin highlighted the need for legislation to improve the safety of industrial sites and recognized the importance of the European public's 'need to know' about the risk of exposure and safety procedures. The resulting Seveso Directive (Directive 82/501/EEC) and its Annex VII requires public dissemination of information regarding major industrial hazards and associated safety protocols. Both the Major Accident Reporting System (MARS) databank and the Community Documentation Centre on Industrial Risk (CDCIR) were created to meet these information mandates (De Marchi et al 1996).

One of the more recent government initiatives to impact toxicology information is the Data Quality Act (also known as the Information Quality Act) enacted in December 2000. The Data Quality Act (DQA) is composed of just two paragraphs incorporated into the Treasury and General Government Appropriations Act (Pub L. 106-554, 114 Stat. 2763A-153). The Act directs the Office of Management and Budget to establish government-wide guidelines that 'provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by Federal agencies' (Sect. 515 Appendix C). In addition, federal agencies must provide a means for interested parties to contest the accuracy of the information.

The main consequence of the Act has been the filing of numerous petitions by industry to cast a shadow on the quality of information about to be used in upcoming regulatory decisions. By way of example, three 'requests for corrections' were made during the first year of the law's implementation (SKAPP). All three requests disputed study results associated with protecting the public or workers from effects due to atrazine, salt intake, and asbestos. Numerous other challenges have been made in recent years (OMB Watch 2005).

While proponents argue that DQA 'establishes a mechanism to hold government accountable for the quality of the information disseminated' (SKAPP), others see it as a tool to 'delay, manipulate, and unfairly affect the outcome of federal agencies' activities' (OMB Watch 2007). It remains to be seen what lasting effect the Data Quality Act will have on the dissemination and utilization by the government of toxicology-related information.

Without a doubt, increased social awareness and regulatory measures to protect workers and the public provided the initial thrust behind the surge in

toxicology information. Indeed, it has been suggested that pressure from the regulatory arena drives the development and evolution of toxicology (Doull 1984). Yet, in recent years, advances in both scientific progress and technological innovation have been largely responsible for propelling forward the supply of toxicology information, both in terms of volume and quality.

Scientific progress

As noted earlier, toxicology incorporates knowledge from a variety of other disciplines. As these fields develop, so too does toxicology. Scientific progress, especially in the spheres of molecular biology, bioinformatics, and chemistry has played a profound role in expanding the toxicology knowledge base and fostering new toxicology information systems.

Molecular biology

Molecular biology has been revolutionized by advances in hardware (automation, DNA sequencing, mass spectroscopy, microarrays, etc.) and new experimental techniques (polymerase chain reaction, siRNA, RNAi, etc.). The resulting sequencing of various genomes, analyses of gene expression, and insights into protein structure have opened new vistas in understanding the molecular basis of biological activity. Subdisciplines have emerged, each with their own tools and techniques, to study specific gene-activated molecules: genomics (DNA/RNA), proteomics (proteins), and metabolomics (metabolites). Toxicology is incorporating this new 'omics' knowledge into its own subdiscipline, toxicogenomics. The knowledge gained in understanding cellular networks and pathways will be critical in elucidating the mechanisms of toxic events.

The massive data generated from these studies are being captured in a multitude of mostly public databases – nucleotide sequences (e.g., GenBank, EMBL), protein sequences (e.g., SwissProt, RefSeq, UniProt), gene (e.g., OMIM, dbSNP), genome (e.g., Mouse Genome Database, VirGen), gene expression (e.g., ArrayExpress, OncoMine), metabolic pathways (e.g., PathDB, LIGAND) (Oxford University Press, 2006). Starting in 1996, *Nucleic Acids Research* began devoting its January issue to highlighting new molecular biology databases of interest to experimental and computational biologists. The resulting Molecular Biology Database Collection now amounts to 968 databases, up 110 from last year (Galperin, 2007). The growth in these databases signifies the richness of knowledge being uncovered. As well, the dissemination efforts in this area exemplify the global trend towards open public access to research.

Ultimately, the goal is to integrate the biochemical 'omics' knowledge with the physiological parameters to build a cohesive model of the biological system (Anand & Mehendale 2005). This new field, systems biology, relies on computational methods to construct a comprehensive model of the interplay among the key biological components (Ideker et al 2001, Hurban 2004). In addition, success will depend upon unique collaborations and partnerships among researchers from varying disciplines (Hurban 2004). Towards that end, the Institute for Systems Biology was designed to 'transcend traditional organizational and disciplinary barriers' (Institute for Systems Biology 2006). Likewise, the National Center for Toxicogenomics at NIEHS was created to facilitate a cohesive strategy for advancing toxicology using a systems approach. The focus of its effort is the Chemical Effects in Biological Systems (CEBS) database (discussed below).

Bioinformatics and computational biology

The insights from 'omics' research would not be feasible without the corresponding development of bioinformatics (Witkamp 2005). The magnitude of data and information garnered through the 'omics' technlogies, such as DNA sequences, transcriptional changes, protein networks, and metabolic pathways, must be properly organized and structured before it can be analyzed. Bioinformatics has emerged to meet the challenge. The union of biology, computer science, linguistics, statistics, among other fields has become indispensable as more high-throughput approaches are used for molecular analyses. Utilizing algorithms, text and data mining, and visualization techniques, bioinformatics generates computational, or in silico, approaches to answer complex biological questions (Reynolds 2005).

Although bioinformatics is also referred to as computational biology, attempts have been made to distinguish the two terms. Typically, bioinformatics refers to the collection, management, and dissemination of data, whereas, computational biology is the application of the data to understanding biological activity (Schmidt 2003a). At a basic level, bioinformatics is represented by the various databases, such as GenBank, that are strictly repositories of data structured for easy retrieval. At an intermediary level are tools, such as BLAST or SAGEmap, that perform insightful sequence alignment and function and structure analysis. Finally, more complex computational biology is exemplified by sophisticated information

systems, e.g., expert systems, which integrate data from multiple sources to solve multifaceted problems.

The need to incorporate data types from other disciplines combined with the sheer magnitude and complexity of data, make bioinformatics essential to toxicology research. The significance of the role can be seen in the number of courses, books, journal articles, forums, and organizational departments now devoted to computational toxicology.

Bioinformatics and computational toxicology have infiltrated every aspect of toxicology research – from risk assessment and hazard identification to drug development and predictive toxicity. The expectation is that computational toxicology will resolve many of the complex challenges still facing the discipline – calculating low dose–response curves, extrapolating animal toxicity results to human outcomes, discerning the toxicity of chemical mixtures, and uncovering the key to individual susceptibility (Anand & Mehendale 2005).

Chemistry

Because toxicology is concerned with the effects of chemicals on biological systems, chemical information is inherently part of the toxicology domain. The history of chemical information is quite long, so this section will merely highlight chemoinformatics developments that support progress in toxicology. Chemoinformatics is often defined as 'any activity related to the application of information technology to the study of properties, effects and uses of chemical agents' (Rosania et al 2007).

The need for chemoinformatics has been driven by the general increase in the number of compounds discovered (estimated at 1 million/year), the corresponding amount of information becoming available on these compounds, and the resulting complexity of the chemical questions that need to be resolved (Engel 2006). The array of chemical information is diverse, incorporating bibliographic text, physiochemical properties, spectra, structure, reactions, etc. *Chemical Abstracts*, one of the first bibliographic print indices, was also one of the first to convert to digital form in the 1950s. Databank repositories extract chemical property and spectra data from print sources such as *Beilstein Handbook of Organic Chemistry* and *Gmelin Handbook of Inorganic Chemistry* into their online equivalents. A third form of database captures the crucial chemical structure and reaction information (Engel 2006). CAS Registry is the largest and most comprehensive structure database for organic and inorganic compounds, peptide sequences, proteins, and nucleic acids (CAS 2007). ChemReact, CASREACT, ChemInform, among others provide chemical reaction information.

Searching for chemical substances by name, structure, or property is critical to utilizing chemical and toxicology information systems. Varying naming conventions and synonyms make it a challenge to search for a substance in a uniform manner. Accepted descriptive chemical nomenclature has been developed by both the International Union of Pure and Applied Chemistry (IUPAC) as well as the Chemical Abstracts Service. Numerical systems, such as Beilstein's Lawson number and CAS Registry Numbers, assign a unique identifier to each substance that denotes some chemical family and structure information (Wright 2001).

Early structure searching relied on chemical nomenclature and linear notation because initial computing systems could not interpret two-dimensional structure diagrams (Chen 2006). Chemical representation has since evolved from line notation (e.g., Wiswesser, SMILES) and matrices, to connection tables and 3D computer-based representations (e.g., CORINA, CONCORD) (Engel 2006). Two relatively recent initiatives to encode chemical information to enhance machine-readability include IUPAC's InChI (http://inchi.info/) and the Chemical Markup Language (CML), based on the XML schema (http://www.xml-cml.org/).

Structure locator services, such as ChemFinder (http://chemfinder.cambridgesoft.com/) and ChemIDplus (http://chem.sis.nlm.nih.gov/chemidplus/), maintain a central listing of chemical structures and provide full structure-searching capability, usually through structure software like ChemDraw (Richard et al 2006). These tools link textual information with the chemical structure and property data.

Chemical modeling and computational chemistry require extensive and well-annotated data sets to develop machine learning methods and conduct in silico processing (Gasteiger 2006). Inhibiting the research effort has been the proprietary ownership of the popular small molecule databases, such as MDL's Available Chemicals Directory and the American Chemical Society's CAS Registry (Chen et al 2005). However, in recent years, several public initiatives are fostering the ability to interconnect data sets and export data in formats capable of rigorous analysis. Among these are ChemDB, Harvard's ChemBank, UCSF's ZINC, and the European Bioinformatics Institute's ChEBi. Each database has its own unique combination of objectives, data set size, and informatics capabilities (Chen et al 2005). PubChem (http://pubchem.ncbi.nlm.nih.gov/), available through the NCBI's Entrez system, integrates chemical, structural, and biological properties of over 12.8 million small molecule compounds. The backbone of PubChem is

comprised of three databases: PC Substance, PC Compound, and PC BioAssay, focusing on substance information, compound structures, and bioactivity data, respectively. The database has been enriched through connections to other Entrez databases.

Beyond databases, more advanced expert systems are being developed for computer-assisted structure elucidation (CASE) and synthesis design (CASD) as well as quantitative structure–activity relationships (QSAR) (Chen 2006). It is through QSAR that toxicologists are starting to predict in silico the toxicity of a chemical.

The next trend is the fusion of bioinformatics (the large-molecule space) with chemoinformatics (the small-molecule world). That union is necessary to correlate the chemical's structure and its reactions with the chemical's associated biological effects (Gasteiger 2006).

Chemoinformatics faces several challenges in the coming years. First, researchers need more comprehensive and validated data sets. These data sets need to not only be publicly available, but well-annotated, standardized, and interconnected. Finally, more efficient analytical tools are needed to extract knowledge from these large-scale repositories (Mallard 1999, Chen et al 2005).

Technological innovation

The unprecedented leaps in computing speed, hard disk size, and memory space have facilitated the storage, retrieval, analysis, and dissemination of ever-increasing volumes of data and information. As a result, the paper-based tools of card catalogs and indexes have been transformed into fully searchable databases.

Telecommunications and digital networks form the backbone of the Internet and World Wide Web, making it possible to freely share a wealth of information not only locally, but globally as well. Web browsers, search engines, subject directories and hypertext support information retrieval on the World Wide Web. Electronic mail, listservs, instant messaging, and discussion groups facilitate social networking and person-to-person communication. Wireless communication networks are enabling portable, handheld devices to be used in a variety of applications. The National Library of Medicine has reviewed a handful of these toxicology-related PDA software programs (National Library of Medicine 2006).

In addition, analytical tools and instruments have increasingly become integrated with computing systems to create a seamless flow of capturing and storing to analyzing and interpreting data. One of the earlier systems, developed by the National Center for Toxicological Research in the late 1970s, permitted collection, processing, and analysis of large-scale, rodent-based tests (Lawrence et al 1977). On a much larger scale, Xybion's PATH/TOX (http://www.xybion.com/index.php?pg=51) system integrates toxicology, pharmaceutical, histology, pathology, necropsy, and other laboratory activities into a unified comprehensive data acquisition and management system. Usually, such data-collecting and -processing systems are intended for support of research and testing within an organization and the resulting data banks are not usually accessible to outsiders. However, the advent of the Internet and increasing researcher expectation are gradually encouraging open data accessibility.

Some examples of databases that are making research results publicly available include the various NCBI *Entrez* molecular biology databases such as GenBank and the Swiss Institute of Bioinformatics ExPASy server for proteomics. These centralized databases provide a web interface for any researcher to upload data and perform queries. Another form of open access data sharing is through federated data sites where each facility maintains its own site, but a central interface allows researchers to search across the multiple resources. The Biomedical Informatics Research Network (BIRN) was developed in this mode. Funded by the National Institutes of Health, BIRN is a 'geographically distributed virtual community of shared resources offering tremendous potential to advance the diagnosis and treatment of disease' (Biomedical Informatics Research Network 2007).

These technological advances have created a paradigm shift in scientific discovery. The most visible impact can be seen in the generation, utilization, and dissemination of exponential volumes of information. The ironic consequence is that technological progress has generated an ever-expanding volume of data, requiring yet faster and more powerful information systems to manage it all. But more significantly, technology has embedded itself into the core of the scientific research process – impacting what approaches are used, the rate of progress achieved, and the direction of research effort. The discipline of toxicology is not immune to technology's influence. The conduct of toxicology has been recast with an increased reliance on technology-driven approaches.

BACKGROUND IN TOXICOLOGY INFORMATION SYSTEMS

The above three factors have generated a plethora of reports, articles, toxicity tests, etc., subsequently prompting a need for information systems to collect,

organize, manage, and analyze the influx of data and information stemming from these sources. This section will briefly define information systems and highlight the seminal role of the National Library of Medicine in advancing toxicology information systems.

What is an information system?

While today we tend to presume an information system requires computing technology, in fact, it may be 'automated or manual and comprises people, machines, and/or methods' (ATIS 2007) to 'capture, transmit, store, retrieve, manipulate, or display information to serve a specific purpose' (Alter 1996).

The intended purpose of the information system defines the type of data, structure, and interface to be used in the system. When dealing with the hybrid nature of toxicology, an added challenge exists of managing information from diverse disciplines, each with its own terminology, datasets, methodologies, and technologies.

Early toxicology information systems

Toxicology literature began as early as 1500 BC with the Ebers Papyrus describing the effects of poisons (Doull 2001). The discipline did not find its own publication voice until 1930 with the *Sammlung von Vergiftungsfällen* [*Archives of Toxicology*] (Copestake 1999). A 1959 editorial in the first issue of the English journal *Toxicology and Applied Pharmacology* stated that the journal was needed because 'toxicology is emerging as a scientific discipline and that there is a need for centralization of toxicology data' (Doull 2001). Until the 1970s, printed matter and professional meetings were the primary mechanism for information dissemination in the field.

The subsequent growth in publishing brought on by increased demand for toxicology information due to regulations and researcher interest, spurred the need for a way to manage and track the literature. Indexing and abstracting tools were consequently developed to capture the wealth of information encapsulated in the journal articles. Such reliable standards as *Biological Abstracts, Chemical Abstracts, Excerpta Medica*, and *Index Medicus* offered means of tracking toxicology literature (Smyth 1960), albeit in a limited way by today's standards. Still, no information systems were dedicated to serving the toxicologist, to pull together and make readily accessible the far-flung data being generated by increased testing and appearing in an increasing array of publications.

One of the key documents providing an insight into the dissemination of toxicology information was the 1966 Report of the United States President's Science Advisory Committee entitled 'Handling of Toxicological Information' (President's Science Advisory Committee 1966), known here as the PSAC Report. The PSAC Panel expressed its concern about the dispersion of toxicological information over a large area of the published journal literature, published and unpublished reports, and unpublished information files of industrial companies and government agencies. The panel's major finding was that 'there exists an urgent need for a much more coordinated and more complete computer based file of toxicological information than any currently available, and further, that access to this file be more generally available to all those legitimately needing such information' (PSAC, p. 212). The recommendations of the PSAC Panel led, in 1967, to the establishment of the Toxicology Information Program (TIP) at the National Library of Medicine (NLM) (Miles 1982).

Leading the computing wave: NLM's Toxicology Information Program

The TIP came into existence around the same time that computing technology, networks, and telecommunication links were becoming mainstream applications. NLM took advantage of this technology to develop MEDLARS (Medical Literature Analysis and Retrieval System) in 1964, followed in 1971 by MEDLINE, the online version of *Index Medicus*. As part of NLM, the Toxicology Information Program was able to leverage this expertise and, as a result, has played a key role in effectively employing technology to make toxicology information widely and publicly available.

The Toxicology Information Program's first initiative was to launch TOXLINE, the only available comprehensive bibliographic electronic database of toxicology literature. The program developed further fact-type databases for chemical (Chemline and ChemID) and toxicological (Hazardous Substance Data Bank) applications. Either because of legislative mandate or out of a desire to make their information more broadly accessible, other federal agencies contributed their databases to the TIP network; e.g., the Environmental Protection Agency's GENE-TOX and IRIS (Integrated Risk Information System) and the National Cancer Institute's CCRIS (Chemical Carcinogenesis Research Information Systems). As the breadth and number of databases continued to expand in the network, a need emerged to aggregate the sources within a single 'portal'. In 1985, TOXNET was developed to meet that need. It currently provides access to TOXLINE, HSDB (Hazardous Substance

Data Bank), ChemID*plus*, IRIS (Integrated Risk Information System), ITER (Integrated Toxicity Estimates for Risk), GENE-TOX, ALTBIB (Bibliography on Alternatives to Animal Testing), among others. An added feature of TOXNET is the ability to search across multiple databases at one time.

The program's name was changed to Toxicology and Environmental Health Information Program (TEHIP) in 1994 to reflect its expanded role in creating, organizing, and disseminating environmental health information. In 1995, the Institute of Medicine (IOM) formed the Committee on Toxicology and Environmental Health Information Resources for Health Professionals. The task of this committee was to investigate the information needs of health professionals and to recommend to the NLM the role it should play in organizing and directing access to environmental health and toxicology information. The committee's findings (Liverman et al 1997), like the 1966 PSAC Report, supported the importance of ready access to environmental and toxicological information and the continuing need for coordination to assist in this endeavor. The committee also declared that since the environment is increasingly recognized as having an impact on human and ecological health, there is a far larger and diverse potential audience for this type of information. And finally, the committee recognized the importance of the NLM in playing a key role in organizing and providing pointers to all available toxicology and environmental health information.

Today, TEHIP, through its Environmental Health and Toxicology website (http://sis.nlm.nih.gov/enviro.html), offers access to a comprehensive array of resources spanning toxicology, hazardous chemicals, environmental health, and related areas of importance to health professionals, the general public, scientists, and policymakers. Besides the TOXNET databases, other available resources include ToxTutor, a tutorial on the basics of toxicology, and DIRLINE, a directory of useful resources in health, biomedicine, and toxicology. ToxSeek is a recently incorporated customizable metasearch and clustering engine for toxicology and environmental health topics. Among future projects is a Dietary Supplements Labels Database, and the World Library of Toxicology, Chemical Safety, and Environmental Health, a curated gateway to quality web resources around the world (Wexler 2004).

THE TECHNOLOGY WAVE IN TOXICOLOGY INFORMATION SYSTEMS

Virtually all toxicology information systems now rely on a database infrastructure to systematically store a collection of data or information in order to facilitate retrieval. As a result, toxicology information systems have evolved as new programming software and tools have enhanced database management systems. Early database systems of the 1980s used relational databases and structured query language (SQL) to facilitate easier searching and quicker retrieval of information from the database. However, as the volume and complexity of data expanded, the need to support browsing and intricate queries became important. Object-oriented programming was developed in the 1990s as a solution. At the same time, Java, ColdFusion, and other tools were being used to integrate databases with the new online world of the World Wide Web. The latest trend is to convert database content into an XML (Extensible Markup Language) format in order to exchange data between disparate systems. As larger (terabyte and even petascale) systems continue to develop, more will be required of the technology to handle and analyze the data.

Database content has typically taken two forms: literature-based and fact-based. However, the recent computing advances have added a third form, knowledge-based.

Literature-based (referential)

Bibliographic retrieval systems, whether online or in printed form, are referential in that they direct the user to published literature that contains the sought-after facts.

As mentioned previously, the earliest toxicology information system with a database backbone was TOXLINE, a one-stop source for bibliographic information in toxicology. The original intent to follow the MEDLINE lead and 'mechanize' an existing abstracting and index (A&I) source for online bibliographic retrieval had to be adjusted because no one secondary source adequately covered the field of toxicology. It was decided, therefore, to combine 'toxicology subsets' from various A&I services into one file that would look reasonably homogeneous to the online user. Thus, TOXLINE initially incorporated relevant segments from *Index Medicus, Biological Abstracts, Chemical Abstracts*, and *International Pharmaceutical Abstracts* (Bauden 1979, Schultheisz 1981).

Because of the continual growth of toxicology information in the published arena, TOXLINE did not reach its goal of becoming the single 'one-stop shopping center' for toxicology information, but one of a number of online databases to be consulted for comprehensive retrieval of information (Schultheisz et al 1978, Bac 1980). As a result, several changes were made in 2000 to TOXLINE. Since a significant portion of TOXLINE

citations come from MEDLINE, NLM created an independently searchable toxicology subset in PubMed to offer medical subject headings (MeSH), related articles, document delivery, and link-out features. The remaining TOXLINE subsets fall into areas such as technical reports and research projects, meeting abstracts, other special literature (such as the RISKLINE database from the Swedish Chemicals Agency and the CIS database from the International Labour Office), plus a variety of archival collections (e.g. Pesticides Abstracts, Poisonous Plants Bibliography, etc.) still retained and relevant, but no longer being updated (Goshorn 2001).

Other non-NLM toxicology-related bibliographic databases include BIOSIS, Enviroline (from the Congressional Information Service), TSCATS (EPA) and Pollution Abstracts which covers environmental fate and release literature. Cancer-related literature is accessible through two National Cancer Institute funded resources, CANCERLIT, now a subset in PubMed, and the *Chemical Carcinogenesis Research Information System* (CCRIS) file, available through TOXNET. Pesticide information is available in the Crop Protection File (Derwent) and AGRICOLA (National Agricultural Library) files. NIOSHTIC-2 (U.S. National Institute for Occupational Safety and Health) and the CIS file from the International Labour Office cover the bibliographic records for occupational exposure to chemicals and other toxic hazards.

Fact- or data-based (descriptive)

Facts and data are often extracted from primary sources, such as handbooks, and provide data elements or descriptive facts related to the subject. While *data* and *fact* tend to be used synonymously, *data* often connote numeric values, while *facts* represent observations that are described in words (Wright 2001). The descriptive elements may cover the substance's identity, chemical/physical properties, structure, production or use, environmental fate and level of release, occupational health and safety limits and guidelines, and toxicity data (dose/response, pathology, effects, etc.).

Initial toxicology databanks were literature-derived factual data stores such as the U.S. government-sponsored systems HSDB (Hazardous Substances Data Bank), RTECS (Registry of Toxic Effects of Chemical Substances), and IRIS (Integrated Risk Information System).

The HSDB (http://www.nlm.nih.gov/pubs/factsheets/hsdbfs.html), built and operated by the NLM, was started as the Toxicology Data Bank (TDB) in 1978 to provide users online, interactive access to evaluated toxicological data. All data are referenced and derived from a core set of books, government documents, technical reports and selected primary journal literature. HSDB is peer-reviewed by the Scientific Review Panel (SRP), a committee of experts in the major subject areas within the databank's scope. The HSDB, with over 150 data elements and over 5000 chemical records, is organized as a handbook of compounds with their chemical, physical, toxicological, and environmental attributes. It focuses on the toxicology of potentially hazardous chemicals and is enhanced with information on human exposure, industrial hygiene, emergency handling procedures, environmental fate, regulatory requirements, and related areas.

The Registry of Toxic Effects of Chemical Substances (RTECS) is a compilation that provides brief descriptions of substances for which acute or other toxic effects have been reported in the literature. As with other toxicology information systems intended to support U.S. health and safety initiatives, the RTECS system has been mandated by the U.S. Congress and is created under the sponsorship of NIOSH. The original edition, known as the Toxic Substances List, was published on June 28, 1971 and included toxicological data for approximately 5000 chemicals. RTECS now contains over 160 000 chemicals, providing nomenclature, CAS registry numbers, and mutagenic, teratogenic, and carcinogenic effects data, as well as references to government regulations and standards. RTECS is available through several commercial vendor systems (e.g., Dialog, MDL, Micromedex/Tomes, STN International) and not as part of the TOXNET Web database offerings.

Two toxicology literature-based systems are the Carcinogenic Potency Database (CPDB, http://potency.berkeley.edu/cpdb.html) by University of California at Berkeley and the Lawrence Berkeley National Laboratory and the Genetic Toxicology Database (GTD) developed by the U.S. National Toxicology Program. Both databases captured the results of chronic, long-term animal tests that had been published in the literature through 1998. A variety of qualitative and quantitative data was analyzed and included species, strain, route of administration, dose duration, tumor type, and carcinogenic potency (TD_{50}), among others. CPDB captured the results of 6153 cancer tests related to 1485 chemicals, while GTD reports on 2300 chemicals. Although no longer being updated, both of these databases provide useful historical data on the toxic effects of a variety of chemicals.

More recently, the 'data' or 'fact' databases are becoming repositories of data generated from experimental or field studies. The National Toxicology Program uses its own local website (http://ntp.niehs.nih.gov/) to disseminate a range of data available

from both acute in vitro and in vivo studies as well as from its traditional 2-year toxicological and carcinogenesis studies. Further contributions include results from immunology, developmental, reproductive, and genetic toxicity studies.

Similarly, the National Gene Vector Laboratory (NGVL) Toxicology database (http://www.ngvl.org/pharmtox/) was recently developed to publicize information on animal studies that investigate the biodistribution of gene therapy vectors to different target organs and to evaluate potential toxic effects associated with the use of various vector systems. These studies are critical in assessing the safety of a vector and are used by the FDA to support their use in gene therapy clinical trials.

The U.S. EPA's EnviroFacts Data Warehouse (http://www.epa.gov/enviro/) provides a single portal to access U.S. EPA data about environmental activities that may affect air, water, and land in the United States. Several databases, including the Toxic Release Inventory, are searchable through EnviroFacts.

Knowledge-based (discovery, analysis, prediction)

Many of the recently developed approaches are sophisticated computerized systems designed to collect, process, and especially analyze biological data generated from research and testing. These complex systems have been made possible by the progress mentioned earlier in bio- and chemoinformatics, computational biology, biostatistics, and computer science. The sophisticated algorithms and modeling used in these systems have been targeted to elucidate a toxin's mechanism of action, identify biomarkers of individual susceptibility, and predict a chemical's toxicity.

The two most active applications for knowledge-based toxicology information systems are in the fields of toxicogenomics and predictive toxicology.

Toxicogenomics

During the 1990s, microarray technology replaced the traditional gel electrophoresis and autoradiography for gene detection. The new high-throughput technology, being almost 6000× faster than the older method of DNA sequencing, has culminated in a wealth of data (Schmidt 2003b). Microarrays can be used to profile gene expression, identify potential drug targets, or detect genetic alterations (e.g., mutations, sequence changes). Applied to toxicology, microarrays make it possible to identify a toxicant's gene expression 'fingerprint' to gain insights into its molecular mechanisms of toxicity (Shankar & Mehendale 2005). The ability to profile genes expressed in a cell or tissue also provides toxicologists with a means to detect early toxicant exposure, compare modes of action across species, and differentiate classes of toxicants (Ballatori 2003).

The challenge of toxicogenomics involves the annotation, data integration, data analysis, data mining, and database/tool development necessary to extract knowledge from the resulting microarray data (Mattes et al 2004). The Gene Ontology (GO) was developed to fulfill the need to annotate gene function and bridge the gap between the gene's sequence and its biology (Gene Ontology Consortium 2001). In addition, text mining algorithms are being utilized to extract relationships from the literature on gene functions, pathways, and protein networks (Rajpal 2005).

General microarray repositories are numerous; e.g., ArrayExpress and NCBI's Gene Expression Omnibus for multiple arrays, HuGE Index for expression of human genes in normal tissue, Oncomine for cancer arrays, among many others. It is recommended that researchers do not rely on only one resource, since the number of published sequences as well as the quality of annotations varies by site (Schmidt 2003a).

Full-scale toxicogenomic databases have only recently been developed within the past several years. The U.S. Drug Administration's National Center for Toxicogenomics Research (NCTR) created ArrayTrack (http://www.fda.gov/nctr/science/centers/toxicoinformatics/ArrayTrack/), a database that combines varied public sets of chemical data, toxic endpoints, gene sequence and function, and pathway information into a prototype toxicoinformatics system. As a test-bed design, the objective of ArrayTrack is to improve techniques for managing, visualizing, extracting, and disseminating the data from microarray studies (Tong et al 2003). In 2005, efforts were made to integrate ArrayTrack with the Chemical Effects in Biological Systems Knowledge Base.

The National Institute of Environmental Health Sciences' National Center for Toxicogenomics (NIEHS/NCT) began development in 2004 of the Chemical Effects in Biological Systems (CEBS) Knowledge Base (http://cebs.niehs.nih.gov/). It is one of the first of its kind to aggregate chemical, toxicity, molecular expression, pathway, and regulatory data from different sources into a searchable, unified interface. CEBS can be searched by compound, structure, gene, pathway, among other variables.

The Comparative Toxicogenomics Database (CTD) (http://ctd.mdibl.org/) is setting out to be the first to compile aquatic and mammalian data to facilitate cross-species comparisons of interactions between chemicals and a gene or protein. The ultimate goal is

to elucidate which genes are conserved across species, what toxic effects do chemicals have on these genes or their proteins, what is the molecular mechanism behind the toxicity, and what accounts for the genetic basis of individual susceptibility (Mattingly et al 2006).

The development of CTD started in 2003 with a three-phase approach. First, gene sequences, toxic chemicals, and bibliographic references were installed in the system. The sequence data came from GenBank for nucleotide and SWISS-PROT for proteins. Reference literature associated with these sequences was extracted from both the source databases as well as PubMed. The second step incorporated analytical tools, such as BLAST for similarity searches and ClustalW for multiple alignments. The final phase involved creating an online public interface for dissemination (Mattingly et al 2006). CTD and CEBS were designed to be complementary and compatible with one another (Waters 2003).

Predictive toxicology

Two forces are compelling the development of information systems that can predict the toxicity of a substance. First, societal concerns over animal testing and the resulting implementation of the 'Three R' principles to reduce, refine, or replace animals in testing are turning toxicologists towards in vitro and in silico techniques. As well, the escalation in the volume of both chemical and pharmaceutical compounds waiting for testing mandates quicker, more cost-effective methods of ranking and classifying compounds.

Predictive toxicology is the union of bioactivity profiling through bioassays with chemoinformatics, data mining, and quantitative structure–activity relationship (QSAR) modeling (Richard 2006). The bioassays highlight a cell's toxic response to a chemical. Comprehensive, extensive, and public bioassay data repositories, such as PubChem, are necessary to achieve valid predictions (Richard 2006). In addition, data standards and controlled vocabulary for data mining and chemical structure representation and indexing for chemoinformatics must also be in place. Finally, QSAR expert systems distill the data and attempt to quantitate a chemical's structure with its physical property or biological effects (e.g., toxic endpoint) (Pittinger et al 2005).

QSARs are generally applied in three areas: priority setting for chemical testing, classification of the chemical's hazard, and screening for health and ecological risk (Pittinger et al 2005). Preliminary testing of a drug or chemical for toxic effects can quickly eliminate that drug from further development or raise the priority to fully test the chemical. A variety of QSAR systems are already available for various applications: physical-chemical properties (EPISUITE), environmental fate and transport (EFAST, PBT Profiler, Catabol), aquatic toxicity (ECOSAR), and human health effects (TOPKAT, MCASE, DEREK).

Use of QSARs in the regulatory process has slowly become acceptable, but only subsequent to analysis of the empirical study data. The OECD has compiled an extensive database on Chemical Risk Assessment Models (http://webdomino1.oecd.org/comnet/env/models.nsf) that tracks QSAR models currently being used by OECD government members. The EPA employs several types of QSARs as part of its need to screen and prioritize chemicals. For example, EPA uses TOPKAT to predict the health effects associated with endocrine-disrupting chemicals that are byproducts of drinking water disinfection products (Pittinger et al 2005). Finally, the European Union's Registration, Evaluation, and Authorization of Chemicals (REACH) program has approved the use of QSAR to expedite the screening process of 29 342 chemicals planned for review (Hengstler et al 2006).

The Environmental Protection Agency unveiled its Distributed Structure-Searchable Toxicity (DSSTox) database (http://www.epa.gov/ncct/dsstox/index.html), which offers curated chemical structures in combination with historical toxicity data to foster structure–activity modeling. At its core is a set of standards for chemical structure data and documentation files that are promoted for use in other chemical relational databases and SAR models.

Toxicogenomics and predictive toxicology are not mutually exclusive methods. Efforts are underway to integrate EPA's DSSTox and NCT's CEBS to establish an infrastructure for linking chemical structure searching with traditional toxicity, molecular mechanisms, and chemical profile data (Environmental Protection Agency 2007).

APPLICATIONS OF TOXICOLOGY INFORMATION SYSTEMS

Besides drawing from other disciplines, toxicology information and its systems contribute to other fields. Described below are a handful of toxicology information systems applications used in environmental science, clinical medicine, drug development, occupational health, and public health.

Environmental toxicology

The field of environmental toxicology explores the passage of agents through the environment and how

those agents may have injurious effects on flora, fauna, and the broader ecosystem. Chemical, as well as species-specific, information is critical to ecotoxicology systems. Chemical property databases of relevance include CHEMFATE and BIODEG. Both extract empirical data on a chemical's environmental fate and biodegradation from the bibliographic literature (Russom 2002). Ecotoxicity databases are often used for risk assessment, chemical screening and ranking, and predictive modeling.

In 1995, the EPA's ECOTOXicology (ECOTOX) database was developed as a single portal for searching and retrieving toxicity data from the AQUIRE (aquatic life), PHYTOTOX (terrestrial plants) and TERRETOX (wildlife) databases (http://cfpub.epa.gov/ecotox/help.cfm?sub=about). It was originally accessible to government users through telnet, but became publicly available when a web-based interface was launched in 2000.

Currently, ECOTOX includes more than 320 000 individual effect records abstracted from 17 195 peer-reviewed publications representing over 7800 chemicals and 5300 aquatic and terrestrial species. ECOTOX facilitates data sharing through the option of ASCII (American National Standard Code for Information Interchange) delimited file formats.

The Environmental Residue-Effects Database (ERED) (http://el.erdc.usace.army.mil/ered/) is a joint EPA–US Army Corp of Engineers effort that extracts from the literature reported correlations between tissue contaminant concentrations and toxic responses (e.g., behavioral, biochemical, cellular, reproductive, etc.). The database covers literature published from 1964 to 2001 and contains over 3463 records abstracted from about 700 publications, covering more than 222 compounds and 188 aquatic species.

Two expert systems, IPEST and POCER (Pesticide Occupational and Environmental Health Risk Indicator) calculate the environmental impact of a pesticide for a specific field crop on groundwater, surface water, air, soil, and humans (van der Werf & Zimmer 1998, Claeys et al 2005).

Geographic information systems (GIS) have found novel uses in the areas of risk assessment and exposure. The U.S. Environmental Protection Agency has developed a GIS-based application that incorporates wind speed, pesticide application rates, and other parameters to calculate the likelihood of non-target areas being exposed to a chemical hazard, which plant species would be more sensitive, and charting possible locations for field surveys or monitoring (Pfleeger et al 2006).

Clinical toxicology

The application of toxicology information in clinical practice typically is directed towards treating patients who are experiencing adverse effects from a toxic agent or pharmaceutical interaction. While historically, poison management information has been text-based, poison control centers and emergency physicians today rely on online tools such as Micromedex' POISINDEX (http://www.micromedex.com/products/poisindex/). This system quickly and accurately identifies ingredients for thousands of commercial, biological, and pharmaceutical products and provides data on clinical effects, range of toxicity, and treatment protocols. Similarly TOXBASE, a product of the UK National Poisons Information Service, is a longstanding poison and drug interaction database that has been used since 1998 (http://www.spib.axl.co.uk/). Skyscape has developed another tool specifically for mobile use. Its 5 Minute Toxicology Consult (5MTox) is a handheld version of the desktop download edition. It is geared toward the clinician who needs to quickly assess and treat a poisoned patient (http://www.skyscape.com/estore/ProductDetail.aspx?ProductId=271). CliniTox is a computer-based decision support system to provide veterinarians with the most recent clinical toxicology information for poisoned farm animals. Users may search based on chemical, type of application, or clinical/pathological outcome (Kupper et al 2004).

Drug discovery and development

Combinatorial chemistry and high-throughput screening techniques have fostered phenomenal growth in the amount of potentially useful pharmacological compounds. Yet, that increased number has not translated into an increase in new drug applications to and successful acceptance by the FDA (Borman 2006). The culprit of the high attrition rate is the failure of compounds to pass toxicity testing (Johnson 2001). The intersection of predictive modeling, toxicogenomics, microscale computing, and chemoinformatics offers the possibility to mine the essential ADME Tox (absorption, distribution, metabolism, and excretion) and pharmacokinetic data to optimize a chemical's pharmacological properties and minimize its toxicity (Johnson 2001).

Pharmacological data repositories include Wombat (http://sunsetmolecular.com/products/?id=4), a database of over 136 000 chemical and 307 000 biochemical activity, and its derivative Wombat PK (http://sunsetmolecular.com/products/?id=5,

a clinical pharmacokinetic database of 643 drugs with human ADMETox outcomes.

The application of microscale computing for determining the metabolic fate of a compound is speeding up the drug discovery process by eliminating toxic compounds earlier in the preclinical phase of development. The Metabolizing Enzyme Toxicology Assay Chip (MetaChip) can rapidly and efficiently gauge a drug's metabolic reactions as if it were occurring in a human liver (Lee et al 2005).

Occupational health

Ensuring the safety of workers requires knowing the nature of chemical hazards and what to do in the event of an exposure. One of the earliest useful resources was a reference book entitled *Patty's Industrial Hygiene and Toxicology. Patty's* is now available online as an e-book, making it much more accessible and easier to use. Two multi-file systems that integrate medical, chemical hazard, environmental, toxicological, regulatory, and risk information includes TOMES (Micromedex) and ExPub (Expert Publishing). TOXNET's HAZMAP (http://hazmap.nlm.nih.gov/) links jobs and hazardous tasks with occupational diseases and their systems. Utilizing mobile technology, the Wireless Information System for Emergency Responders (WISER) provides emergency personnel with ready information (e.g., substance identification, human health effects, containment advice, etc.) to respond to hazardous material incidents (http://wiser.nlm.nih.gov/).

Numerous international efforts are involved in providing chemical safety information. The International Programme on Chemical Safety's INCHEM database (http://www.inchem.org/), provides current and peer-reviewed chemical safety publications and database records. The OECD's Environmental, Health and Safety Programme has an extensive compilation of databases related to high production volume chemicals, industrial chemical releases, among others (http://www.oecd.org/linklist/0,2678,en_2649_34365_2734144_1_1_1_1,00.html).

Public health

Numerous information systems have been developed specifically for public health professionals or for the public directly. In January 2001, the Pew Environmental Health Commission issued the report 'America's Environmental Health Gap: Why the Country Needs a Nationwide Health Tracking Network' (Pew Environmental Health Commission 2000). The report, which stated that the existing environmental health system is neither adequate nor well-organized, recommended the creation of a 'Nationwide Health Tracking Network for disease and exposures'. As a result, the CDC's National Environmental Public Health Tracking Program (McGeehin et al 2004) was created to track, monitor, and correlate the relationships among hazards, exposures, and health effects. Its website (http://www.cdc.gov/nceh/tracking/) serves as a compendium of its own as well as other government agencies resources, databases, and programs.

NLM's TEHIP has been a leader in developing more public-oriented toxicology resources. Four interesting databases useful for the public audience include the Household Products Database (HPD), ToxTown, ToxMap, and Lact-Med (Wexler 2004). Through the Household Products Database (http://hpd.nlm.nih.gov/) consumers can link consumer brand products with known health effects associated with their ingredients. The information is extracted from the product labels and Material Safety Data Sheets. ToxTown (http://toxtown.nlm.nih.gov/) is an interactive website that engages the public to learn about the interrelationship among chemicals, the environment, and public health. Locations are highlighted where people may be exposed to chemicals and further information regarding the nature and effects of the chemical is provided. ToxMap (http://toxmap.nlm.nih.gov/toxmap/main/index.jsp) uses geographic information system technology to generate local, state, or national maps where Toxic Release Inventory chemicals have been released on-site into the air, water, or ground. LactMed (http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?LACT) is useful for both clinicians and breastfeeding mothers regarding which drugs may be transmitted through breast milk. Extracted from peer-reviewed literature, the data include maternal and infant levels of drugs, possible effects on breastfed infants and on lactation, and alternate drugs to consider.

Public interest groups and grassroots organizations have also been contributing to the mass of toxicology information systems in recent years. Originally launched by Environmental Defense in 1998, the chemical Scorecard (http://www.scorecard.org/) provides local environmental information on the release of toxic chemicals from nearby industrial facilities. The site was transferred to Green Media Toolshed in 2005. The CHE Toxicant and Disease Database (http://database.healthandenvironment.org/) summarizes links between chemical contaminants and approximately 180 human diseases or conditions. The information

is primarily based on human epidemiological data. The Pesticide Action Network's (PANNA) online PAN Pesticides Database (http://www.pesticidesinfo.org) aggregates human toxicity, ecotoxicity, and regulatory information from various sources on over 6400 active ingredients in pesticides.

CHALLENGES AHEAD FOR TOXICOLOGY INFORMATION SYSTEMS

Given toxicology's current state of reliance on technology-driven methods, it is not surprising that its challenges are technology-based. Despite, or maybe because of the revolutionary advances, the toxicology information realm is still fragmented, utilizing varying non-exchangeable data formats. As well, 'lack of [quality] data' (Yang et al 2006) still impedes the efforts of toxicologists and others to garner a comprehensive understanding of a chemical's effect on biological systems. Thus, toxicology will continue to be challenged to improve data sharing and data integration.

Data sharing

Recently, the concept of data sharing has gained momentum, perhaps in part, due to the U.S. National Institutes of Health's (NIH) requirement that grant proposals submitted to NIH should include a data-sharing plan (National Institutes of Health 2003) and also in part due to publisher requirements for authors to submit study data to repositories (Board on Life Sciences 2003). Two elements need to be in place to facilitate data sharing – freely available data and a controlled vocabulary to facilitate effective retrieval.

The emergence of large, publicly accessible datasets in the past few years has created an environment for open scientific query. These repositories provide the opportunity for researchers to tap into larger than in-house datasets and employ new analyses and new methods. Furthermore, knowing what has already been researched can minimize duplication of effort. The challenge is maintaining funding levels to support these resource-intensive undertakings. Numerous databases, some quite large like BIND and SwissProt, have faced funding challenges and either shut down or were appropriated by commercial vendors (Beltrão 2005).

Naming conventions are notoriously ambiguous in the biosciences. Sharing data assumes that the data terminology itself is the same or can be readily synchronized. A controlled vocabulary creates a structured, unique terminology to eliminate redundant and synonymous terms (Burgoon 2007). Successful initiatives include the NLM's Medical Subject Headings (MeSH) and Unified Medical Language System (UMLS). The Human Genome Organization (HUGO) developed a controlled vocabulary to ensure that each gene is designated only one official name or abbreviation (Burgoon 2007). As well, the Developmental Toxicology database (DevTox) created a Nomenclature Information System designed to harmonize teratology terminology (http://www.devtox.org/nomintro.htm).

Controlled vocabularies are used to generate ontologies, which are an attempt to comprehensively catalogue and describe the relationship among concepts for a specific field. The Gene Ontology (GO) classifies genes by molecular function, biological process, and cellular component to enable databases to communicate with one another and be compatible for data mining (Yang et al 2006).

Data standards

The ability to report, share, and conduct computational analyses between disparate high-throughput datasets requires a robust, dynamic informatics infrastructure. The foundation of that infrastructure mandates a cooperatively developed and widely applied set of data standards. The data standards 'landscape' involves reporting standards, object models, and markup languages (Burgoon 2007).

Data exchange standards create a framework for organizing experimental data. A number of standards and data exchange checklists are in the process of development. Many of these initiatives are tailored to a specific technology or subject area (e.g., nucleic acid sequence data (FASTA, Ensembl), proteins (PDB, mmCIF), protein interation (Proteomics Standards Initiative), and microarrays (MIAME, MAGE-ML)) (Ball et al 2004).

With regard to toxicology, toxicogenomics researchers have extended the Minimum Information About a Microarray Experiment (MIAME) to encompass toxicogenomic-specific fields to create MIAME/Tox (http://www.mged.org/Workgroups/rsbi/MIAME-Tox-Checklist.pdf). Also, the Standard for Exchange of Nonclinical Data (SEND) was launched by the Clinical Data Interchange Standards Consortium (CDISC) to facilitate the transfer of non-clinical safety data from industry to the U.S. Food and Drug Administration (Yang et al 2006). A more recent proposal is underway by a cross-disciplinary group for a 'strawman' checklist defining the absolute minimum information required to report toxicology data (Fostel et al 2007). The intent of this proposal is to lay the groundwork for building more specific standards within toxicology. The standard model will require the same data elements to be

reported across all toxicology arenas (e.g., transcriptomic, clinical pathology, histopathology, etc.). As a result, the standard will facilitate seamless data sharing and database entry across divergent systems.

Finally, the online world has triggered the development of computer languages which use identifier tags to 'markup' or annotate the digital data element. These tags, by describing the document's structure and data elements, provide the computer with instructions on how to format, display, or use the content. Leadscope developed ToxML, an XML-based toxicology-specific markup language, to standardize descriptive tags for compounds, drug information, and types of toxicity tests (e.g., genetic, carcinogenesis, skin sensitivity, environmental fate, etc.) (http://www.leadscope.com/toxml.php). Molecular biology as well as chemistry has seen a plethora of XML-based schema develop. Faced with a myriad of choices, researchers often choose a schema based on regulatory or data repository mandate rather than what is research or cost effective (Burgoon et al 2006).

The benefit of standards is exemplified by the Stanford Microarray Database's initiative to create a seamless pipeline that feeds data from its microarray studies directly into the public repository ArrayExpress (Ball et al 2005).

FUTURE DIRECTIONS

Without a doubt, regulatory, technological, and scientific factors will continue to impact the evolution of toxicology information systems in the future. However, technological advances will be at the forefront of augmenting the toxicology knowledge base in the coming years. Microscale techniques, biosensors, remote instrumentation, and grid computing are a few innovative technologies that are being incorporated in the field.

Evolving microfluidics techniques coupled with scaled-down analytical tools are stimulating the development of cell-based microsystems, also known as 'lab-on-a-chip'. Through the integration of fluid dynamics and electrical, optical, and physical measurements, these chips consolidate several steps of an assay into a single system (Craighead 2006, El-Ali et al 2006). The chips make it possible to isolate and observe an individual molecule. As a result, the lab-on-a-chip will have several uses such as to monitor cells for changes due to pathogen or pollutant exposure, measure biochemical byproducts of cell lysis, or control the growth and differentiation of cells (El-Ali et al 2006).

Biosensors, such as the type used to monitor blood glucose levels, are finding numerous applications in toxicology, especially related to exposure science. These sensors combine a biological element (e.g., tissue, antibody, enzyme, etc.) with physiochemical detectors to calculate a chemical's biological 'fingerprint'. Applications include remote sensing of airborne bacteria, assessing drug residues in food, or detecting levels of a toxic substance before or after bioremediation (Schwartz & Collins 2007).

Recent sensing modalities from nanotechnology and biodefense are being incorporated to create sensors capable of accurately capturing real time data for assessing personal exposure levels (Schwartz & Collins 2007). Successful devices will need to be portable, inexpensive, easy-to-use, and mildly inconvenient (e.g., used in a watch, phone, even clothing) (Schwartz & Collins 2007). The goal will be to correlate the exposure with biomarkers and ultimately with individual susceptibility (Schmidt 2006).

Analytical tools and instrumentation will continue to be computerized. One area seeing innovative developments is in pathology and histopathology. Digitization techniques are necessitating the formation of pathology informatics to manage the hundreds of image data points (McCullough et al 2004). Digital instrumentation also fosters collaboration and technology sharing for research or training. GLI2C CyberChemistry Collaboration is an example of how remote sharing can provide training opportunities for scientists in the developing world (Fitch et al 2006). Students, a group in the U.S. and another group in Africa, load water samples prepared for pesticide analysis onto instruments. Using the web, the instruments are operated remotely by each group and results are relayed between the students. The project was such a success that a new course is being considered to compare lead problems in paint in inner-city Chicago with leaded gasoline used in Africa.

The high-throughput, data-rich environments brought about by scientific and computing advances require ever faster and more robust computing power to not only extract knowledge, but to be able to visualize it. Even current high-performance computing systems are being stretched to their maximum capability. Grid computing, whereby individual computers are interconnected to create a shared network of resources, is offering a powerful solution. Grid computing is finding applications in the area of environmental modeling, large-scale simulations, and high-end visualization. Another future avenue will be the merger of high-throughput and high-performance computing to accommodate analysis of 'many smaller problems' with 'many CPUs' (Derra 2002).

TeraGrid (http://www.teragrid.org) is currently the world's largest 'cyberinfrastructure' coordinating access to high-performance computers, over 100

databases, and high-end experimental resources. The TeraGrid has been used in the Models for Infectious Disease Agent Study (MIDAS) to more effectively respond in the case of an infectious disease outbreak (Anonymous 2007). Another application is IBM's BlueGene/P, which is directing its 1 petaFLOP of computing power towards protein folding to gain insights into the relationship between a protein's structure and its function (Allen 2001).

Tapping into the power of this high-performance computing is the European Center for Virtual Reality. The Center is using virtual reality, or in virtuo, methods to imitate a cell and its environment. Sophisticated models allow the system to simulate complex interactions and replicate the full sequence of reaction at granular levels. The benefit of this approach is that each study element is independent, allowing parameters to be changed at will without needing to devise new experiment protocols (Desmeulles et al 2006).

SUMMARY

Toxicology has been described as 'both a science and an art' (Doull 2001, p. 15). The science entails experimental observation and data collection, while the art manifests itself as prediction or application. In other words, the systems we use to manage the toxicology-related information directly determines how well the practice of toxicology is managed (Kissman 1980).

Regulatory pressure, scientific progress, and technological advances have transformed the toxicology information infrastructure from its descriptive literature-based and databank beginnings to its current dynamic analytical and predictive systems. That infrastructure, composed of computing networks, telecommunications, and informatics tools, has laid the foundation for researchers to gain insights into chemical risk assessment, hazard identification, exposure monitoring, mechanisms of toxicity, among many others. Despite the expansion in the toxicology knowledge base, many complex questions remain. Answers will only be found once cohesive, freely available, and validated information systems are interconnected. Thus, as the scale of toxicological inquiry increases, so too does the 'researcher's interaction with the information infrastructure' (Kalawsky 2005, p. 1867).

CHAPTER

4

Toxicoinformatics Today

MARK A. PERSHOUSE, MELISA BUNDERSON SCHELVAN, AMY ERBE, CORBIN SCHWANKE, AND ELIZABETH PUTNAM

'Toxicoinformatics is an emerging scientific discipline that integrates approaches from multidisciplinary fields of bioinformatics, chemo informatics, computational toxicology, informatics technologies and physiologically-based pharmacokinetic modeling with the objective of knowledge discovery and the elucidation of mechanisms of toxicity.'

National Center for Toxicological Research

Toxicoinformatics represents the synthesis of several different approaches to archiving, organizing, and navigating complex data dealing with toxicologic studies. One approach would be to consider toxicoinformatics simply a subset of the bioinformatics field, a collection of data generated in an attempt to understand toxicological mechanisms. This may be a helpful generality, but does not capture the ultimate scope of the field. For those reading the opening quote above, the reality has already grasped them that most in toxicology already pursue toxicoinformatics on a daily basis. Toxicoinformatics brings together many diverse scientists, from computational toxicologists, to pharmacokinetic modelers, to microarray specialists. Initially, the focus was on analysis of genomic data generated following exposure of various model organisms to toxicants. This has grown to include many associated technologies and disciplines. The compiled lists of resources below include 20 books, 15 journals, 18 manuscripts, two organizations, and eight databases or websites, which can be helpful in exploring toxicoinformatics.

Navigating toxicoinformatic resources requires a command of numerous websites, but paramount among these sites are those that compile many helpful sites and effectively serve as gateways. In this field, the ToxNet website serves this purpose and provides a number of useful sites and search engines to help investigators find toxicoinformatic resources.

TOXNET

The home page for this site begins with a searchable access to 14 different databases. These databases cover a number of relevant subjects, from hazardous substances (HSDB), integrated risk information for over 500 chemicals (IRIS), genetic toxicology test results on over 3200 chemicals (GENE-TOX), maps of toxic chemicals released into the environment (TOXMAP), a bibliographic database of toxicologic citations (TOXLINE), and an interactive guide to commonly encountered toxicants (Tox Town). Databases can be searched one at a time or in multiples. While this is not the only gateway available to those interested in toxicoinformatics databases, it is one of the easiest to use and most robust. It is thus a great place to begin.

RESOURCES

Books

Andreas D Baxevanis, BF Francis Ouellette
Bioinformatics: A Practical Guide to the Analysis of Genes and Proteins, 3rd edition
New York: John Wiley & Sons.

This is a textbook style resource containing 18 chapters. This book covers the use of databases for

bioinformatics as well as predictive and comparative algorithms. Biological examples are used to explain different strategies for performing computational analysis. It is considered one of the best training manuals for navigating the NCBI suite of databases.

Martin J Bishop
Guide to Human Genome Computing 2nd edition
San Diego, CA: Academic Press.

The *Guide to Human Genome Computing* contains 12 chapters useful in the field of human genome analysis as it might apply to toxicoinformatics. This book contains topics such as internet resources, genetic analysis, sib-pair studies, comparative mapping, radiation hybrids, sequence ready clone maps, human genome sequencing, ESTs, gene prediction, and gene expression.

JA Bond
Comprehensive Toxicology: General Principles
New York: Elsevier Science Inc.

Toxicokinetics, mechanisms of toxicity, and risk assessment are covered in this overview of the field of toxicology.

Jurgen Borlak
The Handbook of Toxicogenomics: Strategies and Applications
Weinheim, Germany: Wiley-VCH.

This book will be useful for those interested in developing research strategies in the area of toxicogenomics, incorporating the interdisciplinary aspect of the field to cover the wide range of topics involved.

Michael E Burczynski
An Introduction to Toxicogenomics
Boca Raton, FL: CRC.

The new discipline of toxicogenomics is outlined in this overview. Focusing on toxicology, the central concept underlying the use of microarray analysis for biomedical research is explained. Included in discussions is an overview of the actual mechanics of array-based genomic analysis and techniques used for quality control and material handling. A key aspect of the book is input into analysis of large-scale datasets using clustering methods such as genetic algorithms.

A Malcolm Cambell, Laurie J Heyer
Discovering Genomics, Proteomics, and Bioinformatics
Upper Saddle River, NJ: Benjamin Cummings.

This is a 'workbook'-style textbook targeted at upper-level undergraduates and first-year graduate students. It uses real case studies and web activities to give the student an interactive learning experience.

Hsinchun Chen, Sherilynne S Fuller, Carol Friedman, William Hersh
Medical Informatics: Knowledge Management and Data Mining in Biomedicine (Integrated Series in Information Systems)
New York: Springer Science.

This book contains three sections, each divided into multiple chapters. The first section provides a foundation for understanding the field of medical informatics. Sections two and three provide practical discussions for the use of medical informatics.

Anthony DeCaprio
Toxicologic Biomarkers
New York: Taylor & Francis.

This reference provides the reader with a thorough knowledge of biomarker theory by detailing the development and practical applications of biomarkers in a variety of scientific fields including toxicology, forensics, and pharmaceutics. This guide includes recent studies describing the generation and utilization of biomarkers for the detection of toxicant exposure, human health risk assessment uses, occupational safety testing, drug development applications, and biological and chemical warfare agent detection.

Sean Ekins
Computational Toxicology: Risk Assessment for Pharmaceutical and Environmental Chemicals
Weinheim, Germany: Wiley-VCH.

The predictive tools commonly used in the field of risk assessment for applications such as pharmaceutical development and environmental evaluation are discussed in this book.

Warren J Ewens, Gregory Grant
Statistical Methods in Bioinformatics: An Introduction
New York: Springer Science + Business Media

This book contains 15 chapters. It includes a section on biological topics, including: sequence analysis, BLAST, microarray analysis, gene finding, and the analysis of evolutionary processes. Important statistical techniques are also discussed, including: hypothesis testing and estimation, Poisson processes, Markov models and Hidden Markov models, and multiple testing methods.

Neil C Jones, Pavel A Pevzner
An Introduction to Bioinformatics Algorithms (Computational Molecular Biology)
Cambridge, MA: MIT Press.

An Introduction to Bioinformatics Algorithms is an undergraduate-level text. This book contains discussions of problems that are biologically relevant as well as approaches to possible solutions. Also included are

short biographies of some of the leading personalities in the field.

Dan E Krane, Michael L Raymer
Fundamental Concepts of Bioinformatics
Upper Saddle River, NJ: Benjamin Cummings.

This book is co-authored by a biologist and a computer scientist to give a unique perspective on the field of bioinformatics. It focuses on basic concepts such as available programs for doing computational analysis and the algorithms used to design them.

Thomas Lengauer, Raimund Mannhold, Hugo Kubinyi, Hendrik Timmerman
Bioinformatics: from Genomes to Drugs
Weinheim, Germany: Wiley-VCH.

This book contains eight chapters. The text focuses on the practical 'application' of bioinformatics and uses real-life scenarios to illustrate points.

David W Mount
Bioinformatics: Sequence and Genome Analysis
Cold Spring Harbor, NY: Cold Spring Harbor Laboratory Press.

This textbook contains 13 chapters. It focuses on the methods used for analyzing DNA, RNA, and protein data. The second edition contains chapter guides and explanatory information panels for students.

CA Orengo
Bioinformatics: Genes, Proteins, and Computers (Advanced Text)
Oxford, UK: BIOS Scientific Publishers Ltd.

This 18-chapter textbook is an advanced-level bioinformatics resource. It covers topics ranging from molecular evolution to global approaches for studying protein–protein interactions. It concludes with a section on data management and internet technologies.

Jonathan Pevsner
Bioinformatics and Functional Genomics
New York: Wiley-Liss.

This book is designed to give the computer scientist a better understanding of the needs of the biological scientists using their programs. This book brings theoretical principles together with practical applications. It also includes background on the principles of bioinformatics.

Micaela Reddy, RS Yang, Melvin E Andersen, Harvey J Clewell III
Physiologically Based Pharmacokinetic Modeling: Science and Applications
Weinheim, Germany: Wiley-VCH.

This book offers an overview of the principles of physiologically based pharmacokinetic (PBPK) modeling. This modeling technique is becoming increasingly important in human health risk assessments and in supporting pharmacodynamic modeling for toxic responses. This is the first comprehensive reference of its kind.

Jim E Riviere
Biological Concepts and Techniques in Toxicology
New York: Taylor & Francis.

Proteomics, toxicogenomics, and metabonomics are highlighted in this guide as examples of disciplines that will impact the future of toxicology. This book offers information on some of the latest advances in molecular biology, mathematical modeling, quantitative risk assessment, and biopharmaceutical development.

Edward H Shortliffe, James J Cimino
Biomedical Informatics: Computer Applications in Health Care and Biomedicine (Health Informatics) 3rd edition
New York: Springer Science.

This book contains 10 chapters starting with the emergence of biomedical informatics as a discipline and continuing with a section on data storage and clinical reasoning. The book also contains chapters on computing, system designs, industry standards, language, imaging, and, finally, ethics.

K Clive Thompson, Kirit Wadhia, Andreas P Loibner (2005)
Environmental Toxicity Testing
Oxford, UK: Blackwell Publishing Ltd.

This reference examines issues in assessing environmental toxicity, discussing how ecotoxicity results are interpreted and applied.

Journals

Artificial Intelligence in Medicine (1989–)
Federal Republic of Germany: Amsterdam Elsevier Science Publishing.
Web: http://sciencedirect.com/science/journal/09333657

'Artificial Intelligence in Medicine publishes original articles from a wide variety of interdisciplinary perspectives concerning the theory and practice of artificial intelligence (AI) in medicine, human biology, and health care.' (description excerpted from the journal's website)

Bioinformatics (1998–)
Oxford, UK: Oxford University Press.
Web: http://bioinformatics.oupjournals.org/

'The leading journal in its field, *Bioinformatics* publishes the highest quality scientific papers and review

articles of interest to academic and industrial researchers. Its main focus is on new developments in genome bioinformatics and computational biology. Two distinct sections within the journal – *Discovery Notes and Application Notes* – focus on shorter papers; the former reporting biologically interesting discoveries using computational methods, the latter exploring the applications used for experiments.' (description excerpted from the journal's website)

BMC Bioinformatics (2000–)
London: Biomed Central.
Web: http://www.biomedcentral.com/1471-2105

'*BMC Bioinformatics* is an Open Access, peer-reviewed journal that considers articles on all aspects of computational methods used in the analysis and annotation of sequences and structures, as well as all other areas of computational biology.' (description excerpted from the journal's website)

BMC Medical Imaging (2001–)
London: BioMed Central.
Web: http://www.pubmedcentral.nih.gov/tocrender.fcgi?journal=41

'*BMC Medical Imaging* is an Open Access, peer-reviewed journal that considers articles on the use, development, and evaluation of imaging techniques to diagnose and manage disease.' (description excerpted from the journal's website)

Briefings in Bioinformatics (2000–)
Birmingham, AL: H. Stewart Publications.

'*Briefings in Bioinformatics* is an international forum for researchers and educators in the life sciences. The journal publishes reviews for the users of databases and analytical tools of contemporary genetics and molecular biology and is unique in providing practical help and guidance to the non-specialist. Papers range in scope and depth, from the introductory level to specific details of protocols and analyses encompassing bacterial, plant, animal and human data.

Detailed subject areas covered by the journal include: DNA sequencing, expression profiling, alignment methods, gene expression studies, protein profiles and HMMs, metabolic and signalling pathways, structure and function prediction, mapping and microarrays.' (description excerpted from the journal's website)

Cancer Informatics (2005–)
Auckland, NZ: Libertas Academica.
Web: http://www.la-press.com/caninfo.htm

'2005 has been a busy and highly productive year for Cancer Informatics. This is somewhat remarkable in view of the fact that last year was the journal's first year of publication. Cancer Informatics was established as the official journal of the International Society for Cancer Informatics (ISCI), established by Associate Professor James Lyons-Weiler in the same year. Working in collaboration with the Association is Libertas Academica, a publishing firm committed to high editorial standards, open access publishing methodologies and superior user-service standards. The journal is fortunate to have at its helm James Lyons-Weiler as Editor-in-Chief.' (description excerpted from the journal's website)

Computerized Medical Imaging and Graphics (1988–)
Tarrytown, NY: Elsevier Science.
Web: http://sciencedirect.com/science/journal/08956111

'*Computerized Medical Imaging and Graphics* is an important source for the latest information on the medical use of new computer applications in radiological imaging, 3-D imaging and microscopy, including research methods and results in CT, MR, PET, SPECT, digital radiology, DSA, ultrasound, confocal microscopy, 3-D reconstruction, image analysis and color analysis. The Journal provides for the rapid review of original research papers, review articles, and preliminary research publications in this important field.' (description excerpted from the journal's website)

International Journal of Medical Informatics (1997–)
Shannon, Co. Clare, Ireland: Elsevier Science Ireland Ltd.
Web: http://sciencedirect.com/science/journal/13865056

'The Journal provides an international medium for dissemination of original results and interpretative reviews concerning the field of medical informatics.' (description excerpted from the journal's website)

Journal of the American Medical Informatics Association (1994–)
Philadelphia, PA: Hanley and Belfus.
Web: http://www.jamia.org

'AMIA's bimonthly journal, JAMIA, presents peer-reviewed articles that assist physicians, informaticians, scientists, nurses, and other health care professionals develop and apply medical informatics to patient care, teaching, research, and health care administration. JAMIA has rapidly established a reputation for presenting high-quality, cutting-edge information. Each issue contains state-of-the-art reviews, discussion forums, and invited editorials presented as brief reviews or full-length papers. A variety of

formats accommodates work at all stages, from model formulation through definitive studies.' (description excerpted from the journal's website)

Journal of Biomedical Informatics (2001–)
San Diego, CA: Academic Press.
Web: http://www.sciencedirect.com/science/journal/15320464

'The *Journal of Biomedical Informatics* (formerly *Computers and Biomedical Research*) has been redesigned to reflect a commitment to high-quality original research papers and reviews in the area of biomedical informatics. Although published articles are motivated by applications in the biomedical sciences (for example, clinical medicine, health care, population health, imaging, and bioinformatics), the journal emphasizes reports of new methodologies and techniques that have general applicability and that form the basis for the evolving science of biomedical informatics.' (description excerpted from the journal's website)

Journal of Chemical Information and Modeling (2005–)
Washington, DC: American Chemical Society.
Web: http://pubs.acs.org/jcim

'Astute chemists, computer scientists, and information specialists look to this bimonthly's insightful research studies, programming innovations, and software and book reviews to keep current with advances in this integral, multidisciplinary field.' (description excerpted from the journal's website)

Journal of Computational Biology (1994–)
New York: Mary Ann Liebert Inc.
Web: http://www.liebertonline.com/cmb

'Journal of Computational Biology provides a forum for communication of scientific and technical issues associated with the analysis and management of biological information at the molecular level.' (description excerpted from the journal's website)

Journal of Molecular Modeling (1995–)
Berlin, Germany: Springer.
Web: http://www.springerlink.com/openurl.asp?genre=journal&eissn=0948-5023

'The Journal of Molecular Modeling focuses on "hardcore" modeling, publishes high quality science including Life Science Modeling (including QSAR, data mining/bioinformatics, structure and substructure search), Materials Modeling, New Methods, and Computational Chemistry in an interdisciplinary manner.' (description excerpted from the journal's website)

Neuroinformatics (2003–)
Totowa, NJ: Humana Press Inc.
Web: http://www.neuroinformaticsONLINE.com

'Neuroinformatics publishes original articles and reviews with an emphasis on data structure and software tools related to analysis, modeling, integration, and sharing in all areas of neuroscience research. The editors particularly invite contributions on: (1) Theory and methodology, including discussions on ontologies, modeling approaches, database design and meta-analyses; (2) Descriptions of developed databases and software tools, and of the methods for their distribution; (3) Relevant experimental results, such as reports accompanied by the release of massive data sets; (4) Computational simulations of models integrating and organizing complex data; and (5) Neuroengineering approaches, including hardware, robotics, and information theory studies. Neuroinformatics also publishes independent "tests and evaluations" of available neuroscience databases and software tools, and fosters a commitment to the principles of tool and data sharing.' (description excerpted from the journal's website)

'The NCTR's Center for Toxicoinformatics was established on June 2nd, 2002. The primary function of this program is to apply and develop toxicoinformatics approaches for omics research and traditional toxicological studies at NCTR and beyond to FDA.' (description excerpted from the website)

Databases

DSSTox
Sponsor: U.S. Environmental Protection Agency
Web: http://www.epa.gov/ncct/dsstox/

Distributed Structure-Searchable Toxicity (DSSTox) Database Network is a project of EPA's Computational

Toxicology Program, helping to build a public data foundation for improved structure–activity and predictive toxicology capabilities. The DSSTox website provides a public forum for publishing downloadable, standardized chemical structure files associated with toxicity data.

The Endocrine Disruptor Knowledge Base
Sponsor: U.S. Food and Drug Administration
Web: http://edkb.fda.gov/

'The Endocrine Disruptor Knowledge Base (EDKB) website consists of a biological activity database, relevant literature citations, computational models, and ultimately, models for risk assessment. It is designed to help research and regulatory scientists, and other interested parties set priorities for testing of endocrine disrupting compounds, make use of the existing body of knowledge, and reduce dependency upon slow and expensive animal experiments.'

EXTOXNET
Sponsor: Oregon State University
Web: http://extoxnet.orst.edu/

'The EXTension TOXicology NETwork (EXTOXNET) is an effort of University of California, Davis, Oregon State University, Michigan State University, Cornell University, and the University of Idaho. Some of the goals of EXTOXNET are to stimulate dialog on toxicology issues, develop and make available information relevant to extension toxicology, and facilitate the exchange of toxicology-related information in electronic form, accessible to all with access to the Internet. The EXTOXNET InfoBase is accessible via the World Wide Web (WWW).'

The Pharmacogenetics and Pharmacogenomics Knowledge Base (PharmGKB)
Sponsor: Stanford University
Web: http://www.pharmgkb.org

'The PharmGKB database is a central repository for genetic, genomic, molecular and cellular phenotype data and clinical information about people who have participated in pharmacogenomics research studies. The data includes, but is not limited to, clinical and basic pharmacokinetic and pharmacogenomic research in the cardiovascular, pulmonary, cancer, pathways, metabolic and transporter domains.'

Saccharomyces Genome Database (SGD)
Sponsor: SGD Curators (The SGD is in the Department of Genetics at the School of Medicine, Stanford University.)
Web: http://www.yeastgenome.org/

SGT is a database for the compilation of the genetics and molecular biology of *Saccharomyces cerevisiae*, or budding yeast.

SOURCE
Sponsor: Genetics Department at Stanford University
Web: http://source.stanford.edu/cgi-bin/source/sourceSearch

'SOURCE is a unification tool which dynamically collects and compiles data from many scientific databases, and thereby attempts to encapsulate the genetics and molecular biology of genes from the genomes of *Homo sapiens*, *Mus musculus*, *Rattus norvegicus* into easy to navigate GeneReports.'

TOXNET
Sponsor: The National Library of Medicine
Web: http://toxnet.nlm.nih.gov/

A collection of databases centered on toxicology, hazardous chemicals and environmental exposures. Includes links to databases such as ToxLine, IRIS and DART.

This publication was made possible by Grant Number RR017670 from the National Center for Research Resources (NCRR), a component of the National Institutes of Health (NIH). The views expressed in this publication do not necessarily reflect the official policies of the Department of Health and Human Services; nor does mention by trade names, commercial practices, or organizations imply endorsement by the U.S. Government.

General Texts

CAREY POPE

The layman, student, academician, or practicing toxicologist has a number of excellent texts that can serve as information resources for any and all aspects of toxicology. Many general texts have been updated over the last few years to incorporate recent advances, for example in the molecular understanding of toxic reactions and mechanisms. The general texts in toxicology can be concise (e.g., Timbrell's *Introduction to Toxicology*) or voluminous (e.g., the 14-volume work *Comprehensive Toxicology*). *Casarett and Doull's Toxicology*, currently in its seventh edition, remains the most complete single-volume resource for toxicological information. Some texts are written with the experimental scientist in mind, while others are written for the public health specialist, instructor, regulator, or the layman.

There are also a number of excellent scientific journals covering all aspects of general toxicology. Several of these journals are the official journals for professional societies including the U.S. Society of Toxicology (*Toxicological Sciences*), the British Society of Toxicology (*Toxicology*), the European Society of Toxicology (*Archives of Toxicology*), and the American College of Toxicology (*International Journal of Toxicology*). Many focus on publications dealing with mechanisms of toxicity. The *Archives of Toxicology* has the longest record of publication (since 1930) and those with the highest impact factors reported for the year 2007 include the review journal *Critical Reviews in Toxicology* (5.15) and *Chemical Research in Toxicology* (3.51), *Toxicology and Applied Pharmacology* (3.8) and *Toxicological Sciences* (3.81). What all of these texts and journals generally have in common is contributions from leaders in the field, providing a substantial resource to persons interested in up-to-date knowledge of how chemicals adversely affect living systems.

Resources are increasingly available on CD-ROM or as web-based material. Additional general texts may be found in specific subject areas such as clinical toxicology or risk assessment.

RESOURCES

Books

Aldridge WN (1996)
Mechanisms and Concepts in Toxicology
London, UK: Taylor and Francis.

Published in the year of his death, this introduction to toxicology by Norman Aldridge is a classic. The book is clearly written and well organized to cover how chemicals elicit toxicity in an easily understandable manner. Kinetics of chemical transport and metabolism, interactions with target molecules, selective toxicity, thresholds, biomonitoring, epidemiology, and environmental and ecotoxicology are covered with specific examples provided throughout. This book is an excellent, succinct overview for students of toxicology.

Anderson D, Conning DM (eds.) (1993)
Experimental Toxicology: The Basic Issues, 2nd edition
Cambridge, UK: Royal Society of Chemistry.

This text contains 25 chapters covering the methods of toxicity evaluations from animal husbandry to experimental design/statistics to experimental ethics. Early chapters focus on basic factors involved in conducting

toxicity evaluation considerations, e.g., physical nature of the toxicant to be studied, dosing routes and internal and external modifying factors (e.g., species, age, nutrition) while later chapters cover issues related to specific areas of toxicologic investigation (e.g., immunotoxicology, reproductive/teratogenesis, carcinogenicity) and integrative material such as risk assessment methodology and regulations/consulting services. While the second edition of *Experimental Toxicology: The Basic Issues* was published over a decade ago (1993), it remains an excellent overview of major issues related to conducting toxicity evaluations and the use of the data generated.

Ballantyne B, Marrs T, Syversen T (eds.) (2000)
General and Applied Toxicology, 2nd edition
London: Macmillan Reference LTD.

This in-depth collection (three volumes with over 2100 pages) has contributions from over 140 experts in the field. Volume 1 covers the 'basic science' of toxicology including chapters on fundamentals (e.g., dose–response), toxicokinetics, mechanisms of cell death, biotransformation, statistics, the toxicology of mixtures as well as chapters on techniques including pathology, clinical chemistry, and considerations of hazards in the laboratory. Volume 1 is also a wealth of information on the theoretical and practical importance of route of administration on toxicity. Volume 2 systematically covers mammalian organ system, genetic, reproductive, and developmental as well as environmental and wildlife toxicology. Volume 3 contains a remarkable amount of information on different specializations (e.g., occupational, industrial toxicology/hygiene, regulatory toxicology) and chapters on topics such as chemical terrorism, disasters, biomarkers, toxicology and the law, and others. Finally, specific agents are discussed in Volume 3 including food additives, pesticides, solvents, metals, warfare agents, and even animal toxins. An extensive subject as well as chemical index is included.

Bingham E, Cohrssen B, Powell CH (eds.) (2001)
Patty's Toxicology, 5th edition
New York: Wiley.

With eight volumes and over 1000 pages, this resource provides in-depth information on toxic hazards of chemicals primarily of industrial concern. *Patty's Toxicology* is a break-out of the original *Patty's Industrial Hygiene and Toxicology* originally published in 1948, which went through four editions. *Patty's Toxicology*, 5th edition, provides basic information on toxicologic principles, and detailed information regarding toxic actions of metals, aromatic hydrocarbons, organic nitrogen compounds, organic halogenated hydrocarbons, aliphatic carboxylic acids, ketones, alcohols, esters, epoxy compounds, glycol ethers, and synthetic polymers. This book is an essential resource for industrial toxicologists.

Boelsterli UA (2003)
Mechanistic Toxicology
London: Taylor and Francis.

This is an introductory text for both undergraduate and graduate students addressing mechanisms of toxicity. The book is clearly written, full of descriptive figures, and contains summary 'learning points' and suggested further reading material at the end of each chapter.

Derelanko MJ, Hollinger MA (eds.) (2002)
CRC Handbook of Toxicology, 2nd edition
Boca Raton, FL: CRC Press.

The 2nd edition of this handbook contains a plethora of toxicology-related facts of use to a variety of disciplines. Basic information is presented throughout in tables (over 500) and figures, minimizing text. Mammalian organ system toxicity is covered chapter-by-chapter in detail. There are eight separate chapters devoted to regulatory toxicology. New chapters cover aquatic toxicology, endocrine toxicology, consumer products, medical devices, and other topics. The *CRC Handbook of Toxi-cology* is one volume packed with useful information for experimenters, regulatory and consulting toxicologists alike.

Gilbert SG (2004)
A Small Dose of Toxicology
Boca Raton, FL: CRC Press
Web: www.asmalldoseof.org

This layman's introductory text on toxicology uses real-life context and simplification of scientific data for the non-scientist reader. *A Small Dose of Toxicology* also serves as a resource, however, for the toxicology student and instructor as well. The author provides a general primer in toxicology illustrated with well-known examples of chemicals including alcohol, caffeine, nicotine, pesticides, heavy metals, solvents, and radiation.

Hayes AW (ed.) (2007)
Principles and Methods of Toxicology, 5th edition.
Boca Raton, FL: CRC Press.

This single volume with over 1800 pages covers basic principles and selected toxic agents, but focuses on the description of methods in experimental toxicology. The 37 chapters provide a history of the field and an overview of toxicology principles, describes current testing

protocols for evaluation of various types of toxic responses, and provides guidance on the interpretation and analysis of toxicologic data. An extensive glossary and index is included. *Principles and Methods of Toxicology* remains a resource for both students and professionals.

Hodgson E, Levi PE (2004)
A Textbook of Modern Toxicology, 3rd edition
Stamford, CT: Appleton & Lange.

This updated edition of a classic textbook for graduate students provides a solid exposure to basic principles of toxicology, toxicant classes, biotransformation, generation and role of reactive metabolites, mechanisms of toxicity, organ system toxicity, toxicity testing methods, forensic and clinical toxicology, risk assessment, environmental toxicology, analytical methods, and other topics. A glossary is included.

Hodgson E, Mailman RB, Chambers JE (1998)
Dictionary of Toxicology, 2nd edition
London: Macmillan Reference.

Over 70 contributors provide concise explanations for more than 2000 of the most critical terms and concepts in toxicology. Chemical structures and chemical abstract services (CAS) numbers are provided for many toxic agents. Some important entries outside of toxicology provide context and relationships to other fields. The *Dictionary of Toxicology* serves as a resource for toxicologists and non-toxicologists and facilitates the standardization of terminology.

Josephy PD, Mannervik B (2006)
Molecular Toxicology, 2nd edition
New York: Oxford University Press.

This book focuses on the molecular basis of biotransformation and toxicity of chemicals. The second edition of *Molecular Toxicology* is organized into three parts, Toxicity at the Cellular Level (Part 1), Enzymology of Biotransformation (Part 2) and Molecular Principles Applied to Specific Toxicants (Part 3). In Part 3, the molecular basis of toxicity is described using examples including alkylating agents, methemoglobinemic agents, aromatic amines, polycyclic aromatic hydrocarbons, and acetaminophen.

Kent C (1998)
Basics of Toxicology
New York: John Wiley.

Basics of Toxicology is designed as a text for undergraduate environmental technology students. It provides an overview of anatomy, physiology and chemistry information in the context of an introduction to toxicology. 'Sidebars' are included to emphasize critical concepts. A glossary and bibliography are included.

Klaasen CD (ed.) (2008)
Casarett & Doull's Toxicology: The Basic Science of Poisons, 7th edition
New York: McGraw-Hill.

The most-recognized and comprehensive resource for toxicologists, the 7th edition of *Casarett & Doull's Toxicology: The Basic Science of Poisons* has over 1300 pages and contributions from over 50 experts in the field. All major topics of toxicology are covered from history to principles to applications. The book is organized into 33 chapters covering general principles (1–4), disposition (5–7), non-organ directed toxicity (e.g., carcinogenesis, 8–10), target organ toxicity (11–21), specific classes of agents (22–27), environmental toxicology (28, 29), and applications (e.g., regulatory toxicology, 30–33). The 7th edition contains more up-to-date coverage of advances in the molecular basis of toxicology. This book remains an essential text for any individual interested in toxicology.

Lewis RA (1998)
Lewis' Dictionary of Toxicology
Boca Raton, FL: Lewis.

This dictionary contains over 1100 pages of brief definitions for common terms used in toxicology. There is extensive cross-referencing but no illustrations. This book is a resource for students and professionals.

Loomis TA, Hayes AW (1996)
Loomis's Essentials of Toxicology, 4th edition
San Diego, CA: Academic Press.

Loomis's Essentials of Toxicology is a brief, general overview of toxicology. It includes discussion of the major classes of toxicants, general properties of chemicals and how they interact with biological systems, methods used to demonstrate toxic responses and the basis for diagnosis and treatment of toxic responses in humans. Examples or case studies are used throughout for demonstration. *Loomis's Essentials of Toxicology* is clearly written and can serve as an excellent introduction to toxicology for both undergraduate and graduate students.

Lu FC, Kacew S (2002)
Lu's Basic Toxicology, 4th edition
New York: Taylor & Francis.

This is an excellent overview of toxicology for students taking toxicology courses or for scientists in related disciplines. The book is organized into four parts with 25 chapters: Part I (general principles of

toxicology), Part II (testing procedures for conventional and non-target organ toxicities), Part III (target organs and systems), and Part IV (toxic substances and risk assessment).

Marquardt H, Schafer S, McClellan RO, Welsch F (eds.) (1999)
Toxicology
San Diego, CA: Academic Press.

Toxicology is a comprehensive text covering principles/fundamentals of toxicology, organ toxicity as well as chemical classes, toxicokinetics, biotransformation, targets, applications, and environmental toxicology. Emphasis is placed on specific areas including risk assessment, mechanisms of cell death, and methodological approaches. *Toxicology* has excellent illustrations throughout. It is organized into six parts with 52 chapters and over 1200 pages. An appendix includes valuable information including reference doses, drinking water standards, and values.

Massaro EJ (ed.) (1997)
Handbook of Human Toxicology
Boca Raton, FL: CRC Press.

Handbook of Human Toxicology contains over 1100 pages organized into five sections: metals toxicology, nutritional toxicology, inhalation toxicology, immunotoxicology, and reproductive and developmental toxicology. The text effectively uses tables and figures to summarize important concepts. Each section contains complete reference lists.

Niesink RJM, de Vries J, Hollinger MA (1996)
Toxicology: Principles and Applications
Boca Raton, FL: CRC Press.

The text of *Toxicology: Principles and Applications* was developed from a course administered through the Open University of the Netherlands. This book containing over 1200 pages and 200 tables focuses on basic principles and concepts of toxicology. Extensive illustrations are included throughout. Each of the chapters (fundamental principles, molecular aspects of toxicity, organ toxicology, organs involved in absorption and elimination, organs involved in maintaining homeostasis, and applications) constitutes a study unit with an individual table of contents, introduction, learning 'core', self-assessment questions and answers, feedback, and summary. A final examination is included at the end of the book that covers the entire 'course'. A list of abbreviations, formula index, glossary, and overall index is included. While it has been over a decade since publication and some areas are necessarily not up-to-date, this book is still a useful learning resource for students and instructors of toxicology.

Ostler NK, Byrne TE, Malachowski MJ (1996)
Health Effects of Hazardous Materials
New York: Macmillan.

This book is intended as an introduction to toxicology for environmental technicians. Topics covered include origin and classification of toxic agents, ADME, target organ toxicity, environmental toxicology, radiation, and common industrial hazards.

Ottoboni MA (1997)
The Dose Makes the Poison: A Plain Language Guide to Toxicology, 2nd edition
Hoboken, NJ: Wiley.

This book is a layman's introduction to toxicology. The author discusses factors and concepts (e.g., dose–response) important in understanding how chemicals elicit toxicity. The second edition covers public distrust of science, epidemiology, reproductive toxicology, and risk assessment relative to current environmental problems. No-effect levels and thresholds, margins of safety, and bioaccumulation are discussed in a clear-cut, easily understandable manner.

Schiefer HB, Irvine DG, Buzik SC (1997)
Understanding Toxicology: Chemicals, Their Benefits and Risks
Boca Raton, FL: CRC Press.

Understanding Toxicology: Chemicals, Their Benefits and Risks is another layman's introduction to toxicology. It provides a concise (160 pages), general overview of the principles of toxicology. This book is for non-toxicologists interested in chemical safety, real and perceived toxic risks, hazardous wastes, and common hazards around the home, at work, and in the environment.

Sipes IG, Gandolfi AJ, McQueen CA (eds.) (1997, 2002)
Comprehensive Toxicology
New York: Pergamon.

This extensive collection of toxicologic information covers the breadth of all subdisciplines of the field. *Comprehensive Toxicology* was published as 13 volumes (with Volume 13 being an index) in 1997, while an update (Volume 14, Cellular and Molecular Toxicology) was published in 2002. While early volumes cover principles (Volume 1), testing (Volume 2), and biotransformation (Volume 3), the remaining volumes are primarily organized by organ system effects. With contributions from leaders in the field, this collection serves as an extensive resource for the spectrum of toxicology interests.

Stine KE, Brown TM (2006)
Principles of Toxicology, 2nd edition
Boca Raton, FL: CRC Press.

Principles of Toxicology is an introduction to toxicology organized by systems: molecular and cellular, physiological, and environmental and ecological. The format is somewhat different from other introductory texts in that toxicity testing and risk assessment are discussed early on (Chapter 1). Subsequent chapters cover toxicokinetics, biotransformation, cellular mechanisms, genomics, non-target system toxicity, organ system toxicity, and applications. Some case studies are included as well as a brief appendix with chemical structures of some of the toxicants discussed.

Timbrell J (1997)
Study Toxicology through Questions
London: Taylor & Francis.

This concise book (160 pages) provides a substantial set of short answer, problem-solving, data interpretation, and multiple choice questions (and their answers) covering all major areas of toxicology including mechanisms, types of toxic responses, modifying factors, biotransformation, disposition, and others. *Study Toxicology through Questions* can be a valuable resource for exam preparation and review, for both students and instructors.

Timbrell JA (2002)
Introduction to Toxicology, 3rd edition
London: Taylor & Francis.

Introduction to Toxicology is an excellent text for the introductory toxicology class. It is organized into 12 chapters. Chapters 1–4 provide an introduction with history of toxicology, and discuss disposition, biotransformation, and types of exposures and toxic responses. Chapters 5–11 cover different classes of toxicants including drugs, industrial chemicals, food additives, pesticides, environmental contaminants, and both natural and household products. The final chapter is devoted to toxicity testing and risk assessment. Each chapter has a summary, learning objectives and sample questions. The answers to all questions are provided at the end of the book along with an appendix. Thus, this text is an excellent learning resource for the beginning toxicology student.

Wexler P (2005)
Encyclopedia of Toxicology, 2nd edition
Oxford, UK: Elsevier.

The *Encyclopedia of Toxicology* is a four-volume compendium of over 3000 pages, with topics arranged alphabetically and covering all aspects of the field including principles and concepts, specific toxicants, types of responses and their mechanistic basis, federal and international regulations, toxicological societies and more. This work was designed primarily as a resource for the non-toxicologist, but is a valuable source of information for students and professionals in toxicology as well. The encyclopedia is extensively indexed and cross-referenced and contains an extensive glossary.

Woolley A (2003)
A Guide to Practical Toxicology: Evaluation, Prediction, and Risk
London: Taylor & Francis.

As the title implies this book is a practical guide to toxicity testing methods and interpretation of results. Initial chapters address the principles of toxicology and then proceed with examining testing methods from in vitro testing, animal testing, and relevance to human testing. Case studies are used to illustrate study design and methods, interpretation, and risk assessment.

Journals

Archives of Toxicology (1930–)
Berlin/Heidelberg, Germany: Springer.
Web: http://www.springer.com/west/home/biomed?SGWID=4-124-70-1018484-0

Archives of Toxicology emphasizes studies related to mechanisms of toxicity, including toxic activities at the molecular level, in humans and experimental animals. Articles in toxicokinetics, forensics, and new analytic methods as well as review articles of general interest are also published.

Chemical Research in Toxicology (1988–)
Washington, DC: American Chemical Society.
Web: http://pubs.acs.org/journals/crtoec/index.html

Chemical Research in Toxicology is an international journal publishing articles focused on the chemical basis of toxicological responses, e.g., identification of novel toxic agents and reactive intermediates, development of new methods to detect chemical-induced modification of biological macromolecules, studies of alteration of macromolecular structure and function by chemical agents, experimental and theoretical studies of chemical factors that control reactivity with macromolecules, and biotransformation as it relates to biological effects.

Critical Reviews in Toxicology (1971–)
Philadelphia, PA: Taylor and Francis.
Web: http://www.tandf.co.uk/journals/titles/10408444.asp

Critical Reviews in Toxicology publishes reviews of timely and critical topics related to mechanisms, toxic

responses, and assessment of toxicants including chemicals such as industrial chemicals, pesticides, pharmaceutical agents, consumer products (e.g., food additives), and environmental contaminants. Particular attention is given to cancer and developmental effects as responses of special societal concern.

Human and Experimental Toxicology (1990– formerly Human Toxicology)
London: Sage Publications.
Web: http://www.sagepub.co.uk/journalsProdDesc.nav?prodId=Journal201813

Human and Experimental Toxicology publishes experimental and clinical studies of chemical-induced functional, biochemical, and structural alterations. The journal emphasizes studies on causes, antidotes, and therapeutic strategies of chemical-induced disease. Both original and review articles are published.

International Journal of Toxicology (1997– formerly *Journal of the American College of Toxicology*)
Philadelphia, PA: Taylor and Francis.
Web: http://www.tandf.co.uk/journals/titles/10915-818.asp

This journal publishes studies on the assessment of toxic hazards of industrial chemicals, pharmaceutical agents, environmental contaminants, and other entities. Emphasis is placed on mechanisms of action relevant to human health. Topics of particular interest include mechanisms of toxicity, risk assessment and safety evaluation, carcinogenicity, reproductive and genetic toxicology, epidemiology and clinical toxicology, new approaches to toxicological testing, alternatives to animal testing and safety/regulatory toxicology.

Journal of Applied Toxicology (1981–)
Hoboken, NJ: Wiley.
Web: http://www.wiley.com/WileyCDA/WileyTitle/productCd-JAT.html

The *Journal of Applied Toxicology* publishes original research, theoretical and literature reviews relating to the toxicity of drugs and chemicals at the molecular, cellular, tissue, and target organ level. Topics include teratogenesis, carcinogenesis, mutagenesis, pharmacokinetics, environmental toxicology and environmental health, analytical/method development studies, and in vitro techniques/alternatives to animal use.

Journal of Toxicological Sciences (1976–)
Japanese Society of Toxicology.
Web: http://www.jtoxsci.org/

This journal publishes studies evaluating toxicity of drugs, food additives, food contaminants, environmental pollutants and other substances, and their mechanisms, biological responses, safety evaluation, experimental techniques, and analytical methods. Original articles, letters, reports, and reviews are published.

Journal of Toxicology and Environmental Health
Philadelphia, PA: Taylor & Francis.
Web: http://www.tandf.co.uk/journals/titles/15287394.asp
Web: http://www.tandf.co.uk/journals/titles/10937404.asp

Journal of Toxicology and Environmental Health is published in two parts, Part A (Critical Issues, i.e., original research articles) and Part B (Critical Reviews, invited and unsolicited review articles). Part A publishes refereed original research in environmental toxicology in general, as well as areas including target organ toxicity, immunotoxicology, risk assessment, carcinogenesis, mutagenesis, ecotoxicology, environmental factors affecting health, epidemiology, and aquatic toxicology. Part B publishes in-depth reviews on the same topics as emphasized in Part A.

Toxicological Sciences (1998– formerly *Fundamental and Applied Toxicology*)
Oxford, UK: Oxford University Press.
Web: http://www.oxfordjournals.org/our_journals/toxsci/about.html

Toxicological Sciences publishes peer-reviewed, hypothesis-driven, original research articles in all areas of toxicology including structural, biochemical, or functional effects, mechanisms of toxicity, effects of dose, route of exposure, metabolism, or species on toxic responses, statistical or mechanism-based approaches to risk assessment and development of new methods in toxicology.

Toxicology (1973–)
Amsterdam, the Netherlands: Elsevier.
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/505518/description?navopenmenu=-2

Toxicology is an international journal publishing original articles in all aspects of adverse effects of xenobiotics health of humans, animals, and ecosystems. Emphasis is placed on toxic effects observed at relevant exposure levels with direct impact on safety evaluation and risk assessment practices.

Toxicology and Applied Pharmacology (1959–)
Amsterdam, the Netherlands: Elsevier.
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/622951/description?navopenmenu=-2

Toxicology and Applied Pharmacology publishes original articles on toxic actions of chemicals, drugs, or natural products in animals or humans, with emphasis on mechanistic approaches to physiological, biochemical, cellular, or molecular understanding of toxicologic/pathologic lesions.

Toxicology Letters (1977–)
Amsterdam, the Netherlands: Elsevier.
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/505519/description?navopenmenu=-2

Toxicology Letters publishes studies in all areas of toxicology, with an emphasis on rapid publication of research letters having sufficient importance, novelty, and breadth of interest. Papers presenting hypotheses/commentaries addressing current issues of immediate interest as well as mini-reviews are published. Information on forthcoming meetings, symposia, and workshops is also included.

Website

A Small Dose of Toxicology
Steven G. Gilbert/Institute of Neurotoxicity and Neurological Disorders
Web: http://www.asmalldoseof.org/SmDs.poster.03.28.06.pdf

This website contains a remarkable amount of information and resources on the general principles of toxicology and specific material on neurotoxicants and neurological disease. Powerpoint presentations, figures, diagrams, and other online materials represent a great resource for the instructor in general toxicology courses.

CHAPTER

6

Analytical Toxicology

KELLI SELFE AND SHAYNE GAD

INTRODUCTION

Analytical toxicology is the use of the entire range of qualitative and quantitative chemical, immunochemical, and physical techniques used in sample preparation, separation, assay calibration, detection and identification, and quantification for the purposes of toxicological research and testing. Examples of the objectives of such analysis include:

- Determining the levels of exposure to potential toxicants via air, water, or food.
- Verifying exposure levels to doses for animals in experimental studies.
- Determining levels of xenobiotics and their metabolites in animal studies.
- Screening blood and urine for the presence of illicit drugs or their metabolites.
- Screening blood, urine, and tissues for the presence of toxic drugs, agents, or their metabolites.
- Measuring levels of endogenous compounds and molecules to evaluate organ function and damage (clinical chemistry).
- Identifying metabolites and macromolecular adjuncts to identify mechanisms of action.

The diagnosis and treatment of health problems induced by chemical substances and the closely allied field of therapeutic drug monitoring rely on analytic toxicology. Advances in analytic toxicology have added both power and problems to toxicology, with the increases in sensitivity and specificity. Although the analytes are present in matrices identical or similar to those seen in forensic toxicology, the results must be reported rapidly to be of use to clinicians in treating patients. The requirement of a rapid turnaround time limits the number of chemicals that can be measured because methods, equipment, and personnel must all be available for an instant response to toxicological emergencies. Investigations for an 'unknown' drug or poison are usually carried out on specimens of urine, blood, or specific tissues.

Related Topic

Forensic toxicology.

RESOURCES

Books

Baselt RC (2004)
The Disposition of Toxic Drugs and Chemicals in Man
Foster City, CA: Chemical Toxicology Institute.

A single source providing an extensive compilation on the disposition of over 640 drugs and chemicals most frequently encountered in episodes of human poisoning. The data relate to the body fluid concentrations of substances in normal or therapeutic situations, concentrations in fluids and tissues in instances of toxicity and the known metabolic fate of these substances in man. Each drug/chemical is broken down into: Occurrence and Usage; Blood Concentrations; Metabolism and Excretion; Toxicity; and Analysis. This 7th edition has been expanded with an additional 139 drugs or chemicals including a number of animal toxins, antibiotics, antidepressants, antidiabetics, antifungal agents, antihyperlipidemic drugs, antineoplastic drugs, antiseptics,

antiviral agents, diuretics, herbal medicines, herbicides, laxatives, solvents, sedative-hypnotics, pesticides, and drugs used to treat Alzheimer's disease.

Botsoglou NA, Fletouris DJ (2001)
Drug Residues in Foods
New York: Marcel Dekker, Inc.

A volume in the Food Science and Technology series which focuses on veterinary drug residues in food products, their toxicity and analysis.

Bradenberger H, Maes RAA (ed.) (1997)
Analytical Toxicology for Clinical, Forensic and Pharmaceutical Chemists (Clinical Biochemistry)
Berlin, Germany: Walter de Gruyter & Co.

This book will be of use to clinical and forensic toxicologists as well as to pharmacists involved in analytical work. The critical evaluations of the analytical possibilities may help with the choice of methods, the additional information with the determination of the goals of an investigation and the interpretation of its results. In addition to all the analytical and toxicological information the book contains, it also tries to teach the analytical toxicologist to place his technical obligations into a larger context.

Flanagan RJ (2005)
Developing Analytical Toxicology Services: Principles and Guidance
Geneva, Switzerland: WHO/ILO/UNEP.

Flanagan RJ, Braithwaite RA, Brown SS, Widdop B, Wolff FA (eds.) (1995)
Basic Analytical Toxicology
Geneva, Switzerland: World Health Organization.

The aim of this manual is to help hospital laboratories in developing countries to provide a basic analytical toxicology service using a minimum of special apparatus. It is not intended to replace standard texts, but to provide practical information on the analysis of a number of substances frequently involved in acute poisoning incidents. Common pitfalls and problems are emphasized throughout, and basic health and safety precautions for laboratory workers are also discussed.

Gad SC, Wexler P, Anderson BD, et al (eds.) (2005)
Analytical toxicology. In: ***Encyclopedia of Toxicology*** pp. 113–116.
Oxford, UK: Elsevier Inc.

Overview of the definition of analytical toxicology as well as analysis of common toxic substances and analytical techniques.

Gupta SK, Singh U, Velpandian T (eds.) (2002)
Analytical Toxicology for Poisoning Management and Toxicovigilance
New Dehli, India: Narosa Publishing House.

This text covers services of the analytical toxicology laboratory, from common general emergency medicine to specialized treatment units. It defines procedures for critical quantitative analysis in treating acute poisoning cases and is a useful reference for those in poisoning diagnosis, case management, and prevention.

Sue Jickells, Adam Negrusz (eds.) (2008)
Clarke's Analytical Toxicology
London: Pharmaceutical Press.

Mieczkowski T (ed.) (1999)
Drug Testing Technology: Assessment of Field Applications (Methods in Analytical Toxicology)
Boca Raton, FL: CRC Press.

This book covers a wide range of research currently being done in drug analysis, *Drug Testing Technology: Assessment of Field Applications* compares and evaluates various methods used to determine abused drugs taken by individuals. Chapters provide overviews of drug incorporation into hair; the use of hair analysis for compliance measurement in the use of anti-epileptic medications; and the application of drug testing to the psychiatric treatment of substance abuse disorders.

Moffat AC, Osselton MD, Widdop B (2004)
Clarke's Analysis of Drugs and Poisons, 3rd edition
London: Pharmaceutical Press.

This is a two-volume reference set previously known as *Clarke's Isolation and Identification of Drugs*, this practical manual and standard reference work provides the definitive source of analytical data for drugs and poisons. It is intended for use primarily by scientists faced with identifying and quantifying these substances in body fluids, tissue samples, and pharmaceutical and industrial products. Volume 1 includes 31 chapters covering all practice areas and analytical procedures in analytical toxicology as well as applications of analytical toxicology techniques, Volume 2 includes 1730 drug monographs.

NIOSH Manual of Analytical Methods, 4th edition (NIOSJ Manual of Analytical Methods), (1994)
Web: http://www.cdc.gov/niosh/nmam/

Satinder A, Scypinski S (2001)
Handbook of Modern Pharmaceutical Analysis
San Diego, CA: Academic Press.

A modern text on methodology for the analysis of pharmaceutical active ingredients and formulations.

Wong Steven HY, Irving Sunshine (eds.) (1997)
Handbook of Analytical Therapeutic Drug Monitoring and Toxicology
Boca Raton, FL: CRC Press.

This volume facilitates searches for appropriate techniques, describes recent contributions from leading investigators, and provides valuable evaluations and advice. Discover how to use non-invasively obtained specimens to your best advantage. The text features alternative biological specimens such as hair, meconium, saliva, sweat, and vitreous humor, which are not extensively used because they require more sensitive procedures than other biological specimens. How to overcome these limitations is a major topic of the handbook. Experts describe basic principles of innovative techniques and detail how they can be adapted to analyzing alternative biological specimens. The evaluations of the pros and cons of various advances in immunodiagnostics and how they apply to analytes will help you determine their suitability to your own laboratory. The *Handbook of Analytical Therapeutic Drug Monitoring and Toxicology* helps you make the most of innovative procedures that will open the doors to productive laboratory practices.

Venn RF (2000)
Principles and Practice of Bioanalysis
Philadelphia, PA: Taylor and Francis.

A modern text on methodology for the analysis of active pharmaceutical ingredients and their metabolites in biological matrices.

Database

The NIOSH Manual of Analytical Methods (NMAM®)

The NIOSH Manual of Analytical Methods database is a compilation of methods for sampling and analysis of contaminants in workplace air, and in the bodily fluids of workers who are occupationally exposed to that air. These methods have been developed specifically to have adequate sensitivity to detect the lowest concentrations and sufficient flexibility of range to detect concentrations exceeding safe levels of exposure, as regulated by OSHA and recommended by NIOSH. The Threshold Values (TLV™) and Biological Exposure Indices (BEI™) of the American Conference of Governmental Industrial Hygienists (ACGIH) are also cited.

Animals in Research

ELIZABEHT NORFLEET, AND SHAYNE GAD

INTRODUCTION

The use of animals in experimental medicine, pharmacological study, and toxicological assessment is a well-established and essential practice. It forms the basis of regulatory requirements for evaluating and establishing the safety of drugs, medical devices, agricultural chemicals, and food additives. Whether serving as a source of cells or tissues for culturing, a disease model, or as a prediction for drug or other xenobiotic action in humans, experiments in animals have provided the necessary building blocks that permitted the explosive growth of medical and biological knowledge in the latter half of the twentieth century. Animal experiments also have served rather successfully as identifiers of potential hazards to and toxicity in humans for synthetic chemicals with many intended uses.

Animals have been used as predictive models for centuries to what chemicals and environmental factors would do to humans. The earliest uses of experimental animals are lost in prehistory, and much of what is recorded in early history about toxicology testing indicates that humans were the test subjects. The earliest clear description of the use of animals in the scientific study of the effects of environmental agents appears to be by Priestley (1792) in his study of gases.

The knowledge gained by experimentation on animals has undoubtedly increased the quality of our lives; however, as is the case with many tools, animals have sometimes been used inappropriately. This has encouraged a measure of critical self-appraisal on the part of scientists concerning the issues of the care and usage of animals. The Society of Toxicology and American College of Toxicology, for example, have established Animals in Research committees, and has published guidelines for the use of animals in research and testing. In general, the purpose of this committee is to foster thinking on the four 'Rs' of animal-based research: reduction, refinement, research into replacements, and responsible use.

Globally, regulation of laboratory animal care started in the 1960s, and the United States initially passed the Animal Welfare Act (AWA) in 1966 (amended to date in 1970, 1976, 1985, 1990 and 2002).

RESOURCES

Books

Bennett BT, Abee CR, Henrickson R (ed.) (1995)
Nonhuman Primates in Biomedical Research: Biology & Management Volume I (American College of Laboratory Animal Medicine)
San Diego, CA: Academic Press.

This volume and its companion *Nonhuman Primates in Biomedical Research: Biology and Management* represent the most comprehensive publications of their type on non-human primates. This volume addresses the diseases of non-human primates with an emphasis on the etiological factors, clinical signs, diagnostic pathology, therapy, and management. Its companion volume serves as a general reference for those who provide care for these animals and for those who use them in biomedical research.

Festing MFW, Overend P, Das RG, Borja MC, Manuel Berdoy (2002)
The Design of Animal Experiments: Reducing the Use of Animals in Research Through Better Experimental Design (Laboratory Animal Handbooks)
London, UK: Royal Society of Medicine Press.

This book covers especially the interface between laboratory animal science and experimental design and is written by British biostatisticians with excellent training in animal experiments.

Fox JG, Anderson LC, Loew FM, Quimby FW (eds.) (2002)
Laboratory Animal Medicine, Second Edition (American College of Laboratory Animal Medicine)
San Diego, CA: Academic Press.

A volume in the American College of Laboratory Animal Medicine series, this second edition has over 40% new material, including the addition of six new topics and many others that are completely rewritten. The book comprehensively covers the biological and disease aspects of laboratory animal medicine while examining other aspects such as the biohazards associated with the use of animal experimentation and factors complicating the bioethics of animal research.

Gad SC (2007)
Animal Models in Toxicology, 2nd edition
Boca Raton, FL: CRC Press.

Reflecting a decade's worth of changes, this second edition is a practical guide to the common statistical problems encountered in toxicology and the methodologies that are available to solve them. The book presents a historical review of the use of animal models used in toxicology and an overview of broad considerations of metabolism and its relevance. Chapters covering the eight major species used in toxicology and experimental biology form the core of the book. With contributions from experts in toxicology, toxicological pathology, and species-specific metabolism, each of these chapters provide an excellent introductory 'course' along with guidance to the literature for more detailed understanding.

Jeppsson I (1997)
Animal Modelling in Surgical Research
Malma University Hospital, Uppsala, Sweden: Harwood Academic Publishers.

This book clearly describes animal models used in gastrointestinal, vascular, endocrine, urologic, central nervous system, and transplantation surgery research and highlights their relevance to the study of human disease. Tumor models are also described, including those of the gastrointestinal tract and breast. The fundamental differences between various animal species and the implications for the choice of animal model are explored in an opening chapter on comparative biology, while a system-by-system approach ensures complete coverage of the models used in different surgical fields.

Shafrir E, Sima Anders AF (2000)
Animal Models of Diabetes: Frontiers in Research, 2nd edition
Boca Raton, FL: CRC Press.

This most recent edition of *Animal Models of Diabetes* provides researchers with updated and expanded information regarding the use of models in experiments with both Type 1 and Type 2 diabetes. It compiles relevant time-saving information on most, if not all, current well-recognized models for both types of diabetes, including various mice, rats, minipigs, and Rhesus monkeys, and provides extensive references for more in-depth study. Among several other topics, it discusses nutritionally diabetes-prone animals, and considerations of insulin resistance and obesity. It also addresses the importance of recent findings on pathogenesis of diabetes and its complications in relation to human disease.

Swearengen James R (ed.) (2005)
Biodefense: Research Methodology and Animal Models
Boca Raton, FL: CRC Press.

To ensure that efforts to improve our biodefensive capabilities continue in an efficient manner, this volume presents a thorough review of biodefense research, encouraging researchers to leverage relevant results, rather than duplicate them. Thus, scientists will be able to make the best use of resources and avoid duplication. With contributions from those who have developed the animal models presented, this book examines bacterial, viral, and toxic agents considered to pose the greatest threat. Each section on a specific agent provides background, followed by a description of those animal models employed in research, and a discussion of how the findings translate to human impact.

Tatlisumak T, Fisher M (eds.) (2006)
Handbook of Experimental Neurology: Methods and Techniques in Animal Research
Cambridge, UK: Cambridge University Press.

Basic relevant information on methodologies used in neurological disease models can be extremely hard to find. This major new reference work contains 30 chapters from over 60 internationally recognized scientists and covers every major methodology and disease model used in current neuroscience research. Divided into two major sections, the first deals with general

methodologies in neuroscience research covering topics from animal welfare and ethical issues to surgical procedures, post-operative care and behavioral testing. Section two covers every major disease model including traumatic brain injury, ischemia and stroke, to Parkinson's disease, epilepsy, and sleep disorders. Delivering critical, up-to-the-minute, methodological information and describing small animal models for almost all major neurological diseases, this book forms an essential reference for anyone working in neuroscience, from beginning students to experienced researchers and medical professionals.

Woodhead AD (1989)
Nonmammalian Animal Models for Biomedical Research
Boca Raton, FL: CRC Press.

This book provides essential knowledge and information required to adequately assess useful alternatives from among the lower vertebrates and the invertebrates. This volume highlights unfamiliar and underdeveloped organisms that have the potential to become very satisfactory surrogates for biomedical research. A practical guide aimed at disseminating information to researchers about new models, this work provides comparative biomedical studies at many levels of the phylogenetic ladder.

CHAPTER

8

Biomarkers

CECILE M. KREJSA AND JEREMY A. FREEMAN

INTRODUCTION

Drug development scientists are increasingly turning to data-rich technologies ('-omics') to describe the activity of their drugs in biological systems. These methods provide more refined information about the role of drug targets in biomolecular pathways, the specific responses of molecular targets and pathways to drug exposure, and the subset of patients that express certain targets and are likely to respond favorably to a given therapy. At the same time, industry and regulatory agencies have developed initiatives to increase the use of biomarkers in drug development, both to increase the information available for decision-making and to speed the process by aiding in patient selection and response monitoring. Thus biomarker studies have emerged as a rapidly growing field in drug discovery and development sciences over the past few years.

In drug development, a biomarker is an objectively measurable characteristic that relates to normal biological processes, pathogenic processes (disease status), anatomic measurements, or pharmacological responses to therapeutic intervention. Thus a large variety of measurable endpoints can be biomarkers, including clinical laboratory results, data from disease-specific diagnostic tests, in vivo imaging results, and data from intervention-specific assays designed to capture pharmacodynamic responses to treatment. Additionally, genotypes that predict certain phenotypes, such as polymorphisms in drug-metabolizing enzymes or drug targets, may be analyzed. Biomarkers are used for multiple purposes, including mechanistic investigations, early assessment of both beneficial and adverse responses, selecting patient subsets based on predicted responses, or defining alternate response endpoints (surrogate endpoints).

Due to the diversity of these experimental approaches and applications, a mix of expertise will be required to appropriately design a biomarker strategy for the many phases of drug development. Toxicological studies might incorporate pharmacodynamic biomarkers, toxicogenomic and/or proteomic endpoints, and a mixture of clinical pathology and flow cytometry assays. Proof-of-concept studies might incorporate in vivo imaging as a complement to tissue-based response monitoring; and clinical trials could be designed to include a subset of the response biomarkers developed in preclinical studies, in addition to disease diagnostics, tests for therapeutic target, and genetic polymorphism analysis.

The expected use of each biomarker will define its need for qualification; as development progresses from discovery to the clinic, the inclusion of certain types of biomarkers may not be feasible. Ultimately, the goal of incorporating biomarkers in drug development is to provide information suitable for decision-making along the way. In a subset of cases, the development and validation of a new clinical diagnostic assay might become an integral part of the drug development process.

Many new biomarkers have emerged from toxicological investigations, as mechanistic toxicologists have applied gene expression analysis and proteomic techniques to study drug-induced toxicities. Likewise, progress has been made to relate data from studies of model toxicants to the application of composite (profile) markers in mechanistic models for drug effects.

Pathway analysis tools have proven useful in interpreting multivariate data, both to clarify the mechanisms of toxicity and to aid in identification of biomarkers that are likely to be found in accessible tissues.

Biomarker development will benefit from the cross-functional communication about novel discovery methods and the successful translation of these approaches to preclinical and clinical investigations. Thus, this chapter on information resources in toxicology represents a mix of various and complementary views on the subject. The goal of this chapter is to introduce these perspectives, which include both general and specialized texts, in-depth reviews from subject area experts and a number of useful online resources for research and regulatory applications. Due to the multidisciplinary nature of the topic, a comprehensive listing of all information resources is not possible; however we feel that the compiled list will serve to address the diverse aspects of biomarker discovery and application, and to illustrate the growing role for biomarkers in drug development.

RESOURCES

Books

General

Bloom J, Dean RA (eds.) (2003)
Biomarkers in Clinical Drug Development
London, UK: Informa Healthcare.

This publication presents the various applications of biomarkers in clinical drug development and research, including pharmacokinetic/pharmacodynamic modeling and clinical trial simulation.

Burczynski ME, Rocket JC (eds.) (2006)
Surrogate Tissue Analysis: Genomic, Proteomic and Metabolomic Approaches
Boca Raton, FL: CRC Press, Taylor & Francis Group, LLC.

This book addresses the major technologies being applied to biomarker discovery and provides examples of their application to clinically accessible tissues. Chapters address technical issues such as tissue suitability and sample handling, as well as regulatory considerations.

DeCaprio AP (ed.) (2006)
Toxicologic Biomarkers
Boca Raton, FL: Taylor & Francis Group, LLC.

This text includes diverse examples of biomarker applications in toxicology, including preclinical drug safety assessment, environmental, occupational, and public health. Chapters on biomarker validation and statistical analysis of biomarker data are included.

Nakamura RM, Grody WW, Wu JT, Nagle RB (eds.) (2004)
Cancer Diagnostics: Current and Future Trends
Totowa, NJ: Humana Press.

This broad reference surveys the state of the art in cancer diagnostic technology, including serum markers, cell-based analysis, use of sentinel lymph node, mutation, microsatellite, and translocation analysis, and histopathological diagnostics based on molecular changes. The use of multiparameter markers such as gene expression analysis for classifying tumors is discussed.

Rogge MC, Taft DR (eds.) (2006)
Preclinical Drug Development
Boca Raton, FL: Taylor & Francis Group, LLC.

This comprehensive reference covers all major aspects of preclinical drug development. Chapters provide detail from a large number of examples, including use of biomarkers in species and model selection, assessment of pharmacologic activity, interpretation of toxicology and pathology findings, and dose selection for clinical trials.

Taylor DL, Haskins JR, Guiliano KA (eds.) (2007)
High Content Screening
Totowa, NJ: Humana Press.

With its largely methodological focus, this book provides guidance for researchers performing mechanistic toxicology and in vitro pharmacology studies. Many of the high-throughput and high-content techniques described are suitable for further investigation of pathways related to candidate biomarkers.

Trull AW, Demers LM, Holt DW, et al (eds.)
Biomarkers of Disease: An Evidence-Based Approach
Cambridge, UK: Cambridge University Press.

A clearly written text with near-encyclopedic coverage of clinically applied biomarkers of disease in the major organ systems, this handbook also covers composite biomarkers used as diagnostic criteria. Informative chapters on statistical evaluation of biomarkers and the concepts of evidence-based medicine are included.

Proteomics

The field of proteomics is changing so rapidly, that it is difficult to suggest a reference book that will not be outdated within a year. Nevertheless, in order to gain an understanding of the scope of the field, the

following texts will shed some light on this rapidly developing field.

Hamacher M, Marcus K, Stühler K, et al (eds.) (2006)
Proteomics in Drug Research
Weinheim, Germany: John Wiley & Sons, Inc.

Hamdan MH, Pier G, Righetti PG (2005)
Proteomics Today: Protein Assessment and Biomarkers Using Mass Spectrometry, 2D Electrophoresis, and Microarray Technology
Hoboken, NJ: John Wiley & Sons, Inc.

Daniel C Liebler (ed.) (2004)
Proteomics in Cancer Research
Hoboken, NJ: John Wiley & Sons, Inc.

Liu B (ed.) (2007)
Tissue Proteomics: Pathways, Biomarkers, and Drug Discovery
Totowa, NJ: Humana Press, Inc.

Flow Cytometry

Darzynkiewicz Z, Roederer M, Tanke HJ (eds.) (2004)
Cytometry, 4th edition: New Developments Methods in Cell Biology, Vol. 75
San Diego, CA: Elsevier Academic Press.
Web: http://www.darzynkiewicz.com/zbigniew/books/cytometry/preface.htm

Provides updated methods and examples for commonly used flow cytometry analyses, including chapters describing appropriate analysis and presentation of multivariate data. Bead array assays, cell cycle analysis, apoptosis and functional flow cytometry assays are described.

Haugland RP (2005)
The Handbook: A Guide to Fluorescent Probes and Labeling Technologies, 10th edition
Carlsbad, CA: Invitrogen Corp.
Web: http://probes.invitrogen.com/handbook/

This hefty catalogue, originally published by Molecular Probes, Inc., has long served as a resource for the fluorescent labeling of cells based on functional cellular processes. Detailed descriptions of the involved chemistry and examples of applications and expected results are included.

Shapiro Howard (2003)
Practical Flow Cytometry, 4th edition
Hoboken, NJ: John Wiley & Sons, Inc.

A comprehensive text providing a strong foundation in flow cytometry practice, this book introduces the reader to instrumentation, probes, and applications. It also includes a large resource list and extensive references.

Pharmacogenomics

Malcolm S, Goodship J (eds.) (2001)
Genotype to Phenotype, 2nd edition
Oxford, UK: BIOS Scientific Publishers Ltd.

A comprehensive text introducing phenotypic associations with genotype, including methods for identifying genetic associations, phenotype prediction, multigenic traits, and the influence of gene–environment interactions. Examples are provided, and most chapters list external resources.

Rothstein M (ed.) (2003)
Pharmacogenomics: Social, Ethical and Clinical Dimensions
Hoboken, NJ: John-Wiley & Sons.

This text is largely focused on implications of pharmacogenomic testing in medicine, including societal challenges associated with genetic testing. Examples of currently used clinical pharmacogenomic tests are provided, and chapters on intellectual property, diagnostics development, and regulation address issues specific to the use of genomic biomarkers in drug development.

Gene Expression Profiling

Burczynski ME (ed.) (2003)
An Introduction to Toxicogenomics
Boca Raton, FL: CRC Press, Taylor & Francis Group, LLC.

A general text introducing gene expression array technology and analysis, with chapters describing applications to model systems and mechanistic studies. A section on predictive use of gene expression profiles includes examples of in-silico methods and clinical applications.

Hamadeh HK, Afshari CA (eds.) (2003)
Toxicogenomics: Principles and Applications
Hoboken, NJ: John Wiley & Sons.

This text compiles basic principles of toxicological investigation with highly informative descriptions of the platforms used for gene expression analysis, an introduction to proteomics techniques, and experimental design considerations including challenges in the interpretation of transcriptomes. Statistical approaches, modeling and prediction, and the use of databases are covered.

Journals

General

Biomarker Insights (2006–)
Biomarkers (1997–)

London, UK: Taylor & Francis.
Web: http://www.informaworld.com/smpp/title~content=t713693137~db=all

This journal has a broad scope including use of biomarkers in environmental health monitoring, ecological toxicology, and clinical drug development.

BMC Clinical Pathology (2001–)
BMC Clinical Pharmacology (2001–)
London, UK: Biomed Central Ltd.
Web: http://www.biomedcentral.com/browse/journals/

The above are peer-reviewed, open access journals published on the web. Content is diverse and interesting, however present publication volume is still relatively low.

Cancer Biomarkers
Amsterdam, the Netherlands: IOS Press.

Organizations

Academy of Molecular Imaging
Box 951735
Los Angeles, CA 90095–1735
Phone: 310 267-2614
Fax: 310 267-2617
E-Mail: ami@mednet.ucla.edu
Web: http://www.ami-imaging.org/index.htm

A professional society for molecular imaging, with a quarterly newsletter and bimonthly journal, *Molecular Imaging and Biology*.

American Association of Pharmaceutical Scientists
2107 Wilson Blvd, Suite 700, Arlington, VA 22201-3042
Phone: 703-243-2800
Fax: 703-243-9650
E-Mail: membership@aaps.org
Web: http://www.aapspharmaceutica.com/

American College of Clinical Pharmacology
3 Ellinwood Court, New Hartford, NY 13413-1105
Phone: 315-768-6117
Fax: 315-768-6119
Web: http://www.accp1.org/

The Clinical Cytometry Society
#5 Revere Drive, Suite 200, Northbrook, IL 60062
Fax: 312.896.5614
E-Mail: admin@cytometry.org
Web: http://www.cytometry.org/

HUPO-The Human Proteome Organization
740 Dr. Penfield Suite 6204
Montreal, Quebec, Canada H3A 1A4
Phone: 514-398-5063
Fax: 514-398-2036
Web: http://www.hupo.org/

An international consortium of proteomics research associations, government researchers, academic institutions, and industry partners. HUPO promotes proteomics research, and sponsors initiatives to promote development and application of proteomics technologies.

International Society for Analytical Cytology
9650 Rockville Pike, Bethesda, MD, USA 20814-3998
Phone: (301) 634-7435
Fax: (301) 634-7429
E-Mail: isac@isac.org
Web: http://www.isac-net.org/

Pharmacogenetics Research Network
National Institute of General Medical Sciences
45 Center Drive MSC 6200, Bethesda, MD 20892-6200
Phone: 301-496-7301
E-Mail: info@nigms.nih.gov
Web: http://www.nigms.nih.gov/Initiatives/PGRN/

A collaboration of medical scientists addressing research questions in the areas of pharmacogenetics and pharmacogenomics. Affiliate membership is available to individuals and groups; funding opportunities and updates on the research of individual consortium members are posted on the website.

The Society for Molecular Imaging
PO Box 293878
Kerrville, TX 78029-3878 USA
Phone: 1-830-257-0112
Fax: 1-830-257-0119
Web: http://www.molecularimaging.org/index.php

An international educational and scientific forum for molecular imaging; with a bimonthly journal, *Molecular Imaging.*

Databases

ADAPT
Patterson Institute for Cancer Research
Web: http://bioinf.picr.man.ac.uk/adapt/Welcome.adapt

A database that associates the sequences from 23 Affymetrix™ array types to expressed transcripts and genes, by directly mapping every probe against publicly available mRNAs/cDNA sequences from RefSeq and Ensembl.

Chemical Effects in Biological Systems
National Institute of Environmental Health Sciences
Web: http://cebs.niehs.nih.gov/cebs-browser/cebsHome.do

Knowledge base compiles information from numerous laboratories studying changes in gene expression, clinical pathology, and histopathology findings following chemical exposure. Currently, data are mainly from model toxicant studies in rodents.

Comparative Toxicogenomics Database
Mount Desert Island Biological Laboratory
Web: http://ctd.mdibl.org/help/siteMap.jsp

Compiles links to chemical search terms, taxonomic references, genes, proteins, and gene ontology tools in addition to a chemical–gene and chemical–protein interaction database with online query capability.

Drug Interaction Table
Indiana University Division of Clinical Pharmacology
Web: http://medicine.iupui.edu/flockhart/

A very useful database of cytochrome P450 mediated drug interactions, listings by drug class and enzyme substrates, inhibitors and inducers, with links to original literature.

Environment, Drugs and Gene Expression (EDGE^2)
University of Wisconsin
Web: http://edge.oncology.wisc.edu/edge.php

Includes hepatic gene expression data from numerous in vivo mouse studies using model toxicants and other treatments, including selected vehicles and inflammatory mediators. Data can be queried by gene, treatment, or both, and some clustering tools are available on the website.

Gene Ontology Database
National Human Genome Research Institute – Gene Ontology Consortium
Web: http://www.geneontology.org/index.shtml

A database of gene annotation terms for describing cellular compartments, biological processes, and molecular function with a controlled vocabulary. Includes annotated databases for numerous species, as well as indexed terms from other databases mapped to the GO terms. Provides links to a variety of tools using GO terms.

Genomics and Bioinformatics Group
Center for Cancer Research, National Cancer Institute
Web: http://discover.nci.nih.gov/index.jsp

Provides access to several datasets developed using the NCI-60 cell lines, and links to tools suitable for microarray or proteomic analysis, along with a publication archive and information about design and analysis of microarray experiments.

Global Proteome Machine Database
Web: http://gpmdb.thegpm.org/

A database of unique protein sequences from numerous taxa, with tools for searching/validating peptides from tandem mass spectrometry proteomics platforms. A free search algorithm and directions for incorporating the database into existing LIMS systems are available.

Human Protein Atlas
Web: http://www.proteinatlas.org/

A database of normal tissues and selected cancers and cell lines, with images of protein localization and expression profiles for over 1500 proteins based on antibody staining (immunohistochemistry). Antibodies used for this project are available for purchase.

iHOP-Information Hyperlinked Over Proteins
Memorial Sloan Kettering Cancer Research Center – Computational Biology
Web: http://www.ihop-net.org/UniPub/iHOP/

A text-mining tool that links literature with other public citations for genes or proteins, iHOP extracts key sentences including the search term from PubMed, and provides links to the original citations from NLM databases.

NIH Nonhuman Primate Reagent Resource
Web: http://nhpreagents.bidmc.harvard.edu/NHP/default.aspx

A database of cross-reactive commercial reagents (antibodies) listing their utility for flow cytometry, ELISA, and other antibody-based assays in several nonhuman primate species. Includes vendor information and several assay protocols and technical notes.

Perlengen Genotype Browser
Web: http://genome.perlegen.com/index.html

Provides genetic variation data for download and tools for viewing and analysis of the extensive SNP database developed by Perlengen for three diverse human populations.

PharmGKB
Pharmacogenetics and Pharmacogenomics Knowledgebase
Stanford University and Pharmacogenetics Research Network
Web: http://www.pharmgkb.org/

A growing searchable repository of reported pharmacogenomic associations with curated information on links between genetic variation and phenotypic categories. Provides links to submitted datasets and literature references.

Stanford Microarray Database
Stanford University
Web: http://smd.stanford.edu/index.shtml

Provides analysis tools and access to annotated microarray datasets from a large number of investigators using a variety of platforms. Both public domain data and registered user access to private domain data are available. Some analysis tools are available only to registered users due to the computational intensity of the jobs.

OTHER RESOURCES

Antibody Resource Page
Web: http://www.antibodyresource.com/

Compiles links to search engines for locating commercially available antibodies and custom antibody service providers. Additional links to educational materials, public databases, journals, and organizations that utilize antibody technology for diagnostics or drug development are also provided.

Center for Integration of Research on Genetics and Ethics
Stanford Center for Biomedical Ethics
Web: http://cirge.stanford.edu/index.html

An extensive resource library has been compiled of policy recommendations for working with genetic and other types of biomarkers in clinical research. Provides documents on informed consent requirements, legal and ethical issues of results disclosure, and links to other websites focused on bioethics and genetics research.

Clinical Proteomics Research Map
Web: http://www.cprmap.com/

An excellent and well-maintained website devoted to the applications of proteomics to clinical research, with links to literature on technologies, diseases and clinical diagnostics projects, publications, ISB courses, and annual symposium.

Computational Proteomics Laboratory
The Fred Hutchinson Cancer Research Center
Web: http://proteomics.fhcrc.org/CPL/home.html

Provides access to several software tools for analysis of proteomics datasets.

Critical Path Initiative Website
Web: http://www.fda.gov/oc/initiatives/criticalpath/

Provides links to Critical Path Initiative documents, including the Critical Path Opportunities List and updates on sponsored projects, a conference archive and other postings relevant to the FDA's 2004 report 'Challenge and Opportunity on the Critical Path to New Medical Products'.

Dako Reference Literature Page
Web: http://www.dako.com/prod_productrelatedinformation?url=support_literature.htm

Provides links to a number of references for immunohistochemistry and cytogenetic analysis of tissues, including a comprehensive guide for immunohistochemical staining methods.

GenomeWeb Daily News
GenomeWeb LLC
Web: http://www.genomeweb.com/

A free electronic newsletter with a focus on business and regulatory news for genomics, proteomics, and metabonomics research institutions. Links to specialized subscription newsletters are provided.

Institute for Systems Biology
Web: http://www.systemsbiology.org/Resources_and_Development

Resource page includes software tools, datasets, and information on current ISB collaboratives.

Microarray Gene Expression Data Society
Web: http://www.mged.org/index.html

An international organization currently focused on establishing standards for microarray data annotation and exchange, database creation, and sharing of microarray data. Web resources include data models (Minimum Information About a Microarray Experiment; MIAME) for many types of experiment including in vivo toxicology studies.

Molecular Imaging Central
Molecular Imaging Program at Stanford
Web: http://www.mi-central.org/index.html

A web resource with focus on molecular imaging and gene therapy. Provides links to major research institutes and organizations, a literature archive, and a large collection of links to sites that describe technologies and biological processes relevant to molecular imaging.

Seattle SNPs
University of Washington, Program for Genomic Applications
Web: http://pga.gs.washington.edu/

Compiles information and tools for genetic variation analysis and provides data from sequencing efforts conducted through the program. Posted resources include tutorials for navigating the major genomic variation databases, and using web-based genomics tools.

Biotechnology

RAFAEL PONCE, AND STEVEN G. GILBERT

INTRODUCTION

Biotechnology-derived therapeutic products represent a diverse class of agents that are categorized by their method of manufacture, typically based on recombinant DNA technology. These products include recombinant proteins and nucleotides as gene therapies, anti-sense therapies, cytokines, monoclonal antibodies, growth factors, soluble receptors, fusion proteins, vaccines, and coagulation factors. Therapeutic targets of these products include genetic deficiency; neurological, cardiovascular, autoimmune and inflammatory disorders; cancer; metabolic disorders; and other conditions.

Given that these molecules are typically derived and produced to mimic endogenous nucleotides and proteins, their toxicity tends to be related to that associated with over-stimulation or suppression of the targeted biological pathways. In addition, unlike potentially active metabolites associated with small molecule therapies, the metabolic by-products of biotechnology-derived therapeutics are generally inactive amino acid and nucleotide fragments. For these reasons, toxicology programs designed to support the development of biologically based therapeutics rely on evidence that the therapeutic agent under evaluation has similar target-binding characteristics and activity in the animal species used for non-clinical testing and humans. These characteristics of toxicity of biologically based therapeutics have led to the development of a harmonized regulatory paradigm between the United States, European Union, and Japan for the non-clinical testing of biotechnology-derived therapeutics (ICH S6 guidance, cited below). In addition, because the toxicity of these agents is dependent on the targeted mechanism of action, the regulatory pathway for an agent in a given therapeutic class is highly dependent on precedence. For these reasons, primary literature on the non-clinical development of a number of molecules is referenced below. However, the reader is advised to review U.S. Food Drug Administration and EU databases (cited below) to obtain the most current summary data on the non-clinical safety programs for specific approved agents.

There is also an accelerating application of biotechnology tools to produce genetically modified organisms (GMOs) that ultimately become part of the food supply or used to produce drugs. Ensuring the safety of products entering the food supply is particularly challenging. The World Health Organization, European Union, and the U.S. government are all working to address GMOs and have developed extensive web-based resources that provide the most current infor-mation.

INFORMATION RESOURCES SECTION

Books

Committee on Identifying and Assessing Unintended Effects of Genetically Engineered Foods on Human Health – National Research Council (2004)
Safety of Genetically Engineered Foods: Approaches to Assessing Unintended Health Effects
National Academies Press

This report addresses some of the unique challenges in addressing safety and other issues related to genetically modified foods and food products derived from

genetically engineered plants and animals. Approaches to evaluating intended and unintended effects are discussed.

Crommelin DJA, Sindelar RD (Eds.) (2002)
Pharmaceutical Biotechnology: An Introductory Text for Pharmacists and Pharmaceutical Scientists, 2nd Edition
Philadelphia, PA: Taylor and Francis, Inc.

Contains 20 chapters that review the basic science of molecular biotechnology, biophysical and biochemical characterization, production, formulation, pharmacokinetics and pharmacodynamics, and other matters of importance to the toxicologist new to this field. Also reviewed are the development of gene therapies, growth factors, cytokines, growth hormones, insulin, vaccines, and other products.

Griffiths SA, Lumley CE (eds.) (1998)
Safety Evaluation of Biotechnology-derived Pharmaceuticals: Facilitating a Scientific Approach
Boston, MA: Kluwer Academic Publishers.

An introductory text that reviews the design and implementation of non-clinical safety programs for biotechnology-derived therapies from the perspectives of the clinician, the toxicologist, and the regulatory (including US, European, and Japanese) authority. Case reviews of growth hormones, cytokines, monoclonal antibodies, gene therapies, and other agents are provided.

Kayser O, Müller RH (eds) (2004)
Pharmaceutical Biotechnology: Drug Discovery and Clinical Applications
Weinheim, Germany: Wiley-VCH Verlag GmbH & Co. KGaA.

Written by international experts from the biotechnology industry, this book covers issues such as drug delivery and targeting, quality and safety management, drug approval and regulatory issues.

Journals

Journal of Biomedicine and Biotechnology (2001–)
Hindawi Publishing Corporation

An international journal publishing original work in all areas of biomedicine (carcinogenesis, epidemiology, gene therapy, mutagenesis, pathology, pharmacology, toxicology, etc.) and biotechnology (microbial, animal, and plant biotechnology).

Web: http://www.hindawi.com/journals/jbb/

Regulatory Toxicology and Pharmacology (1981–)
Amsterdam, the Netherlands: Elsevier.

The journal is devoted to reports of significant developments, public opinion, scientific data, and ideas that bridge the gap between scientific information and the legal aspects of toxicological and pharmacological regulations.

Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/622939/description? navopenmenu=1

Organizations

Biotechnology Industry Organization (BIO)
1225 Eye Street NW, Suite 400
Phone: 202-962-9200
E-Mail: info@bio.org
Web: http://www.bio.org/index.asp?stay=yes

Founded in 1993, BIO is an industry trade organization representing over 500 companies. This organization has a cross-industry working group, BioSafe, focused on safety-related issues of biotechnology-derived therapeutics.

Databases

Agricultural Biotechnology – Laws, Regulations, Policies, and Responsibilities
U.S. Department of Agriculture
Web: http://www.usda.gov/agencies/biotech/laws.html

This site provides information from the three U.S. agencies primarily responsible for regulating biotechnology in the United States – the Department of Agriculture (USDA), the Environmental Protection Agency (EPA), and the Food and Drug Administration (FDA).

Biotechnology Information Directory Section – World Wide Web Virtual Library
Cato Research Ltd
Web: http://www.cato.com/biotech/

This directory, provided by Cato Research Ltd., is a compilation of URLs specific to biotechnology, pharmaceutical development, clinical trials, services, education, and related fields.

EMEA Regulatory Guidance
Web: http://www.emea.europa.eu/htms/human/humanguidelines/nonclinical.htm

The European Medicines Agency (EMEA) is a decentralized body of the European Union with headquarters in London. This website provides a summary of EMEA guidance documents, including guidance on European expectations for safety data and submissions in Europe.

Food Safety – Biotechnology (GM foods)
World Health Organization
Web: http://www.who.int/foodsafety/biotech/en/

This WHO website addresses a wide range of issues in the field of biotechnology and human health, including safety evaluation of vaccines produced using biotechnology, human cloning and gene therapy and specifically addresses food safety issues.

Food Safety – From the Farm to the Fork
European Union
Web: http://ec.europa.eu/food/food/biotechnology/index_en.htm

Address issue of biotechnology applied to produce genetically modified organisms (GMOs) that might be

used by agri-food industries and ultimately in the food production chain.

International Conference on Harmonization of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH)
Web: http://www.ich.org/cache/compo/276-254-1.html

The ICH began in April 1990 when representatives of the regulatory agencies and industry associations of Europe, Japan, and the USA met in Belgium. Topics selected for harmonization included safety criteria for approving and authorizing new medicinal products.

Internet Resources for Biotechnology
University of Delaware Library
Web: http://www2.lib.udel.edu/subj/biotech/internet.htm

This University of Delaware website covers biotechnology, bioengineering, bioinformatics, molecular databases, and related products and services.

National Center for Biotechnology Information (NCBI)
National Library of Medicine, National Institutes of Health
Web: http://www.ncbi.nlm.nih.gov/

A national resource for molecular biology information, NCBI creates public databases, conducts research in computational biology, develops software tools for analyzing genome data, and disseminates biomedical information through newletters and the website.

U.S. Food and Drug Administration (FDA) Regulatory Guidance
Web: http://www.fda.gov/cder/guidance/index.htm#Pharmacology/Toxicology

This website provides a summary of US Food and Drug Administration guidance documents related to regulatory toxicology. These documents provide guidance on FDA expectations for safety data and submissions.

U.S. Regulatory Agencies Unified Biotechnology Website
National Biological Information Infrastructure
Web: http://usbiotechreg.nbii.gov/

The Federal Government of the United States of America established a formal policy in 1986, the Coordinated Framework for Regulation of Biotechnology, a risk-based system to ensure new biotechnology products are safe for the environment and human and animal health.

Other Resources

Key Guidance Documents

ICH S6: Preclinical Safety Evaluation of Biotechnology-Derived Pharmaceuticals (1997)
EU: Adopted by CPMP, September 97, issued as CPMP/ICH/302/95.
MHLW: Published, PAB/PCD, Notification n° 326, 22 February 2000.
FDA: Published in the Federal Register, Vol. 62, No. 222, November 18, 1997, pages 61515.

This is the primary guidance representing the harmonized regulatory perspective for the non-clinical safety development for biologically derived therapeutics in the US, Europe, and Japan.

FDA CBER (1997)
Points to consider in the manufacture and testing of monoclonal antibody products for human use.

Key guidance representing US FDA regulatory considerations for the manufacture and testing of monoclonal antibodies, including non-clinical safety considerations.

FDA CDER (2006)
Guidance for industry: Non-clinical safety evaluation of drug or biologic combinations.

Recent guidance representing US FDA regulatory considerations non-clinical safety evaluation of drug or biologic combinations, where neither, one, or both of the agents have been previously marketed.

CHAPTER

10

Biotoxins

KENNETH R. STILL, AND ASISH MOHAPATRA

INTRODUCTION

Terminology regarding *biotoxins* is extremely important. A *toxin* is a *toxic agent* that is derived from living organisms. *Toxins* may also be referred to as *biotoxins*, even though this is, in a sense, redundant. *Toxin* and *biotoxin* may thus legitimately be used interchangeably. Such substances need to be differentiated from the broader term, poison, or toxic agent, or toxicant, which can be either a toxin or a chemical not produced from living organisms. A *poison*, *toxic agent*, or *toxicant* is generally any material capable of producing a harmful reaction or effect in a biological system. Thus, although all the above terms are often used as if they had the same meaning, readers should be aware of these subtle distinctions. The term *toxinology* is generally applied to the study of *toxins. Toxinology* should not be confused with toxicology, which is the study of adverse effects caused by any chemical (or, indeed radiation) on living systems. The differentiating feature of these two scientific branches of knowledge lies in whether reference is made to chemicals produced only by living organisms that produce adverse effects (*biotoxins*) or a broader array of perpetrating agents. The following relevant resources are important to understand various plant and animal *toxins* and associated health effects.

RESOURCES

Books

Abbas, Hamed K (2005)
Aflatoxin and Food Safety
Taylor & Francis/CRC Press, Boca Raton, FL, USA.
Food Science and Technology Volume: 151

Contains chapters that provide a comprehensive review of aflatoxins, aflatoxin research and impact worldwide, and the toxicology of aflatoxins.

Barkai-Golan, R. (Ed.) (2008)
Mycotoxins in Fruits and Vegetables
Elsevier/Academic Press.

In 14 chapters this book covers mycological, mycotoxicological, and phytopathological aspects of fruits and vegetables. Risk assessment of mycotoxins in perishable produce is described as is detection, prevention, and control methods for mycotoxigenic fungi and the mycotoxins that they may produce.

Botana, Luis M. (2000)
Seafood and Freshwater Toxins: Pharmacology: Physiology, and Detection
Taylor & Francis/CRC Press.
Food Science and Technology Volume 103

Contains more than two dozen chapters that provide information on the pharmacology, physiology, toxicology, chemistry, ecology, and economics of seafood and freshwater toxins. Information provided covers the diarrhetic shellfish toxins, neurotoxic Cyanobacteria toxins, and the effects of each toxin on human health.

Botana, Luis (2007)
Phycotoxins: Chemistry and Biochemistry
Blackwell Publishing.

Presents 18 chapters that discuss 16 phycotoxins in the area of origin, toxicology, chemistry, biochemistry, and

mechanism of action. Presents information on emerging new toxins. Includes thorough discussion of the Brevetoxins, cyclic imines, and the cyanobacterial neurotoxins.

Botana, Luis M (2008)
Seafood and Freshwater Toxins: Pharmacology, Physiology, and Detection, 2nd edition
Taylor & Francis/CRC Press.
Food Science and Technology Volume: 173

Contains 23 chapters that discuss the chemistry, pharmacology, physiology, and toxicology of seafood toxins. Provides information on new toxins such as pfiesteria, spirolides, ostreocin, and cyclic imines.

Burrows, George E, Tyrl, Ronald J (2001)
Toxic Plants of North America
Wiley and Sons.

Covers both wild and domestic toxic plants and addresses animal and human intoxications from ingestion. Plant morphology, distribution, clinical signs of toxicity, and treatment are provided.

Burrows, George E, Tyrl, Ronald J (2006)
Handbook of Toxic Plants of North America
Wiley and Sons.

This handbook contains 11 chapters that cover plants poisonous to animals. The book is organized by body system affected and provides clinical manifestations of plant ingestion. User-friendly handbook that provides general information on plants and keys for plant identification.

Cary, Jeffrey W, Linz, John E, Bhatnagar, Deepak (1999)
Microbial Foodborne Diseases: Mechanisms of Pathogenesis and Toxin Synthesis
Taylor & Francis/CRC Press.

This book covers Gram-negative and -positive bacterial pathogens, fungal and marine toxins, parasitic protozoa, viruses, and related infectious agents. Detailed discussion of prion-based BSE, Norwalk virus disease, *Fusarium* toxins and PSP toxins are provided.

D'Mello, JP Felix (1997)
Handbook of Plant and Fungal Toxicants
Taylor & Francis/CRC Press.

Contained within 22 chapters is a thorough discussion of the role that plant and fungal toxicants play in carcinogenesis. Secondary plant compounds are discussed in the context of plant protection and human health. Toxicants from bracken fern and ponderosa pine are discussed.

Falconer, Ian Robert (2004)
Cyanobacterial Toxins of Drinking Water Supplies
Taylor & Francis/CRC Press/Marcel Dekker, New York, NY, USA.

Broken down into 12 sections this book addresses the biology, chemistry, toxicology, and human health concerns of the cylindrospermopsins and microcystins.

Gardner, Susan C, Oberdorster, Eva (2005)
Toxicology of Reptiles
Taylor & Francis/CRC Press.

This text covers cutting-edge research in the areas of endocrinology, neurophysiology, immunology, and ecology of reptiles. Information is presented from a target organ perspective.

Gupta, Ramesh C (ed.) (2007)
Veterinary Toxicology
Elsevier/Academic Press.

Contains 19 sections including sections on organ toxicity, nanoparticles and carcinogenesis, bacterial toxins, poisonous and venomous organisms, estrogenic toxicants, poisonous plants, mycotoxins, and estrogenic toxicants. Thoroughly covers diagnosing animal poisoning cases. Information on more than 900 medicinal, biological, herbal and non-medicinal agents and antidotes makes this book an important information resource for interested researchers and toxinologists. Signs and symptoms of drug overdose and its treatment – use, mechanisms, adverse reactions, and drug interactions have been provided. Further, specific data and therapy recommendations for each agent are listed. There is an extensive symptoms index and detailed treatment protocols in the book. Chemical Abstract Services Number and the UN/US Department of Transportation number also provided.

Gutman, Yehuda, Lazarovici, Philip (1997)
Toxins and Signal Transduction
Taylor & Francis/CRC Press.
Cellular and Molecular Mechanisms of Toxic Action
Volume: 1

The book's 10 chapters cover the molecular mechanisms involved in toxin mode of action. Potential therapeutic use of toxins via signal transduction is also covered.

Haschek, Wanda (ed.) (2001)
Handbook of Toxicologic Pathology, Two-Volume Set, 2nd edition
Elsevier/Academic Press.

Volume 1 discusses general toxicologic pathology in three parts: basics, practice, and selected topics. Volume 2 presents organ-specific toxicologic pathology.

Moss Joel, Iglewski Barbara, Vaughan Martha, Tu Anthony T (eds) (1995)
Handbook of Natural Toxins: Bacterial Toxins and Virulence Factors in Disease; Volume 8
Taylor & Francis/CRC Press/Marcel Dekker, New York, NY, USA.

This volume discusses the structure and function of bacterial toxins and includes a comprehensive review of virulence. Significant discussions of toxic proteins associated with diphtheria, cholera, pertussis, shigellosis, tetanus, botulism, and anthrax are provided.

Kastin, Abba (ed.) (2006)
Handbook of Biologically Active Peptides
Elsevier/Academic Press.

Contained within 20 sections are thorough discussions of biologically active peptides in venoms, amphibians, bacteria, and specific organ systems.

Mebs, Dietrich (2002)
Venomous and Poisonous Animals: A Handbook for Biologists, Toxicologists and Toxinologists, Physicians and Pharmacists
Taylor & Francis/CRC Press.

This text discusses both marine and terrestrial animals and their toxins. Presents a discussion of the mode of toxin action from natural products, how poisons work, and how venomous animals use their toxins. Included are discussions on some of the more often overlooked terrestrial organisms such as the centipede.

Menez, A (ed.) (2002)
Perspectives in Molecular Toxinology
Wiley and Sons.

Toxinology as a sub-area of biochemistry is discussed in the 27 chapters including structural genomics in toxinology.

Meier, Jurg, White, Julian (1995)
Handbook of Clinical Toxicology of Animal Venoms and Poisons
Taylor & Francis/CRC Press/Marcel Dekker, New York, NY, USA.

Numerous chapters discuss the details of biology, taxonomy, distribution, venom, epidemiology, pathophysiology, diagnosis, and treatment for each animal group that is covered including terrestrial and marine.

Naidu, Narian (2000)
Lactoferrin: Natural – Multifunctional – Antimicrobial
Taylor & Francis/CRC Press, Boca Raton, FL, USA.

Provides an in-depth discussion on lactoferrin as a natural antimicrobial intervention and microbial-blocking technology that is used to protect food from microbes.

Polya, Gideon (2003)
Biochemical Targets of Plant Bioactive Compounds: A Pharmacological Reference Guide to Sites of Action and Biological Effects
Taylor & Francis/CRC Press, St Louis, MO, USA.

Divided into 14 sections, this book characterizes the nature and targets of bioactive substances in plants and how these substances might be used for medicinal purposes. Provides significant information on herbal medicines.

Preedy, Victor R, Watson, Ronald R (2004)
Reviews in Food and Nutrition Toxicity, Volume 2
Taylor & Francis/CRC Press.
Reviews in Food and Nutrition, Volume: 2

Contained within several chapters are review discussions on ciguatera fish poisoning, contaminants in beer, bacterial toxins as well as pesticide toxicity and contamination episodes.

Rochat, Herve and Martin-Eauclaire, Marie-Francis (2000)
Animal Toxins: Facts and Protocols
Springer Publications, New York, NY, USA.
Methods and Tools in Biosciences and Medicine

Written for molecular/cell biologists and neuroscientists, the 20 chapters of this text discuss the origin, structure, molecular mechanism, cellular and pathogenic effects of toxins.

Rossoff, Irving S (2001)
Encyclopedia of Clinical Toxicology: A Comprehensive Guide to the Toxicology of Prescription and OTC Drugs, Chemicals, Herbals, Plants, Fungi, Marine Life, Reptiles and Insect Venoms, Food Ingredients, Clothing and Environmental Toxins
Taylor & Francis/CRC Press/Marcel Dekker, New York, NY, USA.

This encyclopedic reference discusses 6000 drugs, chemical and environmental toxins. Adverse effects and interactions are discussed that are not routinely covered in PDRs.

Tu, Anthony (1991)
Handbook of Natural Toxins: Reptile Venoms and Toxins
Taylor & Francis/CRC Press/Marcel Dekker, New York, NY, USA.

Contained within 24 chapters is relevant information covering venoms and toxins and their actions and antidotes. Current information on the Gila monster and frog toxins are also covered.

Tu, Anthony (1992)
Handbook of Natural Toxins: Food Poisoning
Taylor & Francis/CRC Press/Marcel Dekker, New York, NY, USA.

Contributions from over 30 experts in the field discuss aspects of food poisoning and the agents contributing to the poisoning, such as bacteria, plant, and fungi.

U.S. Food and Drug Administration (1992)
The 'Bad Bug Book': Foodborne Pathogenic Microorganisms and Natural Toxins Handbook
U.S. Food and Drug Administration, MD, USA.
Center for Food Safety and Applied Nutrition

Discusses six categories of concern related to foodborne pathogenic microorganisms: pathogenic agents (prions).

U.S. Food and Drug Administration (2001)
Fish and Fisheries Products Hazards and Controls Guidance, 3rd edition
U.S. Food and Drug Administration
Center for Food Safety and Applied Nutrition

Contains 21 chapters that discuss the hazards associated with fish, fish products, and controls for hazards associated with fish and fish products.

Wexler, Phillip (ed.) (2005)
Encyclopedia of Toxicology, Four-Volume Set, 2nd edition
Elsevier/Academic Press/Marcel Dekker, New York, NY, USA.

More than 1150 entries in this encyclopedic set discuss the chemicals and core areas of toxicology. Alphabetically arranged these four volumes cover organizations, hazardous chemical incidents, social issues, and laws governing chemicals. Several entries in the area of toxinology can be found in these volumes.

Informa Health Care Publications
Poisoning and Toxicology Handbook 4th edition
Editors: Jerrold B Leikin, Evanston Frank, P Paloucek
ISBN: 9781420044799

Journals

Applied and Environmental Microbiology (AEM)
Publishes current research in the areas of biotechnology, microbial ecology, food microbiology, industrial microbiology, and highlights research findings applicable to the development of new processes or products. This journal is published twice monthly and includes sections on: Genetics and Molecular Biology; Enzymology and Protein Engineering; Physiology and Biotechnology; Mycology; Public Health Microbiology; Environmental Microbiology; Microbial Ecology; Geomicrobiology; Food Microbiology; Plant Microbiology; Invertebrate Microbiology; Biodegradation; and Evolutionary and Genomic Microbiology. Print ISSN: 0099-2240. Online ISSN: 1098-5336. Volume 1, 1953.

Biochemistry
This journal covers the arena where chemistry, biochemistry, and molecular biology interrelate. Print Edition ISSN: 0006-2960; Web Edition ISSN: 1520-4995. Published articles cover structure, function, and regulation of biologically active molecules; gene structure and expression; biochemical mechanisms; protein biosynthesis; protein folding; membrane structure–function relationships; bioenergetics; and immunochemistry. Volume 1: 1962.

The Canadian Veterinary Journal
This is the official journal of the Canadian Veterinary Medical Association. This monthly, peer-reviewed, general scientific publication features a wide variety of articles intended for the veterinary practitioner and includes studies covering natural toxins and their effects on animals particularly. ISSN 0008-5286. Volume 1: 1960.

Clinical Microbiology Reviews (CMR)
This journal offers a variety of reviews of developments in clinical microbiology, immunology, bacteriology, virology, mycology, and parasitology. Published quarterly, CMR includes articles on: Pathogenic Mechanisms; Specific or Groups of Microbial Pathogens; Clinical and Laboratory Aspects of Newly Recognized or Reemerging Infectious Diseases; and Recently Developed Antimicrobial Agents and Their Applications. Print ISSN: 0893-8512. Online ISSN: 1098-6618. Volume 1, Number 1: 1988.

Environmental Health Perspectives
Environmental Health Perspectives (EHP) is the official, monthly, peer-reviewed journal of the National Institute of Environmental Health Sciences. EHP disseminates environmental health information and research findings. *EHP* serves as a forum for the discussion of the interrelationships between the environment and human health by publishing peer-reviewed research and the most current, credible news in the field. Volume 1: April 1972.

The Journal of Clinical Microbiology (JCM)
This journal publishes research studies covering microbiological aspects of human and animal infections and infestations, with particular emphasis on etiologic agents, diagnosis, and epidemiology. Published monthly the JCM includes sections that cover: Bacteriology; Chlamydiology and Rickettsiology; Mycobacteriology and Aerobic Actinomycetes; Mycology; Parasitology;

Virology; Clinical Veterinary Microbiology; and Epidemiology. Print ISSN: 0095-1137. Online ISSN: 1098-660X. Volume 1: 1975.

Journal of Neuroscience
The *Journal of Neuroscience* is the official journal of the Society for Neuroscience. The journal publishes papers on a broad range of topics of general interest to those working on the nervous system. ISSN 0270-6474. It is published weekly by the Society, one volume a year. The *Journal of Neuroscience* publishes rigorously reviewed research across the gamut of behavioral, systems and cognitive neuroscience, cellular and molecular neuroscience, and development, plasticity, and repair neuroscience. *The Journal of Neuroscience* is published weekly, 12 months a year. Published from January 1, 1981 to present.

The Journal of Venomous Animals and Toxins, including Tropical Diseases
ISSN 1678-9199

This is a quarterly publication dedicated to Toxinology and Tropical Diseases. This journal is the official journal of The Center for the Study of Venoms and Venomous Animals (CEVAP) and was first published in 1995.

Marine Drugs
A journal covering research, development and production of drugs from the sea, including marine natural product chemistry. ISSN 1660-3397. Published online quarterly. Volume 1, number 1 published December 2003.

Microbiology and Molecular Biology Reviews (MMBR)
This is the definitive review journal covering the disciplines of microbiology, immunology, and molecular and cellular biology. MMBR keeps readers abreast of the latest findings about bacteria, viruses, parasites, fungi, and other higher eukaryotes. Published quarterly, MMBR presents articles on: Physiology and Enzymology; Molecular Biology; Genetics; Ecology; Host-Parasite Relationships Leading to Disease; Cellular Biology; and Virology. Print ISSN: 1092-2172. Online ISSN: 1098-5557. Volume 1, number 1, December 1937.

Molecular Medicine
This journal publishes original research articles on emerging concepts in the interdisciplinary field of molecular medicine. The journal publishes articles helpful in understanding the molecules key to normal body functioning and the pathogenesis of disease. Volume 1, January, 1995. Published by The Feinstein Institute for medical research, Manhasset, NY.

Natural Toxins
Published by Wiley Interscience from 1992–1995 (no longer being published). However, the published articles provide good references on the effects and mechanisms of natural toxins.

Proceedings of the National Academy of Sciences
PNAS publishes high-impact research reports, commentaries, perspectives, reviews, colloquium papers, and actions of the National Academy of Sciences. ISSN: 00278424. Volume 1 published in 1915.

Toxicological Sciences
Toxicological Sciences is the official journal of the Society of Toxicology, and publishes peer-reviewed, hypothesis-driven, original research articles which are structural, biochemical, or functional in nature; address mechanisms of toxicity; address the effects of dose, route of exposure, metabolism, or species on toxic responses; and, studies that address statistical or mechanism based approaches to risk assessment. Online ISSN 1096-0929. Print ISSN 1096-6080. The journal includes timely review articles. Volume 1, Number 1 published January 1981.

Toxicologic Pathology
This journal focuses on the multidisciplinary elements that constitute toxicologic pathology, including spontaneous and experimentally induced morphological and functional changes, environmental exposures, case reports, and risk assessment. The journal publishes original articles, symposia papers, brief communications, current topic reviews, current issues, and fast-track articles. *Toxicologic Pathology* is the official journal for the Society of Toxicological Pathology and releases seven issues per year. Volume 1, Number 1: 1972.

Toxicon
This interdisciplinary journal addresses toxins derived from animals, plants, and microorganisms and is the official journal of The International Society on Toxinology. The journal publishes articles containing the results of original research on problems related to poisons derived from animals, plants and microorganisms; papers on the chemical, pharmacological, zootoxicological, and immunological properties of natural poisons; clinical observations on poisoning where a new therapeutic principle has been proposed or a decidedly superior clinical result has been obtained; material on the use of toxins as tools in studying biological processes and subjects related to venom–antivenom problems. This journal also publishes review articles on toxinology and abstract current literature on venoms, antivenoms, poisons, and antipoisons. ISSN: 0041-0101. Publication commenced in 1962.

Toxin Reviews

Formerly, the *Journal of Toxicology – Toxin Reviews*, this journal publishes four issues a year. *Toxin Reviews* publishes interdisciplinary findings on toxins and toxin mechanisms and features a dual emphasis on classifying toxins by their mechanisms of action, and on new, underutilized substances. First published in 1982.

Print ISSN: 1556-9543; Online ISSN: 1556-9551

Organizations

Australian Venom Research Unit
Pharmacology Department
University of Melbourne
Parkville, Victoria 3010
Australia
Phone: +61 3 8344 7753
Fax: +61 3 9348 2048
E-Mail: mail@avru.org
Web: http://www.avur.org

'The Australian Venom Research Unit (AVRU) is an internationally recognised interdisciplinary research unit focused on the problem of venomous injury in Australia and the Asia-Pacific. It was established by Associate Professor Struan Sutherland, formerly of CSL (Commonwealth Serum Laboratories), on the 1st of July 1994 in the Department of Pharmacology at the University of Melbourne. The Unit builds on 70 years of expertise concerning venom and antivenom research and advocacy at CSL. CSL assisted in the establishment of the Unit and initial annual funding came from the Victorian Department of Human Services. Since 2002, the Unit has been mostly funded by the Australian Government through the Department of Health and Ageing as well as the Australia Research Council. The Australian Venom Research Unit aims to provide world-class expertise on the problem of Australia's venomous creatures, their toxins and the care of the envenomed patient.' (excerpted from http://www.avru.org/about_us.html).

This research unit provides relevant information resources on Australian Venom Compendium (http://www.avru.org/compendium/index.html); a list of Exotic Antivenom Holdings (http://www.avru.org/reference/reference_avhold.html); an extensive archive research references of Struan Keith Sutherland (1936–2002): Guide to Records (http://www.avru.org/archives/sutherland/SUTH.htm); and a browser mode and searchable venom bibliography by author and journal names http://www.avru.org/compendium/bib_search.htm. A valuable addition to the database list is a toxinology specific short glossary which would be very helpful to students and reseachers (http://www.avru.org/reference/reference_glossary.html).

Clinical Toxinology Resources
Web: http://www.toxinology.com

'This website was launched in 2002. It contains taxonomic, distribution, venom, clinical effects, first aid, treatment and antidote information on a growing range of venomous and poisonous animals. The list of species covered is planned to cover all significant animal, plant and mushroom species worldwide. Currently the venomous snake section is the most complete, with all Viperid and Elapid species listed and many Atractaspid and Colubrid species. Some information is available to all, but currently the most detailed information is available only to subscribers. Subscriptions help support the cost of building and maintaining the site, most of which is driven by a vast database.'

To contact the website: an online query form should be completed at: http://www.toxinology.com/fusebox.cfm?fuseaction=main.contact_us.contact_us

Guide to Poisonous Plants
Dr. A.P. Knight, College of Veterinary Medicine and Biomedical Sciences, Colorado State University
Web: http://southcampus.colostate.edu/poisonous_plants/index.cfm?countno=NO

The *Guide to Poisonous Plants* has been designed to enable location of a plant by either knowing the common or botanical name of the plant. If the plant is not known, but the disease symptom is known, it is possible to search by the presenting clinical sign, e.g.: abortion, sudden death, photosensitization. (excerpted from: http://southcampus.colostate.edu/poisonous_plants/report/search.cfm)

Indiana Plants Poisonous to Livestock and Pets
Cooperative Extension Service, Purdue University, West Lafayette, IN 47907
Rebecca J. Goetz, writer, extension assistant; Thomas N. Jordan, extension weed scientist; John W. McCain, extension weed scientist; Nancy Y. Su, assistant
Web: http://vet.purdue.edu/depts/addl/toxic/cover1.htm

The above database can be searched by alphabetical plant listing; toxicity rating; species affected; botanical type. A picture index is also provided. For additional information on this database work which is in the developmental stage, contact the webmaster at webmaster@vet.purdue.edu.

International Society of Toxinology (IST)
Secretary: Prof. D Mebs
Zentrum der Rechtsmedizin
Kennedyallee 104
Frankfurt 70
D7000 Germany
Fax: ++49-69-6301 5882
E-Mail: mebs@em.uni-frankfurt.de
Web: http://www.toxinology.org

The IST was founded in 1962 by scientists and clinicians interested in advancing the science of toxinology. The first international meeting was held in 1966 in Atlantic City, USA. *Toxicon* is the official journal of the IST. The objective of IST is to advance knowledge

on the properties of toxins and antitoxins and to bring together scholars interested in toxins and toxinology. Membership consists of those who have conducted and published meritorious original investigations in toxinology, while persons who do not qualify for membership but are interested in the field of toxinology are eligible for associate membership. For additonal information, interested persons can contact the current secretary of the IST.

North Coast Water Quality and Biotoxin Program Society

Contact: Pat Lawson, Executive Director
100 1st Avenue East, Prince Rupert, British Columbia, Canada V8J 1A6
Approx. hours: 9:00 am–6:00 pm closed 12–1 for lunch and stat holidays
Phone: 1 (250) 627-5135
Fax: 1 (250) 627-8493
E-Mail: Eby@biotoxinprogram.com
Web: http://www.biotoxinprogram.com

It is based in the city of Prince Rupert, British Columbia, Canada. The society coordinates biotoxin and water quality monitoring and testing services for shellfish harvesting and growing interests on the North Coast mainland and Haida Gwaii (Queen Charlotte Islands) in British Columbia, Canada.

The Biotoxin program is a non-governmental organization (NGO) that consists of representatives from local First Nations and non-First Nations communities, shellfish farmers, scientists, economic development groups, and local, provincial and federal governments. Coastal British Columbia has endemic paralytic shellfish poisoning (PSP) blooms that are of particular concern to local First Nations who harvest shellfish regularly as part of their traditional heritage. Monitoring stations tend to be very remote, so the North Coast Water Quality & Biotoxin Program faces a complex set of challenges.

This society is supported by the Canadian Food Inspection Agency (CFIA), Nechako Kitamaat Development Fund Society, Skeena-Queen Charlotte Regional District and Western Economic Partnerships Agreement (BC MAFF & WEDC).

Databases from Universities and Other Institutions

Animal Toxin Database (ATDB)

Director: Prof. Song-Ping Liang Ph. D
College of Life Sciences, Hunan Normal University
Changsha 410081, China
Phone: +86-731-8872556
Fax: +86-731-8861304
E-Mail: liangsp@hunnu.edu.cn
Web: http://protchem.hunnu.edu.cn/toxin/Browse/Species.htm

ATDB is a uni-database platform designed to store chemical structures and annotation data of all animal toxins and presents a new terms system (Toxin Ontology) standardize functional annotations of toxins. For additional information on Toxin Ontology (TO), access http://protchem.hunnu.edu.cn/toxin/Ontology/Introduction.htm

The database focuses on answering four basic questions about animal toxins:

What is the category of the toxin(s)? (e.g. Neurotoxin, cytotoxin or others);

What is the biological activity of the toxin(s)? (e.g. Vesicle transport regulation or channel inhibition);

What are the symptoms induced by the toxins(s)? (e.g. Hemolysis, Hemorrhage or Death); and,

What is the target of the toxin(s) (e.g. Muscle, Nervous systems or Blood)

The author of this database has claimed that ATDB may be the most comprehensive toxin database which has 3235 peptide toxins from 379 species. Most of them are annotated manually using more than 9166 TO terms by trained biologists. To cite information from the database, readers can use the following bibliographic reference. Quan-Yuan He, Quan-Ze He, Xing-Can Deng, Lei Yao, Er Meng, Zhong-Hua Liu, and Song-Ping Liang (2007) ATDB : a uni- database platform for animal toxins Nucleic Acids Res., In press; doi: doi:10.1093/nar/gkm832.

Canadian Poisonous Plants Information System – Canadian Biodiversity Information Facility (CBIF)

E-Mail: cbif@agr.gc.ca <cbif@agr.gc.ca >
Web: http://www.cbif.gc.ca/pls/pp/poison? p_x=px

The Canadian Poisonous Plants Information System (CPPIS) provides data on plants that cause poisoning in livestock, pets, and humans. The plants include native, introduced, and cultivated outdoor plants as well as indoor plants that are found in Canada. Some food and herbal plants are also included that may cause potential poisoning problems. Although, the information resources available on this website are oriented primarily to a Canadian audience, they can be used elsewhere. For examples, the plants grown in and around homes can be grown throughout the temperate regions of the world. Also, many houseplants are tropical in origin. Other plant species included here have been introduced to North America as well as other temperate regions of the world. The information on the native plant species is applicable wherever they grow

in North America (excerpted from http://www.cbif.gc.ca/pls/pp/ppack.html_doc?p_type=434&p_x=px)

Cornell University Poisonous Plants Informational Database
Web: http://www.ansci.cornell.edu/plants/toxicagents/

This database lists toxic agents associated with plants such as alkaloids, alcohols and ketones, carbohydrates, chealating poisons, glycosides, lipids, metals, mycotoxins, phenolic toxicants, proteins and amino acids, resins and vitamins and other miscellenious toxic agens. For additional information access Cornell University Poisonous Plants Database at http://www.ansci.cornell.edu/plants/index.html and College of Animal Science at http://www.ansci.cornell.edu/index.html.

Global Toxin Review – A web portal
Web: http://globaltoxinreview.com

This is an interactive web community that features a journal, databases, and emerging research and topics in toxinology. Interested members can post articles, join in discussions on various toxin-related issues, and submit articles and research results to the editorial board to be considered for featured articles for a given month. Upon registration, one can participate and gain access to their natural toxin database and share information with other toxinologists and related researchers from all over the world.

At this time, registration is free. The objective of this online publication is to help the field of toxinology and to build a better future through effective information sharing, research collaboration and understanding this emerging field (excerpted from http://globaltoxinreview.com/portal/).

The database section of the website has doctoxin – a natural toxin searchable database. Further, relevant information resources, research articles, and publications have been listed under several other categories such as Arthropod Toxins, Microbial Toxins, Reptile Toxins, Plant Toxins, Marine Toxins, Clinical/Diagnostic Toxinology, General Toxicology, and Historical Toxinology (excerpted from http://globaltoxinreview.com/portal/index.php?page=article&cmd=searchform_tox).

For contact information of the Executive Director/Editor (Dr. Mitchell E Fadem) and other board members, click on information on the web page.

International Veterinary Information Service (IVIS) – Drug Databases and Toxin Databases
P.O. Box 4371 Ithaca NY 14852, USA
E-Mail: info@ivis.org (preferred)
Web: http://www.ivis.org

IVIS is an online publisher of veterinary books and proceedings. The IVIS website currently includes 1673 book chapters and proceeding articles. Access to this page is free but restricted to animal health professionals only. Information resources on toxins, drugs databases, and other databases can be accessed by becoming a member.

Plant Toxic to Animals Database
Mitsuko Williams, Veterinary Medicine Librarian
University of Illinois at Urbana-Champaign
Web: http://www.library.uiuc.edu/vex/toxic/toxic.htm

A brief explanation of the structure of the database is provided below. Within the Toxic Plant Database, two alphabetical lists of plant names, one by common names and the other by scientific names are provided. When a plant is selected in either of the lists, the description of the plant contains a representative plant image at the height of its growth and a brief description for identifying the plant. This section may also contain links to other images of the same plant at different growth stages.

From the description, five other parts of the same plant entry can be accessed such as: 1. Distribution (geographical and the type of area); 2. Conditions of poisoning (how animals are most often poisoned, i.e., time of year, weather conditions, etc. 3. Control (controlling plant growth to prevent poisoning); 4. Toxic principle (chemical principle of the plant which causes the poisoning); 5. Clinical signs (displayed by animals that may have been poisoned by the plant). (excerpted from http://www.library.uiuc.edu/vex/toxic/format.htm).

US FDA/CFSAN Poisonous Plants Database
5100 Paint Branch Parkway, College Park Maryland 20740-3835
Web: http://www.cfsan.fda.gov/~djw/plantox.html

According to USFDA-CFSAN, the information in this database is meant to be used only for scientific exchange. It has not been approved by the USFDA for publication nor does it have any official status. The information resources database available on this website is continuously increasing and being modified. Readers can utilize this new searchable database by 'plant name' or 'plant toxins'. This database replaces the static pages of bibliographic information and the vascular plant list previously available. It contains references to the scientific literature describing studies of the toxic properties and effects of plants and plant parts.

WCH Clinical Toxinology Resources
Web: http://www.toxinology.com

The web portal from the University of Adelaide, Australia provides relevant information resources on

venoms and toxins from snakes, spiders, scorpions, marine and terrestrial invertebrates and vertebrates, and mushrooms are provided. It covers the whole world, with both general information and information about particular organisms, located through a searchable database, which allows users to look for an animal, plant, or mushroom, based on a common name, a scientific name or family, a country or region. Subscribers have access to the full information resources from the system. Information resources are primarily designed for health professionals looking for information on diagnosis and treatment of envenoming and poisoning and other related information. For each organism information resource, there are details on the taxonomy, description (how to identify it), distribution (often with maps), general biology, venom or poison details, summarizing published research, clinical effects, summary of clinical case reports from the medical and scientific literature, treatment guidelines, and available antivenoms and how to obtain them from the producer. It is possible to search not only by animal type and location, but by clinical findings. Thus it acts as a variety of 'expert system' to aid diagnosis. Subscribers can contribute directly by submitting case reports, which will be used to update clinical effects and treatment guidelines. Non-health professionals will also find the site invaluable, for finding taxonomic information, including descriptions of animals. This may be useful for herpetologists, arachnologists, marine biologists, and colleagues. People keeping or studying these animals may also find the subscriber-level data useful, especially amateur herpetologists and zoos keeping venomous snakes. Poisons centers and toxicologists may find it useful as a source of information for acute cases and for information on available antivenoms and producers. Educators may find it useful for sourcing information for lectures, or for assignments.

To contact, access the online form at: http://www.toxinology.com/fusebox.cfm?fuseaction=main.contact_us.contact_us.

CHAPTER

11

Cancer

ANNA M. FAN

INTRODUCTION

The study and evaluation of carcinogenicity of environmental agents is a major focus in the field of toxicology and the protection of environmental and human health. These involve an understanding of the underlying biological system relating to carcinogenesis and developing and evaluating human and animal testing data. The elements involve origins, causes, and incidences of cancer; basic science of cancer; principles in carcinogenesis and carcinogenesis testing; mechanisms of action; human epidemiological investigations and experimental animal or short-term testing: design, quality control, validation, correlation between animal and human data, prediction and epidemiological evidence, exposure, factors affecting carcinogenesis, and data on specific chemicals and agents. The activities involve researching, generating, storing, managing and disseminating data; developing guidelines for generating data and related methodologies; and evaluating and interpreting data for quantitative carcinogenic risk assessment. The parties involved include researchers, government agencies, other public and private parties and other organizations. The availability and accessibility of information and data are critical to achieve the above. This chapter provides a resource list of the major books, journals and journal articles, organizations and databases that represent the up-to-date literature and resources on current issues in studying and evaluating the wide spectrum and diverse toxicological aspects in cancer.

RESOURCES

Books

Adami HO, Hunter D, Trichopoulos D (eds.) (2002)
A Textbook of Cancer Epidemiology
New York: Oxford University Press

This book provides an overview of cancer epidemiology. It examines risk factors such as environmental exposure, lifestyle choices, and genetic susceptibilities. The background section contains basic information on descriptive cancer data, genetics, biomarkers, and causal inferences. The site-specific chapters include clinical synopsis, epidemiology, inherited susceptibility and somatic mutations; and risk factors such as tobacco, alcohol, diet, reproductive and hormonal factors, infections, ionizing radiation, occupation, medical conditions, physical activity, and anthropometric measures. Part I covers Background. The chapters include: Burden of cancer; The origin of cancer; Genetic epidemiology of cancer; Biomarkers of cancer epidemiology; and Concepts in cancer epidemiology and etiology. Part 2 covers Cancer epidemiology and site-specific cancers. The chapters include: Oral and pharyngeal cancers; esophageal cancer; stomach cancer; colorectal cancer; Cancer of the liver and biliary tract; Pancreatic cancer; Cancer of the lung, larynx, and pleura; skin cancer; Breast cancer; Cervical cancer; Endometrial cancer; Ovarian cancer; Prostate cancer; Testicular cancer; Urinary bladder cancer; Kidney cancer; Brain cancer; Thyroid cancer; Hodgkin's lymphoma; non-Hodgkin's lymphoma; and Leukemias.

Acros JC, Argus MS, Woo YT (eds.) (1995)
Chemical Induction of Cancer: Modulation and Combination Effects. An Inventory of the Many Factors Which Influence Carcinogenesis
Boston, MA: Birkhauser.

This book systematically discusses exogenous and endogenous factors that can influence the outcome of carcinogenesis. The multifactor interaction network of carcinogenesis is first discussed followed by a focus on the interactive relationships of the factors. It reviews the elements of the network – initiation process and beyond, repositories of heritable epigenetic information, mixed function oxidases, promoters vs. epigenetic carcinogens, promoters, inhibitors, calories intake vs. rate of cell proliferation, neuroendocrine interface, neuroimmunoendocrine interface, effect of aging, reactive radical species, aging, cancer, and loss of homeostasis. The book provides references for cancer research, prevention measures, and adjuvant therapies.

Benigni R (ed.) (2003)
Quantitative Structure-Activity Relationship (QSAR) Models of Mutagens and Carcinogens
Boca Raton, FL: CRC Press

This book presents QSAR studies on chemical mutagens and carcinogens. It provides a general introduction to QSAR theory and a review of existing QSAR models. It shows how QSAR can contribute to the elucidation of mechanisms, to identifying toxic chemicals solely by their chemical structure, and to the design of safer chemicals. The chapters include: General introduction to QSAR; Mechanisms of action of chemical carcinogens and their role in structure-activity (SAR) relationship analysis and risk assessment; QSAR for individual classes of chemical mutagens and carcinogens; QSARs for the mutagenicity and carcinogenicity of aromatic amines; Public sources of mutagenicity and carcinogenicity data: Use in structure-activity relationship models; SAR in the assessment of carcinogenesis: the MUTIcase approach; Predicting mutagenicity of congeneric and diverse sets of chemicals using computed molecular descriptors: A hierarchial approach; Quantitative structure-activity relationships for acute aquatic toxicity: the role of mechanism of toxic action in successful modeling; and SARs and QSARs of mutagens and carcinogens: Understanding action mechanism and improving risk assessment.

Choy WN (ed.) (2001)
Genetic Toxicology and Cancer Risk Assessment
New York: Marcel Dekker

This book reviews roles of genetic toxicology in human cancer risk assessment, examines predictive values of genotoxicity tests and associated testing requirements and guidelines, and discusses structure-activity relationship, does-response, molecular epidemiology and biomarkers. The chapters include: Human cancer genetics; Genetic toxicity tests for predicting carcinogenicity; Genotoxic and non-genotoxic mechanisms of carcinogenesis; Structure-activity relationship and its role in cancer risk assessment; Regulatory genetic toxicology tests; Complementary genetic toxicology assays; the mouse lymphoma assay (MLA) using the microwell method; the in vitro micronucleus assay; ICH guidelines on genotoxicity and carcinogenicity: scientific background and regulatory practice; New OECD genetic toxicology guidelines and interpretation of results; Does-response relations in chemical carcinogenesis and cancer risk assessment; Molecular epidemiology and biomarkers; Quantitative cancer risk assessment of non-genotoxic carcinogens; and Risk assessment of genotoxic carcinogens.

Clayson D (Author) (2000)
Toxicological Carcinogenesis
Boca Raton, FL: Lewis Publishers

This book provides a discussion of the causes of cancer; detection of carcinogens in humans using epidemiology, bioassays, and alternative approaches; exposure factors such as occupation, cigarette smoking, diet and nutrition; carcinogenesis mechanisms; and controlling exposures. The book starts with the chapter Introduction: What causes cancer? Part I covers the investigation of cancer causation. The chapters include: Epidemiology – Studies of cancer causes in humans; Standard animal bioassays for carcinogens; and Other methods for the identification of carcinogens: Are they quick, less expensive, and as reliable? Part II covers possible human exposures to carcinogens. The chapters include: Exposures in the workplace; Cigarette smoking: a modern plaque; Diet and nutrition; Pharmaceuticals; The General Environment; Rodent carcinogenesis bioassay as a predictor for human cancers; Part III covers reducing the risk of cancer. The chapters include: Carcinogenesis mechanisms; Carcinogenesis risk assessment; Legislation, regulation, and education; and Major goals of research.

DeVita VT, Hellman S, Rosenberg SA (eds. and contributors) (2004)
Cancer: Principles and Practice of Oncology, Seventh Edition
Philadelphia, PA: Lippincott Williams & Wilkins

This book discusses molecular biology, etiology of cancer, principles and practice of oncology, cancer prevention, multimodality treatment and various cancer types. It examines molecular biologic techniques that

include proteomics, genomics, targeted therapies, RNA interference, cDNA arrays, and tissue arrays. It discusses bioinformatics and societal issues in oncology, including regulatory issues, telemedicine, and international differences in oncology. The book consists of Parts 1 to 4 in two volumes, a total of 75 chapters and 3034 pages.

Part I covers molecular biology of cancer. The chapters include: Cancer: a conceptual framework; Genomics and proteomocs; Destabilization of the cancer genome; Teleomere, teleomerase, and cell immortalization; Cell signalling; Cell cycle; Programmed cell death; Angiogenesis; Invasion and metastasis; and Cancer stem cells. Part II covers principles of oncology. The chapters include: Etiology of cancer: Tobacco; Etiology of cancer: cancer susceptibility syndromes; Etiology of cancer: Viruses; Etiology of cancer: inflammation; Etiology of cancer: Chemical factors; Etiology of cancer: Physical factors; Etiology of cancer: Dietary factors; Etiology of cancer: obesity and physical activity; Epidemiology of cancer; Principles of surgical oncology; Principles of radiation oncology; Principles of medical oncology; Principles of immunotherapy; Principles of health services research; Pharmacology of cancer chemotherapy; Pharmacology of cancer biotherapeutics; Pharmacology of endocrine manipulation; Design and analysis of clinical trials. Part III covers practice of oncology. The chapters include: Cancer prevention: Tobacco dependence and its treatment; Cancer prevention: chemoprevention; Cancer prevention: Role of surgery in cancer prevention; Genetic counselling; Cancer screening; Specialized techniques in cancer management; Role of endoscopy in cancer management; Cancer of the heck and neck; Cancer of the lung; Neoplasms of the mediastinum; Cancers of the gastrointestinal tract; Cancers of the genitourinary system; Cancer of the testis; Gynecologic cancers; Cancer of the breast; Cancer of the endocrine system; Sarcomas of the soft tissue and bone; Benign and malignant mesothelioma; Cancer of the skin; Melanoma; Neoplasms of the central nervous system; Cancers of childhood; Lymphomas; Acute leukemias; Chronic leukemias; Plasma cell neoplasms; Paraneoplastic syndromes; Cancer of unknown primary site; Diagnosis and treatment of peritoneal carcinomatosis; Immunosuppression: related malignancies; oncologic emergencies; Treatment of metastatic cancers; Stem cell transplantation; Infections in the cancer patient; Management of adverse effects of treatment; Supportive care and quality of life; Rehabilitation of the cancer patient; Societal issues in oncology; Information systems in oncology; and Complementary, alternative, and integrative therapies. Part 4 covers new approaches in cancer treatment. The chapters include: Gene therapy; Cancer immunotherapy, focused ultrasound; RNA inhibition; Charged particle therapy; Robotic surgery; and Nanotechnology.

Edler L, Kitsos C (eds.) (2005)
Recent Advances in Quantitative Methods in Cancer and Human Health Risk Assessment (Wiley Series in Probability and Statistics)
Hoboken, NJ: John Wiley & Sons

The book begins with the introduction of quantitative risk assessment playing a lead role in the development of quantitative methods. The birth of risk assessment was motivated and guided by the wish to determine threshold doses or exposures to set regulatory limits. The outcome of risk assessment is now increasingly becoming the basis of risk management decisions. The discussion recognizes that risk assessment is a complex field with many aspects to be discussed in the chapters to follow.

Part I covers cancer and human health risk assessment. The chapters include: Principles of cancer risk assessment; The risk assessment paradigm. Part II cover the biological aspects of carcinogenesis. The chapters include: Molecular epidemiology and cancer research; Genetic polymorphism in metabolic enzymes as lung cancer risk factors; Biological carcinogenesis: theories and models; Biological and mathematical aspects of multistage carcinogenesis; and Risk assessment and chemical and radiation hormesis: a short commentary and bibliographic review. Part III covers modeling for cancer risk assessment. The chapters include: Modeling exposure and target organ concentrations; Stochastic carcinogenesis models; A unified modeling approach: from exposure to disease endpoints; Modeling lung cancer screening; and Optimal regimens of cancer screening. Part IV covers statistical approaches for carcinogenesis studies. The chapters include: Analysis of survival data with non-proportional hazards and crossings of survival functions; Does-response modeling; Benchmark does approach; Uncertainty analysis: the Bayesian approach; and Optimal designs for bioassays in carcinogenesis. Part V covers specific modeling approaches for health risk assessment. The chapters include: Cancer risk assessment for mixtures; Designs and models for mixtures; Assessing cumulative risk; and Estimating the natural history of breast cancer from bivariate data on age and tumor size on diagnosis. Part VI covers case studies. The chapters include: Statistical issues in the search for biomarkers of colorectal cancer using microarray experiments; Optimal experimental designs for prediction of morbidity after lung resection; Logistic regression methods and their implementation; The use of logistic regression, discriminant analysis and classification trees in predicting persistent remission

in childhood leukemia; Non-melanoma skin and lung cancer incidence is relation to arsenic exposure: 20 years of observation; and Thyroid cancer incidence rates in Zaragoza.

Frank SA (2007)
Dynamics of Cancer: Incidence, Inheritance, and Evolution (Princeton Series in Evolutionary Biology)
Princeton, NJ: Princeton University Press

This book provides an analysis of how particular genetic and environmental causes influence the age of onset of cancer. It uses molecular, demographic and evolutionary level of analysis and a unique conceptual and historical framework for understanding the causes of cancer. The introduction chapter presents aim and summaries of the chapters. Part I covers background. The chapters include: Age of cancer incidence; Multistage progression; History of theories. Part II covers dynamics. The chapters include: progression dynamics; Theory I; Theory II; Genetics of progression; Carcinogens; and Aging. Part III covers evolution. The chapters include: Inheritance; Stem cells: tissue renewal; Stem cells: population genetics; Cell lineage history; and Conclusions.

Fraumeni JF, Eduardo El, Rohan (eds.) (2002)
Cancer Precursors
New York: Springer-Verlag

This book presents a critical review of the current understanding of cancer precursors. An emphasis is given to various cancers on the etiology and natural history, including the role of environmental factors and heritable factors that provoke normal cells to undergo malignant transformation. Epidemiological data are linked wherever possible to molecular and classical cellular pathology for a better understanding of the causal events and mechanisms that initiate the carcinogenic process. It covers epidemiology, detection methods and preventive strategies for cancer precursors. The book has Parts I to V. Part I cover the biological basis of carcinogenesis. Chapters include: Mechanism and biological markers of carcinogenesis; and Morphology of cancer precursor lesions. Part II covers issues related to measurement and interpretation of cancer precursors. The chapters include: Collection, processing, and analysis of preneoplastic specimens; Intermediate markers of cancer research; theoretical and practical issues in the use of surrogate endpoints; and Assessing epidemiological relations and the role of measurement errors. Part III covers site specific precancerous conditions. The Chapters include: Upper aerodisgestive tract; Eesophagus; Stomach; Colon and rectum; Anus; Liver; Pancreas; Lung; Skin; Breast; Cervix; Endometrium; Ovary; Vulva and vagina; Prostate; and Bladder. Part IV covers control of cancer precursors. The chapters include: Screening; Chemoprevention; and Evidenced-based policy recommendations on screening and prevention. Part V covers conclusion and it contains a chapter on Prospects.

Gabriel JA (2007)
The Biology of Cancer
New jersey: John Wiley and sons Inc.

The book consists of three parts. Part I covers understanding cancer. Part II covers the science of cancer. Part III covers from research to treatment. Part I includes the following chapters: What is cancer? Predisposing factors to developing cancer; Cancer: What does a diagnosis mean for an individual and what are the implications for society? Part II includes the following chapters: The cell; Cytotoxic chemotherapy; What are DNA and RNA; Genetics and cancer; The immune system; Tumour markers; Monoclonal antibodies. Part III includes the following chapters: What is translational oncology research? The application of research methodology to cancer research; and Research ethics related to cancer

IARC (2008)
World Cancer Report
Lyon, France: International Agency for Research on Cancer

This report provides a global view of cancer. The sections include global cancer control, etiology of cancer, mechanisms of carcinogenesis, acting for prevention, and cancer site by site. It addresses cancer control in all resource settings, modifiable risk factors that have been identified, prospects for prevention via vaccination for certain cancers (liver cancer, hepatitis B; cervix cancer, human papillomavirus), and the importance of translational research (i.e., translating scientific discovery into new approaches to cancer treatment to translating information about cancer risk factors into changes in population behavior) while a complete understanding of the mechanisms of cancer development is unlikely to come about in the foreseeable future. The last section includes 25 chapters on different cancer types, plus chapters on cancer in children, cancer in adolescents and rare cancers.

Khan M, Pelengaris S. (2006)
The Molecular Biology of Cancer
Malden, MA: Blackwell Publishing

The introductory chapter starts with the burden of cancer and it identifies 11 key points about cancer, a genetic disease. It introduces and summarizes the concepts and topics covered in the book, with an emphasis on new thinking and key novel models for oncogenesis.

The remaining chapters include: Nature and nurture in oncogenesis; DNA replication and the cell cycle; Regulation of growth: growth factors, receptors, and signaling pathways; Oncogenes; Tumor suppressor genes; Apoptosis; Telomeres an scenescence; Genetic instability, chromosomes and repair; Cancer is more than a genetic condition; Cell-matrix adhesion, cell-cell interactions and malignancy; Tumor immunity and immunotherapy; Angiogenesis; Diagnosis of cancer; Treatment of cancer: Chemotherapy and radiotherapy; Caring for the cancer patient; and Genomics and proteomics in cancer research and diagnosis.

Kitchin KT (ed.) (1999)
Carcinogenicity. Testing, Predicting, and Interpreting Chemical Effects
New York: Marcel Dekker, Inc.

This book provides an overview of knowledge and information on carcinogenicity and how to build on it by compiling and evaluating data. It is divided into three parts, on testing, predicting and interpreting carcinogenicity. The first part addresses carcinogenicity testing protocols and how and why the studies are carried out (Chapters 1–5). The second part discusses animal predictive systems, rat liver foci systems, full rodent bioassays, transgenic animal models, animal parameters system (DNA damage, cell toxicity, cell proliferation), hepatic enzyme pyruvate kinase, and short-term tests (Chapters 6–14). The third part presents human, mouse, and rat data for organs with high and low rates (Chapters 15–29). An integrative attempt was made on carcinogenic mechanisms, interspecies differences and interorgan differences in carcinogenesis.

Knowles MA, Selby PJ (2005)
Introduction to the Cellular and Molecular Biology of Cancer (Fourth edition)
New York: Oxford University Press

The chapters include: What is cancer? The causes of cancer; Inherited susceptibility to cancer; DNA repair ad cancer; Epigenetic events in cancer; Molecular cytogenetics of cancer; Oncogenes; Tumour suppressor genes; Cellular immortalization and telomerase activation in cancer; Growth factors and their signaling pathways in cancer; Apoptosis: Molecular physiology and significance for cancer therapeutics; Mechanisms of viral carcinogenesis; Cytokines and cancer; Hormones and cancer; The spread of tumours; Tumour angiogenesis; Stem cells, haemopoiesis, and leukaemia; Animal models of cancer; The immunology of cancer; The molecular pathology of cancer; From transcriptome to proteome; Local treatment of cancer; Chemotherapy; Radiotherapy and molecular radiotherapy; Monoclonal antibodies and therapy; Immunotherapy of cancer; Cancer gene therapy; Screening; and Conclusions and prospects.

Macdonald F (2004)
Molecular Biology of Cancer (Advanced Text)
New York: Garland Science/BIOS Scientific Publishers

This book provides an overview of cancer biology, scientific aspects of genes involved with cancer, applications – molecular testing, and cancer genes as therapeutic targets, and gene analysis techniques. The chapters include: General principles; Oncogenes; Tumour suppressor genes; Cell cycle control genes and mismatch repair genes; Hereditary cancers; Lung cancer; Colorectal cancer; Gastrointestinal cancer; Breast cancer; Genitourinary cancer; Leukemia and lymphoma; Childhood solid tumours; Therapeutic applications; and Molecular techniques for analysis of genes.

McKinnell RG, Parchment RE, Perantoni AO, Pierce GB (2006)
The Biological Basis of Cancer
New York: Cambridge University Press

This book provides discussions in the following chapters: The pathology of cancer; Invasion and metastasis; Carcinogenesis, Genetics and heredity; Cancer associated genes; Cancer in non-human organisms; Epidemiology; Lifestyle: Is there anything more important? The stem cell basis of cancer treatment: concepts and clinical outcomes; Oncology: The difficult task of eradicating caricatures of normal tissue renewal in the human patient. An Introduction is entitled Letters illustrating clinical aspects of cancer. An appendix provides a description of the following selected tumors: Adenocarcinoma of the breast, adenocarcinoma of the prostate, adenocarcinoma of the colon, squamous cell carcinoma, teratocarcinomas, liver cell carcinoma, lung cancer, malignant melanoma, retinoblastoma, neuroblastoma, Wilms tumor (nephroblastoma), sarcomas, and lymphoma and leukemia.

Preziosi L (2003)
Cancer Modelling and Simulation (Chapman & Hall/Crc Mathematical Biology & Medicine Series)
Boca Raton, FL: CRC Press

This book presents mathematical models and computer simulation techniques for understanding the dynamics of tumour development and growth. It provides an overview of the processes involved in tumour development and growth, including angiogenesis, subcellular mechanisms, and the basic mechanisms of diffusion in avascular and vascular tumours. The chapters include: Biological aspects of tumour angiogenesis; Novel directions in tumour biology: from basement membrane-directed polarity to DNA methylation;

Interstitial transport in solid tumours; Modelling avascular tumour growth; Mechanical models in tumour growth; Modelling tumour induced angiogenesis; Multiscale analysis of angiogenic dynamics and therapy; Adhesion mechanisms in cancer metastasis; Static and dynamic interaction between endothelium and circulating cells in cancer; Mathematical modeling of tissue invasion; Cancer immune system competition: Modelling and bifurcation problem; Analyzing hypersensitivity to chemotherapy in a cellular automata model of the immune system; and Reaction-diffusion systems: A mathematical biology approach.

Ruddon RW (2007)
Cancer Biology
New York: Oxford University Press

This book provides an overview of the nature of cancer and cancer research, including a history of cancer biology, with an emphasis on the mechanics and characteristics of different forms of cancer and stages of cancer. The chapters include: Characteristics of human cancer, Causes of human cancer, The epidemiology of human cancer, The biochemistry and cell biology of cancer, Molecular genetics of cancer; Tumor immunology, Cancer diagnosis, Sequelae of cancer and its treatment, and Cancer prevention.

Schottenfeld D and Fraumeni J (2006)
Cancer Epidemiology and Prevention)
New York: Oxford University Press

The book starts with a discussion of the evolution of the concepts of causation and theories of carcinogenesis. It consists of Parts I to V. Part I covers basic concepts. The chapters include: Causation and causal inference; Experimental studies in the assessment of human risk; Morphologic classification of human cancer; Morphology and natural history of cancer precursors; Stages in neoplastic development; Molecular and genetic events in neoplastic transformation; Molecular epidemiology in cancer prevention; Quantitative risk assessment; and Mathematical models in cancer epidemiology. Part II covers the magnitude of cancer. The chapters include: International patterns of cancer; Cancer incidence, mortality, and patient survival in the United sSates; Cancer incidence: mortality, and survival among racial and ethnic minority groups in the United States; Migrant studies; and Economic impact of cancer in the United States. Part II covers the causes of cancer. The chapters include; Tobacco; Alcohol; ionizing radiation; Solar radiation; Occupation; Air pollution; Water pollution; Diet and Nutrition; Exogenous hormones; Pharmaceuticals other than hormones; Viruses; Immunologic factors, including AIDS; Familial aggregation; Inherited susceptibility; Cancers of the nasal cavity and paranasal sinuses; Nasopharyngeal cancer; Laryngeal cancer; Cancers of the lung and pleura; Cancers of the oral cavity and pharynx; Esophageal cancer; Stomach cancer; Pancreatic cancer; Liver cancer; Biliary tract cancer; Cancers of the small intestine; Cancers of the large intestine; The leukemias; Hodgkin's disease; non-Hodgkin's lymphoma; Multiple myeloma; Bone cancer; Soft tissue sarcoma; Thyroid cancer; Breast cancer; Ovarian cancer; Endometrial cancer; Cervical cancer; Cancers of the vulva and vagina; Choriocarcinoma; Renal cancer; Bladder cancer; Prostate cancer; Testicular cancer; Penile cancer; Neoplasms of the nervous system; cutaneous malignant melanoma; Nonmelanoma skin cancer; Cancers in children; and Multiple primary cancers. Part V covers cancer prevention and control. The chapters include: Principles and applications of cancer prevention; Health education and health promotion in cancer prevention; Intervention studies; Fundamental issues in screening for cancer; and Environmental regulation and policy making.

Schulz WA (2007)
Molecular Biology of Human Cancer: An Advanced Student's Textbook
The Netherlands: Springer

The book is divided into three parts. Part I covers molecules, mechanisms, and cells. Part II covers human Cancers. Part III covers prevention, diagnosis, and therapy. Part I contains the following chapters: An introduction to human cancers; Tumor genetics; DNA damage and DNA repair; Oncogenes; Tumor suppressor genes; Cancer pathways; Apoptosis and replicative senescence in cancer; cancer epigenetics; and invasion and metastasis. Part II contains the following chapters: Leukemia and lymphomas; Wilms tumor (nephroblastoma), Cancers of the skin; Colon cancer; bladder cancer; Renal cell carcinoma; Liver cancer; Stomach cancer; breast cancer; and prostate cancer. Part III contains the following chapters: Cancer Prevention: Cancer diagnosis, and Cancer therapy. Each chapter provides additional information for further reading.

Shields PG (ed.) (2005)
Cancer Risk Assessment (Basic and Clinical Oncology)
Boca Raton, FL: Taylor and Francis Group

This book discusses how cancer develops, individual genetic and acquired susceptibilities, assessing cancer risk, assessment and use of biomarkers, and cancer by organ types. It provides molecular, epidemiological and biomarker data on breast, gynecological, liver, brain and prostate cancers. The chapters include: Carcinogenesis

and molecular genetics; Epidemiological approaches to studying cancer I: study design, confounding variables, misclassification and cancer clusters; Epidemiological approaches to studying cancer II: Molecular epidemiology; Methods for genetic testing I: assessing mutations and cancer; Methods for genetic testing II: new methods for assessing acquired DNA damage in humans without cancer; Quantitative cancer risk assessment; Cancer risk assessment I: How regulatory agencies determine what is a carcinogen; Cancer risk assessment II: Methods for determining cancer etiology: assessing risk in individuals; cancer epidemiology; Cancer susceptibility genes and common gene variants that increase cancer risk; Chemical causes of cancer; Viral causes of cancer; Uncertainty in the estimation of radiation related cancer risk; Occupational cancer; Quantification of occupational and environmental exposures in epidemiological studies; Cancer risk for tobacco and alcohol use; Hormones and cancer; Cancer in multiracial and multiethnic populations; Respiratory tract cancers; Heck and neck cancers; Breast cancer; gynecological cancer – ovarian, endometrial, cervical. The natural history of esophageal cancer; Liver cancer – Risk factors and prevention; Brain cancer; New perspectives on epidemiology of haematological malignancies and related disorders; Bladder cancer; and Molecular and biochemical approaches to the etiology of prostate cancer.

Tan WY, Hanin L (2008)
Handbook Of Cancer Models With Applications (Series in Mathematical Biology and Medicine)
Hackensack, NJ: World Scientific Publishing Company

This book discusses cancer models in the following chapters: Oncogenetic trees; Stochastic multistage cancer models: a fresh look at an old approach; Cancer biology, cancer models, and some new approaches to carcinogenesis; Some general stochastic models of carcinogenesis; Modeling the effect of radiation on cell cycle regulation and carcinogenesis; Cancer models, ionizing radiation, and genomic instability: A review; Distribution of the sizes of metastasis: mathematical and biomedical considerations; Mathematical models of cancer and their relevant insights; Major epigenetic hypothesis of carcinogenesis revisited; Induction and repair of DNA damage formed by energetic electrons and light ions; Radiation bystander effects; A stochastic model of human colon cancer involving multiple pathways; Cancer risk assessment of environmental agents by stochastic and space models of carcinogenesis; Stochastic models for preneoplastic lesions and their application for cancer risk assessment; Drug resistance in cancer models; Bladder cancer screening by magnetic resonance imaging; Mathematical framework and wavelets applications in proteomics for cancer study; Advanced statistical models for the design and analysis of tumor xenograft experiments; and Analysis of occult tumor studies.

Warshawsky D, Landolph JR Jr (eds.) (2006)
Molecular Carcinogenesis and the Molecular Biology of Human Cancer
New York: CRC/Taylor and Francis.

This book is intended to be a graduate textbook in molecular carcinogenesis. It contains 24 chapters and a detailed index at the end. The content covers the basic science of cancer, including a historical overview of cancer and chemical carcinogenesis, chemical carcinogenesis, viral carcinogenesis, radiation carcinogenesis, oncogenes, tumor suppressor genes, and genomics and proteonomics approaches to understand the molecular nature of cancer. It includes an overview of human cancer induction and human exposure to carcinogens, complex mixtures of chemical carcinogens, tumors of various human organs, including breast cancer, prostate cancer, skin cancer, cancer of the brain, and cancer of the thyroid. It continues with chemoprevention of chemical carcinogenesis and human cancer, exposure assessment and biomarkers, carcinogenic risk assessment, and the regulation of carcinogens.

Wodarz D, Komarova NL (2005)
Computational Biology Of Cancer: Lecture Notes And Mathematical Modeling
Hackensack, NJ: World Science Publishing Company Ltd.

This book shows how mathematical and computational models can be used to study cancer biology. It introduces the concept of mathematical modeling and then applies it to a variety of topics in cancer biology such as initiation and progression, somatic evolution of cells, genetic instability, and angiogenesis. The book discusses the use of mathematical models for therapeutic approaches. The chapters include: Cancer and somatic evolution; mathematical modeling of tumorigenesis; Cancer initiation – one-hit and two-hit stochastic models; Microsatellite and chromosomal instability in sporadic and familial cancers; Cellular origins of cancer; Costs and benefits of chromosomal instability; DNA damage and genetic instability; tissue aging and the development of cancer; Basic models of tumor inhibition and promotion; Mechanisms of tumor neovascularization; Cancer and immune responses; and Therapeutic approaches: viruses as anti-tumor weapon. An appendix provides exact formula for total probability of double mutations.

Journals

Carcinogenesis (archives of online issues Jan 1, 1980–Oct 1, 2006)
Oxford Journals, Oxford University Press.
Web: http://carcin.oxfordjournals.org

Carcinogenesis is a multidisciplinary journal that brings together all the varied aspects of research that will ultimately lead to the prevention of cancer in humans. The journal publishes papers that warrant prompt publication (or research) in the areas of Cancer Biology, Molecular Epidemiology and Cancer Prevention, and Carcinogenesis. Cancer Biology includes the processes of promotion, progression, signal transduction, apoptosis, genomic instability, growth factors, cell and molecular biology, mutation, DNA repair, and genetics. Molecular Epidemiology and Cancer Prevention includes molecular dosimetry, epidemiology, genetic predisposition to cancer, chemoprevention, nutrition, and cancer. Carcinogenesis includes viral, chemical, and physical carcinogenesis, metabolism of carcinogens, and the formation, detection, and identification and quantification of environmental carcinogens.

Journal of Carcinogenesis
BioMed Central
Web: http://www.biomedcentral.com

The journal receives papers on all aspects of physical and chemical carcinogenesis and mutagenesis. It is an open-access, peer-reviewed, online journal designed to bring together many aspects of research to develop the understanding of carcinogenesis. It considers manuscripts in the areas of carcinogenesis that include physical and chemical carcinogenesis and mutagenesis; processes influencing or modulating carcinogenesis, such as DNA repair, genetics, nutrition, and metabolism of carcinogens; the mechanism of action of carcinogens and modulating agents; epidemiological studies; and the formation, detection, identification, and quantification of environmental carcinogens. The publications include commentaries, original research findings, review articles, and short papers.

Journal of Environmental Science and Health, Part C, Environmental Carcinogenesis and Ecotoxicology Reviews
Marcel Dekker/Taylor and Francis.
Web: http://www.tandf.co.uk/journals/titles/10590501.asp

Environmental Carcinogenesis and Ecotoxicology Reviews is a multidisciplinary journal for the rapid publication of integrative, critical reviews on timely and important subjects in various areas of environmental carcinogenesis. The subjects covered include risk assessment of chemical/physical agents, biological factors of environmental significance, basic research and methodology, theoretical modeling, host susceptibility and mechanistic studies, and protection of environment and ecosystems.

Journal of the National Cancer Institute (Full text coverage January 1999 – present)
Oxford University Press.

The *Journal of the National Cancer Institute* (JNCI) publishes peer-reviewed original research from around the world. It includes broad subjects in clinical medicine and specific subjects in oncology and hematology. For the past several years, the Institute of Scientific Information in its annual Journal Citation Reports has ranked the JNCI as the most-cited original-research cancer journal.

Government/public reports

IARC (1999)
Epidemiology of Childhood Cancer
IARC Scientific Publications, No. 149
Lyon, France: International Agency for Research in Cancer.

This report summarizes the descriptive epidemiology and critically appraises analytical epidemiologic data on childhood cancer. It includes data on childhood neoplasms from cancer registries, using protocols comparable to those employed in the collection of data previously published in the *International Incidence of Childhood Cancer*. This database reveals intriguing patterns of geographical variations in incidence, which point to causation by different etiological factors. The chapters include design issues (case-control studies, cohort studies); hypothesis involving considerations of different routes of exposure; and descriptive epidemiology for leukemias, lymphomas, and other reticuloendothelial neoplasms, neoplasms of the central nervous systems and miscellaneous intracranial and intraspinal neoplasms, and other neoplasms. In addition, it discusses genetic factors and familial aggregation; ionizing radiation; electromagnetic fields; exposures to chemicals and dusts; infection; lifestyle; maternal reproductive history, maternal illness and related drug use; and medical history of the index child.

U.S. EPA (2005)
Guidelines for Carcinogen Risk Assessment
Risk Assessment Forum, U.S. Environmental Protection Agency Washington, DC.
EPA/630/P-03/001F
Web: http://www.epa.gov/cancerguidelines

This document provides a revised set of principles and procedures to guide EPA scientists in assessing cancer

risk from exposures to chemicals or other agents in the environment. It reflects EPA's evolving approach to cancer risk assessment last revised in 1986 and 1999. The guidelines are prospective only and will apply to the agency's current and future risk assessments of environmental pollutants. The guidelines are also used to inform agency decision-makers and the public about risk assessment procedures.

The Health Consequences of Involuntary Exposure to Tobacco Smoke: A Report of the Surgeon General (2006)
U.S. Department of Health and Human Services
Centers for Disease Control and Prevention
National Center for Chronic Disease Prevention and Health Promotion
Office on Smoking and Health

The report concluded that many millions of Americans, both children and adults, are still exposed to secondhand smoke in their homes and workplaces despite substantial progress in tobacco control. A chemical called cotinine is a biomarker of secondhand smoke exposure. Secondhand smoke contains hundreds of chemicals known to be toxic or carcinogenic (cancer-causing), including formaldehyde, benzene, vinyl chloride, arsenic, ammonia, and hydrogen cyanide. Secondhand smoke has been designated as a known human carcinogen (cancer-causing agent) by the U.S. Environmental Protection Agency, National Toxicology Program and the International Agency for Research on Cancer (IARC). The National Institute for Occupational Safety and Health has concluded that secondhand smoke is an occupational carcinogen. Exposure of adults to secondhand smoke has immediate adverse effects on the cardiovascular system and causes coronary heart disease and lung cancer. Concentrations of many cancer-causing and toxic chemicals are higher in secondhand smoke than in the smoke inhaled by smokers. Nonsmokers who are exposed to secondhand smoke at home or at work increase their risk of developing lung cancer by 20–30%.

U.S. EPA (1997)
Health Effects Assessment Summary Tables, FY 1997 Update. EPA 540/R-97-036
Washington, DC: Office of Research and Development and Office of Emergency and Remedial Response.

The Health Effects Assessment Summary Tables (HEAST) is a comprehensive listing consisting almost entirely of provisional risk assessment information relative to oral and inhalation routes for chemicals of interest to Superfund, the Resource Conservation and Recovery Act (RCRA), and the EPA in general.

Mohr U (ed.) (1992–1997)
IARC International Classification of Rodent Tumours. Part I: The rat. 10. Digestive System
IARC Scientific Publications, No. 122
Lyon, France: International Agency for Research in Cancer.

This report on international classification of rodent tumors is part of a series of 10 fascicles to provide information and guidelines especially adapted for international use in practical toxicologic pathology. Included in the classification are tumors and relevant pre-neoplastic lesions of the rat for all organ systems. Hyperplastic and metaplastic changes are only considered in association in as far as they are known to be clearly pre-neoplastic, i.e., incidentally and pathogenetically associated with corresponding tumors. Other reactive hyperplastic lesions, which, for example, develop secondarily to inflammation, are not included. Also, only lesions are considered for which histopathological slides are available or which have been documented with pictures in the literature. The goal is to harmonize and standardize the nomenclature and diagnostic categories to be used worldwide for regulatory purpose. The complete range of organ systems is covered in ten fascicles, the latest of which was published in 1997.

IARC (2006)
IARC Monographs on the Evaluation of Carcinogenic Risks to Humans. Preamble. International Agency for Research on Cancer
Lyon, France: World Health Organization.

The preamble discusses the principles and procedures used in developing the IARC monographs (described above), including the scientific criteria that guide the working group's evaluations. In the IARC evaluation process, the strength of the evidence that any carcinogenic effect observed is due to a particular mechanism is evaluated, and designated as 'weak', 'moderate', or 'strong'. Whether the particular mechanism is likely to be operative in humans is then assessed. In the classification process, mechanistic data are used to evaluate evidence of carcinogenicity, help in assessing the relevance and importance of findings of cancer in animals and in humans, and to further determine the final classification of a chemical under evaluation. The initial two partial evaluations are combined into a preliminary default evaluation and designated in one of the categories that classify whether the agent is 'carcinogenic to humans' (group 1), 'probably carcinogenic to humans' (group 2A), 'possibly carcinogenic to humans' (group 2B), 'not classifiable as to its carcinogenicity to humans' (group 3), or 'probably not carcinogenic to humans' (group 4). Then the mechanistic

and other relevant data are considered to determine the need for modification of the default evaluation. In considering all relevant scientific data, the working group may assign the agent to a higher or lower group than the default would indicate.

International Agency for Research on Cancer
International Agency for Research on Cancer (IARC) Monograph series on the Evaluation of Carcinogenic Risks to Humans
Lyon, France: World Health Organization.

The IARC monographs are scientific evaluations of carcinogenic risks to humans of chemicals, complex mixtures, occupational exposures, lifestyle factors, physical and biologic agents, and other potentially carcinogenic exposures. Each monograph includes a critical review of the pertinent peer-reviewed scientific literature as the basis for an evaluation of the weight of the evidence that an agent may be carcinogenic to humans.

The IARC is part of the World Health Organization whose mission is to coordinate and conduct research on the causes of human cancer, the mechanisms of carcinogenesis, and to develop scientific strategies for cancer control. The Agency is involved in both epidemiological and laboratory research and disseminates scientific information through publications, meetings, courses, and fellowships. National health agencies use this information as scientific support for their actions to prevent exposure to potential carcinogens. Since 1971, more than 900 agents have been evaluated, of which approximately 400 have been identified as carcinogenic or potentially carcinogenic to humans.

National Toxicology Program (NTP) Report on Carcinogens
National Toxicology Program
Bethesda, MD

The NTP Report on Carcinogens provides a listing of substances which either are known to be human carcinogens or may reasonably be anticipated to be human carcinogens and to which a significant number of persons residing in the United States are exposed. It is an informational scientific and public health document first ordered by Congress in 1978 that identifies and discusses agents, substances, mixtures, or exposure circumstances that may pose a hazard to human health by virtue of their carcinogenicity. The report is published biennially and serves as a meaningful and useful compilation of data on the following: (1) The carcinogenicity (ability to cause cancer), genotoxicity (ability to damage genes), and biologic mechanisms (modes of action in the body) of the listed substance in humans and/or animals; (2) The potential for human exposure to these substances; and (3) federal regulations to limit exposures.

Driscoll T, Steenland K, Prüss-Üstün A, et al (2004)
Occupational carcinogens: Assessing the environmental burden of disease at national and local levels. Environmental Burden of Disease Series No. 6.
Geneva, Switzerland: World Health Organization.

This guide provides practical advice for assessing the current burden of disease from past and current occupational exposures to carcinogens. The outcomes of such exposures include lung cancer, leukemia, and malignant mesothelioma. The disease burden is measured in terms of the number and proportion of deaths from these conditions, as well as in terms of total disability (using disability-adjusted life years, or DALYs). Exposure at national level is estimated using workforce data for the country, as well as exposure data for carcinogens in different industries (based on European data). The relative risk for cancer for each carcinogen is estimated from international literature. This information is combined to estimate the impact in each country of occupational exposures to carcinogens. This figure is termed the population attributable fraction (AF), and AF estimates are presented as fractions of the deaths and disability that are caused by occupational exposures to carcinogens. The number of deaths attributable to the occupational exposures to carcinogens can then be estimated by multiplying the AF by the number of deaths in the country. The extent of disability can also be estimated by multiplying the AF by disease-specific estimates of DALYs.

U.S. EPA (2005)
Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens
Risk Assessment Forum, U.S. Environmental Protection Agency Washington, DC 20460
EPA/630/R-3/003F
Web: http://www.epa.gov/cancerguidelines

This Supplemental Guidance describes possible approaches that the EPA could use in assessing cancer risks from exposures to children from 0 to 16 years of age. It includes a review of existing scientific literature on chemical effects in animals and humans. It also summarizes the results of the cancer studies that investigated early-life exposure, EPA's analysis of those studies, and analysis to strengthen the scientific basis for adjusting from studies conducted in adults to children. This document is consistent with the National Research Council's 1994 recommendation that 'EPA assess risks to infants and children whenever it appears that their risks might be greater than those of adults.'

Survey of Compounds Which Have Been Tested for Carcinogenicity (1997–1998)
U.S. Public Health Service, under contract to National Cancer Institute

This three-volume set is the 20th edition of U.S. Public Health Service Publication No. 149, *Survey of Compounds Which Have Been Tested for Carcinogenic Activity*, and covers literature published in 1997–98. It is published under contract to the Chemical and Physical Carcinogenesis Branch, Division of Cancer Biology, National Cancer Institute.

Survey of Compounds Which Have Been Tested for Carcinogenic Activity. Cumulative Indexes (1991)
Bethesda, MD: National Cancer Institute.
DHHS-N01-CP-71114, PB92-143767

The volume includes a Cumulative Chemical Name Index containing all chemical names, both common names and CAS preferred names, used in all volumes of the Public Health Service (PHS-149) series in alphabetical order. The chemical accession numbers for the PHS-149 volumes in which each chemical appears accompany each chemical name. In addition to the Cumulative Chemical Name Index, the volume includes a Cumulative CAS Registry Number Index. The index includes all available CAS Registry Numbers listed sequentially with the chemical accession number for each PHS-149 volume in which the chemical is found. Thus, the user can use both chemical name and/or CAS Registry Number to search the PHS-149 volumes for information on a compound.

Stewart BW, Kleihues P (2003)
World Cancer Report
IARC Nonserial Publication
Geneva, Switzerland: World Health Organization.

This report provides a global view of cancer as it documents the frequency of cancer in different countries, trends in cancer incidence and mortality. It describes the known causes of human cancer and the molecular and cellular basis of the multistep process of malignant transformation. It contains an overview of cancer prevention, including screening programs for early diagnosis, as well as advances in surgical and medical oncology, including novel drugs targeting tumor-specific signaling pathways. The efforts of the World Health Organization in the fight against cancer are detailed, together with strategies for cancer control.

Organizations

American Conference of Governmental Industrial Hygienists (ACGIH)

ACGIH (American Conference of Governmental Industrial Hygienists) is an organization devoted to the administrative and technical aspects of occupational and environmental health. The *Documentation of the Threshold Limit Values and Biological Exposure Indices* is the source publication for the TLVs and BEIs issued by ACGIH every year. The categories for carcinogenicity are: (1) Group A1 – confirmed human carcinogen; (2) Group A2 – suspected human carcinogen; (3) Group A3 – confirmed animal carcinogen with unknown relevance to humans; (4) Group A4 – Not classifiable as a human carcinogen; (5) Group A5 – Not suspected as a human carcinogen.

California Environmental Protection Agency, Office of Environmental Health Hazard Assessment
Oakland/Sacramento
Web: vwww.oehha.ca.gov

The California Environmental Protection Agency's (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA), as lead agency for the implementation of the Safe Drinking Water and Toxic Enforcement Act of 1986, maintains the Proposition 65 list of chemicals that have been identified by the State to cause cancer, birth defects, or other reproductive harm. One of the mechanisms by which a chemical can be put on the Proposition 65 list is when the chemical has been identified as causing cancer by an organization that has been designated as 'authoritative' for purposes of Proposition 65. The listing can be reconsidered under certain situations. A Carcinogen Identification Committee (CIC) makes recommendations regarding chemical carcinogen status.

National Cancer Institute (NCI)
There are NCI-designated Cancer Centers in 30 states
National Institute of Health
Bethesda, Maryland 20892
Web: http://www.cancer.gov

The National Cancer Institute (NCI) was established under the National Cancer Act of 1937. It is the Federal Government's principal agency for cancer research and training and is a component of the National Institutes of Health (NIH), one of eight agencies that compose the Public Health Service National Cancer Institute (NCI) (PHS) in the Department of Health and Human Services (DHHS). The National Cancer Act of 1971 broadened the scope and responsibilities of the NCI and created the National Cancer Program. The NCI coordinates the National Cancer Program, which conducts and supports research, training, health information dissemination, and other programs with respect to the cause, diagnosis, prevention, and treatment of cancer, rehabilitation from cancer, and the

continuing care of cancer patients and the families of cancer patients.

National Toxicology Program (NTP)
Located administratively at the NIEHS/NIH
Web: http://ntp.niehs.nih.gov/

The NTP is an interagency program whose mission is to evaluate agents of public health concern by developing and applying tools of modern toxicology and molecular biology. The program maintains an objective, science-based approach in dealing with critical issues in toxicology and is committed to using the best science available to prioritize, design, conduct, and interpret its studies. To that end, the NTP is continually evolving to remain at the cutting edge of scientific research and to develop and apply new technologies. NTP was established in 1978 and it was granted permanent status in 1981. The program was created as a cooperative effort to coordinate toxicology testing programs within the federal government, strengthen the science base in toxicology, develop and validate improved testing methods, provide information about potentially toxic chemicals to health, regulatory, and research agencies, scientific and medical communities, and the public. The three agencies that form the core of the NTP are National Institute of Environmental Health Sciences of the National Institutes of Health (NIEHS/NIH), National Institute for Occupational Safety and Health of the Centers for Disease Control and Prevention (NIOSH/CDC), and National Center for Toxicological Research of the Food and Drug Administration (NCTR/FDA). The NTP relies upon three external groups for advice on its activities and special emphasis panels for independent scientific peer review and advice on targeted issues.

Occupational Safety and Health Association (OSHA)

Under OSHA, carcinogens are addressed in specific standards for the general industry, shipyard employment, and the construction industry. The Identification, Classification, and Regulation of Carcinogens are specified under 29 Code of Federal Regulations (CFR) 1990. The criteria for identification, classification, and regulation of potential occupational carcinogens are described in two categories: Category I Potential Carcinogens and Category II Potential Carcinogens, unless the Secretary considers evidence in provisions under subpart of 1990 and determines that such evidence warrants an exception to these criteria.

World Health Organization (WHO)
Web: http://www.who.int/en/

The World Health Organization, established in 1948, is the United Nations specialized agency for health. WHO's objective is set out in its Constitution which is the attainment by all peoples of the highest possible level of health. Health is defined in WHO's Constitution as a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity. WHO is governed by 193 Member States through the World Health Assembly which is composed of representatives from WHO's Member States. The main tasks of the assembly are to approve the WHO program and the budget for the following biennium and to decide major policy questions. WHOLIS is the WHO's library database available on the web. WHOLIS indexes all WHO publications from 1948 onwards and articles from WHO-produced journals and technical documents from 1985 to the present. An on-site card catalogue provides access to the pre-1986 technical documents.

Databases

California Environmental Protection Agency (Cal/EPA) toxicity values
Web: http://www.oehha.ca.gov/risk/chemicalDB/index.asp

This database provides various toxicity values for chemicals that have undergone evaluations or risk assessments by various programs within the Office of Environmental Health Hazard Assessment, Cal/EPA. They are searchable by chemical name, CAS number or highlighting from a list of chemicals provided. The criteria include Cancer Potency Factors, Acute Reference Exposure Levels (RELs), Chronic Reference Exposure Levels (RELs), Public Health Goals (PHGs), No Significant Risk Levels (NSRL), and Maximum Allowable Daily Levels (MADL). Full documentation can be obtained from the Office's website.

Carcinogenic Potency Database (CPDB)
Web: http://potency.berkeley.edu/text/methods.html

The Carcinogenic Potency Database (CPDB) is a systematic and unifying analysis of chronic, long-term animal cancer tests. It standardizes the published literature and creates a resource containing results reported in 1426 papers in the general literature through 1997 and 429 Technical Reports of the National Cancer Institute/National Toxicology Program (NCI/NTP) through 1998. Results reported for 6153 experiments on 1485 chemical agents are displayed in a plot format organized by chemical name. Detailed information important in the interpretation of bioassays is reported on each experiment (whether positive or negative for carcinogenicity). This includes: qualitative information on strain, sex, route of compound administration, target organ, histopathology,

author's opinion about carcinogenicity, and reference to the published paper, as well as qualitative information on daily dose-rate, duration of dosing, length of experiment, tumor incidence, and dose–response curve shape. A measure of carcinogenic potency, TD_{50} (tumorigenic dose-rate for 50% of experimental animals), its confidence limits, and statistical significance are estimated for each site reported in the database. References for the original published paper are provided. The experiments were not evaluated by CPDB staff regarding whether or not a compound induced tumors in any given experiment; rather, the opinion of the published author is presented for each target site as well as the statistical significance of the TD_{50} calculated from the experimental results.

Chemical Carcinogenesis Research Information System (CCRIS)
Toxicology Data Network
U.S. Library of Medicine

CCRIS is a toxicology data file of the National Library of Medicine's (NLM) Toxicology Data Network (TOXNET®). It is a scientifically evaluated and fully referenced data bank, developed and maintained by the National Cancer Institute (NCI). It contains over 9000 chemical records with carcinogenicity, mutagenicity, tumor promotion, and tumor inhibition test results. Data are derived from studies cited in primary journals, current awareness tools, NCI reports, and other special sources. Test results have been reviewed by experts in carcinogenesis and mutagenesis. CCRIS is accessible via TOXNET at: http://toxnet/nlm.nih.gov. Users can search by chemical or other name, chemical name fragment, Chemical Abstracts Service Registry Number (RN), and/or subject terms. Search results can easily be viewed, printed or downloaded. Search results are displayed in relevancy ranked order. Users may select to display any combination of data from the following broad groupings: (a) Carcinogenicity Studies; (b) Tumor Promotion Studies; (c) Mutagenicity Studies; and (d) Tumor Inhibition Studies. Users can easily conduct their CCRIS search strategy against other databases: Hazardous Substances Data Bank®, Integrated Risk Information System, and GENE-TOX.

ESIS (European Chemical Substances Information System)
Web: http://ecb.jrc.it/esis/

The European Chemical Substances Information System is an IT System which provides information on chemicals related to: EINECS (European Inventory of Existing Commercial Chemical Substances); ELINCS (European List of Notified Chemical Substances); NLP (No-Longer Polymers); HPVCs (High Production Volume Chemicals) and LPVCs (Low Production Volume Chemicals), including EU Producers/Importers lists, C&L (Classification and Labelling), Risk and Safety Phrases, Danger etc.; IUCLID Chemical Data Sheets, IUCLID Export Files, OECD-IUCLID Export Files, EUSES Export Files; and Priority Lists, Risk Assessment process and tracking system in relation to Council Regulation (EEC) 793/93 also known as Existing Substances Regulation (ESR).

Integrated Risk Information System (IRIS)
U.S. EPA
Web: http://www.epa.gov/iris/intro.htm

The Integrated Risk Information System (IRIS) is an electronic database prepared and maintained by the U.S. EPA that contains information on human health effects that may result from exposure to environmental chemicals, including both carcinogens and non-carcinogens. For carcinogens, the chemical files contain descriptive and quantitative information on hazard identification, oral slope factors, and oral and inhalation unit risks for carcinogenic effects. The information is intended for use in public health protection through risk assessment and risk management. Whereas a complete risk assessment consists of hazard identification, dose–response assessment, exposure assessment, and risk characterization, the last step of risk characterization is the transitional step to risk management. IRIS is a tool that provides hazard identification and dose–response assessment information, but does not provide situational information on individual instances of exposure. The information contained in Section II (Carcinogenicity Assessment for Lifetime Exposure) of the chemical files represents a consensus opinion of EPA health scientists representing the Program Offices and the Office of Research and Development. (Section I contains information on Chronic Health Hazard Assessment for Noncarcinogenic Effects.)

International Toxicity Estimates for Risk Database (ITER)
Toxicology Excellence for Risk Assessment (TERA)
Web: http://iter.ctcnet.net/publicurl/pub_search_list.cfm
Web: http://toxnet.nlm.nih.gov

ITER is a database providing human health risk values and cancer classifications for over 600 chemicals of environmental concern from multiple organizations worldwide. It presents risk data in a tabular format for easy comparison, along with a synopsis explaining differences in data and a link to each organization for more information. The information is compiled from Agency for Toxic Substances and Diseases Registry (ATSDR, of the U.S. Centers for

Disease Control and Prevention), Health Canada, U.S. EPA, IARC, National Science Foundation (NSF) International; National Institute of Public Health and the Environment of the Netherlands (Rijksinstituut voor Volksgezondheid en Milieu, RIVM), and independent parties.

OncoLogic™ – A Computer System to Evaluate the Carcinogenic Potential of Chemicals

U.S. Environmental Protection Agency

Web: http://www.epa.gov/opptintr/newchems/tools/oncologic.htm

OncoLogic™ is a desktop computer program that evaluates the likelihood that a chemical may cause cancer, released by U.S. EPA. It predicts cancer-causing potential by: (1) applying the rules of structure–activity relationship (SAR) analysis; (2) mimicking the decision logic of human experts; and (3) incorporating knowledge of how chemicals cause cancer in animals and humans. The chemical classes currently evaluated by OncoLogic™ subsystems include fibers, metals, polymers, and more than 48 classes of organic chemicals. A Miscellaneous Class and a Functional Analysis component are available. Data sources used to build the Knowledge Rules in OncoLogic™ include cancer bioassay data from the following sources to develop the rule packages: (1) six-volume series of monographs entitled 'Chemical Induction of Cancer'; (2) International Agency for Research on Cancer (IARC) monograph series; (3) U.S. National Cancer Institute (NCI)/National Toxicology Program (NTP) technical report series; (4) U.S. Public Health Service Publication series 149 entitled 'Survey of Compounds Which Have Been Tested for Carcinogenic Activity'; and (5) non-classified chemical industry and U.S. EPA research data. Publicly available scientific literatures and external domain experts were also used or consulted whenever necessary.

Risk Assessment Information System (RAIS)

Web: http://rais.ornl.gov/tox/tox_values.shtml

This is a database on sources of chemical-specific toxicity values sponsored by the U.S. Department of Energy (DOE), Office of Environmental Management, Oak Ridge Operations (ORO) Office through a contract with Bechtel Jacobs Company LLC. It recommends the hierarchy of sources in evaluating chemical toxicity for Superfund sites as indicated by U.S. EPA (see above): IRIS, PPRTV, and cited references developed for the EPA OSWER Office of Superfund Remediation and Technology Innovation (OSRTI) programs, and other toxicity values. The 'other' level of the hierarchy includes several sources of toxicity values that are commonly consulted by the EPA Superfund program when a relevant toxicity value is not available from either of the above two databases. They include the Cal/EPA toxicity values, the ATSDR MRLs (addressing non-cancer effects only), and the U.S. EPA HEAST database and cited references; and additional sources of toxicity values.

U.S. EPA OPPTS Harmonized Test Guidelines, Series 870

Office of Prevention, Pesticides and Toxic Substances

Washington, DC: U.S. Environmental Protection Agency.

Web: http://www.epa.gov/opptsfrs/publications/OPPTS_Harmonized/870_Health_Effects_Test Guidelines/Series/

This is a set of guidelines that include a description of the study design for cancer bioassays. Rodents, usually both rats and mice, are commonly used (U.S. EPA test 870.4200). For each species, at least 50 animals/sex/dose are recommended, with the test chemical administered for at least three dose groups plus concurrent controls. Treatment is daily or 5 day/week exposures from just past weaning for at least 18 months in mice, and 24 months in rats. Test chemical may be administered in the food or water, by gavage, by inhalation, or via dermal application. The highest dose tested should produce visible toxic signs, and the lowest dose tested should produce no toxicity. Shortening of lifespan due to tumors is considered acceptable, as long as survival is adequate for acceptable statistical analysis. In addition to parameters examined in non-cancer studies, a much more detailed histopathological examination for tumors is performed. The incidence of tumors is evaluated in a wide variety of tissues, with classification of tumor type (dysplasia, benign, malignant), probable tissue of origin, and sometimes, a severity grade. Other pathological lesions and changes are also noted.

U.S. EPA Toxicity Values (IRIS, PPRTV, HEAST)

Web: http://www.epa.gov/region8/r8risk/hh_toxicity.html

This contains toxicity values for use in Superfund human health risk assessments available from several sources. The recommended hierarchy for these alternative sources is described by U.S. EPA in *Human Health Toxicity Values in Superfund Risk Assessments* (Memorandum, OSWER 9285.7-53, December 2003), also presented below.

Tier 1, IRIS (Integrated Risk Information System, see description above). Most values in this database have undergone thorough review and validation both within and outside EPA. Tier 2, PPRTVs, or EPA's Provisional

Peer Reviewed Toxicity Values, is not available to the general public, but is accessible to EPA risk assessors via EPA's intranet or one may contact the Region 8 Superfund toxicologists for assistance with these values. Tier 3, Other Toxicity Values. Tier 3 includes additional EPA and non-EPA sources of toxicity information, including: (1) the California Environmental Protection Agency's (Cal/EPA) *Toxicity Criteria Database* that contains toxicity values that are peer-reviewed and address both cancer and non-cancer effects; (2) the Agency for Toxic Substances and Disease Registry (ATSDR)'s *Minimal Risk Levels (MRLs) for Hazardous Substances* that are peer-reviewed estimates of the daily human exposure to a hazardous substance that is likely to be without appreciable risk of adverse non-cancer health effects over a specified duration of exposure; (3) toxicity values in EPA's Health Effects Assessment Summary Tables (HEAST) (EPA-540-R-97-036, July 1997). The HEAST values on chemical contaminants are not currently available on EPA's internet site, but may be obtained by contacting a Superfund risk assessor. For radionuclides, the slope factors have been adopted by EPA in its *Preliminary Remediation Goals for Radionuclides Calculator* and the *Soil Screening Guidance for Radionuclides* documents.

CHAPTER

12

Chemical Compendia

ANTOINETTE HAYES

INTRODUCTION

Chemical compendia are collections, whether in print or digital format, of information about a broad array of chemicals. The ones listed in this chapter focus on the chemicals' properties and toxicities. Such compendia typically offer a sweeping look at the chemical and often include recent references to the technical literature. They are a good place to begin researching the effects of chemicals on living organisms and the environment. Many of those here are established standards, with the most recent edition or revision listed. Below are highlighted two examples.

The Agency for Toxic Substances and Disease Registry (ATSDR) offers numerous publications on a broad range of topics from heavy metals to solvents. Their site offers a number of databases and a new section called the 'Toxic Substances Portal' which gives the viewer a 'one click' access to the most current research on a variety of substances. The portal will be updated on an ongoing basis and new topics will be posted in groups of 20 substances at a time. The ATSDR also offers a web section on hazardous waste sites which maps the geography of these sites in the context of schools, roads, and politics. This area might be of particular use to toxicologists working in the field of epidemiology and risk assessment.

Also of interest in this chapter, are the critical reviews prepared by the ECETOC (European Chemical Industry Ecology and Toxicology Centre) in Belgium. The ECETOC began writing these reviews in 1983. The reviews are published on a need basis and relate to chemicals that are mass produced by the ton by many companies and have widespread uses. For example, the latest review concerns trifluoroethane which is used as a propellant in canned air products or as a refrigerant in combination with other chemicals.

RESOURCES

Books, Web Resources

Agency for Toxic Substances and Disease Registry (ATSDR)
Web: http://www.atsdr.cdc.gov

The ATSDR publishes a variety of valuable chemical-specific documents. They have published or have under development more than 289 *Toxicological Profiles* for hazardous substances found at National Priorities List (NPL) sites. These are thorough technical manuals characterizing the toxicology of chemicals (available on CD-ROM from CRC Press: http://www.crcpress.com). ATSDR's *Fact Sheets on Hazardous Substances* are one-page summaries on hazardous substances condensed from the Profiles' Public Health Statement sections. ATSDR's *Case Studies in Environmental Medicine* are self-instructional educational materials designed to guide health professionals through the diagnosis, treatment, and surveillance of persons exposed to hazardous substances. Copies of some of these documents are available at no charge to qualified (determined by ATSDR) individuals by writing to ATSDR, 1600 Clifton Road, Atlanta, GA 30333. Many of these documents are also available for sale through the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 2161 (Phone: 800-553-6847 or 703-487-4650). ATSDR's *Toxicological Profiles* (with annual updates) are

available for sale from CRC Press as part of their CRC-netBase through a variety of CD-ROM products.

Baselt RC (1999)
Disposition of Toxic Drugs & Chemicals in Man, 5th edition
Foster City, CA: Chemical Toxicology Institute.

Contains information on the disposition of hundreds of chemicals and drugs implicated in human poisoning. The types of information include; normal tissue concentrations, concentrations of chemicals after toxic exposures, metabolic distribution of chemicals in human tissues and known metabolites.

Bretherick L (2006)
Handbook of Reactive Chemical Hazards, 7th edition
Burlington, MA: Academic Press.
Web: http://www.books.elsevier.com

Covers a large amount of information (2680 pages) on potential hazards in laboratories from chemical use and exposure. This is a two-volume set primarily focused on chemical reactivity of individual chemicals and chemical mixtures. It is intended for those conducting chemical synthesis and general research involving chemicals. The entries are listed in order of empirical formula and include an index and cross-reference of CAS numbers and chemical formulas. Toxicities that arise from the products of unanticipated side reactions are also described.

Chemie BG (1990–1999)
Toxicological Evaluations: Potential Health Hazards of Existing Chemicals
New York: Springer-Verlag.
Web: http://www.springer.com

English edition of the German BG Chemie toxicological assessments of widely used chemicals. These evaluations are based on documentation found in the scientific literature, on experimental studies commissioned by the BG Chemie, and on experience of the expert panel. Each evaluation includes a summary and assessment, physical properties, and results of toxicity testing. Volume 15 was published in 1999.

Cooper AR (ed.) (1996)
Cooper's Toxic Exposures Desk Reference
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Contains up-to-date summations of hundreds of the most hazardous substances used in industry and found in the workplace. The book and CD-ROM are arranged alphabetically and contain the physical properties and warnings, health hazards, exposure routes and effects, protective equipment, medical management, and workplace monitoring for commonly encountered chemicals.

Cooper AR (1998)
Properties of Hazardous Industrial Materials and Cooper's Chemical Dictionary and Spell Check Database
Boca Raton, FL: Lewis Press.
Web: http://www.crcpress.com

A CD-ROM listing of over 25 000 hazardous materials, including details on their health hazards, storage, and handling. It contains an electronic chemical dictionary and spell checker. The CD-ROM has over 10 000 terms that are cross referenced with chemical data.

Davis DJ, Davis JA (1996)
Hazardous Material Reference Book Cross Index
New York: Van Nostrand–Reinhold.
Web: http://www.wiley.com

Tool to help locate information in case of a hazardous material incident or accident. The book is an index and is streamlined by inclusion of chemical synonyms and also directs the user to the specific source of the detailed information.

Environmental Protection Agency, U. S. (EPA)
Web: http://www.epa.gov

The U.S. EPA publishes an extensive variety of paper and online documents on individual chemicals. Among these documents are the *IRIS Toxicological Reviews.* Recent chemicals covered in this series are acetonitrile, barium and compounds, bentazon, beryllium and compounds, chlordane, chromium (III) insoluble salts, chromium (VI), cumene, methyl methacrylate, methylene diphenyl diisocyanate, naphthalene, and tributyltin. For more information on EPA chemical compilations, visit their website at http://www.epa.gov.

European Chemical Industry Ecology & Toxicology Centre (ECETOC) (1983–)
ECETOC AISBL
Joint Assessment of Commodity Chemicals Series
Web: http://www.ecetoc.org
Brussels, Belgium: ECETOC.

Produced by the ECETOC program for preparing critical reviews of the toxicology and ecotoxicology of existing industrial commodity chemicals. Commodity chemicals (i.e., chemicals produced in large tonnage by several companies and having widespread and multiple uses) are jointly reviewed by an expert panel. Summary data and conclusions of the expert panel are included. The reports go back to 1983, below are some recent reports:

JACC No. 42, Tetrafluoroethylene, 12/03
JACC No. 42a, Corrigenda to JACC No. 42 Tetrafluoroethylene
JACC No. 43, Sec-Butanol, 3/04

JACC No. 44, 1,1,1,3,3-pentafluoropropane, 6/04
JACC No. 45, 1,1-difluoroethane, 10/04
JACC No. 46, 1-chloro-1,2,2,2-tetrafluoroethane, 11/04
JACC No. 47, 1,1-Dichloro-2,2,2-trifluoroethane, 7/05
JACC No. 48, Hexafluoropropylene, 10/05
JACC No. 48a, Corrigenda to JACC No. 48, Hexafluoropropylene
JACC No. 49, Vinylidene Flouride, 11/05
JACC No. 50, 1,1,1,2-Tetrafluoroethane
JACC No. 51, Synthetic Amorphous Silica, 9/06
JACC No. 52, Trifluoroethane, 10/06

Gangolli S (ed.) (1999)
The Dictionary of Substances and Their Effects (DOSE), 3rd edition (2005)
Cambridge, UK: Royal Society of Chemistry.
Web: http://www.rsc.org.

A major compilation of data on chemicals with environmental impact, providing a unique combination of all the data required for the assessment of risks associated with the use of those chemicals. Includes new data from toxicity and ecotoxocity studies; results of recent carcinogenicity, mutagenicity, and environmental fate studies; occupational exposure data for France, Germany, Sweden, and Japan, as well as the UK and USA; new risk and safety phrases; and recent relevant legislation. In seven volumes.

Howard PH, Meylan WM (eds.) (1997)
Handbook of Physical Properties of Organic Chemicals
Boca Raton, FL: Lewis.
Web: http://www.crcpress.com

Contains data of physical and chemical properties on approximately 13 000 organic chemicals. Data include chemical structure, formula, molecular weight, melting/freezing point, boiling point, water solubility, octanol water partition coefficient, vapor pressure, acid dissociation constant, Henry's law constant, and atmospheric hydroxyl radical reaction rate constant.

Lewis Richard J Sr. (2000)
Rapid Guide to Hazardous Chemicals in the Workplace
New York: Wiley.
Web: http://www.wiley.com

Covers chemicals commonly encountered in the workplace. Details ACGIH and OSHA guidelines for exposure. Lists TLVs, TWAs, and PELs for 750 chemicals.

Lewis Sr., RJ (2002)
Hazardous Chemicals Desk Reference, 5th edition
New York: Wiley.
Web: http://www.wiley.com

Offers access to over 6000 compounds commonly used in industry, manufacturing, laboratories, and the workplace. Provides new or updated profiles for each chemical, assessing their hazard potential as poisons, irritants, corrosives, explosives, and carcinogens.

Lewis RJ (2004)
Sax's Dangerous Properties of Industrial Materials, 11th edition
New York: Van Nostrand–Reinhold.Web: http://www.wiley.com

Continues to promote safety by providing up-to-date hazard information on a chemical-by-chemical basis. Over 20 000 materials are included in alphabetical order. The information is cross-referenced and complete bibliographic citations are included for further reading. A 1998 CD-ROM version is also available.

Lewis RJ Sr., Lewis RJ (2007)
Hawley's Condensed Chemical Dictionary with CD-ROM
New York: Wiley-Interscience.
Web: http://www.wiley.com

Dictionary of industrial chemicals containing information on toxicity, reactivity, reactions, terminology, and flammability data. The listings are arranged by chemical name and the chemical information includes; physical properties, source of occurrence, CAS number, potential hazards, chemical formula, and synonyms. This edition has a companion CD-ROM.

Lide DR (ed.) (2006)
CRC Handbook of Chemistry and Physics, 87th edition
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Perhaps the world's most widely used scientific reference, the handbook contains all the most frequently used data in science. Everything from aqueous solubility of organic compounds to flash point data of common substances. Now available in CD-ROM as part of CRCnetBase.

Mackay Donald 1999 edition (2000)
Environmental Fate and Degradation Handbook
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Part of CRC's CRCnetBase, an electronic product available either via a CD-ROM subscription product with annual updates, as a site license program, or as a CD-ROM stand-alone product. Brings together physical-chemical data for similarly structured groups of chemical substances. Synthesizes and continues the *Illustrated Handbook of Physical–Chemical Properties of Environmental Fate for Organic Chemicals.*

Mackay D, Shiu WY, Ma KC (1992–1998)
Illustrated Handbook of Physical–Chemical Properties of Environmental Fate for Organic Chemicals

Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Volume I – Monoaromatic Hydrocarbons, Chlorobenzenes, and PCBs, Volume II – Polynuclear Aromatic Hydrocarbons, Polychlorinated Dioxins, and Dibenzofurans, Volume III – Volatile Organic Chemicals, Volume IV – Oxygen, Nitrogen, and Sulfur-Containing Compounds, Volume V – Pesticides. There is a non-illustrated version of this book and a CD-ROM version published by CRC Press in 2006.

Milne GWA (ed.) (1999)
Gardner's Chemical Synonyms and Trade Names, 11th edition
Hoboken, New Jersey: Wiley.
Web: http://www.wiley.com

Includes industrial chemicals, polymers, plastics, resins, elastomers, plastic, resin, elastomer additives, coating and paints, adhesives, inks, pigments, dyes, textiles, surfactants, fillers and fibers, pharmaceuticals, agricultural chemicals, food additives, and cosmetic additives.

Montgomery JH (2007)
Groundwater Chemicals Desk Reference, 4th edition
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

The 4th edition of this volume is updated with more than 1700 added references. There is a wealth of toxicity data for over 1100 compounds, degradation products cross-referenced to parent compounds, and physical and chemical properties and constants in over 1700 pages of indexed data.

National Research Council (2006)
Human Biomonitoring of Environmental Chemicals
Washington, DC: National Academy Press.
Web: http://www.nap.edu

This volume contains information on biomonitoring and exposure assessment of toxic chemicals in the environment.

National Toxicology Program (NTP)
1996 North American Emergency Response Guidebook
U.S. Department of Transportation, Washington, DC

Developed jointly by the U.S. Department of Transportation, Transport Canada, and the Secretariat of Communications and Transportation of Mexico for use by firefighters, police, and other emergency services personnel who may be the first to arrive at the scene of a transportation incident involving a hazardous material. It may be purchased from the U.S. Government Printing Office, Superintendent of Documents, Stop: SSMB, Washington, DC 20402 (Fax: 301-489-8995). A new version is planned for publication in the year 2000.

National Toxicology Program (NTP), Division of Toxicology Research and Testing
Management Status Report
Research Triangle Park, NC: NTP.

A periodical publication that provides the status of chemicals studied by the NTP. For copies, contact the Central Data Management, Mail Drop E1-02, NIEHS, P.O. Box 12233, Research Triangle Park, NC 27709 (Phone: 919-541-3419; Fax: 919-541-3687; e-mail: CDM @NIEHS.NIH.GOV). Also available through the NTP web site (http://ntp-server.niehs.nih.gov)

National Toxicology Program (NTP), Division of Toxicology Research and Testing
Report on Carcinogens 11th edition
Research Triangle Park, NC: NTP.

A listing of chemicals that are either known carcinogens or suspected to be carcinogenic based on their chemical profiles. This list is limited to chemicals to which a significant number of people living within United States might be exposed.

O'Neil MJ (ed.) (2006)
The Merck Index, 14th edition
New York: John Wiley and Sons.
Web: http://www.wiley.com

The Merck Index, published continuously since 1899, is the definitive encyclopedic reference for chemicals, drugs, and biologicals. Some of the types of compounds included are drugs used in the pharmaceutical industry, organic chemicals, dyes, pesticides, natural products, and veterinary drugs. A companion CD-ROM is included with this edition.

Patnaik P (2007)
A Comprehensive Guide to the Hazardous Properties of Chemical Substances, 3rd edition
New York: Wiley-Interscience.
Web: http://www.wiley.com

Compendium of hazardous drugs and chemicals (over 1500 chemical structures) that correlates chemical structure to toxicity, making it a valuable resource for both the pharmaceutical and chemical industries. This volume includes chapters on metals, alkaloids, alcohols, particulates, and nerve agents.

Pohanish RP (1997)
Rapid Guide to Hazardous Chemicals in the Environment
New York: Wiley.Web: http://www.wiley.com

Collects in one place detailed guidance on regulations, standards, and other pertinent information on chemicals of environmental concern. Approximately 1500

chemicals are covered and the applicable regulations are identified and cross-referenced for ease of use. A CD-ROM version is available.

Pohanish RP (ed.) (2002)
Handbook of Toxic and Hazardous Chemicals and Carcinogens, 4th edition
Park Ridge, NJ: Noyes.
Web: http://www.knovel.com

Presents concise chemical, health, and safety information on approximately 1500 toxic and hazardous chemicals in the pharmaceutical, energy, plastics, cleaning, and agricultural industries. Data are furnished on exposure, permissible limits in air, permissible concentrations in water, routes of entry, harmful effects and symptoms, first air, personal protective methods, storage, shipping, etc. This edition contains an expanded chemical synonym and tradename index and an extensive synonym listing that is cross-referenced to the generic name of the chemical.

Pohanish RP, Green SA (2003)
Wiley Guide to Chemical Incompatibilities, 2nd edition
New York: Wiley.
Web: http://www.wiley.com

This is a unique resource that provides data on the incompatibility of thousands of commonly used chemical compounds. The second edition of this volume contains data on over 11 000 chemical compounds listed in alphabetical order (with CAS numbers). There is a glossary of general chemical terminology located at the end of the book.

Prager JC (1997)
Environmental Contaminant Reference Databook
New York: Wiley.
Web: http://www.wiley.com

In three volumes, identifies regulated chemicals and chemicals of special interest to environmental professionals. Provides information such as CAS number, sampling, analysis, detection limits, manufacturers, odor thresholds, firefighting procedures, and remediation methods. It is available in hardback (1997), paperback (1998), and a CD-ROM version (1998).

Prager JC (1997)
Pohanish RP, Green SA (1997)
Hazardous Materials Handbook
New York: Van Nostrand-Reinhold.Web: http://www.wiley.com

Covers more than 1240 substances and presents technical data as well as chemical properties for widely used and transported industrial materials. This easy-to-use text also includes a CAS and synonym section. A CD version is available from Wiley.

Proctor NH, Hathaway GJ (2004)
Proctor and Hughes' Chemical Hazards of the Workplace, 5th edition
New York: Van Nostrand–Reinhold.
Web: http://www.wiley.com

Information on over 625 individual compounds, arranged alphabetically. For each chemical there is a monograph and a chemical profile that includes the chemical formula, CAS No., TLV, synonyms, physical properties, exposure sources and routes, information on dose–responses, target organs, and signs and symptoms of exposure (acute and chronic). References are included.

Review Office
NTP Technical Report Series
Web: http://www.ntp.niehs.nih.gov
Research Triangle Park, NC: NTP.

Studies of chemicals designed and conducted to characterize and evaluate the toxicologic potential, mainly carcinogenic activity, of selected chemicals in laboratory animals (primarily rodents). Chemicals selected for NTP toxicology and carcinogenesis studies are chosen primarily on the bases of human exposure, level of production, and chemical structure. The interpretive conclusions presented in the reports are based only on the results of the NTP studies. The NTP studies are not limited to carcinogenicity studies. They also conduct long-term and short-term toxicity studies, chemical disposition and toxicokinetic studies, genetically modified model studies, immunological studies, and developmental and reproductive toxicity studies. The NTP also investigates the use of alternative models in toxicity research such as the use of non-mammalian species, in vitro methods, and in silico models for predictive toxicology. The abstracts and other study information for 13-week and 2-year studies are available at the NTP's World Wide Web site: http://ntp.niehs.nih.gov.

Ryan R, Terry CE (eds.) (1999–2000)
Toxicology Desk Reference: The Toxic Exposure and Medical Monitoring Index, 5th edition
New York: Taylor & Francis.
Web: http://www.tandf.co.uk

In three volumes, with an extensive cross-reference index. Intended to provide a comprehensive source of medical, legal, and technical information concerning human exposure to metals and chemicals and to be a first resource for professionals involved in medical

monitoring, industrial hygiene, environmental control, and toxic tort litigation. Information provided on the listed chemicals includes air monitoring reference ranges, kinetics, clinical effects, critical sites of toxicity, biological monitoring tests, laboratory tests and interpretation, federal and state requirements, and case reports. Available on CD-ROM (2000) loose leaf (1997) and paperback (1997).

Urben P (ed.) (2006)
Bretherick's Handbook of Reactive Chemical Hazards, Two Volume Set, 7th edition
Burlington, MA: Academic Press.
Web: http://www.academicpress.com

This two-volume edition contains information concerning all reported risks that result from chemical reactions. The potential risks covered include fire, explosions, and toxic exposures. The book covers the reactivity risk of chemicals and chemical combinations and is widely used in laboratory safety protocols.

Verschueren K (2001)
Handbook of Environmental Data on Organic Chemicals, 4th edition
New York: Wiley-Interscience.
Web: http://www.wiley.com

Contains over 2000 pages of in-depth information on organic chemicals and chemical mixtures. This edition is updated to include the latest research on chemical mixtures and new organic compounds. Coverage includes control measures to reduce the impact of dangerous organic compounds on the ecosystem. Each substance (alphabetically) is categorized by physical and chemical properties, air pollution factors, water and soil pollution factors, and biological effects. There is also information on proposed biodegradation pathways, aquatic toxicity data, odor thresholds, sampling and analysis information, and structural formulas. Also issued in paperback (1996) and as a CD-ROM (2001).

World Health Organization (WHO) (1976–)
Poison Information Monographs (PIM)
Geneva, Switzerland: WHO.

The PIMs (over 300 published) contain information on poisonous chemicals, pharmaceuticals, plants, and animals. Each monograph contains details on the compound that includes synonyms, CAS number, physico-chemical properties, uses, toxicology and ADME information (absorption, distribution, metabolism, and elimination).

World Health Organization (WHO) (1976–2006)
Environmental Health Criteria
Geneva, Switzerland: WHO.
Avenue Appia 20
Ch-1211 Geneva 27
Switzerland
Web: http://www.who.int

A distinguished series of over 230 monographs intended to provide critical reviews on the effects on human health and the environment and of chemicals and physical and biological agents. It is published under the joint sponsorship of the United Nations Environment Programme, the International Labour Organisation, and the World Health Organization. Monographs were recently completed on human exposure assessment, zinc, vinyl chloride, flame retardants, dinitro-ortho-cresol, biomarkers in risk assessment, and betonite. Available from WHO Distribution and Sales, WHO Headquarters, CH-1211 Geneva 27, Switzerland (email: bookorders@who.ch). Also note that these criteria documents, the chemical assessment documents below, and many others produced by WHO's International Programme on Chemical Safety and available on the 'IPCS INCHEM' CD-ROM (for a subscription fee) and for free on the web (http://www.inchem.org.).

World Health Organization (WHO) (2006)
Concise International Chemical Assessment Documents (CICAD)
Geneva, Switzerland: WHO.

Begun in 1998 and produced within the framework of the Inter-Organization Programme for the Sound Management of Chemicals. CICADs are concise documents providing summaries of relevant scientific information concerning the potential effects of chemicals on human health and the environment. They are based on selected national or regional evaluation documents or existing WHO *Environmental Health Criteria* documents. Their primary objective is to characterize hazard and dose–response from exposure to a chemical. The most recent CICADs published were on heptachlor, tribromophenol, tin, butoxyethanol, and cobalt.

Chemicals: Cosmetics and Other Consumer Products

PERTTI J. HAKKINEN

INTRODUCTION

People can use many consumer products during a typical day, starting from the moment they wake up in the morning, e.g., brush teeth, use soap and shampoo during a shower, etc. Over the rest of a day, people could use (or be exposed to other people using) products such as air fresheners, ammonia, antifreeze, antiperspirants and deodorants, bleach, cosmetics, detergents, disinfectants, drain cleaners, glues, insecticides and pesticides, oven cleaners, paints, and toys. Some products can contain several hundred chemicals, many of which (e.g., fragrance and flavor ingredients) might not be listed individually on product labels.

RESOURCES

Books

Baker S, Driver J, McCallum D (eds) (2001)
Residential Exposure Assessment
A Sourcebook. Kluwer Academic/Plenum Publishers.

This book is a compendium of information about predictive methods and tools, monitoring methods, data sources, and key variables that characterize exposure in and around all types of residences. Includes chapters on a general framework for assessing residential exposures to chemical, biological, and physical agents, chapters about the assessment of dermal, inhalation, and oral exposures in and around residences, a chapter on assessment of consumer products and related sources, and chapters about data (e.g., exposure factors) and other information sources (e.g., software to model exposures).

Gosselin RE, Smith RP, Hodge HC, Braddock J (eds.) (1984)
Clinical Toxicology of Commercial Products, 5th edition
Williams & Wilkins.

Although the content is now over 20 years old, it still provides very useful information on the types of chemicals that many types of consumer products can contain, and information about the safety of those chemicals.

Wexler P, et al (eds.) (2005)
Encyclopedia of Toxicology, 2nd edition
Academic Press, Elsevier.

Includes several chemicals in consumer product-related topics: Bleach by J. Weber, Consumer Products by N. Linde, Cosmetics and Personal Care Products by P. Sterchele, Deodorants and Antiperspirants by Z. Cai and P. J. Hakkinen, Detergents by Z. Cai and P. J. Hakkinen, Fragrances and Perfumes by A. M. Api and P. J. Hakkinen, and Safety Testing, Clinical Studies by A. Pagnoni.

Newsletters

Product Safety Newsletter
This is an independent weekly newsletter for executives concerned with consumer product safety regulations, legislation, and standards. The first focus of the newsletter is the U.S. Consumer Product Safety Commission, but it also covers the regulation of certain consumer products by other government agencies, and the injury prevention activities of government organizations and others. It also provides readers with information about U.S. state and international activities, including injury prevention, and the development of standards and testing methods. A limited version of the content is available for free by email five day a week. http://www.productsafetyletter.com/profile/.

General Interest Works

1001 Chemicals in Everyday Products, 2nd edition
Rose Lewis G
Wiley-Interscience, 1998

A Consumer's Dictionary of Cosmetic Ingredients: Complete Information About the Harmful and Desirable Ingredients Found in Cosmetics and Cosmeceuticals
Winter R
Three Rivers Press, 2005

Michalun N, Michalun V
Milady, 2000

Databases

Environmental Working Group (EWG)
Skin Deep Cosmetic Safety Database
This database provides the ingredients in nearly 25 000 cosmetic and personal care products, and links them to information in toxicity and regulatory databases. www.cosmeticsdatabase.com.

GREENGUARD Environmental Institute (GEI)
GEI is an industry-independent, non-profit organization that oversees the GREENGUARD Certification Program. As an ANSI Authorized Standards Developer, GEI establishes acceptable indoor air standards for indoor products, environments, and buildings. GEI's mission is to improve public health and quality of life through programs that improve indoor air. www.greenguard.org.

Human and Environmental Risk Assessment (HERA) Project
HERA included European producers of household cleaning products and their ingredients, and their website provides access to risk assessment documents with information about the safety and exposures

associated with various types of ingredients used in household cleaning products. http://www.heraproject.com

Project on Emerging Nanotechnologies
Established in 2005 as a partnership between the Woodrow Wilson International Center for Scholars and the Pew Charitable Trusts. The Inventory of Nanotechnology Consumer Products provides a look at the several hundred nanotechnology-based consumer products currently on the U.S. market. www.nanotechproject.org/44

(U.S.) National Institutes of Health, National Library of Medicine
The 'Household Products Database' contains formula information for several thousand U.S. consumer products, together with access to their Material Safety Data Sheets (MSDSs) provided by the manufacturers. http://hpd.nlm.nih.gov.

(U.S.) National Institutes of Health, National Library of Medicine
'ToxMystery' introduces students and others online to potential everyday environmental health hazards as they move from room-to-room in a house. http://toxmystery.nlm.nih.gov/.

(U.S.) National Institutes of Health, National Library of Medicine
'ToxTown' contains information on chemicals and environmental health risks that might be encountered in everyday life, in everyday places. The neighborhoods that are currently included cover suburban, urban, rural, the U.S. and Mexico border areas, and coastal health risks, and selecting a neighborhood will provide information on chemical and environmental concerns for that type of location. This includes the types of chemicals that might be found in a location. http://toxtown.nlm.nih.gov.

Drugs

TODD STEDEFORD AND CHING-HUNG HSU

INTRODUCTION

The use of therapeutic agents as a means of preventing or attenuating organ system deficits and/or dysfunction is a global, multibillion-dollar business. Beyond prescription drugs (i.e., those requiring the assistance of a healthcare practitioner for appropriate selection, 'safe' use, and monitoring), a vast market for over-the-counter (OTC) products and dietary supplements exists. However, as with any useful product having biologic, pharmacologic, or physiologic activity, whether it is a prescription drug or a dietary supplement, adverse effects are a potential risk.

With the advent of the internet, the form and speed with which individuals communicate drug discovery findings or adverse event reporting for post-marketed products have resulted in greater access to key documents, such as the Physicians Desk Reference (PDR), via electronic sources, as well as online journals, databases, and books.

This chapter provides resources on prescription drugs, OTC products, and dietary supplements. A selection of books and journal articles is provided, along with a listing of international organizations devoted to the research and regulation of such products. In addition, an assortment of open access and fee-for-service databases, which provide full-text information on drugs, over-the-counter medications, and supplements, has been compiled.

RESOURCES

Books

Baselt RC (2004)
Disposition of Toxic Drugs and Chemicals, 7th edition
Foster City, CA: Biomedical Publications.
Web: http://www.biomedicalpublications.com/dt7.htm

Presents the current essential information on the disposition of the chemicals and drugs frequently encountered in human poisoning episodes; includes body fluid concentrations of substances in normal or therapeutic situations, concentrations in fluids and tissues in instances of toxicity and the metabolic fate of these substances in man.

Cupp MJ (2000)
Toxicology and Clinical Pharmacology of Herbal Products, 1st edition
Totowa, NJ: Humana Press.
Web: http://www.humanapress.com

Describes detailed pharmacology and toxicology of widely used herbal medicines, including clinical and pathological findings from clinical trials and case reports of adverse effects, pharmacokinetics, methods of chemical and biofluids analysis, and the known pharmacologic and toxicologic effects arranged by organ, organ system, or therapeutic/toxicologic effect.

Gad SC (2002)
Drug Safety Evaluation, 1st edition
New York: Wiley-Interscience.
Web: http://www.wiley.com/WileyCDA/WileyTitle/productCd-0471407275.html

Covers a wide variety of topics, specifically relevant to the pharmaceutical and biotechnology industries, including: acute toxicity testing in pharmaceutical safety evaluation, genotoxicity, safety assessment of inhalant drugs, immunotoxicology in pharmaceutical development, large animal studies, and evaluation of human tolerance and safety in clinical trials.

Gad SC, Brock WJ (2007)
Safety Evaluation: International Regulations for Drug and Medical Device Approval
United Kingdom: Taylor & Francis CRC Press.

Web: http://crcpress.co.uk/

Analyzes international drug laws and regulations that pertain to safety and prescribes how safety procedures can be implemented. This text describes the development process for products in various markets, outlining those aspects of drug and device regulation related to evaluating safety. Reviews the major regulatory bodies responsible for approval of new products, particularly in the United States, European Union, and Japan, and provides a clear understanding of the regulation requirements.

Kahn CM, Line S (2005)
The Merck Veterinary Manual, 9th edition
Hoboken, NJ: John Wiley & Sons.
Web: http://www.wiley.com/WileyCDA/WileyTitle/productCd-0911910506.html

A comprehensive and reliable source of information on all aspects of animal healthcare, includes information on new and emerging animal diseases, emergency and critical care, exotic and laboratory animals, animal-to-human disease transmission, etc.

Krinsky DL, LaValle J, Hawkins E, Pelton R, Ashbrook-Willis N (2003)
Natural Therapeutics Pocket Guide, 2nd edition
Hudson, OH: Lexi-Comp, Inc.
Web: http://www.lexi.com/web/index.jsp

Provides condition-specific information on the use of herbs, nutritional supplements, nutraceuticals, homeopathy, and lifestyle modification. Over 175 natural products are covered in addition to information on the natural treatment to 75 medical conditions and patient advisory leaflets on top 100 natural products.

Lacy CF, Armstrong LL, Goldman P, Lance LL (2006)
Drug Information Handbook, 14th edition
Hudson, OH: Lexi-Comp, Inc.
Web: http://www.lexi.com/web/index.jsp

Contains 1380 monographs, each of which includes up to 33 fields of information, with details on dosage by age group, indication, and route of administration, drug interactions by enzyme system and effect, and adverse reactions by affected organ system and incidence. Also included are labeled and unlabeled/investigational uses, pharmacodynamics/kinetics data, dosing adjustments for organ dysfunction, and other key content.

Brunton L Lazo, Parker K (eds.) (2005)
Goodman & Gilman's The Pharmacological Basis of Therapeutics
New York: McGraw-Hill Medical Publishing Division.
Web: http://www.mhprofessional.com/product.php?isbn=0071468048

Available as a hardcover or in digital format, this book provides detailed information on pharmacological and toxicological effects.

McKenna DJ (2002)
Botanical Medicines: The Desk Reference for Major Herbal Supplements, 2nd edition
Binghamton, NY: Haworth Press.
Web: http://haworthpress.com/store/product.asp?sku=4527

Covers pharmacological studies on the main medicinal plants used in clinical practice and sold in pharmacies in the Western world; provides information such as botanical data (classification and nomenclature, common names, geographic occurrence, and botanical characteristics), history and traditional uses, chemistry, therapeutic applications, pre-clinical studies, clinical studies, recommended dosages, safety profiles (including toxicology), side effects and contraindications, drug interactions and special precautions, and safety recommendations during pregnancy and lactation.

Milne GWA (2002)
Veterinary Drugs: Synonyms & Properties
Hoboken, NJ: John Wiley & Sons.
Web: http://www.wiley.com/

Provides over 700 unique veterinary agents, their chemical structures, and exhaustive listings of product tradenames and manufacturers. Organizes drugs by therapeutic category, with each main entry including the following information: the commonly adopted chemical name, three internationally used identifiers of the compound (CAS, EINECS, and Merck), physical properties and acute toxicity, along with its known biological activity and FDA-labeled applications.

Rossoff IS (2001)
Encyclopedia of Clinical Toxicology: A Comprehensive Guide to the Toxicology of Prescription and OTC Drugs, Chemicals, Herbals, Plants, Fungi, Marine Life, Reptiles and Insect Venoms, Food Ingredients, Clothing and Environmental Toxins
United Kingdom: Taylor & Francis, CRC Press.
Web: http://www.crcpress.co.uk/

Describes adverse effects and interactions that may not be reported by manufacturers and may not be published in physician desk references and the other standard compendia; provides information about the effects, interactions, and lethal doses of thousands of toxic substances that can destroy health, seriously endanger health, or cause death.

Woolf TF (1999)
Handbook of Drug Metabolism, 1st edition
United Kingdom: Taylor & Francis, CRC Press.
Web: http://www.crcpress.co.uk/

Describes xenobiotic oxidation reactions, exhibits lung metabolism, cytochrome P450 regulation, and molecular and biochemical aspects of enzyme inhibition, explores metabolic-based drug interactions, surveys intersubject variabilities in drug response, examines practical applications of in vitro methodologies for studying toxicities, and discusses expressed human drug-metabolizing enzymes.

Approved Drug Products with Therapeutic Equivalence Evaluations (the 'Orange Book'), 27th edition (2007)
United States: U.S. Food and Drug Administration
Web: http://www.fda.gov/cder/orange/obannual.pdf

A text compiled by the U.S. Food and Drug Administration's Center for Drug Evaluation and Research that provides a list of products that have been approved under Section 505 of the Federal Food, Drug, and Cosmetic Act. A companion document titled the 'Cumulative Supplement' is published monthly and provides updated information on newly approved drugs, changes and revisions to current data including therapeutic equivalence evaluations, and updated patent and exclusivity data, http://www.fda.gov/cder/orange/default.htm.

PDR for Nonprescription Drugs, Dietary Supplements, and Herbs, 2nd edition (2006)
United States: Thomson Healthcare.
Web: https://estore.thomsonlearning.com/tl1/en/ US/storefront/pdr

An essential guide to over-the-counter medications, dietary supplements, and herbs. This book provides complete descriptions of the most commonly used over-the-counter medications, including information such as: ingredients, indications, and interactions of hundreds of over-the-counter drugs; administration and dosage recommended for symptomatic relief; color photographs of over-the-counter drugs for quick identification; and organization by therapeutic categories for fast access.

Physicians' Desk Reference, 61st edition (2007)
United States: Thomson Healthcare
Web: https://estore.thomsonlearning.com/tl1/en/US/storefront/pdr

Provides complete data on more than 4000 drugs by name (brand and generic), manufacturer, product category, usage information, warnings, and drug interactions, plus more than 2000 full-size, full-color photos cross-referenced to the drug.

Red Book: Pharmacy's Fundamental Reference, 111th edition (2007)
United States: Thomson Healthcare.
Web: https://estore.thomsonlearning.com/tl1/en/US/storefront/pdr

A reliable source for accurate product information and prices on prescription drugs, over-the-counter items and reimbursable medical supplies. Includes valuable clinical and pharmaceutical reference information on over 100 000 prescription and over-the-counter items but also includes the broad spectrum of healthcare information.

Wiley Handbook of Current and Emerging Drug Therapies, Volumes 1–4 (2006)
Hoboken, NJ: John Wiley & Sons, Inc.
Web: http://www.wiley.com/WileyCDA/WileyTitle/productCd-047004098X.html

Provides a general overview of the etiology and pathophysiology of important disease indications within every major therapeutic area. Includes a comprehensive analysis of currently approved drugs for targeting specific diseases, and information on mechanism of action, efficacy, side effects, and future prospects.

Wiley Handbook of Current and Emerging Drug Therapies, Volumes 5–8 (2007)
Hoboken, NJ: John Wiley & Sons, Inc.
Web: http://www.wiley.com/WileyCDA/WileyTitle/productCd-0470040998.html

Provides a general overview of the etiology and pathophysiology of important disease indications within every major therapeutic area. This book includes a comprehensive analysis of currently approved drugs for targeting specific diseases, and information on mechanism of action, efficacy, side effects, and future prospects.

Journals

American Journal of Therapeutics (AJT) (1994–)
United States: Lippincott Williams & Wilkins.
Web: http://www.americantherapeutics.com

Includes articles relating to the latest therapeutic approaches and drug approval process, as well as therapeutic reviews covering pharmacokinetics, regulatory affairs, pediatric clinical pharmacology, hypertension, metabolism, and drug delivery systems.

Annual Review of Pharmacology and Toxicology (1961–)
United States: Annual Reviews.
Web: http://arjournals.annualreviews.org/loi/pharmtox

Filters and synthesizes primary research to identify the principal contributions in the fields of pharmacology and toxicology.

Anti-Cancer Drugs (1990–)
United Kingdom: Lippincott Williams & Wilkins.
Web: http://www.anti-cancerdrugs.com/

A journal devoted to publication of innovative investigations on therapeutic agents against cancer, and aims to stimulate and report research on both toxic and non-toxic anticancer agents. The scope on the journal covers both conventional cytotoxic chemotherapy and hormonal or biological response modalities.

Biopharmaceutics & Drug Disposition (1979–)
United States: John Wiley & Sons, Inc.
Web: http://www3.interscience.wiley.com/

Publishes original reports and review articles of studies in biopharmaceutics, drug disposition, pharmacokinetics and pharmacodynamics, especially those which have a direct relation to the therapeutic use of drugs.

Clinical Drug Investigation (1995–)
New Zealand: Adis International.
Web: http://www.ingentaconnect.com/content/adis/cdi

Provides coverage on clinical trials, outcomes research, clinical pharmacoeconomic studies, pharmacoepidemiology studies, and clinical pharmacodynamic and pharmacokinetic studies.

Current Drug Metabolism (2000–)
United States: Bentham Science Publishers, Ltd.
Web: http://www.bentham.org/cdm/index.htm

Covers the latest and outstanding developments in drug metabolism and disposition and serves as an international forum for the publication of timely reviews in drug metabolism.

Drug and Chemical Toxicology (1977–)
United Kingdom: Taylor & Francis.
Web: http://www.tandf.co.uk/journals/journal.asp?issn=0148-0545&linktype=1

Includes articles relating to a broad spectrum of toxicological data relevant to risk assessment and harmful effects due to exposure, e.g., descriptive and mechanistic research that illustrates the risk assessment and harmful effects due to exposure. New findings and methods, along with safety evaluations are also included.

Drug Metabolism and Drug Interactions (1988–)
Israel: Freund Publishing House, Ltd.
Web: http://www.freundpublishing.com/index.html

Devoted to the mechanisms by which drugs and other foreign compounds are metabolized, the mechanisms by which drugs may interact with each other as well as with biological systems, and the pharmacological and toxicological consequences of such metabolism and interactions.

Drug Metabolism Reviews (1972–)
United Kingdom: Taylor & Francis.
Web: http://www.tandf.co.uk/journals/titles/03602532.asp

Provides critically needed reviews of drug metabolism research covering established, new, and potential drugs; environmentally toxic chemicals; absorption; metabolism and excretion; and enzymology of all living species.

Drug Safety (1990–)
New Zealand: Adis International.
Web: http://www.ingentaconnect.com/content/adis/dsf

Provides coverage on the disciplines of pharmacovigilance, pharmacoepidemiology, benefit–risk assessment and risk management.

Drugs of the Future (1976–)
Spain: J.R Prous S.A Publishers.
Web: http://journals.prous.com/journals/servlet/xmlxsl/

Publishes comprehensive drug monographs containing product information on new compounds in development, including synthesis, pharmacological action, pharmacokinetics and metabolism, toxicology and clinical studies.

European Journal of Pharmaceutical Sciences (1993–)
Sweden: European Federation for Pharmaceutical Sciences (EUFEPS).
Web: http://www.elsevier.com/

Publishes reports in medicinal chemistry, pharmacology, drug absorption and metabolism, pharmacokinetics and pharmacodynamics, pharmaceutical and biomedical analysis, drug delivery including gene delivery, drug targeting, pharmaceutical technology, pharmaceutical biotechnology, and clinical drug evaluation.

Expert Opinion on Drug Metabolism & Toxicology (2005–)
United Kingdom: Informa Healthcare.
Web: http://www.expertopin.com/loi/emt

Provides a forum for the commentary and analysis of current and emerging research approaches on the absorption, distribution, metabolism, and excretion arena, as well as metabolic, pharmacokinetic, and toxicological issues relating to specific drugs or drug classes.

Expert Opinion on Drug Safety (2002–)
United Kingdom: Informa Healthcare.
Web: http://www.expertopin.com/loi/eds

Each issue covers articles focused on the following key issues: occurrence, management, and prevention of drug-associated adverse events; risk–benefit analyses of individual drugs and drug classes; safety in 'at-risk' patient populations; comparative tolerability studies; and pharmacovigilance and pharmacoepidemiological studies.

Journal of Pharmacology and Experimental Therapeutics (JPET) (1909–)
United States: American Society for Pharmacology and Experimental Therapeutics.
Web: http://jpet.aspetjournals.org/

Covers aspects of the interactions of chemicals with biological systems, including autonomic, behavioral, cardiovascular, cellular, clinical, developmental, gastrointestinal, immuno-, neuro-, pulmonary, and renal pharmacology, as well as analgesics, drug abuse, metabolism and disposition, chemotherapy, and toxicology.

Organizations

American Association of Pharmaceutical Scientists
2107 Wilson Boulevard, Suite 700
Arlington, VA 22201-3042
Phone: 703-243-2800
Fax: 703-243-9650
Web: http://www.aapspharmaceutica.com/

AAPS Pharmaceutica is the web portal for the American Association of Pharmaceutical Scientists, a professional, scientific society of more than 12 000 members employed in academia, industry, government, and other research institutes worldwide. Founded in 1986, AAPS provides a dynamic international forum for the exchange of knowledge among scientists to enhance their contributions to public health. AAPS offers timely scientific programs, ongoing education, information resources, opportunities for networking, and professional development.

The American Society for Pharmacology and Experimental Therapeutics (ASPET)
E220
9650 Rockville Pike
Bethesda, MD 20814-3995
USA
Phone: 301-634-7060
Fax: 301-634-7061
E-Mail: info@aspet.org
Web: http://www.aspet.org/

ASPET aims to promote pharmacological knowledge and its application and to conduct research pertaining thereto. The society also publishes scientific journals, including *Drug Metabolism and Disposition*, *Journal of Pharmacology and Experimental Therapeutics*, *Molecular Pharmacology*, and *Pharmacological Reviews*.

Center for Drug Evaluation and Research (CDER)
United State Food and Drug Administration
Division of Drug Information
5600 Fishers Lane, HFD-240
Rockville, MD 20857
USA
Phone: 301-827-4570
Online contact: http://www.fda.gov/cder/comment.htm
Web: http://www.fda.gov/cder/

CDER evaluates new drugs before they can be sold in the United States by reviewing new drug applications. CDER also ensures that safe and effective drugs are available to improve the health of consumers, and that prescription and over-the-counter drugs, both brand name and generic, work correctly and that the health benefits outweigh known risks.

Center for Food Safety and Applied Nutrition (CFSAN)
United State Food and Drug Administration (U.S. FDA)
5600 Fishers Lane
Rockville, Maryland 20857
USA
Phone: 888-463-6332
Web: http://www.cfsan.fda.gov/~dms/supplmnt.html

CFSAN, in conjunction with the U.S. FDA's field staff, is charged to promote and protect the US public's health by ensuring that the nation's food supply is safe, sanitary, wholesome, and honestly labeled, and that cosmetic products are safe and properly labeled. CFSAN regulates dietary supplements under a different set of regulations (e.g., Dietary Supplement Health and Education Act of 1994) than those covering 'conventional' foods and drug products (prescription and over-the-counter).

European Medicines Evaluation Agency (EMEA)
7 Westferry Circus
Canary Wharf
London E14 4HB
United Kingdom
Phone: 44-20 74 18 84 00
E-Mail: info@emea.europa.eu
Web: http://www.emea.europa.eu

http://www.emea.eu.int/htms/aboutus/organigramme.htm EMEA is a decentralized body of the European Union. Its main duty is to protect and promote public and animal health, through the evaluation and supervision of medicines for human and veterinary use. It is responsible for the scientific evaluation of applications for European marketing authorization for medicinal products.

Health Canada
Drugs and Health Department
Address Locator 0900C2
Ottawa, Ontario
Canada
K1A 0K9
Phone: 613-957-2991 or (866) 225-0709
Fax: 613-941-5366
E-Mail: Info@hc-sc.gc.ca
Web: http://www.hc-sc.gc.ca/dhp-mps/index_e.html

Health Canada is the federal regulator and the Department strives to maintain a balance between the potential health benefits and risks posed by all drugs and health products with the highest priority in determining the balance is public safety. It endeavors to minimize the health risk factors and maximize the safety provided by the regulatory system for these products.

Online contact: https://ssl.g-02.jp/jpma/cgi-bin/ques/ques.cgi
Web: http://www.jpma.or.jp/english/

JPMA is a voluntary organization of research-based pharmaceutical manufacturers which has 74 members including 20 overseas affiliates. JPMA aims to support the sound development of the industry by proactively establishing policies and recommendations, responding to globalization, and reinforcing public relations.

National Institute on Drug Abuse (NIDA)
National Institutes of Health
6001 Executive Boulevard, Room 5213
Bethesda, MD 20892-9561
USA
Phone: 301-443-1124
E-Mail: information@nida.nih.gov or (240-221-4007 en español)
Web: http://www.nida.nih.gov/

NIDA is charged to lead the United States in bringing the power of science to bear on drug abuse and addiction with critical components such as the strategic support and conduct of research across a broad range of disciplines, and ensuring the rapid and effective dissemination and use of the results of that research to significantly improve prevention, treatment, and policy as it relates to drug abuse and addiction.

Pharmaceutical Research and Manufacturers of America (PhRMA)
950 F Street, NW
Suite 300
Washington, DC 20004
Phone: 202-835-3400
Fax: 202-835-3414

PhRMA represents the leading pharmaceutical research and biotechnology companies in the United States. Its mission is to conduct effective advocacy for public policies that encourage discovery of important new medicines for patients by pharmaceutical/biotechnology research companies.

Society of Toxicology (SOT)
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
E-Mail: sothq@toxicology.org
Web: http://www.toxicology.org

SOT is a professional and scholarly organization of scientists from academic institutions, government, and industry representing the great variety of scientists who practice toxicology in the U.S. and abroad. It is the leading global force in advancing science to enhance human, animal, and environmental health with the mission to advance health through the science of toxicology. The society also has a scientific journal entitled *Toxicological Sciences*.

Therapeutic Goods Administration (TGA)
Department of Health and Ageing
P.O. Box 100, Woden ACT 2606
Australia
Phone: 02 6232 8444
Fax: 02 6232 8605
E-Mail: info@health.gov.au
Web: http://www.health.gov.au/tga

The TGA conducts various assessment and monitoring activities to ensure therapeutics available in Australia are acceptable, with the goal that the Australian community has access, within a reasonable time, to therapeutic advances.

Databases

The CDER Handbook
Center for Drug Evaluation and Research (CDER), U.S. Food and Drug Administration
Web: http://www.fda.gov/cder/handbook/

An online resource with information on the following: new drug development and review, generic drug review, over-the-counter drug review, post drug approval process, communicating with CDER, and other activities.

Clinicians Ultimate Guide to Drug Therapy
GlobalRPh, Inc.
Web: http://www.globalrph.com/index.htm

GlobalRPh.com was officially launched in December of 2000. This open-access site is based on a hospital-wide intranet that is located at the VA Medical Center

in Detroit Michigan. The site contains a wealth of information including but not limited to databases on the following: drug abbreviations, drug searches, drug/food reactions, and new drugs.

DEA, Drug Information
U.S. Drug Enforcement Administration
Web: http://www.dea.gov/concern/concern.htm

An open-access, online database maintained by the U.S. Drug Enforcement Administration, which contains the following information on a variety of drugs: description/overview, control status, street names, short-term effects, long-term effects, trafficking trends, use/user population, arrests/sentencing, drug seizures, legislation, treatment resources, photos, and related news releases.

Drug Information and Supplement Information – MayoClinic.com
Mayo Foundation for Medical Education and Research
Web: http://www.mayoclinic.com/health/drug-information/DrugHerbIndex

An open-access, online database with alphabetical listings for drugs and supplements, containing the following information on each entry: U.S. brand names, description, before using, proper use, precautions, and side effects.

Drugs@FDA
U.S. Food and Drug Administration
Web: http://www.accessdata.fda.gov/scripts/cder/drugsatfda/index.cfm

An open-access, searchable database that allows users to find information by drug name, active ingredient, or application number. The website contains a demo that provides the user with a basic understanding of how to search Drugs@FDA.

European Medicines Agency (EMEA) – Authorised medicines for human use
Web: http://www.emea.europa.eu/htms/human/epar/a.htm

An alphabetized, online listing of European Public Assessment Reports (EPAR) that provide scientific conclusions reached by the Committee for Medicinal Products for Human Use (CHMP) after the completion of centralized evaluation processes.

European Medicines Agency (EMEA) – Authorised medicines for veterinary use
Web: http://www.emea.europa.eu/htms/vet/epar/eparintro.htm

An alphabetized, online listing of European Public Assessment Reports (EPAR) that provide scientific conclusions reached by the Committee for Medicinal Products for Veterinary Use (CMPVU) after the completion of centralized evaluation processes.

Inactive Ingredient Search for Approved Drug Products
U.S. Food and Drug Administration
Web: http://www.accessdata.fda.gov/scripts/cder/iig/index.cfm

The Inactive Ingredients Database provides information on inactive ingredients present in FDA-approved drug products. Users can search the Inactive Ingredients Database by entering any portion of the name of an inactive ingredient. The search must contain at least three characters. Search results are displayed alphabetically, sorted first by ingredient, then by the route of administration and dosage form.

Index to Drug-Specific Information
U.S. Food and Drug Administration
Web: http://www.fda.gov/cder/drug/DrugSafety/DrugIndex.htm

An online, alphabetized list of drugs with information provided in one of three different formats: (1) Patient Information Sheet (with and without FDA Alerts); (2) Consumer Information Sheet (for drugs approved since 1998; these will all be eventually converted to Patient Information Sheets); and (3) Drug Information Page (may include a Patient or Consumer Information Sheet, Healthcare Professional Sheet, approval information, FDA press releases, questions and answers about a drug, and other related information).

International Bibliographic Information on Dietary Supplements (IBIDS) Database
National Institutes of Health, Office of Dietary Supplements
Web: http://dietary-supplements.info.nih.gov/Health_Information/IBIDS.aspx

Provides open access to bibliographic citations and abstracts from published, international, and scientific literature on dietary supplements. Users can choose to search the Full IBIDS Database, a subset of Consumer Citations Only or Peer Reviewed Citations Only.

Investigational Drugs Database (Iddb3)
Thomson Current Drugs
Web: http://www.iddb3.com/

A fee-for-service database with coverage on all aspects of investigational drug development, from first patent to eventual launch or discontinuation.

IPCS INTOX Databank
International Programme on Chemical Safety
Web: http://www.intox.org/databank/index.htm

An online databank that contains physical, chemical, and toxicological information on chemicals, pharmaceuticals, animals, plants, bacteria, fungi, as well as treatment guides, antidotes, and supplemental documents.

The Merck Veterinary Manual
Merck & Co., Inc.
Web: http://www.merckvetmanual.com/mvm/index.jsp

An open-access, online manual, which provides in-depth coverage of advances in veterinary science, the emergence of new pathogens and new diseases, advances in diagnosis and treatment, and expanded coverage of specialty fields such as cardiology, neurology, ophthalmology, toxicology, and emergency medicine.

National Drug Code Directory
U.S. Food and Drug Administration
Web: http://www.fda.gov/cder/ndc/database/default.htm

Drug products are identified and reported using a unique, three-segment number, called the National Drug Code (NDC), which is a universal product identifier for human drugs. The U.S. Food and Drug Administration (FDA) publishes information in the NDC Directory and allows users to search the information by proprietary name, active ingredient, application number, NDC number, and firm name.

Prescription Drug Information, Side Effects, Interaction-Drugs.com
Drugsite Trust
Web: http://www.drugs.com

A comprehensive and up-to-date drug information resource available online with fast, easy searching on over 24 000 prescription and over-the-counter medicines.

RxList – The Internet Drug Index for Prescription Drug Information, Interactions, and Side Effects
RxList, Inc.
Web: http://www.rxlist.com/script/main/hp.asp

An open-access database with coverage on thousands of prescription and over-the-counter medications, including information on uses, side effects, precautions, interactions, and overdose.

Veterinary Drug Residues in Food (MRLs/EMRLs)
FAO/WHO Food Standards, Codex alimentarius
Web: http://www.codexalimentarius.net/mrls/vetdrugs/jsp/vetd_q-e.jsp

An open-access database that allows users to conduct searches for the maximum residue limit of specific chemicals in a variety of animal species and food products.

WebMD Health – Drug Index
WebMD, Inc.
Web: http://www.webmd.com/drugs/index-drugs.aspx

An alphabetical compilation of prescription and over-the-counter medications that provides search options and information on the uses, side effects, precautions, interactions, and overdose for each entry.

Chemicals: Dusts and Fibers

VICTORIA A. CASSANO AND TEE L. GUIDOTTI

INTRODUCTION

Dusts are finely divided particles in the solid phase which, when suspended in air, form aerosols. Aerosols may also form from particles in the liquid phase, or mists. Aerosols have a variety of properties and characteristic behavior depending on composition and air movement. Dusts within aerosols behave in air and adjacent surfaces according to their mass, density, size, dimensions, and electrostatic charge. Once inhaled, their fate in the upper respiratory tract and in the lung is determined by their mass, size, shape, and electrostatic charge. Once deposited in the lung, they may persist or be degraded according to their composition and water solubility. Only then does the dust exert any physiological effect it will have and aerosol science and particle deposition studies give way to toxicology.

These citations represent a selected list of references, including some important older sources, with a heavy emphasis on the major, controversial, and emerging issues of the last decade: asbestos, silica, wood dust, and nanoparticles. Some dust diseases of the lung may be associated with asthma and immunological responses, such as hypersensitivity pneumonitis, hard metal disease, and beryllium disease, but the majority are characterized by a fibrotic response to the deposition of dust in the alveolus, resulting in a pneumoconiosis. Three are particularly troublesome because of the intensity of the fibrosis and how common they are in the workplace: silicosis, asbestosis, and coal workers' pneumoconiosis.

Asbestos studies are highly contentious with on-going debate over the relative toxicity of chrysotile, notwithstanding that commercial chrysotile is known to be associated with lung cancer, mesothelioma, and non-malignant asbestos-related disease. Silica studies have been dominated in recent years by studies that sought to question or confirm the association of lung cancer with silica exposure but as this question is now largely settled, attention has turned to characterizing the rheumatological and kidney disorders associated with inhaled silica. Wood dust presented a surprise a decade ago when softwood dust was found to be associated with nasal and sinus carcinoma, as is hardwood dust; the relevant particle size for wood dust is greater than for mineral dusts. Nanoparticles and fine particulate air pollution have been intensively studied just in the last 10 years and their subtle but intense effects are still being characterized.

RESOURCES

Books

Castleman BI, Berger SL (2005)
Asbestos: Medical and Legal Aspects, 5th edition
New York: Aspen.

A comprehensive history of asbestos, asbestos exposure in the workplace, and asbestos litigation. Detailed description and evaluation of legal arguments put forth by plaintiff and defense counsel, with an emphasis on what companies knew about asbestos hazards at various times.

Cherry N, Ogden T (eds.) (1997)
Inhaled Particles VIII
Proceedings of an International Symposium on Inhaled Particles organized by the British Occupational Hygiene Society, 26–30 August 1996

Amsterdam, the Netherlands: Pergamon.

Inhaled Particles are a series of international symposia which have been organized by the British Occupational Hygiene Society since 1960. Inhaled Particles VIII was a landmark meeting held in Cambridge on 26–30 August 1996, entitled 'Occupational and Environmental Implications for Human Health'. This volume collects 123 concise papers on occupational and environmental exposure, inhalation, deposition, clearance, pathophysiology, experimental methodology, and modeling of dusts, including radioactive particles, fibers, coal, and silica. Inhaled Particles IX (2001) has been widely anticipated but has not yet appeared. It is reportedly still in production at Oxford University Press. Abstracts from the 2001 meeting are available on-line at http://www.abdn.ac.uk/~oem148/news0215.hti.

Dodson RF, Hammar SP (eds.) (2006)
Asbestos, Risk Assessment, Epidemiology and Health Effects
Boca Raton, FL: Taylor and Francis.

An overview of asbestos research, bringing many topics together in one place related to health risk.

Goldman L, Coussens C. (eds.) (2005) Roundtable on Environmental Health Sciences, Research and Medicine
Implications of Nanoparticles for Environmental Health Research
Washington DC: National Academies Press.

Institute of Medicine. Committee on Asbestos: Selected Health Effects (2006)
Asbestos: Selected Cancers
Washington DC: National Academies Press.

A highly authoritative reference on the association between asbestos and cancers other than lung cancer.

International Agency for Research on Cancer (IARC) (1997)
Evaluation of the Carcinogenic Risk to Humans. Silica, some Silicates, Coal Dust, and Para-aramid Fibrils, Volume 68
Lyon, France: IARC Scientific Publications.
The essential reference on silica-associated lung cancer risk.

National Institute for Occupational Safety and Health
Health Effects of Occupational Exposure to Respirable Crystalline Silica
NIOSH Hazard Review
Department of Health and Human Services, Centers for Disease Control and Prevention, DHHS (NIOSH) Publication No. 2002-129, Cincinnati OH, April 2002.

This document summarizes information on silica-related lung disease, cancer risk, and rheumatological disorders. A comprehensive overview of silica.

Peters GA, Peters BJ (1980–2000)
Sourcebook on Asbestos Diseases
Charlottesville, VA: Lexis Publications.

The Sourcebook has long been the essential reference for attorneys and professionals working in the field of asbestos. Each of the 21 volumes features many detailed chapters written by experts on all aspects of asbestos-related disease.

Roggli VL, Oury TD, Sporn TA (eds.) (2004)
Pathology of Asbestos Associated Disease, 2nd edition
New York: Springer.

Surveys research and advances in its discussion of asbestos-induced diseases, including the mineralogy of asbestos, environmental exposure, and the pathology of asbestosis and asbestos-associated cancer. A detailed discussion on mesothelioma includes a historical background, addresses etiology and epidemiology, pathology, differential diagnosis, treatment, and prognosis.

Journal

Particles and Fibre Toxicology
This online journal is an open-access journal from Biomed Central (http://www.biomedcentral.com/) that receives manuscripts on the toxicological effects of particles and fibres; it also advocates multidisciplinary studies. For additional information and access to the journal, refer to http://www.particleandfibretoxicology.com/home/.

Journal articles

The journal literature on dusts and fibers is vast and highly specific. Few review articles address more than one dust and comparative studies are scarce.

American Thoracic Committee, Ad Hoc Committee (2004) [on Update of 1986 Criteria for the Diagnosis of Nonmalignant Asbestos-Related Disease: Guidotti TL, Miller A, Christiani D, Wagner G, Balmes J, Harber P, Brodkin CA, Rom W, Hillerdal G, Harbut M, Green FHY]. Chemicals: Metals

RUSSELL BARBARE AND SHAYNE GAD

INTRODUCTION

No general principles that govern the toxicity of all metals and their compounds exist; however, a few generalizations are possible. Oxidation state and solubility are critical factors in toxic reactions. Metals usually produce their effects by reaction with enzymes, cell membranes, or specific cell components. These reactions can inhibit or stimulate the actions of these substances and components.

For the general population, the primary route of exposure is ingestion with food or with drinking water inhalation. The secondary route is inhalation, which can include exposure from environmental contamination or from industrial work. The very young and the elderly are most susceptible to metal toxicity. Essential metals such as calcium and iron can cross the placental barrier and a few toxic metals such as lead and mercury can also.

A small number of metals and their compounds are carcinogenic to humans but the vast majority are not. Some metals are essential for good health (e.g., copper, chromium, selenium). Others are suspected to be inessential (e.g., beryllium, lead, tin). Still others are under investigation (e.g., arsenic).

Metals are generally circulated bound to some blood protein and can selectively bioaccumulate; thus, metals can affect either specific target organs or multiple anatomical sites. For example, lead can deposit in the bone, affect the central nervous system (CNS), and interfere with the metabolism of the heme in hemoglobin; cadmium appears to concentrate in the kidneys and the liver; and mercury is a CNS toxin. Acute toxicity from metals can also cause non-specific symptoms including nausea and vomiting.

The metabolic product of the metal can determine the action in the organ in which the metal is deposited. Mercury is converted to methyl mercury chloride, which is soluble in lipids and appears to be concentrated over time in organs with high lipid content. Often, metabolism of metals can lead to detoxification and excretion. Some metals, such as selenium metal and oxides, are converted to the volatile trimethyl derivative and are exhaled. Metals such as cadmium, zinc, copper, and mercury induce special protein complexes called metallothioneins, which may be part of a detoxification function. Iron forms a number of other protein complexes (ferritin, hemosiderin, and transferrin), which are a normal part of body chemistry and are mainly metabolized by the liver.

RESOURCES

Books

Bingham E, Cohrssen B, Powell CH (eds.) (2001)
Patty's Toxicology, 5th edition

Covers chemical and metal toxicology from an industrial standpoint. The majority of the works are evaluations grouped by substance similarity, but it also includes articles on categories on toxicology, e.g. carcinogenesis and ecogenetics. The chapters generally cover both acute and long-term exposure, both accidental and planned exposure, and both animal and human data. Consists of nine volumes with a comprehensive index.

Bowden GT, Fisher SM (eds.) (1997)
Comprehensive Toxicology Volume 12: Chemical Carcinogens and Anticarcinogens

Discusses the actions of various chemical carcinogens, including metals, as well as ultraviolet and ionizing radiation in the context of the multistage process of both experimental and human carcinogenesis.

Chang LW, Magos L, Suzuki T (eds.) (1996)
Toxicology of Metals

Comprehensively reviews metal toxicology, covering aspects from exposure to symptoms to endpoints. This work covers broad subjects such as the major aspects and issues of metal toxicology as well as focused subjects such as carcinogenicity, neurotoxicity, and renal toxicity. Consists of two volumes.

Dart RC (ed.) (2004)
Medical Toxicology, 3rd edition

Approaches substance toxicology through the points of view of diagnosis, forensics, and treatment. Includes diagnosis suggestions for multiple diseases, antidotes and supportive care for known toxicities, and the toxicology and treatments for common drugs, poisons, chemicals, and natural toxins.

Ford MD, Delaney KA, Ling LJ, Erickson T (eds.) (2001)
Clinical Toxicology

Contains toxicology and treatment reviews of a number of therapeutic agents, illegal drugs, industrial and cleaning chemicals, and pesticides. The first two sections are on general management principles and treatment of specific symptoms and are therefore of less interest to the toxicologist.

Fowler BA, Nordberg M, Friberg L, Nordberg G (eds.) (2007)
Handbook on the Toxicology of Metals

Covers metal toxicology in detail by having separate chapters dedicated to individual metals but also having chapters covering general topics such as risk assessment, diagnosis, exposure routes, biochemistry, and ecotoxicology. The volume also includes chapters for specific toxicology areas such as carcinogenicity, reproductive toxicology, and immunotoxicology.

Goyer RA, Klaassen CD, Waalkes MP (eds.) (1995)
Metal Toxicology

Reviews the toxicology of metals mostly by a target organ system but also investigates underlying mechanisms, influencing factors, and carcinogenicity.

Goyer RA, Mehlman MA (eds.) (1977)
Toxicology of Trace Elements

Reviews primarily metal toxicology in a detailed manner, covering environmental, analytic, mechanistic, epidemiologic, pharmacokinetic, and target organ aspects.

Hayes AW (ed.) (2007)
Principles and Methods of Toxicology, 5th edition

Primarily covers the main ideas and techniques of toxicology but also solvents, crop protection chemicals, and metals.

Lewis RJ Sr. (ed.) (2004)
Sax's Dangerous Properties of Industrial Materials, 11th edition

Presents regulatory limits and reported toxicity levels, i.e. MLDs, LD_{50}s, TDLOs, etc., in a compact format along with basic chemical properties and a short safety profile. Consists of three volumes with a comprehensive index, including a CAS index.

Pohanish RP (ed.) (2002)
Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens, 4th edition

Includes short descriptions of toxicity, exposure routes, and first aid, but concentrates on material handling and exposure prevention. Sittig's also includes the appropriate regulatory authorities with the regulated limits and recommended cleanup procedures. The format is similar to that found on MSDS forms. Consists of two volumes with a comprehensive index.

Journals

Drug and Chemical Toxicology

Food and Chemical Toxicology

Online Databases

Agency for Toxic Substances and Disease Registry (ATSDR)

Provides general information on toxic substances, including metals. The material is generally at the level of the educated layman and there are several tutorials with self-checks available. A subdivision of the U.S. Department of Health and Human Services.
Web: http://www.atsdr.cdc.gov/contents.html

Entrez Cross-Database Search

Searches several databases in the U.S. National Institutes of Health (NIH)/National Library of Medicine (NLM) family. The most notable difference from other databases is that it includes records from the U.S. National Center for Biotechnology Information, which has proteomic and genomic information such as the exact structure of known biological compounds with the metal in question and known karyotypes for metal-based neoplasms.
Web: http://www.ncbi.nlm.nih.gov/sites/gquery

Haz-Map

From the NIH, NLM's TOXNET system, it covers occupational exposure to metals and other hazardous agents by agent, by disease, or by job.
Web: http://hazmap.nlm.nih.gov/

Household Products Database

From the NIH, NLM, it allows searching for metals and other compounds that occur in household products. This database focuses on potential exposure from household products but also provides links to other toxicological sources such as TOXNET.
Web: http://householdproducts.nlm.nih.gov/

International Programme on Chemical Safety (IPCS)

Provides international information on chemical safety, with assessments of safety from both a human and environmental level. The primary format is specific monographs, so general information and data on less notable metals may not be available. IPCS is in partnership with the Canadian Centre for Occupational Health and Safety (CCOHS) and is part of a cooperative agreement among UNEP, ILO, FAO, WHO, UNIDO, UNITAR, and OECD.
Web: http://www.inchem.org/

TOXLINE

From the NIH, NLM, it allows searches of articles from a comprehensive set of toxicology literature. The primary advantages of this over NLM's PubMed are specificity (focused on toxicology) and its inclusion of U.S. and international working group publications.
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?TOXLINE

TOXNET
Searches databases from the U.S. NIH, NLM family that are specifically focused on hazardous chemicals, toxic releases, and environmental health. The information type is specific to the individual databases but includes information for informed citizens, healthcare professionals, and toxicologists. Databases on this system with important specific foci are listed separately.

Chemicals: Pesticides

ALLAN S. FELSOT

INTRODUCTION

The literature regarding basic mechanisms of pesticide toxicity, exposure assessment, and risk characterization has literally exploded over the last decade since publication of the 3rd edition of the IRT. The various information sources referenced in this listing were chosen primarily for their focus on human exposure and epidemiology. However, books and journals also covered references about environmental chemistry and ecotoxicological effects so that the interested reader could have some guidance for initiating a search on environmental aspects of pesticide technology.

Notable among the specific journal articles are series of publications by singular university or government entities that have been operating under large, multiyear Federal grants to focus on children and worker health in relation to pesticide exposure. For example, the Federally funded Agricultural Health Study (AHS) has a mandate to elucidate relationships between farmworker health and disease and associations with farm practices, especially pesticide use. The project is a collaborative effort between researchers from the National Institute of Environmental Health Sciences, the National Cancer Institute, and the Environmental Protection Agency. This project has turned out a disproportionate number of exposure and epidemiological investigations in two cohorts of farmworkers and their spouses and children. All of the papers produced under the aegis of the AHS are available online at the program website, URL: http://www.aghealth.org/. Thus, selected papers of particular importance are shown below because they have addressed important epidemiological issues, or alternatively the publication has generated media attention.

In addition to research focused on hazards of pesticides to humans, a few university research groups have been elaborating biochemical mechanisms of pesticide toxicity. Notable among these publications has been the intense focus on neurotoxicity of organophosphate insecticides. The included journal articles were chosen because they have reviewed and analyzed the literature over the last decade and/or they highlighted significant new findings regarding pesticide exposure and effects. The articles are cataloged under various focus areas of toxicology, especially including neurotoxicology and carcinogenicity. Each article is designated as either exposure assessment, basic mechanistic research on a particular physiological system (e.g., neurological, endocrine), or epidemiology.

Nearly all of the references listed were published after the last edition of the IRT. In some cases, especially for books, important continuing series were left out of the 3rd edition, yet represent a significant source of information about all aspects of pesticide technology, especially as studied with regard to exposure assessment. In compiling a useful and reasonably current list of bibliographic sources that are likely to stand the test of time, one has to be selective when the field is rapidly advancing owing to policy decisions reflecting societal concerns about the technology. Indeed, included under journal articles is a section on current pesticide-related policy issues. With this caveat in mind, the listed resources shown below represent the 'state-of-the-art' literature for pesticide toxicology related to human health effects.

RESOURCES

Books

American Chemical Society Symposium Series Books

The Division of Agrochemicals of the American Chemical Society has been holding biannual symposia on various topics of pesticide toxicology and environmental chemistry for over 30 years. The titles shown below are descriptive of the contents and have been published since the 3rd edition of the IRT. As indicated in the book title, themes have focused on exposure assessment for risk characterization.

Arthur EL, Barefoot AC, Clay VE (eds.) (2003) Terrestrial Field Dissipation Studies. Purpose, Design, and Interpretation. ACS Symposium Series 842, 343 pp. Washington, DC: American Chemical Society.

Ballantine LG, McFarland JE, Hackett DS (eds.) (1998) Triazine Herbicides: Risk Assessment. ACS Symposium Series 683, 480 pp. Washington, DC: American Chemical Society.

Clark JM (ed.) (1995) Molecular Action of Insecticides on Ion Channels. ACS Symposium Series 591, 356 pp. Washington, DC: American Chemical Society.

Books Based on the IUPAC (International Union of Pure and Applied Chemistry) International Congresses of Pesticide Chemistry

Every 4 years since the 1960s, IUPAC has sponsored an International Congress devoted to all aspects of pesticide technology. Each book contains chapters based on keynote presentations that accompany various subject sessions. In these books one can find an evolution of pesticide chemistry and toxicology and thinking about risk assessment of the technology. The most recent publication emphasizes new product chemistries that would be considered 'reduced risk' by the Environmental Protection Agency.

Brooks GT, Roberts TR (ed.) (1999) Pesticide Chemistry and Bioscience. The Food-Environment Challenge, 438 pp. Cambridge, UK: Royal Society of Chemistry. (IUPAC 9th Pesticide Chem. Congr., London, UK)

Ohkawa H, Miyagawa H, Lee PW (eds.) (2007) Pesticide Chemistry: Crop Protection, Public Health, Environmental Safety, 497 pp. Weinheim, Germany: Wiley-VCH Verlag GmbH & Co. (IUPAC 11th International Congress of Pesticide Chemistry, Kobe, Japan)

Ragsdale NN, Kearney PC, Plimmer JR (eds.) (1995) Eighth International Congress of Pesticide Chemistry. Options 2000, 450 pp. Washington, DC: American Chemical Society.

Voss G, Ramos G (eds.) (2003) Chemistry of Crop Protection. Progress and Prospects in Science and Regulation, 395 pp. Weinheim, Germany: Wiley-VCH. (IUPAC 10th Pesticide Chem Congr, Basel, Switzerland)

Books Reviewing Herbicide or Fungicide Mode of Action

These books, which were not covered in the last edition of the IRT, provide thorough discussions of herbicide mode of action and therefore provide insights into possible vertebrate toxicology. Many of the herbicides discussed are still in modern use. Some cover environmental chemistry and impact on non-target plants.

Boger P, Sandmann G (1989) Target Sites of Herbicide Action. 295 pp. Boca Raton, FL: CRC Press.

Boger P, Sandman G (eds.) (1993) Target Assays for Modern Herbicides and Related Phytotoxic Compounds, 299 pp. Boca Raton, FL: Lewis Publishers.

Journals

The following journals routinely publish articles dealing with all aspects of pesticide technology. Historically, a disproportionate number of pages had been devoted to pesticide topics. However, over the last decade, especially as new contaminants have emerged, fewer articles are about pesticides.

Aquatic Toxicology (1981–)
Amsterdam, the Netherlands: Elsevier.

Focuses on mechanisms of toxicity in aquatic environments and responses to toxic agents at community, species, tissue, cellular and subcellular level, including aspects of uptake, metabolism and excretion of toxicants.
Web: http://www.elsevier.com/wps/find/journal_browse.cws_home (note that this URL will allow access to all Elsevier journals listed in this section).

Archives of Environmental Contamination and Toxicology (1973–)
New York: Springer

Articles cover analytical chemistry, biochemistry, pharmacology, toxicology, and environmental chemistry of all environmental contaminants. Exposure focus includes non-target plants and animals, including humans.
Web: http://www.springerlink.com/content/0090-4341

Bulletin of Environmental Contamination and Toxicology (1967–)
New York: Springer.

Rapid publication of significant advances and discoveries in the fields of air, soil, water, and food contamination and pollution as well as articles on methodology and other disciplines concerned with the introduction, presence and effects of toxicants in the total environment.
Web: http://www.springerlink.com/content/101156/

Chemosphere (1972–)
Amsterdam, the Netherlands: Elsevier.

Multidisciplinary journal, offers maximum dissemination of investigations related to all aspects of environmental science. Divided into four sections: 'Persistent Organic Pollutants and Dioxins'; 'Environmental Chemistry'; 'Environmental Toxicology and Risk Assessment'; 'Science for Environmental Technology'.
Web: http://www.elsevier.com/wps/find/journal_browse.cws_home

Ecotoxicology (1992–)
Amsterdam, the Netherlands: Springer.

Fundamental research on the effects of toxic chemicals on populations, communities, and terrestrial, freshwater, and marine ecosystems. Papers focus on mechanisms and processes of effects on ecosystems with an

examination of the impact caused at the population or community level.
Web: http://www.springerlink.com/content/0963-9292

Ecotoxicology and Environmental Safety (1977–)
Amsterdam, the Netherlands: Elsevier.

Focused on the integrated mechanistic research on exposure pathways and interactions of substances and chemical mixtures in environmental media; on bioavailability; circulation and assimilation in target and non-target organisms, their biological response and damage mechanisms (endocrine disruption, genotoxicity), as well as on a further fate in the food chain, including humans.
Web: http://www.elsevier.com/wps/find/journal_browse.cws_home

Environmental Health Perspectives (1972–)
Research Triangle Park, NC: National Institute of Environmental Health Sciences.

Research and news on the impact of the environment on human health; includes many studies of exposure assessment and epidemiology.
Web: www.ehponline.org/

Environmental Pollution (1970–)
Amsterdam, the Netherlands: Elsevier.

Papers address issues relevant to the nature, distribution and ecological effects of all types and forms of chemical pollutants in air, soil, and water.
Web: http://www.elsevier.com/wps/find/journal_browse.cws_home

Environmental Science and Technology (1967–)
Washington, DC: American Chemical Society.

Currently focuses on all natural and anthropogenic contaminants, publishing articles on basic environmental chemodynamics, trends in residues, waste remediation, exposure assessment, and risk characterization.
Web: http://pubs.acs.org/journals/esthag/

Environmental Toxicology and Chemistry (1982–)
Pensacola, FL: Society of Environmental Toxicology and Chemistry.

Papers describe experimental or theoretical work that advances an understanding of contaminants from the perspective of environmental toxicology and environmental chemistry. Many papers are focused on hazard identification, but also includes a few on risk characterization.
Web: http://www.setacjournals.org/perlserv/?request=get-archive

Journal of Agricultural and Food Chemistry (1953–)
Washington, DC: American Chemical Society.

Focus on discovery and biological activity of potential crop protection products (natural and synthetic) and environmental chemistry of pesticides; now dominated by papers on prevalence and biological activity of plant antioxidants and various aspects of other food biochemicals in relation to food taste and quality.
Web: http://pubs.acs.org/journals/jafcau/index.html

Journal of Environmental Quality (1972–)
Madison, WI: American Society of Agronomy.

Articles focus on environmental chemistry of natural and anthropogenic chemicals, as well as environmental processes associated with agricultural operations and urban environments.
Web: http://jeq.scijournals.org/

Journal of Environmental Science and Health, Pt. B: Pesticides, Food Contaminants, and Agricultural Wastes (1966–)
London, UK: Taylor Francis.

Original research reports on analytical techniques or improvements on existing methods applicable to residues of pesticides, food contaminants (natural and additive), and other chemical contaminants, and their metabolites in the ecosphere. Subjects include persistence, binding, translocation, chemical and biodegradation, and metabolic fate of contaminant chemicals; methods of detoxification; and toxicological considerations and consequences. The journal also encompasses the development of integrated methods of pest control and various aspects of agricultural wastes.
Web: http://www.tandf.co.uk/journals/

Journal of Toxicology and Environmental Health, Parts A & B (1975–)
London, UK: Taylor Francis.

Focus is on basic toxicology of a wide variety of contaminants with numerous articles historically about pesticides (Part A). Includes numerous review articles (Part B) on specific pesticides and on affected physiological systems.
Web: http://www.tandf.co.uk/journals/

Pest Management Science (formerly Pesticide Science) (1970–)
Hoboken, NJ: Wiley Interscience.

Covers all aspects of research and development, application, use and impact on the environment of products designed for pest control and crop protection.

Web: http://www.interscience.wiley.com/cgi-bin/jhome/68504529?CRETRY=1&SRETRY=0

Pesticide Biochemistry and Toxicology (1971–)
Amsterdam, the Netherlands: Elsevier.

Focus is toxicodynamics of all pesticides, including natural products. Welcomes molecular, biochemical, and physiological approaches to advance comparative toxicology and understand selectivity and pest resistance.

Reviews of Environmental Contamination and Toxicology (formerly Residue Reviews) (1962–)
New York: Springer.

Monographs of comprehensive reviews of all contaminants (natural and synthetic) including analysis, environmental chemistry, toxicology, exposure assessment, risk characterization, and epidemiology.
Web: http://www.springer.com/west/home/new+&+forthcoming+titles+(default)?SGWID=4-40356-69-173621538-0

Journal Articles

Exposure Assessment

The following articles from the AHS studied the reliability of self-reported information from workers that has typically been the basis for cohort comparisons in epidemiological studies. In addition, AHS research began to focus on biomonitoring.

Bell EM, Sandler DP, Alavanja MC, et al (2006) High pesticide exposure events among farmers and spouses enrolled in the Agricultural Health Study. J. Agricultural Safety and Health 12(2): 101–116.

Blair AR, Tarone R, Sandler DP, et al (2002) Reliability of reporting on life-style and agricultural factors by a sample of participants in the Agricultural Health Study from Iowa. Epidemiology 13: 94–99.

Coble J, Arbuckle T, Lee WJ, et al (2005) The validation of a pesticide exposure algorithm using biological monitoring results. J. Occup. Environ. Hygiene 2: 194–201.

Curwin BD, Hein MJ, Sanderson WT, et al (2005) Urinary and hand wipe pesticide levels among farmers and nonfarmers in Iowa. J. Expo. Anal. Environmen. Epidemiol. 15(6): 500–508.

Curwin BD, Hein MJ, Sanderson WT, et al (2007) Urinary pesticide concentrations among children, others and fathers living in farm and no-farm households in Iowa. Ann. Occup. Hyg. 51(1): 53–65.

Dosemeci M, Alavanja MCR, Rowland AS, et al (2002) A quantitative approach for estimating exposure to pesticides in the Agricultural Health Study. Ann. Occup. Hyg. 46(2): 245–260.

Hoppin JA, Yucel F, Dosemeci M, et al (2002) Accuracy of self-reported pesticide use duration information from licensed pesticide applicators in the Agricultural Health Study. J. Expo. Anal. Environ. Epidemiol. 12: 313–318.

Hoppin JA (2005) Integrating exposure measurements into epidemiologic studies in agriculture. Scan. J. Work Environ. Health 31(suppl. 1): 115–117.

The following set of papers was published by researchers associated with PNASH, the Pacific Northwest Agricultural Safety and Health Center at the University of Washington (URL: http://depts.washington.edu/pnash/). The National Institute of Occupational Safety and Health over the last decade funded centers like PNASH throughout the U.S. to study all aspects of agricultural workers safety and health. Some of these centers have also been conducting assessments of children's exposure to pesticides, as well as potential health outcomes, under EPA funding mandates.

Other Children and Worker Exposure Assessment Articles

Particularly notable among this next subset of exposure assessment papers is a focus on biomonitoring urinary metabolites (especially of OP insecticides) or parent pesticides in children and farmworkers. The focus on children has been on exposures from use of pesticides in residential settings.

Web Resources

The evolution of internet access has greatly facilitated finding information about any toxicological subject. Even if entire journal articles cannot be downloaded, the abstracts are freely available along with links for communication with the senior author of an article. Thus, one can always request a reprint of the full article. In addition to facilitated access to the peer-reviewed research literature, a number of government and NGO websites have valuable information about pesticide toxicology and chemistry, and perhaps as importantly, scientific policy governing pesticide technology. Felsot (2002) comprehensively reviewed electronic resources of pesticide information. Below is an update of the more important websites that represent databases of information useful for conducting human health risk assessments.

Felsot AS (2002) WEB resources for pesticide toxicology, environmental chemistry, and policy: a utilitarian perspective. Toxicology 17: 153–166.

California EPA-Department of Pesticide Regulation (DPR) Risk Assessments

Web: http://www.cdpr.ca.gov/docs/risk/rcd.htm

CDPR conducts independent human health risk assessments for numerous active ingredients. Each is available form this site as a downloadable PDF file. From the home page of CDPR, one can also find useful information about all aspects of pesticide technology, including links to information about how CDPR regulates pesticides and conducts risk assessments.

EXTOXNET

Web: http://ace.orst.edu/info/extoxnet/

This site, which is hosted by Oregon State University, has an alphabetized linkable list of pesticides (under the link called 'Pesticide Information Profiles'). Although some of the information is becoming dated, and pesticides registered within the last several years are not included, the information provides a complete overview of pesticide mammalian toxicity, ecotoxicity, and environmental fate.

National Pesticide Information Center

Web: http://npic.orst.edu

Fact sheets downloadable as PDF files have been developed for some active ingredients (31 at this time) and are written in non-technical language. Some of them give detailed information about both hazards and dose-response relationships (for example, see the fact sheet for the insecticide synergist piperonyl butoxide). Fact sheets have also been developed on specific pesticide topics. Many of the pesticides with technical fact sheets are those commonly used in urban environments.

Non-Governmental Organizations

NCAP (Northwest Coalition for Alternatives to Pesticide)

Web: http://www.pesticide.org/

This NGO website provides information about pesticide hazards but also alternatives to pesticides that could provide effective pest control. The site also

includes information on inert ingredients and hosts various campaigns for increasing the public's right to know about pesticide ingredients. The site contains numerous fact sheets for registered pesticides that have appeared in the NGO's publication, *Journal of Pesticide Reform*.

PANNA (Pesticide Action Network of North America)
Web: http://www.panna.org/

NGO sites tend to be focused on hazard identification without consideration of exposure. Nevertheless NCAP and PANNA have extensive fact sheet information about many pesticides. PANNA has a searchable database that provides an acute toxicity endpoint (for example, oral and dermal LD_{50}) and narrative hazard information.

Program on Breast Cancer and Environmental Risk Factors
Web: http://envirocancer.cornell.edu/

Developed and hosted by Cornell University faculty, BCERF's mission is to address 'the relationship between environmental risk factors and breast cancer through a variety of research and education strategies'. The site has downloadable PDF files of critical analyses and HTML formats of fact sheets and extensive bibliographies. Most pesticides highlighted on the site are those where any association with breast cancer had been suspected from animal and human studies. The site has a search engine, and recent additions include a database of turf pesticides and cancer risk.

U.S. EPA Home Page to start searching for information
Web: http://www.epa.gov/pesticides

This site is EPA's portal for the plethora of information developed by the agency about all aspects of pesticide technology. Thus, from this portal one should be able to find information about specific active ingredients as well as regulations and science policy for conducting pesticide risk assessments. The site also includes a highlights section that links to news regarding recent agency decisions and science reviews.

U.S. EPA FIFRA Scientific Advisory Panel
Web: http://www.epa.gov/scipoly/sap/

This site posts numerous EPA position papers that have analyzed basic and applied pesticide toxicology issues that the agency desires its advisory panel to comment on. Many papers are oriented to science policy concerning modeling and testing that will aid in making pesticide registration decisions.

U.S. EPA Re-registration Eligibility Decision Database
Web: http://www.epa.gov/pesticides/reregistration/status.htm

This site has an alphabetical list of pesticides for which EPA has issued a re-registration eligibility decision. Documents are available for download as PDF files.

Organizations (professional scientific societies that include pesticides as a focal area)

American Chemical Society, Division of Agrochemicals
1155 Sixteenth Street, NW
Washington, DC 20036
Phone: (800) 227-5558
E-Mail: service@acs.org

CHAPTER

18

Chemicals: Solvents[1]

WILLIAM K. BOYES

INTRODUCTION

The organic solvents are among the most common substances in industry and commerce. They are used for a wide variety of applications where dissolving organic compounds is of interest. Among the principal applications are metal cleaning and degreasing, painting, printing, dry cleaning, adhesives, and fuels and fuel additives. Organic solvents are also common in consumer products such as glues, cleaning products, and inert ingredients in pesticide formulations. When measured by volume, three of the top five hazardous air pollutants released into the air are the common organic solvents toluene, benzene, and xylene. These three substances together comprise approximately 40% of all hazardous air pollutants released into the U.S. air each year. There are some chemicals that are not typically used as chemical solvents, but are usually considered among the solvents due to their similar chemical structure, propensity to release hydrocarbon vapors, and toxic properties. These include styrene monomer, a base substance for production of polystyrenes, and many components of fuels and gasoline. Gasoline contains many hundreds of organic compounds, but the common presence of benzene, toluene, ethylbenzene, and xylene (BTEX) has led to the use of BTEX as a marker of gasoline exposure. In a subset of the NHANNES III study, toluene and several organic solvents were detected in blood samples from greater than or equal to 75% of the U.S. population. Many hazardous waste sites contain substantial quantities of organic solvents, in particular chlorinated organics such as trichloroethylene and perchloroethylene. In proportion to their widespread use and large potential for human exposure, there is likewise a large and diverse scientific literature on the toxicity of organic solvents. One good source to begin an overview of the diverse toxicity of organic solvents is Bruckner et al (2008).

The toxicity of organic solvents is linked in large part to two key aspects of their physical nature, first they are lipophilic and second many are volatile. Lipophilic substances distribute readily across most biological membranes including the common portals of entry (lung, gut, skin) and across biological membranes that may serve as penetration barriers to other substances, including the blood–brain barrier and the placenta. Many of the common organic solvents are relatively small in molecular weight, such as toluene or trichloroethylene, and lack strong electrostatic intermolecular forces, causing them to have a low vapor pressure. Consequently, many organic compounds readily enter the vapor phase when they encounter air, and inhalation is typically the primary route of exposure. This can be true even when the more water-soluble of the organic solvents, such as TCE, are encountered as water contaminants (Scott & Cogliano 2000). Inhalation of vapors generated during showering may be the primary route of exposure for waterborne volatile organic contaminants. Recent efforts to reduce the hazards of organic solvents have included substitution of less volatile alternative constituents of fuels and other common products.

[1]This manuscript has been reviewed by the National Health and Environmental Effects Research Laboratory, Office of Research and Development, U.S. Environmental Protection Agency and approved for publication. Approval does not signify that the contents reflect the policies of the Agency nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

A common target organ for toxicity of organic solvents is the nervous system. Acute exposure to solvent vapors can lead to rapid behavioral, cognitive, and perceptual changes. Associated with these changes, neurophysiological measures of the function of the central nervous system are altered as well. Low levels of exposure may initially lead to increased excitation and activation, and a feeling of euphoria. With increasing exposure, these effects may be followed by sedation and general CNS depression. Recovery from acute solvent exposure is typically rapid and complete, and generally follows the time course of metabolism and clearance of the compound. Chronic or repeated episodes of acute high-level exposures can be followed by persistent or irreversible deficits in neurological function. These deficits have been observed primarily as impaired cognitive function, impaired performance on visual functions tests such as color discrimination or visual contrast sensitivity, and in some cases impaired balance and poor motor coordination associated with cerebellar dysfunction. The book by Arlien-Søborg (1992) is the most comprehensive source of information available on the neurotoxic properties of organic solvents. More recently Spencer et al (2000) provide chapters describing the neurotoxicity of several important organic solvents.

The vast literature on the toxicology of organic solvents and related substances makes it practically impossible to compile a comprehensive bibliography. The following is by no means a complete bibliography of the available primary literature. Instead this list of resources is intended to reflect some of the major sources of information available, including recent review articles, and should aid in the identification of the primary institutions involved in research and evaluation of potential health risks from exposure to organic solvents.

RESOURCES

Books

Arlien-Søborg P (1992)
Solvent Neurotoxicity
Boca Raton, FL: CRC Press.

Although somewhat dated now, this book remains the most comprehensive account of solvent neurotoxicity. Separate chapters are dedicated to toluene, xylene, styrene, n-hexane, methyl *n*-butyl ketone, methyl ethyl ketone, 2,5-hexanedione, methylene chloride, methyl chloride, trichloroethylene, 1,1,1-trichloroethane, white spirit, and solvent mixtures. Much of the literature on solvent neurotoxicology in occupationally exposed humans stems from the latter half of the 20th century, when occupational exposure levels were higher, for the most part, than they are in developed countries today. Therefore, this book contains important toxicological information that is less likely to be reported today.

Ash M, Ash I (2003)
Handbook of Solvents, 2nd edition
Synapse Information Resources, Inc.

Useful to solvent formulators and manufacturers, containing chemical and health and safety information for trade names and products that are used as solvents across industry sectors.

Bingham E, Corsen B, Powell CH (eds) (2001)
Patty's Toxicology, 5th edition
New York: John Wiley & Sons.

This multivolume set of books provides detailed reviews of the toxicological information relevant to major industrial compounds. The target audience is industrial hygiene professionals and allied fields in order to provide information adequate to manage a safe work environment. These volumes are also useful more broadly because of the depth of information provided.

Bruckner LV, Anand SS, Warren DA (2008)
Toxic effects of solvents and vapors. In: Klaassen CD (ed)
Casarett and Doull's Toxicology: the Basic Science of Poisons, 7th edition
New York: McGraw-Hill Medical Publishing Division.

This chapter provides an excellent overview of the general toxicity of solvents and vapors, especially regarding metabolism and other toxicokinetic factors. Solvents are detailed according to the following classes: chlorinated hydrocarbons, aromatic hydrocarbons, alcohols, ethers, fuels and fuel additives, and carbon disulfide.

Bushnell PJ, Crofton KM (1999)
Organic solvents. In: Niesink RJM, Jaspers RMA, Kornet LMW, van Ree JM, Tilson HA (eds)
Introduction to Neurobehavioral Toxicology Food and Environment, pp. 395–428
Boca Raton, FL: CRC Press.

This book chapter provides an overview of the neurotoxic properties of organic solvents including tables of the concentrations at which individual substances have olfactory and irritant properties, and tables listing solvents having ototoxic, sensory, motor and cognitive effects in laboratory animals and humans.

Reddy MB, Yang RS, Clewell H J III, Andersen ME (2005)
Physiologically Based Pharmacokinetic Modeling, Science and Applications

Hoboken, NJ: Wiley-Interscience, John Wiley & Sons, Inc.

This book contains detailed sections regarding pharmacokinetic modeling of organic solvents including alkenes, halogenated alkanes and alkenes, and aromatic compounds.

Reichardt C (2003)
Solvents and Solvent Effects in Organic Chemistry 3rd edition
Hoboken, NJ: Wiley-Interscience, John Wiley & Sons, Inc.

Solvent chemistry for the organic chemist. Provides insight into the properties of different organic solvents that are important for product formulations, and may serve as a reference in trying to select less toxic materials with specific chemical properties.

Spencer PS, Schaumburg HH, Ludolph AC (2000)
Experimental and Clinical Neurotoxicology, 2nd edition
New York: Oxford University Press.

This book contains chapters describing neurotoxic properties of many compounds including several organic solvents, or compounds that have solvent-like toxicity, including: carbon disulfide, n-hexane, methylene chloride, organic solvent mixtures, styrene, tetrachloroethylene, toluene, and trichloroethylene.

Journals

American Journal Industrial Medicine (1980)
Web:
http://www3.interscience.wiley.com/cgi-bin/jhome/34471

This journal publishes many articles regarding occupational health and exposure to organic solvents.

Environmental Health Perspectives (1972)
Web: http://www.ehponline.org/

This journal contains many articles on volatile organic compounds, especially considering those that many be contaminants of outdoor or indoor air.

Journal of Toxicology and Environmental Health (1975)
Web: http://www.tandf.co.uk/journals/titles/15287394.asp

Publishes numerous research articles on solvent toxicity.

NeuroToxicology (1979)
Elsevier (prior to 2001 this journal was published by Intox Press)
Web: http://www.neurotoxicology.com/journal.htm

This journal published papers on the toxic effects of a variety of substances on the nervous system, including many organic solvents. A special issue of this journal (vol. 7(4), 1986) presented proceedings of a workshop on neurobehavioral effects of solvents, including a diagnostic framework for clinical assessments.

Neurotoxicology and Teratology (1979)
Elsevier
Web: http://www.elsevier.com/wps/find/journaldescription. cws_home/525481/description#description

This journal frequently publishes experimental studies of solvent neurotoxicity in both humans and laboratory animals.

Scandinavian Journal of Work Environment & Health (1975)
Web: http://www.sjweh.fi/index.php

This journal publishes many papers on organic solvent toxicity in occupational settings, including the so-called 'Scandinavian painter's syndrome'.

The SIRC Review (1990)
The Styrene Information and Research Center, Washington DC
Web: www.styrene.org

This journal is sponsored by the styrene industry and presents articles relevant to the use of styrene and protection of public health and the environment. Many of the articles are commissioned by the Styrene Information and Research Center.

Toxicological Sciences (1981)
Web: http://toxsci.oxfordjournals.org/

This is the official journal of the Society of Toxicology and publishes many peer-reviewed research articles on solvent toxicity.

Journal Articles

Adgate JL, Church TR, Ryan AD, et al (2004) Outdoor, indoor, and personal exposure to VOCs in children. Environ. Health Perspect 112: 1386–1392.

This paper presents measured and time-average modeled levels of exposure to VOCs among a sample of American elementary school children.

Benignus VA, Bushnell PJ, Boyes WK (2005) Toward cost-benefit analysis of acute behavioral effects of toluene in humans. Risk Anal. 25: 447–456.

This article compares the effects of toluene to those of ethanol in a quantitative manner, with the goal of using the data on the economic consequences of ethanol exposure to help estimate benefit–cost relationships for control of exposure to toluene and other volatile organic compounds.

Benignus VA, Geller AM, Boyes WK, Bushnell PJ (2005) Human neurobehavioral effects of long-term exposure to styrene: a meta-analysis. Environ. Health Perspect. 113: 532–538.

This article presents a meta-analysis of the available literature from workplace exposures to styrene on the neurotoxic outcomes of simple and choice reaction times and color vision impairment.

Bowen SE, Batis JC, Paez-Martinez N, Cruz SL (2006) The last decade of solvent research in animal models of abuse: Mechanistic and behavioral studies. Neurotoxicol. Teratol. 28: 636–647.

This article presents a review of the literature of developmental exposure to toluene as related to potential drug abuse exposure scenarios.

Bukowski JA (2001) Review of the epidemiological evidence relating toluene to reproductive outcomes. Reg. Toxicol. Pharmacol. 33: 147–156.

A review of six published studies linking occupational toluene exposure to increased risks of spontaneous abortion, congenital malformation, or reduced fertility.

Bushnell PJ, Boyes WK, Shafer TJ, Bale AS, Benignus VA (2007) Approaches to extrapolating animal toxicity data on organic solvents to public health. Neurotoxicol 28: 221–226.

This review article describes a quantitative modeling framework to predict risks of exposure to organic solvents based on estimates of target tissue dose.

Caldwell DJ, Armstrong TW, Barone NJ, Suder JA, Evans MJ (2000) Hydrocarbon solvent exposure data: Compilation and analysis of the literature. Am. Ind. Hygiene Assoc. J. 61: 881–894.

A paper reporting creation of a database for estimating exposure to hydrocarbon for product end-users.

Churchill JE, Ashley DL, Kaye WE (2001) Recent chemical exposures and blood volatile organic compound levels in a large population-based sample. Arch. Environ. Health 56: 157–166.

A survey of blood levels of volatile organic compounds in the U.S. general population without occupational exposure based on data from the NHANES III study.

Dick FD (2006) Solvent neurotoxicity. Occup. Environ. Med. 63: 221–226.

A general overview of neurotoxic effects of solvent exposure targeted to occupational physicians.

Dreiem A, Myhre O, Fonnum F (2002) Relationship between lipophilicity of C6-10 hydrocarbon solvents and their ROS-inducing potency in rat cerebellar granule cells. Neurotoxicol 23: 701–709.

This paper presents data on the generation of reactive oxygen species in a primary tissue culture assay by aliphatic, alicyclic and aromatic hydrocarbons as a function of their log octanol/water partition coefficients.

Fustinoni S, Consonni D, Campo L, et al (2005) Monitoring low benzene exposure: comparative evaluation of urinary biomarkers, influence of cigarette smoking, and genetic polymorphisms. Cancer Epidemiol. Biomarkers Prev. 14: 2237–2244.

Developing biomarkers for evaluating low level occupational or environmental exposures to benzene.

Gagnaire F, Langlais C (2005) Relative ototoxicity of 21 aromatic solvents. Arch. Toxicol. 79: 346–354.

A comparison of 21 organic solvents given to orally to rats, allowing assessment of structure/activity relationships for causing a loss of hearing.

Hooiveld M, Haveman W, Roskes K, et al (2006) Adverse reproductive outcomes among male painters with occupational exposure to organic solvents. Occup. Environ. Med. 63: 538–544.

An epidemiological study of Dutch painters shows an increased relative risk of having offspring with congenital malformations associated with occupational solvent exposures.

Lamb JC, Hentz KL (2006) Toxicological review of male reproductive effects and trichloroethylene exposure: Assessing the relevance to human male reproductive health. Repro. Toxicol. 22: 557–563.

A critical review of the literature available regarding potential effects of exposure to trichloroethylene on male reproductive health.

McDermott C, Allshire A, van Pelt FNAM, Heffron JJA (2007) Sub-chronic toxicity of low concentrations of industrial volatile organic pollutants in vitro. Toxicol. App. Pharmacol. 219: 85–94.

A comparison of the toxicity of toluene, n-hexane and methyl ethyl ketone using two in vitro tissue culture systems, and exposure durations between 15 min and 5 days.

Morata TC (2003) Chemical exposure as a risk factor for hearing loss. J. Occup. Environ. Med. 45: 676–682.

Overview of a workshop dealing with hearing loss from combined exposures to organic solvents or other ototoxic compounds and noise.

Nielsen GD, Lund SP, Ladefoged O (2006) Neurological effects of white spirit: contribution of animal studies during a 30-year period. Basic Clin. Pharmacol. Toxicol. 98: 115–123.

A critical review of the literature on neurotoxic effects in experimental animals following exposures to mixtures of organic solvents including white spirit.

Ridgway P, Nixon TE, Leach J-P (2003) Occupational exposure to organic solvents and long-term nervous system damage detectable by brain imaging, neurophysiology or histopathology. Food Chem. Toxicol. 41: 153–187.

This is a critical review of 70 reports of neurotoxicity from occupational solvent exposure, including 40 of which reported objective measures of impairment other than neuropsychological testing.

Sallmen M, Baird DD, Hoppin JA, Blair A, Sandler DP (2006) Fertility and exposure to solvents among families in the Agricultural Health Study. Occup. Environ. Med. 63: 469–475.

A cross-sectional analysis of participants in an epidemiological study of pesticide exposure in which increased levels of solvent usage was associated with increased relative risks of low fertility.

Schreiber JS, Hudnell HK, Geller AM, et al (2002) Apartment residents' and day care workers' exposures to tetrachloroethylene and deficits in visual contrast sensitivity. Environ. Health Perspect. 110: 655–664.

A report linking residence in apartment buildings that contain co-located dry cleaning businesses with reduced sensitivity to perceive visual contrast. This is notable because the concentrations of perchloroethylene in the air of the apartments were substantially lower than those reported to cause changes in neurologic performance in previous studies of occupational or residential exposure.

Scott CS, Cogliano VJ (2000) Trichloroethylene health risks – state of the science. Environ. Health Perspect. 108(Suppl. 2).

This supplemental issue of the journal Environmental Health Perspectives was dedicated to reviewing the state of the science regarding trichloroethylene including assessments of exposure, health effects, pharmacokinetic models, metabolism, and cancer and non-cancer hazards.

Simmons JE, Evans MV, Boyes WK (2005) Moving from external exposure concentration to internal dose: duration extrapolation based on physiologically based pharmacokinetic derived estimates of internal dose. J. Toxicol. Environ. Health Part A 68: 927–950.

This paper provides a step-by-step approach to the development and use of physiologically based pharmacokinetic modes in a risk assessment context, using the example of the acute neurophysiological consequences of exposure to trichloroethylene as a case in point.

Spurgeon A (2006) Watching paint dry: Organic solvent syndrome in late-twentieth-century Britain. Med. Hist. 50: 167–188.

An historical account of the differences between Great Britain and other European countries in the recognition and diagnosis of occupational organic solvent encephalopathy.

Till C, Westall CA, Koren G, Nulman I, Rovet JF (2005) Vision abnormalities in young children exposed prenatally to organic solvents. Neurotoxicol 26: 599–613.

This paper shows that there are concerns for neurological development of the children of mothers who have occupational exposures to organic solvents. Previously this problem was considered primarily to be relevant only to the higher concentration exposures characteristic of inhalant abusers.

Triebig G, Hallermann J (2001) Survey of solvent related chronic encephalopathy as an occupational disease in European countries. Occup. Environ. Med. 58: 575–581.

A review across European countries of the rates and trends of diagnosis of occupational solvent-induced encephalopathy.

Watson RE, Jacobson CF, Williams A, Howard WB, DeSesso JM (2006) Trichloroethylene-contaminated drinking water and congenital heart defects: A critical analysis of the literature. Reprod. Toxicol. 21: 117–147.

The epidemiological and experimental literatures are reviewed with respect to reports of congenital heart defects attributed to exposure to trichloroethylene (TCE). The authors apply Hill's criteria for evidence of causation, and conclude that there is no evidence to link

gestational TCE exposure at environmental concentrations to the production of congenital heart defects.

Organizations

American Chemistry Council (ACC)
1300 Wilson Blvd.
Arlington, VA 22209
Phone: 703-741-5000
Fax: 703-741-6050
Web: http://www.americanchemistry.com/s_acc/index.asp

The American Chemistry Council (ACC) advocates for companies engaged in the business of chemistry. ACC has an extensive website related to chemicals, business, and health.

American Council of Governmental Industrial Hygienists (ACGIH)
1330 Kemper Meadow Drive
Cincinnati, Ohio 45240, USA
Phone: 513-742-6163
Fax: 513-742-3355
E-mail: mail@acgih.org
Web: http://www.acgih.org/home.htm

ACGIH is an organization of industrial hygienists working for the safety of workers. They produce well-respected guidelines of exposure to many solvents.

American Petroleum Institute (API)
1220 L Street, NW
Washington, DC 20005-4070
Phone: 202-682-8000
Web: http://www.api.org/

American Petroleum Institute is a national trade association that represents America's oil and natural gas industry. The API website has information about petroleum chemicals and products.

European Chemicals Bureau (ECB)
TP582
Institute for Health and Consumer Protection
Joint Reasearch Centre, Ispra Site
European Commission
Via fermi 1
I-21020 Ispra (VA), Italy
Phone: +39-0332-78-9037
Web: http://ecb.jrc.it/

The European Chemicals Bureau (ECB) is the focal point for data and the assessment procedure on dangerous chemicals, and provides scientific and technical support for the conception, development, implementation, and monitoring of EU policies related to dangerous chemicals.

Halogenated Solvents Industrial Alliance (HSIA)
1300 Wilson Boulevard
Arlington, Virginia 22209
Phone: 703-741-5780
Fax: 703-741-6077
E-mail: info@hsia.org
Web: http://www.hsia.org/

HSIA is an industry-supported group dedicated to serving the interests of the halogenated solvents industry.

International Agency for Research on Cancer (IARC)
150 Cours Albert Thomas
69372 Lyon CEDEX 08
France
Phone: +33 (0)4 72 73 84 85
Fax: +33 (0)4 72 73 85 75
E-mail: cie@iarc.fr
Web: http://monographs.iarc.fr/

Guided by interdisciplinary working groups of expert scientists IRAC produces monographs that identify environmental factors that can increase the risk of human cancer that can be used to prevent exposure to potential carcinogens.

Mickey Leland National Urban Air Toxics Research Center
P.O. Box 20286, Houston, Texas 77225-0286
Phone: (713) 500-3450
Fax: (713) 500-0345
E-mail: NUATRC@uth.tmc.edu
Web: http://www.sph.uth.tmc.edu/mleland/

The Mickey Leland National Urban Air Toxics Research Center (NUATRC), a non-profit organization located in the Texas Medical Center, is a research facility designed to sponsor and gather scientific information on the human health effects caused by exposure to air toxics including volatile organic compounds.

Styrene Information and Research Center (SIRC)
1300 Wilson Boulevard, Suite 1200
Arlington, Virginia 22209
Phone: 703-741-5010
Fax: 703-741-6010
E-mail: sirc@styrene.org
Web: http://www.styrene.org/

Styrene Information and Research Center (SIRC) is an industry-supported non-profit organization dedicated to being the principal focal point for public information and research on styrene.

Databases

American Cancer Society
Web: http://www.cancer.org/docroot/PED/content/PED_1_3X_Benzene.asp?sitearea=PED

Informational website on benzene written for laymen.

American Lung Association
Web: http://www.lungusa.org/site/apps/s/content.asp?c = dvLUK9O0E&b=34706&ct=66856

Information about effects of solvents on lung including respiratory irritation and other effects.

CDC/ATSDR
Web: http://www.atsdr.cdc.gov/HEC/CSEM/

Substance-specific continuing education courses for physicians or other health professionals available for several organic solvents including benzene, Stoddard solvent, toluene, and trichloroethylene.

CDC/NIOSH
Web: http://www.cdc.gov/niosh/topics/organsolv/

Safety and Health Topic: Organic Solvents. Includes links to Criteria Documents (critical reviews of scientific and technical information relevant to occupational hazards and control of risks from specific substances) and Current Intelligence Bulletins (emerging information about occupational hazards).

CDC/NIOSH
Web: http://www.cdc.gov/niosh/topics/noise/research/noiseandchem/noiseandchem.html

The proceedings of a workshop on the interaction between organic solvents or other ototoxic compounds and noise in the production of occupationally induced hearing loss.

CleanerSolutions
Web: http://www.cleanersolutions.org/

Web-based tools to help substitute greener product ingredients.

EPA. Integrated Risk Information System (IRIS)
Web: http://www.epa.gov/iris/index.html

Database of EPA risk assessments by chemical, including documentation of the rationale for each assessment.

EPA. National-Scale Air Toxics Assessment (NATA)
Web: http://www.epa.gov/ttn/atw/nata/index.html

National scale exposure modeling and risk estimates for compounds and compound classes listed under the 1990 Amendment to the Clean Air Act as Hazardous Air Pollutants, a list that includes numerous organic solvents.

EPA. Toxic Release Inventory (TRI)
Web: http://www.epa.gov/triexplorer/

Database of chemical emissions reported to EPA.

International Labor Organization
Web: http://www.ilo.org/public/english/protection/safework/cis/products/safetytm/solvents.htm

General information about safe use and handling of solvents in the workplace.

Occupational Safety and Health Organization (OSHA)
Web: http://www.ilo.org/public/english/protection/safework/cis/products/safetytm/solvents.htm

Informational website on the safety and health topics related to use of solvents in the workplace.

Oregon Health & Science University, Center for Research on Occupational and Environmental Toxicology
Web: http://www.croetweb.com/links.cfm?topicID=39

This website lists numerous databases and informational resources regarding common organic solvents.

Solvents Database (Chemicals & Chemical Engineering) by George Wypych (CD-ROM-Jan 15, 2001)
Noyes Publications

This is a searchable CD-ROM database with the chemical and physical properties of more than 1100 solvents. Among the sets of information provided are solvent performance, processing characteristics, and environment and health information.

Toxicology Excellence for Risk Assessment
Web: http://www.tera.org/

This organization facilitates the Voluntary Children's Chemical Evaluation Program (VCCEP). This program is an agreement between EPA and involved industries to assess the potential risks to children for several industrial chemicals, including a number of organic solvents such as benzene, toluene, ethylbenzene, and xylenes. The website links to documents developed by contractors to the participating industries that summarize the currently available information relevant to each substance, and also comments from an independent peer-review committee evaluating the documents.

Toxicology Profiles
Agency for Toxic Substances and Disease Registry
Web: http://www.atsdr.cdc.gov/toxpro2.html

Toxicology Profiles summarize relevant information for about 175 substances commonly found at National Priorities List hazardous waste sites. Many of the profiles are for organic solvents.

CHAPTER

19

Chemicals: Selected Chemicals

ANTOINETTE HAYES

INTRODUCTION

This chapter focuses on selected chemical reviews concerning alcohol (ethanol), arsenic, caffeine, dioxin, formaldehyde, fluoride, PCBs, rubber, tobacco, etc. The following references will give the researcher a broad overview of the chemical literature available in the areas listed above and also areas relating to the reactions of chemical mixtures and the effects of chemical interactions on the human body and environment. Also included is a reference on environmental forensics which is the science that deals with the forensic analysis of environmental contamination, and a reference on green chemistry, which institutes the use of environmentally safe chemicals in processes where chemicals are mass produced and the probability of release into the environment is increased.

These references are broad overviews meant to be used as a starting point for more extensive research in the selected areas. The latest editions are listed where applicable. Many references, though seemingly dated, continue to be highly regarded tools for research in their respective fields and for this reason, are included in this list.

RESOURCES

Books

Abel EL (ed.) (2004)
Fetal Alcohol Syndrome
New York: Springer.
Web: http://www.springer.com

This book provides straightforward facts regarding the impact of alcohol consumption as it affects the development of the embryo and fetus. Current research addressing the immediate and delayed effects is covered. A chapter is devoted to assessing the behavior of children who were exposed, in utero, to alcohol.

Barton J, Rogers R (1997)
Chemical Reaction Hazards
New York: Gulf Professional Publishing.
Web: http://www.elsevier.com

This book provides information regarding the hazards of chemical mixtures and the combination of incompatible substances. It describes safety measures that should be taken when working with chemicals and offers examples in the appendices which relate 100 incidents of hazardous mixtures.

Benowitz NL (ed.) (1998)
Nicotine Safety and Toxicity
New York: Oxford University Press.
Web: http://www.oub.co.uk

Looks at nicotine in relation to cardiovascular disease, cancer, reproduction, and behavioral toxicity.

Bhattacharya P (ed.) (2007)
Arsenic in Soil and Groundwater Environment, Volume 9: Biogeochemical Interactions, Health Effects and Remediation (Trace Metals and Other Contaminants in the Environment)
New York: Elsevier Science.
Web: http://www.elsevier.com

This volume contains information regarding the latest developments in arsenic contamination of groundwater

and soil and remediation efforts. It also reports the effects of arsenic on plants, animals, and humans.

Chang LW (1996)
Toxicology of Metals, Volume I (Toxicology of Metals)
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Comprehensive book on metal toxicology covering toxic endpoints such as cancer, neurodegenerative diseases, and renal toxicities.

Cheremisinoff NP (1994)
Hazardous Chemicals in the Polymer Industry
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Written as a practical reference for engineers, technicians, and compounders. The handbook gives information on toxic and hazardous properties, symptoms of overexposure, safe handling and shipping, fire hazards, and spill responses for both generic and specific polymer chemicals.

Chin SB, Pisoni DB (2006)
Alcohol and Speech
New York: Academic Press.
Web: http://www.academicpress.com

Serves as a reference source for those interested in speech motor effects evident in the acoustic record, reaction times, speech communication strategies, and perceptual judgments accompanying ingestion of ethanol. It is a comprehensive review of the effects of alcohol on speech and compares the various theoretical concerns which form this research. An interesting example from the Exxon Valdez oil spill is reviewed.

Chollat-Traquet C (1992)
Women and Tobacco
Geneva, Switzerland: World Health Organization.
Web: http://www.who.int

Intended to inform all those concerned with the effects of tobacco use and the health of women. The six chapters include the issues at stake, women and usage patterns, tobacco and health (organs and systems affected), factors influencing use of tobacco, prevention and cessation aids, and a strategy for long-term control. Each chapter includes selected references for detailed follow-up.

Toxicological and Performance Aspects of Oxygenated Motor Vehicle Fuels
Committee on Toxicological Aspects of Oxygenated Motor Vehicle Fuels (1996)
Washington, DC: National Academy Press.
Web: http://www.nap.edu

Assesses the effects of oxygenated gasoline on public health, air quality, fuel economy, engine performance, and water quality. The basic chemical discussed throughout is methyl *t*-butyl ether. In addition to evaluating the scientific basis of the government report covering this topic, research attempting to better understand the overall impact of oxygenated fuels is presented.

Comyns AE (2007)
Encyclopedic Dictionary of Named Processes in Chemical Technology
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

This book defines over 3000 processes used in the chemical industry, covering a broad range of chemicals. Each entry is accompanied by the name of the process, the date of its introduction, patent information, and its usage internationally.

Davis DE (ed.) (1999)
Tobacco: Production, Chemistry, and Technology, Illustrated
Malden, MA: Blackwell Publishing.
Web: http://www.blackwellpublishing.com

A comprehensive, illustrated review of tobacco.

Deitrich RA, Erwin VG, (eds.) (1995)
Pharmacological Effects of Ethanol on the Nervous System
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Reviews current data on the action of ethanol in the central nervous system and the resulting behavioral effects. Old theories of effect are updated. Particularly helpful are chapters covering the fetal alcohol syndrome and the effects of long-term ethanol exposure. The mechanisms for effect at the neurotransmitter level are well presented.

Doble M, Kumar A (2007)
Green Chemistry and Engineering
New York: Academic Press.
Web: http://www.elsevier.com

This book describes processes, materials, and the theories behind conducting green chemistry or chemistry that is geared toward the use of environmentally friendly methods that reduce the release of harmful emissions and waste.

Erickson MD (1997)
Analytical Chemistry of PCBs, 2nd edition
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

A comprehensive review of the analytical chemistry of PCBs. Includes gas chromatographic determination,

mass spectrometry, sampling approaches, separations, interlaboratory studies, and PCB toxicology.

Halliwell BB (ed.) (2006)
Cigarette Smoke and Oxidative Stress
New York: Springer.
Web: http://www.springer.com

Reviews the mechanisms of diseases caused by cigarette smoke including cancers, cardiovascular disease, and pulmonary diseases.

Kozlowski LT, Henningfield JE (2004)
Cigarettes, Nicotine, and Health: A Biobehavioral Approach (Behavioral Medicine and Health Psychology)
Thousand Oaks, CA: Sage Publications, Inc.
Web: http://www.sagepub.com

Addresses the psychology of tobacco use, epidemiology, and pharmacology. Also cover the health consequences of tobacco and nicotine use.

Robertson Larry W, Hansen Larry G (eds.) (2001)
Recent Advances in Environmental Toxicology and Health Effects (Hardcover)
Kentucky: University Press of Kentucky

Some Industrial Chemicals
Lyon, France: World Health Organization.
Web: http://www.who.it

Volume 27 of the *IARC Monographs on the Evaluation of Carcinogenic Risks to Humans*. Reviews 14 industrial chemicals by an expert committee for their potential to be carcinogenic to humans. This book presents a relatively complete bibliography of the pertinent information along with the evaluation by the committee. The following chemicals were considered not classifiable regarding their carcinogenicity to man: ethylene, vinyl toluene, *N*-methylolacrylamide, methyl methac-rylate, and 2-ethylhexyl acrylate; the following were classified as possibly carcinogenic to humans: propylene oxide, isoprene, styrene, 4-vinylcyclohexene, and 4-vinylcyclohexene diepoxide; the following were classified as probably carcinogenic to humans: styrene-7,8-oxide and acrylamide; and the following was classified as carcinogenic to humans: ethylene oxide.

Marrs TC, Maynard RL, Sidell F (eds.) (2007)
Chemical Warfare Agents: Toxicity and Treatment 2nd edition
Hoboken, NJ: Wiley.
Web: http://www.wiley.com

Comprehensive review of chemical warfare agents, their mechanisms, disposition in the environment, and regulatory issues concerning their use and misuse.

Murphy BL, Morrison RD (2007)
Introduction to Environmental Forensics
New York: Academic Press.
Web: http://www.elsevier.com

This book is in textbook format and offers an excellent introduction to the field of environmental forensics. It outlines forensic techniques used to identify the source of chemical pollutants, the time the contamination occurred, and chemical 'fingerprinting' methods used when analyzing a spill.

Ojima I, McCarthy JR, Welch JT (eds.) (1996)
Biomedical Frontiers of Fluorine Chemistry
American Chemical Society, Washington, DC
Web: http://www.acs.org

Reviews recent research on fluorine-containing, biologically relevant molecules in biology and medicinal chemistry. The text covers applications of organofluorine compounds as enzyme inhibitors, antithrombotics, anticancer agents, central nervous system agents, and antifungal and antiviral agents.

Pilch RF, Zilinskas RA (eds.) (2005)
Encyclopedia of Bioterrorism Defense
Hoboken, NJ: Wiley.
Web: http://www.wiley.com

Covers biotechnology and bioterrorism and detection technologies. Also covers specific biowarfare agents and over 100 articles and case studies.

Ramamoorthy S, Ramamoorthy S (1997)
Chlorinated Organic Compounds in the Environment: Regulatory and Monitoring Assessment
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Toxicity profiles provided for each chemical allow for evaluation of the short- and long-term effects on the environment. Discussions of environmental residues and pertinent worldwide regulations help readers compare chloro-organic contamination in different areas and analyze the associated regulatory approaches.

Romano JA, Lukey BJ, Salem H (eds.) (2007)
Chemical Warfare Agents: Chemistry, Pharmacology, Toxicology, and Therapeutics 2nd edition
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Covers the effects of chemical warfare agents and includes effects of short-term and long-term exposures and antidotes.

Schecter A, Gasiewicz TA (eds.) (2003)
Dioxins and Health, 2nd edition
Hoboken, NJ: Wiley-Interscience.
Web: http://www.wiley.com

Presents the latest information relating to potential human health risks of dioxin. The main areas include cancer, immune system compromise, reproductive and developmental disorders, neurological damage, and endocrine system alterations. Most of the 20 chapters include specific new data relating to the particular end-point toxicity, and the difficulty of applying both the human and the animal data to an appropriate quantitative risk assessment is considered throughout.

Schnoor JL (ed.) (2001)
Fate of Pesticides and Chemicals in the Environment (Environmental Science and Technology: A Wiley-Interscience Series of Texts and Monographs)
Hoboken, NJ: Wiley-Interscience.
Web: http://www.wiley.com

Scientific collaboration between the U.S. and the Soviet Union regarding the fate of pesticides in the environment and public health issues surrounding contamination and exposure.

Sheftel VO (1995)
Handbook of Toxic Properties of Monomers and Additives
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Provides comprehensive information on the toxic effects of plastics ingredients that enter the body, mainly by the oral route. The chapters include sections covering background information and format, monomers, plasticizers, stabilizers, catalysts, initiators, and other agents, and rubber ingredients, solvents, and other additives.

Smolinske SC (1992)
CRC Handbook of Food, Drug, and Cosmetic Exipients
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Summary of inactive ingredients in pharmaceutical, food, and cosmetic products that may be of concern to hypersensitive individuals.

Spiller G (ed.) (1997)
Caffeine
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

Botany, cultivation, processing, composition, and consumption patterns of natural products such as tea, coffee, mate, and cocoa and chocolate products are described. Consumption of caffeine is examined in detail. An overview of basic physiology and biochemistry of caffeine is provided. Ergogenic, cognitive, and emotional effects of caffeine are discussed, as are specific health effects – serum cholesterol, cancer and fibrocystic breast disease, calcium and bone health, and human reproduction.

Stenerson J (2004)
Chemical Pesticides: Mode of Action and Toxicology
Boca Raton, FL: CRC Press.
Web: http://www.crcpress.com

This volume covers a wide range of chemical pesticides organized based on their mode of action. Also gives a nice introduction on pesticides, toxicity, and issues such as pesticide resistance.

World Health Organization (WHO) (1997)
Flame Retardants: A General Introduction,
Environ-mental Health Criteria No. 192
Geneva, Switzerland: WHO.
Web: http://www.who.it

Provides a general overview of the properties, mechanisms of action, production, use, and performance of chemicals added to polymeric materials, both natural and synthetic, to enhance flame-retardant properties. Flame-retardant chemicals are most often used with low-to-moderate cost commodity polymers to either lower ignition susceptibility or lower flame spread once ignition has occurred. The volume also indicates some of the known health and environmental hazards for certain flame retardants.

Yang RSH (ed.) (1994)
Toxicology of Chemical Mixtures
San Diego, CA: Academic Press.
Web: http://www.academicpress.com

Chapters presented attempt to answer the question of whether exposure to mixtures of chemicals results in interactions that alter the potential toxicologic response to the individual chemicals involved. Major sections include introduction and principles, real-life case studies or special problem-related situations, target organ toxicity or special toxicologic responses related to chemical mixture exposures, and contemporary issues.

Clinical Toxicology and Clinical Analytical Toxicology

PRIYA TAILOR AND SHAYNE GAD

INTRODUCTION

Clinical toxicology includes physicians and scientists involved with the understanding of the diagnosis and treatment of poisoning. Some clinical toxicologists work with poisoned patients through poison control (and poison information and treatment) centers (see Poison Centers chapter), while others are in a university, hospital, government agency, or in industry. A related discipline is veterinary toxicology, dealing with the diagnosis and treatment of poisoning in animals (see Veterinary Toxicology chapter).

The function of clinical analytic toxicology (also called clinical chemistry in toxicology) is to provide, via laboratory analysis of tissues and fluids, evaluations of the qualitative and quantitative characteristics of (1) specific endogenous and potentially adverse exogenous chemical components present in samples of blood, urine, feces, spinal fluid, and tissues, (2) changes in the formed elements of the blood and their function, and (3) histological changes in tissues and the components of the blood. The purpose is to help identify abnormal or pathological changes or their causes in organ system functions.

The most common biological specimens used in such analyses are blood, urine, and selected postmortem tissue samples. Many different tests exist to test for almost any type of chemical or cellular component in blood or urine; for example, blood glucose, electrolytes, enzymes, hormones, lipids (fats), other metabolic substances, proteins, red blood cells, white blood cells, and platelets. The tests used here were all initially developed for human clinical medicine, and may not possess the same utility when performed as part of either animal toxicity studies or the investigation of poisoning in a wide variety of other species. As such, one could consider clinical analytic toxicology to have at least three separate (but not independent) areas of investigation – clinical chemistry, tissue evaluations (histopathology, covered in another entry in this book), and forensic toxicology. To a degree, each of these is a part of a clinical analytic toxicology evaluation.

Clinical chemistry evaluations are commonly recommended in animal toxicology studies. Regulatory agencies such as the U.S. Food and Drug Administration and the U.S. Environmental Protection Agency have set guidelines for clinical pathology testing in nonclinical toxicity and safety studies. Measurement of chemical components of biological fluids allows the toxicologist to do serial sampling, detect metabolic injury or organ-specific effects, and perhaps gain additional information helpful in establishing the no-effect level and determining the mechanism of toxicity. When using serum enzymes as markers of tissue or organ damage, the enzyme of interest must reasonably reflect pathological change in a specific tissue, organ, or group of organs and must be easily measured.

The tests that are routinely performed provide information concerning hepatocellular and biliary integrity and function, renal function, carbohydrate, protein and lipid metabolism, and mineral and electrolyte balance. Modern analytical techniques require only small sample volumes to make accurate determinations, allowing in-life evaluations of effects in mice and larger species at multiple times during the course of a study without compromising animal health.

Forensic toxicology evaluates exogenously sourced materials in the body, with the information generated

having potential legal uses from the determination of whether harm was done by the intentional or accidental exposure to toxic materials (see Forensic Toxicology chapter). The techniques employed are those of analytical toxicology (see Analytical Toxicology chapter).

RESOURCES

Books

Barile FA (2004)
Clinical Toxicology: Principles and Mechanisms
Boca Raton, FL: CRC Press LLC.

This book focuses on the current and contemporary principles and mechanisms of clinical toxicology. It examines the complex interactions associated with clinical toxicological events and chemical exposure. It also addresses the signs and symptoms of diseases and pathology caused by toxins and drug administration. Topics such as biological and chemical toxins, changes in protocols for managing toxic ingestions, new antidotes, and changes in particular treatments are also covered.

Dart RC (2004)
Medical Toxicology, 3rd edition
Philadelphia, PA: Lippincott Williams & Wilkins.

Ford M (ed.) Delaney K, Ling L, Erickson T (2000)
Clinical Toxicology
Los Angeles, CA: W.B. Saunders.

This book provides a detailed outline needed to assess, diagnose, and manage poisoned and overdosed patients. Clinically oriented and practical, this complete, yet concise, resource is organized to give clinicians quick access to fundamental toxicological information.

Gossel TA, Bricker JD (1994)
Principles Of Clinical Toxicology 3rd edition
New York: Raven Press Ltd.

In this third edition, the editors have made numerous changes for managing poison ingestion and treatment selection. It focuses primarily on the classes of toxic agents, their common sources and usual methods of intoxication, incidence and frequency of poisoning, mechanisms of action, clinical signs and symptoms of poisoning and management guidance.

Haddad LM, Shannon MW, Winchester JF (1998)
Clinical Management of Poisoning and Drug Overdose, 3rd edition
Philadelphia, PA: WB Saunders Company.

Hoffman RS, Nelson LS, Howland MA, Lewin NA 2006
Goldfrank's Toxicologic Emergencies
New York: McGraw-Hill Professional

Katzung BG (2006)
Basic & Clinical Pharmacology (Basic and Clinical Pharmacology) 10th edition
New York: McGraw-Hill Medical.

The 10th edition of this book has up-to-date information on integration of basic with clinical science as well as in-depth coverage of key pharmacology topics. For example it covers basic principles to pharmacologic considerations for autonomic, cardiovascular–renal, smooth muscle, CNS, endocrine, antimicrobial, and chemotherapeutic and immunotherapeutic drugs. It is also updated with dozens of new, recently approved drugs, including monoclonal antibodies.

Ling L, Clark RF, Erickson T, Trestrail JH (2001)
Toxicology Secrets, 1st edition
Philadelphia, PA: Hanley & Belfus.

This text contains 64 chapters covering topics such as general toxicology principles, over-the-counter drugs, prescription medications, antibiotics, cardiac drugs, psychopharmacologic medications, drugs of abuse, metals, chemicals, pesticides, gases, food poisoning, botanicals, envenomations, and toxic terrorist threats.

Lyle DP (2004)
Forensics for Dummies
Hoboken, NJ: Wiley Publishing, Inc.

CHAPTER

21

Developmental and Reproductive Toxicology

STEVEN G. GILBERT AND KIMBERLY S. GRANT

INTRODUCTION

Reproduction and development are fundamental to the existence and evolution of all life. The complex biological processes that are required for normal fetal development must be executed in an organized and precisely timed manner. If developmental processes deviate from these preprogrammed stages and sequences, errors in development can occur. Genetic and environmental perturbations to the developing fetus can be expressed at birth in the form of structural malformations (birth defects) and functional deficits (losses in neurobehavioral competence). The first written documentation of fetal malformations was discovered on the Tablet of Nineveh about 4000 years ago along the Tigris River. In the 15th and 16th centuries, structural anomalies in newborns were thought to be associated with the devil and there are cases in which both the mother and child were killed. Insight into the cause of birth defects advanced along with medical and scientific understanding. Expertise and knowledge of reproduction and development has coalesced into the scientific discipline of teratology. Teratology, derived from the Greek term for monster, originally focused on the causes and prevention of physical or gross malformations in offspring at birth but has now expanded to include studies on deviations in behavioral and sensory development.

The recognition that environmental chemicals could dramatically affect fetal development was demonstrated in the 1950s when Japanese women exposed to methylmercury gave birth to severely affected infants (cerebral palsy, seizures, blindness, deafness, mental retardation). In 1961, the adverse effects of therapeutic medication drugs on development were recognized when women exposed to thalidomide during pregnancy gave birth to infants with missing and malformed limbs. James G. Wilson, a scientific pioneer, defined the Six Principles of Teratology in his book 'Environment and Birth Defects' in 1973. These core principles are still relevant and provide a foundation to better understand the causes of birth defects and developmental disabilities.

1. The final manifestations of abnormal development are death, malformation, growth retardation, and functional disorder.
2. Susceptibility of the conceptus to teratogenic agents varies with the developmental stage at the time of exposure.
3. Teratogenic agents act in specific ways (mechanisms) on developing cells and tissues in initiating abnormal embryogenesis (pathogenesis).
4. Manifestations of abnormal development increase in degree from no effect to the totally lethal level as dosage increases.
5. The access of adverse environmental influences to developing tissues depends on the nature of the agent.
6. Susceptibility to a teratogen depends on the genotype of the conceptus and on the manner in which the genotype interacts with environmental factors.

Over the last 50 years, a rich body of literature has developed regarding the effects of chemical and physical agents on reproduction and development. Below is a sampling of this literature that highlights a variety of resources and seminal publications in the field.

RESOURCES

Books

Anderson D, Brinkworth M (Eds.) (2007)
Male-mediated Developmental Toxicity
Royal Society of Chemistry, London

This book examines the causes and developmental effects of male germline mutations on future generations. The effects of both environmental and chemotherapeutic drug exposures are addressed.

Bennett PN (Ed.) (1996)
Drugs and Human Lactation
Elsevier, Amsterdam

Provides an overview of lactational drug exposure, including aspects of pharmacokinetics and drug effects on infant behavior and health.

Briggs GG, Yaffe S J, Freeman RK (2005)
Drugs in Pregnancy and Lactation: A Reference Guide to Fetal and Neonatal Risk, 7th Edition
Lippincott Williams & Wilkins, Baltimore

This edition features information on more than 1000 drugs. Most reviews are based on cases of human exposure. Animal experimental information is included only where human data are unavailable.

Briggs Update: Drugs in Pregnancy and Lactation, a quarterly update, is also available, as is a CD-ROM version of the book.

Committee on Developmental Toxicology, Board on Environmental Studies and Toxicology, National Research Council (2000)
Scientific Frontiers in Developmental Toxicology and Risk Assessment
The National Academies Press, Washington, DC

This book, developed by a committee of experts, explores recent advances in the fields of developmental biology, molecular biology, and genetics and integrates these findings within the conceptual framework of developmental toxicology.

Principles for Evaluating Health Risks in Children Associated with Exposure to Chemicals
Environmental Health Criteria 237 (2007)
World Health Organization, Geneva Switzerland
http://www.who.int/ipcs/publications/ehc/ehc237.pdf

This volume, published under the joint sponsorship of the United Nations Environment Programme, the International Labour Organization and the World Health Organization, and produced within the framework of the Inter-Organization Programme for the Sound Management of Chemicals is a comprehensive report addressing the unique vulnerability of children to social economic factors, nutrition, environmental chemicals and other hazards. In addition, risk assessment issues and preventive methods are considered.

Frazier L, Hage M (1998)
Reproductive Hazards of the Workplace
Van Nostrand-Reinhold, New York

The focus of this book is on the development of practical strategies for assessing and managing reproductive risk within an occupational setting. Using numerous case studies, the basics of reproductive and developmental biology, risk assessment, and workplace risk reduction are detailed and discussed. The roles that chemical, physical, ergonomic, biologic, and psychosocial factors play in reproductive health are also considered.

Friedman JH, Polifka JE (1998)
The Effects of Neurologic and Psychiatric Drugs on the Fetus and Nursing Infant: A Handbook for Health Care Professionals
Johns Hopkins Unviersity Press, Baltimore

A concise guide to the potential teratogenic risks of some 225 drugs that are prescribed for neurologic and psychiatric disorders in pregnant and nursing women. Rates the risk of teratogenic effects 'none, likely, minimal, small, moderate, high, or undetermined.'

Friedman JM, Polifka JE (2000)
Teratogenic Effects of Drugs: A Resource for Clinicians, (TERIS) 2nd edition
Johns Hopkins University Press, Baltimore

The 2nd edition of this comprehensive book is a hardcopy of TERIS, a computer database that covers the teratogenic risks associated with over 2000 drugs and environmental toxins. For each drug/chemical that is listed in TERIS, a comprehensive literature review through the National Library of Medicine bibliographic databases is conducted and a summary of the teratogenic risk is provided. This book is intended as a resource for professionals needing a quick but detailed look at the developmental risks associated with drug exposure in pregnant women.

Friedman JM, Polifka JE (1996)
The Effects of Drugs on the Fetus and Nursing Infant: A Handbook for Health Care Professionals
Johns Hopkins University Press, Baltimore

Provides an assessment of information available regarding fetal and neonatal risks associated with maternal use of common medications during pregnancy or lactation. The book is arranged alphabetically

by drug name and entries provide an assessment of potential for teratogenicity, an assessment of the quality and quantity of data available, effects reported in exposed infants, the risk from drug exposure during breast-feeding, and key references.

Forman R, Gilmour-White S, Forman N (1996)
Drug-Induced Infertility and Sexual Dysfunction
Cambridge University Press, New York

This book lays the groundwork for quick and informed clinical decision making on the role of drugs in infertility and sexual dysfunction. Following a review of sexual and reproductive function, chapters on antihypertensive therapy, CNS and psychotropic drugs, chemotherapeutic agents, hormonal therapy, antibiotics, drugs of abuse, and therapeutic medications are presented.

Hansen DK, Abbott BD (Eds) (2008)
Developmental Toxicology, third edition
Series: Target Organ Toxicology
Informa Healthcare, New York

This heavily revised new edition approaches issues related to developmental pharmacology and toxicology from a mechanistic perspective and brings in recent advances in genetics, biochemistry, cell biology, and molecular embryology.

Hood RD (2005)
Developmental and Reproductive Toxicology: A Practical Approach, 2nd edition
CRC Press, Boca Raton, FL

This is an updated edition and re-titled from *Handbook of Developmental Toxicology.* It provides a practical guide for developmental toxicologists by collecting and containing in a single place, information that is otherwise scattered throughout the literature. It contains both mechanistic studies of known developmental toxicants and the toxicological assessment of pharmaceutical agents, food additives, pesticides, industrial chemicals, and environmental pollutants to which pregnant women may be exposed.

Kacew S, Lambert GH (Eds.) (1997)
Environmental Toxicology and Pharmacology of Human Development
Taylor & Francis, London

Recent advances and extensive developments in the field are detailed. The book provides a review of the pharmacokinetic characteristics, metabolism, and renal handling of chemicals and drugs in the fetus, lactating infant, and developing newborn. It also discusses topics such as maternal–fetal exposure, heavy metals, pesticides, solvents, contaminants and breast milk, caffeine, genetic predisposition to toxicity, and retinoids.

Kalter H (2003)
Teratology in the Twentieth Century: Congenital Malformations in Humans and How Their Environmental Causes were Established
Elsevier Science, The Netherlands

An interesting historical perspective of issues related to congenital malformations associated with environmental factors.

Knobil E, Neill JD (Eds.) (1998)
Encyclopedia of Reproduction
Academic Press, New York

Covers in four volumes expanded information on all aspects of animal reproduction. The systems covered range from invertebrates to humans. Over 500 articles are included.

Korach KS (Ed.) (1998)
Reproductive and Developmental Toxicology
Dekker, New York

Offers extensive discussions on the pharmacological, environmental, endocrinological, and natural factors that alter reproduction or developmental processes. The text elucidates the effects on mechanisms of reproduction. Included in the book is an overview of the basic biology and physiology of organ systems affected by toxicants, detailed examples of altered developmental toxicity, analysis of germ cell toxicity and infertility, and discussion of how gonadal processes may be susceptible to toxicants.

Koren G (Ed.) (2001)
Maternal–Fetal Toxicology: A Clinician's Guide, 3rd ed.
Informa Healthcare, Dekker, New York

Presents accurate, up-to-date estimates of the teratogenic risks of exposure to drugs, chemicals, viruses, and radiation during pregnancy. It also covers the maternal–fetal toxicology of medicinal plants, developmental risk assessment, and biological markers of intrauterine exposure to drugs of abuse. It includes clinical cases in most chapters.

Little BB (2006)
Drugs and Pregnancy: A Handbook
A Hodder Arnold Publication

A practical reference guide directed toward physician and nurse practitioners to assist in understanding the toxic as well as expected side effects of drug exposure during pregnancy.

National Research Council (2001)
Evaluating Chemical and Other Agent Exposures For Reproductive and Developmental Toxicity
National Academy Press, Washington, DC

The National Research Council reviews and recommends approaches that can be used to evaluate chemicals and physical agents for their potential to cause reproductive and developmental toxicology.

Naz RK (2004)
Endocrine Disruptors: Effects on Male and Female Reproductive Systems, 2nd ed.
CRC Press, Boca Raton, FL

This new edition examines the epidemiology and etiology of environmental toxicants/hormone imposters, many of which act as reproductive toxicants that cause fertility problems and carcinogenic hazards.

Needleman HL, Bellinger D (Eds.) (1994)
Prenatal Exposure to Toxicants: Developmental Consequences
Johns Hopkins University Press, Baltimore

Summary of work in some of the key areas to provide the clinician, researcher, and public health specialist with insight into the current status of this area and a look at future needs. The four major sections are neurodevelopmental toxicology, toxicants well studied in humans, toxicants studied mainly in animals, and regulatory issues.

Neill JD (Ed.) (2005)
Knobil and Neill's The Physiology of Reproduction, Vols. 1 and 2, 3rd edition
Academic Press, New York

This new edition includes molecular level mechanism and presents a critical assessment of the state of the art in every aspect of research on the physiology of reproduction. Each section provides both an overview and details of topics, including gametes and fertilization, the reproductive system, endocrine control functions, reproductive behavior and its control, and the reproductive process and its control.

Nicolopoulou-Stamati P, Hens L, Howard CV (Eds) (2007)
Reproductive Health and the Environment
Springer, The Netherlands

An up-to-date documentation of the effects of toxic environmental contaminants, air pollution, and exposure to medical drugs on reproductive health and fertility on males and females.

O'Rahilly R, Muller F (2001)
Human Embryology and Teratology, 3rd Edition
Wiley-Liss, New York

The 3rd edition provides a reorganized and up-to-date, reasonably brief, reliable text specifically on the human embryo and fetus. Focused on the developmental stages during which various morphological features normally appear in the embryonic period proper. The book is divided into two major sections – the first deals with general embryology and teratology and the second with systemic embryology and teratology, addressing both normal and abnormal development.

Sadler TW (2006)
Langman's Medical Embryology, 10th Edition
Lippincott Williams & Wilkins, Baltimore

A concise, well-illustrated presentation of essential facts on human development, including summary tables and charts. This is directed at the medical student and researcher in the field of developmental biology. Includes a CD-ROM with extensive illustrations and animation of embryonic development.

Sastry BVR (Ed.) (1995)
Placental Toxicology
CRC Press, Boca Raton, FL

Examines placental transfer and toxicology of drugs and environmental agents to placenta as well as to the fetus. Placental and fetal consequences of exposure of pregnant women to drugs, environmental agents, and infections such as HIV are discussed. Featured chemical classes include drugs of addiction, pesticides, and hormonally active materials.

Schardein JL (2000)
Chemically Induced Birth Defects, 3rd Edition
Informa Healthcare Dekker, New York

Catalogs the available data on drugs and chemicals for their potential teratogenicity in animals and humans. The basic divisions are drugs and chemicals and they are sorted in a way which makes access to the desired specific information easy. The data are presented on a chemical-by-chemical basis and not by the various endpoints determined.

Schardein JL, Macina OT (2006)
Human Developmental Toxicants: Aspects of Toxicology and Chemistry
CRC Press, Boca Raton, FL

Contains information on chemical structures, properties, and biological activities for 50 known human and animal developmental toxicants. The book also includes a CD with an accessible database on chemicals and health effects.

Shepard TH, Lemire RJ (2007)
Catalog of Teratogenic Agents, 12th edition
Johns Hopkins University Press, Baltimore

Considered by many to be an important compilation of teratogenic agents. Helps link the information on experimental teratogenic agents with congenital defects in human beings. Agents listed include chemicals, drugs, physical factors, and viruses. A special effort was made to obtain agents to which pregnant women may be exposed, including pharmaceuticals, chemicals, environmental pollutants, food additives, household products, and viruses.

The Teratology Society (2005)
Teratology Primer (Paperback)
The Teratology Society

The Teratology Primer, written for beginning students and interested members of the public, provides the basics on the causes and consequences of birth defects.

Wilson JG (1973)
Environment and Birth Defects
Academic Press, New York

A classic text that remains a valuable reference to those working in the field of developmental toxicity. The aim is to provide the principles of information needed to evaluate environmental factors that may represent risks to unborn generations. Two areas of special concern handled by this book are mutagenesis and teratogenesis.

Journals

Birth Defects Research
Part A: Clinical and Molecular Teratology Journal
Part B: Developmental and Reproductive Toxicology Journal
Part C: Embryo Today: Reviews
John Wiley & Sons Press
www.teratology.org

These journals, sponsored by the Teratology Society, publish original research on basic and clinical studies on birth defects, developmental and reproductive effects of chemical and physical agents. Part A and B are continued publication of older journals (see below).

Development (1987–)
The Company of Biologists
Cambridge, UK
http://dev.biologists.org/

Focuses on the mechanisms of plant and animal development.

Neurotoxicology (1979–)
Elsevier Inc.

Neurotoxicology publishes papers dealing with the effects of toxic substances on the nervous system of humans and experimental animals of all ages.

Neurotoxicology and Teratology (1979–)
Elsevier Inc.

Focused on the neurobehavioral and neurochemical effects of developmental exposure to environmental chemicals, therapeutic drugs, and drugs of abuse.

Reproductive Toxicology (1987)
Elsevier Inc.

Publishes original research on the effects of chemical or physical agents on reproduction including in vitro, animal, or human research. This is the official journal of the European Teratology Society.

Teratogenesis, Carcinogenesis and Mutagenesis Teratology (1981–2002)
John Wiley & Sons Press

Focuses on original research on chemical and physical agents that elucidated the causes or mechanisms of teratology; now published as ***Part B: Developmental and Reproductive Toxicology***, as a journal of the Teratology Society.

Teratology (1968–1995)
John Wiley & Sons Press

An important historical account of research in teratology, now published as *Birth Defects Research Part A: Clinical and Molecular Teratology*, the official journal of the Teratology Society.

Phone: UK +44 (0)1483 689212
Fax: UK +44 (0)1483 686401
Email: L.Burton@surrey.ac.uk
Web: http://www.etsoc.com/

According to the website, the objectives of the Society are to stimulate interest in and promote the exchange of ideas and information about the etiology, prevention, and treatment of congenital malformations and is dedicated to the prevention of adverse effects on reproduction and development.

March of Dimes
1275 Mamaroneck Avenue
White Plains, NY 10605
Phone: (914) 997-4488
Web: http://www.marchofdimes.com/

The March of Dimes 'mission is to improve the health of babies by preventing birth defects, premature birth, and infant mortality.'

Middle Atlantic Reproduction and Teratology Association (MARTA)
For contact information visit the website
Web: http://www.e-marta.org/

Established in 1968, MARATA is an organization of academic and industry professionals and institutions committed to the study of reproduction and developmental anomalies.

National Center on Birth Defects and Developmental Disabilities (NCBDDD)
Centers for Disease Control and Prevention
1600 Clifton Rd, Atlanta
GA 30333, U.S.A.
Phone: (404) 639-3534/(800) 311-3435
Web: http://www.cdc.gov/ncbddd/default.htm

The NCBDDD works to identify the cause and prevent birth defects and developmental disabilities, and promotes the health of babies, children, and adults, toward ensuring that everyone has the opportunity to reach and maintain their full potential.

Neurobehavioral Teratology Society (NBTS)
For contact information visit the website
Web: http://www.nbts.org/

Founded in 1977, the mission of NBTS is to understand how the environment affects the health of infants and children. To this end, society members study how environmental chemicals, drugs, and genetic factors impact the developing nervous system.

Organization of Teratology Information Specialists (OTIS)
Phone: (866) 626-6847
Web: http://otispregnancy.org/

OTIS works to prevent birth defects through education and research in part by supporting a network of Teratogen Information Services across the U.S. and Canada. Their website has an extensive list of fact sheets.

Society for Developmental Biology (SDB)
9650 Rockville Pike
Bethesda, MD 20814-3998
Phone: (301) 634-7815
Fax: (301) 634-7825
E-mail: ichow@sdbonline.org
Web: http://www.sdbonline.org/

Founded in 1939, The Society for Developmental Biology (SDB) exists to 'promote the field of developmental biology and to advance our understanding of developmental biology at all levels.'

Teratology Society
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: (703) 438-3104
Fax: (703) 438-3113
E-mail: tshq@teratology.org
Web: http://teratology.org/

Founded in 1960, the Teratology Society promotes research into the causes and biological processes leading to abnormal development and birth defects including both basic and clinical research.

Databases

Canadian Congenital Anomalies Surveillance Network (CCASN)
http://www.phac-aspc.gc.ca/ccasn-rcsac/index.html

Established in 2002, CCASN, is designed to bringing together research, surveillance, and clinical and public health practices, with the goal to enhance the quality of surveillance data.

The Center for the Evaluation of Risks to Human Reproduction (CERHR)
Web: http://cerhr.niehs.nih.gov/

A resource for the latest information about potentially hazardous effects of chemicals on human reproduction and development.

International Federation of Teratology Societies
Atlas of Developmental Abnormalities in Common Laboratory Mammals
Web: http://www.ifts-atlas.org/ifts/

This atlas provides a set of images of both rare and common observations in fetuses and neonates from common laboratory mammals.

Reproductive Toxicology Center
Web: http://www.reprotox.org

Reproductive Hazard Information, Environmental Impact of Human Reproduction and Development. Impact of physical and chemical environment on human reproduction and development.

Teratogen Information System (TERIS)
Web: http://depts.washington.edu/terisweb/teris/

TERIS is a computerized, subscription-only, database that summarizes and rates the teratogenic potential of over 2000 chemicals and drugs. Aimed at clinicians, this on-line service also provides access to Shepard's Catalogue to Teratogenic agents.

CHAPTER

22

Disaster Preparedness and Management

C.C. BARTON

INTRODUCTION

A disaster is a serious disruption of the functioning of a community or a society causing widespread human, material, economic, or environmental losses which exceed the ability of the affected community or society to cope using its own resources. Over 96% of all deaths from natural disasters occur in developing countries. Natural disasters kill one million people around the world each decade and leave millions more homeless each year.

Disaster preparedness and management refers to measures taken to prepare for and reduce the effects of disasters. That is, to predict, prevent, and mitigate their impact on vulnerable populations, and respond to their consequences.

Disaster preparedness is a continuous and integrated process resulting from a wide range of activities and resources rather than from a distinct activity by itself. It requires the contributions of many different areas ranging from training and logistics, to health care to institutional development. Viewed from this broad perspective, disaster preparedness encompasses three main objectives:

1. Increasing the efficiency, effectiveness, and impact of disaster emergency response mechanisms at the community, state, and national levels. This includes: (a) the development and regular testing of warning systems (linked to forecasting systems) and plans for evacuation or other measures to be taken during a disaster alert period to minimize potential loss of life and physical damage; (b) the education and training of officials and the population at risk; (c) the training of first-aid and emergency response teams; and (d) the establishment of emergency response policies, standards, organizational arrangements, and operational plans to be followed after a disaster.
2. Strengthening community-based disaster preparedness. This could include educating, preparing, and supporting local populations and communities in their everyday efforts to reduce risks and prepare their own local response mechanisms to address disaster emergency situations.
3. Developing activities that are useful for both addressing everyday risks that communities face and for responding to disaster situations.

Disaster management can be defined as the effective organization, direction, and utilization of available counter-disaster resources. Another view is that there must be pre-disaster preparedness or mitigation measures to avoid or reduce the impact of disasters.

Emergency management (or disaster management) involves preparing, supporting, and rebuilding society when natural or human-made disasters occur. In general, any emergency management is the continuous process by which all individuals, groups, and communities manage hazards in an effort to avoid or ameliorate the impact of disasters resulting from the hazards. Actions taken depend in part on perceptions of risk of those exposed. Effective emergency management relies on integration of emergency plans at all levels of government and non-government involvement. Activities at each level (individual, group, community) affect the other levels. It is common to place the responsibility for governmental emergency management with the institutions for civil defense or within the conventional structure of the emergency services.

The nature of emergency management is highly dependent on economic and social conditions local to the emergency, or disaster. The process of emergency management involves four phases: mitigation, preparedness, response, and recovery.

Mitigation efforts attempt to prevent hazards from developing into disasters altogether, or to reduce the effects of disasters when they occur. The mitigation phase differs from the other phases because it focuses on long-term measures for reducing or eliminating risk. The implementation of mitigation strategies can be considered a part of the recovery process if applied after a disaster occurs. However, even if applied as part of recovery efforts, actions that reduce or eliminate risk over time are still considered mitigation efforts.

Mitigation measures can be structural or non-structural. Structural measures use technological solutions, like flood levees. Non-structural measures include legislation, land-use planning (e.g. the designation of non-essential land to be used as flood zones), and insurance. Mitigation is the most cost-efficient method for reducing the impact of hazards. However, mitigation is not always suitable and structural mitigation in particular may have adverse effects on the ecosystem.

Personal mitigation is mainly about knowing and avoiding unnecessary risks. This includes an assessment of possible risks to personal/family health and to personal property. An example of personal non-structural mitigation would be to avoid buying property that is exposed to hazards, e.g. in a flood plain, in areas of subsidence or landslides.

Personal structural mitigation in earthquake-prone areas includes installation of an Earthquake Valve to instantly shut off the natural gas supply to the property, seismic retrofits of property, and the securing of items inside the building to enhance household seismic safety such as the mounting of furniture, refrigerators, water heaters, and breakables to the walls, and the addition of cabinet latches. In areas prone to prolonged electricity black-outs a generator would be an example of an optimal structural mitigation measure. The construction of storm cellars and fallout shelters are further examples of personal mitigative actions.

In the preparedness phase, emergency managers develop plans of action for when the disaster strikes. Common preparedness measures include: (a) the communication plans with chain of command; (b) development and practice of multiagency coordination and incident command; (c) proper maintenance and training of emergency services; (d) development and exercise of emergency population warning methods combined with emergency shelters and evacuation plans; and (e) stockpiling and maintenance of supplies and equipment.

An efficient preparedness measure is an emergency operations center (EOC) combined with a practiced region-wide doctrine for managing emergencies. Another preparedness measure is to develop a volunteer response capability among civilian populations. Since volunteer response is not as predictable as professional response, volunteers are most effectively deployed on the periphery of an emergency.

On the contrary to mitigation activities which are aimed at preventing a disaster from occurring, personal preparedness is targeted on preparing activities to be taken when a disaster occurs, i.e. planning. Preparedness measures can take many forms. Examples include the construction of shelters, warning devices, back-up life-line services (e.g. power, water, sewage), and rehearsing an evacuation plan. For evacuation, a disaster supplies kit should be prepared and for sheltering purposes a stockpile of supplies.

The response phase includes the mobilization of the necessary emergency services and first responders in the disaster area. This is likely to include a first wave of core emergency services, such as firefighters, police, and ambulance crews. They may be supported by a number of secondary emergency services, such as specialist rescue teams.

In addition volunteers and non-governmental organizations such as the local Red Cross may provide immediate assistance. A well-rehearsed emergency plan developed as part of the preparedness phase enables efficient coordination of rescue efforts. Emergency plan rehearsal is essential to achieve optimal output with limited resources. In the response phase, medical assets will be used in accordance with the appropriate triage of the affected victims. Where required, search and rescue efforts commence at an early stage.

The response phase of an emergency may commence with a search and rescue phase. However in all cases the focus will be on fulfilling the basic needs of the affected population on a humanitarian basis. This assistance may be provided by local, state, or national agencies and organizations. Effective coordination of disaster assistance is often crucial, particularly when many organizations respond and local emergency management agency capacity may be over-stretched and diminished by the disaster itself.

On a personal level the response can take the shape either of a home confinement or an evacuation. In a home confinement scenario, a family should be prepared to stay inside their homes for days with minimum outside support. In an evacuation scenario, a family evacuates by an automobile (or other mode of transportation) with the maximum amount of supplies.

The aim of the recovery phase is to restore the affected area to its previous state. It differs from the

response phase in its focus; recovery efforts are concerned with issues and decisions that must be made after immediate needs are addressed. Recovery efforts are primarily concerned with actions that involve rebuilding destroyed property, re-employment, and the repair of other essential infrastructure.

In the United States, the National Response Plan dictates how the resources provided by the Homeland Security Act of 2002 will be used in recovery efforts. It is the Federal government that often provides the most technical and financial assistance for recovery efforts in the United States.

The recovery phase starts when the immediate threat to human life has subsided. In the reconstruction it is recommended to reconsider the location or construction material of the property.

Emerging tools and technologies such as Semantic Web application in public health preparedness and response has shown promise in effective information sharing, data integration, and timely decision making.

RESOURCES

Books

Alexander D (2002)
Principles of Emergency Planning and Management
New York: Oxford University Press.

As interest in planning for emergencies and disasters burgeons, and educational and training programs proliferate, this is the first book to meet the need for a concise yet comprehensive and systematic primer on how to prepare for a disaster. Providing readers with a comprehensive, systematic, yet concise introduction to effective preparation for disasters, it provides a unified starting point encompassing the scattered and parochial literature in this nascent field of academic enquiry and practical endeavor. The book provides a general introduction to the methods, procedures, protocols, and strategies of emergency planning, with emphasis on situations in industrialized countries and the local level of organization (i.e. cities, municipalities, metropolitan areas, and small regions), though with ample reference to national and international levels. Rather than concentrating on the practices of any one country or state, the author focuses on general principles. The book is designed to be a reference source and manual from which emergency managers can extract ideas, suggestions and pro-forma methodologies to help them design and implement emergency plans. A comprehensive all-hazards approach is adopted, with frequent reference to the most important individual hazards and the planning and management needs that they create. Twelve examples of actual emergency planning and management problems are analyzed in detail. The book is written especially for the new generation of emergency planners and managers that is emerging as a result of intensified governmental interest in disaster preparedness. Many of them will occupy positions in government or other organizations that require emergency plans. The book will also be of value to students of disasters and hazards who have a practical interest in how disasters are planned for and managed, and to professional workers and trainees who will eventually have to participate in disaster plans. The book is designed to be easily integrated with training courses in emergency preparedness.

Haddow G, Bullock J (2005)
Introduction to Emergency Management, 2nd edition (Butterworth-Heinemann Homeland Security)
Boston, MA: Butterworth-Heinemann.

Introduction to Emergency Management, Second Edition is a practical reference for students and professionals covering disaster response planning and mitigation. The book details the Federal Emergency Management Agency (FEMA) (U.S.), the Federal Response Plan (FRP), and the roles, responsibilities, and interrelationship between FEMA and state and local emergency management systems. It also covers the changes in emergency management since the events of September 11, 2001, the latest information on the Office of Homeland Security, and includes several detailed appendices. The book (1) includes continual connection of theory to real-world examples of disasters including the Tsunami disaster and instances of terrorism; (2) contains dozens of diagrams and statistics illustrating disaster management history and facts; and (3) provides links to Emergency Management websites and information sources, including homeland security sources.

Schneid TD, Collins LR (2000)
Disaster Management and Preparedness (Occupational Safety and Health Guide Series)
New York: Taylor & Francis.

This book addresses all the special considerations important in planning for disasters, from natural disasters to acts of terrorism to catastrophic events. It covers all aspects from assessing the risk prior to a disaster to the legal ramifications following a disaster. The text addresses the 'how-tos' of avoiding the common mistakes which turn natural and man-made catastrophes into economic disasters. It encompasses not only the tried and true tactics used for decades but also focuses on areas often overlooked during the reactive and post-disaster phases. Organizations

can be prepared and proactive by using this guide to make a disaster management plan before disaster strikes.

Waugh WL (1999)
Living With Hazards, Dealing With Disasters: An Introduction to Emergency Management
Armonk, NY: M.E. Sharpe, Inc.

This is the first concise introduction to emergency management, the emerging profession that deals with disasters from floods and earthquakes to terrorist attacks.

Coverage includes: (1) The history of emergency management and its evolution from volunteer effort to trained intervention; (2) Organization of emergency management systems – local, state, regional, national, international; governmental, for-profit, and non-profit; (3) Managing natural disasters – floods, earthquakes, hurricanes, wildfires, tornadoes, avalanches, etc.; (4) Managing manmade disasters – civil defense, terrorism, hazardous materials accidents, fires, structural failures, nuclear accidents, transportation disasters; (5) Policy issues in the management of risk, emergencies, and disasters; and (6) Disaster management in the twenty-first century – technological and political challenges.

Twenty case studies illustrate the handling of actual disasters including the Northridge Earthquake and the Oklahoma City Bombing. Discussion questions and guides to online information sources facilitate use of the book in the classroom and professional training programs.

Journals

Australasian Journal of Disaster and Trauma Studies
New Zealand: Massey University.
Web: http://www.massey.ac.nz/~trauma/welcome.shtml

The *Australasian Journal of Disaster and Trauma Studies* is a peer-reviewed electronic journal utilizing the Internet as a medium for the collation and distribution of original material on disaster and psychological trauma studies within Australia, New Zealand, and the Pacific Rim. Coverage includes disaster and trauma mitigation and prevention, response, support, recovery, treatment, policy formulation, and planning and their implications at the individual, group, organizational, and community level. The Journal is interested in events of natural, technological, and human-induced origin and their effects at individual, community, organizational, and national levels.

Disaster Prevention and Management
Emerald Group Publishing Limited, Bingley, UK
Web: http://www.emeraldinsight.com/info/journals/dpm/dpm.jsp

Disaster Prevention and Management, an international journal, sets out to advance the available knowledge in the fields of disaster prevention and management and to act as an integrative agent for extant methodologies and activities relating to disaster emergency and crisis management. Publishing high-quality, refereed papers, the journal supports the exchange of ideas, experience and practice between academics, practitioners, and policy-makers.

Journal of Natural Disaster Science
Kyoto, Japan: Gokasho, Uji.
Web: http://www.soc.nii.ac.jp/jsnds/contents/jsdn_back_number/jsdn_bn_list.html

The *JNDS*, published since 1979, has provided a unified forum for scientific research on various problems concerning natural hazards and the prevention or mitigation of natural disasters. From Volume 20 (1998) *JNDS* has been restructured as the journal of the Society for Natural Disaster Science, Japan. Publication is open to those who wish to contribute results of original research studies or investigations. All areas of Natural Disaster Science will be represented through regular papers, special reports, letters, and discussions. Original papers that provide new findings on natural hazard phenomena, and papers on interdisciplinary subjects dealing with the reduction of natural disasters are highly encouraged. Timely special reports are planned in the event of large-scale disasters.

Organizations

American Red Cross National Headquarters
2025 E Street, NW
Washington, DC 20006
Phone: 202-303-4498 or 800-REDCROSS (800-733-2767)
Web: http://www.redcross.org/

The American Red Cross (chartered as the American National Red Cross) is a humanitarian organization that provides emergency assistance, disaster relief, and education inside the United States, as part of the International Federation of Red Cross and Red Crescent Societies.

Today, in addition to domestic disaster relief, the American Red Cross offers compassionate services in five other areas: community services that help the needy; support and comfort for military members and their families; the collection, processing, and distribution of lifesaving blood and blood products; educational programs that promote health and safety; and international relief and development programs.

Department of Homeland Security
245 Murray Lane, SW
Washington, DC 20528-0300
Phone: 202-282-8000
Web: http://www.dhs.gov/index.shtm

The National Strategy for Homeland Security and the Homeland Security Act of 2002 served to mobilize and organize our nation to secure the homeland from terrorist attacks. This exceedingly complex mission requires a focused effort from our entire society if we are to be successful. To this end, one primary reason for the establishment of the Department of Homeland Security was to provide the unifying core for the vast national network of organizations and institutions involved in efforts to secure our nation. In order to better do this and to provide guidance to the 180 000 DHS men and women who work every day on this important task, the Department developed its own high-level strategic plan. The vision and mission statements, strategic goals, and objectives provide the framework guiding the actions that make up the daily operations of the department.

Disaster Preparedness and Emergency Response Association
P.O. Box 797
Longmont, CO 80502
Web: http://www.disasters.org/index.htm

DERA is a membership organization founded in 1962 as a non-profit association linking professionals, volunteers, and organizations active in all phases of disaster preparedness and emergency management. DERA remains an independent, non-governmental organization (NGO) with dual missions of professional support and disaster service.

DERA currently has active members around the world and invites you to obtain the benefits of membership

while sharing your knowledge, skills, and abilities to help those in need.

DERA provides professional support, resource sharing, leadership opportunities, and extensive networking for members and is actively involved in providing critical emergency assistance in response to several recent disasters.

Federal Emergency Management Agency
500 C Street S.W.
Washington, D.C. 20472
Phone: 800-621-FEMA (3362)
Web: http://www.fema.gov/

On March 1, 2003, the Federal Emergency Management Agency (FEMA) became part of the U.S. Department of Homeland Security (DHS). The primary mission of the Federal Emergency Management Agency is to reduce the loss of life and property and protect the Nation from all hazards, including natural disasters, acts of terrorism, and other man-made disasters, by leading and supporting the Nation in a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery, and mitigation.

FEMA has more than 2600 full-time employees. They work at FEMA headquarters in Washington D.C., at regional and area offices across the country, the Mount Weather Emergency Operations Center, and the National Emergency Training Center in Emmitsburg, Maryland. FEMA also has nearly 4000 standby disaster assistance employees who are available for deployment after disasters. Often FEMA works in partnership with other organizations that are part of the nation's emergency management system. These partners include state and local emergency management agencies, 27 federal agencies and the American Red Cross.

International Association of Emergency Managers
201 Park Washington Court
Falls Church, VA, 22046-4527
Web: http://www.iaem.com/index.htm

The International Association of Emergency Managers (IAEM) is a non-profit educational organization dedicated to promoting the goals of saving lives and protecting property during emergencies and disasters.

National Emergency Management Association
PO Box 11910
Lexington, KY 40578
Phone: 859-244-8000
Fax: 859-244-8239
Web: http://www.nemaweb.org/index.cfm

NEMA is the professional association of and for state emergency management directors. NEMA's mission is to: (a) provide national leadership and expertise in comprehensive emergency management; (b) serve as a vital emergency management information and assistance resource; and (c) advance continuous improvement in emergency management through strategic partnerships, innovative programs, and collaborative policy positions.

Provides access to books, journals, and reports about how societies prepare for and respond to natural hazards and catastrophic events. Can search by title, author, keyword, call #, or year published. Search results provide bibliographic information, but do not link directly to a resource.

Integrated Risk Information System (IRIS)
U.S. Environmental Protection Agency
Web: http://www.epa.gov/iris/index.html

The Integrated Risk Information System (IRIS), prepared and maintained by the U.S. Environmental Protection Agency (U.S. EPA), is an electronic database containing information on human health effects that may result from exposure to various chemicals in the environment. IRIS was initially developed for EPA staff in response to a growing demand for consistent information on chemical substances for use in risk assessments, decision-making, and regulatory activities. The information in IRIS is intended for those without extensive training in toxicology, but with some knowledge of health sciences.

The heart of the IRIS system is its collection of computer files covering individual chemicals. These chemical

files contain descriptive and quantitative information in the following categories:

- Oral reference doses and inhalation reference concentrations (RfDs and RfCs, respectively) for chronic non-carcinogenic health effects
- Hazard identification, oral slope factors, and oral and inhalation unit risks for carcinogenic effects
- International Toxicity Estimates for Risk Database (ITER)
- Toxicology Excellence for Risk Assessment
- http://www.tera.org/ITER/
- ITER is a free Internet database of human health risk values and cancer classifications for over 600 chemicals of environmental concern from multiple organizations worldwide. It presents risk data in a tabular format for easy comparison, along with a synopsis explaining differences in data and a link to each organization for more information.

QUAKELINE
University of Buffalo's Multidisciplinary Center for Earthquake Engineering Research
Web: http://mceer.buffalo.edu/utilities/quakeline.asp

QUAKELINE® is a bibliographic database developed and maintained by the Information Service. It covers earthquakes, earthquake engineering, natural hazard and disaster mitigation, and related topics. Varied publications are featured, including books, journal articles, conference papers, proceedings, technical reports, CDs, slides, and videos. The database is updated on a monthly basis and currently provides content for over 44 900 records.

Resource Guide for Public Health Preparedness
New York Academy of Medicine
Web: http://www.phpreparedness.info/

Provides access to various types of documents pertaining to public health preparedness, such as executive summaries, fact sheets, and glossaries. The 'Advanced option' allows you to search the database by document type, intended audience, or 'event category,' which includes biological or nuclear attacks. Every search result links directly to a resource.

Risk Assessment Information System
US Department of Energy
Web: http://rais.ornl.gov/

Database of toxicity values and information used to disseminate risk tools and supply information for risk assessment activities.

Toxicological Data Network (TOXNET)
US National Library of Medicine
Web: http://toxnet.nlm.nih.gov/

A central clearinghouse for 14 separate databases on toxicology, hazardous chemicals, environmental health, and toxic releases.

TOXNET
US National Library of Medicine
Web: http://toxnet.nlm.nih.gov/

Cluster of databases maintained by the National Library of Medicine's Division of Specialized Information Services. A total of 10 databases that provide information on various aspects of toxicology hazard identification. Can search databases individually or all at once.

CHAPTER

23

Environmental Toxicology: Aquatic

SAMANTHA J. JONES

INTRODUCTION

Aquatic toxicology generally involves the measurement of contaminant levels to characterize the hazards imposed on the aquatic environment; however, this field of study also includes information on how those contaminants can affect humans in and around these aquatic environments. Defined as the study of the effects due to anthropogenic materials and activities on aquatic organisms, aquatic toxicology is observed on multiple levels, from the subcellular to individual organisms to communities and ecosystems (Rand 1995).

The detrimental effects to both the aquatic environment and humans from anthropogenic chemical contaminants are illustrated in numerous historical incidents. One such incident occurred in Japan in the 1950s, in which an industrial release of mercury spilled into Minamata Bay. This resulted in mercury poisonings and severe neurotoxicological and developmental effects in the local villagers that consumed the tainted fish and shellfish from the bay (Hodgson & Levi 1997). Another well-known event, the *Exxon Valdez* oil spill in Prince William Sound, Alaska, occurred in 1989. This incident resulted in the release of more than 250 000 barrels (4.2×10^7 liters) of crude oil into the Sound (Harwell & Gentile 2006). The impact of the contamination on birds and marine mammals was significant. It has been estimated that approximately 375 000 seabirds died as a direct result of the oil spill (Ford et al 1996). The lasting effects of the incident on the Prince William Sound aquatic ecosystems and surrounding environment remain controversial.

Increased publicity of the deleterious effects of pesticides on wildlife and regulations such as the 1977 Clean Water Act helped propel environmental toxicology to the forefront of the public consciousness in the 1960s and 1970s. As part of this movement, aquatic toxicology expanded as interests were renewed in water quality and the quality of aquatic organisms (Mac 1998, Macek 1980).

Aquatic environments provide unique opportunities to study the impact of contaminants because toxicants frequently enter aquatic environments via multiple avenues, such as effluent discharge, terrestrial runoff, and atmospheric deposition (Kendall et al 2001, Pritchard 1993). Chemically induced toxic effects in freshwater and marine organisms, such as the *Daphnia magna* (commonly referred to as a water flea) and the *Pimephales promelas* (fathead minnow), serve as indicators of toxicological risk to humans and the environment (Kendall 2001). Established acute lethality toxicity tests commonly utilize aquatic organisms. While these acute tests represent a less likely scenario (when compared with a sublethal, longer-term approach), they remain ecologically significant tools that allow for comparisons across species and chemicals. Full life cycle fish tests have been developed to better represent the chemically induced changes in behavioral, physiological, and reproductive processes in affected aquatic organisms (Mac 1998).

Past research and information related to aquatic toxicology provided a foundation for the development of standard methods of analysis, while techniques for identifying biomarkers are constantly refined to increase sensitivity and specificity to detect chemical contaminants (Mac 1998). The expansion of chemical, biological, and toxicological databases has carried over into aquatic toxicology and allowed for improved characterization of the toxicity of aquatic chemical

contaminants. Furthermore, the incorporation of computational toxicology has supported the progression from mere detection of a pollutant to reliable, predictive outcomes that aid in preventing aquatic exposure to contaminants.

The multidisciplinary research that comprises the field of aquatic toxicology has provided a better understanding of the effects anthropogenic activities and chemical contaminants have on aquatic environments. Additionally, this increase in knowledge has improved the methods utilized and consequently, the confidence in measuring the potential hazards associated with humans exposed to contaminated aquatic environments and organisms (Pritchard 1993).

This chapter provides a plethora of resources used in the field of aquatic toxicology. The resources assembled are informative whether one is looking at the pollution generated by anthropogenic activities and the affected aquatic ecosystems or observing how contaminants in water and aquatic organisms affect water quality and the subsequent exposure to humans.

RESOURCES

Books

Abel PD, Axiak V (eds.) (1990)
Ecotoxicology and the Marine Environment
New York: Horwood.

Provides an unusual blend of approaches to the application of toxicological data in the monitoring and control of marine pollution. Describes and discusses the most recent developments in the application of ecotoxicological principles and outlines ways in which toxicological techniques can be applied in practice.

Abel PD (1996)
Water Pollution Biology, 2nd edition
Washington, DC: Taylor & Francis.

Provides a thorough examination of the scale of water pollution problems and using case studies, explores the types of investigations biologists need to undertake in solving them. Focuses on the interaction between scientific and legislative approaches, including the use of monitoring and toxicological data in formulating pollution control strategies. The 3rd edition of this book was released in 2007.

Adams WJ, Chapman PM (eds.) (2007)
Assessing the Hazard of Metals and Inorganic Metal Substances in Aquatic and Terrestrial Systems
Pensacola, FL: SETAC Press.

Reviews the scientific underpinnings of the use of persistence as applied to metals, including bioavailability, and the use of bioaccumulation to evaluate aquatic species and aquatic-linked food chains. Examines toxicity procedures as used within Persistence, Bioaccumulation, and Toxicity (PBT) approaches and examines measures for metals in terrestrial ecosystems, seeking improvements or alternatives.

American Society for Testing and Materials (ASTM) (1993)
ASTM Standards on Aquatic Toxicology and Hazard Evaluation
Philadelphia, PA: ASTM Press.

Features 67 ASTM test methods, practices, and guides on field sampling (phytoplankton, zooplankton, benthic macroinvertebrates, and fishes), toxicity of water, toxicity testing of sediment, fate-related procedures, special procedures, uses of toxicological data, avian test procedures, and genotoxicity tests.

Baker LA (ed.) (1994)
Environmental Chemistry of Lakes and Reservoirs
Washington, DC: American Chemical Society (ACS).

Explores a broad range of research dealing with large bodies of water. The main topics include methodological advances, cycling and distribution of major aquatic elements, behavior of trace metals, and organic contaminants. Contains both background and research material.

Barbour MT, Norton SB, Preston HR, et al (eds.) (2004)
Ecological Assessment of Aquatic Resources: Linking Science to Decision-making
Pensacola, FL: SETAC Press.

Compiled following a SETAC Pellston workshop: Applications Workshop on Ecological Assessment of Aquatic Resources in which international representatives from government, academia, and industry addressed the relationship between ecological assessment and ecological risk assessment and their roles in aquatic resources. Guidelines for effectively conducting and communicating ecological assessments are included.

Bitton G, Dutka BJ (eds.) (1986)
Toxicity Testing Using Microorganisms, Volumes 1 and 2
CRC Press, Boca Raton, Florida

Surveys the literature on microbial and enzymatic tests which are used to screen for chemical toxicity in the research laboratory or in an aquatic system and describes the more commonly used microbial toxicity screening procedures.

Blaise C, Férard J (eds.) (2005)
Small-scale Freshwater Toxicity Investigations: Volume 1 – Toxicity Test Methods
The Netherlands: Springer.

Compiles detailed, comprehensive information on biological testing with background, theory, and practice associated with each bioassay.

Blaise C, Férard J (eds.) (2005)
Small-scale Freshwater Toxicity Investigations: Volume 2 – Hazard Assessment Schemes
The Netherlands: Springer.

Describes aquatic hazard assessment schemes in great detail using a homogeneous structure providing batteries of bioassays that are being used internationally to assess the toxic potential of complex environmental media (e.g., effluents, sediments) impacted by chemical contamination stemming from human activities. Contents include information on dealing with point and non-point source pollution using case studies and real world situations as a means of aquatic environment protection. Toxicity testing applications and glossaries of scientific/technical terms are included in each chapter.

Bortone SA (ed.) (2004)
Estuarine Indicators (Marine Science Series)
Boca Raton, FL: CRC Press.

Compiles the principles, concepts, practical use, and application of indicators in estuarine research and management practices that were discussed at a 2003 Estuarine Indicators workshop. Theory and presumed attributes associated with estuarine indicators as well as the methods and protocols of development and evaluation are included. Additional sections address effective and ineffective indicator examples and future directions of research and management practices.

Buffle J, Horvai G (eds.) (2000)
In Situ Monitoring of Aquatic Systems: Chemical Analysis and Speciation
New York: Wiley.

Reviews and evaluates the development, since 1980, of sensors and instrumentation for automatic on-site measurement of water quality. Emphasizes microanalytical monitoring techniques and microtechnology with critical discussions of the state of the art and performance of existing techniques and devices and outlines potential future improvements.

Crompton TR (1997)
Toxicants in the Aqueous Ecosystem
England: Wiley.

Provides coverage of all aspects of the occurrence, toxicity, and analysis of toxicants in the aqueous ecosystem, including natural waters and sedimentary matter present in these waters, aquatic organisms, and plants. Chapters deal with the toxicant effects on the natural waters and the organisms within this environment with topics covering toxicity measurement, control of pollution regulation, and toxicity data on metals and organometallic and organic compounds.

Crompton TR (2007)
Toxicants in the Aqueous Ecosystem: A Guide for the Analytical and Environmental Chemist
England: Springer.

Provides detailed methods for identifying types of inorganic, organic, and organometallic pollutants in

aquatic species (fish, crustaceans, weeds, plants, phytoplankton, and algae) and interpreting the analytical results.

Di Giulio RT, Hinton DE (eds.) (2008)
The Toxicology of Fishes
Boca Raton, FL: CRC Press.

An in-depth, state-of-the-science monograph concerning the interactions of chemical contaminants with freshwater and marine fishes. Includes discussions of critical general principles, such as bioaccumulation, toxicokinetics, biotransformations, mechanisms of toxic action, and adaptations to chemical stress and key target systems of fishes, such as liver, kidney, gills, nervous and immune systems, and reproduction. It also covers methodologies and applications for exposure, assessment, toxicity testing, and ecological studies and includes case studies that illustrate the toxicological impacts of important classes of chemical contaminants in real-world settings. This book was scheduled for release in February, 2008.

European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC) (1993)
Assessment of the Biodegradation of Chemicals in the Marine Environment, Technical Report No. 54
Brussels, Belgium: ECETOC.

Outlines a strategy for a tiered approach to assess the hazard of a chemical in the marine environment. Includes the differences between marine, estuarine, and limnic environments, assessment of existing test methods, and proposals for test guidelines.

European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC) (1993)
Environmental Hazard Assessment of Substances, Technical Report No. 51
Brussels, Belgium: ECETOC.

Describes the development of a process for aquatic environmental hazard assessment. Includes principles and practical approaches.

European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC) (1999)
Monitoring and Modeling of Industrial Organic Chemicals with Particular Reference to Aquatic Risk Assessment, Technical Report No. 76
Brussels, Belgium: ECETOC.

Details water pollution, organic compounds and other chemicals, organic water pollutants, and environmental risk assessment.

European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC) (2003)
Aquatic Hazard Assessment II, Technical Report No. 91
Brussels, Belgium: ECETOC.

Updates information previously presented in Technical Report No. 56: Aquatic Toxicity Data Evaluation, describing the compilation of referenced aquatic toxicity data points for approximately 350 chemicals.

Evans MS (ed.) (1988)
Toxic Contaminants and Ecosystem Health: Great Lakes Focus
New York: Wiley.

Based on the proceedings of a meeting of the Task Force on the Health of Aquatic Communities. The book is divided into three parts. Part 1 deals with Great Lakes biota and the effect of toxic substances on their well-being. Part 2 deals with approaches for investigating the effects of toxic substances and specific objectives of the discharge and concentration of various pollutants. Part 3 contains the deliberations of a workshop held after the meeting.

Garrigues P, Barth H, Walker CH, et al (eds.) (2001)
Biomarkers in Marine Organisms
The Netherlands: Elsevier.

Serves as an overview of biological markers in marine animals, detailing the results obtained during development and application of biological markers as indicators of marine environment exposure to toxic chemicals. Practical use of indicators and the evaluation of the health effects associated with environmental contamination in marine ecosystems are also covered. Sentinel species discussed include fish, bivalves, and crustaceans. Detailed experimental procedures developed for chemical and biochemical measurements are included.

Hamelink JL, Landrum PF, Bergman HL, et al (eds.) (1994)
Bioavailability, Physical, Chemical, and Biological Interactions
Boca Raton, FL: Lewis.

Discusses the relationship between the measured environmental concentrations of chemical contaminants and the true, biologically available exposure concentrations that have adverse effects on aquatic life in that environment. This is intended to provide a synopsis of the major factors which control the bioavailability of chemicals to different organisms in aquatic environments.

Harris R, Krabbenhoft DP, Mason R, et al (eds.) (2007)
Ecosystem Responses to Mercury Contamination: Indicators of Change
Pensacola, FL: SETAC Press.

Outlines the infrastructure and methods needed to measure, monitor, and regulate the concentration of mercury present in the environment. Proposes a set of indicators to use as a measure of changing mercury concentrations in air, water, soil, and aquatic biota. Offers a monitoring strategy and guidance for determining if concentration levels are changing systematically over time. Explains how additional monitoring strategies can relate observed changes in mercury concentrations to regulatory controls on mercury emissions. An integrated framework for establishing a national-scale program to monitor mercury concentrations in the environment is included.

Heath AG (1995)
Water Pollution and Fish Physiology, 2nd edition
Boca Raton, FL: Lewis.

Provides a reasonably concise synthesis of what is known about how pollutants affect physiological processes in fish. After an introductory chapter, experimental hypoxia, respiratory and cardiovascular responses, hematology, liver, ionic regulation, uptake and kinetics, energetic, enzyme changes, immune system, and behavioral, reproductive, and physiological effects are discussed in relation to chemical exposure.

Hill IR, Heiminback F, Leewangh P, et al (eds.) (1994)
Freshwater Field Tests for Hazard Assessment of Chemicals
Boca Raton, FL: Lewis.

Presents a series of papers critically assessing the theory and practice of freshwater field tests to move toward future development. Contains a set of recommendations for key issues involving the conduct of field tests, interpretation of results, and further research.

Hofer TN (ed.) (2008)
Marine Pollution: New Research
New York: Nova Science.

Discusses marine pollution characterized by the entry of chemicals or particles into the ocean. Presents problems associated with the many potentially toxic chemicals that can adhere to tiny particles which are then taken up and concentrated upward within ocean food chains and incorporated in terrestrial food chains. Topics include mining deep sea vents, pollution in bivalves, algal blooms, marine debris, oxidative stress, aquatic ecosystems and mitigation, fecal indicator bacteria in beach sand and water, petroleum pollution and penguins, and heavy metals. This book presents the latest research in the field from around the world. Release is scheduled for May, 2008.

Hoffman D, Rattner BA, Burton AG Jr, et al (eds.) (2002)
Handbook of Ecotoxicology, 2nd edition
Boca Raton, FL: Lewis.

Contains revised and updated information about the rapidly expanding field of ecotoxicology. Two chapters are devoted to aquatic toxicology: 'Aquatic Toxicology Test Methods' (Chapter 2) and 'Model Aquatic Ecosystems in Ecotoxicology Research: Considerations of Design, Implementation, and Analysis' (Chapter 3).

Howells G (ed.) (1994)
Water Quality for Freshwater Fish
Pennsylvania, PA: Gordon & Breach.

Provides a source of critically evaluated water-quality data concerning the effects of various toxins on freshwater fish. The report covers all stages of life cycle and relative trophic levels, including aquatic invertebrates and plants with potential for bioaccumulation up the food chain.

Huang CP, O'Melia CR, Morgan JJ (eds.) (1995)
Aquatic Chemistry: Interfacial and Interspecies Processes
Washington, DC: American Chemical Society (ACS)

Presents principles of aquatic chemistry in 19 chapters from experienced investigators. Includes recent developments in the field to allow a better understanding of the mechanisms regulating the chemical composition of natural waters. The transformation and transport of species in aquatic systems through interphase and interspecies interactions are discussed. The principles covered herein can be applied to the design of air, soil, water, and wastewater treatment systems.

Johnson, W. W. and Finley, M. T. (eds.) (1980)
Handbook of Acute Toxicity of Chemicals to Fish and Aquatic Invertebrates. Resource Publication 137
Washington, DC: U.S. Department of the Interior, Fish and Wildlife Service.

Results of toxicity tests on fish and aquatic invertebrates conducted at the Columbia National Fisheries Research Laboratory are presented, including 1587 acute toxicity tests on 271 chemicals in approximately 30 species of both fish and invertebrates.

Kennish MJ (1997)
Pollution Impacts on Marine Biotic Communities
Boca Raton, FL: CRC Press.

Features a basic introduction to pollution-related issues in coastal regions, case histories of highly contaminated systems, specific coverage of marine pollutants (from organic and radioactive wastes to heavy

metals and polycyclic aromatic hydrocarbons), and use and management of coastal resources.

Kraybill HF, Dawe CJ, Harshbonger JC, et al (eds.) (1977)
Aquatic Pollutants and Biological Effects with Emphasis on Neoplasia
New York: New York Academy of Sciences.

Stresses neoplasms in aquatic animals, including mollusks, eels, salamanders, carp, hagfish, and trout. Other topics include implications for humans of biological effects on marine animals and public health aspects.

Laws EA (2000)
Aquatic Pollution: An Introductory Text, 3rd edition
New York: Wiley.

Details pollution in marine and freshwater systems to provide both ecological and toxicological information on the scientific aspects of environmental issues. Utilizes case studies and an extensive collection of literature to describe fundamental concepts. Updates include new chapters on acid rain, groundwater pollution, and plastics.

Malins DC, Ostrander GK (1994)
Aquatic Toxicology: Molecular, Biochemical, and Cellular Perspectives
Boca Raton, FL: Lewis.

Examines findings from recent research on the chronic effects of pollutants on aquatic species. Evaluates modern techniques in molecular biology and biochemistry.

Montgomery JH (2007)
Groundwater Chemicals: Desk Reference, 4th edition
Boca Raton, FL: Lewis.

Collection of comprehensive data on groundwater chemical contaminants has been updated and expanded to include bioconcentration factors, aquatic toxicity values, environmental degradation rates and corresponding half-lives, ionization potentials, aqueous solubility of miscellaneous compounds, and environmental endocrine disruptors with references that also cover environmental fate and transport in various media, organic priority pollutants, and chemicals commonly found in the environment and workplace. The data should be useful to the environmental-regulated community and consultants in conducting risk-based contamination assessments. The main body of the book deals with chemical-specific information.

Mothersill C, Austin B (2003)
In Vitro Methods in Aquatic Ecotoxicology
New York: Springer.

Focuses on in vitro methods to study the toxicology of polluting agents (including heavy metals, radionuclides, micro-organics, estrogenic compounds, and complex mixtures) in the aquatic environment. The development of standardized techniques and validation of controlled substance- and species-specific experiments are some of the advantages of in vitro methods that allow for the execution of mechanistic studies without the problems of individual variation.

Munawar M, den Bestens PJ (eds.) (2005)
Ecotoxicological Testing in Marine and Freshwater Ecosystems
Boca Raton, FL: CRC Press.

Explores aquatic ecosystem health assessment describing ecotoxicological techniques and methods and evaluating the latest bioassay techniques used in the field, including both water and sediment analyses. Detailed discussions of the integration of data, recommendations for the preservation, enhancement, and restoration of ecosystem functions, risk communication, and risk perception are included. The authors analyze how improvements in data processing and information technology have led to the assessment of spatial variability and cover emerging research fields such as biomarkers, genome expression, multispecies tests, and tiered approaches. The appendices highlight the strengths and limitations of the techniques and provide references to additional literature.

Murty AS (1986)
Toxicity of Pesticides to Fish
Boca Raton, FL: CRC Press.

A detailed treatment of the environmental fate of pesticides and their acute and chronic toxicological effects on fish.

Neilson AH (1994)
Organic Chemicals in the Aquatic Environment: Distribution, Persistence, and Toxicity
Boca Raton, FL: CRC Press.

Discusses basic issues of chemical analysis, distribution, persistence, and ecotoxicology, with an emphasis on microbial reactions.

Newman MC (1995)
Quantitative Methods in Aquatic Ecotoxicology (Advances in Trace Substances Research)
Boca Raton, FL: CRC Press.

A quantitative evaluation of the science of ecotoxicology. Focuses on aquatic systems although the methods can be applied to terrestrial systems. Chapters discuss fundamental concepts and definitions as well as the fate and effects of toxicants at various levels of ecological organizations.

Norberg-King T, Ausley LW, Burton DT, et al (eds.) (2005)
Toxicity Reduction and Toxicity Identification Evaluations for Effluents, Ambient Waters, and Other Aqueous Media
Pensacola, FL: SETAC Press.

A Pellston Workshop discussing updates and advances in understanding the toxicity reduction evaluations (TRE) process and the science of toxicity identification evaluations (TIE) in aqueous effluents, surface water, and sediments. Serves as a comprehensive guide, including over 30 case studies, to document various aspects of the TRE process with specific attention directed to TIE procedures as they relate to the control of aqueous discharges and aquatic life toxicity under the 1977 Clean Water Act.

Nriagu JO (ed.) (1983)
Aquatic Toxicology
New York: Wiley.

Volume 13 in the series *Advances in Environmental Science and Technology.* This volume deals with the toxicity of many inorganic and organic contaminants to aquatic biota. Assesses the response at community, species, tissue, cellular, and subcellular levels to particular toxicants and covers the mechanisms of uptake, metabolism, and excretion of many pollutants. Methodology used in aquatic toxicology is also discussed.

Nriagu JO, Lakshminarayana JSS (eds.) (1989)
Aquatic Toxicology and Water Quality Management
New York: Wiley.

Volume 22 in the series *Advances in Environmental Science and Technology.* A toxicological survey of important aquatic pollutants that evaluates new concepts, methods, and data, and provides an overview of key research results. Topics ranging from principles of aquatic toxicology and the development of water quality guidelines for the protection of aquatic resources to the environmental effects of monitoring and future trends in water quality management are included. Important linkages for practical and effective environmental effects assessment between aquatic and terrestrial ecosystems are noted.

Ostrander G (ed.) (2005)
Techniques in Aquatic Toxicology, Volume 2
Boca Raton, FL: CRC Press.

Designed to assist research scientists and technicians in testing for everything from DNA damage to bioaccumulation of common toxins to assays of fish embryos and tissues. This second volume includes an update of approximately five techniques from the first volume (1996) and the addition of about 24 new techniques. The blend of established and recently developed techniques is detailed in sections covering the assessment of toxicity in whole organisms and at the cellular and subcellular levels, as well as contaminant identification, impacts in aquatic ecosystems, and general techniques. Each chapter covers a particular method or procedure, including a brief introduction, a materials section, a procedures section, results, and discussion. The chapters are designed to allow flexibility in modifying or adapting a technique for particular needs.

Paquin PR (2003)
Metals in Aquatic Systems: A Review of Exposure, Bioaccumulation, and Toxicity Models
Pensacola, FL: SETAC Press.

Reviews the literature and existing models for aquatic risk assessments of metal with descriptions of the utility, applicability, strengths and weaknesses, and recommendations for improvement. Model categories include fate and transport, chemical equilibrium, and bioaccumulation and toxicity.

Ramamoorthy S, Baddaloo SR (1995)
Handbook of Chemical Toxicity Profiles of Biological Species, Volume 1 – Aquatic Species
Boca Raton, FL: CRC Press.

Offers toxicity profiles on aquatic species. Data are arranged in decreasing order of toxicity for aquatic species such as amphibians, algae, bacteria, crustaceans, fish, insects, mollusks, and protozoa.

Rand GM (ed.) (1995)
Fundamentals of Aquatic Toxicology: Effects, Environmental Fate and Risk Assessment, 2nd edition
Washington, DC: Taylor & Francis.

A comprehensive source of information in aquatic toxicology for graduate students and practitioners. Addresses current testing procedures, data evaluation and interpretation, chemical fate in aquatic environments, structure–activity relationships, environmental legislation, and risk assessment. The 3rd edition of this book was scheduled for release in 2008.

Rao SS (ed.) (1999)
Impact Assessment of Hazardous Aquatic Contaminants
Boca Raton, FL: Lewis.

Characterizes complex toxicants and the resulting harmful effects on the cellular and subcellular levels in aquatic biota. Current information on contamination from industrial activity and remediation of

marine life as well as strategies and solutions for aquatic life management are presented to address global environmental issues.

Suter GW, II (ed.) (2006)
Ecological Risk Assessment, 2nd edition
Boca Raton, FL: Lewis.

Examines the risks of chemicals and mixtures to aquatic systems and characterizes chemical contaminants and other stressors in the application of ecological risk assessment. It contains a description of advances in science and practice of ecological risk assessment since 1992 and emphasizes risk assessments that predict the effects of new chemicals and effluents relative to those that describe the extent, magnitude, and causation of effects that began in the past.

Svensson EP (ed.) (2008)
Aquatic Toxicology Research Focus
New York: Nova Science.

Aquatic toxicology is the study of the effects of manufactured chemicals and other anthropogenic and natural materials and activities on aquatic organisms at various levels of organization, from subcellular through individual organisms to communities and ecosystems. This book presents the latest research in this field from around the globe including topics such as oxidative stress, metal toxicity, microbial and chemical assays, pesticides, environmental variation, *Legionella* spp. and *Pseudomonas* spp., and aquatic environments. Release of this book was scheduled for May, 2008.

Taylor EW (ed.) (1996)
Toxicology of Aquatic Pollution: Physiological, Cellular and Molecular Approaches
New York: Cambridge University Press.

Discusses the mechanisms of toxicity of aluminum, other metals, and aromatic hydrocarbons at low to sublethal levels. New approaches to pollution monitoring are considered, including large-scale models for the exchange of xenobiotics between fish and their environment and the alternative use of sensitive cellular and molecular markers of pollution.

Tessier A, Turner D (eds.) (1995)
Metal Speciation and Bioavailability in Aquatic Systems
England: Wiley.

A comprehensive review of the fundamental concepts and models, speciation measurements and field applications in metal speciation and bioavailability in aquatic environments that includes current developments regarding the interactions between trace metals and aquatic organisms. Laboratory bioassays are reviewed to thoroughly examine their use and limitations as predictive tools and as the basis for management decisions. The interdisciplinary nature of this topic ensures that this volume is invaluable for chemists, biochemists, biologists, ecologists, and environmental engineers involved in the fields of metal ecotoxicology, metal speciation, environmental and analytical chemistry, and the management of trace metals in aquatic systems.

Vos JG, Bossart G, Fournier M, et al (eds.) (2003)
Toxicology of Marine Mammals (New Perspectives: Toxicology and the Environment)
New York: Taylor and Francis.

Provides an overview of the effects of natural and anthropogenic toxicants on marine mammal organs and systems and contains the health status and contamination of various species including whales, pinnipeds, dolphins, polar bears, manatees, and sea otters. Case studies and future perspectives add to the comprehensive collection.

Wangersky PJ (ed.) (2000)
Marine Chemistry (Handbook of Environmental Chemistry)
Germany: Springer.

Focuses on recent topics including carbon dioxide absorption and gas exchange at the sea surface, photochemistry of marine aerosols, biomarkers in marine ecosystems, and the oceanic carbon cycle to provide an understanding of the global ecosystem between animals and environmental stress.

Weber LJ (ed.) (1982 and 1984)
Aquatic Toxicology, Volumes 1 and 2
New York: Raven Press.

Presents a concise description of some of the core biology needed to begin to use fish as models for toxicity testing. Proceeding from general to specific, emphasis on routes of administration, and exposure to toxins of concern in the environment are the main themes. Major physiological systems (cardiovascular, hepatic, respiratory, and nervous) are described as well as procedures to monitor wellbeing following exposure to various agents. A particularly useful chapter describes the potential for identification of carcinogens in fish.

Wells PG, Lee K, Blaise C (eds.) (1997)
Microscale Testing in Aquatic Toxicology: Advances, Techniques, and Practice
Boca Raton, FL: CRC Press.
Contains over 40 chapters on bioassay techniques and applications useful for aquatic hazard assessment and environmental quality monitoring and testing.

Wood EM (1987)
The Toxicity of 3400 Chemicals to Fish
Washington, DC: EPA/Office of Toxic Substances (OTS).

Presents results of an investigation undertaken to locate chemicals which would cause acute toxicity to fish at extremely low concentrations. These findings are intended to allow prioritization of testing/research needs in the area.

U.S. EPA Office of Water

The EPA publishes numerous documents related to water, including *Drinking Water Criteria, Drinking Water Health Advisories, Ambient Water Quality Criteria*, and *Water Quality Standards.* These are generally available online (http://www.epa.gov/ow) or from the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161. The publications catalog of EPA's Office of Water is on the Web at http://yosemite.epa.gov/water/owrccatalog.nsf. A browsable version of EPA's *Drinking Water Regulations* and *Health Advisories* is also available at http://www.epa.gov/waterscience/.

Journals

Aquaculture (1972–)
Amsterdam, the Netherlands: Elsevier.
Web: http://www.sciencedirect.com/science/journal/00448486

A collection of international research evaluating aquatic food resources and the improvement and management of these resources. Environments include freshwater, brackish, and marine waters that are related directly or indirectly to human consumption.

Aquatic Conservation: Marine and Freshwater Ecosystems (1991–)
England: Wiley.

Articles focus on freshwater, brackish, or marine habitats and conserving aquatic biological resources. Emphasizes cooperation to efficiently solve problems with conservation of aquatic resources.

Aquatic Sciences (1920–)
Switzerland: Springer.

Articles include reviews of the boundaries and impact of human activities on aquatic systems utilizing a range of approaches from the molecular level to whole ecosystems. Topics include geological, microbial, biological, chemical, physical, hydrological, and societal processes and interactions as well as interactions between water and land, air, and sediment.

Aquatic Toxicology (1981–)
The Netherlands: Elsevier.

Consists of scientific articles on effects induced by toxic agents on multiple levels (communities, species, tissue, cellular, and subcellular levels) within aquatic environments. Mechanisms of toxicity and aspects of uptake, metabolism, and excretion of toxicants are explored in an attempt at understanding effects of toxic substances on aquatic ecosystems as exhibited in biochemical and physiological reactions resulting in organisms exposed to toxicants. The development of procedures and techniques that significantly advance the understanding of processes and events that produce toxic effects and the human health aspects of aquatic toxicology are also covered.

Hydrobiologia (1958–)
Netherlands: Springer.
Web: http://springerlink.metapress.com/content/1573-5117/

Publishes articles of research, and reviews and opinions concerning the biology of all aquatic environments. Hypothesis-driven studies in aquatic ecology, limnology, oceanography, and systematics that provide information at the molecular, organism, community, and ecosystem level are includes as well as descriptive, theoretical papers are accepted.

Journal of Aquatic Animal Health (1989–)
Maryland: American Fisheries Society (AFS).
Web: http://afs.allenpress.com

Contains articles concerned with the health of aquatic organisms serving scientists and culturists on an international level. Topics include the causes, effects, treatments, and prevention of diseases of marine and freshwater organisms, particularly fish and shellfish. Additionally, biochemical and physiological aspects of fish health are described and environmental and pathogenic impacts are assessed.

Journal of Aquatic Ecosystem Health and Management Society (AEHMS) (1998–)
Philadelphia, PA: Taylor and Francis.
Web: http://www.aehms.org/journal.html

Includes articles that focus on the health of freshwater, marine, and estuarine ecosystems promoting comprehension of ecosystem functioning and impact of anthropogenic stress with an international and multidisciplinary approach to conservation of global aquatic ecosystems.

Marine Environmental Research (1978–)
Amsterdam, the Netherlands: Elsevier.
Web: http://www.sciencedirect.com/science/journal/01411136

Serves as a forum for information on biology, chemistry, and toxicology of chemical contaminants in marine environments with emphasis on understanding of the environmental processes. Focuses on articles on chemical, physical, and biological interactions in oceans and coastal waters. Evaluation of the roles of anthropogenic and natural causes of change in marine ecosystems as well as theoretical or conceptual developments in marine science are topics of interest.

Water, Air, and Soil Pollution (1971–)
The Netherlands: Springer.
Web: http://springerlink.metapress.com/content/1573-2932/

Includes articles that cover an interdisciplinary approach to all aspects of pollution and solutions to pollution in the biosphere. Aquatic topics include marine pollution and groundwater, waste water, pesticides, and sediment pollution. The effects of pollutants on humans, vegetation, fish, and aquatic species and the ecological implications are explored.

Water Environment Research (1928–)
Virginia Water Environment Federation.
Web: http://www.ingentaconnect.com/content/wef/wer

Includes articles on water quality assessment and point and non-point source pollution monitoring, water conservation and reuse, aquatic sediments and sediment/water interactions, modeling and simulation of environmental multimedia processes and systems. Additionally, drinking water and wastewater treatment with topics covering residuals and biosolids management, odors, and gaseous emissions are included.

Water Research (1967–)
Amsterdam, the Netherlands: Elsevier.

Concerned with science and technology of water quality and water quality management throughout the world. Topics include water quality standards and analyses, chemical, physical, and biological methods of monitoring water quality, and studies on inland, tidal or coastal waters, urban waters, including surface and ground waters and point and non-point sources of pollution. Analysis of sediments and water and the interactions between water and the atmosphere along with mathematical and modeling techniques are included. The journal also addressed public health and risk assessment.

Organizations

American Water Works Association (AWWA)
6666 West Quincy Avenue
Denver, Colorado 80235
Phone: 303-794-7711 or 800-926-7337
Fax: 303-347-0804
E-mail: see web site for contact page
Web: http://www.awwa.org

An educational and scientific society that is dedicated to improving water quality and supply. The association has become an international authoritative source on water quality and is concerned with improving the supply and quality of water as it relates to public health.

Aquatic Ecosystem Health and Management Society (AEHMS)
P.O. Box 85388
Brant Plaza, Postal Outlet
Burlington, Ontario
Canada
L7R 4K5
Fax: 905-634-3516
E-mail: munawarm@dfo-mpo.gc.ca
Web: http://www.aehms.org

The society focuses on international cooperation and communication of aquatic ecosystem health and promotes the protection, conservation, and sustainable management of global aquatic resources. Encourages understanding and management of aquatic ecosystems from an integrative, multidisciplinary, multitrophic perspective.

Society of Environmental Toxicology and Chemistry (SETAC)
1010 North 12th Avenue
Pensacola, Florida 32501-3367
USA
Phone: 850-469-1500
Fax: 850-469-9778
E-mail: setac@setac.org
Web: http://www.setac.org

Provides a forum for the study of environmental issues, management and conservation of natural resources, education, and research in the environmental field. Fields of study include anatomy and physiology, biology, environmental chemistry, soil sciences and engineering, atmospheric sciences and engineering, ecology, economics, classical toxicology, and genetics.

Databases

ASFA (Aquatic Sciences and Fisheries Abstracts)
Aquatic Sciences and Fisheries Information System (ASFIS), Food and Agriculture
Organization of the United Nations (FAO)
Web: http://www.fao.org/figis/servlet/static?dom=org&xml=asfa_prog.xml

The result of cooperative efforts in monitoring over 5000 serial publications, books, reports, conference proceedings, translations and limited distribution literature. As of June, 2006, the database contained over 1 million bibliographic references (or records) to the world's aquatic science literature accessioned since 1971; with monthly updates adding approximately 3700 new records. The database encompasses topics such as aquaculture, aquatic organisms, aquatic pollution, environmental quality, freshwater and marine environments, conservation, marine biotechnology, policy and legislation, meteorology, and oceanography. Access to the ASFA Bibliographic Database is available through subscription from CSA or from one of the CSA licensed providers (NISC, DIALOG, STN International (online)).

EAT (ECETOC Aquatic Toxicity)
European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC)
Web: http://www.eat-database.com

Information on the toxicity of substances to fresh and marine water species is maintained in the database which contains over 5450 entries that comprehensively covers ecotoxicity data for approximately 600 chemicals. The data included are comprised of highly reliable scientific information published from 1970 to 2000.

ECOSAR (Ecological Structure Activity Relationships)
U.S. Environmental Protection Agency (EPA)
Web: http://www.epa.gov/opptintr/newchems/tools/21ecosar.htm

A software program that predicts the toxicity of industrial chemicals that are discharged into water. This personal computer program uses structure activity relationships (SARs) to estimate the toxicity of these chemicals to aquatic organisms such as fish, invertebrates, and algae.

ECOTOX (Ecotoxicology)
U.S. Environmental Protection Agency (EPA)
Web: http://cfpub.epa.gov/ecotox/

Unique integration of three databases to provide single chemical toxicity information. The three, previously independent, databases: AQUIRE (Aquatic Information Retrieval), PHYTOTOX (Plant Toxicity), and TERRETOX (Terrestrial Toxicity Database), contain toxicity data from peer-reviewed literature for aquatic life, terrestrial plants, and terrestrial wildlife, respectively.

Other Resources

American Society for Testing and Materials (ASTM) (1989)
Aquatic Toxicology and Hazard Assessment, 12th edition (Special Technical Publication 1027)
Philadelphia, PA: ASTM Press.

A serial publication that is published annually and contains papers from the Symposium on Aquatic Toxicology and Hazard Assessment, sponsored by ASTM Committee E-47 on Biological Effects and Environmental Fate and its Subcommittee E47.01 on Aquatic Toxicology. This edition contains 34 papers that debate the merits of test development, animal and plant culture, nutrition and testing, and the lack of interagency harmony. The various topics include: field techniques, interpretation of microcosm data, quality assurance in ecotoxicity testing, sediment toxicity testing, culturing and testing of new organisms, nutrition and testing, target toxicant analysis, review of common modes of toxic action, and benefits of interagency harmonization of methodology.

American Society for Testing and Materials (ASTM) (1990)
Aquatic Toxicology and Risk Assessment, Volume 14 (Special Technical Publication 1124)
Philadelphia, PA: ASTM Press.

A serial publication that is published annually and contains papers from the Symposium on Aquatic Toxicology and Risk Assessment, sponsored by ASTM Committee E-47 on Biological Effects and Environmental Fate and its Subcommittee E47.01 on Aquatic Toxicology. This volume encompasses evolving concepts and perspectives in aquatic toxicology and hazard assessment with topics such as organ system toxicology and biomarkers, risk assessment and complex mixtures, sediment toxicity assessment, toxicant reduction strategies, bioconcentration, toxicity evaluation, carcinogenesis, and the Animal Welfare Act.

Aquatic Sciences and Fisheries Abstracts (ASFA) Series, Food and Agriculture Organization of the United Nations (FAO)
Aquatic Pollution and Environmental Quality *(ASFA 3)*
CSA (Supplier)
7200 Wisconsin Avenue
Bethesda, Maryland 20814
USA
Phone: 800-843-7751 (US); 301-961-6700 (outside US)
Fax: 301-961-6720
E-mail: sales@csa.com

A biweekly abstracts journal that focuses on the increasing global concern over the consequences of marine and aquatic pollution and is devoted exclusively to research and policy on the contamination of oceans, seas, lakes, rivers, and estuaries. ASFA 3 contains information collected since 1990 on aquatic pollution, prevention and control, effects on organisms, characteristics, behavior, and fate, and environmental quality that will benefit those who are interested in aquatic environments and marine pollution problems. As of May, 2006, over 139 000 references have been recorded and monthly updates are comprised on approximately 588 new records.

Aquatic Toxicity Workshop (ATW) (1974–)
Web: http://www.atw.ca

An annual workshop organized and supported by volunteer scientists across Canada to discuss current and emerging issue with open dialogue between the researchers and the regulating agencies. The workshops have focused on fish and invertebrate toxicity tests as well as chemical, physical and biological effects on aquatic ecosystems. Additionally, protective, proactive measures are proposed and discussed. The 34th annual Workshop will be held in 2007, covering topics such as development of bioassays, endocrine disruption, aquaculture, persistent contaminants, amphibian decline, effects of agriculture/pesticides, and mining of metals and diamonds as well as newer topics covering the genomics, proteomics, and metabolomics and climate change in aquatic toxicology.

U.S. Environmental Protection Agency (EPA) (2005)
Fish Physiology, Toxicology, and Water Quality: Proceedings of the Eighth International Symposium
Web: http://www.epa.gov/athens/publications/reports/EPA600R06062_8thFishSymposiumFinal.pdf

The meeting focused on hypoxia and vertebrates and comparing terrestrial to aquatic vertebrates. Includes 13 papers that discuss the fish, reptilian, and mammalian responses to hypoxia at the behavioral, physiological, and molecular levels.

CHAPTER

24

Environmental Toxicology: Air[1]

ASISH MOHAPATRA, DIETER SCHWALA, AND PERTTI J. HAKKINEN

INTRODUCTION

The study of air toxicology on human health and ecosystems is an integrated approach. It involves analysis of the complex dynamics of indoor and outdoor air quality, emission of pollutants and their dispersion and chemical transformation, exposure of populations in indoor and outdoor environments, health and environmental impacts as a consequence of exposure, source control measures, policy decisions (e.g., on acceptable magnitudes of emissions of chemicals of interest from various materials and products) related to indoor and outdoor air quality standards, economic incentives for consumers and polluters, and multistakeholder participation, collaboration, and sharing of information. Websites provide access to information on air toxicology, indoor and outdoor air quality, and the Internet provides opportunities for exchange and sharing of information. The information resources below are organized under 'Ambient air' and 'Indoor air' subsections covering the realm of air toxicology. Further, information resources under each subsection are listed under Books, Journals, Journal articles, Organizations and Web portals, and Databases. Additional information resources from government and non-governmental global agencies are also provided below.

RESOURCES

Books

Ambient Air

Jon Ayres, Robert L. Maynard, Roy Richards (2006)
Air Pollution and Health
Hardcover: 264 pages
Publisher: World Scientific Publishing Company
1st edition (September 15, 2006)
ISBN-10: 1860941915
ISBN-13: 978-1860941917

This comprehensive book covers a wide range of topics of interest to physicians, immunologists, toxicologists, public health advocates, and epidemiologists, including extensive references to the current literature on human response to air pollution.

Bell JNB, Treshow M (eds.) (2002)
Air Pollution and Plant Life (Hardcover)
Wiley, 2nd edition (June 15, 2002)

This book has a comprehensive overview of the impacts of air pollution on plant life. A group of international experts has written chapters that cover the main historical aspects and sources of pollutants, atmospheric transport and transformations of pollutants, and issues of global change and the use of science in air pollution policy formulation. Further, it covers the main phytotoxic pollutants, emphasizing their impacts ranging from the molecular to ecological levels of plant organization. Furthermore, the book also emphasizes the effects of air pollutants in altering plant response to both abiotic and biotic stressors.

Godish T (2004)
Air Quality, 4th edition
Hardcover: 480 pages
Publisher: CRC Press
ISBN-10: 156670586X
ISBN-13: 978-1566705868

The 4th edition of this book provides a comprehensive overview of air quality issues and atmospheric chemistry, the effects of pollution on public health and the environment, and the technology and regulatory practices used to achieve air quality goals. It includes new information related to toxicological principles and risk assessment, the health effects of particulate air pollutants, and a revised discussion on public policy concerns with a focus on air quality standards for ozone depletion and global warming.

Ness S (2007)
Air Monitoring for Toxic Exposures: An Integrated Approach. 2nd edition
John Wiley & Sons Inc.
Hardcover, 640 Pages

This book explores and evaluates potentially harmful exposures of people to hazardous chemicals such as radon, and biologicals such as bioaerosols. It provides practical information on how to perform air sampling, collect biological and bulk samples, evaluate dermal exposures, and determine the advantages and limitations of methodologies.

Omasa K, Isamu Nouchi, Luit J De Kok (eds.) (2006)
Plant Responses to Air Pollution and Global Change (Hardcover)
Springer: 1st edition

This book covers emerging topics on the plant metabolism of air pollutants and elevated carbon dioxide, responses of whole plants and plant ecosystems, genetics and molecular biology for the improvement of function, experimental ecosystems and climate change research, global carbon-cycle monitoring in plant ecosystems, and other important issues. The authors are researchers from Europe, the United States, Australia, and East Asia.

Seinfeld JH, Pandis SN (2006)
Atmospheric Chemistry and Physics from Air Pollution to Climate Change
Paperback: 1232 pages
Publisher: Wiley-Interscience: 2nd edition (August 11, 2006)
ISBN-10: 0471720186
ISBN-13: 978-0471720188

This book has been a premier text in the field of chemistry of the atmosphere covering important topics such as chemistry of the stratosphere and troposphere; formation, growth, dynamics, and properties of aerosols; meteorology of air pollution; transport, diffusion, and removal of species in the atmosphere; formation and chemistry of clouds; interaction of atmospheric chemistry and climate; radiative and climatic effects of gases and particles; and formulation of mathematical chemical/transport models of the atmosphere. The three new chapters in this edition are on atmospheric radiation and photochemistry; general circulation of the atmosphere; and global cycles. Several chapters such as stratospheric chemistry, tropospheric chemistry, and organic atmospheric aerosols have been updated based on the latest research findings.

USEPA (2007)
Air Toxic Program on Toxic Air Pollutants, Risk Assessments, Releases, Health Risks, Evaluating Exposures, Carcinogenic Risk (CD-ROM)
33 914 Pages
Progressive Management

This e-book provides a comprehensive guide to U.S. Environmental Protection Agency (EPA) regulation of toxic air contaminants. Toxic air contaminants, also known as hazardous air pollutants (HAPs), are those pollutants that are known or suspected to cause cancer or non-cancer health effects, such as reproductive effects or birth defects, or adverse environmental effects. EPA has been working with state, local, and tribal governments to reduce air toxics releases of 188 pollutants to the environment.

Indoor air

Baker SR, Driver J McCallum D (eds) (2001)
Residential Exposure Assessment: A Sourcebook (Hardcover)
New York: Kluwer Academic/Plenum Publishers.
Hardcover: 394 pages
ISBN: 0306465175

This book, initiated by the Society of Risk Analysis (SRA) and the International Society of Exposure Science (formerly the International Society of Exposure Analysis), is a compendium of information written by residential exposure experts about predictive methods and tools, monitoring methods, data sources, and key variables that characterize chemical, biological agent, and physical agent exposures in and around all types of residences (apartments, single-family homes, condominiums, farmhouses, mobile homes, row houses, retirement homes, and school dormitories). Residential exposure assessments are used to check indoor air quality, compliance with U.S. and other statutes, and as part of the evaluation of consumer product safety.

Bardana EJ (ed.) (1997)
Indoor Air Pollution and Health
(Clinical Allergy and Immunology Series Vol.9)
New York: Marcel Dekker.
Hardcover: 528 pages
Informa Healthcare: 1st edition

This book integrates health and building science, and presents a variety of viewpoints from diverse disciplines, including allergy, toxicology, oncology, environmental science, building engineering, and law. The book investigates various sources that affect air quality such as biologic agents, pesticides, tobacco smoke, solvents, combustion products, volatile organic compounds, indoor allergens, and radon.

Burge H (1995)
Bioaerosols
Boca Raton, FL: Lewis.

This book is a synthesis of the information available on air pollution research, and is a valuable resource that brings together important aspects of the relationship between humans and biological contaminants in indoor air. The 13 chapters provide essential information on the effects of air quality on the many organisms coexisting in our indoor and outdoor atmospheres.

Cox CS, Wather CM (1995)
Bioaerosols Handbook
Boca Raton, FL: Lewis.

This book provides up-to-date detailed descriptions, comparisons, and calibration methods for bioaerosol samplers, together with appropriate sampling methodologies and analytical procedures. Physical and biological properties are considered from both practical and theoretical viewpoints. The main parts deal with principles of sampling, calibration techniques, analysis, and examples from the experiences of current practitioners.

Gammage RB, Berven BA (eds.) (1996)
Indoor Air and Human Health, 2nd edition
Boca Raton, FL: Lewis.

This book covers areas such as chemical sensitivity, behavioral effects, upper airway irritants, allergic reactions and infections, bioaerosols, human and animal models, and risk assessment.

Penney David G (2007)
Carbon Monoxide Poisoning
Informa Health Care Publishers
Hardcover: 808 pages
Publisher: Informa Healthcare: 1st edition (November 1, 2007)

This book explores new information on CO toxicity, including rehabilitation, the dissemination of information to the public, litigation involving CO poisoning, economic loss assessment, and firefighting. Further, it emphasizes topics related to successful means to prevent, identify, and manage the effects of CO poisoning. Furthermore, detailed information on the risk of CO poisoning from kitchen ranges, recreational vehicles, and powerboats is provided. Other topics include diagnostic procedures and devices, and the pros and cons of hyperbaric oxygen therapy. It reviews the physiological effects of acute and long-term exposure to CO, as well as the neurocognitive and neurobehavioral sequelae.

Shih-Houng Young (2007)
Toxicology of 1-3-Beta-Glucans: Glucans as a Marker for Fungal Exposure (Digital-Kindle Edition)
File Size: 5963 KB
Print Length: 232 pages
Publisher: Taylor & Francis: 1st edition

This digital edition covers the basic chemistry and immunobiology of beta glucans. The book introduces current methods for detecting 1-3-beta-glucans in environmental samples and reviews risk evaluation in the environment. Further, it discusses evaluating occupational and environmental exposure, studies suggesting a strong link between environmental glucan concentrations and pulmonary inflammation, and signal transduction pathways and specific receptors.

Spengler JD, John F McCarthy, Jonathan M Samet (eds.) (2000)
Indoor Air Quality Handbook
McGraw-Hill Professional: 1st edition

This handbook has chapters from world experts on how to create and maintain safe and healthy indoor environments in schools, hospitals, sports facilities, office buildings, apartments, homes, and transportation vehicles. Further, the handbook answers a range of questions such as health and comfort effects, physiologic thresholds, ventilation measurement, and employee programs. Further, extensive information on indoor environmental instrumentation, contaminants, codes, and guidelines for assessment and the design of indoor environments have been provided. In addition, information on evaluation of indoor air quality complaints, assessment methods, and risk management and communication strategies are provided. Sick building investigations, indoor concentration data for biologicals (e.g., molds, pollens, and other allergens) chemical contaminants (e.g., VOCs), particles and fibers (e.g., asbestos) has been extensively researched in this book. Other critical information and issues such as health and productivity costs of poor IAQ filtration, air cleaning, and American

Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) standards are described.

(U.S.) Institute of Medicine (2000)
Clearing the Air: Asthma and Indoor Air Exposures
National Academy of Publishers

This publication includes 11 chapters correlating pathophysiology with the incidence of asthma in indoor environments, and recommendations are provided on how to manage asthma by improving indoor air quality.

(U.S.) National Research Council (2000–2007)
Subcommittee on Acute Exposure Guideline Levels, Committee on Toxicology
Acute Exposure Guideline Levels for Selected Airborne Chemicals
Volumes 1–5

These reports review documents on acute exposure guideline levels (AEGLs) for selected airborne chemicals developed by the National Advisory Committee on Acute Exposure Guideline Levels for Hazardous Chemicals (NAC).

(U.S.) Institute of Medicine (2004)
Committee on Damp Indoor Spaces and Health
Damp Indoor Spaces and Health
National Academy of Publishers

This book covers the health impact of exposures resulting from damp indoor environments, and offers recommendations for public health intervention. Further, it examines the relationship between damp or moldy indoor environments and adverse health outcomes, and discusses how and where buildings get wet, how dampness influences microbial growth and chemical emissions, and various ways to prevent and remediate dampness. The review of the literature finds sufficient evidence of an association between damp indoor environments and some upper respiratory tract symptoms, coughing, wheezing, and asthma symptoms in sensitized persons.

Sample chapters include:
Burge H
Biological Agents
Driver J, Connor J Jr, Guiseppi-Elie A, et al
General Framework for Assessing Potential Human Exposures to Chemical, Biological, and Physical Agents in the Residential Environment
Whitmyre G, Dang W, Driver J, et al
Consumer products and related sources
Eisenberg M (1998)
Risk Assessment and Indoor Air Quality
Boca Raton, FL: Lewis.

This book examines the problem of long-term exposure to low-level concentrations of toxins. In addition to commonly found toxins such as chemical fumes from furnishings and carpeting, and indoor use of pesticides, this book discusses risks associated with exposure to indoor allergens and infectious disease pathogens such as Legionnaires' disease.

Ambient Air

Air Quality, Atmosphere and Health
Print 1873-9318, Electronic 1873-9326
Contact: Joan Robinson
Phone: +49-6221-4878130 (Germany)
Publication: Since February 2008

This multidisciplinary journal focuses on the atmospheric consequences of human activity and its implications for human and ecological health. It primarily publishes original research articles and integrative reviews offering local, regional and global perspectives. The subject areas include climate change and air quality, greenhouse gases, acid precipitation, air quality management, risk assessment, atmospheric chemistry, air pollution climatology, clean air technology, and forest-fire emissions.

Atmospheric Environment
Editors-in-Chief: P. Brimblecombe, H.B. Singh
ISSN: 1352-2310
Publisher: Elsevier
Year of publication: since 1967

This journal covers air pollution research and its applications, with the main objective of providing a scientific understanding of the consequences of natural and human-induced disturbances of the earth's atmosphere. It publishes original results based on experiments, theory and modeling of the atmosphere, from the scale of buildings and streets to the global scale. Areas of importance include air pollution research and its applications, air quality and its effects, dispersion and transport, deposition, biospheric–atmospheric exchange, atmospheric chemistry, and induced changes in radiation and climate. It also includes review articles, special issues and supplements, and new directions on emerging issues columns.

Clean Air: International Journal for a Clean Environment
Editor-in-Chief: Maria da Graca Carvalho
ISSN: 15614417
Publisher: Begell House

This journal covers new and innovative technologies which maximize energy conversion while minimizing undesirable emissions. The main objectives are to promote integrated energy solutions for a better environment, contribute to a sustainable energy economy, provide a framework for the discussion of change in worldwide energy systems, and to promote the dissemination of new energy technologies appropriate to developing countries within the global market.

Global Change Biology
Editor: Steve Long
Print ISSN: 1354-1013
Online ISSN: 1365-2486
Frequency: Monthly
Current Volume: 14/2008

This journal promotes understanding of the relationships between current environmental change and biological systems. The topics include rising tropospheric ozone and carbon dioxide concentrations, climate change, loss of biodiversity, and eutrophication. Both biological responses and feedbacks to change are included, and may be considered at any level of organization from molecular to biome. It focuses on primary research articles, but also includes technical papers, mini-reviews, and opinion articles. Studies which integrate across levels of organization to provide a mechanistic understanding are particularly encouraged. Studies may be experimental, observational, or theoretical, and include aquatic or terrestrial and managed or natural environments.

Phone: +1-412-904-6009 (direct)
or +1-412-232-3444, ext. 6009
Email: aknopes@awma.org

This is one of the oldest published, peer-reviewed, technical journals in the world, first published in 1951 under the name *Air Repair*. The target audience includes those occupationally involved in air pollution control and waste management.

Water, Air, and Soil Pollution
Editor-in-Chief: Jack T. Trevors
ISSN: 0049-6979 (print version)
ISSN: 1573-2932 (electronic version)
Publisher: the Netherlands: Springer.

This journal covers all aspects of pollution and solutions to pollution in the biosphere. Topics include chemical, physical and biological processes affecting flora, fauna, water, air and soil. In addition to aquatic pollution and waste, sewage and sediment pollution, it covers sources, transport, deposition, accumulation, acid precipitation, atmospheric pollution, effects of pollutants on humans, vegetation, fish, aquatic species, micro-organisms, animals, ecological implications of pollution and pollution models. The journal has a special section on 'Meteorology & atmospheric sciences.'

Indoor Air
Publisher: Blackwell Munksgaard.
Homepage: http://www.blackwell-synergy.com/rd.asp?goto=journal&code=INA
First published year: 1991

This journal publishes original research results in the broad area defined by the indoor environment of non-industrial buildings. The multidisciplinary content includes indoor air-related fields such as health effects, thermal comfort, monitoring and modeling, source characterization, ventilation, and other environmental control techniques. The research results from those papers can be used by designers, building owners, and operators for a healthy and comfortable environment for building occupants, as well as giving medical practitioners information on how to deal with illnesses related to the indoor environment.

Indoor and Built Environment
Publisher: SAGE Publications Ltd
Homepage: http://ibe.sagepub.com/
First published year: 1992

This journal publishes reports related to the quality of the indoor and built environment, and their effect on the health, performance, efficiency and comfort of persons living or working there. Topics range from urban infrastructure, design of buildings, and materials used to laboratory studies including animal simulations and in vitro effects. The journal is available electronically on SAGE Journals Online at http://ibe.sagepub.com.

Organizations

Numerous governmental and non-governmental organizations offer access to air (indoor and outdoor) toxicology information resources. Particularly noteworthy are sites from the United Nations (UN) technical agencies such as the World Health Organization (WHO), the United Nations Environment Programme (UNEP), the World Bank and other development banks such as the Asian Development Bank (ADB), Clean Air Initiatives, European Union (EU), the European Environmental Agency (EEA), the United States Environmental Protection Agency (U.S. EPA) and the (U.S.) National Library of Medicine, and Stockholm Environment Institute (SEI). The World Health Organization (WHO), U.S. EPA and SEI websites offer information on emission inventories and emission factors; the U.S. EPA addresses dispersion modelling, and WHO offers extensive web sites on the

health impacts of indoor and outdoor air pollutants. Also noteworthy is the site from the German Association for Technical Co-operation (GTZ). Various organizations also provide opportunities for training, e.g. web sites offering training in air quality include UNEP, the U.S. EPA, the GTZ and SEI.

Air Pollution Training Institute (APTI), U.S. EPA

U.S. EPA's APTI primarily provides technical air pollution training to U.S. air pollution professionals and others. The curriculum is available in classroom, telecourse, self-instruction, and web-based formats. The training topics include all aspects of air quality management and toxicology. Recently introduced topics are training courses on the chain of custody, environmental statistics, and emission inventories. The course entitled 'Preparation of Fine Particulate Emission Inventories' provides a Student Manual and a Workbook on the web. The APTI home page is http://www.epa.gov/air/oaqps/eog/index.html.

Air Quality Guidelines

The first globally applicable guidelines for air quality of WHO were published in 2000, giving guideline values for about 80 non-carcinogenic air pollutants and 50 carcinogenic ones. This document looks at the guidelines and guideline values in the framework of urban atmospheric toxicology and impact of climate change. The publication can be downloaded from http://whqlibdoc.who.int/hq/2000/WHO_SDE_OEH_00.02_pp1-104.pdf and http://whqlibdoc.who.int/hq/2000/WHO_SDE_OEH_00.02_pp105-190.pdf. The most recent global guideline values for the common compounds – particulate matter, sulphur dioxide, nitrogen dioxide, and ozone – were published in 2005 and can be downloaded from the WHO European Regional Office website http://www.euro.who.int/air/activities/20050222_2.

Air Quality Management (AQM) Online Portal, USEPA

USEPA's AQM Online Portal at http://www.epa.gov/air/aqmportal/resources.htm seeks to identify useful training resources within the USEPA as well as other good sources of information. Available tools and training materials include control strategies, emissions inventories, dispersion modelling, and concentration monitoring.

Basic Environmental Health (1998) – Text Book

Web: http://whqlibdoc.who.int/hq/1998/WHO_EHG_98.19_(chapters1-3).pdf
Web: http://whqlibdoc.who.int/hq/1998/WHO_EHG_98.19_ (chapters4-7).pdf
Web: http://whqlibdoc.who.int/hq/1998/WHO_EHG_98.19_(chapters8-12).pdf

CAI-Asia

In 2001, Asian Development Bank together with the World Bank and the U.S. Agency for International Development/U.S.-Asia Environmental Partnership established the **Clean Air Initiative for Asian Cities (CAI-Asia)** as a multi-sector network promoting measures to improve air quality in the region. The Clean Air Initiative for Asian Cities (CAI-Asia) promotes and demonstrates innovative ways to improve the air quality of Asian cities through partnerships and sharing experiences. CAI-Asia addresses and provides reports and presentations on monitoring; modelling; emissions inventories; impacts; transboundary air pollution; policies and instruments; mobile and stationary sources; area sources; indoor air pollution; and education and awareness.

CAI-Asia organises the biannual Better Air Quality (BAQ) Workshops. Information on BAQ 2008 can also be found at the CAI-Asia website http://www.cleanairnet.org/caiasia/1412/channel.html.

CAI-Asia makes available country and city synthesis reports (CSR), which provide overviews of urban air quality management in cities in Asia. The CSRs cover the status and drivers of urban air pollution, impacts of air pollution on health, environment and economy, the air quality management framework on the national and local (city) levels, and the challenges that face the cities and the countries in implementing and improving their existing AQM frameworks. CSRs can be accessed at http://www.cleanairnet.org/caiasia/1412/article-70822.html.

CAI-LAC

The **Clean Air Initiative in Latin American Cities (CAI-LAC)** was also launched in 1998. On its website http://www.cleanairnet.org/lac/1471/propertyname-1893.html CAI-LAC publishes information on emission inventories, air quality monitoring and modelling and health, environmental and economic impacts of air pollution on the urban, regional and global scales. CAI-LAC developed a strategy for clean air to be implemented between 2007 and 2012. The strategy can be found at http://www.cleanairnet.org/lac_en/1415/channel.html.

CAI-SSA

The **Clean Air Initiative in Sub-Saharan Africa (CAI-SSA)** was launched in 1998 as a response to an increase in **air quality problems** in the region. The first workshops organized by CAI-SSA served to initiate the phase-out of lead in gasoline in Africa. In 2006,

the Better Air Quality Workshop (BAQ SSA) was organized which aimed to discuss air quality management issues by bringing them to the forefront of decision makers to come up with practical solutions. In 2007, CAI-SSA published a review on air quality management in 27 SSA countries (Schwela, 2007). Information can be accessed at http://www.cleanairnet.org/ssa/1414/article-70809.html.

Clean Air Initiative

The **Clean Air Initiative (CAI)** advances innovative ways to improve air quality in cities by sharing knowledge and experiences through partnerships in selected regions of the world.
The specific objectives of the CAI are to:
Raise awareness of the dangers of urban air pollution;
Measure baseline vehicle emissions, air quality, pollution exposure and effects;
Identify the most cost-effective control options;
Design, implement, and monitor the impacts of Air Quality Action Plans to reduce pollution; and
Strengthen local expertise on air quality management.
In the various regions of the world, the Clean Air Initiative organizes conferences and workshops and publishes on the Web reports, presentations and case studies. The initiative is currently active in Asia, Latin America and Sub-Saharan Africa. General information on the CAI can be found at http://www.cleanairnet.org/cai/1403/article-33678.html.

Deutsche Gesellschaft fur Technische Zusammenarbeit (GTZ)

For over thirty years, GTZ's key tasks have included developing its partners' potential and capacities in supporting countries with respect to Air Quality Management and moderating the concomitant processes of learning and change. "Capacity Development – empowering partners, promoting potentials" is the slogan for holistic competency development, which GTZ regards as the key to sustainable development. The spotlight of GTZ's work in 2007 was phrased "Capacity Development". The work of GTZ for the environment is performed in five areas: **Environmental policy and institution-building, sustainable management of natural resources, preparation and implementation of international agreements on the environment, urban-industrial environmental management, regional, transnational environmental cooperation.** The website of GTZ is http://www.gtz.de/en/17870.htm.
A Sourcebook on Sustainable Urban Transport was developed in 2002 and is continuously updated. The sourcebook contains six modules which address institutional and policy orientation; land use planning and demand management; mass transit options, walking and cycling; vehicles and fuels; environmental and health impacts; and resources for policy makers. It can be downloaded after free-of-charge registration at the Sustainable Urban Transport Project (SUTP) website http://www.sutp.org/content/view/426//lang,uk/.

Emission Factors

How to build up an emissions inventory and emission factors for stationary and mobile sources particularly suited for developing countries can be found in a WHO publication on the rapid assessment of sources of air, water, and soil pollution. The name of the file is WHO_PEP_GETNET_93.1-A.pdf and it can be downloaded from http://whqlibdoc.who.int/hq/1993/.

Environmental Epidemiology – a Textbook on Study and Public Health Applications

Web: http://whqlibdoc.who.int/hq/1999/WHO_SDE_OEH_99.7_(chapter1-4).pdf
Web: http://whqlibdoc.who.int/hq/1999/WHO_SDE_OEH_99.7_(chapter5-7).pdf
Web: http://whqlibdoc.who.int/hq/1999/WHO_SDE_OEH_99.7_(chapter8-12).pdf

Environmental Health

WHO's publications on environmental health (and others) can be found at two complementary webpages:

- http://whqlibdoc.who.int/hq/YEAR/ where YEAR = 1990, . . . , 2005; and
- http://www.who.int/phe/en/

Some other relevant publications are listed below:
"A methodology for understanding and estimating air pollution health effects"
http://whqlibdoc.who.int/hq/1996/WHO_EHG_96.5.pdf
Methods for health impact assessment in environmental and occupational health
http://whqlibdoc.who.int/hq/1998/WHO_EHG_98.4.pdf.

European Centre for Ectoxicology and Toxicology of Chemicals (ECETOC) (1994)

ECETOC addresses the safe manufacture, supply and use of chemicals, biomaterials and pharmaceuticals. Its mission is to use scientific evidence and expert judgment to ensure robust human and environmental risk assessment of these agents in the various media including air. The main output of ECETOC's work programme is published in a range of peer-reviewed technical reports and documents, criteria documents and monographs. The ECETOC website is http://www.ecetoc.org/Content/Default.asp.

European Environmental Agency (EEA)

The EEA aims to support sustainable development and to help achieve significant and measurable improvement in Europe's environment through the provision of timely, targeted, relevant and reliable information to policy-making agents and the public. Recent Web publications of the EEA referring to Atmospheric toxicology and impact of climate change include the 'EMEP/CORINAIR Emission Inventory Guidebook – 2007', the 'Greenhouse gas emission trends and projections in Europe 2007', the report on 'Air pollution in Europe 1990-2004', and the 'Greenhouse gas emission trends' assessment which all can be downloaded from http://www.eea.europa.eu/themes/air.
The EEA has also published a multilingual environmental glossary with terms relevant for air quality management and toxicology, which can be accessed at http://glossary.eea.eu.int/EEAGlossary/.

European Federation of Allergy and Airways

EFA, 2004. Towards Healthy Air in Dwellings in Europe. The THADE Report. European Federation of Allergy and Airways Diseases Patients Association. 97 pp. http://www.efanet.org/activities/documents/THADEReport.pdf

European Union (EU)

European Commission (EC) legislation provides the basis for urban air quality management in EU Member States. A number of Directives addresses issues of air quality management, environmental impact assessment (EIA) of planned projects and strategic environmental assessment (SEA) of programmes and policies. The Framework Directive (96/62/EC) outlines the information to be included in national, regional and local plans to improve ambient air quality. While in Daughter Directives (1999/30/EC; 2000/69/EC; 2002/3/EC; 2004/107/EC) the EU sets air quality limits, the Member States are able to decide what are most appropriate means of achieving these standards within their country (Haq et al., 2002). Framework and Daughter Directives can be found at the EUR-Lex website http://eur-lex.europa.eu/EurovocView.do?idRoot=1&refinecode=LEG*T1=V112;T2=V1;T3=V5&eurovocrep=52.
In the European Union, Environmental Impact Assessment (EIA) is regulated by the Directive on Environmental Impact Assessment of the **effects of projects** on the environment introduced in 1985 and amended in 1997. The aim of an Environmental Impact Assessment (EIA) is to provide environmental protection for a planned project (e.g. a planned industrial area, a planned airport) by foreseeing and preventing environmental, particularly air pollution, problems. The EIA process ensures that air quality consequences of projects are identified and assessed before authorisation is given. Stakeholder opinion is taken into account after public hearings before authorisation of the project. Stakeholders are informed of the decision afterwards. The strength of EIA is to enable the best environmental balance to be found between a project and its surroundings and in helping to determine whether the project is acceptable. The EIA Directive can be found at http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri = CELEX:31985L0337:EN:NOT.
Additional information on various related projects on indoor and outdoor air quality and exposure assessment can be found in the following documents:
EU European Commission, JRC, 2004. The INDEX Project: Critical Appraisal of the Setting and Implementation of Indoor Exposure Limits in the EU. (331 pp).
http://web.jrc.ec.europa.eu/pce/pce-documentation.html (The report is listed among many other reports on the website)
The main objective of the INDEX project was to propose a list of priority compounds that should be considered for regulation in indoor environments based on the overall population risk caused by indoor sources, toxicological properties (in addition to hypersensitivity for allergy and asthma); known health effects and comfort considerations.
The AIRMEX study dealt with the measurements of indoor/outdoor air and personal chronic exposure to pollutants in various European cities. Its results can be found in a presentation entitled "Emerging Substances in indoor Air" http://www.norman-network.com/public_docs/slides_stresa/day_1_session_i/kotzias/sess1_kotziasi.pdf.

Global Burden of Disease

More recently, WHO estimated the global burden of disease (GBD) due to 22 risk factors including outdoor air pollution, indoor smoke from solid fuel use, lead and climate change. The report can be found at http://www.who.int/whr/2002/en/ and the basic information on burden of disease estimates at www.who.int/evidence. Documentation and GBD 2000 summary tables are available on the WHO websites:
http://www3.who.int/whosis/menu.cfm?path=evidence,burden,burden_manual
http://www3.who.int/whosis/menu.cfm?path=evidence,burden
A calculation template for disability adjusted life years (DALYs), and list of disability weights used for the yearly estimates of the GBD (WHO, 2002), are available at the WHO web site:

http://www3.who.int/whosis/menu.cfm?path = whosis,burden,burden_manual,burden_manual_other&language = english.
This template should be used in connection with the *National Burden of Disease Manual* at: http://www3.who.int/whosis/menu.cfm?path=whosis,burden&language = english.

Health Effects Institute (HEI), USA

Charlestown Navy Yard
120 Second Avenue
Boston, MA 02129-4533, USA
Phone: +1 (617) 886-9335
Fax: +1 (617) 886-9330
Publications ordering/information: pubs@healtheffects.org

HEI's mission is to provide credible science to support environmental regulations and other policy decisions. The results of each HEI-funded project undergo peer-review by outside scientists and the HEI Health Review Committee. Periodically HEI analyzes and interprets the scientific issues pertaining to a specific environmental problem. The results of these analyses are published in HEI Special Reports. Since 2000, HEI has been publishing all reports free of charge on its website before they appear in print. Research topics of HEI include accountability, toxic air pollutants, carbon monoxide, diesel exhaust, fuels and fuel additives, pollutant mixtures, nitrogen oxides, ozone and particulate matter. A special compendium called 'Public Health and Air Pollution in Asia – Science Access on the Net' (PAPASAN) compiles studies of the health effects of air pollution in Asia. The relevant website for this information is http://pubs.healtheffects.org/types.php?type=2.

Indoor Air Quality

Web: http://www.who.int/indoorair/en/
Web: http://www.who.int/indoorair/info/en/

To combat this substantial and growing burden of disease, WHO has developed a comprehensive programme to support developing countries. WHO's Programme on Indoor Air Pollution focuses on research and evaluation, capacity building, evidence for policy-makers (excerpted from http://www.who.int/indoorair/en/). Several relevant WHO indoor air quality resources are provided below.
Bruce N, Rehfuess E, Mehta S et al (2006) Indoor air pollution. In: Jamison D, Breman J G, Measham A R et al (eds.) Disease Control Priorities in Developing Countries, second edition. Oxford, UK: World Bank and Oxford University Press.
Web: http://www.who.int/indoorair/publications/indairpoll/

Indoor Air Quality

Dasgupta S, Huq M, Khaliquzzaman M, Pandey K, Wheeler D 2004 Who Suffers from Indoor Air Pollution? Evidence from Bangladesh. World Bank Policy Research Working Paper 3428. 24 pp.

Indoor Air Quality Information Resources, U.S. EPA

Web: http://www.epa.gov/iaq/
Web: http://www.epa.gov/iaq/resources.html

This information resources web portal from U.S. EPA has relevant resources in indoor air quality, asbestos, lead, mould, radon, and secondhand smoke. Further, various protocols for indoor air quality, health effects, indoor air risk mitigation procedures, and emerging protocols can be found. For examples, Information on an emerging tool called Environmental Relative Moldiness Index (ERMI) is available in the following publication:
Vesper SJ, Mckinstry C, Haugland RA (2007) Relative Moldiness Index© as predictor of childhood respiratory illness. J. Expo. Sci. Environ. Epidemiol. 17(1): 88–94.
Additional information can be accessed from: http://www.epa.gov/nerl/news/forum2006/vesper.pdf
Other relevant publication includes:
United States Environmental Protection Agency (U.S. EPA)

Indoor Air Quality (IAQ) Tools for Schools Kit

Web: http://www.epa.gov/iaq/schools/
US Environmental Protection Agency (2001)

Mold Remediation in Schools and Commercial Buildings

Web: http://www.epa.gov/mold/mold_remediation.html

Institute for Inspection, Cleaning and Restoration Certification *(IICRC) (http://www.iicrc.org)*

IICRC has two important peer reviewed guidance documents on water damage and mold remediation.
IICRC S500-Standard and Reference Guide for Professional Water Damage Restoration
IICRC S520-Standard and Reference Guide for Professional Mold Remediation

Indoor Environmental Standard Organization (IESO)
12339 Carroll Avenue
Rockville, MD 20852
Phone: (301) 230-9636
Toll Free: (800) 406-0256
Fax: (301) 230-9648
E-Mail: info@iestandards.org

The IESO was established in 2002 to assist IAQ businesses. It is a non-profit organization that provides a national forum for the development and publication of voluntary consensus standards for the assessment of indoor environments. The mission of IESO is to be the foremost developer and provider of voluntary consensus indoor environmental quality standards, related technical information, and services having recognized quality and applicability that promote public health and safety, and the overall quality of life (excerpted from http://www.iestandards.org)
The users of those documents are encouraged to critically evaluate the applications of those standards and guidelines in various indoor environments.

International Organization for Standardization (ISO)

The ISO is the world's **largest developer** and publisher of **International Standards**. ISO is a **network** of the national standards institutes of **157 countries.** ISO is a **non-governmental organization** that forms a bridge between the public and private sectors. For air quality, ISO has developed a number of standards addressing air quality terminology, exchange of data, particle size fraction definition, monitoring uncertainty, determination of specific air pollutants in the ambient air, and determination of emissions from stationary and mobile sources. The catalogue of ISO standards referring to air quality can be found at http://www.iso.org/iso/iso_catalogue/catalogue_ics/catalogue_ics_browse.htm?ICS1=13&ICS2=40.

International Programme on Chemical Safety (IPCS)

Web: www.who.int/pcs/index.htm and www.who.int/pcs/pcs_pubs.html

The International Programme on Chemical Safety (IPCS) is a joint program of UNEP, the International Labour Organisation (ILO), and the WHO. The purpose of IPCS is to establish the scientific basis for safe use of chemicals and to strengthen national capabilities and capacities for chemical safety. IPCS evaluates chemical risks to human health and the environment and develops methodologies for these evaluations. Many of the IPCS documents are available on-line, while ordering instructions are provided for the rest. Risk assessment documents for specific substances are produced by a number of IPCS and WHO programmes and activities include:

- Environmental Health Criteria Documents (EHC) http://www.inchem.org/pages/ehc.html,Health and Safety Guides (HSG), http://www.inchem.org/pages/hsg.html
- Concise International Chemical Assessment Documents (CICAD) http://www.inchem.org/pages/cicads.html

Important Environmental Health Criteria include:

- Nitrogen oxides (1997), No. 188
- Diesel Fuel and Exhaust Emissions (1997), No. 171
- Carbon Monoxide, 2nd edition. (1999), No 213
- Human Exposure Assessment (2006) No 214

International Society of Indoor Air Quality and Climate (ISIAQ)

c/o Finnish Society of Indoor Air Quality and Climate
Attn: Ms. Helka Backman, ISIAQ Administrator
P.O. Box 25, FIN-02131, Finland
Tel.: +358 9 4355 5612, Fax: +358 9 4355 5655
e-mail: info@isiaq.org

ISIAQ is an international and multidisciplinary, scientific, non-profit organization which supports the creation of healthy, comfortable and productive indoor environments. Additional information can be found at www.isiaq.org. The publications website has links to the peer reviewed "Indoor Air" journal, "newsletter" and "e-newsletter". Newsletter publications can be submitted to:
ISIAQ Newsletter, ISIAQ Secretariat
c/o Finnish Society of Indoor Air Quality and Climate
P.O. Box 25, FIN-02131 Espoo, Finland
Tel. +358 9 4355 560, Fax: +358 9 4355 565
E-Mail: info@isiaq.org
Indoor Air Quality Association (IAQA), Inc.
12339 Carroll Avenue
Rockville, MD 20852
Phone: (301) 231-8388
Fax: (301) 231-8321
E-Mail: iaqa@aol.com
Web: http://www.iaqa.org/

The IAQA was established in 1995 to promote consistent standards, procedures and protocols in the IAQ Air Quality industry. In 2005, it's membership was consolidated with two other IAQ organizations: The American Indoor Air Quality Council (AmIAQ) and the Indoor Environmental Standards Organization (IESO). As of January 1, 2006, IAQA emerged from the consolidation with 5566 members. It has a monthly newsletter (40+ pages) titled, "Indoor Environment

Connections" (http://www.ieconnections.com). The association also has a bi-monthly 24-page technical newsletter with abstracts on the latest scientific and medical findings in the areas of indoor air quality and health. IAQA also promotes and provides peer reviewed standards and protocols from other professional organizations such as **Institute for Inspection, Cleaning and Restoration Certification**-IICRC (http://www.iicrc.org) and **Indoor Environmental Standard Organization (IESO).**

The Mickey Leland National Urban Air Toxics Research Center (NUATRC)

P. O. Box 20286, Houston, Texas, 77225-0286
Phone: (713) 500-3450
Fax: (713) 500-0345
E-Mail: NUATRC@uth.tmc.edu
Web: http://www.sph.uth.tmc.edu/mleland/default.htm

The NUATRC is a non-profit organization authorized by the U.S. Congress in the Clean Air Act Amendments of 1990 and incorporated in 1991. It is named after the late Congressman Mickey Leland. Its mission is to develop and support research leading to an improved understanding of the potential human health risks from exposure to indoor and outdoor air toxics. NUATRC's research program is developed by a Board of Directors and a Scientific Advisory Panel of experts from academia, industry, and government agencies. Current objectives include the study of the health effects in human populations exposed to indoor and outdoor air toxics, development of new approaches and methods, and to provide sound, peer-reviewed scientific data for regulatory purposes. The webpage is http://www.sph.uth.tmc.edu/mleland/Webpages/publications.htm

Organisation for Economic Co-Operation and Development (OECD)

The OECD – http://www.oecd.org/home/- provides governments with the analytical basis to develop environmental policies and instruments that are effective and economically efficient, including climate change issues, environment and sustainable development, economic policy and the environment in developing countries, environmental country reviews, and the environmental-social interface.
Environmental country reviews exist for 35 countries and can be accessed at http://www.oecd.org/infobycountry/0,3380,en_2649_34307_1_1_1_1_1,00.html.
Information on OECD publications for environmental indicators and OECD environmental data can be found at: http://www.oecdbookshop.org/ and http://www.oecdbookshop.org/oecd/display.asp?CID = oecd&LANG = EN&SF1 = DI&ST1 = 5LH237G3XPVB, respectively.
OECD is also providing a glossary of statistical terms relating to air quality, which can be accessed at http://stats.oecd.org/glossary/index.htm.

Stockholm Environment Institute (SEI)

SEI co-ordinates the Regional Air Pollution in Developing Countries (RAPIDC) Programme funded by the Swedish International Development Cooperation Agency (SIDA). It is carried out in collaboration with universities and inter-governmental agencies and research organizations in Asia and Africa. The aim of RAPIDC is to facilitate the development of agreements/protocols to implement measures, which prevent and control air pollution. Work areas include capacity building in Africa and Asia for emission inventories and scenarios, dispersion modelling, human health impact assessment, and rapid urban integrated assessment. For several countries of the South African Development Community (SADC), an Air Pollution Information Network for Africa (APINA) has been formed in order to enhance supranational collaboration on air quality management. A similar network was created in Asia for countries that have signed the Malé Declaration. Information on RAPIDC can be accessed at http://www.sei.se/rapidc/about.htm.
SEI developed six training modules on air quality management as output of the Clean Air for Asia Training Programme which was funded by the European Union's Asia Urbs programme. These modules refer to legislation, governance, implementation and enforcement; emissions inventories, dispersion modelling, monitoring and health impact assessment. The modules can be found on the SEI website http://www.sei.se/cleanair/

(U.S.) National Library of Medicine (NLM)

Medline Health Information resources from National Library Medicine have specific information web pages on different health related topics. Authentic information resources in emerging issues in indoor and outdoor air quality are provided.
Indoor Air Pollution: http://www.nlm.nih.gov/medlineplus/indoorairpollution.html
Outdoor Air Pollution: http://www.nlm.nih.gov/medlineplus/airpollution.html
Other NLM information sources include ToxTown®, an interactive guide to commonly encountered toxic substances in everyday locations such as in a house or on a farm (http://toxtown.nlm.nih.gov), the Household Products Database of U.S. consumer product formulations and other information , the Haz-Map (occupational toxicology database of chemicals and

biologicals, and TOXMAP®, which uses U.S. maps to show the amounts and locations of the release of chemicals into the environment reported by industrial facilities in response to the EPA's Toxics Release Inventory. Information about these and other NLM resources is available from http://www.nlm.nih.gov/pubs/factsheets/tehipfs.html.

UN-Habitat/UNEP

The Sustainable Cities Programme (SCP) is a facility established in the early 1990s to enhance capacities in urban environmental planning and management. The programme targets urban local authorities and stakeholders in participatory approaches.

The SCP Urban Air Quality Handbook systematically underlines an effective process for urban air quality management, with an emphasis on (i) Information & Expertise, (ii) Strategy Formulation and Action Planning, and (iii) Implementation and Institutionalisation. The handbook discusses the formulation and implementation of participatory urban air quality management, following a step-by-step procedure based on the SCP process. To further assist in developing and implementing an air quality management plan within the context of the SCP process, a Toolkit has been prepared. Its main purpose is to provide cities with information and techniques to help with the further assessment of information, development of strategies and implementation of those strategies. Handbook and Toolkit, combined as a 'Toolbook', can be found at http://unep.org/urban_environment/PDFs/handbook.pdf.

United Nations Environment Programme (UNEP)

UNEP has produced resources on air quality to facilitate the transfer of knowledge for sustainable development. Links to UNEP resources on air quality include the following documents:

- Air Quality Handbook and Toolkit (see UN-Habitat below)
- Eliminating Lead from Gasoline: Report on Valve Seat Recession
- Greener Driving
- Opening the Door to Cleaner Vehicles in Developing and Transition Countries: The Role of Lower Sulphur Fuels

This information can be accessed at http://www.unep.org/tools/default.asp?ct=air. Other UNEP projects relevant to air quality management include the atmospheric brown cloud (ABC) in Asia, regional monitoring within the Male declaration, acid rain and collection of GHG emissions within the Asia Least Cost Greenhouse Gas Abatement Strategy (ALGAS). Information can be downloaded from http://www.rrcap.unep.org/ew/air/projects.cfm. UNEP's web page http://www.unep.org/tools/default.asp?ct=urban provides links to further urban issues including:

- Assessment of Policy Instruments for Reducing Greenhouse Gas Emissions from Buildings
- Cleaner Vehicles in Developing and Transition Countries

A technical manual on wet and dry deposition outlining agreed methodologies was developed and finalized in consultation with national implementing agencies and relevant experts. A manual for national training programmes on air pollution monitoring was also published. Both manuals are accessible at http://www.rrcap.unep.org/ew/air/male/CPdoc.cfm.

The UNEP/TNT Toolkit for clean Fleet Strategy Development is designed to help develop a strategy for reducing the environmental impacts of vehicle fleets. It can be accessed at http://www.unep.org/tnt-unep/toolkit/. It provides information on vehicular air pollutants; the relationship between vehicle characteristics, fuel quality, and emissions; health effects; effects on the built environment; and sources of greenhouse gases and effects of climate change. Further tools are devoted to potential actions such as maintenance; driver behaviour; fuel quality; emission control technologies, advanced and future vehicles and fuels; strategy development for reducing the fleet's environmental impacts and the control of its efficiency; and a tool to estimate the fleet's emissions.

United States Environmental Protection Agency (U.S. EPA)

The U.S. EPA offers a wealth of information on all topics of air quality. Topics include a glossary, emission factors, emission inventory, dispersion models, reference methods for air pollutant monitoring, health and environmental impacts. The entry point for this information is the air quality management web portal at http://www.epa.gov/air/aqmportal/index.htm. This site seeks to identify useful resources within the EPA web site as well as other good sources of information. The site allows navigate to the following air quality management activities.

- Air Quality Goal Setting
- Legislation, Regulation & Implementation
- Compliance & Enforcement
- Public Participation
- Emissions Inventory
- Monitoring
- Modeling
- Human & Environmental Assessment
- Control Strategies

The web page http://www.epa.gov/air/airpollutants.html provides specific information to many air pollutants including the common pollutants (sulphur dioxide, nitrogen oxides, ozone, carbon monoxide, particulate matter, and lead), chlorofluorocarbons, mercury, propellants, radiation, radon, toxic air pollutant, and volatile organic compounds.
The website http://www.epa.gov/oar/oaqps/emission.html of the Office of Air Quality Planning and Standards assesses the consequences of air pollution emissions and the results of efforts to curb these emissions.
Within U.S. EPA's Technology Transfer Network (TTN) the Clearing House for Inventories & Emissions Factors (CHIEF) information is available on emission inventories, emission factors, and emission modelling. The website is: http://www.epa.gov/ttn/chief/.
The Support Centre for Regulatory Air Models (SCRAM) site provides information about mathematical models used to predict the dispersion of air pollution. The site includes computer codes, meteorological input data, documentation and guidance on usage. Its address is http://www.epa.gov/oar/oaqps/emission.html#scram.
Preferred and recommended dispersion models, which are required for State Implementation Plans, can be found in the Support Centre for Regulatory Atmospheric Modelling of the TTN at http://www.epa.gov/scram001/dispersion_prefrec.htm. Models include a steady-state plume model (AERMOD), a non-steady-state puff dispersion model (CALPUFF) and other dispersion models. The codes for these models can be downloaded free of charge together with the corresponding documentations and model evaluation databases.

WHO 2006 Development of WHO Guidelines for Indoor Air Quality, Report on a Working Group Meeting Bonn, Germany 23-24 October 2006.

World Health Organization (WHO)

WHO's publications are distributed over numerous websites and reports on particular topics and are not easy to find due to the fact that many publications before 2005 are arranged on the Web according to the internal organization structure of WHO. Therefore in the following paragraphs individual web pages are quoted in order to facilitate the finding of relevant papers. Training materials relevant for air quality and toxicology which are available on the WHO website include exercises for environmental epidemiology. Epi Info Teaching Modules can be downloaded from http://whqlibdoc.who.int/hq/1996/WHO_EHG_96.15.pdf. Problem-based training exercises for environmental epidemiology for students are available at http://whqlibdoc.who.int/hq/1998/WHO_EHG_98.2.pdf. Although these materials based on older epidemiological studies they are still relevant for the purpose of training on health impact assessment.

World Bank

In July 1998, the World Bank Group approved the 'Pollution Prevention and Abatement Handbook 1998: Toward Cleaner Production' (PPAH), for use in World Bank Group operations. The PPAH was compiled by environmental staff from the World Bank and the International Finance Corporation (IFC). It addresses pollution management, environmental standards, waste, energy efficiency, economic analysis, monitoring of emissions and modelling of concentrations, and health impact assessment. The PPAH can be downloaded from the IFC website http://www.ifc.org/ifcext/enviro.nsf/Content/PPAH.

Clean Air Strategic Alliance (http://www.casahome.org/)

CASA is a multi-stakeholder partnership, composed of representatives selected by industry, government and non-government organizations, which recommends strategies to assess and improve air quality in Alberta. There are various project teams working in ambient and indoor air quality. For additional information, readers can access information resources at: http://www.casahome.org/?page_id=13

Climate Change, Air Pollution and Health Research Network

Web: http://www.climateairhealth.ca/html/aboutus.htm

The New Brunswick Lung Association (www.nb.lung.ca) and the Lung Associations' International Centre for Air Quality and Health (http://www.can-us-airhealth.org/) and Climate Change and Health Office of Health Canada, coordinate the Climate Change, Air Pollution and Health Research Network. This research Network also participates in the Canadian Climate Change Impacts and Adaptation Research Network (C-CIARN) (http://www.c-ciarn.ca) through Health Canada's climate change and health office.
The New Brunswick Lung Association and the Lung Associations' International Centre host this network for Air Quality and Health. It is a not-for-profit community charity organization, located in Fredericton, New Brunswick, Canada affiliated with the national Canadian Lung Association (CLA). The primary concern of the network is respiratory health and it is involved in numerous programs that help reduce air pollution and /or climate change:

Databases

The following list provides relevant air quality databases from USA, Europe, Canada and other countries.

AIRBASE

Web: http://air-climate.eionet.europa.eu/databases/airbase/

AirBase is a public air quality database system of the European Environmental Agency (EEA). In order to maintain this database, air quality monitoring information is submitted by the participating countries throughout Europe. It consists of multi-annual time series of air

quality measurement data and their statistics for a representative selection of stations and for a number of pollutants. Furthermore, it contains meta-information on the monitoring networks involved, their stations and their measurements. Geographically, it covers all the countries from the European Union, the EEA member countries and some EEA candidate countries. Based on the Council decision, 97/101/EC (a reciprocal Exchange of Information (EoI)), the EU member countries must report on ambient air quality. On the other hand, the EEA member countries either committed themselves to report to the EEA or develop the appropriate measuring and reporting protocol following EEA's EuroAirnet programme critiria. All data reported within EuroAirnet are also included in the database.

AirBase replaced the two EU databases APIS (Air Pollution Information System; air quality data) and GIRAFE (meta information on air quality networks and stations).

AirView is the web-application that provides a user interface for free data retrieval from this database. An user can also download the data as files as XML based exports from AirBase and access and modify the contents in XML compatible applications, such as web browsers and MS Excel (XP).

European Topic Centres (ETC) are centers of thematic expertise contracted by the European Environment Agency (EEA) to carry out specific tasks identified in the EEA strategy. The ETC on Air and Climate Change (ACC) assists the EEA in its support to EU policy in the field of air pollution and climate change. The ETC/ACC is a consortium of European institutes with MNP as its lead organization. Furthermore, the ETC/ACC reports on the progress of EU environmental policy on air quality, air emission and climate change issues. Additionally, it participates in European Environmental Outlook reports of the EEA. It collects data concerning the current state of the environment and further harmonizes European monitoring networks and reporting obligations.

airdata

Web: http://www.epa.gov/air/data/

The AirData Web site provides access to air pollution data for the United States of America (USA). For example, highest level of ozone that was measured in a particular state last year can be found by conducting a specific search. Further, locations of air pollution monitoring sites and sources of air pollution for each town are also provided. AirData has the capability of producing reports and maps of air pollution data based on specific search criteria provided by the user of the database. Further, AirData presents annual summaries of air pollution data from two EPA databases described below.

(i)*Air Quality System (AQS) database*

AQS provides air monitoring data, ambient concentrations of criteria and hazardous air pollutants at monitoring sites in cities and towns.

(ii) *National Emission Inventory (NEI) database*

NEI provides estimates of annual emissions of criteria and hazardous air pollutants from various types of sources. In 2002, the NEI database in replaced two other U.S. EPA emission databases for criteria air pollutants (**National Emission Trends, or NET**) and hazardous air pollutants (**National Toxics Inventory, or NTI**).

Air Quality Statistics (AQS) Database

Web: http://www.aeat.co.uk/netcen/airqual/statbase/dbasehome.html

The UK AQS Database contains options for the user to enter queries and retrieve statistical data related to the Air Quality in the UK from the present back to 1970. The national statistical tables are related to measured concentrations from the monitoring networks operated on behalf of the DEFRA, and also for estimates of air emissions. High professional standards are set out in the National Statistics Code of Practice. These data sets undergo rigorous quality assurance reviews to ensure that they meet research needs of various users. According to the website, they are produced free from any political interference. Contact the agency at aqinfo@aeat.co.uk for additional information.

Database of childhood acute respiratory infections in developing countries

Web: http://www.who.int/indoorair/health_impacts/databases_ari/en/index.html

In 2002, WHO Department of Child and Adolescent Health and Development developed a literature review database of published studies on acute respiratory infections. It contains information abstracted from a total of 220 reviewed papers. No calculations or standardizations were carried out for these datasets. Users are cautioned to refer to the detailed description of the database, which contains information on structure, variables and limitations.

Health Effects Institute (HEI) Air Quality Database

Web: http://hei.aer.com/login.php

The HEI Air Quality Database has been prepared and maintained by Atmospheric and Environmental Research (AER) Inc. It focuses on PM2.5 components and gaseous pollutants at and near sites in the U.S. EPA's PM2.5 Chemical Speciation Trends Network

(STN) and State, Local and Tribal air monitoring stations (SLAMS). It was originally prepared and made available in association with HEI's Request for Applications 05-1 (Studies to Compare Components and Characteristics of Particulate Matter Associated with Health Effects), which was issued in the summer of 2005. The Database is now available to researchers and investigators interested in using the information for research studies on air quality and health. The Database contains information on speciated PM components and gaseous pollutants at these sites for the years 2000-2006. Generally, information is updated regularly within 2-3 years. Users can access the database by setting up a user account with Dr. Betty Pun at AER (bpun@aer.com). Contact Dr. Pun with Questions about information in the Database. Contact Dr. Geoffrey Sunshine at (gsunshine@healtheffects.org) on Questions about RFA 05-1.

Indoor air pollution database for China

Web: http://www.who.int/indoorair/health_impacts/databases_china/en/index.html

WHO compiled a database of indoor measurements in 1994 to help provide access to databases and information on levels of various air pollutants in both urban and rural residences in China. More than 110 publications (1980–1994), are cited in this database that is organized by Pollutant (i.e., particulates, sulphur dioxide, carbon monoxide, nitrogen oxides and benzo[a]pyrene); Fuel type (coal, gas, biomass) and Location (urban, rural). The full report has an introduction to the database tables and conclusions about the overall pattern of indoor air pollution in China. The full report can be accessed at: http://whqlibdoc.who.int/hq/1995/WHO_EHG_95.8.pdf Excel spreadsheets for the main database tables are available at the UC Berkeley web site: http://ehs.sph.berkeley.edu/hem/page.asp?id = 32.

USEPA Source Ranking Database (SRD)

Web: http://www.epa.gov/oppt/exposure/pubs/srd.htm

SRD performs a systematic screening review of over 12,000 potential indoor pollution sources and identifies high-priority product and material categories for further evaluation. This database can also identify the products that have contained a specific chemical. Users can download SRD from the website.

World Health Organization Indoor air databases

Global indoor air pollution database
Web: http://www.who.int/indoorair/health_impacts/databases_iap/en/index.html

This Access database on global indoor air pollution was developed by researchers at the University of California at Berkeley to provide measured household indoor air pollution levels in approximately 250 communities around the world. Users of the databases and researchers can review and analyze findings within and across studies, and can either query the database directly or export the files into a statistical programme for in-depth analysis.

CHAPTER

25

Environmental Toxicology: Hazardous Waste

C.C. BARTON, AND S.C. SCHMITZ

INTRODUCTION

Human exposure to hazardous wastes is due to exposure to ground and surface water; soil, sludges, and dust; and indoor and outdoor air that contain elevated levels of hazardous chemicals. Hazardous waste can be the by-products of manufacturing processes or discarded commercial products. Hazardous waste can be specifically defined and listed in U.S. Environmental Protection Agency regulations or can be wastes that exhibit at least one of four characteristics – ignitability, corrosivity, reactivity, or toxicity.

The following is a list of resources on toxicology and the exposure to hazardous waste in the environment. Included in the resources are books, journals, journal articles, organizations, and databases that discuss the following topics:

- Basic chemistry and biochemistry
- Toxicological effects of specific chemicals
- Fat and transport of hazardous materials in the environment
- Metabolism of hazardous chemicals
- Exposure assessment
- Controlling risks from exposure to hazardous wastes
- Case studies of exposure to hazardous wastes
- Regulation of hazardous wastes and environmental law
- Treatment, storage, and disposal of hazardous wastes
- Site clean-up of hazardous waste
- Pollution prevention and recycling of hazardous waste
- Health and safety and personal protection equipment.

RESOURCES

Books

Andrews LP (Ed.) (1990)
Hazardous Waste and Public Health: International Congress on the Health Effects of Hazardous Waste
Princeton Scientific, Princeton, NJ

Collection of over 100 papers and 90 poster presentations from an international congress. The material is divided into the following main sections: hazardous wastes and public health approaches, policy and ethics, international programs, the role of communities, environmental exposure assessment, biomarkers, hazard assessment and risk estimation, health effects, and information services.

Applegate JS, Laitos JG (2005)
Environmental Law – RCRA, CERCLA, and the Management of Hazardous Waste
Foundation Press, New York, NY

This book surveys, organizes, and explains the most important provisions of RCRA and CERCLA while providing relevant background. This publication goes beyond other publications by emphasizing the scientific, policy, and legal issues that make hazardous waste management a difficult and complex problem for Congress, EPA, and practicing lawyers.

Bilitewski B, Hardtle G, Marek K (1996)
Worker Protection during Hazardous Waste Remediation
Van Nostrand–Reinhold, New York

Addresses specific problems and provides solutions for the practices needed to maintain a safe work environment and maintain compliance with SARA and the applicable OSHA standards. Covers employee/employer responsibilities, hazard recognition, engineering and personal protective equipment recommendations, and safety plans.

Chalmers G (1997)
Hazardous Waste and Human Health
Oxford University Press, Oxford

Considers health issues related to hazardous waste as well as prevention and control.

Johnson BL, Andrews JS, Xintaras C, Mehlman MA (Eds.) (1997)
Standard Handbook of Hazardous Waste Treatment and Disposal, 2nd edition
McGraw-Hill, New York

Provides information and data relevant for hazardous waste management, site clean-up, and alternative treatment. Topics covered include laws and regulations, hazardous waste characteristics and issues, special categories of hazardous wastes, pollution prevention, and recycling.

King RB, Long GM, Sheldon JK (1997)
Practical Environmental Bioremediation: The Field Guide, Second Edition
CRC Press, Boca Raton, FL

The Field Guide presents updated material, case histories, and many instructive illustrations to reflect the evolving image of this fast-emerging industry. Bioremediation technology has witnessed great strides towards simplifying treatability formats, finding new approaches to field application, more potent nutrient formulations, monitoring protocols and the resulting general improvement in results. This new guide condenses all currently available knowledge and presents necessary technical aspects and concepts in language that can be readily comprehended by the technical student, experienced scientist or engineer, the aspiring newcomer, or anyone else interested in this exciting natural cleanup technique.

King RB, et al (1998)
Hazardous Waste: Toxicology and Health Effects
Stockton Press, New York

Volume 25 in the series, *Advances in Modern Environmental Toxicology*. Papers of significant ongoing research and policy development generated under the Superfund statute.

Lunn G, Sansone EB (1994)
Biological Treatment of Hazardous Wastes
Wiley, New York

Provides engineers, scientists, and technical personnel with a conceptual framework to develop effective treatments adaptable to any hazardous waste scenario they may encounter.

Manahan SH (1990)
Hazardous Waste Chemistry, Toxicology, and Treatment
Lewis Publishers, Chelsea, MI

Designed in a compact form, it is an easy-to-understand book on the chemistry and toxicology of hazardous substances and wastes. It begins with a basic coverage of chemistry and biochemistry, environmental chemical processes, and toxicology. Detailed chapters discuss the chemistry and toxicology of inorganic and organic hazardous substances and biohazards. The fully documented text explains procedures for eliminating, detoxifying, and disposing of hazardous wastes with continual reference to their basic chemistry and toxicology.

Maslansky SP, Maslansky CJ (1997)
Destruction of Hazardous Chemicals in the Laboratory, 2nd edition
Wiley, New York

Collection of detailed procedures that can be used to degrade and dispose of a wide variety of hazardous chemicals. The procedures are applicable to the amounts generally found in the chemical laboratory. This edition also expands the scope to bulk quantities and is aimed so that laboratory technicians can perform the procedures safely.

Maughan JT (1996)
Health and Safety at Hazardous Waste Sites: An Investigator's and Remediator's Guide to HAZWOPER
Van Nostrand–Reinhold, New York

Covers hazard recognition, toxicology, respiratory protection, air monitoring, personal protective equipment, site control, health and safety programs, contingency planning, and confined space entry. The appendices provide a generic emergency response plan, a generic health and safety plan, and excerpts from applicable federal laws on hazardous waste operations and emergency response, permitting required for confined space entry, and excavations.

Moore EB (2000)
An Introduction to the Management and Regulation of Hazardous Waste
Battelle Press, Columbus, OH

This text is a cursory overview of hazardous wastes and their management from both a technical and a regulatory perspective. The content of the text is based upon two major federal laws that regulate hazardous wastes: the Resource Conservation and Recovery Act (RCRA), which regulates newly generated hazardous wastes, and the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), which regulates abandoned or uncontrolled hazardous waste sites.

National Research Council. Committee on the Health Effects of Waste Incineration (1999)
Ecological Assessment of Hazardous Waste Sites
Van Nostrand-Reinhold, New York

Examines the overall approach to risk assessments as well as techniques for evaluating prominent aspects of ecological assessments. The main areas include terrestrial pathways of contaminants, sediment quality and contamination, and toxicity testing. Case studies involving ecological problems are presented.

Payne SM (1998)
Waste Incineration and Public Health
National Academy Press, Washington, DC

Provides details on processes involved in incineration and how contaminants are released, environmental dynamics of contaminants and routes of human exposure, and tools and approaches for assessing human health effects.

Sellers K (1998)
Strategies for Accelerating Cleanup at Toxic Waste Sites
Lewis, Boca Raton, FL

Provides practical methods to accelerate cleanup and decision-making. Tables list remedial and investigative technologies.

Travis CC, Cook SC (1989)
Fundamentals of Hazardous Waste Site Remediation
Lewis, Boca Raton, FL

Discusses the basics of hazardous materials chemistry, hydrogeology, reaction engineering, and cleanup-level development.

Turnberg WL (1996)
Hazardous Waste Incineration and Human Health
CRC Press, Boca Raton, FL

Examines topics such as composition of hazardous waste, incineration technology, risk assessment methodology, health risk assessment for organics and metals, and food chain analysis.

Wagner TP (1998)
Biohazardous Waste: Risk Assessment, Policy, and Management
Wiley, New York

Covers all important areas of biohazardous waste management, including regulation, collection, and disposal, with a section on health hazard assessment.

Waxman MF (Ed.) (1996)
The Complete Guide to the Hazardous Waste Regulations, 3rd edition
Wiley, New York

A new edition of an essential reference containing up-to-date information on changes made to the hazardous waste and hazardous materials program since 1991. Clarifies all RCRA, TSCA, HMTA, OSHA, and Superfund rules. Includes a summary of state-specific hazardous waste requirements.

Woodside G (1999)
Hazardous Materials and Hazardous Waste Management, 2nd Edition
Wiley, New York

For the professional faced with making sense of the reams of governmental regulations surrounding waste handling and disposal from the EPA, OSHA, and the Nuclear Regulatory Commission, untangling the legal jargon can be as challenging as managing these materials and wastes. Explaining how these complex regulations interrelate and when they apply, the first edition of *Hazardous Materials and Hazardous Waste Management* became an instant reference staple – offering practical, comprehensive guidance on current definitions of hazardous wastes and materials as well as their use, management, treatment, storage, and disposal.

Woodside G (1999)
Hazardous Waste Site Operations: A Training Manual for Site Professionals
Wiley, New York

Brings together information from available resources to those individuals involved in hazardous waste remediation or the generation of hazardous waste. The manual can be used either as the prime reference in conducting mandated training or to supplement lectures and training. The book provides a broad overview of the possible hazards encountered with hazardous wastes and how workers can properly protect themselves and conduct their work.

Journals

Journal of Hazardous Materials (1976–)
Elsevier, Amsterdam, London, New York
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/502691/description# description

The *Journal of Hazardous Materials* publishes full-length research papers, reviews, project reports, case studies, and short communications which improve our understanding of the hazards and risks certain materials pose to people and the environment or deal with ways of controlling the hazards and associated risks.

Waste Age
Prism Business Media, Inc.
Web: http://wasteage.com

Waste Age serves private contracting firms, governmental entities, consulting engineers, industrial plants, retailing firms, and hospitals, as well as equipment dealers, distributors, manufacturers, and other allied to the field. Every issue is devoted to bringing industry professionals the most comprehensive and up-to-date news and information.

Environmental Health Perspectives
National Institute of Environmental Health Sciences
Web: http://www.ehponline.org/

Environmental Health Perspectives (EHP) is a monthly journal of peer-reviewed research and news on the impact of the environment on human health. EHP's mission is to serve as a forum for the discussion of the interrelationships between the environment and human health by publishing in a balanced and objective manner the best peer-reviewed research and most current and credible news of the field.

Practice Periodical of Hazardous, Toxic, and Radioactive Waste Management
American Society of Civil Engineers
Web: http://www.pubs.asce.org/journals/hz.html

The *Practice Periodical of Hazardous, Toxic, and Radioactive Waste Management* publishes articles relating to the allied engineering and scientific disciplines involved in the environmental aspects of the management of hazardous, toxic, and radioactive waste. These include the traditional areas of investigation, design, and construction and the related areas of planning, analysis, oversight, operations, regulations, and policy. This publication offers articles about practical approaches and solutions as well as application-oriented research to the problems and challenges faced by practicing engineers, scientists, and government policymakers.

Journal of the Institute of Environmental Sciences and Technology
Institute of Environmental Sciences and Technology
Web: http://www.iest.org/journal/journal.htm

The *Journal of the Institute of Environmental Sciences and Technology* is an official publication of the Institute of Environmental Sciences and Technology (IEST) and is of archival quality and non-commercial in nature, established to advance knowledge through technical articles selected by peer review, and published as a benefit to IEST members and the technical community at large and as a permanent record of progress in the science and technology of the environmental sciences.

Journal of the Air and Waste Management Association (1951–)
Air and Waste Management Association
Web: http://www.awma.org/journal/

The *Journal of the Air and Waste Management Association* is one of the oldest continuously published, peer-reviewed, technical environmental journals in the world. It is intended to serve those occupationally involved in air pollution control and waste management through the publication of timely and reliable information.

Environmental Progress
American Institute of Chemical Engineers
Web: http://www.aiche.org/Publications/EnvironmentalProgress/index.aspx

Environmental Progress, a quarterly publication of the American Institute of Chemical Engineers, reports technological advances vital to engineering professionals whose responsibility includes or is related to environmental issues. It also covers such critical issues as abatement, control, containment of effluents and emissions, and various environmental compliance standards.

Journal of Exposure Science and Environmental Epidemiology
Nature Publishing Group, London, New York
Web: http://www.nature.com/jes/index.html

Journal of Exposure Science and Environmental Epidemiology is a peer-reviewed publication that publishes research important to exposure assessment for toxic substances, environmental epidemiology that includes a strong exposure analysis component and related disciplines that advance the exposure assessment process.

Environmental Science and Technology
American Chemical Society, Washington, DC
Web: http://pubs.acs.org/journals/esthag/index.html

Published twice monthly, *Environmental Science and Technology* is a unique source of information for scientific

and technical professionals in a wide range of environmental disciplines. In its research section, contributed material may appear as current research papers, policy analyses, or critical reviews. Also included is a magazine section called the A-Pages that provide authoritative news and analysis of the major developments, events, and challenges shaping the field.

Organizations

Agency for Toxic Substances and Disease Registry
1825 Century Blvd.
Atlanta, GA 30345
Phone: 800-232-4636
Web: http://www.atsdr.cdc.gov

The mission of the Agency for Toxic Substances and Disease Registry (ATSDR), as an agency of the U.S Department of Health and Human Services, is to serve the public by using the best science, taking responsive public health actions, and providing trusted health information to prevent harmful exposures and disease related to toxic substances. ATSDR produces 'toxicological profiles' for hazardous substances found at National Priorities List (NPL) sites. These hazardous substances are ranked based on frequency of occurrence at NPL sites, toxicity, and potential for human exposure. Toxicological profiles are developed from a priority list of 275 substances. ATSDR also prepares toxicological profiles for the Department of Defense (DOD) and the Department of Energy (DOE) on substances related to federal sites. A website has been dedicated to Hazardous waste sites in the USA (http://www.atsdr.cdc.gov/2p-hazardous-waste-sites.html).

American Council on Science and Health
1995 Broadway
Second Floor
New York, NY 10023-5860
Phone: 212-362-7044
Fax: 212-362-4919
E-mail: acsh@acsh.org
Web: http://www.acsh.org

The American Council on Science and Health (ACSH) is a consumer education consortium concerned with issues related to food, nutrition, chemicals, pharmaceuticals, lifestyle, the environment and health. ACSH is an independent, nonprofit, tax-exempt organization. The nucleus of ACSH is a board of 350 physicians, scientists and policy advisors – experts in a wide variety of fields – who review the Council's reports and participate in ACSH seminars, press conferences, media communications, and other educational activities.

Occupational Safety and Health Administration (OSHA)
200 Constitution Avenue
Washington, D.C. 20210
Phone: 800-321-6742
Web: http://www.osha.gov/SLTC/hazardouswaste/index.html

OSHA's mission is to assure the safety and health of America's workers by setting and enforcing standards; providing training, outreach, and education; establishing partnerships; and encouraging continual improvement in workplace safety and health. OSHA and its state partners have approximately 2100 inspectors, plus complaint discrimination investigators, engineers, physicians, educators, standards writers, and other technical and support personnel spread over more than 200 offices throughout the country. This staff establishes protective standards, enforces those standards, and reaches out to employers and employees through technical assistance and consultation programs.

U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Phone: 800-424-9346
Web: http://www.epa.gov/oswer/index.htm

The Office of Solid Waste and Emergency Response provides policy, guidance, and direction for EPA's solid waste and emergency response programs. They develop guidelines for the land disposal of hazardous waste and underground storage tanks. They provide technical assistance to all levels of government to establish safe practices in waste management. They administer the Brownfields program which supports state and local governments in redeveloping and reusing potentially contaminated sites. They also manage the Superfund program to respond to abandoned and active hazardous waste sites and accidental oil and chemical releases as well as encourage innovative technologies to address contaminated soil and groundwater.

Databases

Integrated Risk Information System (IRIS)
U.S. Environmental Protection Agency
Web: http://www.epa.gov/iris/index.html

The Integrated Risk Information System (IRIS), prepared and maintained by the U.S. Environmental Protection Agency (U.S. EPA), is an electronic database containing information on human health effects that may result from exposure to various chemicals in the environment. IRIS was initially developed for EPA staff in response to a growing demand for consistent information on chemical substances for use in risk assessments, decision-making, and regulatory activities. The information in IRIS is intended for those without extensive training in toxicology, but with some knowledge of health sciences.

The heart of the IRIS system is its collection of computer files covering individual chemicals. These chemical files contain descriptive and quantitative information in the following categories:

- Oral reference doses and inhalation reference concentrations (RfDs and RfCs, respectively) for chronic non-carcinogenic health effects.
- Hazard identification, oral slope factors, and oral and inhalation unit risks for carcinogenic effects.

International Toxicity Estimates for Risk Database (ITER)
Toxicology Excellence for Risk Assessment
Web: http://www.tera.org/ITER/

ITER is a free Internet database of human health risk values and cancer classifications for over 600 chemicals of environmental concern from multiple organizations worldwide. It presents risk data in a tabular format for easy comparison, along with a synopsis explaining differences in data and a link to each organization for more information.

Risk Assessment Information System
US Department of Energy

Web: http://rais.ornl.gov/

Database of toxicity values and information used to disseminate risk tools and supply information for risk assessment activities.

Toxicological Data Network (TOXNET)

US National Library of Medicine
Web: http://toxnet.nlm.nih.gov/

A central clearinghouse for 14 separate databases on toxicology, hazardous chemicals, environmental health, and toxic releases.

CHAPTER

26

Environmental Toxicology: Terrestrial

C.C. BARTON, AND S.C. SCHMITZ

INTRODUCTION

Exposure to hazardous chemicals in soil and sediments can occur in animal species that live or spend a significant amount of time in terrestrial environments and in humans through dermal exposure and incidental ingestion of soil and sediments.

Dermal and incidental exposure in humans generally represents a small percentage of the total potential exposure to chemicals in the environment. The majority of the exposure to hazardous chemicals in the environment comes from exposure to drinking water and to air that contains higher levels of environmental contamination. An exception to this occurs in some younger children who exhibit pica behavior which is an abnormal appetite for non-food substances such as soil. This type of eating disorder can sometimes result in serious health problems such as lead poisoning.

The following is a list of resources on toxicology and the exposure to hazardous chemicals in the terrestrial environment. Included in the resources are books, journals, journal articles, and organizations that discuss the following topics:

- Soil chemistry
- Cleanup of contaminated soil and sediments
- Assessment of hazards and risk of exposure to soil contaminants
- Toxicity to soil invertebrates
- Impacts of pesticides on soil toxicity
- Fate and transport of chemicals in soils and sediments
- Case studies of exposure to chemicals in soils and sediments.

RESOURCES

Books

Buonicore AJ (Ed.) (1996)
Cleanup Criteria for Contaminated Soil and Groundwater, 2nd edition
ASTM Press, Philadelphia.

Book and diskette summarize cleanup criteria developed by the U.S. EPA under various legislative mandates.

Spark Donald L (2003)
Environmental Soil Chemistry
Academic Press, New York

Illustrates fundamental principles of soil chemistry with respect to environmental reactions between soils and other natural materials and heavy metals, pesticides, industrial contaminants, acid rain, and salts. Timely and comprehensive discussions of applications to real-world environmental concerns.

European Chemical Industry Ecology and Toxicology Centre (ECETOC) (1990)
Technical Report No. 40: Hazard Assessment of Chemical Contaminants in Soil
ECETOC, Brussels

Describes the hazard assessment process for soil contaminants. Also evaluates the significance of the presence of contaminants in the environment.

Hoffman D, et al (Eds.) (1995)
Handbook of Ecotoxicology Soil, Climatic, and Biological Constraints
CRC Press LLC, Boca Raton, FL

Focuses on toxic substances and how they affect ecosystems worldwide. Presents methods for quantifying

and measuring ecotoxicological effects in the field and in the lab, as well as methods for estimating, predicting, and modeling in ecotoxicology studies.

Ingersoll CG, Dillon T, Biddinger GR (Eds.) (1997)
Ecological Risk Assessments of Contaminated Sediments
SETAC, Pensacola, FL

Presents a critical evaluation of existing approaches to determining the risk of contaminated sediments. The text identifies principles and practices for this task designed to improve the process. The text pinpoints critical applications, such as product assessment, navigational dredging, and site cleanup, and pertinent issues such as ecological relevance and methodological uncertainty.

Lokke H, Van Gestel AM (1998)
Handbook of Soil Invertebrate Toxicity Tests
Wiley, New York

A comprehensive user guide to toxicity testing which provides readily accessible information on the results of terrestrial invertebrate testing. Presents guidelines for the application of new test systems for soil ecotoxicity testing.

Sheppard S, Bembridge J (Eds.) (1998)
Advances in Earthworm Ecotoxicology
SETAC, Pensacola, FL

Subject areas covered include bioavailability and internal load, the use of modeling to estimate long-term implications of impacts of toxic compounds on individuals for population survival, and other developments in earthworm research.

Tarradellas J, et al (Eds.) (1997)
Soil Ecotoxicology
CRC Lewis, Boca Raton, FL

Discusses the sources, fate, and transport of hazardous chemicals in soils. The fate (biodegradation and modeling) and the potential impacts of pesticides on soil ecosystems are emphasized, and methodologies for performing toxicity assessments are provided.

van Straalen NM, Krivolutsky DA (Eds.) (1996)
Bioindicator Systems for Soil Pollution
Kluwer, Dordrecht

Presents new approaches to the development of bioindication systems for the soil environment. The emphasis is on the use of inetebrates, as part of the soil life-support system. Discusses general ecotoxicological approaches, community and systems approaches, and various case studies in Eastern and Western Europe and the United States.

Yaron B, et al (1996)
Soil Pollution: Processes and Dynamics
Springer, Berlin

Investigates the properties of the interacting materials, pollutant partitioning between the soil phases, pollutant behavior in soils affected by environmental factors, and the principles to be considered in defining pollutant behavior.

Journals

Archives of Environmental Contamination and Toxicology
Springer, New York
Web: http://www.springeronline.com/journal/244

Archives of Environmental Contamination and Toxicology is a repository of significant, full-length articles describing original experimental or theoretical research work pertaining to the scientific aspects of contaminants in the environment. It provides a place for the publication of detailed, definitive, complete, credible reports concerning advances and discoveries in the fields of air, water, and soil contamination and pollution, human health aspects, and in disciplines concerned with the introduction, presence, and effects of deleterious substances in the total environment.

Environmental Toxicology
Wiley Periodicals, Inc., New Jersey
Web: http://www.interscience.wiley.com/jpages/1520-4081

The journal publishes in the areas of toxicity and toxicology of environmental pollutants in air, dust, sediment, soil, and water, and natural toxins in the environment.

Soil and Sediment Contamination
Taylor and Francis, Philadelphia, PA
Web: http://www.tandf.co.uk/journals/titles/15320383.asp

A bimonthly, internationally peer-reviewed publication; focuses on soil and sediment contamination from sludges, petroleum, petrochemicals, chlorinated hydrocarbons, pesticides, lead and other heavy metals.

Water, Air, and Soil Pollution
Springer, Netherlands
Web: http://www.springeronline.com/journal/11270

An international, interdisciplinary journal on all aspects of pollution and solutions to pollution in the biosphere. This includes chemical, physical, and biological processes affecting flora, fauna, water, air, and soil in relation to environmental pollution.

Organizations

The Association for Environmental Health and Sciences
150 Fearing Street
Amherst, MA 01002
Phone: 413-549-5170
Fax: 413-549-0579
E-mail: paul@aehs.com
Web: http://www.aehs.com

The Association for Environmental Health and Sciences (AEHS) was created to facilitate communication and foster cooperation among professionals concerned with the challenge of soil protection and cleanup. AEHS members represent the many disciplines involved in making decisions and solving problems affecting soils, including chemistry, geology, hydrogeology, law, engineering, modeling, toxicology, regulatory science, public health, and public policy.

Databases

ARAMS™
ARAMS accesses various databases for defining chemical properties, bioaccumulation factors, toxicity reference values, and other inputs. Some databases are distributed with the software and reside on local disk storage along with the ARAMS software and models, while others are accessible over the Internet to allow seamless download and input of up-to-date information. Databases presently used by ARAMS include the following:

- FRAMES constituent database, which includes physicochemical properties required for fate/transport modeling, bioaccumulation factors, and human health toxicity reference values from IRIS and HEAST
- Range constituent database, which is like the FRAMES constituent database, but consists of chemicals expected to be found on firing ranges (Technical Report ERDC/EL TR-02-27 and MS Access 2000 database)
- Environmental Residue Effects Database (ERED) for aquatic ecological health effects
- Biota-Sediment Accumulation Factors (BSAF) (Clarke and McFarland 1991) for aquatic uptake
- Terrestrial Toxicity Database (TTD), which includes toxicity reference values and soil screening levels for terrestrial wildlife. TTD can be downloaded from here (42 MB) for access outside of ARAMS. The background report can also be downloaded here
- A species life history profiles database and a BAF database for use with terrestrial wildlife exposure

models was developed as part of the Terrerstrial Wildlife Exposure Model (TWEM) model package and is distributed with ARAMS and resides locally
- Linkage to the Web-based Risk Assessment Information System (RAIS). Database for download of chemical-specific factors (physicochemical properties, exposure factors, and bioaccumulation factors) and human health toxicity reference values

Reference

Clarke JU, McFarland VA (1991) Assessing Bioaccumulation in Aquatic Organisms Exposed to Contaminated Sediments. Miscellaneous Paper D-91-2, Waterways Experiment Station, Vicksburg, MS 39180.

ECOTOX

http://cfpub.epa.gov/ecotox/

The ECOTOXicology database (ECOTOX) is a source for locating single chemical toxicity data for aquatic life, terrestrial plants and wildlife. ECOTOX was created and is maintained by the U.S.EPA, Office of Research and Development (ORD), and the National Health and Environmental Effects Research Laboratory's (NHEERL's) Mid-Continent Ecology Division (MED).

ECOTOX integrates three previously independent databases-AQUIRE, PHYTOTOX, and TERRETOX-into a unique system which includes toxicity data derived predominately from the peer-reviewed literature, for aquatic life, terrestrial plants, and terrestrial wildlife, respectively.

CHAPTER

27

Environmental Toxicology: Wildlife

C.C. BARTON AND S.C. SCHMITZ

INTRODUCTION

Wildlife toxicology is the study of the effects of environmental contaminants on the reproduction, health, and wellbeing of wildlife. Some of the initial concern and impetus of the modern environmental movement was the result of the perceived impact of environmental chemicals to wildlife.

Wildlife will be exposed to environmental chemicals form the water they drink and in which they live, from the foods that they eat and from the air that they breathe. Some chemicals, such as mercury and PCBs, have the ability to bioaccumulate within the tissues of animals and can present a potential of toxicity to humans that may consume these animals as a source of food. Consumption of certain species of fish can present a health concern to individuals who eat large amounts of these fish species.

The following is a list of resources on toxicology and the exposure of hazardous chemicals to wildlife. Included in the resources are books, journals, journal articles, and organizations that discuss the following topics:

- Effects of chemicals on animal tissue
- Exposure of wildlife to pesticides
- Exposure to endocrine disruptors
- Population studies
- Impacts on ecosystems
- Toxicological impacts to reptiles, mammals, marine mammals
- Wildlife diseases
- Wildlife management
- Biomagnification.

RESOURCES

Books

Beyer WN, Heinz GH, Redmon-Norwood AW (1996)
Environmental Contaminants in Wildlife: Interpreting Tissue Concentrations
Lewis, Boca Raton, FL

Deals exclusively with the question: How much of a chemical in the tissues of an animal is harmful? This book contains not only discussions of different chemicals but also information for those doing the task of evaluating the harm of environmental contaminants to wildlife. Chemicals discussed in this book include organochlorine pesticides, PCBs, dioxins, PAHs, metals, selenium, and fluoride.

Brewer L, Fagerstone K (Eds.) (1998)
Radiotelemetry Applications for Wildlife Toxicology Field Studies
SETAC, Pensacola, FL

Represents the proceedings from a SETAC workshop on radiotelemetry in support of pesticide field studies. Includes the description and results of several radiotracking and radiotelemetry studies designed around U.S. EPA guidelines mandating registrants of pesticides to determine the 'unreasonable and adverse effects' of these pesticides on wildlife.

Gardner SC, Oberdorster E (2005).
Toxicology of Reptiles (New Perspectives: Toxicology and the Environment)
Taylor and Francis, New York

Toxicology of Reptiles cohesively summarizes much of the cutting-edge research taking place in fields such as reptilian endocrinology, neurophysiology, immunology, and ecology. This volume also addresses conservation needs along with the complications often associated with population studies. The text is easy to synthesize and apply in the evaluation and understanding of potential risks to reptiles from environmental contaminants. This book provides a comprehensive description of the current state of knowledge of reptilian toxicology from the perspective of target organ systems. It covers major contaminant classes within each chapter, focusing on contaminants of greatest concern.

Kendall R, Dickerson R, Giesy J, Suk B (Eds.) (1998)
Principles and Processes for Evaluating Endocrine Disruption in Wildlife
SETAC, Pensacola, FL

Uses a risk-based approach to provide current information, principles, and processes for evaluating the effects of endocrine-modulating chemicals on wildlife. This text is a reference tool for educational purposes and is useful to environmental and industrial managers and planners involved in environmental law and policies.

Kendall RJ, Lacher TE (Eds.) (1994)
Wildlife Toxicology and Population Modeling: Integrated Studies of Agroecosystems
CRC Press, Inc., Boca Raton, FL

The book examines the foundation of ecological modeling and its application in assessing the ecological risk assessment of agricultural chemical use. State-of-the-art techniques and methods of ecological modeling have been compiled to provide insight into what must be done to minimize the impact of agricultural chemicals and other toxic substances on the environment. *Wildlife Toxicology and Population Modeling* is encyclopedic in coverage, presenting useful tools for environmental decision-making and the latest in the theory and application of the science.

Peterle TJ (1996)
Wildlife Toxicology
Van Nostrand-Reinhold, New York

Presents an historical overview leading to current regulatory positions and follows with specifics of agent-induced changes. For specific chemicals, information regarding the breakdown and environmental partitioning, transport to and through natural systems, accumulation potential, lethal and chronic effects, and impact on ecosystems is provided, with a discussion of the evolutionary implications for man.

Shore RF, Rattner BA (Eds.) (2001)
Ecotoxicology of Wild Mammals (Ecological & Environmental Toxicology Series)
John Wiley and Sons Ltd., New York, NY

In examining the exposure and effects of environmental contaminants in wild mammal populations, this book addresses four core questions: (1) What exactly do we know about environmental contaminants in wild mammals? (2) What are the commonalities and differences between mammal orders/species in the effects that contaminants have? (3) How and to what degree of accuracy can we predict the adverse effects of environmental contaminants on mammalian wildlife? (4) How significant are contaminant insults compared with other density-independent and -dependent factors such as habitat loss, climatic factors, and disease?

Vos JG, Bossart G, Fournier M, O'Shea T (2002)
Toxicology of Marine Mammals (New Perspectives: Toxicology and the Environment)
Taylor and Francis, New York

Toxicology of Marine Mammals focuses on the effects of natural and introduced toxicants on organs and systems in marine mammals. It includes overviews on health status and contamination with chapters devoted to whales, pinnipeds, dolphins, polar bears, manatees, and sea otters. The concluding chapter addresses perspectives for the future. This volume features research from a vast geographic landscape, with case studies on intriguing areas of contamination such as the St. Lawrence River and the Baltic Sea. Toxicologists working in marine biology and veterinary medicine, conservation scientists, fisheries scientists, environmental scientists, and wildlife managers will all benefit from this comprehensive resource.

Journals

Bulletin of Environmental Contamination and Toxicology
Springer, New York, NY
Web: http://www.springerlink.com/content/1432-0800

The *Bulletin of Environmental Contamination and Toxicology* provides publication of significant advances and discoveries in the fields of air, soil, water, and food contamination and pollution as well as articles on methodology and other disciplines concerned with the introduction, presence, and effects of toxicants in the total environment.

Environmental Toxicology and Chemistry
Alliance Communications Group, Lawrence, KS

Web: http://etc.allenpress.com/entconline/?request=index-html

Environmental Toxicology and Chemistry is an international journal dedicated to furthering scientific knowledge and disseminating information on environmental toxicology and chemistry, including the application of these sciences to risk assessment.

Journal of Wildlife Diseases
Wildlife Disease Association, Inc., Lawrence, KS
Web: http://www.jwildlifedis.org

The *Journal of Wildlife Diseases* publishes the results of original research and observations dealing with all aspects of infectious, parasitic, toxic, nutritional, physiologic, developmental, and neoplastic diseases, environmental contamination, and other factors impinging on the health and survival of free-living or captive populations of wild animals, including fish.

Journal of Wildlife Management
The Wildlife Society, Bethesda, MD
Web: http://www.wildlifejournals.org

The *Journal of Wildlife Management* contains information from original research that contributes to the scientific foundations of wildlife management. Suitable topics include the results and interpretations of investigations into the biology and ecology of wildlife that can be used for management.

Organizations

The Nature Conservancy
4245 North Fairfax Drive, Suite 100
Arlington, VA 22203-1606
Phone: 703-841-5300
Web: http://www.nature.org

The Nature Conservancy is a leading conservation organization working to protect the most ecologically important lands and waters around the world for nature and people. The mission of The Nature Conservancy is to preserve the plants, animals, and natural communities that represent the diversity of life on Earth by protecting the lands and waters they need to survive.

The Society of Environmental Toxicology and Chemistry
1010 North 12th Avenue
Pensacola, FL 32501-3367
Phone: 850-469-1500
Fax: 850-469-9778
Email: setac@setac.org
Web: http://www.setac.org/

The Society provides a forum where scientists, managers, and other professionals exchange information and ideas for the development and use of multidisciplinary scientific principles and practices leading to sustainable environmental quality.

The Wildlife Society
5410 Grosvenor Lane, Suite 200
Bethesda, MD 20814-2144
Phone: 301-897-9770
Fax: 301-530-2471
Email: lisa@wildlife.org
Web: http://www.wildlife.org

The Wildlife Society (TWS), founded in 1937, is an international non-profit scientific and educational association dedicated to excellence in wildlife stewardship through science and education. Their mission is to enhance the ability of wildlife professionals to conserve diversity, sustain productivity, and ensure responsible use of wildlife resources for the benefit of society. TWS has a wildlife toxicology working group: http://www.wildlife.org/wg/toxicology.

Epidemiology

AMANDA S. PERSAD

'I have yet to see any problem, however complicated, which, when you look at it in the right way, did not become still more complicated.'

Paul Anderson

Quoted in Anderson & May, *Infectious Diseases of Humans: Dynamics and Control*, Oxford University Press 1991

INTRODUCTION

With the establishment of relationships between environmental and occupational exposures and adverse human health effects, epidemiology has gained increasing recognition due to its contribution to risk assessment. Loosely defined as the study of the distribution and determinants of health-related states in human populations, epidemiology, in terms of risk assessment, evaluates the association between exposure and disease risk in humans. Epidemiology studies have aided in identifying potential health hazards that stem from a host of exposures including occupation (e.g., radiation and leukemia), diet (e.g., vitamin A and liver toxicity), microorganisms (e.g., human papilloma virus and cervical cancer), hormones (e.g., hormonal drugs and birth defects), and the environment (e.g., lead and mental development).

Epidemiology studies are divided into two main categories, experimental and observational (Rothman & Greenland 1998). Experimental studies such as clinical trials are typically utilized in the pharmaceutical industry. In toxicology and risk assessment, observational study designs are more prevalent. These observational studies are subdivided into hypothesis-generating studies, which include case reports/series, ecological studies and some cross-sectional studies, and hypothesis-testing studies such as cohort and case-control studies. The latter study designs are favored as they convey more robust information about the association between an exposure and a potential disease risk, and have less potential for bias.

Causation and the criteria for causation have been a contentious issue in epidemiology. Early observational epidemiology studies dealt with acute, infectious diseases in which a pathogen or a causative agent could be readily traced and causation could be established with Koch's postulates. With environmental or occupational exposures and diseases with long latency periods, the establishment of a causal link is a challenge (Persad et al 2003). Of the many theories proposed for the determination of causal relationship between exposure and disease, Hill's criteria have been the most widely accepted (Hill 1965).

The field of epidemiology continues to evolve as genomics and molecular epidemiology yield tools to identify susceptible populations, biomarkers for exposure, and a better understanding of the underlying mechanisms linking exposure and health outcome. This chapter provides a list of resources that highlight the advances in epidemiology in the last 10 years.

RESOURCES

Books

Aldrich T, Griffith J, Cooke C (2002)
Environmental Epidemiology and Risk Assessment
John Wiley & Sons Inc, Hoboken

Introduces environmental epidemiology and risk assessment through historical environmental incidents such as Chernobyl, Love Canal, and Seveso. This 'how to' book provides instruction on study design and conduct of epidemiology studies as well as considerations for disease mechanisms, disease clusters, and surveillance techniques.

Aschengrau A, Seage GR (2007)
Essentials of Epidemiology in Public Health, 2nd Edition
Jones and Bartlett Publishers, Sudbury

Covers the basic epidemiologic concepts and data sources. This introductory text contains full chapters on bias, confounding, effect modification and the role of statistics in epidemiology, and uses current examples from the epidemiologic literature throughout.

Bertollini R, Lebowitz MD, Saracci R, Savitz DA (1996)
Environmental Epidemiology: Exposure and Disease
Lewis, Boca Raton, FL

Identifies priorities for research relevant to public health in selected areas of environmental epidemiology. This text covers various areas of environmental epidemiology from three different points of view: environmental exposures, epidemiological methodology, and major disease groups.

Buffler P, Rice J, Bird M, Boffetta P (Eds.) (2004)
Mechanisms of Carcinogenesis: Contributions of Molecular Epidemiology
IARC, Lyon

Report based on the November 2001 'Mechanistic Considerations in Molecular Epidemiology of Cancer' workshop. This report highlights metabolic and biochemical issues in molecular epidemiology of cancer. Additionally, gene–environment interactions, gene–gene interactions, and hypothesis-generating tools for determining cancer etiology are also discussed.

Carrington M, Hoelzel AR (Eds.) (2001)
Molecular Epidemiology: A Practical Approach
Oxford University Press, Oxford

Provides a broad overview of molecular epidemiology emphasizing basic concepts and methodologies, recent advances in host genetics, and the relationship between pathologies and immune system genetics.

Checkoway H, Pearce N, Kriebel D (2004)
Research Methods in Occupational Epidemiology, 2nd Edition
Oxford University Press, New York

Introduces research approaches specific to occupational epidemiology. In addition to basic epidemiology concepts, this book discusses occupational health surveillance and exposure measurement. This text is designed to serve as both a textbook for courses on occupational epidemiology and as a practical handbook for practicing professionals.

Couturier AJ (Ed.) (2000)
Occupational and Environmental Infectious Diseases: Epidemiology, Prevention, and Clinical Management
OEM Health Information, Beverly Farms

One-stop resource for key information on the occupational and environmental infectious diseases. This book covers OSHA bloodborne pathogen standard, emerging and re-emerging infectious diseases, zoonotic diseases, traveler- related infections, biologic warfare/terrorism and ADA/FMLA issues.

Day INM (Ed.) (2002)
Molecular Genetic Epidemiology: A Laboratory Perspective
Springer-Verlag, Berlin

Describes established methodologies in population-based molecular genetics. This book is geared towards research scientists, pharmaceutical companies, and research clinicians interested in characterizations of clone banks, mapping of genomes, and linkage and association studies of single-gene and complex traits in humans, animals, and plants.

Elliott P, Cuzick J, English D, Stern R (Eds.) (1996)
Geographical and Environmental Epidemiology: Methods for Small Area Studies
Oxford University Press, New York

Address both the theoretical and practical issues that surface when describing the geographical distribution of disease. This book uses case studies to showcase problems faced when investigating apparent disease clusters.

United Nations Environment Programme, World Health Organization, International Labour Organisation, International Program on Chemical Safety (1983).

Frank G (2007)
Community Nutrition: Applying Epidemiology to Contemporary Practice, 2nd Edition
Jones and Barlett Publishers, Sudbury

Geared for a graduate-level audience, this textbook illustrates how epidemiology can be utilized in the field of community nutrition. This book provides up-to-date information on general population nutrition, dietary guidance, and nutrition in chronic disease among other topics.

Friedman GD (2004)
***Primer of Epidemiology, 5th* Edition**
McGraw-Hill, New York

Offers a concise introduction to the field of epidemiology. In 18 chapters, this primer covers basic principles, types of study designs, statistical overview, forefronts in epidemiology, and study problems with answers.

Friis RH, Sellers TA (2003)
Epidemiology for Public Health Practice, 3rd edition
Jones and Bartlett Publishers, Sudbury

Provides a comprehensive overview of the fundamentals of epidemiology. This textbook covers major topics ranging from study designs and methodology to quantitative analysis.

Gerstman BB (2003)
Epidemiology Kept Simple: An Introduction to Classic and Modern Epidemiology, 2nd Edition
Wiley-Liss, Hoboken

A concise textbook describing the fundamental concepts, principles, and methods of classic and modern epidemiology through real-life examples, exercises, and occasional humor.

Gordis L (2004)
Epidemiology, 3rd Edition
W.B. Saunders, Philadelphia

Describes the principles of epidemiology along with public policy and ethical concerns using an 'easy to understand' approach. This textbook utilizes figures, cartoons, and review questions to bolster the material presented.

Graham JD (Ed.) (1995)
The Role of Epidemiology in Regulatory Risk Assessment
Elsevier, Amsterdam

Based on the Proceedings of the Conference on the Proper Role of Epidemiology in Risk Analysis, Boston, MA, 13–14 October 1994.

Higginson J, Muir CS, Munoz N (2005)
Human Cancer: Epidemiology and Environmental Causes
Cambridge University Press, New York

Provides a global picture of the epidemiology of cancer and its environmental causes. This reference covers general epidemiological methods, suspected etiologies, specific cancer types, and legal and ethical issues related to cancer epidemiology.

Kelsy JL, Whittemore AS, Evans AS, Thompson WD (1996)
Methods in Observational Epidemiology, 2nd Edition
Oxford University Press, New York

Provides a complete overview of the design, conduct, and analysis of observational studies.

Khoury MJ, Little J, Burke W (Eds.) (2003)
Human Genome Epidemiology: A Scientific Foundation for Using Genetic Information to Improve Health and Prevent Disease (Monographs in Epidemiology and Biostatistics)
Oxford University Press, New York

Explores the role of epidemiology methods and its application in genomics. Using disease-specific case studies, this book illustrates the methodologic approaches used in genetic epidemiology.

Jekel JF, Katz DL, Elmore JG (2007)
Epidemiology, Biostatistics, and Preventive Medicine-with Student Consult Online, 3rd Edition
W.B. Saunders, Philadelphia

Integrates epidemiology, biostatistics, preventive medicine and public health in terms of clinical relevance. This textbook is designed for medical and public health students, using real-life medical examples and including USMLE-style questions with detailed answers and explanations.

Merril RM, Timmreck TC (2006)
Introduction to Epidemiology, 4th Edition
Jones and Bartlett Publishers, Sudbury

Introductory textbook that covers a broad scope of topics in epidemiology. This book is designed for practicing professionals in health care as well as undergraduate and graduate students in public health.

Morton RF, Hebel JR, McCarter RJ (2004)
A Study Guide to Epidemiology and Biostatistics, 5th Edition
Jones and Bartlett Publishers, Sudbury

Comprehensive study guide that introduces the fundamentals of epidemiology and biostatistics. The clear explanations in this book are accompanied by online self-assessment quizzes.

Nasca P, Pastidas H (2007)
Fundamentals of Cancer Epidemiology, 2nd Edition
Jones and Bartlett Publishers, Sudbury

Well-rounded textbook on cancer epidemiology. In addition to defining cancer and cancer etiology, the text includes discussions about cancer screening, interactions of genetic and environmental risk factors, and cancer prevention strategies.

National Research Council, Committee on Environmental Epidemiology (1997)
Environmental Epidemiology, Volume 2: Use of the Gray Literature and Other Data in Environmental Epidemiology
National Academy Press, Washington, DC

Describes effective epidemiological methods for analyzing data and focuses on errors that may occur in the course of analyses. Also investigates the utility of the gray literature in helping to identify the often elusive causative agent behind reported health effects.

Nieuwenhuijsen M (Ed.) (2003)
Exposure Assessment in Occupational and Environmental Epidemiology
Oxford University Press, Oxford

Outlines basic principles of exposure assessment. This reference identifies cutting-edge methods and application in assessing occupational and environmental pollution and subsequent adverse health effects.

Oleckno WA (2002)
Essential Epidemiology: Principles and Applications
Waveland Press Inc., Prospect Heights

Comprehensive textbook that covers the basic principles and methods of epidemiology. Geared for undergraduate and graduate students in the health professions, this book utilizes algorithms and annotated step-by-step solutions to assist students in grasping the principles of epidemiology.

Rothman KJ (2007)
Modern Epidemiology, 3rd Edition
Lippincott-Raven, Philadelphia

Covers the principles and methods of contemporary epidemiologic research. Specific research areas include infectious diseases; ecologic studies; disease surveillance; analysis of vital statistics; screening; and clinical, environmental/occupational, reproductive/perinatal, genetic, and nutritional epidemiology.

Scutchfield FD, Keck W (2002)
Principles of Public Health Practice, 2nd Edition
Delmar Learning, Clifton Park

Describes the characteristics of local, state, and federal agencies involved in public health practice. This resource examines current topics such as performance standards, the public health workforce, and international health.

Selvin S (2004)
Statistical Analysis of Epidemiologic Data, 3rd Edition
Oxford University Press, New York

Surveys many statistical methods with application to epidemiologic data. It draws from the fields of statistics, biostatistics, vital statistics, and epidemiology.

Steenland K, Savitz D (Eds.) (1997)
Topics in Environmental Epidemiology
Oxford University Press, New York

Presents a comprehensive overview of the epidemiology of common environmental exposures. This book highlights the design, analysis, and overall methodology of epidemiology studies. Additionally, topics such as risk assessment, meta-analysis, and exposure are also discuss**e**d.

Strom BL, Kimmel SE (Eds.) (2007)
Textbook of Pharmacoepidemiology
J. Wiley, Chichester

One-stop resource for pharmacoepidemiology. This textbook is designed for those seeking an introduction in pharmacoepidemiology as well as practicing professionals in need of a reference source. The book covers the range of methodologies used to evaluate safety and effectiveness of medicines, details of potential data sources, and evaluation issues.

Szklo M, Javier Nieto F (2005)
Epidemiology: Beyond the Basics, 2nd Edition
Jones and Bartlett Publishers, Sudbury

Intermediate-level textbook providing more rigorous discussion on fundamentals in epidemiology. Using real-life examples, the book broadens the readers' understanding of epidemiology by presenting topics such as sensitivity analysis, meta-analysis, and exploring the role of this field in medicine and public health.

Thomas DC (2004)
Statistical Methods in Genetic Epidemiology
Oxford University Press, Oxford

Presents an overview of statistical methods of data analysis through examples from the scientific literature. In addition, this comprehensive reference includes chapters on molecular biology, genetics, epidemiology, and statistics.

Wilkinson, P. (Ed.) (2006)
Environmental Epidemiology
Open University Press, New York

Resource for public health practitioners to assist with investigating and interpreting potential health hazards. This book covers five major areas: clusters, air pollution, radiation and hazardous waste, water and health, and climate change.

Guidelines on Studies in Environmental Epidemiology
World Health Organization, Geneva

Based on the October 1975 WHO Study Group on Epidemiological Methods for Assessment of the Effects of Environmental Agents on Human Health. The guidelines cover a broad spectrum of topics including study designs, exposure assessment, measurement, and interpretation of health effects, organization and conduct of studies, analysis, interpretation, reporting, and uses of epidemiology studies.

Journals

American Journal of Epidemiology (1952–)
Oxford University Press, Cary
http://aje.oxfordjournals.org

Publishes empirical research findings and epidemiology research methodology articles. The journal is geared towards epidemiologists and those who use epidemiological data.

American Journal of Public Health (1911–)
American Public Health Association, Washington, DC
http://www.ajph.org

Includes articles relating to original research, research methods, and program evaluation in the field of public health. This journal also serves as a forum for the analysis of health policy.

Annals of Epidemiology (1990–)
Elsevier for American College of Epidemiology, Philadelphia
http://www.annalsofepidemiology.org/

Peer-reviewed, international journal that emphasizes the use of epidemiology in a multidisciplinary approach to understanding disease etiology.

Cancer Epidemiology, Biomarkers and Prevention (1990–)
American Association for Cancer Research, Philadelphia
http://cebp.aacrjournals.org/

Includes peer-reviewed research articles on cancer causation, mechanisms of carcinogenesis, use of biomarkers, and the role of behavioral factors in cancer etiology prevention, and survivorship.

Epidemiology (1990–)
Williams and Wilkins and Epidemiology Resources, Cambridge
http://www.epidem.com

Publishes on a broad spectrum of epidemiologic topics including chronic, reproductive, environmental, psychosocial, infectious-disease and genetic epidemiology. Additionally, this journal places special emphasis on theory and methodology, and welcomes articles that explore the fundamentals of epidemiology.

Epidemiology and Infection (1987–)
Cambridge University Press, Cambridge

Includes articles that focus on the prevention and control of infectious diseases in both man and animals. In addition to microbiology, virology, immunology, tropical infections, this journal publishes articles on the clinical, social, and public health aspects of disease.

European Journal of Epidemiology (1985–)
Springer, Dordrecht
http://www.springerlink.com/content/1573-7284

Publishes a broad range of articles that relate to different aspects of epidemiology. Areas of interest include public health planning, preventive medicine, clinical trials, vaccinology, psychology, molecular biology, mathematical modelization, and computer sciences. This journal also considers articles that discuss social, economical, and political issues that influence the science.

Genetic Epidemiology (1984–)
Wiley-Liss, New York

Considers articles that explore the genetic etiology of human traits in families and populations. The journal includes articles on the relative contribution of genetic and environmental factors to human disease, applied research and statistical methodologies that advance the field of genetic epidemiology.

International Journal of Epidemiology (1972–)
Oxford University Press, London

Publishes research on a broad spectrum of epidemiology topics including research and application of findings from both communicable and non-communicable diseases studies as well as cutting-edge methodologies for data analysis.

Internet Journal of Epidemiology (2003–)
Internet Scientific Publications, Sugar Land
http://www.ispub.com/ostia/index.php?xmlFilePath=journals/ije/front.xml

Peer-reviewed, open access journal publishing articles from all aspects of epidemiology.

Journal of Clinical Epidemiology (1955–)
Elsevier, New York

Emphasizes research and application of epidemiology findings in the clinical setting.

Journal of Epidemiology and Community Health (1947–)
British Medical Association, London
http://jech.bmjjournals.com/

Includes original research, opinions and literature pertaining to all aspects of epidemiology and public health.

Journal of Exposure Science and Environmental Epidemiology (1999–)
Nature Publishing Group, New York
http://www.nature.com/jes

Publishes research on exposure assessment for toxic substances as well as advances in exposure analysis.

Ophthalmic Epidemiology (1994–)
Taylor and Francis, Abingdon

Publishes articles related to ophthalmic epidemiology, public health, and prevention of blindness.

CHAPTER

29

Ethical Considerations

STEVEN G. GILBERT

INTRODUCTION

The foundation of our decision making rests on knowledge gained by experience and research but is overlaid by individual values and a broader construct of ethics. Toxicological research and experience has provided enormous amounts of data which must be translated into information. This information along with our values and ethics guides our decision making. Garrett Hardin observed that 'It is our considered professional judgment that this dilemma has no technical solution.' (Hardin 1968). It is through our science and ethics that we must manage the commons combined with knowledge of our technology. The expanding influence of the toxicological sciences on individual, business, and societal issues confers a great responsibility that demands increasing sensitivity to the ethical, legal, and social implications of toxicology.

Multiple elements have converged to highlight the ethical dynamics of toxicology. There is greater recognition of the ethical dimension of decision-making that incorporates toxicological information. This has resulted in an increasingly well-defined framework for discussing our social and ethical responsibility. There is a growing recognition that ethics plays a crucial role in public health decision-making that often involves conflicts between individual, corporate, and social justice goals. Consensus has developed that all research involving humans or animals must be conducted in a responsible and ethical manner. Finally, it is incumbent upon individuals involved in toxicological research to be aware of biases and potential conflicts of interest and adhere to the highest ethical standards.

Aldo Leopold, arguably, America's first bioethicist wrote in 1949: 'A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise.' (Leopold 1949). This statement speaks to the essence of toxicology which is to understand the effects of chemicals on the biotic community. The health effects of chemicals on the community are clearly evident from our experiences with PCPs, lead, DDT, and other persistent chemicals. Subsequently, it was recognized that some segments of our society were deferentially at risk from chemical exposure which evolved into an appreciation of environmental justice. Environmental justice is now an important component of many community-based programs. In addition there is a growing appreciation for the direct financial cost to society as well as the individual cost related to environmental exposures many of which are not distributed equally across society.

Biomedical ethicists developed a more formal approach for health care based on the four principles of biomedical ethics, respect for autonomy, beneficence (do good), non-maleficence (do no harm), and justice (be fair) became well established as a basis for decision-making (Beauchamp et al 1994). These principles formed the foundation for rules and regulations regarding the conduct of human research and ultimately animal research. A further evolution is the development of community-based participatory research which takes into consideration issues at the community level. Incorporating elements of science and ethical philosophy into a single statement, the precautionary principle, acknowledges that ethics and values are part of the decision-making process with

regard to human and environmental health (see Chapter 43, *Precautionary Principle*).

Toxicologists are often involved in the interpretation of data that influence regulatory policy which has raised the possibility of conflicts of interest affecting the decision-making process. This has resulted in more emphasis on conflict of interest issues and on guidelines for individual disclosures. These issues are central to individual values and integrity and influence of interpretation and communication of research results. Many professional societies have established codes of ethics for their members.

The commitment to examine the ethical, legal, and social implications of the toxicological sciences has grown along with its influence on societal issues.

Books

Beauchamp TL, Childress JF (1994)
***Principles of Biomedical Ethics*, 4th edition**
New York: Oxford University Press.

An overview of the philosophical foundations of biomedical ethics followed by a discussion of the four principles of biomedical ethics: respect for autonomy, nonmaleficence, beneficence, and justice.

Hayward T (2005)
Constitutional Environmental Rights
Oxford: Oxford University Press.

Addresses issues related to human rights to an adequate environment and why it is both feasible and necessary to incorporate into state constitutions.

Institute of Medicine (2002)
Integrity in Scientific Research: Creating an Environment That Promotes Responsible Conduct
United States: National Academies Press.

This report focuses on integrity and the elements that foster an environment that enable and encourage individuals to act with integrity.

Jonas H (1984)
The Imperative of Responsibility – In Search of an Ethics for the Technological Age
Chicago and London: The University of Chicago Press.

Examines the foundation of ethics in light of technological developments and advances in scientific knowledge. This is a broad overview but raise important issues for the toxicologist and risk management in a society dependent on chemicals.

Leopold A (1949)
A Sand County Almanac
Reprinted by Ballantine Books, 1991.

Aldo Leopold is arguably the first to express the basic concept of bioethics, while addressing of land use and the biotic community that exists with the land. A great orginal work, this is one of the foundational books of environmental and human ethics in United States.

Pojman LP (2005)
Environmental Ethics – Readings in Theory and Application
United States: Thomson Wadsworth.

Starting with an historical perspective on the development of environmental ethics and then reviews various ethical theories. It concludes with articles and essays on the practical consideration of ethics relevant to toxicology such as pesticides.

Shamoo AE, Resnik DB (2002)
Responsible Conduct of Research
New York: Oxford University Press.

Provides an introduction to the ethical issues involved in the conduct of biomedical research. Include are questions for discussion and case studies on topics of authorship, intellectual property, peer review, and conflict of interest.

Journals

The American Journal of Bioethics (2001–)
Taylor and Francis Group, London
http://www.bioethics.net/

Includes articles on wide range of bioethical issues.

Ethics in Science and Environmental Politics
Inter-Research Science Center
http://www.int-res.com/journals/esep/esep-home/

An international publication, ESEP provides a global stage for presenting, discussing, and developing issues concerning ethics in science, environmental politics, and in the new constructs of eco-ethics and econ-ethics.

***Online Journal of Health Ethic*s**
ISSN: 1551-4218
The University of Mississippi Medical Center
School of Nursing
2500 North State Street
Jackson, Mississippi 39216-4505
http://ethicsjournal.umc.edu/ojs/index.php

Provides a forum to inform ethical debates from a worldview that includes a wide range of articles.

CHAPTER

30

Everyday Exposures

ASISH MOHAPATRA, AND PERTTI J. HAKKINEN

INTRODUCTION

The objective of this chapter is to list information resources, including emerging and cutting edge ones, available in exposure and risk assessment as they relate to everyday exposures. Information resources have also been provided in the areas of exposure controls and other risk management measures so that reduction or elimination of some exposures can be effectively achieved.

A thorough quantitative analysis of exposure assessment information is critical to understand the complex everyday exposure patterns from a public health risk assessment perspective. Daily living can involve exposures up to thousands of chemicals from many sources. Documented non-occupational sources include consumer products, residential and other water, indoor and outdoor air, food and food packaging, beverages, toys, furniture, carpeting, paint, and other building materials, household dust containing chemicals from consumer products, outdoor soil, and soil tracked indoors.

The consumer product exposures can involve many products, perhaps 20 or more during a day, used alone or in combination, and a single product can include several hundred chemicals. The uses of household cleaning, personal care, and other types of products can lead to dermal, inhalation, and oral exposures. For example, oral exposures can occur for a toothpaste chemical, and a detergent residue or other component of a fabric being mouthed by a child.

The use of residential and non-residential water can lead to dermal, inhalation, and oral exposures, e.g., skin contact during showering and inhalation of chemicals volatilized during and after showering. Further, indoor and outdoor inhalation exposures to the chemicals in air can be in addition to deposition on and absorption into household materials (e.g., carpets and foods and food packaging), leading to dermal and oral exposures. While air levels are most often associated with inhalation exposure, other types of air-related exposures can occur, e.g., dermal uptake of chemicals found in vapors has been observed, as has the ability to swallow chemicals that enter the respiratory tract. The ingestion of the chemicals found in foods and beverages involves hundreds of chemicals, and breast milk is another documented source of exposure to many chemicals.

A recent area of strong research interest is the study of indoor air chemistry, including the reactions that can occur between ozone and the chemicals used in cleaning products, air fresheners, and paint. For example, the terpenes widely used in consumer products can react with ozone under product use conditions, leading to formation of formaldehyde, hydroxyl radical, and secondary organic aerosol (very small particles that can be inhaled).

Human behavior and decisions can play large roles in determining the sources of, and the types and levels of exposures to chemicals. For example, personal cleaning habits can help determine how clean a residence is kept. Other important personal behaviors and decisions include: (1) the types of consumer products that are purchased, (2) where and how the consumer and other occupants of the residence use the products, (3) how products might be used together for various cleaning tasks, and (4) whether kitchen or bathroom fans are used or windows are opened to

increase the circulation of air if certain consumer products are used.

According to Ott et al (2007), the classical *source-oriented approach* (that looks for contamination at the source and then calculates how much exposure there is at the receptor level) has been difficult in establishing a definitive linkage between exposure to pollutants and stressors from a source and its impact to a receptor (humans or animals). Furthermore, Ott et al (2007) has proposed that the emerging exposure science field should follow a *receptor-oriented approach* that approaches measurements of pollutants or stressors at the contact boundary of the person and then works backward from the personal exposure to find the actual source. This emerging approach has shown promise in identifying new sources of pollutants. This direct measurement of exposure has led to investigating new indoor sources in consumer grade products (e.g., toys and other products are a subject of rigorous testing and analysis for lead), building materials and human activities.

It is obvious that a person's daily exposure to a single chemical might come from many sources. Further, these sources, when combined over the minute-by-minute activities and locations, can possibly lead to daily exposures to hundreds of chemicals. The information resources provided include books and published reviews about everyday exposures to chemicals, publications covering some of the points noted above, professional societies and other organizations relevant to this topic, and useful web-based databases. Readers also interested in daily exposures to biological and physical agents can use the *Residential Exposure Assessment: A Sourcebook* chapters noted below, and the Loftness, Hakkinen, Adan, Nevalainen (2007) 'Elements That Contribute to Healthy Building Design' review as entry points.

RESOURCES

Books

Baker SR, Driver J, McCallum D (eds) (2001)
Residential Exposure Assessment: A Sourcebook
Kluwer Academic/Plenum Publishers, New York, NY.
Hardcover: 394 pages
Language: English
ISBN: 0306465175

This book, initiated by the Society of Risk Analysis (SRA) and the International Society of Exposure Science (formerly the International Society of Exposure Analysis), is a compendium of information written by residential exposure experts about predictive methods and tools, monitoring methods, data sources, and key variables that characterize chemical, biological agent, and physical agent exposures in and around all types of residences (apartments, single-family homes, condominiums, farmhouses, mobile homes, row houses, retirement homes, and school dormitories). Residential exposure assessments are used to check indoor air quality, compliance with U.S. and other statutes, and as part of the evaluation of consumer product safety. Sample chapters include:

Burge H 'Biological Agents'

Driver J, Connor J, Jr, Guiseppi-Elie A, Hakkinen PJ, McCallum D, McKone T, Schreiber J, Spengler J, Tell J, Wallace L, Wood W, Youngren S 'General framework for assessing potential human exposures to chemical, biological, and physical agents in the residential environment.'

Whitmyre G, Dang W, Driver J, Eberhart M, Fell L, Hakkinen PJ, Jaycock M, Kennedy P, Osimitz T 'Consumer products and related sources.'

Claire A Franklin (author), John P Worgan
Occupational and Residential Exposure Assessment for Pesticides
Wiley Series in Agrochemicals & Plant Protection (Hardcover)
Hardcover: 438 pages
John Wiley and Sons Ltd
ISBN: 0471489891

This book focuses on the exposure to pesticides by agricultural workers and residential users of pesticides through inhalation and physical contact. It discusses more recently discovered risks such as pesticides on indoor carpets and includes new trends in data interpretation. This title complements the other title on pesticide exposure in the series: '*Pesticide Residues in Drinking Water*.'

NAS (National Academy of Sciences), Subcommittee on Flame-Retardant Chemicals, Committee on Toxicology, Board on Environmental Studies and Toxicology, National Research Council (2000)

Toxicological Risks of Selected Flame-Retardant Chemicals

National Academies Press; Washington, D.C.
http://www.nap.edu/catalog/9841.html (Executive summary)

The subcommittee was charged to review the toxicological and exposure data for 16 flame-retardant chemicals to assess potential health risks to consumers and the general population resulting from potential exposure to these chemicals in residential furniture. The subcommittee was also asked to identify data gaps and make recommendations for future research. The subcommittee was not charged or able, with the available data and resources, to evaluate adverse effects from occupational exposures, or the potential ecological effects that might result from the disposal of household furniture. The subcommittee assumed that human exposure to flame-retardant chemical-treated fabric in homes can occur potentially via skin contact, ingestion (specifically for infants or children who might suck or chew on fabric), inhalation of particles generated during abrasion of surface fibers, and inhalation of vapors off-gassing from treated fabric.

Robert A Howd, Anna M Fan (Eds) (2007)
Risk Assessment for Chemicals in Drinking Water
Hardcover: 392 pages
Wiley-Interscience
ISBN-10: 0471723444
ISBN-13: 978-0471723448

This is a comprehensive reference on state-of-the-art risk assessment methodologies for drinking water. The book discusses the major steps and goals in risk assessments and suggests ways to improve the methodologies and accuracy, while consolidating up-to-date information on the current principles and practices in one authoritative reference. It includes an overview of risk assessment practices and regulatory guidelines; describes the use of variability analysis, exposure analysis, physiologically based pharmacokinetics, and modeling for both cancer and non-cancer endpoints. Furthermore, it describes the practices of major organizations, including the USEPA, Health Canada, World Health Organization (WHO), and California Office of Environmental Health Hazard Assessment. It includes complete chapters on risk assessment for essential nutrients, arsenic, chloroform, and perchlorate. The book explains how to address susceptible sub-populations, including the elderly and infants and children, in risk assessments. The book covers the potential of using genomic and proteomic screens and addresses recent advances, emerging issues, and future challenges in various drinking water contaminant issues. This is stated to be the definitive resource for health and environmental scientists, toxicologists, risk assessors and managers, regulators, consultants, and other professionals responsible for the safety of drinking water.

M Schapiro (2007)
The Toxic Chemistry of Everyday Products and What's at Stake for American Power
Hardcover: 224 pages
ISBN: 978-1-933392-15-8
Chelsea Green Publishing, White River Jct., VT

This book 'shows how laws adopted by the European Union – where stricter consumer-safety standards are in place – have forced multinationals into manufacturing safer products.' It 'will change the way American consumers think about everyday products – from plastic softeners that can contribute to sexual malformations to lipstick additives that are potential toxins to the brain, liver, kidneys, and immune system. And it will stir them into forcing our government to take the lead of others, including the European Union, China, and countries in Central and South America.'

Stephen S Olin (Ed.) (1998)
Exposure to Contaminants in Drinking Water: Estimating Uptake through the Skin and by Inhalation
Hardcover: 256 pages
CRC Press
ISBN-10: 0849328047
ISBN-13: 978-0849328046

The book examines the state of science, identifies and reviews the available information resources; evaluates various models and approaches; and demonstrates the feasibility of developing estimates of the distribution of absorbed doses of contaminants in drinking water through contact with the skin and by inhalation. This book is the product of a 15-member expert working group formed by the Risk Science Institute (RSI) of the International Life Sciences Institute (ILSI) under a cooperative agreement with the U.S. Environmental Protection Agency's (USEPA) Office of Water. The authors are experts in exposure modeling and measurement; water chemistry; time-activity patterns; dermal and respiratory uptake; and the use of probability distributions in characterizing exposures.

Wayne R. Ott, Anne C. Steinemann, Lance A. Wallace (2006)
Exposure Analysis
ISBN: 1566706637
Number of pages: 533
CRC Press

This book is stated to be a first-of-its-kind resource in the emerging scientific discipline of 'exposure analysis.' It is a comprehensive source on the environmental pollutants that affect human health and it discusses human exposure through pathways including air, food, water, dermal absorption, and, for children, non-food ingestion. The existing knowledge and methodology for major pollutants such as VOCs, particles, and pesticides and basic mathematical methods and practical tools used by the exposure analyst are reviewed. This book provides the basic tools needed to identify sources, understand causes, measure exposures, and develop strategies for improving public health. Furthermore, the book summarizes existing definitions of exposure, dose, and related concepts and provides the mathematical framework at the heart of these conceptual definitions. Using secondhand smoke (SHS) as an example, the book illustrates how exposure analysis studies can change human behavior and improve public health. An extensive section on air pollutants considers volatile organic compounds (VOCs), carbon monoxide (CO), fine and ultrafine particles, and the latest personal air quality monitors for measuring individual exposure. Another detailed section examines exposures to pesticides, metals such as lead, and dioxin that may occur through multiple routes such as air, food, and dust ingestion. The book explores important aspects of dermal exposure such as the absorption of volatile organic compounds while showering or bathing and exposure through multiple carrier media. The authors describe quantitative methods that have been validated for predicting the concentrations in enclosed everyday locations, such as automobiles and rooms of the home. They also discuss existing laws and examine the relationship between exposure and national policies.

Journals

Journal of Exposure Science and Environmental Epidemiology *(JESEE*, formerly the *Journal of Exposure Analysis and Environmental Epidemiology*)
Nature Publishing Group (NPG); USA
Website: http://www.nature.com/jes/index.html

This publication includes peer-reviewed research important to exposure assessment for toxic substances, environmental epidemiology that includes a strong exposure analysis component, and related disciplines that advance the exposure assessment process. *JESEE* also publishes papers on exposure analysis such as measurements and modeling; mechanisms of exposure; development of molecular biomarkers; genomic, proteomic, and metabonomics studies that assess exposure in the context of health effects; studies on chemical, biological, and physical principles required to analyze human exposure from single and multiple routes; occupational exposure studies; and, population-based studies. It is the official publication of the International Society of Exposure Science (ISES), formerly the International Society of Exposure Analysis (ISEA).

There are no other peer-reviewed journals focused on 'Exposure Science, Assessment and Analysis' topic.

The following journals publish original research articles, reviews, and other experimental studies in exposure science, assessment, and analysis. Detailed information on these journals can be found elsewhere in this book. Other public-health-related journals carry exposure-science-related articles.

- *Environmental Health Perspectives*
- *Environmental Science & Technology*
- *Risk Analysis*
- *Science of the Total Environment*
- *Toxicology*
- *Toxicology Letters*
- *Toxicological Sciences*
- *Journal of Toxicology and Environmental Health* (critical reviews).

Organizations and Web Portals

International Society of Exposure Science (ISES), formerly the International Society of Exposure Analysis (ISEA)

The ISES was established in 1989 to foster and advance the science of exposure analysis related to environmental contaminants, both for human populations and ecosystems. The membership promotes communication among all disciplines involved in exposure analysis, recommends exposure analysis approaches to address substantive or methodological concerns, and works to strengthen the impact of exposure assessment on environmental policy (excerpted from http://www.iseaweb.org/). For contact information check http://www.iseaweb.org/officers/to contact one of the executive members or officers of the society. Glossary of Exposure Analysis is available at http://www.iseaweb.org/glossary.php

Society of Risk Analysis (SRA) – Exposure Assessment Specialty Group (EAS)

The EAS Group includes SRA members interested in the role of exposure assessment in risk analysis. The Group promotes and fosters independent and collaborative research in all facets of exposure science to advance the state of the art and serves as a resource to the Society in matters concerning the role of exposure in risk analysis (http://www.sra.org/about_specialty_groups_overview.php#exp).

ExposureScience.Org

This website is intended as an independent public service and information resource for the scientific community. It is not officially affiliated with any government agency or industry group. The main authors of materials on this website are academic researchers. ExposureScience.Org hosts research projects in the field of exposure science, provides a forum for scientists and researchers to collaborate and exchange ideas in the emerging areas of exposure science, assessment, and analysis. It also provides public access to various scholarly materials and information resources related to the different exposure-science-related projects. The web portal allows downloading of published articles, reports, software, and data related to exposure science research work. The web portal also maintains private areas (member only) of the site where research discussions and posts can be made prior to any formal publication. To contact the executive body of this web portal, access http://www.exposurescience.org/contact.

United States Environmental Protection Agency (USEPA)

http://www.epa.gov/heasd/ctepp/index.htm

Report Title: Protecting Children's Health: an EPA Study Measures the Levels of Commonly Used Chemicals in Homes and Day Care Centers

Report Title: Evaluating Exposures to Toxic Air Pollutants: A Citizen's Guide
http://www.epa.gov/ttn/uatw/3_90_023.html

(U.S.) Consumer Product Safety Commission (CPSC)
http://www.cpsc.gov/

The US CPSC is charged with protecting the public from unreasonable risks of serious injury or death from more than 15 000 types of consumer products under the agency's jurisdiction. The CPSC is committed to protecting consumers and families from products that pose a fire, electrical, chemical, or mechanical hazard or can injure children. The CPSC's work to ensure the safety of consumer products – such as toys, cribs, power tools, cigarette lighters, and household chemicals – contributed significantly to the 30% decline in the rate of deaths and injuries associated with consumer products over the past 30 years (excerpted from http://www.cpsc.gov/about/about.html).

The library section of the CPSC webpage has a lot of relevant information resources related to consumer products, safety and injury issues and household chemical exposure issues (http://www.cpsc.gov/library/library.html).

Health Canada
Consumer Products and Safety

'Health Canada helps protect the Canadian public by researching, assessing and collaborating in the management of the health risks and safety hazards associated with the many consumer products, including pest management products, that Canadians use everyday' (excerpted from http://www.hc-sc.gc.ca/cps-spc/index_e.html).

Relevant information resources available on:
Children's products (http://www.hc-sc.gc.ca/cps-spc/child-enfant/index_e.html);
Household products (http://www.hc-sc.gc.ca/cps-spc/house-domes/index_e.html);
Personal products (http://www.hc-sc.gc.ca/cps-spc/person/index_e.html);
Pest management products (http://www.hc-sc.gc.ca/cps-spc/pest/index_e.html).
Pest Management Regulatory Agency
http://www.pmra-arla.gc.ca/

Health Canada's Pest Management Regulatory Agency (PMRA) is the federal agency responsible for the regulation of pest control products in Canada. As the federal authority under the Pest Control Products Act (PCPA), the PMRA develops pest management policies and guidelines; promotes sustainable pest management; looks to improve the regulatory process to increase efficiency; enforces compliance with the PCPA; and, distributes pest management information to the general public and key stakeholders.

The primary objective of PMRA is to prevent unacceptable risks to people and the environment from the use of pest control products and the mission is to protect human health and the environment by minimizing the risks associated with pest control products in an open and transparent manner, while enabling access to pest management tools, namely, these products and sustainable pest management strategies (excerpted from http://www.pmra-arla.gc.ca/english/aboutpmra/about-e.html). Exposure prevention, toxicology and health effects related publications are available from their publication website (http://www.pmra-arla.gc.ca/english/pubs/pubs-e.html).

Europa Portal

It is the web portal of the European Union (http://europa.eu) that provides up-to-date coverage of European Union affairs and essential information on European integration. Web browsers can consult all legislation currently in force or under discussion, access the websites of each of the EU institutions and find out about the policies administered by the European Union under the powers devolved to it by the Treaties. Searches of the web portal for relevant documents can be made via http://europa.eu/geninfo/query/search_en.html.

European Commission
(http://ec.europa.eu/index_en.htm)

Parent's Guide to Buying – Safety Guide to Children's personal care products

This new children's products safety guide will help parents navigate and find safer products with fewer ingredients linked to allergies, cancer, and other concerns for children (http://www.cosmeticsdatabase.com/special/parentsguide/).

Fragrance Products Information Networks (FPIN)
http://www.fpinva.org/

The objective of the site is to gather available information and make it readily available to the medical, scientific and regulatory communities, and the public. The purpose of this information network is to educate readers on health and environmental concerns related to fragrance so that consumers can make informed choices. The broad goal is to use education, science, and information to address very complex issues regarding fragrances exposure and health effects. Readers can find relevant exposure related documents on the website.

Databases

(U.S.) NATIONAL INSTITUTES OF HEALTH (NIH), National Library of Medicine (NLM)-Household Products Database
http://hpd.nlm.nih.gov/index.htm

Information in the Household Products Database is taken from a variety of publicly available sources, including brand-specific labels and Material Safety Data Sheets (MSDS) prepared by manufacturers. The database is designed based on classifying everyday U.S. consumer products into several categories such as;

- Auto products (http://hpd.nlm.nih.gov/cgi-bin/household/prodtree?prodcat=Auto+products);

- Inside the home products (http://hpd.nlm.nih.gov/cgi-bin/household/prodtree?prodcat=Home+inside);
- Pesticides (http://hpd.nlm.nih.gov/cgi-bin/household/ prodtree?prodcat=Pesticides);
- Landscape and yards (http://hpd.nlm.nih.gov/ cgi-bin/household/prodtree?prodcat=Landscaping/Yard);
- Personal care and use (http://hpd.nlm.nih.gov/ cgi-bin/household/prodtree?prodcat=Personal+care/use);
- Home maintenance (http://hpd.nlm.nih.gov/ cgi-bin/household/prodtree?prodcat=Home+maintenance);
- Arts and crafts (http://hpd.nlm.nih.gov/cgi-bin/household/prodtree?prodcat=Hobby/Craft)
- Pet care (http://hpd.nlm.nih.gov/cgi-bin/household/prodtree?prodcat=Pet+Care); and
- Home office products (http://hpd.nlm.nih.gov/cgi-bin/household/prodtree?prodcat=Home+Office)

Ingredients of each product are listed and MSDS associated with each ingredient are provided on this website. It is important to note that from a public health exposure prevention and management perspective, exposure criteria and limits provided in the MSDS list may not be applicable to residential and other non-industrial work environments.

'SKIN DEEP' COSMETIC SAFETY DATABASE

This is a personal care products safety database maintained by Environmental Working Group. Skin Deep Cosmetic Safety Database is a safety guide to cosmetics and personal care products designed by researchers at the Environmental Working Group. Skin Deep pairs ingredients in more than 25 000 products against 50 definitive toxicity and regulatory databases, making it the largest integrated data resource of its kind. Why did a small nonprofit take on such a big project? Because the FDA doesn't require companies to test their own products for safety.

(excerpted from http://www.cosmeticsdatabase.com/index.php)

Specific information on cosmetic ingredients can be obtained from http://www.cosmeticsdatabase.com/splash.php?URI=%2Fspecial%2Fparentsguide%2Fsummary.php

HUMAN EXPOSURE DATABASE SYSTEM (HEDS)

HEDS is the Human Exposure Database System that is being developed by the United States Environmental Protection Agency (USEPA), USA It is an integrated database system that contains chemical measurements, questionnaire responses, documents, and other information related to EPA research studies of the exposure of people to Environmental contaminants." (From USEPA website – accessed online – January 31, 2008). HEDS can be accessed at http://www.epa.gov/heds/ – Human Exposure Database System. Other exposure assessment and analysis related surveys, databases, research publications and exposure assessment software models can be found in the following web links under USEPA.

Radiation Related exposure in urban environments

http://www.epa.gov/radtown/enter-radtown.htm
RAD Town exposure web page from USEPA

This web page focuses on radiation-related exposure in urban environments in the USA.

TOTAL EXPOSURE ASSESSMENT METHODOLOGY (TEAM)

The Total Exposure Assessment Methodology (TEAM) was designed by the U.S. Environmental Protection Agency to develop and demonstrate methods to measure human exposure to toxic substances in air and drinking water. pTEAM refers to Particle exposure studies and vocTEAM refers to Volatile organic chemicals exposure studies. TEAM was initiated by RTI international for the US EPA in the 1970s. It represented the first use of statistically sampled populations to establish the relationships between an individual's exposure to toxic substances and actual substance absorption by body tissue. These data sets became key component in formulating human health risk assessments.

During a TEAM pilot project, a remarkable discovery was made. The monitored participants, like most Americans, spent 70% to 90% of their time indoors. For almost all chemicals of interest, exposures for those participants were higher than values taken by fixed outdoor monitors. Even in unpolluted locales, indoor air did not meet basic air quality standards From the TEAM results emerged a new emphasis on understanding and preventing indoor air problems (excerpted from RTI international website: http://www.rti.org/page.cfm?objectid=2EBA89BD-6BB0-4C14-938066C6237E1BC9).

(U.S.) DEPARTMENT OF HEALTH AND HUMAN SERVICES, CENTERS FOR DISEASE CONTROL AND PREVENTION (CDC)

National Biomonitoring Program from the Center for Disease Control (CDC), USA

'CDC's Environmental Health Laboratory conducts the National Biomonitoring Program (NBP). The Program specializes in biomonitoring, which is the direct measurement of people's exposure to toxic substances in the environment by measuring the substances or their metabolites in human specimens, such

as blood or urine. Biomonitoring measurements are the most health-relevant assessments of exposure because they indicate the amount of the chemical that actually gets into people (from all environmental sources (e.g., air, soil, water, dust, food) combined, rather than the amount that may get into them.' (Excerpt from http://www.cdc.gov/nceh/dls/national_biomonitoring_program.htm accessed February 3, 2008).

National Exposure Report from the CDC
http://www.cdc.gov/nceh/dls/national_exposure_report.htm

National Exposure Report from the CDC (the most extensive assessment ever made of the exposure of the U.S. population to selected chemicals of interest in the U.S. environment)

The report can be accessed from-http://www.cdc.gov/exposurereport/ or http://www.cdc.gov/exposurereport/3rd/pdf/thirdreport.pdf (accessed online January 31, 2008)

A summary of US exposure and estimation program from various federal departments can be found at http://www.scorecard.org/chemical-profiles/ref/exp.html.

Human Exposure Monitoring Program (HEMP)
Wood Buffalo Environmental Association (WEBA)
http://www.wbea.org/content/view/31/72/

The Fort McMurray, Alberta based non-governmental organization WBEA has initiated an ongoing Human Exposure Monitoring Program (HEMP) to continuously monitor select individuals that are exposed to air contaminants in their everyday environments. This is the first long term human exposure monitoring program (conducted at the community level) in the world. Volunteer complete a screening survey and consent form and wear two types of personal air monitoring equipment at all times. Then they allow additional air monitoring equipment to be set up inside and outside their home. Further, they complete a time activity diary; a demographic, exposure, and health survey. Battery-operated monitors are replaced with new batteries. The HEMP program examines the relationship between concentrations of selected air contaminants in personal, indoor, and outdoor air and to examine the factors affecting human exposure to air contaminants. Further, trends in air contaminant levels (if any) are established that people of Wood Buffalo are exposed to in their everyday environments. These data may assist WBEA in establishing links between air quality of Fort McMurray region and its potential health related effects. Data collected from the program may also aid in future research and the development of other programs in the region. For additional information, contact:

CHAPTER

31

Food and Nutrition

WAVERLY THORSEN

INTRODUCTION

The study of food and nutrition toxicology is inherently interdisciplinary, encompassing the principles of both food and nutrition research, as well as the concepts of toxicological work. As such, research in this field can range from modeling the pharmacokinetics of micronutrients in the human body, to the measurement of pesticide residues in drinking water. This chapter presents a comprehensive review of selected resources available in the field of food and nutrition toxicology. Emphasis is placed on current and emerging research, particularly focusing on diet and health, dietary supplements, functional foods, nutrient–gene interactions, and drug–nutrient interactions.

This chapter is intended to encompass the many realms of food and nutrition toxicology including mechanistic and clinical research, as well as the risk assessment and regulatory aspects. Further information is available at each of the institutes and societies listed under the 'Organizations' section, and in the numerous peer-reviewed scientific literature presented in each of the journals listed. There is a wealth of additional information available from online internet sources, including database resources, and online newsletters and organization websites.

RESOURCES

Books

Abbas HK (ed.) (2005)
Aflatoxin and Food Safety
Food Science and Technology Series, no. 149
CRC Press, Boca Raton, FL

Focuses specifically on food safety concerns related to aflatoxin. Discusses the wide range of issues associated with the mycotoxin. Included are chapters on the economic costs of mycotoxin management in the United States, worldwide food safety perspectives, aflatoxin regulation and improvements and advances in analysis. Additionally, the human health component is addressed with a chapter on the epidemiology of aflatoxin exposure and human liver cancer.

Aggett PJ, Kuiper HA (Eds.) (2000)
Risk Assessment in the Food Chain of Children
Nestle Nutrition Workshop Series
Lippincott, Williams, and Wilkins, New York, NY

Comprehensive review of the many exposure routes and health effects of food contaminants in children. Chapters include potential hazard exposure through breast milk, the effect of perinatal exposure of PCBs and dioxins on the neurological and cognitive development in children, and the role of the gastrointestinal tract in handling hazards in the food chain. The final chapter discusses novel foods and novel hazards associated with those foods.

Altug T (2003)
Introduction to Toxicology and Food
CRC Press, Boca Raton, FL

The first five chapters of this book provide background and general information on toxicological principles including definitions, toxin classification, and toxication. Chapters 6, 8, and 9 focus particularly on food/

nutrition toxicology, discussing natural sources of toxicants in foods, food additives, and chemopreventers in the diet. Toxicity testing is also discussed and includes in vitro and in vivo studies, as well as epidemiological human studies and biomarker research.

Awad AB, Bradford PG (Eds.) (2006)
Nutrition and Cancer Prevention
CRC Press, Taylor and Francis, Boca Raton, FL

A reference that presents the current research on dietary modulation of human health and the development of cancer. Traditional micronutrients and their potential roles in cancer prevention and development are discussed, including vitamin A, vitamin C, and folic acid. Additionally, functional food components such as phytosterols, carotenoids, phytoestrogens, and flavanoids are also evaluated in terms of their roles in cancer mechanisms. The effect of lifestyle influences on cancer development, such as alcohol intake and obesity, are also addressed.

Baer-Dubowska W, Bartoszek A, Malejka-Giganti D (Eds.) (2005)
Carcinogenic and Anti-carcinogenic Food Components
CRC Press, Boca Raton, FL

The 17 chapters in this book provide a comprehensive evaluation of chemopreventive and genotoxic food components. Additionally, mechanisms of carcinogenesis are also discussed. Food components evaluated include polyunsaturated fatty acids, phenolic compounds, carotenoids, and flavanoids. The research is current and timely, for instance, an analysis of resveratrol, a compound found in red wine and grapes, thought to have anticarcinogenic properties, is found in Chapter 12.

Boullata JI, Armenti VT (Eds.) (2004)
Handbook of Drug–Nutrient Interactions
Humana Press, Totowa, NJ

Provides a thorough review of the influence of nutritional status and dietary intakes on drug effects, and on the influence of pharmaceuticals on nutritional status. Chapters include information on dietary supplement interactions with medications and the effects of foods on drug metabolism. The final section in the book focuses on drug–nutrient interactions in specific health conditions including patients with cancer, organ transplantation, and chronic infections.

Bowman BA, Russell RM (Eds.) (2006)
Present Knowledge in Nutrition, 9th edn
ILSI Press, Washington, DC

Reflects the growth in the science base and application of nutritional science to a wide variety of related disciplines. Principles of nutrition have evolved from the identification of their role in preventing deficiency states to the prevention of chronic rather than acute adverse states. Also includes a wealth of public health information related to nutrition.

Branen AL, Davidson PM, Salminen S, Thorngate J (Eds.) (2002)
Food Additives, 2nd edn
Marcel Dekker, New York, NY

Comprehensive review of food additives and toxicological effects. Includes topics from hypersensitivity of food additives to regulatory issues. Current food additive topics such as antioxidants, flavor enhancers, fatty acids, and sweeteners are also discussed. Describes both toxicological aspects as well as nutritional aspects of food additives.

Burdock GA (1996)
Encyclopedia of Food and Color Additives, 3 vols.
CRC Press, Boca Raton, FL

This reference set provides descriptions of all substances listed in the Everything Added to Food in the U.S. (EAFUS) database, including food additive categories and some substances not considered to be 'additives,' such as corn oil. Provides concise, understandable descriptions of the substances.

Burdock GA (2005)
Fenaroli's Handbook of Flavor Ingredients, 5th edn
CRC Press, Boca Raton, FL

This handbook is divided into two sections. The first section of the book reviews general information about natural flavor ingredients, such as the history, sensory mechanisms, human taste perception, and the nomenclature and classifications of flavor ingredients. The second section of the book contains an alphabetical listing of approximately 200 natural flavor ingredients. In terms of food and nutrition toxicology, this book is most helpful to toxicologists as a resource for natural flavor ingredients.

Clydesdale FM (Ed.) (1997)
Food Additives: Toxicology, Regulation, and Properties
CRC Press, Boca Raton, FL

Database (Priority-Based Assessment of Food Additives, PAFA) compiled by the Center for Food Safety and Applied Nutrition, Food and Drug Administration. Includes information on Everything Added to Food in the United States (EAFUS). On CD-ROM.

Dabrowski WM, Sikorski ZE (Eds.) (2005)
Toxins in Food
CRC Press, Boca Raton, FL

This reference examines natural and anthropogenic toxins in foods, including natural plant toxins, phyto estrogens, and bacterial toxins. Timely chapters on toxic components of food packaging materials and on the effects of processing on the nutritive qualities and toxicity of foods are also included. Moreover, food allergies, sensitivities, and intolerances are also discussed in the context of current associations between food and health.

De Vries J (Ed.) (1996)
Food Safety and Toxicity
CRC Press, Boca Raton, FL

Examines many current problems and changes in food safety and toxicity affecting food researchers, regulators, and many other interest groups. The main sections explore the relationship between the origin of potentially toxic compounds and ingestion, the possible consequence of this ingestion, and the prevention and minimization of health risks.

De'Mello JPF (Ed.) (2003)
Food Safety: Contaminants and Toxins
CABI Publishing, Cambridge, MA

Provides a comprehensive review of naturally occurring and anthropogenic contaminants in foods, and the impacts on food safety. Part one focuses on biotoxins (plant, bacterial, shellfish, and mycotoxins) in foods, while Part two describes anthropogenic contaminants (pesticides, polychlorinated biphenyls, polycyclic aromatic hydrocarbons, and nitrates) in foods. The third section of the book presents case studies on such topics as prion diseases in relation to meat and animal product safety, and genetically modified foods and human health.

Food and Nutrition Board, Committee on the Framework for Evaluating the Safety of Dietary Supplements (2005)

Dietary Supplements: A Framework for Evaluating Safety
National Academies Press, Washington, DC

Timely and informative reference on evaluating the safety of dietary supplements. An important application of toxicological principles to food and nutrition. Includes chapters on human and animal data and vulnerable groups/special populations. Also presents case studies for specific supplements and potential adverse health risks.

General Accounting Office (GAO) (2002)
Genetically Modified Foods
GAO-02-566 United States General Accounting Office, Washington, DC
Web: http://www.gao.gov/new.items/d02566.pdf

Reports on the possible risks and benefits of genetically modified foods. Evaluates the Food and Drug Administration's (FDA) procedures for assessing the safety of genetically modified foods, and provides recommendations to the FDA for improved screening. Provides a helpful background on genetically modified food biotechnology and identifies genetically modified foods currently approved for consumption. This report provides a current analysis of the risks and benefits of biotechnology and foods.

Goktepe I, Juneja VK, Ahmedna M (Eds.) (2006)
Probiotics in Food Safety and Human Health
CRC Press, Taylor Francis, Boca Raton, FL

A resource for comprehensive information on pre- and probiotics and human health. This book addresses the agricultural, nutritional, biochemical, and toxicological aspects of probiotics in the human food supply. This resource is timely in light of recent studies suggesting a role for probiotics in cancer prevention. The safety and regulation of probiotics in the food supply are also discussed.

Hamilton D, Crossley S (Eds.) (2004)
Pesticide Residues in Food and Drinking Water: Human Exposure and Risks
J. Wiley, Hoboken, NJ

A comprehensive summary of the complexities of human exposure to pesticide residues in foods and drinking water. This book examines a wide spectrum of toxicological and nutritional aspects including the environmental fate of pesticides and the effects of food processing on pesticide residues. Additional chapters include pesticide metabolism in plants (crops) and livestock, as well as International Standards for pesticide residues.

Hui YH (Ed.) (2001)
Foodborne Disease Handbook, 2nd edn
Marcel Dekker, New York, NY

In-depth discussion of the transmission, identification, diagnosis, treatment, and prevention of foodborne pathogens. Volume 1 covers diseases caused by bacteria, Volume 2 discusses diseases caused by viruses, parasites, pathogens, and discusses hazard analysis and critical control point (HAACP) systems, and Volume 3 discusses diseases caused by plant toxicants. Volume 4 discusses seafood and environmental toxins.

International Agency for Research on Cancer (1997)
Coffee, Tea, Mate, Methylxanthines, and Methylglyoxal
World Health Organization, Lyon

http://monographs.iarc.fr/ENG/Monographs/vol51/volume51.pdf

Volume 51 of the *IARC Monographs on the Evaluation of Carcinogenic Risks to Humans.* Convened by expert panels to review all of the long-term toxicity information on the chemicals in the title with particular emphasis on cancer. This monograph presents a thorough review of this information. The panels concluded that there is limited evidence that coffee is carcinogenic to the human urinary bladder and there is inadequate information for other sites; that tea and mate drinking is not classifiable as to its carcinogenicity, and that caffeine, theophylline, theobromine, and methylglyoxal are not classifiable. This book is an excellent source for the specific long-term information available on the compounds.

International Agency for Research on Cancer (2004)
Some Drinking-Water Disinfectants and Contaminants, Including Arsenic
World Health Organization, Lyon
http://monographs.iarc.fr/ENG/Monographs/vol84/volume84.pdf

This monograph (volume 84), compiled and written by the World Health Organization, International Agency for Research on Cancer evaluates the scientific data on the carcinogenicity of specific drinking water contaminants, including naturally occurring arsenic, and disinfection by-products. The disinfection by-products reviewed include chloramine, chloral and chloral hydrate, and di- and tri-chloroacetic acid, as well as 3-chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone. Each compound is evaluated using the available exposure data, human and animal carcinogenicity data, and other relevant data.

Johns-Cupp M, Tracy TS (Eds.) (2003)
Dietary Supplements: Toxicology and Clinical Pharmacology
Humana Press, Totowa, NJ

Part one of this reference discusses legal and regulatory aspects of dietary supplements. Part two presents individual chapters on specific dietary supplements, and toxicological and clinical pharmacology are included. Individual monographs in Part two include over-the-counter steroids, coenzyme Q10, pyruvate, and red yeast rice extract, among others. The appendix provides a comprehensive summary table on dietary supplements.

Joint FAO/WHO Expert Committee on Food Additives (2006)
WHO Food Additive Series
World Health Organization, Geneva, Switzerland
http://www.who.int/ipcs/publications/jecfa/monographs/en/index.html

This important monographic series summarizes safety data on selected food additives and contaminants and individual volumes are based on meetings of the Joint FAO/WHO Expert Committee on Food Additives (JECFA). The data reviewed in these monographs form the basis for acceptable daily intakes (ADIs). Number 49, for example, published in 2001, covers the toxicological evaluation of certain veterinary drug residues in food.

Kotsonis FN, Mackey M (Eds.) (2002)
Nutritional Toxicology, 2nd edn
Taylor and Francis, New York

This reference contains chapters on the role of nutrients in protecting the body against toxicants. Also included are chapters on developments in food production. The book brings together diverse issues that are at the forefront in nutritional toxicology, including antioxidants and protection from free radicals, and interactions between foods, nutritional supplements, and drugs. A comprehensive resource for a quick reference or an in-depth reading.

Miliotis MD, Bier JW (Eds.) (2003)
International Handbook of Foodborne Pathogens
Marcel Dekker, New York, NY

Comprehensive resource of foodborne viruses and bacteria are both established and emerging. Also includes information on mycobacterium, marine biotoxins, and foodborne protista, among others. The second part of the book provides an interesting summary of the geographic incidence of foodborne illnesses by country/region. Risk assessment and hazard analysis and critical control point (HACCP) systems are also discussed.

Omaye ST (2004)
Food and Nutritional Toxicology
CRC Press, Boca Raton, FL

A thorough reference guide to concepts in food and nutrition toxicology. The book is divided into three sections which include (1) fundamental concepts, (2) toxicants in foods, and (3) food contamination and safety. It begins with a discussion of general toxicological principles (e.g., toxicokinetics and dose–response relationships), and then reviews dietary factors that influence toxicity. Both in vitro and in vivo laboratory toxicity testing method are also discussed. Individual microorganisms are reviewed including their mechanism of action and clinical symptoms in foodborne pathogens exposure. The book concludes with a discussion of emerging food safety issues.

Papas AM (Ed.) (1999)
Antioxidant Status, Diet, Nutrition, and Health
CRC Series in Contemporary Food Service
CRC Press, Boca Raton, FL

Integrates the biological, nutritional, and health aspects of antioxidant status. Topics examined include factors affecting and methods for evaluating antioxidant status in humans, effect of diet and physiological stage, and the role of antioxidant status in nutrition, health, and disease.

Pokorny J, Yanishlieva N, Gordon MH (Eds.) (2001)
Antioxidants in Food: Practical Applications
Woodhead Publishing Limited, and CRC Press, Boca Raton, FL

Contains 15 chapters on numerous aspects of antioxidants found in, and used in, foods from both plant and animal origin. An overview chapter on antioxidants and food stability describes mechanisms of oxidation and antioxidant effects. Additional chapters include information on antioxidants and health, natural antioxidants, and the regulation of antioxidants in foods (includes European Union, the United States, Australia, and Japan).

Preedy VR, Watson RR (Eds) (2005)
Reviews in Food and Nutrition Toxicity, Volumes 1–4
CRC Press, Boca Raton, FL

The four volumes of this reference provide a comprehensive review of the current research related to food and nutrition toxicity. Topics include food safety, food technology, and food and nutrition toxicology. The most recent volume (Volume 4) contains chapters on heavy metals in breast milk, selenium toxicity, and toxicological considerations of dietary sulfur, among other chapters. Environmental, toxicological, nutritional, and public health disciplines are integrated in each volume, providing an informative, interdisciplinary reference.

Shahidi F (Ed.) (1997)
Antinutrients and Phytochemicals in Food
American Chemical Society, Washington, DC

Volume 662 of the *ACS Symposium Series*. From the Preface: 'Antinutrients in foods are responsible for the deleterious effects that are related to the absorption of nutrients and micronutrients which may interfere with the function of certain organs . . . certain harmful effects might also be due to the breakdown products of these compounds.'

Shahidi F, Ho CT, Watanabe S, Osawa T (Eds.) (2003)
Food Factors in Health Promotion and Disease Prevention
American Chemical Society, Washington, DC

A comprehensive reference on numerous food components and their health effects. Mechanisms are also discussed. Includes a wide range of topics such as cancer chemoprevention by phytopolyphenols, and signal transduction, and modulation of cytokine gene expression by curcumin. The interaction between anthropogenic contaminants and nutritional components is also discussed in Chapter 11, which is entitled 'Green tea extracts prevent dioxin toxicity through the suppression of transformation of the aryl hydrocarbon receptor.'

Shils ME, Shike M, Ross AC, Caballero B (Eds.) (2006)
Modern Nutrition in Health and Disease, 10th edn
Lippincott, Williams, and Wilkins, New York, NY

An extremely thorough, up-to date reference for nutritional knowledge in health and disease. This book is divided into six parts which include historical nutrition landmarks, specific dietary components (e.g., macronutrients, minerals and vitamins), nutrition in biological systems, nutritional life-cycle requirements, prevention and management of disease, diets in population health, and regulatory information. Toxicological aspects of food and nutrition such as overdoses, tolerable upper limits, and bioavailability are presented in many of the chapters.

Tschanz C, Butchko HH, Stargel WW, Kotsonis FN (Eds.) (1996)
The Clinical Evaluation of a Food Additive: Assessment of Aspartame
CRC Press, Boca Raton, FL

Covers the rigorous scientific, regulatory, and clinical testing and evaluation applied to aspartame. The book provides an overview of the food additive evaluation process and describes the clinical studies used to evaluate anecdotal medical complaints such as headaches, seizure, and allergic-type reactions.

Watson DH (Ed.) (2004)
Pesticide, Veterinary, and Other Residues in Food
Woodhead Publishing, Cambridge, MA

This reference provides a broad scope of information on food residues. Includes genetic factors in susceptibility to carcinogens, methods for analyzing residues in foods, and specific detection methods for various residues (pesticides, herbicides, fungicides). Also discusses individual contaminants as food residues, including dietary estrogens, polycyclic aromatic hydrocarbons, and polychlorinated biphenyls.

Journals

Advances in Food and Nutrition Research (1948–1989 as *Advances in Food Research*)
Academic Press, San Diego, CA

Includes articles on the relationship between food and nutritional science. Scientific developments and emerging research in the field are presented. Example articles include the latest science on lycopene and cancer, and food components that reduce cholesterol absorption.

American Journal of Clinical Nutrition (1952–1954 as *Journal of Clinical Nutrition*)
American Society for Clinical Nutrition, Bethesda, MD
http://www.ajcn.org/

The journal of the American Society for Clinical Nutrition focuses on the relationship between nutrition and human health. Research articles include nutritional effects on cardiovascular disease development and prevention, and the role of nutrition in obesity. Results from studies on gene–nutrient interactions and nutritional epidemiology are also presented.

Food Additives and Contaminants (1984–)
Taylor and Francis, Philadelphia, PA

Presents research on analytical methodology, occurrence, persistence, safety-evaluation, detoxification, and surveillance of anthropogenic additives and contaminants in foods. Also includes regulatory issues. Overall research areas include pesticide and veterinary drug residues, environmental contaminants, migration from food packaging, and allergenicity of foods, among others.

Food and Chemical Toxicology (1963–1982 as *Food and Cosmetics Toxicology*)
Pergamon, New York, NY

Focuses on the toxic effects of natural and synthetic chemicals in the environment. Research is reported on the safety and health implications of food, water, and other consumer products as well as on industrial and agricultural chemicals and pharmaceutical products. Additional articles focus on the safety evaluation of novel or biotech foods. Articles in this journal combine the food science, toxicology, and chemistry disciplines.

Food and Drug Law Journal (1946–)
Commerce Clearing House, Chicago, IL

A journal from the Food and Drug Law Institute. Includes articles relating to regulation and legislation that impacts the food, drug, cosmetic, medical device, and healthcare technology industries. Also evaluates court decisions in food and drug law (e.g., intellectual property, antitrust, constitutional, and criminal law) and examines food and drug regulatory issues in other countries.

Journal of Agriculture and Food Chemistry (1953–)
American Chemical Society, Washington, DC
http://pubs.acs.org/journals/jafcau/index.html

Focuses on food and agriculture chemistry and biochemistry. Includes articles on topics of food composition, processing effects, and safety. Also examines the chemistry, toxicology, metabolism, and environmental fate of pesticides, veterinary drugs, and fertilizers.

Journal of Food Protection (1937–)
International Association for Food Protection, Des Moines, IA
http://www.ingentaconnect.com/content/iafp/jfp

Published by the International Association for Food Protection, this journal presents current research in food science and technology. Research articles related to food protection, food safety and quality, and food microbiology. Explores novel laboratory methods related to food safety and microbiology and presents an international scope.

Journal of Nutritional Biochemistry (1990–)
Butterworths, Stoneham, MA

Includes research articles on advances in the field of nutritional sciences. Focuses on cross-discipline research, presenting experimental nutrition data related to biochemistry, neurochemistry, molecular biology, toxicology, physiology, and pharmacology. Both in vitro and in vivo data are presented.

Journal of Nutritional and Environmental Medicine (1999–)
Taylor and Francis, Philadelphia, PA

This journal's main focus is on allergy and environmental medicine, particularly presenting studies with clinical relevance. Includes articles on nutritional toxicology, chemical sensitivity, nutrition and reproductive function, antioxidants in health and disease, relevant laboratory methods, and nutritional supplementation. Also includes state-of-the-art reports on applicable current clinical practice.

Journal of Nutrition (1928–)
American Society for Nutrition, Philadelphia, PA
http://jn.nutrition.org/

This journal presents research on all aspects of experimental nutrition research conducted in humans and other animal species. In terms of food and nutrition toxicology, research is published on diet and disease, nutrient–gene interactions, nutrition and immunology, nutrition and pharmacology and toxicology, nutrition and epidemiology, and vitamins and minerals.

Nutrition and Metabolism (2004–)
BioMed Central, Published online
http://www.nutritionandmetabolism.com/home/

This open-access, online journal (peer-reviewed) focuses on nutritional biochemistry and related clinical fields. Includes articles on the integration of nutrition, exercise physiology, and molecular and cellular biochemistry of metabolism. Also explores research on cell-signaling and nutrient–gene interactions.

Organizations

American Chemical Society
1155 Sixteenth Street, NW
Washington, DC 20036
Phone: 800-227-5558 (US only)
202-872-4600 (outside the US)
Fax: 202-872-4615
E-mail: help@acs.org
Web: http://acswebcontent.acs.org/home.html

The primary scientific society for all fields of chemistry. Consists of 33 technical divisions which include agriculture and food chemistry and chemical toxicology. The society supports interdisciplinary research in chemistry.

American Public Health Association
800 I Street, NW
Washington, DC 20001
Phone: 202-777-APHA
Fax: 202-777-2534
E-mail: comments@apha.org
Web: http://www.apha.org/

Represents the oldest and largest organization of public health professionals in the world. Promotes research on disease prevention and health promotion. Also is concerned and involved with federal and state policies related to public health.

American Society for Nutrition
9650 Rockville Pike, Suite L-4500
Bethesda, MD 20814
Phone: 301-634-7050
Fax: 301-634-7892
E-mail: sec@nutrition.org
Web: http://www.nutrition.org/

Formed in 2005 through the merger of the American Society for Nutritional Sciences, the American Society for Clinical Nutrition, and the Society for International Nutrition Research. Represents the premier research society for nutritional sciences. Promotes research in fundamental nutrition, multidisciplinary fields, and clinical research.

Federation of American Societies for Experimental Biology
9650 Rockville Pike
Bethesda, MD 20814
Phone: 301-634-7000
Fax: 301-634-7001
E-mail: webmaster@faseb.org
Web: http://www.faseb.org/

Serves as a federation of over 20 member societies including the American Society for Pharmacology and Experimental Therapeutics, American Society for Nutrition, and the Environmental Mutagen Society. FASEB's mission is to promote and advance biological science that leads to improvements in human health.

Food, Drug and Law Institute
1155 15 Street NW, Suite 800
Washington, DC 20005
Phone: 800-956-6293; 202-371-1420
Fax: 202-371-0649
E-mail: comments@fdli.org
Web: http://www.fdli.org/

A scientific society focused on major policy, legislative, regulatory, and enforcement actions related to food and drugs. Also provides and supports education and training in the regulatory programs of the Food and Drug Administration (FDA) and other governmental organizations.

International Association for Food Protection
6200 Aurora Avenue, Suite 200W
Des Moines, Iowa 50322
Phone: 515-276-3344; 800-369-6337
Fax: 515-276-8655
E-mail: info@foodprotection.org
Web: http://www.foodprotection.org/main/default.asp

International society focused on the latest developments (scientific, technical, and practical) in food safety and sanitation. Brings together individuals from all employment sectors, academia, government, and industry, concerned with food safety and protection.

International Life Sciences Institute
One Thomas Circle
Washington, DC 20005
Phone: 202-659-0074
Fax: 202-659-3859
E-mail: ilsi@ilsi.org
Web: http://www.ilsi.org

An international institute focused on promoting human health through scientific advancements. Specifically explores the interdisciplinary scientific issues related to nutrition, food safety, toxicology, risk assessment, and the environment.

Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, VA 20190
Phone: 703-438-3115
Fax: 703-438-3113
E-mail sothq@toxicology.org
Web: http://www.toxicology.org/

The primary scientific society promoting toxicological research in the United States and abroad. Focuses on advancing science to promote human, animal, and environmental health. Consists of 21 specialty sections which include food safety, carcinogenesis, and regulation and safety evaluation.

Databases

Agricola
United States Department of Agriculture, National Agricultural Library
http://agricola.nal.usda.gov/

Provides agricultural online access to scientific collections of the National Agricultural Library. Two bibliographic datasets are available in this database including the online public access catalogue (e.g., books, audiovisuals, serials) and the article citation database (i.e., abstracts and citations of journal articles).

CARDS Database
Computer Access to Research on Dietary Supplements, Office of Dietary Supplements, National Institutes of Health
http://ods.od.nih.gov/Research/CARDS_Database.aspx

A database of dietary supplement research projects that are federally funded (e.g., United States Department of Agriculture, Department of Defense, and the National Institutes of Health). Searches are conducted according to type of dietary supplement studied, the type of study, health outcomes or biological effects, a distinction between directly related and indirectly related research, and keywords, among other variables. Note: The Office of Dietary Supplements, National Institutes of Health supports an additional dietary supplement database called International Bibliographic Information on Dietary Supplements (http://grande.nal.usda.gov/ibids/index.php).

CFSAN Color Additives
Food and Drug Administration, Center for Food Safety and Applied Nutrition
http://www.cfsan.fda.gov/~dms/col-toc.html

Database on all aspects of food additives including background and historical information, color laws and regulations, certifications, petition processes, and specific color additive and cosmetic products. Also contains a link to the 'everything added to food in the US' (EAFUS) database (http://www.cfsan.fda.gov/~dms/eafus.html).

FDA Poisonous Plant Database
Food and Drug Administration, Center for Food Safety and Applied Nutrition, US
http://www.cfsan.fda.gov/~djw/plantox.html

Provides a compilation of studies conducted on the toxicity of plants available in the scientific literature. Latest update: March 2006, containing approximately 97 000 records. Where available, information on the plants' common name, family name, Latin name, and standard plant name are listed.

IARC Cancer Databases
International Agency for Research on Cancer
http://www.iarc.fr/ENG/Databases/index.php

IARC cancer databases contain multiple database resources. These include a monographs database on carcinogenic risks to humans, cancer epidemiology database, and a TP53 mutation database, among others. A comprehensive resource for cancer-related research.

Inform All Food Allergy Database
Institute of Food Research, Norwich, UK
http://www.foodallergens.info/database.html

Funded by the European Union, this database provides information on animal and plant food allergens. For each allergen listed, general food summaries, clinical and biochemical data are reported. This database contains information geared for both the layperson as well as the trained scientist.

Micronutrient Information Center
Linus Pauling Institute, Oregon State University
http://lpi.oregonstate.edu/infocenter/

Provides comprehensive information on micronutrients including vitamins, minerals, other nutrients (e.g., carnitine, choline, lipoic acid), and dietary phytochemicals, relating to disease prevention and health promotion. A nutrient index and disease index are also available. Information presented for individual micronutrients includes their function, metabolism, deficiencies, RDA values, disease prevention, sources, drug interactions, and safety.

NAPRALERT
Natural Products Database, Program for Collaborative Research in the Pharmaceutical Sciences, University of Illinois, Chicago
http://www.napralert.org/

Database of over 200 000 scientific papers and reviews on natural products. Topics include clinical studies of natural products, natural products and nutrition interactions, and metabolism and pharmacokinetics. Twenty-five percent of the database comes from abstracts, and 75% comes from original research articles. There is a nominal fee associated with citation retrieval from this database.

NDL, Nutrient Data Laboratory
United States Department of Agriculture, Agricultural Research Service
http://www.ars.usda.gov/Main/site_main.htm?modecode=12-35-45-00

Comprehensive listing of the macronutrient and micronutrient compositions of an exhaustive list of foods and food components. Also contains additional databases ('database products' at http://www.ars.usda.gov/Services/docs.htm?docid=5121) such as nutrient datasets for flavonoids, cholines, added sugars, and proanthocyanidins in selected foods.

PDQ – NCI Comprehensive Cancer Database
Physician Data Query, National Cancer Institute, National Institutes of Health
http://www.cancer.gov/cancertopics/pdq/cancerdatabase

Comprehensive cancer database with peer-reviewed summaries, clinical trials registry, and a directory of health professionals and organizations involved in cancer care. Databases include research on cancer treatment, screening, cancer prevention, genetics, and complementary and alternative medicine.

Other resources

Center for Food Safety and Applied Nutrition, Food and Drug Administration
http://www.cfsan.fda.gov/~dms/nutrlist.html

An on-line 'library' of selected non-FDA sources of food and nutrition information. Includes other governmental sources and non-governmental sources of food and nutrition information such as institutes, resource databases, and publications. Also lists selected food and nutrition list serves.

Food and Nutrition Information Center, USDA
http://fnic.nal.usda.gov/nal_display/index.php?info_center=4&tax_level=1

A website resource providing news, resource lists, database links, and additional information about food and nutrition. Particularly relevant for toxicology-related resources are the food safety and dietary supplement links. A section on 'Surveys, Reports, and Research' also provides additional information on research databases and reports.

FSNET, Food Safety Network
University of Guelph, Ontario, Canada
http://www.foodsafetynetwork.ca/en/

An online national repository of food-safety-related information. Online reports and publications on topics such as pesticides, risk assessment and analysis, agricultural biotechnology and genetic engineering. Access to list serves is also listed on the website.

International Life Sciences Institute
http://www.ilsi.org/Publications/ILSINews/

Website resource of the official link to the ILSI newsletter. Published quarterly, the newsletter provides updates on ILSI activities, publications, and research. Examples of article topics include agricultural biotechnology, and safety assessment for nutritionally enhanced biotech foods. There are also publication reviews for recently released ILSI publications.

Institute of Medicine, National Academies of Science
http://www.iom.edu/

Website resource with links to current IOM projects and report on numerous topics including food, nutrition, and diet, and public health and prevention. Dietary reference intakes, food safety, dietary supplements, and safety of genetically engineered foods are examples of report topics within the food and nutrition section.

National Center for Complementary and Alternative Medicine, NIH
http://nccam.nih.gov/news/newsletter/2006_summer/

The website for the NCCAM official newsletter, providing an outlet for dissemination of important research related to complementary and alternative medicine. A link for online notification for the latest issue is located under 'subscribe on-line'.

National Food Safety and Toxicology Center
Michigan State University
http://www.foodsafe.msu.edu/index.html

Website resource on food safety and toxicology. Contains links on consumer food safety, publications, and outreach. Also contains a link to the Center's newsletter, as well as links to other federal, state, and non-governmental food safety and toxicology sites.

CHAPTER

32

Forensic Toxicology

PETER R. STOUT

If you haven't published it, you didn't do it.

Dr. Irving Sunshine

INTRODUCTION

Forensic toxicology is a multidisciplinary field involving the detection and interpretation of the presence of drugs and other potentially toxic compounds in bodily tissues and fluids. These analyses and interpretations are conducted in a manner to be defensible in court.

Forensic toxicology continues to be a dynamic field with evolving technology applications. Tandem mass spectrometry methods, particularly liquid chromatography-tandem mass spectrometry (LC-MS/MS), have grown in importance. These technologies provide greater sensitivities and flexibility for the detection of larger and more polar compounds that are difficult or impossible to analyze with gas chromatographic methods. Continued development of immunoassays for a wider range of compounds has kept immunoassays a vital part of the analytical armamentarium. Time of flight mass spectrometry (TOF-MS) has also become more important in the field. Likely, the next few years will see the continued influence of LC-MS/MS as a dominant analytical instrument. This is particularly true as instrumentation becomes smaller, more affordable, reliable, and sensitive.

Human performance testing, specifically analysis and interpretation of driving under the influence of drugs (DUID) has received increased attention. Non-traditional or alternate matrices (hair and oral fluid) continue to attract attention with potential benefits but also continue to raise many questions for the interpretation of these results and the potential confounders limiting their use.

Doping control or 'sports testing' is a high-profile though small component of toxicology. This primarily involves the testing in urine or blood for compounds that are viewed to give unfair competitive advantages. Some compounds are used 'out of competition' or to aid in training while others are 'in competition' drugs that give an advantage at the time the athlete is competing.

The advent of more, larger peptide-based drugs will present analytical challenges for forensic toxicologists. Also the rising field of pharmacogenomics and the concept of the genetic autopsy may alter dramatically the interpretation of drug concentrations. As more evidence is gained about the interplay between an individual's geno- and phenotypes and their mxetabolic capacity, changes in dosing and in the interpretation of what is viewed to be toxic and therapeutic are likely to occur.

The following references provide an overview of the field from basic to advanced issues within the field. References include material for analytical issues as well as interpretive issues. Non-traditional matrices are also represented in the references.

RESOURCES

Books

Baselt RC (2001)
Drug Effects on Psychomotor Performance
Biomedical Publications, Foster City, CA

This text includes monographs on over 120 compounds. The monographs provide pharmacokinetic information, pharmacology and a summary of some laboratory studies on the drugs. Summaries of psychomotor studies on the drugs are also provided with an attempt to provide some information for the interpretation of psychomotor effects.

Baselt RC (2004)
Disposition of Toxic Drugs and Chemicals in Man, *7**th*** edn
Biomedical Publications, Foster City, CA

A compilation of mini-monographs of individual drugs and chemicals from A–Z. The 7th edition adds an additional 139 compounds to the prior edition. Monographs provide basic pharmacokinetic information about each drug, some metabolic information and some review of literature on the compound.

Drummer OH with Odell M (2001)
The Forensic Pharmacology of Drugs of Abuse
Arnold, London (Oxford University Press, U.S.)

This text provides a solid overview of the pharmacology of many drugs of abuse. It has some information on the analysis of these compounds in biological matrices. The text includes sections on stimulants, benzodiazepines, cannabis, opioids, ethanol and smaller sections on less widely abused drugs.

Eckert WG (Ed.) (1997)
Introduction to Forensic Sciences, 2nd edn
CRC Press, Boca Raton, FL

For students and practitioners, this text treats the various methods of applying forensic sciences in a logical and relatively non-technical fashion. Features new to this edition include DNA typing, computerized fingerprint classification, serology instrumentation, drug and law enforcement, updated historical perspective, and updated lists of sources and addresses. Includes a chapter specifically on forensic toxicology.

Garriott JC (Ed.) (1996)
Medicolegal Aspects of Alcohol
Lawyers & Judges Publishing Co.

A comprehensive overview of all aspects of alcohol, the most common drug used and abused. The book contains information on analysis and interpretation of alcohol. Also provides an excellent overview of alcohol metabolism.

Kintz P (Ed.) (2006)
Analytical and Practical Aspects of Drug Testing in Hair
CRC Press, Boca Raton, FL

A continuation of materials covered in *Drug Testing in Hair.* This text includes updated information on analytical techniques and issues and has a diverse collection of opinions about hair testing.

Levine B (Ed.) (2003)
Principles of Forensic Toxicology, *2**nd*** edn
AACC Press, Washington DC

For students and practitioners, this text provides a comprehensive grounding in all aspects of forensic toxicology. The text has chapters on the major disciplines within forensic toxicology, the major methodologies and monographs on the major drug classes.

Moffat AC, Osselton MD, Widdop B (Eds.) (2004)
Clarke's Analysis of Drugs and Poisons, *3**rd*** edn
Pharmaceutical Press, London

A greatly revised and updated new edition of the classic analytical toxicology text. Volume 1 provides expanded chapters on analytical techniques updated to reflect more modern practices. Volume 2 contains monographs for over 1700 drugs and compounds with reference spectra and other analytical data.

Smith FP, Siegel JA (Eds.) (2005)
Handbook of Forensic Drug Analysis
Elsevier Academic Press, San Diego, CA

Provides a serious and technical overview of the analysis of common illicit drugs. Also provides information on the collection and handling of drug evidence.

Journals

The American Journal of Forensic Medicine and Pathology (1980–)
Raven Press, New York, NY

Features articles with a pathology perspective. Many case reports with toxicology are presented in this journal.

Canadian Society of Forensic Science Journal (la Societe canadienne des sciences judiciaries) (1974–)
The Society – Canadian Society of Forensic Science
http://www.csfs.ca/journal/journal.htm

The *Canadian Society of Forensic Science Journal* is published quarterly and is devoted to the publication of original papers, comments and reviews in the various branches of forensic science. Matters of forensic interest in the social sciences or relating to law enforcement and jurisprudence may also be published.

Forensic Science Reviews
Central Police University Press, Taipei, Taiwan

Contains review articles on a variety of forensic disciplines. This journal has worked with the Society of Forensic Toxicology to publish monographs drugs and driving for various compounds. Published bi-annually.

Forensic Science International (1972–)
Elsevier, Atlanta, GA
http://www.elsevier.com/wps/find/journaldescription.cws_home/505512/description#description

Another widely read journal in forensic toxicology containing many international publications. Contains many methodological papers as well as more basic research. Published monthly.

Journal of Analytical Toxicology (1977–)
Preston Publications, Niles, IL
http://www.jatox.com

Widely read journal for forensic toxicology. A primary source for many investigators in the field. Published an annual special edition with papers from the Society of Forensic Toxicologists' annual meeting. Published monthly.

Journal of Forensic Sciences (1972–)
Blackwell Publishing Inc. Malden, MA
http://www.aafs.org/

The publication of the American Academy of Forensic Sciences. This journal is distributed to the membership of the Academy and contains articles in all of the forensic disciplines. Published six times per year.

Journal Articles

Organizations

American Academy of Forensic Sciences (AAFS)
410 North 21st Street
Colorado Springs, CO 80904
Phone: (719) 636-1100
E-mail: reception@aafs.org
Web: http://www.aafs.org/

For nearly 60 years, the American Academy of Forensic Sciences (AAFS) has served a distinguished and diverse membership. Its nearly 6000 members are divided into ten sections spanning the forensic sciences. Membership represents all of the United States, and 55 other countries worldwide. The Academy's strength lies in its diversity of representation in forensic sciences allowing for interaction across fields not possible in other organizations. Each section provides opportunities for professional development, personal contacts, awards, and recognition.

American Board of Forensic Toxicology (ABFT)
410 North 21st Street

Colorado Springs, CO 80904
Phone: (719) 636-1100
Fax: (719) 636-1993
E-mail: ABFTOX@aol.com
Web: http://www.abft.org/

The Board is a non-profit organization that serves to certify individual professionals in toxicology. Two levels of individual board certification are offered a Diplomate and a Forensic Toxicology Specialist. The Board also accredits laboratories performing post-mortem and human performance testing (especially alcohol analysis). This is one of the few laboratory accreditations available for this type of laboratory.

Canadian Society of Forensic Science
La Société Canadienne des Sciences Judiciaires
P.O. Box 37040
3332 McCarthy Road
Ottawa, Ontario
Canada K1V 0W0
Phone: (613) 738-0001
Fax: (613) 738-1987
E-mail address: see contact page
Web: http://www.csfs.ca/

Founded in 1953 the Society now has approximately 500 members. The Society is organized into sections representing various fields of forensic sciences including forensic toxicology. The society strives to enhance the statue of forensic sciences through education and service to the field.

Forensic Toxicology Certification Board (FTCB)
Robert M. Sears
SC Law Enforcement Division, Forensic Services
PO Box 21398, Columbia, SC 29221-1398
Phone: (803) 896-7365
Fax: (803) 896-7542
E-mail: robsears@usit.net
Web: http://home.usit.net/~robsears/ftcb/index.htm

Founded in 1992, FTCB seeks to enhance the professionalism of practitioners in areas of forensic toxicology including Forensic Toxicology, Forensic Alcohol Toxicology and Forensic Drug Toxicology. This is achieved through educational and certification objectives.

The International Association of Forensic Toxicologists
Address enquires to regional offices (see website)
E-mail: info@tiaft.org
Web: http://www.tiaft.org/

This 45-year-old association has over 1400 members from all regions of the world. The stated aims of this association are to promote cooperation and coordination of efforts among members and to encourage research in forensic toxicology. The members come from the police force, medical examiners and coroners' laboratories, horseracing and sports doping laboratories, hospitals, departments of legal medicine, pharmacology, pharmacy and toxicology.

Society of Forensic Toxicologists, Inc. (SOFT)
One MacDonald Center
1 N.MacDonald Street, Suite 15
Mesa, AZ 85201
Phone: 1-888-866-SOFT (7638)
E-mail: office@soft-tox.org
Web: http://www.soft-tox.org/

Holding its first formal meeting in 1974, The Society of Forensic Toxicologists, Inc. (SOFT) is an organization composed of practicing forensic toxicologists and those interested in the discipline for the purpose of promoting and developing forensic toxicology. SOFT has approximately 1000 members and holds annual meetings around the country occasionally meeting in conjunction with TIAFT.

CHAPTER

33

Genetic Toxicology

ROBERT R. YOUNG

INTRODUCTION

Genetic toxicology is the study of the damage to deoxyribonucleic acid (DNA). Genetic toxicology has a wide range of information resources available that includes textbooks, journals, governmental agencies, professional associations, and websites containing bibliographic information, information on genetic toxicology and toxicology data. This chapter will identify various types of information resources that are available to workers in genetic toxicology. This chapter does not identify primary journal articles on specific topics in genetic toxicology. This is due to the large number of articles needed to adequately represent all aspects of the field and the fact that most of the fundamental articles are adequately reviewed or cited in the various print or web resources cited.

RESOURCES

Books (2000 and Later)

Genetic toxicology is a sub-discipline of toxicology. Reference material on genetic toxicology is often found in more comprehensive textbooks on toxicology than in books specifically on genetic toxicology. The following section presents both recent general toxicology textbooks with sections on genetic toxicology and genetic toxicology textbooks published since 2000.

Choy WN (2001)
Genetic Toxicology and Cancer Risk Assessment
Informa Healthcare, New York, NY, 390 pages. ISBN 0824702948.

Topics covered in this book include reviews of mechanisms of carcinogenesis, and the role of genetic toxicology in human cancer risk assessment. The book examines the regulatory use of standard ICH and OECD mutagenicity tests, the use of structure–activity relationship models, and the use of thresholds in carcinogenicity safety assessment.

Derelanko MJ, Hollinger MA (2001)
Handbook of Toxicology, Second Edition
CRC Press, Boca Raton, FL, 1440 pages. ISBN 0849303702.

This is a comprehensive textbook on toxicology with 33 chapters covering various areas of toxicology including genetic toxicology, carcinogenicity, risk assessment, and regulatory toxicology. The 24-page chapter on Genetic Toxicology, Chapter 15, provides an overview of the area and discusses the common assays used in genetic toxicology.

Gad S (2000)
In Vitro Toxicology
CRC Press, Boca Raton, FL, 410 pages. ISBN 1560327693.

In vitro models of toxicology testing are discussed in terms of the toxicity endpoint measured and target organ system. In vitro assays for mutagenicity are discussed.

Jacobson-Kram D, Keller KA (2005)
Toxicological Testing Handbook
Informa Healthcare USA, New York, NY, 520 pages. ISBN 0849338581.

This second edition provides an overview of toxicology with a chapter on Genetic Toxicology. Genetic

toxicology assays in routine regulatory use are discussed focusing on how the assays work, protocol design, and data evaluation. Others chapters cover the various disciplines of toxicology, guidance on study design, and global regulatory requirements.

Josephy PD, Mannervik B (2005)
Molecular Toxicology
Oxford University Press, USA, New York, NY, 608 pages. ISBN 0195176200.

This book focuses on the underlying genetic and molecular mechanisms of cellular, organ, and organism toxicology. Included in this second edition are discussions of drug metabolism, DNA damage and repair, and apoptosis.

Kirkland DJ (Ed.) (2005)
Basic Mutagenicity Tests: UKEMS Recommended Procedures
Cambridge University Press, Cambridge, UK, 158 pages. ISBN-10: 0521019052.

This book provides a review of the four standard genetic toxicology assays specified in global regulatory test guidelines for pharmaceuticals, industrial chemicals, and agricultural chemicals. Assays reviewed included the bacterial reverse mutation assay, in vitro mammalian cell cytogenetic assays, in vitro mammalian cell mutation assays, and in vivo cytogenetic assays. The book is based on consensus guidelines drawn up by industry, academia, and regulators in the UK in agreement with international testing guidelines.

Klaassen CD (Ed.) (2007)
Casarett & Doull's Toxicology, The Basic Science of Poison
McGraw-Hill Professional, New York, NY, 1280 pages. ISBN 0071470514.

This is the most recent revision of one of the most widely used textbooks in toxicology. Chapter 9 of this 33 chapter book covers genetic toxicology. This chapter, and Chapter 8 on chemical carcinogens, are the two primary chapters dealing with genotoxins and genotoxic carcinogens. Unit 2, consisting of Chapters 5, 6, and 7, covers toxicokinetics and the adsorption, distribution, excretion, and biotransformation of xenobiotics.

Wexler P (Ed.) (2005)
Encyclopedia of Toxicology
Academic Press, New York, NY, 2000 pages. ISBN 0127453547.

This second edition of this comprehensive encyclopedia of toxicology encompasses four volumes and 2000 pages. Genotoxicity is well represented by a genetic toxicology entry as well as specific entries based on type of genetic damage or assays that measure specific types of damage (e.g. Ames, chromosome aberrations, DNA adducts, and dominant lethal).

Books (Before 2000)

There are more genetic toxicology textbooks published before 2000 than after. In this group are a number of well-written, but somewhat dated, textbooks on genetic toxicology. These books still provide a good foundation for understanding genetic toxicology. They also provide a historical background for the development of the field of genetic toxicology and the regulations based on genetic toxicology.

Brusick DJ (1987)
Principles of Genetic Toxicology
Plenum Press, New York, NY, 308 pages. ISBN 0306425327.

One of the early textbooks on genetic toxicology, first published in 1980, and revised in 1987. This book provides a comprehensive review of the field as it existed in the 1980s. Good discussions of many assays in current use as well as other assays that are no longer routinely used.

Brusick DJ (1994)
Methods for Genetic Risk Assessment
CRC Press, Boca Raton, FL, 272 pages. ISBN 1566700396.

This was one of the first books to investigate the relationship of human exposure to genetically damaging agents and cancer risk assessment. The book reviews assays to evaluate genotoxicity, assessment of mechanisms for human exposure, measurement of actual exposure, and risk estimation strategies.

Flamm WG, Lorentzen RJ (1985)
Mechanisms and Toxicity of Chemical Carcinogens and Mutagens
Volume 12 of Advances in Modern Environmental Toxicology
Princeton Scientific Publishing, Princeton, NJ, 264 pages. ISBN 0911131124.

This book provides a general overview of the area of genotoxic carcinogens and the assays used to investigate chemical interactions with DNA.

Gold LS, Zeiger E (Eds) (1996)
Handbook of Carcinogenic Potency and Genotoxicity Database
CRC Press, Boca Raton, FL, 768 pages. ISBN 9780849326844.

Preclinical genotoxicity data have been used by regulatory agencies as a predictor of genotoxic carcinogens and human carcinogenic risk. This book provides the bridging data between predictive genetic toxicology assays and long-term rodent carcinogenicity assays. The book contains the Carcinogenic Potency Database (CPDB). The database includes extensive information from 5000 long-term carcinogenicity experiments on 1300 chemicals. Of interest to genetic toxicologists is the fact that the book also includes a summary of the NTP genetic toxicity test results on 1500 chemicals, which are referenced to the original publications, including the Salmonella (Ames) test, L5178Y mouse lymphoma cell mutation test, chromosome aberration and sister chromatid exchange test, and the sex-linked recessive lethal mutation test in *Drosophila melanogaster*.

Chemical Mutagens: Principles and Methods for Their Detection formed a 10-volume series of books, edited jointly or individually between 1971 and 1986, by Alexander Hollaender and Frederick de Serres. The 10 volumes are described below.

Hollaender A, De Serres FJ (Eds) (1971)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 1
Plenum Publishing Corporation, New York, NY. 310 pages. ISBN 0306371014.

Hollaender A, De Serres FJ (Eds) (1971)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 2
Springer-Verlag New York, NY, 300 pages. ISBN 0306371022.

Hollaender A (Ed.) (1973)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 3
Plenum Press, New York, NY, 304 pages. ISBN 0306371030.

Hollaender A (Ed.) (1976)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 4
Plenum Press, New York, NY, 304 pages. ISBN: 0306371049.

Hollaender A, De Serres FJ (Eds) (1978)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 5
Plenum Press, New York, New York, 348 pages. ISBN 0306371057.

Hollaender A, De Serres FJ (Eds) (1980)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 6
Plenum Press, New York, NY, 485 pages. ISBN 0306371014.

De Serres FJ, Hollaender A (Eds) (1982)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 7
Plenum Press, New York, NY, 497 pages. ISBN 030640771.

De Serres FJ (Ed.) (1983)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 8
Plenum Press, New York, NY, 386 pages. ISBN 0306413361.

De Serres FJ (Ed.) (1984)
Chemical Mutagens: Principles and Methods for Their Detection, Volume 9
Plenum Press, New York, NY, 306 pages. ISBN 0306416964.

De Serres FJ (Ed.) (1986)
Chemical Mutagen: Principles, and Methods for Their Detection, Volume 10
Plenum Press, New York, NY, 545 pages. ISBN 0306421712.

This series of books formed the basic reference text for many genetic toxicology laboratories for several decades. These volumes chronicled the evolving field of genetic toxicology. While some sections are technically dated today, the series provides a useful overview of genetic toxicology and the foundations of the field.

Li AP, Heflich RH (1991)
Genetic Toxicology
CRC Press, Boca Raton, FL, 504 pages. ISBN 0849388155.

This book provides a broad overview of various aspects of genetic toxicology. Topics covered include mechanisms of genetic damage, relationship of genetic damage to cancer, genetic toxicology assays, different classes of mutagenic agents, environmental monitoring, human monitoring, and regulations associated with genetic toxicology.

Moutschen J (1985)
Introduction to Genetic Toxicology
John Wiley & Sons, New York, NY, 202 pages. ISBN 0471901431.

An introductory book for the non-specialist translated from the original French edition. This book reviews the various types of agents that can damage DNA and methods to detect genetic damage.

Rossman TG (1992)
Induced Effects of Genotoxic Agents in Eukaryotic Cells
CRC Press, Boca Raton, FL, 167 pages. ISBN 1560322721.

This book reviews the molecular biology of genotoxic damage in mammalian and yeast cells.

Non-Technical Books

Burdon RH (2003)
The Suffering Gene: Environmental Threats to Our Health
McGill-Queen's University Press, Montreal, QC and Kingston, ON, Canada, 360 pages. ISBN 0773526560

This is a book written for the non-scientist on how chemicals and radiation in the environment can adversely affect the genetic health of humans. This book approaches genetic toxicology from the perspective of how environmental exposure to DNA-damaging agents adversely affects human health.

Frickel S (2004)
Chemical Consequences: Environmental Mutagens, Scientist Activism, and the Rise of Genetic Toxicology
Rutgers University Press, New Brunswick, NJ, 224 pages. ISBN 0813534135.

This book provides a history of the birth of the field of genetic toxicology. This non-technical book chronicles the scientific, social, and political forces that led to the establishment of the field that eventually became genetic toxicology. The awareness that chemicals could damage DNA and adversely affect human health led to research and eventually regulation of human exposure to DNA-damaging agents.

Journals

Environmental and Molecular Mutagenesis
Wiley-Liss, Inc
Hoboken, NJ
Web: www.interscience.wiley.com/journal/10009058/home

This is the official journal of the Environmental Mutagen Society.

European Journal of Genetic and Molecular Toxicology
European Environmental Mutagen Society
Web: www.swan.ac.uk/cget/ejgt1.htm

The *European Journal of Genetic and Molecular Toxicology* is an online journal published by the European Environmental Mutagen Society (www.swan.ac.uk/cget/ejgt1.htm).

Genes and Environment

The Japanese Environmental Mutagen Society publishes this journal in English. Their original journal, published in Japanese, was titled *Environmental Mutagen Research*. The journal changed its official language into English in 2006, and is now titled *Genes and Environment*.

Mutagenesis
Oxford University Press
Oxford, UK
Web: http://mutage.oxfordjournals.org/

Mutagenesis is the journal of the United Kingdom Environmental Mutagen Society.

Mutation Research
Elsevier Science B.V., Amsterdam, The Netherlands
Web: www.elsevier.com/wps/find/journaldescription.cws_home/600799/description#description

Mutation Research is the journal of record for Genetic Toxicology. The journal has three sections each with a different focus. A fourth journal, *DNA Repair*, is editorially separate from *Mutation Research* but is part of the *Mutation Research* series. The individual journal titles are:

- *Mutation Research – Fundamental and Molecular Mechanisms of Mutagenesis*
- *Mutation Research – Genetic Toxicology and Environmental Mutagenesis*
- *Mutation Research – Reviews in Mutation Research*
- *DNA Repair*: Responses to DNA damage and other aspects of genomic stability.

Tweats DJ, Scott AD, Westmoreland C, Carmichael PL (2007) Determination of genetic toxicity and potential carcinogenicity in vitro – challenges post the Seventh Amendment to the European Cosmetics Directive. Mutagenesis 22(1): 5–13.

Witte I, Plappert U, de Wall H, Hartmann A (2007) Genetic toxicity assessment: employing the best science for human safety evaluation. Part III: the comet assay as an alternative to in vitro clastogenicity tests for early drug candidate selection. Toxicol. Sci. 97(1): 21–26.

Databases

The best sources for web-based bibliographic references and specialized information in the field of genetic toxicology are the various databases maintained by the US National Library of Medicine (NLM). The main web page of NLM (www.nlm.nih.gov) guides users to various menu options to access the information available from NLM. Notable for genetic toxicologists in this health resource menu are links to MEDLINE/PubMed® (Entrez) and the NLM Gateway. Medline Plus® (http://medlineplus.gov) provides access to the general public through a simplified web interface in English (http://medlineplus.gov/) and Spanish (http://medlineplus.gov/spanish/).

PubMed®
Web: http://pubmed.gov

PubMed provides access to MEDLINE and other health-related databases, with links to participating online journals and other related databases and web resources.

NLM Gateway
Web: http://gateway.nlm.nih.gov

Allows searches in multiple National Library of Medicine databases, i.e. PubMed, MedlinePlus, OMIN, DIRLINE, etc.

NLM Entrez
Web: www.ncbi.nlm.nih.gov/Entrez/

The Entrez search screen permits integrated searches across various databases at National Center for Biotechnology Information and NLM of interest to researchers in genetic toxicology and toxicogenomics.

TOXNET
Web: http://toxnet.nlm.nih.gov
http://toxnet.nlm.nih.gov/pda/ (ToxNet access via PDA devices)

Databases on toxicology, hazardous chemicals, and environmental health are maintained by the Specialized Information Services Division of NLM (http://sis.nlm.nih.gov/). There are multiple specialized databases that can be searched together, individually or in unique combinations. The following specialized databases of interest to genetic toxicologists may be reached from the TOXNET menu or directly from the weblinks below.

ChemIDPlus
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?CHEM (ChemIDPlus Lite)
http://chem.sis.nlm.nih.gov/chemidplus (Advanced)

Two means to access a database that links a dictionary of over 370 000 chemicals to Medline and other NLM medical databases searchable by chemical structure.

HSDB (Hazardous Substances Data Bank)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?HSDB

Data file focusing on the toxicology of potentially hazardous chemicals.

TOXLINE (Toxicology Literature Online)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?TOXLINE

Online bibliographic information covering biochemical, pharmacological, physiological, and toxicological effects of drugs and other chemicals.

CCRIS (Chemical Carcinogenesis Research Information System)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?CCRIS

Carcinogenicity and mutagenicity test results for over 8000 chemicals.

DART (Developmental and Reproductive Toxicology)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?DARTETIC

Bibliographic database covering teratology and other aspects of developmental and reproductive toxicology.

GENE-TOX (Genetic Toxicology)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?GENETOX

Database created by the EPA and containing peer-reviewed genetic toxicology test data for over 3000 chemicals.

IRIS (Integrated Risk Information System)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?IRIS

Hazard identification and dose–response assessments for over 500 chemicals.

ITER (International Toxicity Estimates for Risk)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?iter

Risk information for over 600 chemicals from authoritative groups worldwide.

Multi-Database (Multi-Database Search)
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?Multi

Search all factual chemical databases including HSDB, CCRIS, IRIS, GENETOX, and Lact-Med.

Government Agencies and Regulatory Information

US Food and Drug Administration
FDA Center for Drug Evaluation and Research (CDER)
Web: www.fda.gov/cder

This is one of five centers at the USFDA and is responsible for human drug registration. Many useful webpages are maintained in the CDER website including links to the following.

ICH Regulatory Guidelines provide the framework for genetic toxicology testing drugs, impurities and degredants of drugs in the US, Europe and Japan.
Web: http://www.fda.gov/cder/guidance/

Establishment of the Genetic Toxicology Review Committee to facilitate and harmonize review of preclinical genetic toxicology submissions to the various divisions within CDER.
Web: www.fda.gov/cder/mapp/7400.4.pdf

Guidance document titled 'Guidance for Industry and Review Staff: Recommended Approaches to Integration of Genetic Toxicology Study Results' published in January 2006. This document provides a framework for evaluating positive genetic toxicology data so as to minimize unnecessary repeat testing and to provide better insight into
Web: www.fda.gov/cder/guidance/6848fnl.pdf

FDA Center for Food Safety and Applied Nutrition (CFSAN)
Web: www.cfsan.fda.gov

FDA CFSAN is the center of FDA that deals with food safety. The first FDA guideline for mutagenicity testing of chemicals was developed by CFSAN and codified in the Draft Redbook II originally issued in 1993. A revised version, *Redbook 2000: Toxicological Principles for the Safety of Food Ingredients*, is available electronically at www.cfsan.fda.gov/~redbook/redtoca.html.

US Environmental Protection Agency
Web: www.epa.gov

Office of Pollution Prevention and Toxics (OPPT)
Web: www.epa.gov/opptint

EPA's Office of Pollution Prevention and Toxics (OPPT) (www.epa.gov/oppts) manages programs to evaluate new and existing chemicals and their risks. As part of this responsibility, OPPTS has developed harmonized testing guidelines including genetic toxicology test guidelines in section 870.
Web: www.epa.gov/opptsfrs/home/guidelin.htm

National Toxicology Program (NTP)
Web: http://ntp-server.niehs.nih.gov.

NTP is an interagency program supported by the NIEHS, the National Institute for Occupational Safety and Health (www.niehs.nih.gov/home.htm) (NIOSH, an institute of the Centers for Disease Control and Prevention) (www.cdc.gov/niosh/homepage.html), and the National Center for Toxicological Research (NCTR, a laboratory of the FDA) (www.fda.gov/nctr/

index.html). The NTP website provides genetic toxicology information taken from NTP-sponsored studies. An example of NTP genetic toxicology data is found in the NTP Testing Information and Study Results webpage (http://ntp-server.niehs.nih.gov/main_pages/NTP_ALL_STDY_PG.html).

Organization for Economic Cooperation and Development (OECD)
Web: www.oecd.org

OECD is the lead agency on harmonizing genetic toxicology test guidelines. OECD test guidelines are organized into four sections: physical chemical properties, effects on biotic systems, degradation and accumulation, and health effects. There are a series of approved genetic toxicology test guidelines for various genetic toxicology assays. This includes the four commonly performed assays: bacterial reverse mutation assay (OECD 471), In Vitro Mammalian Chromosome Aberration Test (OECD 473), Mammalian Erythrocyte Micronucleus Test (OECD 474), and In Vitro Mammalian Cell Gene Mutation Test (OECD 476). The titles of individual OECD test guidelines may be viewed at www.oecd.org/document/55/0,3343,en_2649_34377_2349687_1_1_1_1,00.html.

Associations and Professional Societies

Genetic toxicology has benefited from active professional societies at the international, regional, national, and local levels for almost 30 years. Various national or regional societies are listed by geographic region with affiliated local associations.

International Association of Environmental Mutagen Societies (IAEMS)
Web: www.iaems.net/about.asp
IAEMS Headquarters
1821 Michael Faraday Drive
Suite 300
Reston, Virginia 20190 USA
Phone: +1-703-438-3103

The IAEMS is the umbrella organization to which most national or regional associations are affiliated. This organization was formed to understand the mutational basis of human disease, environmental effects, and human risk for genetic-related disease. Other goals include facilitating international acceptance of testing methods, promoting science-based risk assessment, providing education and training, and promoting collaborative research at the international level.

United States

Environmental Mutagen Society (EMS)
1821 Michael Faraday Drive
Suite 300
Reston, VA 20190
Phone: +1-703-438-8220
Web: www.ems-us.org

EMS was organized in 1969. The website provides information on the society, membership, annual meetings, placement services, and publications. EMS publishes the journal *Environmental and Molecular Mutagenesis*.

There are also a number of regional genetic toxicology societies in the US. These associations tend to be volunteer-driven without formal headquarters. They are best contacted via their websites.

Genetic Toxicology Association (GTA), founded in 1975, serves the mid-Atlantic region of the US. The new GTA website is www.gta-us.org.

Genotoxicity and Environmental Mutagen Association (GEMS), founded in 1982, serves the North Carolina and southeast region of the US (http://gems-nc.org/).

Genetic and Environmental Toxicology Association (GETA) serves northern California (www.ems-us.org/GETA/).

Europe

European Environmental Mutagen Society
Web: www.eems-eu.org
EEMS, founded under the leadership of Dr. Frits Sobels in 1970, maintains a website where programs, meetings, and publications are listed. The EEMS publishes the journal *European Journal of Genetic Toxicology*.

Regional societies of EEMS are active in many European countries. The larger ones are found in Belgium, France, Italy, The Netherlands, and the United Kingdom. Germany, Austria and Switzerland are grouped in a German-speaking society. Denmark, Finland, Norway, Sweden, and Iceland are grouped in a Nordic society. Other societies include national associations in Armenia, Bulgaria, Croatia, Czech Republic and Slovakia, Greece, Hungary, Poland, Portugal, Russia, Serbia, Slovenia, and Spain. Contact information for each country is located at www.eems-eu.org or at the specific association websites below.

Belgian Environmental Mutagen Society (BEMS)
Web: http://cdfc00.ugent.be/bems/default.htm

BEMS, founded in 1980, seeks to encourage research into problems associated with environmental mutagens, organize scientific meetings, and to provide

guidance as needed to governmental and private industries.

Société Française de Toxicologie Génétique (SFTG)
Web: www.sftg.org

SFTG serves the French genetic toxicology community with a website that is maintained in both French and English.

Gesellschaft für Umwelt- Mutationsforschung e.V. (GUM)
Web: www.gum-net.de(German)

This German-speaking section of the EEMS, founded in 1971, promotes experimental mutation research, organized workshops and conferences, and promotes contacts between authorities, industry, and academia. Membership is primarily drawn from Germany, Austria, and Switzerland.

NordEMS
Web: www.nordems.dk

NordEMS, founded in 1982, is the Nordic society of EEMS European Environmental Mutagen Society. It serves members from Denmark, Finland, Norway, Sweden, and Iceland.

United Kingdom Environmental Mutagen Society (UKEMS)
Web: www.ukems.org

UKEMS, organized in 1977, serves genetic toxicologists in the UK. The UKEMS publishes the journal *Mutagenesis*.

Asia-Pacific Associations

Asian Association of Environmental Mutagen Societies (AAEMS)
Web: www.j-ems.org/aaems/aames_index.html

This is a relatively new organization that seeks to promote communication and scientific exchange among the Asian regional national associations and those researchers involved in genetic toxicology in the region. Member societies and contact information are provided on their website. National association members include the Chinese Environment Mutagen Society (CEMS), Korean Environment Mutagen Society (KEMS), Philippine Environment Mutagen Society (Philippine EMS), Thai Environment Mutagen Society (Thai EMS), Japanese Environment Mutagen Society (JEMS), and Indian Environment Mutagen Society (Indian EMS).

The Japanese Environmental Mutagen Society (JEMS)
Web: www.j-ems.org (Japanese version) and http://www.j-ems.org/en1/home.html (a more limited English version)

The JEMS is the most active genetic toxicology association in the Asia-Pacific region. The association hosts an annual meeting.

Mutagenicity and Experimental Pathology Society of Australasia (MEPSA)
Web: www.mepsa.org

MEPSA was formed in 1999 by combining two societies: the Australia and New Zealand Environmental Mutagen Society (ANZEMS) and the Australasian Society for Experimental Pathology (ASEP). The new society seeks to further the interests of the two pre-decessor associations by focusing on experimental pathology and environmental mutagenesis.

Latin America and Africa

Sociedade Brasileira de Mutagênese Carcinogênese e Teratogênese Ambiental (SBMCTA)
Web: www.sbmcta.org.br (Portuguese)

This Brazilian association, founded in 1989, supports research and scientific communication in the fields of genetic toxicology, carcinogenicity, and teratogenicity.

Asociación de Mutagenesis, Carcinogeneisi Y Teratogenesis Ambiental (ALAMCTA)
Web: www.iaems.net/membership.asp#ALAMCTA

ALAMCTA represents Spanish-speaking countries in Latin America.

Pan-African Environmental Mutagen Society (PAEMS)
Web: www.iaems.net/membership.asp#PAEMS

Organizations for the Development of 'Alternative' Genetic Toxicology Methods

Historically, genetic toxicology was one of the first scientific disciplines to focus on the development of in vitro assays to predict adverse in vivo effects. Decades ago, programs such as the US National Toxicology program supported validation of many of the standard genetic toxicology assays in routine use for product safety testing. Support for the development and validation of new genetic toxicology programs has moved in part on to new institutions with the mandate of developing 'alternative' methods. Alternative methods generally imply the reduction or elimination of animal models for safety testing.

European Centre for the Validation of Alternative Methods (ECVAM)
EC-Joint Research Centre
via E. Fermi 1
I-21020 Ispra (VA), Italy

Phone: +39-0332-789111
Web: http://ecvam.jrc.it

ECVAM supports the evaluation and validation of alternative assays to measure in vitro a wide range of toxicological endpoints previously detectable only in laboratory animals. ECVAM has supported work in several areas of genetic toxicology including evaluating the in vitro micronucleus test as an alternative to the in vitro chromosome aberration assay and both the in vitro Balb/3T3 and SHE transformation assays as alternatives to in vivo rodent carcinogenicity assays.

Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM)
NIEHS
P.O. Box 12233, Mail Drop EC-17
Research Triangle Park, NC 27709, USA
Phone: +1-919-541-2384
Web: http://iccvam.niehs.nih.gov/

The NTP Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM) administers the ICCVAM program. ICCVAM consists of representatives from 15 US Federal regulatory and research agencies that use, generate, or disseminate toxicological information. The Genetic Toxicity Working Group reviews and provides comments to sponsors on proposed validation studies, provides recommendations on test method nominations and submissions for alternative test methods related to genetic toxicity, and evaluates proposed test guidelines and activities relevant to genetic toxicity from the Organization for Economic Co-Operation and Development.

Japanese Center for the Validation of Alternative Methods (JaCVAM)
Division of Pharmacology, Biological Safety Research Center
National Institute of Health Sciences
1-18-1 Kamiyoga, Setagaya-ku
Tokyo 158-8501, Japan
Phone: +81-3-3700-9874

JaCVAM, supported through the Japanese National Institute of Health Sciences, sponsors the development and validation of alternative assays. Activities are often coordinated with ECVAM and ICCVAM. JaCVAM has taken a leadership role in the validation of the in vivo Comet assay (www.j-ems.org/archives/pdf/20070711.pdf) and is organizing a similar validation of the in vitro Comet assay.

CHAPTER

34

Mixtures

R.C. HERTZBERG, AND G. RICE

INTRODUCTION

Understanding the toxicity of realistic chemical exposures requires understanding joint toxicity from multiple chemicals. These exposures typically vary over time: the total exposure level, the relative proportions of component chemicals, and the exposures for each route are changing. Research on toxicology and risk assessment of multichemical exposures is then complicated because toxicologic interactions vary with exposure sequence, duration and route, as well as with total dose, relative chemical proportions, and endpoint.

Toxicological testing of even the most common chemical combinations is impractical, so research often focuses on efficient study designs and statistical methods that minimize the number of animals and dose groups, often only detecting departures from dose addition. Publications that identify interaction mechanisms are rare. Those that do most often report pharmacokinetic (e.g., metabolic) interactions; few articles describe interactions involving toxicological mechanisms or direct physical–chemical interactions (e.g., two chemicals combining to form a new chemical). Regulatory agencies, most notably the U.S. Agency for Toxic Substances and Disease Registry (ATSDR), U.S. Environmental Protection Agency (EPA), and (U.S.) National Institute for Occupational Safety and Health (NIOSH) have sponsored programs specifically to address mixture toxicity, but usually for only a few high-priority mixtures, such as combinations commonly found at Superfund sites, organophosphate pesticides, drinking water disinfection byproducts, and manufacturing dusts and fumes. Risk assessment methods are usually simple, involving variations on dose or response addition, sometimes including a default formula or factor for potential interactions. A few interaction databases have been constructed in the last 20 years, but none is current, and none contains descriptions of interaction mechanisms. Recently, research has moved toward in silico experimentation, i.e., the investigation of interactions by complex biologically based mathematical models that incorporate both interactions as well as other related physiological processes.

RESOURCES

Books/Documents

ATSDR (2004)
Guidance Manual for the Assessment of Joint Toxic Action of Chemical Mixtures
Agency for Toxic Substances and Disease Registry, U.S. Department of Health and Human Services, Public Health Service, Atlanta

Provides a discussion of specific methods used by ATSDR for addressing chemical mixture risk, including an extensive description of a weight of evidence approach for characterizing the quality of available pairwise interactions information. It also includes some approaches by other agencies (http://www.atsdr.cdc.gov/interactionprofiles/ipga.html).

Calabrese EJ (1991)
Multiple Chemical Interactions, Toxicology and Environmental Health
Chelsea, MI: Lewis Publishers.

Extensive collection of information on interactions involving chemicals and drugs, organized by chemical type and endpoint. It also includes a section on principles and concepts, one on regulatory approaches, and reproduces two EPA mixture risk publications as appendices. All sections are somewhat dated. For example, the principles section has no discussion of the cost-effective ray designs (whose publications started in the 1990s) and no discussion of ternary or more complex interactions. It does reflect most of the main regulatory procedures for mixtures in use at the time of publication, and thus is limited mainly to additivity approaches. The huge amount of toxicological information, however, remains highly useful.

Cornell J (1990)
Experiments with Mixtures: Designs, Models, and the Analysis of Mixtures Data, Second edition
New Tork: John Wiley and Sons, Inc.

Mainly statistical but addresses several issues related to mixture experiments, especially where the main variables are relative proportions of components.

Danish Veterinary and Food Administration (DVFA) (2003)
Combined Actions and Interactions of Chemicals in Mixtures: The Toxicological Effects of Exposure to Mixtures of Industrial and Environmental Chemicals (Fødevare Rapport 2003: 12)
Søborg: DVFA

Includes recommendations to the DVFA of risk assessment methods for mixtures. Contains extensive but brief discussions of different types of interaction processes grouped by the type of toxic effect, as well as one section on kinetics interactions. It is somewhat dated, e.g., no discussion of ternary interactions, nor of efficient experimental designs. Sections on interaction concepts, experimental designs, and regulatory methods are brief overviews (http://www.foedevarestyrelsen.dk/FDir/Publications/2003012/Rapport.pdf).

Goldstein R, Hewitt W, Hook J (Eds) (1990)
Toxic Interactions
Academic Press, New York.

Extensive discussion of experimental design, toxicologic principles for interactions in general (e.g., mixed function oxidase system) and then specific information on interactions in the liver, kidney, lung, and cardiac system. Some of the terms are dated, and the experimental design chapter is quite simple compared to current approaches, but the descriptions of toxicologic interaction processes are detailed and include good examples.

Health Council of the Netherlands (2002)
Exposure to Combinations of Substances: A System for Assessing Health Risks
The Hague: Health Council of the Netherlands.
Publication no. 2002/05

Emphasizes whole mixtures, fractions (component groups with similar properties), or components using a Hazard Index approach, and briefly discusses new methods such as pattern recognition for statistically establishing mixtures of similar composition. Although fairly consistent with the USEPA procedures, this report is more of a framework; few procedural details are presented.

Hertzberg RC, Rice GE, Teuschler LK (1999)
Methods for Health Risk Assessment of Combustion Mixtures
Roberts S, Teaf C, Bean J (eds) Hazardous Waste Incineration: evaluating the human health and environmental risks, pp. 105–148.
CRC Press, Boca Raton.

Presents the concepts of the EPA mixture risk guidance as applied to incineration, from whole mixture approaches to component-based interaction approaches.

Hertzberg RC, Rice GE, Teuschler LK, Wright J, Simmons JE (2007)
Health Risk Assessment of Chemical Mixtures in Drinking Water
New York: John Wiley & Sons, Inc.,
In Howd R, Fan A (eds) Risk assessment for chemicals in drinking water, pp. 123–170.

Presents a number of newer mixture risk assessment concepts developed at U.S. EPA and discusses mixtures exposure assessment issues.

Myers R, Montgomery D (2002)
Response Surface Methodology: Process and Product Optimization Using Designed Experiments, Second Edition
New York: Wiley

Extensive treatment of response surface techniques, applications, pitfalls, and concepts. Although mainly oriented toward data analysis (whatever the source), the guidance about experimental design is substantial and can easily be interpreted for toxicology research.

NIOSH (2005)
Mixed Exposures Research Agenda: A Report by the NORA Mixed Exposures Team
Cincinnati, OH: National Institute for Occupational Safety and Health, U.S. Department of Health and Human Services, Centers for Disease Control and Prevention.

The document articulates many of the issues involved with mixed exposures, recommends research strategies, and defines research priorities that could lead to improved interventions for protecting workers from mixed exposures (http://www.cdc.gov/niosh/docs/2005-106/).

NRC (National Research Council) (1988)
Complex Mixtures: Methods for in vivo Toxicity Testing
Washington, DC: National Academy Press.

Some excellent discussions of traditional mixture issues, including toxicity testing methods and interaction concepts, but is weakened by inconsistent terminology (e.g., mostly relates to simple mixtures, very little on truly complex mixtures) and by being somewhat dated.

Reffstrup T (2002)
Combined Actions of Pesticides in Food (Fødevare Rapport 2003:12)
Søborg: Danish Veterinary and Food Administration.

Extensive collection of interaction examples for pesticides. It includes brief summaries of some regulatory approaches and perhaps their brevity has led to the vague descriptions and to some misrepresentations. No discussion is included of experimental design nor of statistical methods for toxicology data analysis.

Rice G, Teuschler L, Simmons JE, Hertzberg R (2005)
Mixtures, Toxicology and Risk Assessment
San Diego: Academic Press
In Wexler P (Ed.) Encyclopedia of Toxicology, pp. 120–123.

This entry details the relative potency factor method, an application of dose addition.

Rothman KJ, Greenland S (1998)
Concepts of Interaction
Philadelphia: Lippincott-Raven Publishers
In Modern epidemiology, Chapter 18, 2nd edn., pp. 329–342.

Extensive discussion of the terminology and underlying concepts of interaction as used in toxicology, statistics and epidemiology, and how stratified analysis can benefit interaction studies.

U.S. EPA (1990)
Technical Support Document on Health Risk Assessment of Chemical Mixtures. EPA/600/8-90/064
National Center for Environmental Assessment, Cincinnati.

Contains a summary of available evidence on mixture dose–response, including an analysis of the studies in the USEPA Mixtox database, and discussions of whole mixture similarity criteria and of basic additivity concepts of mixture components.

U.S. EPA (2000)
Supplementary Guidance for Conducting Health Risk Assessment of Chemical Mixtures. EPA/630/R-00/002
Risk Assessment Forum, Washington, DC.

Extensive description of terminology, concepts, and procedures for component additivity, whole mixture assessment, and toxicologic interaction, including an interaction-based hazard index that quantitatively incorporates binary interaction information. It also includes the USEPA 1986 mixture guidelines in an appendix (http://cfpub.epa.gov/ncea/raf/recordisplay.cfm?deid=20533).

U.S. EPA (2002)
Region/ORD Workshop on Cumulative Risk Assessment
Office of Science Policy, Washington, DC

Workshop proceedings that include several presentations on research strategies and risk methods for various combinations of chemical and nonchemical stressors (www.epa.gov/osp/regions/cumrisk.htm).

U.S. EPA (2003)
Exposure and Human Health Reassessment of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) and Related Compounds. NAS Review Draft EPA/600/P-00/001Cb
Washington, DC, National Center for Environmental Assessment.

Comprehensive set of documents that describe sources of dioxin-like compounds in the United States, environmental levels, and background exposures, site-specific assessment procedures, and applications of toxicity equivalence factors (http://www.epa.gov/ncea/pdfs/dioxin/nas-review/).

U.S. EPA (2003)
The Feasibility of Performing Cumulative Risk Assessments for Mixtures of Disinfection By-Products in Drinking Water. EPA/600/R-03/051
U.S. EPA, Cincinnati, OH

Expands the EPA approaches for component additivity to include multiple exposure routes. It develops exposure estimates for 13 major DBPs, accounting for physicochemical properties of the DBPs and population activity patterns that affect the amount of human contact time with drinking water (e.g., tap water consumed, time spent showering, building characteristics). The cumulative relative potency factor approach is advanced that integrates dose addition and response addition to produce multiple-route, chemical mixture risk estimates using total absorbed doses

(http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=56834).

U.S. EPA (2003)
Framework for Cumulative Risk Assessment. EPA/600/P-02/001F
Office of Research and Development, National Center for Environmental Assessment, Washington, DC

Extensive discussion of multiple issues affecting the joint toxicity of combinations of exposure to chemical and non-chemical stressors. Also discusses interactive impacts of socioeconomic factors, such as access to health care.

U.S. EPA (2006)
Considerations for Developing Alternative Health Risk Assessment Approaches for Addressing Multiple Chemicals, Exposures and Effects (External Review Draft)
Cincinnati, OH, Office of Research and Development, National Center for Environmental Assessment in collaboration with U.S. Department of Energy Argonne National Laboratory, Environmental Assessment Division (http://oaspub.epa.gov/eims/eimscomm.getfile?p_download_id=456398)

Focuses on the evaluation of health risks from exposures to multiple chemicals, including multiple exposure routes and times as well as multiple health endpoints. Qualitative and semiquantitative approaches are provided that simplify the number of potential combinations of chemicals, exposures, and effects to make the risk assessment more feasible.

Yang R (ed.) (1994)
Toxicology of Chemical Mixtures: Case Studies, Mechanisms, and Novel Approaches
New York, Academic Press.

Covers a wide range of topics, including experimental design, statistical estimation, dose–response models, bioassay protocols, toxicologic mechanisms, and regulatory methods.

Molecular, Cellular, and Biochemical Toxicology

JACQUES DESCOTES

INTRODUCTION

Molecular, cellular, and biochemical toxicology is an extremely wide area encompassing most, if not all in vitro and mechanistic aspects of current toxicological science. Therefore, the list of key references provided below can only be considered as an introduction. Textbooks covering key aspects including the most recent methods and techniques as well as issues of major concern are listed. Although articles devoted to this field can be found within almost any toxicology journal, quite a few are more exclusively devoted to articles devoted to molecular, cellular, and biochemical toxicology. The proposed list of books, journals, and journal articles is restricted to general recent reviews dealing with the most relevant aspects.

RESOURCES

Books

Boelsterli UA (2007)
Mechanistic Toxicology: The Molecular Basis of How Chemicals Disrupt Biological Targets
CRC Press, Boca Raton, FL

Gives insights into the processes and mechanisms underlying the toxicity of chemicals, and explains how foreign compounds exert their damaging effects on cells and tissues.

Davis, M. (2002)
Apoptosis Methods in Pharmacology and Toxicology: Approaches to Measurement and Quantification
Humana Press

Contains concise methods for the detection, mechanisms, and quantification of apoptosis that is critical for the design of toxicology and pharmacology studies.

Fishbein JC (2006)
Advances in Molecular Toxicology
Elsevier, Amsterdam

Describes most recent progresses in selected aspects of molecular toxicology with a focus on elucidation of mechanisms at the molecular level and on advances in technological approaches employed.

Gad SC, Strauss S (2000)
In vitro Toxicology
Taylor & Francis, New York

Covers a broad range of in vitro models for use in either identifying or understanding most forms of toxicity including irritation, sensitization, lethality, mutagency, and developmental toxicity, and a full spectrum of target organ systems such as skin, eye, heart, liver, kidney, nervous system. Each of these specialty areas is presented from a perspective of presenting the principal models and their uses and limitations.

Gibson GG, Skett P (2003)
Introduction to Drug Metabolism, 3rd Edition
Nelson Thornes, Cheltenham, UK

Provides an aid to teaching and a source of reference for postgraduates working in the drug metabolism field. Includes a number of examples from therapeutic agents as well as chemicals and environmental pollutants.

Hamadeh HK, Afshari CA (2004)
Toxicogenomics: Principles and Applications
John Wiley & Sons, New York

For specialists and non-specialists. Provides a description of key technologies in genomics, proteomics, metabonomics, and bioinformatics, as well as their applications to toxicology research.

Hensley K, Floyd RA (2003)
Methods in Biological Oxidative Stress
Springer, New York

Contributors detail best experimental methods for detecting free radicals and reactive oxygen species or their by-products, ranging from established standard protocols to advanced methodologies using HPLC, mass spectrometry, and electron paramagnetic resonance. Each technique is described in step-by-step detail. Useful notes explain the pitfalls to avoid and the chemical principles underlying each method.

Hodgson E, Smart RC (2001)
Introduction to Biochemical Toxicology
John Wiley & Sons, New York

Provides a good introductory text for graduate students on the underlying biochemical, molecular, and cellular mechanisms through which toxicants produce their adverse responses. The 3rd edition includes new chapters such as immunotoxicology, cutaneous toxicology, and molecular epidemiology.

Josephy PD, Mannervik P (2006)
Molecular Toxicology
Oxford University Press, New York

Explains the principles of toxicology in depth and from the perspective of modern biochemistry and molecular biology. Emphasizing molecular approaches, the book covers xenobiotic transformation, reactive intermediates, cloning, expression, and analysis of enzymes involved in biotransformation, molecular toxicology of aromatic amines, nitrosamines, PAHs, and chlorinated compounds.

Keohavong P, Grant SG (2004)
Molecular Toxicology Protocols
Humana Press, New York

Describes a collection of techniques for analyzing genotoxic exposure and detecting the resulting biological effects. Analytical methods that can be specifically applied to human populations and patients are emphasized.

Kubic TE, Burczynski ME (2003)
An Introduction to Toxicogenomics
CRC Press, Boca Raton, FL

Provides a comprehensive overview with a focus on toxicology. It introduces the basic principles of microarray/oligonucleotide array-based genomic analysis. The book then features the basics of data analysis and clustering methods such as genetic algorithms. Finally, it covers expression profiling in the field of toxicology and details both mechanistic and predictive studies.

Manahan SE (2002)
Toxicological Chemistry and Biochemistry
CRC Press, Boca Raton, FL

Describes the basic concepts of general, organic, and environmental chemistry and biochemistry. The book goes on to discuss biodegradation, bioaccumulation, and biochemical processes that occur in water and soil and describes xenobiotics analysis for determining toxicants and their metabolites in blood and other biological materials. A chapter on genetic aspects explains the ways in which chemical damage to DNA can cause mutations, cancer, and other toxic effects on specific body systems. The author also considers the role of genetics in determining individual susceptibilities to various toxicants. The second half of the book is devoted to the toxicological chemistry and biochemistry of various classes of chemical compounds.

Ortiz de Montellano PR (ed.) (2004)
Cytochromes P450: Structure, Mechanism and Biochemistry
Springer, New York

Summarizes the current state of research in the field of drug metabolism. The emphasis is on multidisciplinary approaches related to structure, mechanism, biochemistry, and regulation, and their relevance in human medicine.

Parvez H, Labbe G, Reiss C (2001)
Molecular Responses to Xenobiotics
Elsevier, Amsterdam, The Netherlands

Provides insight into the target(s), activity, and mechanism of action of xenobiotics, and reveals the detailed response and fate of the cell. The articles contained in this volume were written by leading experts in the field and each article is introduced with a tutorial, for those not familiar with the concepts and described methods.

Phillips IR, Shephard EA (2006)
Cytochrome P450 Protocols
Springer, New York

Describes the techniques for investigating the large superfamily of proteins that are of central importance in detoxifying or activating many foreign hydrophobic compounds, including therapeutic drugs, chemical carcinogens, and environmental pollutants. The focus is on P450 species from mammals, but the methods are also suitable for those from other sources. The techniques described are used for purifying, spectral analysis, expression in heterologous cells, determining functional capabilities, detecting and quantifying, gene expression and its regulation, and cell culture.

Plant N (2003)
Molecular Toxicology
Taylor & Francis, New York

Provides a concise introduction to the theoretical principles of molecular toxicology followed by specific examples. The book concludes with a section on toxicity assessment methods, where the impact of molecular biology is having a considerable impact, including DNA microarrays, proteomics, and bioinformatics.

Stacey GN, Doyle A, Ferro M, Doyle A, Ferro M (2002)
Cell Culture Methods for in Vitro Toxicology
Springer, New York

Introduces the reader to a range of techniques involved in the use of in vitro cell culture in toxicological studies. It deals with major cell types studied in the field of toxicology and will be useful for anyone wishing to start work with animal cell cultures or to refresh their knowledge relating to in vitro cell models. Prominent features of in vitro technologies also include regulation, biosafety, and standardization.

Tiffany-Castiglioni E (2004)
In Vitro Neurotoxicology: Principles and Challenges
Springer, New York

Reviews neurotoxicants of significance to human health, especially those for which metabolism and dose–response are well studied both in vivo and in vitro: lead, mercury, organophosphorus insecticides, polychlorinated biphenyls and dioxin, ethanol, and endogenous proteins. Chapters discuss neurodevelopmental and neurodegenerative diseases, including the concept of astroglia as depots for lead and other metals in the central nervous system and factors involved in the onset of puberty in females.

Van Den Heuvel JP, Greenlee WF, Perdew GH, Mattes WB (2002)
Comprehensive Toxicology: Cellular and Molecular Toxicology
Pergamon, New York

Volume 14 of the series *Comprehensive Toxicology* describes the use of extremely powerful molecular and cell biology techniques in toxicology. Each chapter contains a listing of major peer-reviewed articles and reviews and useful websites, and a broad introductory section that outlines the subsequent sections.

Warshawsky D, Landolph JR (2005)
Molecular Carcinogenesis
CRC Press, Boca Raton, FL

Twenty-four chapters on the technical and historical aspects of the science of cancer. The first section details pathology, epidemiology, stress responses, DNA methylation, oncogenes, tumor suppressor genes, DNA repair, chemical mutation, and chemical, viral, and radiation carcinogenesis. The second part focuses on breast, thyroid, skin, brain, prostate, lung, bladder, and colon cancer, leukemia, immunology and immunotherapy, and gene therapy.

Zalups RK, Koropatnick DJ (2000)
Molecular Biology and Toxicology of Metals
CRC Press, Boca Raton, FL

Provides a review and analysis of the current state of knowledge of metal ion transport and metabolism in prokaryotic and eukaryotic cellular systems, and also deals with the influence of both essential and non-essential transition metals on gene expression and the ability of cells to respond to extracellular signals. It covers the latest information on specific metals and the biological molecules with which metals interact. It also details mechanisms in the handling and toxicity of metals in specific organ systems, and the role of metals in cell signalling and gene transcription in target cells.

Zawia NH (2004)
Molecular Neurotoxicology: Environmental Agents and Transcription
CRC Press, Boca Raton, FL

Ten contributions characterize the role of specific transcription factor families in neurotoxicity, various models of growth and neurodegeneration, the role of DNA repair in the nervous system, and the impact of neurotoxicants on a variety of cell signaling intermediates. Zinc finger transcription factors, the rel/nuclear factor-kappa B family of factors, transgenic animal models of specific neurodegenerative disorders, environmental toxins that selectively affect the central nervous system, and genetic studies on alcohol-related diseases are covered. An introductory chapter overviews methods of monitoring gene expression, recombinant DNA technology, and types of genetically engineered animals.

Journals

Biochemical and Molecular Medicine (alternatively known as *Biochemical Medicine* and *Biochemical Medicine and Metabolic Biology* and *Molecular Genetics and Metabolism*)
For a detailed description of this journal:
http://www. biolc.com/wps/find/journal description.cws_home/622920/ description#description.

Biochemical Pharmacology
This is an international journal published by Elsevier. Emphasis has been given on original work with reference to the interaction of drugs and non-therapeutic xenobiotics with biological systems. Specific emphasis is placed on findings that relate to the actions and metabolism of drugs and toxic substances at the biochemical and molecular levels. Furthermore, submissions in the areas of behavioral and physiological pharmacology and toxicology are also considered if studies are described and directed at defining mechanisms of action. Other areas that are represented in the journal include, but are not limited to, cancer chemotherapy, neuropharmacology, inflammation/immunopharmacology, antimicrobials, behavioral, respiratory, gastrointestinal, cardiovascular, and endocrine pharmacology and toxicology. Submissions relating to either pharmacodynamics or pharmacokinetics are also considered. As per Elsevier, reports based on experiments conducted with mixtures, plant, or animal extracts will not be considered for publication unless the chemical structures and concentrations of all substances are known. Submissions to the journal must be in English.

Furthermore, the journal publishes reports such as 'full-length Research Papers' containing the results of original research on an issue of relevance to pharmacology and 'Commentaries' that are commissioned articles which provide the author's view on a selected topic of interest to pharmacologists (taken from http://www.elsevier.com/wps/find/journaldescription.cws_home/525454/description#description).

Cell Biology and Toxicology
This is an international journal primarily devoted to research publications at the cellular level. It publishes papers of high scientific values in the areas of cell biology, genetic, molecular, and cellular toxicology. Further, it presents scientific reports that deal with the basic biology and with the physiological, pharmacological, and toxic response of cellular systems. Studies of subcellular and cellular systems derived from both prokaryotic and eukaryotic cell types are also included. Studies of toxic effects may include, but are not limited to, cytotoxicity, mutagenicity, carcinogenicity, and teratogenicity. Specifically, the journal emphasizes approaches to cellular studies or molecular structure activity correlations that provide relevant scientific information leading to the decreased use of experimental animals. Furthermore, it publishes papers describing original research results, reviews, announcements of scientific meetings or courses, and availability of funding, fellowships, and scholar-ships (excerpted from http://www.springer.com/life+sci/cell+biology/journal/10565).

Chemical Research in Toxicology
This journal serves as an international research forum dedicated to the chemical basis of toxicological responses. Researchers present their latest findings on the molecular mechanisms by which chemical and biological toxic agents interact with living systems. Further, the molecular mechanisms of the cellular responses to toxic agents and the mechanisms by which the cellular responses to toxic agents affect the whole organism are also covered in the journal. This ultimately leads to presentation of results related to further investigations of the pathogenesis of disease; and the development and application of new methodologies for the study of the interaction of toxic agents with living systems. The journal publishes articles, communications, chemical profiles, reviews, mini-reviews, and perspectives on structural, mechanistic, and technological advances in research related to toxic effects of chemical agents. In addition, features entitled 'forum and letters to the editor' are published periodically. Based on the information on their website, this journal, beginning in 2008, will regularly publish two new features, 'Highlights selected articles from the current issue', and 'Spotlight', that highlights articles of interest from other journals. Additionally, guest editorials from leaders in the field will highlight relevant issues facing toxicologists around the world. Editorial Advisory Board members will also provide their perspectives on their latest research. This description is derived from http://pubs.acs.org/journals/crtoec/about.html.

Chemico-Biological Interactions
This is a journal covering topics such as molecular, cellular, and biochemical toxicology. It publishes reports and review articles that examine the molecular, cellular, and/or biochemical basis of toxicologically relevant outcomes. Specific importance is placed on mechanisms in terms of interactions between chemicals and biological systems. The results of such research may include all traditional endpoints caused by synthetic or naturally occurring chemicals, both in vivo and in vitro systems. Relevant health effect endpoints may include, but are

not limited to, carcinogenesis, mutagenesis, respiratory toxicology, neurotoxicology, reproductive and developmental toxicology, and immunotoxicology. This description is taken from: http://www.elsevier.com/wps/find/journaldescription.cws_home/505510/description# description.

Critical Reviews in Toxicology

This international journal has covered many facets of toxicological research and emerging issues in toxicology. It provides objective analyses of relevant topics such as mechanisms, responses, and assessment of toxicants. Articles can include coverage of commodity and specialty chemicals; for example, formaldehyde, acrylonitrile, and pesticides; pharmaceutical agents of all types; consumer products such as macronutrients and food additives; and environmental agents such as ozone and dioxin. Review articles can include toxicological effects ranging from subtle physiological alterations to overt toxicity manifested in major systems, i.e., respiratory, gastrointestinal, endocrine, urogenital, musculoskeletal, nervous, hematopoietic, and immunological. Specific emphases are also on cancer and developmental and toxicological effects. Furthermore, mechanisms of toxicant action at all levels of biological organization are also addressed – from macromolecules and cells up to integrated organisms and populations of laboratory animals and humans. This description has been excerpted from http://www.tandf.co.uk/journals/titles/10408444.asp.

Free Radical Biology and Medicine

This is an official international, interdisciplinary journal of the Society for Free Radical Biology and Medicine – An Affiliate Journal of the International Society for Free Radical Research (SFRR). The topics include chemical, biochemical, physiological, pathological, pharmacological, toxicological, and medical approaches to research on free radicals and oxidative biology. Publications related to original contributions dealing with all aspects of free radical and oxidant research including both in vitro and in vivo studies (excerpted from http://www.elsevier.com/wps/find/journaldescription.cws_home/525469/description#description).

In Vitro and Molecular Toxicology

According to the former editor of this journal, this publication has been discontinued. Subscriptions are no longer available (http://www.liebertonline.com/ivt?cookieSet=1).

This peer-reviewed journal offered a wide range of investigative work with respect to molecular and cellular basis and expression of diverse toxic phenomena. Major topics included methods, developments, and validation of in vitro toxicology tests; impact of in vitro methodology on product safety testing; and methods for in vitro to in vivo extrapolation (http://journalseek.net/cgi-bin/journalseek/journalsearch.cgi?field=issn&query=1097-9336).

Journal of Biochemical and Molecular Toxicology

This is an international journal that contains original research papers, communications, mini-reviews, and book reviews, primarily focusing on the molecular mechanisms of action and detoxication of exogenous and endogenous chemicals and toxic agents. The scope of the journal includes publications in the areas of effects on the organism at all stages of development, on organ systems, tissues, and cells as well as on enzymes, receptors, hormones, and genes. Furthermore, the biochemical and molecular aspects of uptake, transport, storage, excretion, lactivation and detoxication of drugs, agricultural, industrial, and environmental chemicals, natural products and food additives are all other subjects of publication. Of particular interest and relevance are aspects of molecular biology related to biochemical toxicology. These may include studies of the expression of genes related to detoxication and activation enzymes, toxicants with modes of action involving effects on nucleic acids, gene expression and protein synthesis, and the toxicity of products derived from biotechnology. Toxicologist those who are active investigators in this field are not the only group who may be interested in this journal but other scientists such as biochemists, molecular biologists involved in industrial and contract research and testing laboratories, and those who are involved in legal and regulatory work related to toxic chemicals will find this journal relevant to their areas of work. It is published bimonthly with one volume of 6 issues per calendar year. This description is taken from http://ca.wiley.com/WileyCDA/WileyTitle/productCd-JBT.html.

Journal of Molecular Medicine

It covers all aspects of human biology and pathophysiology and the emphasis is on the progress and precision in the understanding, prevention, diagnosis and treatment of human diseases. It publishes original papers, rapid communications, review articles and correspondence of the highest quality pertinent to all aspects of human biology and pathophysiology (excerpted from http://www.springer.com/biomed/molecular/journal/109?detailsPage = description).

Molecular and Cellular Proteomics

American Society of Biochemistry and Molecular Biology (http://www.asbmb.org/) publishes Molecular and Cellular Proteomics which are available (open access) at http://www.mcponline.org/.

Molecular Carcinogenesis
This journal publishes research papers on investigations of molecular aspects of the mechanisms involved in chemical, physical, and viral (biological) carcinogenesis. Areas of interest may include, but are not limited to, the structure, expression, or function of genes or gene products associated with normal growth and differentiation and alterations in neoplasia; characterization of genes or gene products expressed in preneoplastic or neoplastic cells; molecular studies that define a specific function of a tumor-associated protein or its effects on cellular function; virtually all research on molecular aspects of oncogenes, tumor suppressor genes, and their gene products; carcinogenesis studies in transgenic mice; and research on human tumor viruses (taken from http://ca.wiley.com/WileyCDA/WileyTitle/productCd-MC.html).

Molecular Pharmacology
The American Society for Pharmacology and Experimental Therapeutics is the publisher of this journal. It presents original applications of biochemistry, biophysics, genetics, and molecular biology associated with innovative pharmacologic research to elucidate basic problems in pharmacology and toxicology, including areas such as molecular mechanisms involved in drug receptor-effective coupling, xenobiotic metabolism, and antibiotic and anticancer drug action. This description has been excerpted from http://highwire.stanford.edu/cgi/journalinfo?qNum=all&journal_set=molpharm&sendit=Submit. The main website for the journal is http://molpharm.aspetjournals.org/.

Toxicology and Applied Pharmacology
This journal publishes original scientific research related to action of chemicals, drugs, or natural products to animals or humans. Research publications address mechanistic approaches to physiological, biochemical, cellular, or molecular understanding of toxicologic/pathologic lesions and to methods used to describe these responses. Papers concerned with alternatives to the use of experimental animals are encouraged. This description has been excerpted from http://www.elsevier.com/wps/find/journaldescription.cws_home/622951/description#description.

Toxicology in vitro
This journal is responsible for original research papers and reviews on the topic of application and use of in vitro systems for assessing or predicting the toxic effects of chemicals and elucidating their mechanisms of action. These techniques include utilizing cell or tissue cultures, isolated cells, tissue slices, subcellular fractions, transgenic cell cultures, and cells from transgenic organisms, as well as in silico modeling. The journal focuses on investigations that involve the development and validation of new in vitro methods (e.g. for prediction of toxic effects based on traditional and in silico modeling; on the use of methods in high-throughput toxicology and pharmacology; elucidation of mechanisms of toxic action; the application of genomics, transcriptomics, and proteomics in toxicology, as well as on comparative studies that characterize the relationship between in vitro and in vivo findings). Submissions of manuscripts that focus on the development of in vitro methods, their practical applications and regulatory use (e.g. in the areas of food components cosmetics, pharmaceuticals, pesticides, and industrial chemicals) are strongly encouraged. This short description of the journal has been taken from http://www.elsevier.com/wps/find/journaldescription.cws_home/800/description#description.

Nanotechnology

RUTH LYDDY

INTRODUCTION

Nanotechnology is commonly considered to deal with particles in the size range <100 nm, and with the nanomaterials manufactured using nanoparticles. The approaches to the toxicology testing, and assessment of the human and environmental risks are undergoing rapid development. One risk assessment area of strong interest is the extent to which nanoparticle and nanomaterial toxicity can be extrapolated from existing data for particles and fibers.

The research and development of nanotechnology is very active globally, and nanotechnologies are already used in hundreds of products, including sunscreens, cosmetics, textiles, and sports equipment. Nanotechnology is also being developed for use in drug delivery, biosensors, and other biomedical applications. Further, nanotechnologies are also being developed for use in environmental applications, e.g., clean-up of environmental pollutants.

RESOURCES

Books and Monographs

Cao G (2004)
Nanostructures & Nanomaterials: Synthesis, Properties & Applications

Imperial College Press, London; Distributed by World Scientific Pub., Hackensack, NJ. 433p

A general introduction to technical aspects of nanomaterials and nanotechnology, including synthesis, characterization, properties, and applications of nanostructures and nanomaterials.

Donaldson K, Borm P (eds.) (2007)
Particle Toxicology
CRC Press/Taylor & Francis Group, Boca Raton, FL
ISBN 0849350921

Reviews the mechanisms and properties of pathogenic particles and their effects on target cells at various sites in the body; covers particle science biology, chemistry, and toxicology, plus mathematical modeling and human studies as avenues for future research.

Goldman L, Coussens C (eds) (2005)
Implications of Nanotechnology for Environmental Health Research. Roundtable on Environmental Health Sciences, Research, and Medicine, Board on Health Sciences Policy, Institute of Medicine
National Academies Press, Washington, DC.
ISBN 0-309-09577-8
Web: http://books.nap.edu/openbook.php?record_id=11248&page=R1

A panel of experts from academia, industry, and government examined the environmental health issues surrounding the emergence of nanotechnology. The report summarizes the discussions and presentations identifying additional research needs, processes for potential change, and gaps in our knowledge.

Gogotsi Y (ed.) (2006)
Nanomaterials Handbook
CRC Press, Boca Raton, FL
ISBN 0-8493-2308-8

Technical discussions describing all major classes of materials, written primarily for materials scientists and engineers, but useful as a reference resource for toxicologists.

Hester RE, Harrison RM (eds) (2007)
Nanotechnology: Consequences for Human Health and the Environment
Royal Society of Chemistry, Cambridge, UK.
ISBN-10: 0854042164

Broad overview of the sources, behavior, and risks associated with nanotechnology; describes the current range of uses for nanomaterials, and considers environmental and human health consequences of nanoparticles and nanotubes.

Hunt G, Mehta MD (eds) (2006)
Nanotechnology: Risk, Ethics and Law
Earthscan Publications, Ltd., London and Sterling, VA.
ISBN: 1844073580/ 978 1 84407 358 0

Considers the risks and benefits of nanotechnology, and the complex ethical and legal questions facing governments, the public, investors, and businesses worldwide.

Karn B, Masciangioli T, Zhang W, Colvin V, Alivisatos P (eds) (2005)
Nanotechnology and the Environment: Applications and Implications
ACS Symposium Series 890.
American Chemical Society, Washington, DC.

Discusses the environmental aspects of nanotechnology and nanoparticles, including risk assessment, toxicity, and fate in the environment.

Kumar CSSR (ed.) (2006)
Nanomaterials: Toxicity, Health and Environmental Issues, 1st Edition
Wiley-VCH, Weinheim.
ISBN: 978-3-527-31385-3

Offers an overview of nanoparticle-related risks to humans, air, water, and the general environment relative to particle type and size and exposed surroundings, bringing together both medical and nanotechnological aspects and covering all important nanomaterial classes: carbon materials, polymers, metals, and metal oxides.

Monteiro-Riviere NA, Tron CL (eds) (2007)
Nanotoxicology: Characterization, Dosing and Health Effects
Informa Healthcare, New York.
ISBN: 1420045148

Examines the interaction of nanomaterials with the biological system, including membrane transfer, screening methods, and impact on major organs.

Schmid G (ed.) (2006)
Nanotechnology: Assessment and Perspectives
Springer, Berlin and New York.
ISBN 354032819X

Evaluates the state of the art in nanoscience and nanotechnology, covering the natural sciences as well as philosophical, ethical, toxicological, and economic aspects, and considers possible future developments.

Theodore L, Kunz RG (2005)
Nanotechnology: Environmental Implications and Solutions
John Wiley, Hoboken, NJ.
ISBN 0471699764

Looks at nanotechnology's impact on the environment from the perspective of air, water, solid waste, health risks, and ethical considerations.

Zhao Y, Nalwa HS (eds) (2007)
Nanotoxicology: Interactions of Nanomaterials with Biological Systems
American Scientific Publishers, Stevenson Ranch, CA.
ISBN-10: 1588830888; ISBN-13: 978-1588830883

Includes 16 review chapters covering major aspects of the impact of nanomaterials on the human body, their interactions with biological systems, and their risk assessments; Summarizes the toxicological effects and biological properties (in vitro or in vivo) for a wide variety of man-made nano-structured materials.

Journals

International Journal of Nanomedicine (2006–)
Dove Medical Press, Ltd., Auckland, NZ
Web: www.dovepress.com/articles.php? journalid=5
ISSN 1176-9114/1178-2013

Focuses on the application of nanotechnology in diagnostics, therapeutics, and drug delivery systems throughout the biomedical field; highlights research and development leading to potential clinical applications.

Journal of Biomedical Nanotechnology (2005–)
American Scientific Publishers, Stevenson Ranch, CA
Web: www.aspbs.com/jbn/
ISSN 1550-7033

Covers applications of nanotechnology in biotechnology, medicine, biosciences, and all other related fields of life sciences encompassing both fundamental and applied research.

Journal of Nanobiotechnology (2003–)
BioMed Central
Web: www.jnanobiotechnology.com/

Provides open access articles covering all aspects of scientific and technological advances in the fields of medical, biological, and nanoscale sciences.

Journal of Nanoparticle Research (1999–)
Springer, The Netherlands
Web: www.springerlink.com/content/103348
ISSN: 1388-0764/1572-896X

Publishes interdisciplinary articles devoted to nanoparticle science and technology.

Nano Letters (2001–)
American Chemical Society, Washington, DC
Web: http://www.pubs.acs.org/journals/nalefd
ISSN: 1530-6984/1530-6992

Reports on fundamental research in all branches of the theory and practice of nanoscience and nanotechnology, including physical, chemical, and biological phenomena, processes, and applications.

Nanomedicine: Nanotechnology, Biology, and Medicine (2005–)
American Academy of Nanomedicine
Elsevier, New York
Web: www.sciencedirect.com/science/journal/15499634
ISSN: 1549-9634

Publishes basic, clinical, and engineering research in all aspects of nanomedicine, including diagnostic, experimental, clinical, and pharmacological nanomedicine and engineering,

Nanotoxicology (2007–)
Taylor & Francis, London
Web: www.tandf.co.uk/journals/titles/17435390.asp
ISSN: 1743-5390/1743-5404

Addresses research relating to the potential for human and environmental exposure, hazard, and risk associated with the use, production, and development of nano-structured materials.

Particle and Fibre Toxicology (2004–)
BioMed Central
Web: www.particleandfibretoxicology.com
ISSN: 1743-8977

Provides open access to peer-reviewed, multidisciplinary research and reviews on the toxicological effects of particles of all types, with increasing attention to nanoparticles.

The Virtual Journal of Nanotechnology Environment, Health & Safety (VJ-Nano EHS) (2006–)
The International Council on Nanotechnology (ICON) and Rice University's Center for Biological and Environmental Nanotechnology (CBEN)
Web: http://icon.rice.edu/virtualjournal.cfm

Draws on ICON's EHS Database to highlight recently published literature; contains citations and links to articles that have appeared in a variety of traditional journals and that are related to the environment and health impacts of nanotechnology, with a particular emphasis on nanomaterials.

Organizations

Center for Biological and Environmental Nanotechnology
Rice University
6100 Main Street, MS-63
Houston, Texas 77005
Phone: 713-348-4195
Fax: 713-348-8218
Email: tchamp@rice.edu
Web: http://cnst.rice.edu/

Funded by the National Science Foundation, CBEN's mission is to discover and develop nanomaterials that enable new medical and environmental technologies. Activities include research, educational and training programs, and public outreach for broader issues such as technology transfer, public acceptance, and workforce training.

Center on Nanotechnology & Society
565 W. Adams Street
Chicago Illinois
Phone: 312-906-5337
Email: info@nano-and-society.org
Web: www.nano-and-society.org/

Illinois Institute of Technology's Center on Nanotechnology and Society provides support and a clearinghouse for informed interdisciplinary research, education and dialogue on the ethical, legal, policy, business, and broader societal implications of nanoscale science and technology. Resources include NELSI Global Document Archive, webcasts, conferences, news articles, commentary, and links to extensive resources.

Environmental Defense
Web: www.environmentaldefense.org/go/nano

Environmental Defense is a non-partisan, non-profit organization working to promote the use of science to solve environmental problems, including a major initiative on nanotechnology issues. Key objectives include increasing risk research, improving regulatory policy, and establishing corporate standards of care. Their NanoRisk Framework is a joint project with DuPont to define a systematic process to identify, manage, and reduce potential health, safety and environmental risks of nano-scale materials across all life-cycle stages.

European Commission
Web: (Nanotechnology Home Page) http://cordis.europa.eu/nanotechnology/home.html
Web: (Nanotechnology Safety Aspects) http://cordis.europa.eu/nanotechnology/src/safety.htm

The European Commission is active in developing regulatory framework and risk assessment methodologies for the EU countries; it supports collaborative R&D into the potential impact of nanotechnology on human health and the environment via toxicological and ecotoxicological studies.

International Association of Nanotechnology (IANT)
1290 Parkmoor Avenue
San Jose, CA 95126 USA
Phone: 408-280-6222
Fax: 408-280-6255
Email: info@ianano.org
Web: www.ianano.org/

IANT is a non-profit organization that brings together government, industry, and academic sectors to foster scientific research and responsible business development through research, training, meetings, and congresses. Efforts focus on building nanotechnology and nanotoxicology framework and tools including guidelines, methodologies, regulations, policies, and standards.

International Council on Nanotechnology (ICON)
CBEN, MS-63
Rice University
P.O. Box 1892
Houston, TX 77251-1892
Phone: 713-348-8210
Fax: 713-348-8218
Web: http://icon.rice.edu/

ICON is an international multi-stakeholder organization for nanotechnology stewardship based at Rice University. It aims to assess, communicate, and reduce nanotechnology's environmental and health risks

while maximizing its societal benefit. Resources include reports and practice documents, electronic journal, and a bibliographic database.

(U.S.) National Institute for Occupational Safety and Health (NIOSH)
395 E Street, S.W., Suite 9200
Patriots Plaza Building
Washington, DC 20201
Phone: 1-800-CDC-INFO (1-800-232-4636); Outside the U.S. 513-533-8328
Fax: 513-533-8347
Web: www.cdc.gov/niosh/topics/nanotech

NIOSH conducts strategic planning and research and provides guidance on the occupational safety and health implications and applications of nanotechnology. Efforts focus on 10 critical topic areas including exposure and risk assessment, models and mechanisms of toxicity, dosimetry, and workplace safety. Website includes guidance and policy documents, links to resources, NIOSHTIC-2 bibliographic database, and a global online Nanoparticle Information Library.

Organisation for Economic Co-operation and Development (OECD)
2, rue André Pascal
F-75775 Paris Cedex 16
France
Phone: +33 1-45-24-82-00
Fax: +33 1-45-24-85-00
Web: www.oecd.org/department/0,3355,en_2649_37015404_1_1_1_1_1,00.html

OECD Environmental Directorate's Safety of Manufactured Nanomaterials program focuses on the implications of the use of nanomaterials for human health and environment safety, with emphasis on testing and assessment methods. The website includes a section with country surveys, reviews, guides, websites, and conference and workshop information for each country within the OECD membership.

Society of Toxicology (SOT)
1821 Michael Faraday Drive, Suite 300
Reston, VA 20190
E-mail: sothq@toxicology.org
Phone: (703) 438-3115
Fax: (703) 438-3113
Web: www.toxicology.org/

The Society of Toxicology (SOT) is a professional and scholarly organization based in the U.S. but with an international membership. The Nanotoxicology Specialty Section provides a forum for interaction and collaboration related to research on the pharmacokinetics, toxicity, exposure assessment, and risk assessment of nanomaterials. Its activities encompass such issues as screening and toxicity testing of nanomaterials, in vitro and in vivo dosimetry, risk assessment and risk communication, as well as conducting programs and conferences.

U.S. Environmental Protection Agency (US EPA)
National Center for Environmental Research
Ariel Rios Building
1200 Pennsylvania Avenue, NW
Washington, D.C. 20460
Web: http://es.epa.gov/ncer/nano/index.html

U.S. EPA's regulatory responsibility is to protect the environment and human health, and it is currently evaluating an appropriate policy framework for nanotechnology. The Nanotechnology section of their website highlights EPA's research in this area, and provides information on related research at EPA and in other organizations, including news, lectures, reports, publications, proceedings and symposia.

Databases

ICON Environmental, Health and Safety (EHS) database
Web: http://icon.rice.edu/virtualJournal.cfm

Sponsored by the International Council on Nanotechnology, the ICON Environmental, Health and Safety (EHS) database contains abstracts and citations for research papers related to the EHS implications of nanoscale materials.

NIOSH Nanoparticle Information Library
Web: www2a.cdc.gov/niosh-nil/index.asp

Global information on nanomaterials, including their health and safety-associated properties; intended to meet the needs of researchers, industrial users, and occupational health professionals. Scope includes information on material properties, surveillance and toxicology studies, origin/synthesis methods and information for contacting people who are developing nanomaterials.

NIOSHTIC-2
Web: www2a.cdc.gov/nioshtic-2/default.html

NIOSHTIC-2 is a searchable bibliographic database of occupational safety and health publications, documents, grant reports, and journal articles supported by NIOSH.

Project on Emerging Nanotechnologies Inventories of Current Research
Web: www.nanotechproject.com/index.php?id=18

Sponsored by the Woodrow Wilson International Center for Scholars and the Pew Charitable Trusts, the

global inventories catalogs primarily government-funded research into the human health, safety, and environmental implications of nanotechnology.

Websites

NanoForum
Web: www.nanoforum.org

Nanoforum is funded by the European Union and serves as Europe's nanotechnology information gateway, providing access to reports, white papers, funding opportunities, education, training, and events throughout Europe.

Nanotechnology Risk Resources Website
Web: www.nsec.wisc.edu/NanoRisks/NS--NanoRisks.php

The University of Wisconsin's Nanoscale Science and Engineering Center offers a useful section of their website for risk assessment and toxicology issues, containing references to papers, articles, and books on potential health and environmental risks of nanomaterials sorted by material or compound, body organ or biological effect studied, or other miscellaneous issues. Also included are links to government reports, websites, and regulatory materials.

Nanowerk
Web: www.nanowerk.com

Nanowerk LLC is a publisher in the area of nanoscience and nanotechnology whose website portal provides links to a nanomaterials database, news, conference and seminar listings, universities, labs, researchers, associations, networks and international initiatives involved in nanotechnology in 43 countries and regions.

OECD: Safety of Manufactured Nanomaterials
Web: http://www.oecd.org/department/0,3355en_2649_37015404_1_1_1_1_1,00.html

Global directory of links to publications, documents, and information listed by country.

SafeNano Initiative
Web: www.safenano.org

The SafeNano Initiative of the Institute of Occupational Medicine is the UK's premier site for information concerning the potential risks from nanoparticles and fibers. Website includes news and links to resources and current research and a database of documents and publications.

Newsletters

EH&S NanoNews
Web: www.ehsnanonews.com

Bimonthly newsletter published by Gradient Corporation highlighting news, government activities, and recent publications on risk, health, and safety issues of nanoparticles and nanotechnology.

NanoReg Report
Web: www.NanoRegNews.com

Biweekly newsletter dedicated to global nanotechnology regulatory news.

Nanorisk
Webe: www.nanorisk.org/

A bimonthly newsletter published by Nanowerk LLC covering the latest developments in nanotechnology research, and environmental, health and safety issues.

NIOSH: Focus On Nanotechnology
Web: www.cdc.gov/niosh/topics/nanotech/focus.html

Newsletter provides a regularly updated electronic report on new NIOSH developments related to research on Nanotechnology and Occupational Health.

Reports

National Institute for Occupational Safety and Health (NIOSH) (2006)
Approaches to Safe Nanotechnology: An Information Exchange with NIOSH
Web: www.cdc.gov/niosh/topics/nanotech/ safenano/

This 60-page document reviews current state of knowledge about nanoparticle toxicity and control, and invites commentary and exchange of information to promote nanotechnology worker safety.

European Commission, Scientific Committee on Emerging and Newly Identified Health Risks (2006)
European Commission Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR) modified opinion on: The appropriateness of existing methodologies to assess the potential risks associated with engineered and adventitious products of nanotechnologies. (Adopted by the SCENIHR during the 10th plenary meeting of 10 March 2006)
Web: http://ec.europa.eu/health/ph_risk/committees/04_scenihr/docs/scenihr_o_003b.pdf

Scientific background and opinion on existing risk assessment methodologies and their applicability to nanotechnology and its products.

Ostiguy C, Lapointe G, Trottier M, Menard L, Cloutier Y, Boutin M, Antoun M, Normand C (2006)

Health Effects of Nanoparticles. Studies and Research Projects/ Report R-469
Institut de recherche Robert-Sauvé en santé et en sécurité du travail (IRSST), Montreal.
Web: www.irsst.qc.ca/en/_publicationirsst_100209.html

Review of current knowledge about nanoparticles, their synthesis and applications, health and safety risks, and the challenges in evaluating occupational exposure.

Davies J Clarence; Project on Emerging Technologies (2006)
Managing the Effects of Nanotechnology
Project on Emerging Technologies, Woodrow Wilson International Center for Scholars, Washington, D.C. 34p.
www.wilsoncenter.org/index.cfm?fuseaction=news.item&news_id=165552

The report analyzes the strengths and weaknesses of existing laws that apply to nanotechnology and outlines a possible new regulatory framework.

Aitken RJ, Creely KS, Tran CL (2004)
Nanoparticles: An Occupational Hygiene Review
HSE Books, Sudbury.
Research Report No. 274: Prepared by the Institute of Occupational Medicine for the Health and Safety Executive.
Web: www.hse.gov.uk/research/rrhtm/rr274.htm

This review focuses on potential routes and levels of exposure, industrial sources of exposure, control measures and potential trends in processes for manufacturing nanoparticle products.

Jong WH de, Roszek B, Geertsma RE; Rijksinstituut voor Volksgezondheid en Milieu (2005)
Nanotechnology in Medical Applications: Possible Risks for Human Health. RIVM report 265001002/2005
RIVM, Bilthoven, Netherlands
Web: www.rivm.nl/bibliotheek/rapporten/265001002.html

Report outlines recommendations for the development of guidance documents at a European level for the safety evaluation of nanotechnology products applied in medical technology; identifies needs for further research.

U.S. Environmental Protection Agency, Science Policy Council, Nanotechnology Workgroup (Feb. 15, 2007)
Nanotechnology White Paper (EPA/100/B-07/001)
U.S. Environmental Protection Agency, Washington, DC
Web: www.epa.gov/osa/nanotech.htm

Examines potential environmental implications, risks and applications of nanotechnology in support of efforts to develop a regulatory framework for nanotechnology.

International Organization for Standardization (ISO) (2007)
***'Workplace Atmospheres – Ultrafine, Nanoparticle and Nano-structured Aerosols – Inhalation Exposure Characterization and Assessment'* ISO/TR 27628:2007(E)**
Web: www.iso.org/iso/iso_catalogue/catalogue_tc/catalogue_detail.htm? csnumber4423

Guideline focuses on nanoaerosols in the occupational setting, and covers exposure characterization, mechanisms of formation and transportation, and on industrial processes.

Other Resources

Nanosafe/Nanosafe2
Web: www.nanosafe.org/

Funded by the European Commission, this project is aimed at the safe and sustainable production and use of nanomaterials. Work is presently focused on development of methods for nanotoxicity evaluation, the development of monitoring devices and personal protective equipment, and analysis of regulatory issues.

National Nanotechnology Initiative (NNI)
Web: http://nano.gov/

The NNI provides a multiagency framework in the U.S. for efforts in nanoscale science, engineering, and technology, as well as their environmental, health, and safety impacts. NNI funds research, supports government and university laboratories, develops educational resources and supporting infrastructure and tools.

National Toxicology Program (NTP) – Nanotechnology Safety Initiative
Web: http://ntp.niehs.nih.gov/go/nanotech

The NTP has a broad-based research program to address potential human health hazards associated with the manufacture and use of nanoscale materials, to evaluate the toxicological properties of major nanoscale materials classes, and to develop model systems to investigate how nanoscale materials interact with biological systems.

Project on Emerging Nanotechnologies
Web: www.nanotechproject.org/

The Project on Emerging Nanotechnologies was established in April 2005 as a partnership between the Woodrow Wilson International Center for Scholars and the Pew Charitable Trusts. The Project's efforts are dedicated toward minimizing risk and engaging the public interest to realize potential benefits as nanotechnologies advance.

CHAPTER

37

Noise

GUANG-DI CHEN

I have often lamented that we cannot close our ears with as much ease as we can our eyes.

Richard Steele, 1720

INTRODUCTION

When considering noise in relation to sound, what is commonly meant is meaningless background sound of greater than usual volume. However, in the study of effect of noise on health, the 'noise' may mean any traumatic sounds (such as weapon noise in the field and pure tones at high intensity used in animal experiments in the lab to induce cochlear disruptions) and unwanted sounds (such as loud music from neighbors).

This section lists books and review papers that discuss auditory (and also non-auditory) effects of acoustic noise published since 1990. To fully appreciate scientific reports of noise-induced injuries in the ear, a basic understanding of acoustics, anatomy of the ear (especially the cochlea), and auditory physiology is required. A few of the listed books provide fundamental acoustics and anatomy/physiology of the ear. We would recommend *Occupational Exposure to Noise: Evaluation, Prevention and Control* by Goelzer B, Hansen CH, Sehrndt GA (2003), which can be downloaded from the World Health Organization (WHO) website: http://www.who.int/occupational_health/publications/occupnoise/en/index.html.

This section also lists journals, in which research papers of noise-induced hearing loss are usually published. *Noise and Health* is the journal devoted to research on all aspects of noise and its effects on human health. Another journal, in which many papers of noise study are published, is *Hearing Research*. Information on noise-induced hearing loss and its prevention can also be obtained from websites of several organizations, such as National Institute for Occupational Safety and Health (NIOSH), Occupational Safety and Health Administration (OSHA), National Institute on Deafness and other Communication Disorders (NIDCD), World Health Organization (WHO), and Noise Pollution Clearinghouse (NPC).

RESOURCES

Books

Axelsson A, et al (Eds) (1996)
Scientific Basis of Noise-Induced Hearing Loss
Thieme, Stuttgart

Papers are grouped into four sections, all with respect to noise-induced hearing loss: biological basis, experimental studies, auditory performance changes, and human studies.

Behar A, et al (2000)
Noise Control, A Primer
Singular

Covers sound and noise, hearing and hearing loss, auditory and non-auditory effects of noise, noise measurement, hearing protection devices, noise control, and occupational hearing conservation regulations and standards.

Berger EH, et al (Eds) (2000)
The Noise Manual, Fifth Edition
American Industrial Hygiene Association

Papers are grouped into four sections: Fundamentals of sound, vibration, and hearing; Elements of a hearing conservation program; Noise interference and annoyance; and Regulations, standards, and laws.

Borchgrevink HM (Ed.) (1990)
Effects of Noise and Blasts
Scandinavian Audiology, supplementum 34
Bardu Trykkeri A/S, Norway

Papers are grouped into four sections: Impulse noise and blasts – Damage risk criteria; Impulse noise – Selection of susceptible individuals; Treatment of noise induced hearing loss; Hearing loss and hearing protection.

Cowan JP (1994)
Handbook of Environmental Acoustics
Van Nostrand-Reinhold, New York

Provides easy to follow explanations of acoustic terminology, noise control design, and regulatory noise issues. Key aspects of environmental noise are clarified in basic language in such areas as common noise sources, current noise regulations, guidelines and standards, effects of noise on people and animals, relevant noise rating methods, and noise control designs.

Dancer AL, et al (Eds) (1992)
Noise-Induced Hearing Loss
Mosby/Year Book, New York

Examines noise-induced hearing loss from the perspectives of cochlear mechanisms, central changes, cofactors, performance changes, hearing protection, susceptibility and resistance to noise, and parameters of the exposure.

Dobie RA (1993)
Medical-Legal Evaluation of Hearing Loss
Van Nostrand-Reinhold, New York

Covers the physics of sound, normal hearing, disorders causing hearing loss, hearing evaluation, hearing conservation programs, and operational guidance for prevention of hearing loss. Case studies are used to illustrate both methods of analysis and typical reports.

Fay TH (Ed.) (1991)
Noise and Health
New York Academy of Medicine, New York

Discusses sources of noise and its effect on the cardiovascular, neuroendocrine, immunological, and gastrointestinal systems. Specific strategies for noise abatement and reviews of noise legislation are included. The last section deals with public awareness of the hazards of noise.

Goeltzer B et al (Eds) (2003)
Occupational Exposure to Noise: Evaluation, Prevention and Control
World Health Organization
This book can be downloaded from the following site:
http://www.who.int/occupational_health/publications/occupnoise/en/index.html

There are 12 chapters.
1. Fundamentals of acoustics; 2. The anatomy and physiology of the ear and hearing; 3. The pathophysiology of the ear; 4. Exposure criteria, occupational exposure levels; 5. Noise sources; 6. Sound measuring instruments; 7. Strategies for noise surveys; 8. Hearing measurement; 9. Hazard prevention and control programs; 10. Engineering noise control; 11. Personal measures and hearing conservation; 12. Sources of information

Henderson D et al (Eds) (2001)
Noise Induced Hearing Loss: Basic Mechanisms, Prevention and Control
Noise Research Network Publications, London

Papers are grouped into nine sections, all with respect to noise-induced hearing loss: genetics, mechanisms of cell death, physiological changes caused by noise, treatments and protection, combined exposures, measures of noise and its effects, potential diagnostic signs, human aspects of NIHL, and summary.

Humes LE et al (Eds) (2005)
Noise and Military Service: Implications for Hearing Loss and Tinnitus
The National Academies Press
Online available: http://www.nap.edu/catalog/11443.html#toc

There are 7 chapters.
1. Overview of the problem and introduction; 2. Noise-induced hearing loss; 3. Noise and noise-induced hearing loss in the military; 4. Tinnitus; 5. Responding to noise risks: Hearing conservation programs in the military; 6. Reports of audiometric testing in service medical records of military veterans; 7. Conclusions and comments.

Icon Health Publications (2004)
Noise-Induced Hearing Loss – a Medical Dictionary, Bibliography, and Annotated Research Guide to Internet References
Lightning Source Inc

This is a 3-in-1 reference book. It gives a complete medical dictionary covering hundreds of terms and expressions relating to noise-induced hearing loss. It also gives extensive lists of bibliographic citations. Finally, it provides

information to users on how to update their knowledge using various Internet resources. The book is designed for physicians, medical students preparing for Board examinations, medical researchers, and patients who want to become familiar with research dedicated to noise-induced hearing loss.

Kryter KD (1994)
The Handbook of Hearing and the Effects of Noise: Physiology, Psychology, and Public Health
Academic Press, San Diego

Presents the methods and results of research for quantitatively describing the major attributes of hearing and the effects of sound and noise on people.

NIOSH (1998)
Criteria for a Recommended Standard: Occupational Noise Exposure
DHHS (NIOSH) publication No. 98-126
Web: http://www.cdc.gov/niosh/docs/98-126/
There are seven chapters:

Chapter 1: Recommendations for a noise standard; Chapter 2: Introduction; Chapter 3: Basis for the exposure standard; Chapter 4: Instrumentation for noise measurement; Chapter 5: Hearing loss prevention programs (HLPPs); Chapter 6: Hearing protectors; Chapter 7: Research needs.

Palmer, K.T. et al (2001)
Occupational Exposure to Noise and Hearing Difficulties in Great Britain
Suffolk, England, Health & Safety Executive Books

The objectives of this research were to determine the prevalence of self-reported hearing difficulties and tinnitus in working-aged people from the general population, and to estimate the risks from occupational exposure to noise and the number of attributable cases nationally.

Prasher D, Canlon B (1999)
Cochlear Pharmacology and Noise Trauma
Noise Research Network Publication, London

The book contains 15 presentations with group discussions.

Seidman M, Moneysmith M (2006)
Save Your Hearing Now, The Revolutionary Program That Can Prevent And May Even Reverse Hearing Loss
Warner Wellness

About the telltale signs of hearing loss and what you can do about it.

Journals

Hearing Research (1978–)
Elsevier, Amsterdam, Netherlands
Web: http://www.sciencedirect.com/science/journal/03785955

The aim of *Hearing Research* is to provide a forum for papers concerned with basic auditory mechanisms. Papers on comparative aspects of hearing in animals and man, and on effects of drugs and environmental contaminants (such as noise pollution) on hearing function are also considered.

Noise and Health (1998–)
Noise Research Network (*nRn*) Publications, London, UK
Web: http://www.ucl.ac.uk/noiseandhealth/index.htm

Noise and Health is an international journal devoted to research on all aspects of noise and its effects on human health. An interdisciplinary journal for all professions concerned with auditory and non-auditory effects of occupational, environmental, and leisure noise. It aims to provide a forum for presentation of novel research material on a broad range of topics associated with noise pollution, its control, and its detrimental effects on hearing and health. It covers issues from basic experimental science through clinical evaluation and management, technical aspects of noise reduction systems and solutions to environmental issues relating to social and public health policy.

Professional Organizations and Associations

Association for Research in Otolaryngology (ARO)
19 Mantua Rd. Mt. Royal, NJ 08061
Phone: 856-423-0041
Web: http://www.aro.org/

ARO is an international association of scientists and physicians dedicated to scientific exploration among all of the disciplines in the field of otolaryngology. Research efforts involve the ear, nose, head, neck and related functions including hearing, balance, speech, taste and smell among others.

National Institute for Occupational Safety and Health (NIOSH)
Cincinnati, Ohio 45226
Phone: 1-800-356-4674
Fax: 1-888-232-3299
Web: http://www.cdc.gov/niosh/homepage.html

NIOSH is an agency of the U.S. Department of Health and Human Services, being established to help assure safe and healthful working conditions for working men and women by providing research, information, education, and training in the field of occupational safety and health. It was created by Congress under the Occupational Safety and Health Act, signed by President Richard M. Nixon, on December 29, 1970.

For NIOSH topics or database about noise research and protection, go to the following sites:
http://www.cdc.gov/search.do?action=search&subset=niosh &queryText=noise
http://www.cdc.gov/niosh/topics/noise/workplacesolutions/toolsDatabase_alt.html

Occupational Safety and Health Administration (OSHA)
200 Constitution Avenue, Washington, D.C. 20210
Phone: 1-800-321-6742
Web: http://en.wikipedia.org/wiki/Occupational_Safety_and_Health_ Administration

OSHA is an agency of the U.S. Department of Labor. It was created by Congress under the Occupational Safety and Health Act, signed by President Richard M. Nixon, on December 29, 1970. Its mission is to prevent work-related injuries, illnesses, and deaths by issuing and enforcing rules (called standards) for workplace safety and health.

For information about noise, go to: http://en.wikipedia.org/wiki/Noise.

The National Institute on Deafness and Other Communication Disorders (NIDCD)
31 Center Drive, MSC 2320, Bethesda, MD 20892-2320
E-mail: nidcdinfo@nidcd.nih.gov
Web: http://www.nidcd.nih.gov/

NIDCD is one of the institutes that comprise the National Institutes of Health (NIH). NIH is the Federal government's focal point for the support of biomedical research. NIH's mission is to uncover new knowledge that will lead to better health for everyone. Established in 1988, NIDCD is mandated to conduct and support biomedical and behavioral research and research training in the normal and disordered processes of hearing, balance, smell, taste, voice, speech, and language.

For information about studies of noise and noise-induced hearing loss, go to: http://www.nidcd.nih.gov/health/hearing/

Noise Pollution Clearinghouse
Montpelier, VT 05601
Phone: 1-888-200-8332
Web: http://www.nonoise.org/

The Noise Pollution Clearinghouse is a national nonprofit organization with extensive online noise-related resources. The Noise Pollution Clearinghouse seeks to: raise awareness about noise pollution; create, collect, and distribute information and resources regarding noise pollution; strengthen laws and governmental efforts to control noise pollution; establish networks among environmental, professional, medical, governmental, and activist groups working on noise pollution issues; assist activists working against noise pollution.

World Health Organization (WHO)
Avenue Appia 20, 1211 Geneva 27, Switzerland
Phone: (+ 41 22) 791 21 11; Fax: (+ 41 22) 791 3111
Web: http://www.who.int/en/

The World Health Organization is the United Nations' specialized agency for health.

CHAPTER

38

Occupational Health

ANDREW MAIER

INTRODUCTION

The broad area of occupational health practice includes professionals who share the goal of occupational injury and disease prevention. Practices that set out the measures and requirements for achieving this goal are embedded in regulatory requirements, professional consensus standards, professional guidelines documents, and programs implemented by the private sector. For example, in the United States, regulatory requirements in the field are encoded in the Code of Federal Regulations and enforced by the Occupational Safety and Health Administration (OSHA) under the Authority of the Occupational Safety and Health Act (1970). In addition, many important guidance documents, databases, and training resources are available from the National Institute for Occupational Safety and Health (NIOSH). Important consensus and voluntary standards related to occupational health are available from organizations such as the American National Standards Institute (ANSI) and ASTM International (formerly the American Society for Testing and Materials). Additional guidance documents are available from professional organizations such as the American Industrial Hygiene Association (AIHA) and the American Conference of Governmental Industrial Hygienists (ACGIH). There are international counterparts to many of these types of organizations.

Occupational health includes numerous specialty fields. Occupational health nurses and physicians perform medical surveillance activities along with the diagnosis and treatment of work-related injury and disease. Industrial hygienists are engaged in the recognition, evaluation, and control of occupational health risks. Industrial hygienists often provide training to workers on potential toxicological effects of exposure, conduct exposure evaluations, and develop risk management strategies to reduce the potential for adverse exposures. Occupational epidemiologists and toxicologists often provide a supporting role for occupational medicine professionals and industrial hygienists. Occupational epidemiologists provide support for assessing the incidence and prevalence of work-related diseases. Occupational toxicologists evaluate the effects of chemical agents on workplace health based on toxicology findings. These health professionals become involved in developing hazard communication information, setting safe exposure levels such as occupational exposure limits, and aiding in the assessment of the potential for work-related health effects from chemical exposure situations. The roles of these various professionals can overlap and a multidisciplinary team can become involved to address complex occupational health issues.

Professionals who work in these diverse aspects of the occupational health field share the need for accessing information related to the toxicology and adverse health effects of chemicals. Many of the resources used in occupational health practice are general resources shared by other specialties in toxicology. This chapter focuses on those resources of particular interest to occupational health. One such focus area is on the evaluation and management of occupational diseases and there are many core textbooks and diagnostic guides available. In addition, agencies such as OSHA and NIOSH provide guidance on occupational medical tests and surveillance for workplace exposures. There are numerous resources related to the

many facets of industrial hygiene, including those that address sources of occupational exposure, industrial hygiene assessment methods, as well as control strategies. Some of the reference works in the industrial hygiene field include material directly relevant to toxicology evaluations, and these references are the focus of this chapter. Hazard communication is an area of occupational health practice that receives significant focus, particularly due to the growing effort to adopt harmonized hazard communication and labeling systems internationally (see the separate chapter in this book on Hazard Communication for additional information resources). Finally, a significant focus of the field is the development of guidelines for assessing safe exposure.

A significant interface between toxicology and other occupational health professionals is in the development of occupational exposure limits (OELs). A major emphasis of the field is in developing OELs that provide the practicing occupational health professional with an estimate of the airborne concentration that is expected to be safe for all or nearly all workers who may be exposed over a working life-time. These OELs have varying exposure periods of interest depending on the nature of the chemical effect involved. OELs are commonly set on the basis of protection for a full shift exposure (a full shift time-weighted average or TWA), a shorter period of time such as 15 minutes for acute effects (often called a short-term exposure limit or STEL), or to protect from immediate effects (often called a ceiling limit). Such values are used to communicate hazards to workers, to provide an objective benchmark for ensuring control measures are adequate, and for triggering medical surveillance needs. OELs are established by many agencies around the world. Regulatory agencies such as OSHA establish legally enforceable standards, while other agencies (NIOSH) and professional organizations (AIHA and ACGIH) establish voluntary standards or guidance values. The names of the specific standards or values vary across organizations. In some cases the methodologies for deriving the standards or values differ, and reading the accompanying documentation and the underlying rationale for the exposure limits of interest is critical. Information resources for many of the agencies that provide such OELs are included below.

Much of the activity in the area of guidance for safe exposure focuses on airborne limits. However, methods for providing guidance for assessing dermal exposures are a growing area. Where such values do not exist, exposure guidance based on measuring estimates of the internal dose (e.g., blood, urine, exhaled air, etc.) may also be available. This latter consideration is included in the context of biological monitoring or biomarkers of exposure (see the separate chapter in this book on Biomarkers for additional information resources). While validated biomarkers are available for fewer chemicals than those that have traditional OELs, they have significant utility for integrating exposure across pathways and verifying the degree of actual dose to systemic target tissues. Many chemicals do not have adequate toxicology data to develop a quantitative estimate of a safe air concentration, but do have adequate hazard information. For such chemicals an alternative approach that makes use of hazard information to estimate potential OEL ranges and control strategies has been developed. This concept is called control banding or the application of performance-based standards. Some of the key publications in the field related to these alternatives to air concentration-based OELs are included below.

RESOURCES

Books

Industrial Hygiene Practice

DiNardi SR (ed.) (2003)
The Occupational Environmental: Its Evaluation, Control, and Management, Second Edition
AIHA Press, Fairfax, VA, USA.

One of the standard textbooks for occupational safety and health professionals. Covers all key areas of basic industrial hygiene methods and practice. The text also provides chapters related to topics in occupational toxicology, occupational risk assessment, and occupational exposure limits.

Perkins JL (2008)
Modern Industrial Hygiene
American Conference of Governmental Industrial Hygienists (ACGIH), Cincinnati, OH, USA.

A multivolume set focused on providing a comprehensive textbook and resource work with additional emphasis on examples and applications. Volume 1 focuses on industrial hygiene considerations related to recognition and evaluation of chemical exposure assessment. Volume 2 extends the focus to exposure assessment for biological agents, as well as chapters on other biological aspects of industrial hygiene practice such as physiology and toxicology for the respiratory tract and skin, biological monitoring, and the biological basis for occupational exposure limits.

Plog BA, Quinlan PJ (eds) (2001)
Fundamentals of Industrial Hygiene, Fifth Edition
National Safety Council, Itasca, IL, USA.

One of the standard textbooks for occupational safety and health professionals. Covers all key areas of basic industrial hygiene methods and practice. The text also provides chapters related to topics in occupational toxicology, including basic physiology, chemical toxicology, and the interpretation of exposure limits. This latest addition also includes chapters on occupational health nursing and occupational medicine.

Occupational Toxicology

Harbison R (ed.) (1998)
Hamilton and Hardy's Industrial Toxicology, Fifth Edition
Mosby-Year Book, Inc., Philadelphia, PA, USA.

The book is primarily organized as separate chapters on individual chemical agents in chemical classes of interest to occupational health. Each chapter describes basic industrial hygiene and exposure considerations for the chemical, key target organs for acute and chronic effects, pertinent diagnosis and surveillance methods, and a summary of mechanisms of toxicological action. In addition to the chemical-specific chapters that form the bulk of the book, general chapters on occupational diseases, chemical carcinogenesis, and reproductive toxicity are included.

Harris R, Bingham E, Cohrssen B, Powell CH (eds) (2000)
Patty's Industrial Hygiene and Toxicology, 5th Edition (13 Volume Set)
Wiley-Interscience, Hoboken, NJ, USA.

This comprehensive reference includes 13 volumes that cover methods and practical issues in industrial hygiene and toxicology along with providing chapters summarizing the toxicology data for selected chemicals and chemical classes. The methodology chapters cover in detail issues related to industrial hygiene and occupational toxicology practice. The chemical-specific toxicology chapters provide a detailed review of acute and chronic toxicity based on animal toxicology and human health effects information.

Hathaway GJ, Proctor NH (2004)
Proctor and Hughes' Chemical Hazards of the Workplace, Fifth Edition
Wiley, Hoboken, NJ, USA.

Provides introductory sections that review basic concepts in toxicology, clinical manifestations of exposure, occupational disease diagnosis, and industrial hygiene principles. The bulk of the text provides a stream-lined profile for over 600 chemicals found in the workplace. Entries for each chemical include data on chemical identity, exposure limits, physical properties, and exposure information. Toxicity information highlights acute and chronic effects (especially as related to known human exposure levels), including information on carcinogenic, mutagenic, and reproductive effects. Occupational medicine information includes treatment protocols and medical surveillance techniques (including biological monitoring).

Encyclopaedia of Occupational Health and Safety, 4th Edition
International Labour Office (ILO), Geneva, Switzerland
Web: http://www.ilocis.org/en/contilo.html (web access to entire content)

Covers the core allied fields encompassing occupational health and safety. The topics are written by internationally renowned experts, and are intended to provide jargon-free answers to the most critical questions involving health and safety in the workplace. The parts of the encyclopedia include the body, health care, management and policy, tools and approaches, psychosocial and organizational factors, general hazards, the environment, accidents and safety management, chemicals, industries based on biological resources, industries based on natural resources, chemical industries, manufacturing industries, textiles and apparel industries, transport industries, construction, services and trade, and guides.

Luttrell WE, Jederberg WW, Still KR (eds) (2008)
Toxicology Principles for the Industrial Hygienist
American industrial Hygiene Association, Fairfax, VA, USA.

This book has been written and edited by industrial hygienists and toxicologists. It is the most comprehensive toxicology reference specifically for the industrial hygienist. Emphasis is on basic principles and case studies that relate to the working environment. This toxicology reference presents 36 chapters divided into five sections, and includes case studies. The sections of the book include Understanding Toxicology, Sites of Action of Chemicals Found in the Workplace, Chemical Group Toxicology; Application of Toxicological Information; and Sources of Toxicological Information. Each chapter is written with the idea of what a toxicologist would tell an industrial hygienist in 15 minutes about the specific subjects.

Ullmann's Industrial Toxicology
Wiley-VCH. (2005) Hoboken, NJ, USA.

This two-volume set is condensed from the 40-volume Ullmann's Encyclopedia and covers information on

applying the science of toxicology in both the occupational and environmental setting. The articles provide the fundamentals necessary for understanding the effects of chemical hazards on humans and ecosystems. The set includes articles on industrial toxicology, ecotoxicology, process safety as well as occupational health and safety.

Winder C, Stacey N (eds) (2004)
Occupational Toxicology, Second Edition
Basingstoke: CRC Press. Taylor & Francis Ltd.

Provides an introduction to aspects of toxicology that relate to the workplace. The text describes effects of chemical exposures with chapters on specific target organs of particular relevance to occupational exposures such as the lungs, skin, liver, kidneys, and the nervous system. Chapters also describe toxic effects of classes of agents found in the workplace such as metals, pesticides, solvents, plastics, gases, and particulates. The importance of a multidisciplinary approach to the field is highlighted by covering interrelated aspects of hygiene, epidemiology, and occupational medicine.

Occupational Medicine and Nursing

Greenberg M, Hamilton R, and Phillips S (1997)
Occupational, Industrial, and Environmental Toxicology
Mosby-Year Book, Philadelphia, PA, USA.

Primarily a text for the occupational toxicologist, occupational physician, or clinical toxicologist. The material is presented to facilitate the diagnosis and treatment of occupational toxicology patients. The material is organized by occupation, industry, and environment and provides information on plausible exposures to chemical agents, systemic effects expected to arise from such exposures, and suggested treatments.

Hunter D, Adams PH, Baxter PJ, Aw T, Cockcroft A, Harrington JM (eds) (2000)
Hunter's Diseases of Occupations
Oxford University Press, New York, NY, USA.

A standard textbook in occupational medicine. The book covers diseases caused by occupations, and the assessment, management, and treatment of patients. The book is aimed at both clinicians dealing with specific patients and occupational physicians and other occupational health professionals who need to recognize, diagnose, or treat occupational disease. The newest edition builds on the comprehensive coverage of occupational diseases by addressing newer areas of concern arising from exposures connected with the newer technologies, and the effects of chemicals in the environment.

LaDou J (2006)
Current Occupational & Environmental Medicine, Fourth Edition
McGraw-Hill Medical, New York, NY, USA.

Covers common and important occupational and environmental diseases, injuries, and exposures. Includes the latest OSHA/NIOSH guidelines for occupational exposure standards, detailed diagnostic checklists to aid diagnosis and treatment, a step-by-step review of how to manage an occupational health and safety program, details on health risk analysis, legal aspects of occupational and environmental medicine, and preventive approaches to terrorist attacks on industry.

Levy BS, Wegman DH, Baron SL, Sokas RK (eds) (2005)
Occupational and Environmental Health: Recognizing and Preventing Disease and Injury
Lippincott Williams & Wilkins.

A comprehensive, practical guide to recognizing, preventing, and treating work-related and environmentally induced injuries and diseases. Chapters address the range of clinical and public health concerns arising from exposures in the workplace, and to agents released into the environment. The text is reinforced by presentation of case studies. This newest edition includes chapters on environmental health (including water pollution, hazardous waste, global environmental hazards), the role of non-governmental organizations in environmental health, and risk communication (i.e., responding to community environmental health concerns), and risk management topics (conducting workplace investigations and assessing and enforcing compliance with health and safety regulations).

McCunney RJ (ed.), Rountree PP (ed.), Barbanel CS (ed.), Borak JB (ed.), Bunn WB (ed.), McCunney RJ (author) (2003)
A Practical Approach to Occupational and Environmental Medicine, Third Edition
Lippincott Williams & Wilkins, Philadelphia, PA, USA.

This text provides a comprehensive and practical guide to the diagnosis, treatment, and prevention of occupational disorders. This latest edition emphasizes prevention. A comprehensive index provides reference ease for examination of all aspects of occupational and environmental medicine. The book was sponsored by the American College of Occupational and Environmental Medicine.

Oakley K (ed.) (2008)
Occupational Health Nursing, Third Edition
John Wiley & Sons Limited (the content of this edition was first published in 2002 by Whurr Publishers Limited), West Sussex, UK.

A textbook written specifically as a resource for students and practicing occupational health nurses. Formatted for quick reference on essentials in the field, with updated information on legislation and new guidance documents.

Rosenstock L, Cullen M, Brodkin C, Redlich C (2004)
Textbook of Clinical Occupational and Environmental Medicine, Second Edition
Saunders, Philadelphia, PA, USA.

Provides a comprehensive text addressing the detection, diagnosis, and treatment of the full range of disorders caused by physical, chemical, and biologic agents found in the occupational setting, and arising from environmental exposures. The text provides in-depth, authoritative guidance on clinical problems and analysis of legal and regulatory issues impacting the practice of occupational medicine.

Occupational Exposure Limit Documentation

American Conference of Governmental Industrial Hygienists (ACGIH) (2001)
Documentation of the Threshold Limit Values and Biological Exposure Indices, 7th Edition

Provides the underlying documentation and rationale supporting the Threshold Limit Value (TLV) and Biological Exposure Indices (BEI). A compilation of published documentation for occupational exposure limits (i.e., the TLVs) and biological exposure indices used for biological monitoring (i.e., the BEIs), as established by committees of the ACGIH. Each TLV document summarizes information on the basic chemical identity, physical properties, toxicokinetics, animal toxicology data, and human exposure experience. A rationale for the recommended TLV is provided. Each BEI document summarizes the data on toxicology, exposure, and toxicokinetics and provides a rationale for the recommended BEI.

American Industrial Hygiene Association (AIHA) Workplace Environmental Exposure Level (WEEL) Committee (2007)
2007 Workplace Environmental Exposure Levels (WEEL) Complete Set
AIHA Press, Fairfax, VA, USA.

A compilation of published documentation for occupational exposure limits (i.e., the WEELs), as established by a committee of the AIHA. Each WEEL document summarizes information on the basic chemical identify, physical properties, toxicokinetics, animal toxicology data, and human exposure experience. A rationale for the recommended WEEL is provided.

Brandys RC, Brandys BM (2007)
Global Occupational Limits for Over 5,000 Specific Chemicals
OEHCS Publications, Inc., Hinsdale, IL, USA.

A compilation providing a comprehensive listing of occupational exposure limits from organizations and agencies around the world.

Guide to Occupational Exposure Values

ACGIH, Cincinnati, OH, USA. (2008)

A concise handbook of occupational exposure limits from selected organizations and agencies.

The MAK-Collection for Occupational Health and Safety

Wiley-VCH, Hoboken, NJ, USA. (2007)

This latest edition provides the documentation for the maximum workplace concentrations established by the German Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area. The documentations provide the occupational exposure limits as well as supporting toxicity and epidemiology data.

Control Banding Guidance

Guidance for Conducting Control Banding Analyses
AIHA, Control Banding Working Group (2007)

The AIHA working group developed this guide covering key concepts, significant developments, and research needs associated with a control-based approach to identifying and controlling hazardous agents. Includes a comprehensive reference list, and study resources and other helpful aids for conducting control banding analyses.

Web Portal

Osh.Net
Web: http://www.osh.net/

Osh.Net is a web portal for occupational health and safety resources and information, overseen by a team of licensed occupational health and safety experts, including certified industrial hygienists, safety specialists, registered nurses, occupational health physicians, and Internet communications professionals. Osh.Net seeks to provide access to information that is timely and from relevant and credible resources. They search the web for new and useful links, and update their links monthly through a hands-on screening process. Osh.Net monitors the OSHA, CDC, and NIOSH websites on a regular basis for the latest in governmental compliance news, and Osh.Net's writers interpret and provide insights on the latest federal standards or emerging health/safety issues.

Newsletters and Forums

Many of the leading organizations and agencies in the area of occupational health (as provided in the 'Organizations' section of this chapter) publish newsletters with information related to their organization as well as articles on issues that affect worker health.

In addition there are email groups and list servers dedicated to occupational health issues. One example is Occ-Env-Med-L (Occupational & Environmental Medicine for Clinicians & Public Health Professionals digest), a free discussion forum for clinical and public health professionals (only) about topics in Occupational & Environmental Medicine, housed at the University of North Carolina School of Public Health. http://occhealthnews.net/occ-env-.htm#Rules. Further, the Osh.Net web portal described above publishes an e-newsletter and provides access to an Osh.Net forum as an interactive resource to support the free exchange of occupational health and safety information. The e-newsletter has several thousand opt-in subscribers. The scope of the forum covers all aspects of health and safety, with specific sub-forums in place to discuss the OHSAS standards, OSHA and general Workplace and Occupational Safety.

Databases and Other Website-Based Resources

American Industrial Health Association (AIHA), Information by Topic Web pages (http://www.aiha.org/Content/Topics/). Numerous topics are included, e.g., asbestos, nanotechnology, and regulatory/standards issues.

Canadian Centre for Occupational Health and Safety (CCOHS), OSH Answers FREE! This is a searchable database for finding answers to hundreds of frequently asked health and safety questions. This web site also provides subscription access to other databases, including material safety data sheets (MSDSs), CHEMINFO, CHEMpendium™, RTECS®, OSH References, and Canadian enviroOSH. http://www.ccohs.ca/

European Union, European Agency for Safety and Health at Work. The website provides links to leading organizations from individual European Union countries that develop guidance documents on occupational health issues, including occupational exposure limits. http://osha.europa.eu/

International Labour Organization (ILO) – International Occupational Safety and Health Information Centre. The Centre provides a database of links to exposure limit information for many countries internationally. http://www.ilo.org/public/english/protection/safework/cis/index.htm

(U.K.) Health and Safety Executive (HSE), COSHH Essentials. This web site was developed to help firms comply with the U.K.'s Control of Substances Hazardous to Health Regulations (COSHH), and contains 'easy steps to control health risks from chemicals.' It provides advice for controlling the risks associated with chemicals for a range of common tasks, and takes users through a number of steps asking for information about the tasks and chemicals of interest. Direct advice for some processes, tasks, or services is also offered. http://www.coshh-essentials.org.uk/

(U.S.) National Institute for Occupational Safety and Health. Provides numerous databases containing occupational toxicology information, including occupational exposure limits (NIOSH Recommended Exposure Limits), industrial hygiene sampling and analytical methods, acute inhalation exposure values for respiratory protection selection (NIOSH Immediately Dangerous to Life or Health Values), medical surveillance and injury and illness statistics, and exposure statistics. http://www.cdc.gov/niosh/. Various safety and health topics have their own NIOSH web pages, e.g., control banding (http://www.cdc.gov/niosh/topics/ctrlbanding/). NIOSH resources and publications can be searched using NIOSHTIC (http://www2a.cdc.gov/nioshtic-2/default.asp)

(U.S.) National Institutes of Health, National Library of Medicine, HazMAP. A database searchable by agent, disease, or exposure that links basic information for chemicals and chemical classes on sources of exposure, exposure assessment information, and adverse effects, and occupational diseases. http://hazmap.nlm.nih.gov/

Organizations

American Association of Occupational Health Nurses. http://www.aaohn.org/ (note that there are numerous related organizations in other countries)

CHAPTER

39

Genomics

MARK A. PERSHOUSE, MELISA BUNDERSON SCHELVAN, AND CORBIN SCHWANKE

The growing realization that we will have to understand our favorite biological molecules in the context of many thousands of others and that a wide net must be cast to be sure that we have, in fact, found the important ones … If one is going to fish, it is best to do so in teeming waters with the finest equipment and flawless technique.

John N. Weinstein, Science 282: 628–629, 1998

This publication was made possible by Grant Number RR017670 from the National Center for Research Resources (NCRR), a component of the National Institutes of Health (NIH). The views expressed in this publication do not necessarily reflect the official policies of the Department of Health and Human Services; nor does mention of tradenames, commercial practices, or organizations imply endorsement by the U.S. Government.

INTRODUCTION

Genomics comprises several distinct areas of research; *transcriptomics*, the study of global RNA expression; *genotyping*, measurement of DNA polymorphisms and mutations; and *bioinformatics*, the systematic analysis of biological data generated by technologies such as genomics.

The field of genomics has had a rocky past, not only in toxicology, but in the biomedical sciences in general. This is due primarily to the nature of the studies. In a major shift from the research paradigm that has dominated research since the earliest philosophers and thinkers, genomics studies do not require a hypothesis. They are, in fact, considered 'hypothesis generating'. Other ways of describing the genomic approach are, '**not** hypothesis limited' (Staudt & Brown 2000) or 'discovery-based' investigations. For scientists trained from their earliest science fair projects in the absolute requirement for a testable hypothesis, genomics is indeed a 'fishing expedition' and unfamiliar territory. Mark Schena, in his early book entitled 'Microarray Biochip Technology' used the analogy of Galileo with one of the first telescopes. Galileo's investigations of the nature of the universe were indeed unfocused and discovery-based. He had no testable hypothesis because he was at a point in technological development where the questions being asked were inherently different than most scientific investigations to date. With the telescope he could ask for the first time, 'What is out there?', without a clear goal in mind. Genomics has been described as a similar technological leap in the history of science. With a robust microarray, an investigator can ask the simple, but profound question, 'When I change one variable in a cell; add a toxicant, a higher or lower dose, a longer or shorter exposure, or remove the function of a critical response gene, what gene expression changes take place in the cell (tissue, organism)?' These experiments have provided countless new hypotheses to follow, and begun the complex task of integrating knowledge of gene function with mechanisms of disease progression. Rather than proceeding one gene or protein at a time based only on historical knowledge, genomics allows the rapid focusing of our investigations to highly relevant pathways and genes. As the

technology becomes more available, reproducible, and inevitably more affordable, the pace of research will proceed at a faster pace. In the end, this is good news specifically for affected individuals and in general for all of biomedical science.

Resources utilized by genomics researchers rely heavily on rapidly changing digital resources, so some of the best resources are web-based. However, some printed texts have proven useful for those new to the field, as an introduction, or as a reference work to those more experienced in the field. Several are listed below. Peer-review journals have recently begun to emerge that focus almost entirely on genomic publications, but over the last 10–20 years, publications of genomic data have found their way into a large variety of journals in a multitude of disciplines. Thus, this list is rather long and represents only a handful of journal publishing genomics data.

RESOURCES

Books

Mount DW, Baxevanis A, Ouellette BFF (2001)
Bioinformatics: A Practical Guide to the Analysis of Genes and Proteins. Third Edition
John Wiley & Sons, Inc., Hoboken NJ

This is an 18-chapter textbook that focuses on the use of relevant biological examples to explain methods for the computational analysis and organization of bioinformatics data. Beginning with an explanation of sequence and mapping databases, the book goes through predictive methodologies, intermolecular interactions and biological pathways, and assessing pairwise sequence similarity. It also covers different analysis methods as well as phylogenetic analysis, computational approaches in comparative genomics, using DNA microarrays to assay gene expression, proteomics and protein identification and the use of PERL to facilitate biological analysis.

Mount DW (2001)
Bioinformatics: Sequence and Genome Analysis, Second Edition
Cold Spring Harbor Laboratory Press

This textbook contains 13 chapters focusing on the computational analysis of DNA microarray data. This book covers all the basics of bioinformatics, including how to collect and store sequences in the laboratory, alignment of pairs of sequences, and introduction to probability and statistical analysis of sequence alignment, multiple sequence alignment as well as sequence database searching for similar sequences. There is also a chapter on phylogenetic prediction, RNA secondary structure, gene prediction and regulation and protein classification and structure prediction. The book finishes with a chapter on genome analysis, bioinformatics programming and analysis of microarrays.

Schena M (1999)
DNA Microarrays
Oxford University Press, Oxford, UK
Web: http://www.oup.com/uk/catalogue/?ci=9780199637768

Contains 10 chapters outlining a practical approach to DNA microarray technology. The book begins with an introduction to the fundamentals of biochips and follows with a description of full methodological details and current applications.

McClelland M, Pardee AB (Eds) (1999)
Expression Genetics: Accelerated and High-Throughput Methods
Biotechniques Update Series-Eaton Pub Co., Natick, MA

A collection of 37 papers from Biotechniques representing high-throughput techniques for analyzing or finding differentially expressed genes.

Krawetz SA, Womble D (2003)
Introduction to Bioinformatics: A Theoretical and Practical Approach
Human Press, Totowa, New Jersey
Web: Humanapress.com

This comprehensive book is divided into four sections including: (1) Biochemistry, cell, and molecular biology, (2) Molecular genetics, (3) The UNIX operating system, and (4) Computer applications. It is useful for assisting the genomic scientist with a basic review of biological systems as well as providing a foundation for using the tools necessary for analyzing the vast amount of data generated by microarrays.

Schena M (2003)
Microarray Analysis
John Wiley and Sons, Inc., Hoboken, NJ

This textbook-style resource contains 16 chapters covering the basics of microarray analysis all the way to future trends: chips in the clinics. This comprehensive book covers the basics of biochemistry, genes and

genomes, microarray surfaces, targets and probes, microarray manufacturing, detection, and informatics. There is also a chapter on methodological architecture, cleanroom technology, gene expression profiling as well as genetic screening and diagnostics.

Schena M (2000)
Microarray Biochip Technology
Eaton Publishing, Natick, MA

This textbook contains 15 chapters detailing a variety of DNA microarray applications from various vendors and research labs.

Speed T (Ed.) (2003)
Statistical Analysis of Gene Expression Microarray Data
Chapmand & Hall/CRC Washington, DC

This is a four-chapter book on interdiscliplinary statistics that starts with a description of model-based analysis of oligonucleotide arrays and issues in cDNA microarray analysis. The second chapter focuses on the design and analysis of comparative microarray experiments and is followed by a chapter on classification in microarray experiments. The final chapter explains the intricacies of clustering microarray data.

Journals

American Journal of Human Genetics (1949–)
University of Chicago Press, Chicago, IL
Web: http://www.journals.uchicago.edu/AJHG/journal/

The American Journal of Human Genetics is a record of research and review relating to heredity in humans; to the applications of genetic principles in medicine, psychology, anthropology, and social services; and to areas of molecular and cell biology relevant to human genetics. It is published monthly. The Journal is owned and controlled by The American Society of Human Genetics and is edited, in conjunction with the publisher, by a staff appointed by the Board of Directors of the Society.

Annals of Human Genetics (1954–)
Cambridge University Press, Cambridge, London
Web: http://www.blackwell-synergy.com/servlet/useragent?func=showIssues&code=ahg

The *Annals of Human Genetics* is an international journal publishing rigorously peer-reviewed research. The principal aim of the Annals is to increase understanding of the biology of human variation, both in disease and in health. In recent years it has become apparent that the study of population genetics is extremely relevant to molecular pathology. The interaction of these fields can greatly increase our understanding of the generation and maintenance of variation in the human genome.

BMC Genomics (2000–)
BioMed Central, London
Web: http://www.biomedcentral.com/1471-2164

BMC Genomics is an Open Access, peer-reviewed journal that considers articles on all aspects of gene mapping, sequencing and analysis, functional genomics, and proteomics.

Briefings in Functional Genomics and Proteomics (2002–)
Henry Steward Publications, London
Web: http://bfgp.oxfordjournals.org/

Briefings in Functional Genomics and Proteomics is an international forum for researchers and educators in the life sciences and reviews the techniques, protocols and approaches in genome and proteome research. The journal aims to provide a centralized resource for researchers in the fields of genomics and proteomics as well as give guidance to scientists new to these areas.

Cloning and Stem Cells (2001–)
Mary Ann Liebert, Inc. Larchmont, NY
Web: http://www.liebertonline.com/clo

The Journal publishes peer-reviewed research papers on the remarkable new opportunities in medicine, biology, and agriculture that arise from the demonstration of far greater than expected developmental plasticity in mammalian cells. Papers cover all aspects of cloning along with the culture and differentiation of stem cells from all stages of development from embryo to adult.

Current Opinion in Genetics and Development (1991–)
Current Biology, London
Web: http://sciencedirect.com/science/journal/0959437X

Cytogenetic and Genome Research (2002–)
S. Karger, Switzerland

In recent years, most of its papers have centered on genome research, including gene cloning and sequencing, gene mapping, gene regulation and expression, cancer genetics, comparative genetics, gene linkage and related areas.

DNA Research (1994–)
Universal Academy Press, Tokyo, Japan

Web: http://www.dnaresearch.oxfordjournals.org/

DNA Research is an internationally peer-reviewed journal which aims to publish the highest quality papers on structures and function of genes and genomes.

European Journal of Human Genetics (1992–)
Nature Publishing Group, London
Web: http://www.nature.com/ejhg/

The *European Journal of Human Genetics* is the official Journal of the European Society of Human Genetics, publishing high-quality, original research papers, short reports, News and Commentary articles and reviews in the rapidly expanding field of human genetics and genomics, including a new series on Practical Genetics. The journal covers molecular, clinical and cytogenetics, interfacing between advanced biomedical research and the clinician, and bridging the great diversity of facilities, resources and viewpoints in the genetics community.

Functional and Integrative Genomics (2000–)
Springer, Berlin
Web: http://link.springer-ny.com/link/service/journals/10142/index.htm

Functional and Integrative Genomics is devoted to large-scale studies of genomes and their functions, including systems analyses of biological processes. Topics covered include: whole genome analyses/bioinformatics/expression profiling, genomics (structural, comparative, integrative), proteomics, metabolomics, human disease genes and loci, and large-scale/high throughput analysis of biological systems.

Gene (1976–)
Elsevier, Amsterdam, North Holland
Web: http://sciencedirect.com/science/journal/03781119

The journal publishes papers on all structural, functional, and evolutionary aspects of genes, chromatin, chromosomes and genomes.

Genetics (1916–)
Genetics Society of America, Baltimore, MD
Web: http://www.genetics.org/

Genetics publishes contributions that present the results of original research in genetics and related scientific disciplines. *Genetics* is an official publication of the Genetics Society of America.

Genetics and Molecular Research (2002–)
FUNPEC, Ribeirao Preto, SP Brazil
Web: http://funpecrp.com.br/gmr/index.htm

Genetics and Molecular Research (GMR) publishes research articles, research reports, technical notes, scientific commentaries, news, views, and review articles on Genetics, Evolution and Molecular Biology. It is an exclusively online journal.

Genome (1987–)
National Research Council of Canada Ottawa, Canada
Web: http://pubs.nrc-cnrc.gc.ca/cgi-bin/rp/rp2_vols_e?gen

Genome publishes, in English or French, scientific reports on the mechanisms of genetics, cytogenetics, and evolution.

Genome Biology (2000–)
Genome Biology Ltd., London, UK
Web: http://genomebiology.com

Genome Biology serves the biological research community as an international forum for the dissemination, discussion and critical review of information about all areas of biology informed by genomic research. Key objectives are to provide a guide to the rapidly developing resources and technology in genomics and its impact on biological research, to publish large datasets and extensive results that are not readily accommodated in traditional journals, and to help establish new standards and nomenclature for post-genomic biology.

Genome Letters (2002–)
American Scientific Publishers Stevenson Ranch, CA
Web: http://www.aspbs.com/genomelett

Genome Letters is an international peer-reviewed journal with a wide-ranging coverage, consolidates research activities in all aspects of genome science, genome technology, bioinformatics, biotechnology and medicine into a single, and unique reference source.

Genome Research (1995–)
Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY
Web: http://www.genome.org

Among the topics considered by the journal are genome structure and function, comparative genomics, molecular evolution, genome-scale quantitative and population genetics, proteomics, epigenomics, and systems biology. The journal also features exciting gene discoveries and reports of cutting-edge computational biology and high-throughput methodologies.

Genomics (1987–)
Academic Press, San Diego, CA
Web: http://www.sciencedirect.com/science/journal/08887543

The goal of *Genomics* is to promote the understanding of the structure, function, and evolution of genomes in all kingdoms of life and the application of genome sciences and technologies to challenging problems in biology and medicine.

Human Gene Therapy (1990–)
M.A. Liebert, New York, NY
Web: http://www.liebertonline.com/hum

A rapid-publication peer-reviewed journal covering all aspects of human gene therapy. Publishes scientific papers on original investigations into the transfer and expression of genes in mammals, including humans. Improvements in vector development, delivery systems, and animal models, particularly in the areas of cancer, heart disease, viral disease, genetic disease, and neurological disease, are covered. Includes ethical/legal/regulatory papers related directly to the area of gene transfer into humans.

Human Molecular Genetics (1992–)
Oxford University Press, Oxford, UK; New York
Web: http://hmg.oupjournals.org

Human Molecular Genetics concentrates on full-length research papers covering a wide range of topics in all aspects of human molecular genetics. These include:

- the molecular basis of human genetic disease
- developmental genetics
- cancer genetics
- neurogenetics
- chromosome and genome structure and function
- gene therapy
- mouse and other models of human diseases
- functional genomics
- computational genomics.

The Journal of Gene Medicine (1999–)
John Wiley & Sons, Chichester, UK
Web: http://www3.interscience.wiley.com/cgi-bin/jhome/10009391

The Journal of Gene Medicine publishes high-quality original articles and reviews on the science of gene transfer and its applications in gene and cell therapy. Key areas of interest are the design and production of vectors, delivery and targeting, gene expression and regulation, preclinical studies including animal models, developmental aspects and clinical trials. The editors particularly welcome articles dealing with the methodological aspects of gene transfer in vivo, notably in the context of human studies. Papers presenting research into the mechanisms underlying gene transfer; the application and refinement of new technologies such as RNAi, stem cells and allied approaches such as DNA vaccines; or addressing more fundamental biological issues which could lead to more effective gene transfer are also encouraged.

Journal of Structural and Functional Genomics (2001–)
Kluwer Academic Publishers, Dordrecht, Boston
Web: http://www.kluweronline.com/issn/1345-711X

The scope of JSFG includes: Determination of the three-dimensional structures of gene products including those with unknown biological functions. Research and new methodologies for structural genomics including informatics, protein sample production, and structure determination. Discussion of results of structural genomics projects. Experimental and structure-based functional analysis.

Mammalian Genome (1992–)
Springer International, New York, NY
Web: http://link.springer-ny.com/link/service/journals/00335/

Mammalian Genome focuses on the experimental, theoretical, and technical aspects of genomics and genetics in mouse, human, and other species, particularly those aspects bearing on studies of gene function. Special emphasis is placed on: gene structure and expression studies; mutagenesis, the characterization of new mutations and the identification of animal models of human genetic disorders; genetic, physical, and comparative mapping, particularly for the study of gene function; genetic analysis of complex traits; informatics as related to genome analysis and functional genomics; novel technical approaches.

Molecular Genetics and Genomics (2001–)
Springer-Verlag, Berlin
Web: http://link.springer-ny.com/link/service/journals/00438/

Molecular Genetics and Genomics (MGG) covers all areas of genetics and genomics and encompasses experimental and theoretical approaches in all organisms.

Nature Genetics (1992–)
Nature Publishing Company, New York
Web: http://www.nature.com/ng/

Nature Genetics publishes the very highest quality research in genetics. It encompasses genetic and functional genomic studies on human traits and on other model organisms, including mouse, fly, nematode and yeast. Current emphasis is on the genetic basis for common and complex diseases and on the functional

mechanism, architecture and evolution of gene networks, studied by experimental perturbation.

Nature Reviews: Genetics (2000–)
Nature Publishing Group, London
Web: http://www.nature.com/nrg/

To an extent, all life scientists are geneticists because genetic technology and the accumulation of genomic information has enriched all of biology. You may or may not call yourself a geneticist, but if you work on genes you need to know about the latest developments. Nature Reviews Genetics will cover the full scientific breadth of modern genetics, capturing its excitement, diversity and implications.

Organizations

Argonne National Laboratory-MCS
9700 South Cass Avenue
Building 221
Argonne, IL 60439-4844
Phone: 630-252-7162
Fax: 630-252-5986
Web: http://www-new.mcs.anl.gov/new/

The Mathematics and Computer Science division of the Argonne National Laboratory primarily focuses on increasing scientific productivity by providing expertise in computer science, applied computational mathematics, and computational science. Specifically, there is a bioinformatics group working on high-throughput comparative and evolutionary analysis of genomes.

The Broad Institute
7 Cambridge Center
Cambridge, MA 02142
Phone: 617-452-3000
Fax: 617-452-4588
E-mail: questions@broad.mit.edu
Web: http://www.broad.mit.edu/

The goal of The Broad Institute is to bring basic genomic research to medicine by joining collaborators from MIT, Harvard, and their affiliated hospitals.

EMBL – European Bioinformatics Institute
Wellcome Trust Genome Campus
Hinxton Cambridge
CB10 1SD
UK
Phone: +44 (0)1223 494 444
Fax: +44 (0)1223 494 468
E-mail: http://www.ebi.ac.uk/support/
Web: http://www.ebi.ac.uk/Information/

EMBL is a non-profit, academic research organization, focusing on services in bioinformatics. The EBL is part of the European Molecular Biology Laboratory (EMBL).

Genetics Society of America (GSA)
9650 Rockville Pike
Bethesda, MD 20814
Phone: 301-634-7300
E-mail: Society@genetics-gsa.org
Web: http://genetics.faseb.org/genetics/g-gsa/

A society made up of scientists and educators interested in the field of genetics. The GSA promotes genetic research through publication of the journal *Genetics*.

The Institute for Genomic Research (TIGR)
9712 Medical Center Drive

Rockville, MD 20850
Phone: 301-795-7000
Fax: 301-838-0208
Web: http://www.tigr.org/index.shtml

TIGR has helped set the pace for genomics laboratories around the world, exerting a profound impact as a catalyst for innovation. In its early days, TIGR – which was established through a grant from HealthCare Investment Corporation, Inc. – focused much of its research on identifying expressed human genes to help pinpoint the genetic components of diseases. With its work on those Expressed Sequence Tags, known as ESTs, the Institute helped inaugurate the era of molecular medicine.

Joint Genome Institute (JGI)
JGI Production Genomics Facility
2800 Mitchell Drive
Walnut Creek, CA 94598
Phone: 925-296-5670
Web: http://www.jgi.doe.gov/index.html

The JGI makes high-quality genome sequencing data freely available to the greater scientific community through its web portal. Having played a significant role in the federally funded Human Genome Project – generating the complete sequences of chromosomes 5, 16, and 19 – the JGI has now moved on to contributing in other critical areas of genomics research. While NIH-funded genome sequencing activities continue to emphasize human biomedical targets and applications, the JGI has since shifted its focus to the non-human components of the biosphere, particularly those relevant to the science mission of the Department of Energy.

Max-Planck-Institute for Molecular Genetics
Ihnestraße 63-73
14195 Berlin
Germany
Phone: (+49 30) 8413-0
Fax: (+49 30) 8413-1388
Web: http://seq.mpimg-berlin-dahlem.mpg.de/

Since its foundation in the sixties, research of the institute had focused on DNA replication and gene regulation in bacteria, bacterial phage and fungi and on the structure, function and evolution of ribosomes which were central to the research of H.-G. Wittmann.

Medical Genetics Institute
Cedars-Sinai Medical Center
8635 W. Third St., Suite 1070
Los Angeles, CA 90048
Phone: 1-800-CEDARS-1 (1-800-233-2771)
Fax: 310-423-9939
Web: http://www.csmc.edu/3992.html

A medical genetics institute providing a full range of care for genetic-based diseases as well as teaching programs and NIH-funded research on the genetic basis of disease.

National Center for Genome Resources (NCGR)
2935 Rodeo Park Drive East
Santa Fe, New Mexico 87505
Phone: 505-982-7840
Fax: 505-995-4432
E-mail: mailto:info@ncgr.org
Web: http://www.ncgr.org/

A non-profit life sciences research institute focusing on intersecting the use of mathematics and software to help control and cure infectious disease, global health, and nutrition.

Stanford Human Genome Center
975 California Ave.
Palo Alto, CA 94304
Phone: 650-320-5800
Fax: 650-320-5801
Web: http://www-shgc.stanford.edu/

Originally established as one of the first centers to generate maps of the human genome, the Stanford Human Genome Center now participates in several large-scale mapping projects and studies.

University of Washington Genome Center
Fluke Hall on Mason Road
Box 312545
Seattle WA, 98195
Phone: 206-685-7366
Fax: 206-616-5242
Web: http://www.genome.washington.edu/UWGC/index.cfm

The mission of the University of Washington Genome Center is 'to increase the knowledge about genomes and natural genetic variation. We believe that acquisition of genomic sequence data will increase our understanding of evolution and enhance our ability to identify disease and disease susceptibility, as well as to improve treating illnesses'.

Utah Genome Depot
South 2030 East, RM. 308
Salt Lake City, UT 84112
Phone: 801-585-5606
Fax: 801-585-7177
Web: http://www.genome.utah.edu/#

Based at the University of Utah, the Utah Genome Depot specializes in high-throughput genomic sequencing,

high-throughput resequencing, and library constructions and colony picking. They also have an informatics group.

Wellcome Trust Sanger Institute
Wellcome Trust Genome Campus,
Hinxton, Cambridge, CB10 1SA, UK
Phone: +44 (0)1223 834244
Fax: +44 (0)1223 494919
Web: http://www.sanger.ac.uk/

A genetic research institute organized to understand the role of gene function in health and disease through large-scale sequencing, informatics, and analysis of genetic variation.

Databases

Animal Genome Size Database

Sponsor: Gregory T.R.
Web: http://www.genomesize.com/index.php

The *Animal Genome Size Database* is a 'comprehensive catalogue of animal genome size data. Haploid DNA contents (C-values, in picograms) are currently available for 4295 species (2953 vertebrates and 1342 non-vertebrates) based on 5697 records from 607 published sources.'

The Arabidopsis Information Resource (TAIR)
Sponsor: TAIR is produced by the Carnegie Institution of Washington Department of Plant Biology, and the National Center for Genome Resources (NCGR).
Web: http://www.arabidopsis.org

TAIR is a database for the genetics and molecular biology of the higher plant species, *Arabidopsis thaliana*.

The Cancer Genome Atlas
Web: http://cancergenome.nih.gov/index.asp

'The Cancer Genome Atlas (TCGA) is a comprehensive and coordinated effort to accelerate our understanding of the molecular basis of cancer through the application of genome analysis technologies, including large-scale genome sequencing.'

The Comparative Toxicogenomics Database
Web: http://ctd.mdibl.org

The Comparative Toxicogenomics Database (CTD) elucidates molecular mechanisms by which environmental chemicals affect human disease.

dbSNP
Web: http://www.ncbi.nlm.nih.gov/SNP/
NCBI's database of single nucleotide polymorphisms.

E. Coli *Genome Project*
Sponsor: University of Wisconsin-Madison
Web: http://www.genome.wisc.edu/

'Having sequenced the *E. coli* K-12 genome, [the *E. Coli* Genome Project] maintain and update its annotation. [They] are creating a knockout of every gene, a clone of every ORF, and an extensive gene expression data set under a variety of physiological conditions. These clones and data sets are made available freely to the community.

[They] have also sequenced six additional enterobacterial strains which are pathogens closely related to *E. coli* K-12, and many plasmids. The comparative genomics aim of this effort is to characterize the gene pool of horizontally transferred elements and virulence determinants known as the pathosphere.'

Ensembl
Sponsor: The European Bionformatics Institute and the Sanger Institute

'Ensembl is a joint project between EMBL-EBI and the Sanger Institute to develop a software system which produces and maintains automatic annotation on selected eukaryotic genomes. Ensembl is primarily funded by the Wellcome Trust.'

Flybase
Sponsor: National Human Genome Research Institute, NIH; British Medical Research Council; and The Indiana Genomics Initiative
Web: http://flybase.bio.indiana.edu/

A database of drosophila genes and genomes.

The GDB Human Genome Database
Sponsor: RTI International
Web: http://gdbwww.gdb.org/

'The Official World-Wide Database for the Annotation of the Human Genome'.

International HapMap Project
Web: http://snp.cshl.org/

'The International HapMap Project is a partnership of scientists and funding agencies from Canada, China, Japan, Nigeria, the United Kingdom and the United States to develop a public resource that will help researchers find genes associated with human disease and response to pharmaceuticals.'

Mouse Genome Database List
Sponsor: Neurogenetics at UT Health Science Center
Web: http://www.nervenet.org/main.html

Nervenet.org and The Informatics Center for Mouse Neurogenetics 'hosts the Mouse Brain Library, an

expanding collection of high-resolution histological images, atlases, MRIs, and databases on brain structure of more than 120 different lines of mice. Nervenet also includes several useful genetics and gene mapping databases to download (SNP databases, Map Manager databases, and the Portable Dictionary of the Mouse Genome). The publications section includes revised, expanded, and annotated papers, tutorials, and reviews on neurogenetics, gene mapping, complex trait analysis, stereology, and the control of neuron number.'

National Center for Toxicogenomics
Web: http://www.niehs.nih.gov/nct/home.htm
NIEHS-centered website to look at genomics applications in toxicology.

The Pharmacogenetics and Pharmacogenomics Knowledge Base (PharmGKB)
Sponsor: Stanford University
Web: http://www.pharmgkb.org

'The PharmGKB database is a central repository for genetic, genomic, molecular and cellular phenotype data and clinical information about people who have participated in pharmacogenomics research studies. The data includes, but is not limited to, clinical and basic pharmacokinetic and pharmacogenomic research in the cardiovascular, pulmonary, cancer, pathways, metabolic and transporter domains.'

RCSB Protein Data Bank
Sponsor: Rutgers, the State University of New Jersey
Web: http://www.rcsb.org/pdb/home/home.do

'The RCSB PDB provides a variety of tools and resources for studying the structures of biological macromolecules and their relationships to sequence, function, and disease.'

Saccharomyces Genome Database (SGD)
Sponsor: SGD Curators (The SGD is in the Department of Genetics at the School of Medicine, Stanford University.)
Web: http://www.yeastgenome.org/

SGT is a database for the compilation of the genetics and molecular biology of *Saccharomyces cerevisiae*, or budding yeast.

SOURCE
Sponsor: Genetics Department at Stanford University
Web: http://source.stanford.edu/cgi-bin/source/sourceSearch

'SOURCE is a unification tool which dynamically collects and compiles data from many scientific databases, and thereby attempts to encapsulate the genetics and molecular biology of genes from the genomes of *Homo sapiens*, *Mus musculus*, *Rattus norvegicus* into easy to navigate GeneReports.'

Unigene
Sponsor: National Center for Biotechnology Information
Web: http://www.ncbi.nlm.nih.gov

'Established in 1988 as a national resource for molecular biology information, NCBI creates public databases, conducts research in computational biology, develops software tools for analyzing genome data, and disseminates biomedical information – all for the better understanding of molecular processes affecting human health and disease.'

The Zebrafish Model Organism Database (ZFIN)
Sponsor: NIH; University of Oregon
Web: http://zfin.org/cgi-bin/webdriver?MIval=aa-ZDB_home.apg

'FIN serves as the zebrafish model organism database. The long term goals for ZFIN are a) to be *the* community database resource for the laboratory use of zebrafish, b) to develop and support integrated zebrafish genetic, genomic and developmental information, c) to maintain the definitive reference data sets of zebrafish research information, d) to link this information extensively to corresponding data in other model organism and human databases, e) to facilitate the use of zebrafish as a model for human biology and f) to serve the needs of the research community.'

Other Resources

BCM Search Launcher: Baylor College of Medicine HGSC
Web: http://searchlauncher.bcm.tmc.edu/

A collection of molecular biology-related search and analysis services available on the web. The site features sequence alignment programs, gene recognition, vector trimming, and batch mode analysis.

BioIT World Magazine Online
Web: http://www.bio-itworld.com/

A cutting edge compilation of relevant literature, software, and resources in bioinformatics.

The Computational Biology and Functional Genomics Laboratory
Web: http://compbio.dfci.harvard.edu/

Dr. John Quackenbush and his laboratory have produced this site, which contains many resources for the analysis of microarray data and other genomic data sets.

DNA Microarray (Genome Chip) – Monitoring the Genome on a Chip
http://www.gene-chips.com/

This is a site that focuses on the DNA microarray technology and is maintained by Dr. Leming Shi. It contains information and links relevant for DNA microarray technology, articles on DNA microarray technology, academic links, industry links, data mining, software providers, protein chips, chemical microarrays, related meetings/workshops, and investment opportunities.

GoMiner: Gene Ontology Analysis at NCI
Web: http://discover.nci.nih.gov/gominer/

'GoMiner is a tool for biological interpretation of "omic" data – including data from gene expression microarrays. GoMiner leverages the Gene Ontology (GO) to identify the biological processes, functions and components represented in these lists. Instead of analyzing microarray results with a gene-by-gene approach, GoMiner classifies the genes into biologically coherent categories and assesses these categories.'

Y.F. Leung's Functional Genomics
Web: http://ihome.cuhk.edu.hk/%7Eb400559/

This website provides a compilation of web-based resources for genomics, microarray, bioinformatics and genome mapping and linkage analysis.

MGMD: The mammalian gene mutation databasez
Web: http://lisntweb.swan.ac.uk/cmgt/Pages/databaselinks.htm

This site features a compilation of mutation-related databases and websites. It also features a list of mutation databases by disease gene.

National Library of Medicine Genomic Links
http://www.nlm.nih.gov/pubs/factsheets/humangenome.html

A website maintained by the United States National Library of Medicine of the National Institutes of Health. Contains links to resources relating to the human genome, including a resource guide, gene-based links, sequence sites, genome maps, mapped markers, genetic variations, gene expression sites, and genetic disorders.

NC State Genetics Department
http://www.cals.ncsu.edu/genetics/net-resources.html

This site gives you a list of networked genetics and molecular biology research resources pooled by NC State University's Genetics Department. The list includes links to different agencies relevant to the study of genomics, genome projects and databases, general genomics websites, searching and tools, societies and publications, research centers, research groups, and other information resources.

NOVA Website featuring the QuickTime movie 'Cracking the code of life'
Web: http://www.pbs.org/wgbh/nova/genome/program.html

Educational video from the NOVA program about genomics. This two-hour program is divided into 16 chapters.

Science Magazine Functional Genomics Resources: Educational Resources
http://www.sciencemag.org/feature/plus/sfg/education/glossaries.dtl

A link through *Science Magazine* that directs you to online glossaries useful for keeping up with the rapid changes in terminology of genomics, bioinformatics, and gene medicine.

Virtual Library on Genetics
http://www.ornl.gov/sci/techresources/Human_Genome/genetics.shtml
The U.S. Department of Energy's Office of Science sponsors this Virtual Library on Genetics.

CHAPTER

40

Pathology

HUW BOWEN JONES

INTRODUCTION

Pathology is the study of the essential nature of disease in humans and other animals, especially those changes in organs and tissues that cause or are caused by disease. It is the study of the structural and functional manifestations of disease. This broad definition of pathology pertains as much to human clinical pathology as it does to the safety assessment of drugs and chemicals in animals. The role of the toxicological pathologist is to contribute to the understanding of the sequelae of administration of naturally occurring or human-made substances to laboratory animals and place them into the context of possible adverse human effects. Identification of toxin-induced tissue damage is a critical component of the understanding of human, animal, or environmental safety of xenobiotics that are to be administered to humans or domestic animals or, to which they may be exposed in the environment.

In experimental studies, the role of the toxicological pathologist in providing identification of the nature of perturbation in organs, tissues, and cells following histological examination is pivotal, often forming the basis for further investigations or elucidation of mechanisms of action. Painting the toxicological picture relies upon compilation of in-life observations and measurements, histopathology, hematology, and clinical biochemistry. Whilst the initial histopathological assessment involves examination of stained tissue sections by light microscopy, both diagnostic and investigative pathologists alike have at their disposal a variety of specific tools and techniques, such as, electron microscopy, image analysis, histochemistry, immunohistochemistry and in-situ hybridization to probe and identify the changes in composition of cells and tissues.

It is the nature of information that it ages and becomes out of date. However, the appearances of pathological lesions remain constant. It is the understanding of their pathogenesis, often requiring state-of-the-art technological applications that ultimately sheds new light and contributes to enhanced understanding. The information presented here represents general and specific sources in pathology with contextual references to toxicology. The potential source of information worldwide is enormous: therefore, the information provided below represents a small and subjective selection. The toxicological pathologist requires an understanding of toxicological mechanisms and for that reason, references to other relevant texts are provided.

RESOURCES

Books

Bacha WJ, Bacha LM (2000)
Color Atlas of Veterinary Pathology, Second Edition
Lippincott Williams and Wilkins

Histological processes described with color images of major tissues from eight different species and brief introduction to the different chapters. Excellent book for the veterinary pathologist.

Bancroft JD, Cook HC (1994)
Manual of Histological Techniques and their Diagnostic Application
Churchill Livingstone, Edinburgh, UK.

Includes scientific and medical background to the basic technical methodology used in histopathology. This book is primarily designed to cover practical techniques and includes 17 chapters.

Boorman GA, Eustis SL, Elwell MR, Montgomery CA, Jr, MacKenzie WF (Eds.) (1990)
Jubb KVF, Kennedy PC, Palmer N (Eds.) (1993)
Pathology of Domestic Animals, 4th Edition, 3 volumes
Academic Press, San Diego, CA.

Directed at veterinary pathologists, this book covers the spontaneous and chemically induced lesions present in domestic animals. The volume is organized by organ/organ system and includes 17 chapters. It is a key textbook on the subject.

Burkitt HG, Young B, Heath JW (1993)
Wheater's Functional Histology – A Text and Colour Atlas, 3rd Edition
Churchill Livingstone.

Human histology with color photographs and brief descriptions. A good atlas.

Cheville NF (Ed.) (1994)
Ultrastructural Pathology, An Introduction to Interpretation
Iowa State University Press, Ames, IO, USA.

Designed as a treatise on ultrastructural analysis to fill the gap between what is seen in the electron microscope and what the pathologist encounters in the laboratory. Electron microscopy of pathological tissues is covered in 15 separate chapters with full illustrations.

Cotran RS, Kumar V, Robbins SL, Schoen FJ (Eds.) (2004)
Robbin's Pathologic Basis of Disease, 7th edition
Saunders, Philadelphia, PA.

Integrates information of pathological processes and disorders into morphological, molecular, and genetic components. The information is presented in chapters employing logical, uniform approaches to facilitate readability and comprehension. The first several chapters focus on general principles in pathology with some excellent diagrams. The latter part of the book consists of human-specific pathological lesions. This has served as the standard reference for many years.

Craighead JE (1995)
Pathology of Environmental and Occupational Disease
Mosby, St. Louis, MO.

Addresses environmental and occupational disease. Occupational diseases are considered to be the result of specific types of exposure experienced in the workplace. The book integrates concepts of causation and pathogenesis in the context of the resulting disease and the tissue changes that accompany it.

Eroschenko VP, Di Fiore MSH (2007)
Di Fiore's Atlas of Histology: with Functional Correlations, 10th Edition
Lippincott Williams Wilkins, Philadelphia, PA.

Excellent association of structure with function with excellent quality schematic and micrographic illustrations alongside each other. Excellent introduction to histology, with a CDROM available.

Evans GO (Ed.) (1996)
Animal Clinical Chemistry. A Primer for Toxicologists
Taylor & Francis, London.

A comprehensive book detailing practical approaches to clinical chemistry and guides to the assessment of target organ toxicity.

Faccini JM, Abbott DP, Paulus GJJ (1990)
Mouse Histopathology, A Glossary for Use in Toxicity and Carcinogenicity Studies
Elsevier, Amsterdam.

Provides a bench reference for the lesions observed during the histopathological examination of tissues from routine toxicity studies for the assessment of toxicological or carcinogenic potential of a test substance. The authors have restricted their information base to the most commonly used mouse strain, the CD-1 mouse.

Ghadially FN (1996)
Ultrastructural Pathology of the Cell and Matrix, 4th Edition, 2 vols
Butterworth-Heinemann, Boston, MA.

Serves as an excellent textbook and atlas of cellular pathology, with each chapter including a discussion of normal structure and function. Each of 17 cellular organelles or matrix material is covered in a specific chapter. The ultrastructural pathologist's handbook.

Glaister JR (1986)
Principles of Toxicological Pathology
Taylor & Francis, Philadelphia, PA.

Global view across the principles of toxicological pathology and their applications, especially in target organ pathology and the pathology of laboratory animals. A basic text focusing on cellular processes in pathology.

Gopinath C, Prentice DE, Lewis DJ (1987)
Atlas of Experimental Toxicological Pathology
MTP Press, Lancaster, UK

Essential to those working in the fields of drug testing, experimental pathology, and clinical pharmacology. This is a comprehensive volume dealing with changes that are induced by a wide variety of agents in many species of animals. Each of 11 different organs/organ systems is discussed in detail with photomicrographic examples of common and rarer lesions. An excellent atlas of toxicological pathology lesions well illustrated with color micrographs complemented by a concise description with examples of toxins.

Grasso P (2002)
Essentials of Pathology for Toxicologists
Taylor & Francis, London

A basic text suitable for non-pathologists interested in understanding processes in pathology.

Greaves P (2007)
Histopathology of Preclinical Toxicity Studies
Elsevier Science, Amsterdam.

Focuses mainly on drug-induced pathology in preclinical studies of drug safety assessment. Relevance to human health is also discussed in several instances. An excellent text with informative photographs.

Greaves P, Faccini JM (1992)
Rat Histopathology, A Glossary for Use in Toxicity and Carcinogenicity Studies, 2nd Edition
Elsevier, Amsterdam.

Provides a detailed description of typical histopathological findings that support the use of the given diagnostic term, together with the expected circumstances that accompany the condition. Ample reference is made to human pathology since the aim of studying the rat is to extrapolate the findings to man. This is a valuable text for the pathologist working in toxicity testing.

Haschek EWM, Rousseaux CG (Eds) (2001)
Handbook of Toxicologic Pathology 2nd Edition
Academic Press, San Diego, CA.

An indispensable reference work for the toxicological pathologist. Volume 1 focuses on general toxicology and the second volume details target organ pathology with key examples. Volume 2 examines the interface between toxicology and pathology to provide an overview of structural alterations caused by toxicants and the mechanisms which result in those changes. The book is in textbook format and is intended for students in the fields of pathology, toxicology, and environmental health. After the introduction, the major organs or organ systems are examined in detail. A chapter on chemical carcinogenesis is included.

Hoffbrand AV, Pettit J (2001)
Essential Haematology, 4th Edition
Blackwell Science Inc., Malden, MA.

Comprehensive with detailed descriptions of characteristics of human diseases.

Jasani B, Schmid KW (1993)
Immunocytochemistry in Diagnostic Histopathology
Churchill Livingstone, Edinburgh, UK.

A relatively non-specialized text on the role and scope of immunocytochemistry in routine diagnostic histopathology. The target readership is students and practitioners with practical orientation. The text is organized to include introductory chapters, immunocytochemistry in both neoplastic and non-neoplastic disease states, and the organizational routine for providing such services.

Jensh RP (Ed) (2002)
Bloom and Fawcett's Concise Histology.
Hodder Education, UK.

Excellent basic text for students and non-specialists with numerous micrographs.

Jones TC (primary editor, with others) (1983–)
Monographs on Pathology of Laboratory Animals
Springer-Verlag, New York.

An ongoing series of valuable monographs, some already in their second edition, which has covered the following specific organs and systems:

1. Cardiovascular and musculoskeletal system
2. Digestive system
3. Endocrine system
4. Eye and ear
5. Genital system
6. Hematopoietic system
7. Integument and mammary glands
8. Nervous system
9. Respiratory system
10. Urinary system.

Junqueira LC, Carneiro J, Kelley RO (1992)

Basic Histology, 7th Edition
Prentice Hall International (UK) Ltd., London.

Excellent functional histology text with many helpful diagrams and micrographs.

Lewis SM, Bain BJ, Bates I (Eds) (2001)
Dacie and Lewis's Practical Haematology, 9th Edition
Churchill Livingstone, London.

Excellent with comprehensive practical text on human hematology.

Loeb WF, Quimby FW (Eds) (1999)
Clinical Chemistry of Laboratory Animals, 2nd Edition
Taylor & Francis, London.

Reference work of high standard. Multispecies biochemistry. Essential handbook for the clinical pathologist.

Maronpot RR, Boorman GA, Gaul BW (1999)
Pathology of the Mouse
Cache River Press, Vienna, IL.

A complementary text to the rat histopathology book by Boorman et al and features mouse strain differences. An excellent, detailed compendium with plenty of illustrations.

McGavin MD, Zachary JF (2007)
Pathologic Basis of Veterinary Disease, 4th Edition
Mosby Elsevier.

Essential reading for the veterinary pathologist. Focusses mainly on veterinary rather than toxicological pathology.

McGee JO'D, Isaacson PG, Wright NA, Dick HM (Eds) (1992)
Oxford Textbook of Pathology: (in 2 volumes) Volume 1: Principles of Pathology. Volume 2: Pathology of Systems
Oxford Medical Publications, Oxford, UK

Contains an excellent source of reference of the principles of human pathology with basic information across all organ systems and focuses on diagnosis. Toxicology is not a key feature but contains some references to toxicologically induced lesions.

Mohr U, Dungworth DL, Capen CC (Eds.) (1992)
Pathobiology of the Aging Rat
ILSI, Washington, DC.

Provides information on age-associated changes which influence the interpretation of pathologic data derived from experiments in laboratory rats. The information is presented by system, and emphasis is on the prevalence and nature of the lesions and the current state of knowledge concerning pathogenesis.

Mohr U, Dungworth DL, Ward J, Capen CC, Carlton W, Sundberg J (Eds.) (1996)
Pathobiology of the Aging Mouse, Vols. 1 and 2
ILSI, Washington, DC.

Provides up-to-date information on pathological data from major strains of laboratory mice used throughout the world. Emphasis is placed on the prevalence and nature of naturally occurring and artificially induced lesions and on what is known about their pathogenesis.

Neal MJ (2002)
Medical Pharmacology at a Glance
Blackwell Publishing Group, Oxford, UK.

An excellent summary of pharmacological processes explained clearly and succinctly.

Percy DH, Barthold SW (1993)
Pathology of Laboratory Rodents and Rabbits
Iowa State University Press, Ames, IO.

Designed to serve as a general reference for veterinary pathologists requiring general information on diagnostic features of the diseases of commonly used laboratory animals. The six species covered in this useful volume are the rat, mouse, hamster, gerbil, guinea pig, and rabbit.

Salisbury J (Ed.) (1997)
Molecular Pathology
Taylor & Francis, Washington, DC.

Provides a simple description of how specific aspects of molecular pathology are important to the understanding of disease processes. Each chapter focuses on a common disease and explains how such aspects as histopathology, genetic polymorphism, and molecular techniques construct comprehension of the onset and development of disease.

Scarpelli DG, Craighead JE, Kaufman N (Eds.) (1985)
The Pathologist and the Environment (Monographs in Pathology, No. 26)
Williams & Wilkins, Baltimore, MD.

Covers the role of the anatomical pathologist in the detection of environmental effects. Considers toxicity of drugs and heavy metals and the biochemical epidemiology of cancer.

Slauson DO, Cooper BJ (2002)
Mechanisms of Disease: A Textbook of Comparative General Pathology, 3rd Edition
Mosby Inc., St Louis, MO.

Extensive and well-illustrated. Providing substantial explanation and information regarding disease processes.

Smith CA, Andrews CM, Collard JK, Hall DE, Walker AK (1994)

Colour Atlas of Comparative Diagnostic and Experimental Haematology
Wolfe Publishing, London.

An excellent atlas of interspecies differences in hematology.

Sternberg SS (Ed.) (1992)
Histology for Pathologists
Raven Press, New York.

Attempts to bridge the gap between histologists and pathologists. To this end, each of the 48 chapters considers the significance and function of many histological structures in terms of pathological interpretation. This text is useful to those interpreting structural deviations from the norm to assess biological significance.

Stevens AS, Lowe JS (2005)
Human Histology, 3rd Edition
Mosby-Elsevier Inc.

Excellent basic text for the student and non-specialist. User-friendly, color layout revised to include molecular biology and advances in histological techniques.

Stevens AS, Lowe JS, Young BJS (2003)
Wheater's Basic Histopathology, A Colour Atlas and Text, 4th Edition
Churchill Livingstone, London.

Similar to the basic histology text but featuring illustrations of general and systemic pathological lesions. This updated version focuses more on human clinical pathology.

Timbrell J (2000)
Principles of Biochemical Toxicology
Taylor and Francis, Oxford, UK.

An excellent book making chemical toxicology, including pathways and metabolism understandable for the pathologist.

Turton JA, Hooson J (Eds.) (1997)
Target Organ Pathology
Taylor & Francis, London.

Describes the major organs of the body as targets for chemically induced effects. This text reviews the mechanisms of these toxic effects and the structural and functional changes which occur in the target organ as a result of exposure to toxicants (including drugs, agrochemicals, industrial chemicals, radiation, and heat).

Pathology of the Fischer Rat
Academic Press, San Diego, CA.

Provides a readable text useful not only to pathologists but also to investigators from a variety of disciplines that use the rat as an experimental model. The data used in this book derive from the NTP program covering hundreds of specific studies. A total of 35 chapters, each devoted to a single organ constitute this work.

International Agency for Research on Cancer (IARC)
Pathology of Tumours in Laboratory Animals
IARC, Lyon.

Part of the monographic series IARC Scientific Publications. Vol. 1, Tumours of the Rat (No. 99, 1990); Vol. 2, Tumours of the Mouse (No. 111, 1994); Vol. 3, Tumours of the Hamster, 2nd ed. (No. 126, 1996).

An essential reference to the pathology associated with these species. Recommended.

Journals

Experimental and Toxicologic Pathology (1967)
Elsevier, London
Web: http://www.eurotoxpath.org/organization/index.php?id=journal

Official journal of the European Society of Toxicologic Pathology. The international multidisciplinary journal is devoted to the publication of multidisciplinary studies covering the whole range of research on disease processes and toxicology including cell biological investigations. Its aim is to support the interdisciplinary co-operation of researchers working in pathobiology, toxicology, and cell biology independent of the methods used.

International Journal of Experimental Pathology
Blackwell Publishing Ltd., Oxford, UK
PO Box 1354
9600 Garsington Road
Oxford OX4 2XG
UK
Phone: +44 (0)1865 778315
Fax: +44 (0)1865 471775

The journal encompasses the use of multidisciplinary scientific techniques to investigate the pathogenesis and progression of pathologic processes. Subject areas are in in vitro investigations, animal models, and in clinical research. The key objective is to report on work that addresses the common theme of mechanism at a cellular and molecular level.

For further information on subscription and article submissions go to website.

Toxicologic Pathology (1971)
Web: http://mc.manuscriptcentral.com/toxpath
www.toxpath.org

The journal will publish all subject areas that are relevant to toxicological pathology. Relevant subjects include safety assessment of pharmaceuticals, chemicals, food additives, pesticides, environmentally

relevant chemicals and medical devices; risk characterization of xenobiotics; investigative studies that contribute to refinement of the safety assessment process; mechanistic studies that provide a basis for interpreting and predicting toxicologic outcome; emerging approaches and methods in toxicological pathology; spontaneous diseases that may influence toxicity studies, and animal and alternative models relevant to toxicologic pathology.

CHAPTER

41

Pharmacokinetics and Metabolism

KARL K. ROZMAN

INTRODUCTION

The study of the kinetics of chemicals was first initiated for drugs and consequently termed pharmacokinetics. However, toxicology is not limited to the study of adverse drug effects but entails investigation of deleterious effects of all chemicals. Therefore, the study of kinetics of xenobiotics is more properly called *toxicokinetics*. In contrast, toxicodynamics deals with modeling the manifestation of a toxic effect either driven by the kinetics of a compound or the dynamics of the effect, whichever provides the rate-determining (or -limiting) step(s) for the causative process.

Toxicokinetics is the modeling and mathematical description of the time course of disposition (absorption, distribution, biotransformation, and excretion) of xenobiotics in the whole organism. It is also possible to model the individual steps of disposition (e.g., elimination alone) separately or even to describe the kinetics of xenobiotics in isolated organs (e.g., hepatic clearance). The most common way to characterize the kinetics of drugs in the past has been to represent the body as consisting of a number of compartments, even though these compartments have no apparent physiological or anatomical reality. More recently, physiologically based pharmacokinetic models have been advanced, where mass balance equations allow the modeling of each organ or tissue based on physiological considerations. It should be emphasized that there is no inherent contradiction between the classical and the physiologically based approach. Classical pharmacokinetics requires certain assumptions that the physiologically based models do not need. Under ideal conditions, physiological pharmacokinetic models are able to predict tissue concentrations, which classical models cannot do. However, the appropriate physiological (e.g., blood flow rate, tissue volume, etc.) and biochemical (e.g., rate of biotransformation in a particular tissue) parameters are often unknown or inexact, hampering a meaningful physiologically based pharmacokinetic modeling.

Metabolism or biotransformation is the most important process contributing to the kinetic profile of compounds because it represents more often than not the origin of the rate-determining (-limiting) step(s) in the kinetics of drugs and/or other chemicals.

RESOURCES

Books

Brunton L, Lazo J, Parker K (2005)
Goodman & Gilman's The Pharmacological Basis of Therapeutics (Goodman and Gilman's the Pharmacological Basis of Therapeutics)
McGraw Hill Companies, USA

Covers medical pharmacology, updated to reflect all critical new developments in drug action and drug–disease interaction. It provides detailed discussion of metabolism of drugs in humans as well as in animals. Includes an in-depth treatment of the principles of pharmacokinetics as well as information on the kinetics and metabolism of each drug discussed.

Caira MR, Ionescu C (Eds) (2006)
Drug Metabolism: Current Concepts
Springer, Netherlands

This book provides a comprehensive explanation of the processes taking place after ingestion of a medicinal agent or other xenobiotics, with particular emphasis on the crucial role of metabolism (biotransformation). The necessity of knowledge about these phenomena and how they are incorporated into the design of new drug candidates is also outlined. The user-friendly text focuses on concepts rather than excessive details and is supported by many examples of biotransformations.

Coleman M (2005)
Human Drug Metabolism: An Introduction
John Wiley & Sons, Ltd., West Sussex, UK

This new text provides a concise introduction to drug metabolism that is ideal for undergraduates. Focusing on a conceptual understanding of drug metabolizing systems, the book deals with the methods of xenobiotics detection, of their modification by biotransformation and elimination from the human body.

Crosby DG (1998)
Environmental Toxicology and Chemistry (Topics in Environmental Chemistry)
Oxford University Press, New York

They are two aspects of the same subject, environmental toxicology and environmental chemistry, although they are usually presented as if they were entirely different subjects; even their practitioners often seem unaware of the connectedness. This book is the first text to tie these subjects together, demonstrating the immediate relevance of each subject to the other while also providing basic, easily understandable introductions to both areas. Ideal for advanced undergraduate and graduate students in environmental toxicology courses, the book offers a timely, comprehensive introduction to the principles of toxicology which includes metabolism and the kinetics of chemicals as they apply to our environment. It is also useful for professionals and practitioners in a wide range of environmentally related fields and businesses.

Ette EI, Williams PJ (Eds.) (2007)
Pharmacometrics: The Science of Quantitative Pharmacology
John Wiley & Sons, New Jersey

Pharmacometrics is the science of interpreting and describing pharmacology quantitatively. The pharmaceutical industry is integrating pharmacometrics into its drug development program. This book outlines the science of pharmacometrics and its application to drug development, evaluation, and pharmacotherapy, providing a comprehensive treatise suitable for the training of pharmacometricians.

Evans G (Ed.) (2004)
A Handbook of Bioanalysis and Drug Metabolism
CRC Press, LLC, Boca Raton, FL

This book examines the techniques, methodology, and theory of bioanalysis, pharmacokinetics, and metabolism from the perspective of scientists with extensive professional experience in drug discovery and development. These three areas of research help drug developers to identify the most active component within a class of compounds and to provide safety and efficacy information required by regulators. It covers topics such as high performance liquid chromatography, protein binding, pharmacokinetics and drug–drug interactions. A unique industrial perspective helps to reinforce theory and develop valuable analytical and interpretational skills.

Gad SC (Ed.) (2006)
Animal Models in Toxicology, Second Edition
CRC Press, Boca Raton, FL

This is a practical guide to the common statistical problems encountered in toxicology and the methodologies that are available to solve them. The book presents a historical review of the use of animal models and an overview of broad considerations of metabolism and its relevance for toxicology.

Gibaldi M, Perrier D (1982)
Pharmacokinetics, Second Edition, Revised and Expanded
Marcel Dekker, Inc., New York

This revised and expanded edition of the first edition from 1975 is a must for anybody aiming at understanding classical pharmacokinetics at the conceptual level.

Ioannides C (2002)
Enzyme Systems that Metabolise Drugs and Other Xenobiotics (Current Toxicology)
John Wiley & Sons, West Sussex, UK

This reference work describes the enzyme systems that participate in the metabolism of drugs and other chemicals. Each chapter deals with a specific enzyme system, emphasizing its role in the activation or detoxication of chemicals. Critically discussed aspects include: enzyme function in the metabolism and bioactivation of xenobiotics, substrate specificity, tissue distribution, species differences (to include laboratory animals and humans), hormonal regulation, sex differences, modulation by prior exposure to other chemicals, age-dependent expression, pharmacogenetics, and modulation by disease.

Klaassen C (2007)
Casarett & Doull's Toxicology: The Basic Science of Poisons
McGraw Hill, USA

This book provides an unsurpassed understanding of modern toxicology, including the principles, concepts, mechanisms, and modes of thought that are the foundation of the discipline. The book consists of seven units looking at toxicology from different points of view. Unit 2 deals in depth with disposition of toxicants including toxicokinetics.

Krüse J, Verhaar H, de Raat WK, (Eds) (2002)
The Practical Applicability of Toxicokinetic Models in the Risk Assessment of Chemicals
Kluwer Academic Publishers, Netherlands

In 2000 OpdenKamp Registration & Notification organized a two-day symposium in The Hague, The Netherlands, on `The Practical Applicability of Toxicokinetic Models in the Risk Assessment of Chemicals'. Many speakers from Europe and the United States were invited to present different aspects of this topic, and they prepared comprehensive papers for this symposium book, reflecting the state of the art of modeling and toxicological risk assessment.

Lee J, Obach RS, Fisher MB (Eds) (2003)
Drug Metabolism Enzymes
FontisMedia S.A. and Marcel Dekker, Inc., Netherlands

Cytochrome P450 has a strong bearing on the scientific assessments of genetic polymorphism in metabolism, which is critical in the elimination of drugs and other xenobiotics from the body. The possibility of drug–drug interactions and bioavailability is also discussed. This text systematizes findings on P450 and similar enzymes – as well as related issues affecting the pharmaceutical industry – to promote the next generation of safer, more effective drugs.

Mahmood I (2005)
Interspecies Pharmacokinetic Scaling: Principles And Application of Allometric Scaling
Pine House Publishers, Rockville, MD

Pharmacokinetic allometric scaling is a very useful tool for the selection of first-in-human dose in drug development. This is the first book ever written on the interspecies pharmacokinetic scaling and is an ideal resource for pharmaceutical scientists, preclinical and clinical pharmacologists, physiologists, biochemists, toxicologists, environmental health scientists, veterinarians, and biologists in academia and industry.

Ng R (2004)
Drugs – From Discovery to Approval
John Wiley & Sons, New Jersey

This book presents a clear, step-by-step overview of the drug development and approval process. It introduces basic concepts, then moves on to discuss disease target selection and the discovery processes for both small- and large-molecule drugs. Subsequent chapters explain preclinical studies, clinical trials, regulatory issues, good manufacturing practices (GMPs), and perspectives on the future of drug development. Coverage also includes: a helpful listing of current FDA and European guidelines, a special section on regulatory authorities and processes in Japan and China, appendices on the history of drug discovery and development, and representative examples of drug mechanisms of action as shown.

Reddy M, Yang RS, Andersen ME, Clewell III HJ (2005)
Physiologically Based Pharmacokinetic Modeling: Science and Applications
John Wiley & Sons, New Jersey

This book is a comprehensive reference organized by classes of compounds and modeling purposes so users can quickly access information. It presents an overview of the underlying principles of PBPK model development, and provides a compendium of PBPK modeling information, including historical development, specific modeling challenges, and current practices for: halogenated alkanes, halogenated alkenes, alkenes and aromatic compounds, reactive vapors, alkanes, oxyhydrocarbons and related compounds, pesticides and persistent organic pollutants, dioxins and related compounds, metals and inorganic compounds, drugs; antineoplastic agents, perinatal transfer, mixtures, and dermal exposure models. In addition to pinpointing specific information, readers can explore diverse modeling techniques and applications.

Uetrecht JP, Trager W (2007)
Drug Metabolism: Chemical and Enzymatic Aspects: Textbook Edition
Informa Healthcare USA, Inc., New York

This is a comprehensive textbook which will provide students with a good understanding of drug metabolism, and links chemical and biological terminology together in a clear and concise fashion. The book explains how a drug is metabolized, the effects of the metabolites if present, extensive material to help understand drug metabolism as well as practical problems and solutions.

Woolf T (Ed.) (1999)
Handbook of Drug Metabolism
Marcel Dekker, New York

This reference book provides an overview of the subject from a historical, kinetic, and chemical context. It contains tables, drawings, photographs, and equations, highlights the importance of pharmacokinetics and cytochrome P450, explains clearance, volume of distribution, non-linear kinetics, and sequential metabolism. Phase 1 and 2 metabolism is conceptualized as well as formation of reactive metabolites and more.

CHAPTER

42

Physical Hazards

GENE RIDER

Toxicologists have traditionally been called upon to assess the chemical and biological hazards of products. However they are increasingly required to take a more holistic approach to product hazard evaluation and consider all potential hazards – physical as well as chemical. Increasing emphasis on physical hazards can be seen, for example, in the adoption of the Physical Agents directive by the European Union in 2004, recent changes in ASTM International's Toy Safety Standard addressing magnets, strangulation, and noise, and increasing awareness that injuries are the leading cause of death to children in all developed nations[1].

The following text addresses the wide range of physical hazards associated with products. Emphasis is placed on consumer products rather than industrial or military products, although references from the latter are cited when they have clear relevance to consumer products. References have been chosen with an eye toward eliminating hazards from products. Emphasis was placed on understanding the etiology and susceptible population groups for each hazard. This review begins with an introduction to resources and organizations concerned with physical hazards of consumer products in general. Following this, specific classes of hazard are addressed individually. A hazard definition is provided for each of the specific hazard areas followed by a brief description of the scope of the hazard.

PHYSICAL HAZARDS IN GENERAL

Numerous organizations around the world are concerned with the epidemiology and reduction of physical hazards associated with consumer products. These include governmental organizations at the national, multinational, and sub-national levels as well as non-governmental groups. In some cases regulatory bodies provide valuable information on the identification and elimination of hazards.

When referesncing any of the data sources, caution must be taken and the scope and limitations of the data source considered. For instance, the U.S. Consumer Product Safety Commission (CPSC) has a good data collection of consumer-product-related injuries and fatalities. However, since food is not under CPSC's jurisdiction, a search of the CPSC data with no findings should not be interpreted mistakenly that no incidents have occurred with food. Food is a major source of choking, aspiration, and related injuries, but these injuries fall outside the jurisdiction of the CPSC. Perhaps of even greater significance, it must be kept in mind that injury data typically rely upon hospital registry and its frequency of occurrence does not necessarily correlate with that of fatality. Due to the obvious reason that dead persons are not sent to hospitals for treatment, mortality is often underrepresented by hospital data and any extrapolation should be made with caution. Similarly coroners' records provide a great deal of information on fatalities but should not be used for inferences regarding injuries.

In the United States, the Consumer Product Safety Commission (www.cpsc.gov) provides valuable information on hazards associated with products. In general this information is organized by product rather than hazard. The National Electronic Injury Surveillance System (NEISS, www.cpsc.gov/LIBRARY/neiss.html) operated by the CPSC monitors emergency rooms for incidents of consumer product

[1] www.unicef-icdc.org/publications/pdf/repcard2e.pdf

related injuries. The U.S. Centers for Disease Control and Prevention (CDC) also operate a National Center for Injury Prevention and Control (NCIPC, www.cdc.gov/ncipc/) which provides information on a wide variety of physical hazards including many associated with consumer products. Health Canada (www.hc-sc.gc.ca/cps-spc/index_e.html) serves a similar function in Canada, offering information on general safety and physical hazards of consumer products. The Canadian Hospitals Injury Reporting and Prevention Program (CHIRPP, www.childsafetylink.ca/research-chirpp.asp) collects reports of incidents involving consumer products.

Numerous organizations throughout Europe similarly collect and disseminate information relevant to consumer product safety and accident prevention. The following is a representative sample:

- The United Kingdom (UK) Royal Society for the Prevention of Accidents (RoSPA, www.rospa.com/). The UK Department of Trade and Industry commissioned research in consumer product safety until 2003 and still provides a number of useful publications (www.dti.gov.uk/consumers/Safety/awareness/research/index.html).
- The Dutch Consument En Veiligheid (Consumer Safety Institute, www.veiligheid.nl/csi/websiteveiligheid.nsf/wwwVwContent/homepage.htm).
- The Center for Research and Prevention of Injuries (Greece, www.euroipn.org/cerepri/).
- The Instituto Nacional del Consumo (Spain, www.consumo-inc.es/home/home.htm).
- The Kuratorium für Verkehrssicherheit (Austria, www.kfv.at/index.php?id = 488). In particular the Department of Home, Liesure & Sports.
- Grosse schützen Kleine (Austria, www.grosse-schuetzen-kleine.at/).
- The Norwegian National Institute for Consumer Research (SIFO, www.sifo.nl).
- The Bundesarbeitsgemeinschaft (BAG) Mehr Sicherheit für Kinder (Germany, www.kindersicherheit.de/).
- The Commission de la Sécurité des Consommateurs (France, www.securiteconso.org/).
- Konsument verket (Sweden, www.konsumentverket.se/).

Pan European organizations and projects include:

- Eurosafe (formerly ECOSA), the European Association for Injury Prevention and Safety Promotion, www.actiononinjuries.org/csi/eurosafe2006.nsf/).
- The EU Injury Database (https://webgate.cec.eu.int/idb) which allows public searches of injury data.
- Susy Safe (www.susysafe.org/), the Surveillance System on Suffocation Injuries due to Foreign Bodies in European Children, and
- RAPEX, the EU rapid alert system for dangerous consumer products (http://ec.europa.eu/consumers/dyna/rapex/rapex_archives_en.cfm).

Links to other European organizations can be found through the European Commission Health and Consumer Protection Directorate (http://ec.europa.eu/dgs/health_consumer/index_en.htm). Organizations active in identifying and reducing physical hazards associated with consumer products in Asia and Australia include:

- National Institute of Technology and Evaluation (Japan, www.nite.go.jp/index.html).
- Hong Kong Childhood Injury Prevention and Research Association (www.childinjury.org.hk/).
- Research Centre for Injury Studies incorporating Australian Institute of Health and Welfare National Injury Surveillance Unit (www.nisu.flinders.edu.au/)
- University of Otago Injury Prevention Research Unit (New Zealand, www.otago.ac.nz/ipru/).

Worldwide organizations concerned in part with physical hazards and injuries resulting from consumer products include the World Health Organization (www.who.int/en/) and Unicef (http://www.unicef.org). A great deal of information is also available from the San Diego State University Injury Prevention Literature Update (www.safetylit.org/).

Even though toxicology information resources are the main focus of this book, it is vital to emphasize that an assessment depending solely upon toxicity or hazard can be insufficient or even misleading. A product at a certain hazard level can have dramatically different risk impact on society based upon its exposure level. In consequence, it is suggested that risk assessments be performed in order to holistically evaluate the likelihood and severity of any adverse event happening. By taking into consideration both hazard and exposure, risk assessment can be practically applied in any decision-making process and enable decision makers to act upon their risk appetite or tolerance level. For more information on risk assessment of consumer products, see:

- Rider G. Framework Model of Product Risk Assessment. (2009). J. Injury Prevention Safety Promotion (accepted).
- Rider G, Milkovich S, Stool D, Wiseman T, Doran C, Chen X. Quantitative Risk Analysis, Injury Control and Safety Promotion, Volume 7, Number 2, June 2000, pp. 115–133 (19).

RESOURCES

Key References (General)

Due to the extraordinarily wide range of physical hazards associated with consumer products, few books or articles are able to provide comprehensive or even general discussions of this field. However there are journals whose scopes include a wide range of physical hazards. Suggested references include:

- Rider G (2005) Physical Hazards. In: Wexler P (ed) Encyclopedia of Toxicology, 2nd Edition, vol. 3, pp 424–436.
- American Academy of Pediatrics Committee on Injury and Poison Prevention and Widome MD (1997) Injury Prevention and Control for Children and Youth, Third Edition.
- Baker SP, O'Neill B, Ginsburg MJ, Li G (1991) The Injury Fact Book, 2nd Ed. Oxford University Press, 368 pp.
- Injury Prevention (http://injuryprevention.bmj.com/).
- International Journal of Injury Control and Safety Promotion (www.tandf.co.uk/journals/titles/17457300.asp).
- Robertson L (2007) Injury Epidemiology: Research and Control Strategies, Oxford University Press, 264 pp.

A large number of papers on a wide range of hazards are available from the Intertek Risk Assessment & Management website (www.intertek.com/ram). This site also includes an online gateway to the most comprehensive and up-to-date data sources as well as a number of hazard and risk assessment tools.

Physical Hazard Resources Grouped by Topic

In this section information resources are provided for a wide range of physical hazards associated with consumer products. The information resources are grouped according to the nature of the hazard rather than the nature of the product. A definition is provided for each hazard, followed by a short description of the scope of the hazard that briefly introduces issues such as epidemiology, etiology, and severity of the hazard. Links are provided to organizations, associations, and societies that routinely deal with the subject hazard. Resources are listed in approximate reverse chronological order of publication.

Hazards are ordered roughly into groups. The first group consists primarily of hazards involving entry of foreign material into, blockage of, or closure of body orifices or cavities and subsequent disturbance of bodily functions. These include foreign body injuries, suffocation, drowning/submersion, asphyxia, and strangulation. Resulting injuries are often characterized by a lack of external trauma. Entanglement or tourniquet hazards, where the primary mechanism of injury is restriction of blood flow, is included at the end of this group.

The second group of hazards includes those in which the primary agent is external mechanical force transmitted to or from an object and in which primary trauma is to contacted and/or underlying tissues. Included in this group are impact, laceration, puncture, abrasion, vibration, and explosions. Noise-induced hearing loss is included at the end of this group as it involves damage transmitted from an object to the ear through an intervening layer of air.

The third group of hazards includes strain/sprain and repetitive motion. Again caused by mechanical energy, these hazards result primarily in internal trauma.

The fourth group of hazards includes those in which the agent is thermal energy (or removal thereof).

The final group of hazards includes those in which the principal agent is electrical or electromagnetic energy. Electricity is included first in this group as its effects often include the creation of and subsequent injury due to thermal energy.

Foreign Body Injuries

Airway (Choking, Insertion, Ingestion, and Aspiration Including Magnets and Batteries)

Hazard Definitions

Acute or chronic injuries caused by objects which enter and lodge in the oral airway, lungs, nasal passages, or gastro-intestinal tract.

Scope

Foreign object injuries to the airway are among the most common and potentially life-threatening of physical hazards. Food products, coins, toys, hardware, jewelry, and dental appliances are among the most common airway foreign bodies. Children, the elderly, and the neurologically impaired are the most susceptible subpopulations. Penetration of the airway by foreign objects is possible due to the combined oral airway functions of the oral cavity and pharynx. Humans must interrupt respiration during the pharyngeal phase of the swallow cycle. Asphyxiation hazard for foreign objects is a function of the degree of difficulty in processing the foreign objects into a bolus suitable for successful swallowing. Foreign objects that are difficult to process create a condition where the hazard of asphyxiation is present. Oral airway penetration is the hazard created by swallowing objects that have not

been conditioned into a bolus fit for a successful swallow. This hazard may manifest in asphyxia.

Other Body Cavity (Ear, Urogenital, Rectal)

Hazard Definition

Objects lodged in ears or other non-airway body cavities.

Scope

Foreign objects inserted into non-airway body cavities, while rarely life threatening, may pose a significant risk for serious injury. Children place objects in their ears which may cause tympanic membrane perforation and may require medical intervention. In addition, objects may be inserted into the urogenital or rectal openings. If these objects cannot then be removed, medical intervention is required.

Suffocation

Mechanical (films, air-impermeable flexible materials, rigid and semi-rigid containers covering nose and mouth, confinement in enclosed spaces)

Hazard Definition

Anoxia caused by obstructing the passage of air by sealing the mouth and nose with an external object (example: plastic films, containers).

Scope

Suffocation is one of the leading causes of death to children. Suffocation usually results in death or severe brain injury.

Drowning/submersion

Hazard Definition

Anoxia caused by obstructing the passage of air by submersion of mouth and nose in a fluid.

Scope

Drowning is the single most common cause of death involving consumer products and young people. By definition drowning is fatal. Near drowning generally results in extremely severe injuries.

Asphyxia

Positional Asphyria, Chest Compression

Hazard Definition

Positional asphyxia: Anoxia caused by obstructing the passage of air through posture or chest compression.

Scope

Infants are susceptible to airway obstruction caused by changes in head and jaw position in relationship to the thorax due to compression of the trachea. This same population group is also susceptible to anoxia resulting from compression of the chest resulting in difficulty in breathing. Older children and adults suffer similar injuries when crushed by products such as garage doors.

Strangulation (Respiratory, Cardiovascular, and Vagus Nerve Stimulation)

Strangulation

Hazard Definition

Anoxia caused by external pressure obstructing the passage of air through the airway or by preventing the flow of oxygenated blood to the brain. The vagus nerve controls heart rate and respiration. Stimulation of this nerve by external pressure may result in asphyxiation.

Scope

Strangulation is one of the most common causes of fatal injury, particularly to children. Injuries, when they occur, are usually extremely serious.

Thies KC, Sep D (2007, 14 Mar) Strangulation Injuries in Children. Resuscitation. [Epub ahead of print].

Entanglement (Finger, Toe, Tourniquet Appendage Strangulation)

Hazard Definition

Hazardous condition in which a limb or digit enters a space from which it cannot be removed. Loops acting as tourniquets, and moving rigid components which may pinch or amputate are included.

Scope

Entanglement injuries are often associated with hair. However string and similar consumer products can cause similar injuries. Children are often victims of entanglement injuries.

Impact (Eye Impact, Chest Trauma, Falls, Cardiac Contusion)

Hazard Definition

Fall: Injury caused by dropping down freely under the influence of gravity. The force or impetus transmitted to the body by a collision with an immobile person/ object. May result in fracture or bruising. The force or impetus transmitted to the body by a collision from a moving person/object. May result in fracture or bruising.

Scope

Impact can result in a wide range of injury to all regions of the body. Impact injuries are often associated with traffic accidents and falls. The latter can be severe, particularly in the elderly. Many impact injuries are related to sports and play activities.

Laceration

Hazard Definition

Penetration injury of the skin caused by contact with a sharp edge.

Scope

Laceration is a common injury associated with both knives and unintended sharp edges on consumer products. The severity of laceration injuries can range from very minor to fatal.

Organizations/Associations/Societies

American College of Emergency Physicians (www.acep.org/webportal)

Puncture

Hazard Definition

Penetration injury of the skin caused by contact with a sharp point.

Scope

Puncture injuries often result from interaction with tools having sharp points or consumer products with intended (e.g. pins and needles) or unintended sharp points. Tetanus subsequent to puncture wounds remains a problem in much of the world.

Organizations/Associations/Societies

American College of Emergency Physicians (www.acep.org/webportal)

Abrasion

Hazard Definition

Penetration injury of the skin caused by contact with a rough surface.

Scope

Abrasions are very common childhood injuries often resulting from falling or sliding. Corneal abrasion is another common injury often associated with contact lenses or other ocular foreign bodies. In most cases abrasion injuries are minor although infection is a possible complication. Tetanus subsequent to abrasion wounds remains a problem in much of the world.

Vibration

Hazard Definition

Handarm vibration (HAV) (usually associated with the use of vibrating hand tools), and whole-body vibration (WBV) which is experienced when the operator or driver sits on or in a vibrating machine, usually a vehicle such as a forklift, or one of the numerous kinds of vehicles used in agriculture, transport, materials handling, mining and forestry.

Scope

Injuries from limb or whole-body vibration are generally associated with industrial workers rather than consumer products. However recreational vehicles and professional-grade power tools used increasingly by consumers can be sources of signifi cant mechanical vibration.

Explosions

Hazard Definition

A release of chemical energy in a sudden and often violent manner, usually with the generation of high temperature and release of gases. A release of mechanical energy in a sudden and often violent manner.

Scope

Explosion injuries are most often associated with warfare, where they result in loss of life, limb, and

function on a large scale. Among consumer products, fireworks are most often associated with explosion injuries. However explosion injuries also result from pressurized vessels and malfunctioning gas appliances.

Sound and Noise

Hazard Definition

Permanent or temporary hearing damage caused by short- or long-term exposure to loud sound.

Scope

Hearing loss is caused primarily by damage to hair cells in the inner ear. Traditionally associated with the elderly, hearing loss among younger population groups is of increasing concern. Exposure to loud noise and music is one of the most common causes of hearing loss in children and young adults.

Repetitive Motion

Hazard Definition

Frequently repeated tasks can cause strains and fatigue in muscles, joints, and tendons.

Scope

Repetitive motion injuries are most commonly associated with performing repetitive tasks in the workplace. However recreational computer use and video games may also cause these injuries.

Thermal burns

Scalds (Liquid or Gas)

Hazard Definition

Chemical changes to the skin resulting from contact with liquids and gases of elevated temperatures. Severity of these injuries is related to dose, which is a function of time and temperature.

Scope

Scalds are of particular concern in young children and the elderly due to factors such as thinner skin, slower response time, and inability to escape from hazardous environment.

Contact Burns (Contact with Hot Solid Surface or Open Flames)

Hazard Definition

Chemical changes to the skin resulting from contact with solids of elevated temperatures or open flames. Severity of these injuries is related to dose, which is a function of time and temperature.

Scope

Consumer products commonly associated with contact burns include kitchen appliances. Flame injuries are associated with numerous products, including candles, fireworks, mattresses, upholstered furniture, sleepwear, and other clothing.

Burns

Cryogenic Burns

Hazard Definition

Chemical changes to the skin resulting from contact with solids, liquids, or gases at reduced temperatures.

Scope

Injuries due to contact with cold materials or environments are commonly associated with outdoor workers.

However some consumer products including aerosol cans are capable of producing very low temperatures.

Organizations/Associations/Societies

Electricity

Electric Shock, Electrical Burn, and Electrocution

Hazard Definition

Injuries caused by passage of electric current through tissue. Serious injury may occur if current passes through the central nervous system or heart.

Electrical burns may occur and severity is dependent on voltage, amperage, and duration of contact.

Scope

Exposure to electricity can cause a variety of injuries including burns, injuries to the cardiovascular and nervous system, and impact injuries resulting from falls secondary to electric shock.

Static and Low-frequency Electromagnetic Fields

Hazard Definition

Adverse biological and health effects of electromagnetic fields ranging from static fields to approximately AM radio frequencies (approximately 0 to 100 kHz).

Scope

The primary biological concern regarding low-frequency electromagnetic fields generated by consumer products is a potential link to cancer. There is a

definite risk of interference with implanted medical devices from high-strength fields.

Radio Frequency and Microwave Radiation

Hazard Definition

Adverse biological and health effects of electromagnetic fields in the radiofrequency and/or microwave range (100 kHz to 1 terahertz).

Scope

The primary biological concern regarding radiofrequency and microwave fields generated by consumer products is a potential link to cancer. Intense fields can also interfere with implanted medical devices.

Visible Light and Near-infrared Radiation

Ocular Injury

Hazard Definition

Damage to ocular media caused by light in the wavelength range 380 nm to 1400 nm.

Scope

Acute ocular injury from visible light and near-infrared radiation generally takes the form of retinal

damage. Two mechanisms can be involved: a photochemical mechanism associated with blue light can be characterized by a dose that depends on wavelength, intensity, and time, and a thermal mechanism that is related to local temperature increase on the retina. Historically the sun has been the source of most light-induced ocular injuries. However artificial light sources including both lasers and incoherent light sources (lamps and light-emitting diodes) are capable of causing retinal damage.

Distraction and Interference with Safe Activity

Hazard Definition

Injury occurring from an accident secondary to distraction, impaired vision, or temporary blinding by bright light.

Scope

Injuries resulting from accidents secondary to visual impairment or distraction by a bright light are traditionally associated with automobile and air traffic. However as brighter lights becoming integrated into automobiles and consumer products possibilities of accidents involving bicycle riders and persons engaged in other activities increase.

Flashing-light-induced Seizure

Hazard Definition

Seizure induced by viewing flashing lights, rapidly alternating images of differing colors, or certain patterns.

Scope

A relatively small fraction of the general population is susceptible to seizures induced by flashing lights, rapidly alternating images of different colors (particularly alternating red and cyan), and certain patterns. Induction of seizures has been most often associated with viewing certain television programs, music videos, and strobe lights.

Ultraviolet Light

Skin and Ocular Injury

Hazard Definition

Damage to skin and ocular tissues from ultraviolet light.

Scope

Ultraviolet light is associated with acute skin damage such as sunburn and blistering and chronic diseases such as skin cancer. Ocular exposure to UV light has been linked to cataracts. The eyes of young children are more transparent to UV than those of older children and adults.

Precautionary Principle

STEVEN G. GILBERT, KEES VAN LEEUWEN AND PERTTI HAKKINEN

Precautionary Principle

'When an activity raises threats of harm to human health or the environment, precautionary measures should be taken even if some cause and effect relationships are not fully established scientifically. In this context the proponent of an activity, rather than the public, should bear the burden of proof. The process of applying the precautionary principle must be open, informed and democratic and must include potentially affected parties. It must also involve an examination of the full range of alternatives, including no action.' Wingspread Statement on the Precautionary Principle, Jan. 1998.

INTRODUCTION

John Muir once wrote about the interconnectedness of the world, 'When we try to pick out anything by itself, we find it hitched to everything else in the Universe.' Since human society does not understand every intricacy of the web of life, we must make decisions based on our imperfect knowledge of the world. We must use what we do know to prevent harming the ecological systems we depend on for health and wellbeing: thus the precautionary principle.

The precautionary principle originates from the German principle of foresight or *Vorsorge*. Germany further developed this principle in the 1970s as a foundation for its environmental law and policies on global warming and acid rain. Embracing the principle has also led to a strong and innovative environmental industry in Germany. The European Union has continued to advance a precautionary approach through its new legislation on chemicals, i.e. Registration, Evaluation, Authorization and Restriction of Chemicals (REACH), first introduced as a proposal in 2003 and finally adopted in 2006.

The United States first endorsed the precautionary principle when the U.S. federal government signed and ratified the Rio Declaration following the 1992 United Nations Conference on Environment and Development in Rio de Janeiro. The Rio Declaration definition, also referred to as Agenda 21, states:

> In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.

This definition focuses primarily on environmental impacts and has been expanded to include public health concerns. In 1998, scholars, scientists, advocates, and lawyers gathered to discuss methods for implementing the precautionary principle at Wingspread, the home of the Johnson Foundation in Racine, Wisconsin. The goal was to determine how the precautionary principle could be used in daily environmental and public health policy decisions at the state and federal level. The conference produced the following definition, known as the 1998 Wingspread Statement on the Precautionary Principle (see above).

The precautionary principle includes the following key components:

1. Taking anticipatory action to prevent harm in the face of scientific uncertainty.
2. Exploring alternatives, including the alternative of 'no action.'

3. Considering the full cost of environmental and health impacts over time.
4. Increasing public participation in decision-making.
5. Shifting responsibility for providing evidence of safety to proponents of an activity.

An essential component is the need to evaluate the full range of alternatives when pursuing an activity, new technology or product and to ensure meaningful public participation in the alternatives analysis and decision-making.

The precautionary principle has since been articulated widely in international statements and laws that apply to high-stakes environmental or health concerns. The underlying idea behind each statement is that action should be taken to prevent harm to the environment and human health, even if scientific evidence is inconclusive.

The precautionary principle often functions as a statement of values, to be used as a guideline in the decision-making process. However, it should be pointed out that the precautionary principle is also being enforced more directly in the context of international agreements, including:

- **The Cartagena Protocol on Biosafety of 2003** (http://www.biodiv.org/biosafety/default.aspx), which allows countries to apply the precautionary principle in decisions on importing genetically modified organisms; and
- **The Stockholm Convention on Persistent Organic Pollutants of 2001** (http://www.pops.int/), which uses the precautionary principle as a standard for adding to its original list of 12 banned chemicals.

In the U.S., the principle is not expressly referred to in the federal law. However, the idea of taking precautionary action to prevent harm is at the foundation of several important pieces of national legislation. These include:

- **The National Environmental Policy Act of 1970**, which requires any federally funded project that could potentially harm the environment to undergo an environmental impact study to evaluate whether safer alternatives are possible;
- **The Clean Water Act of 1972**, which established clear water safety goals and standards, in order to protect the 'chemical, physical, and biological integrity of the Nation's waters;'
- **The Occupational Safety and Health Act of 1970**, which aims to ensure safe and health working conditions for U.S. men and women;
- **The Pollution Prevention Act of 1990**, which was enacted following the tragic Exxon-Valdez oil spill to set prevention as the highest priority of U.S. environmental programs; and
- **The Food Quality Protection Act of 1996**, which calls for several uses of organophosphate pesticides to be phased out and requires pesticides to be proven safe for children or else not used.

At a more local level several cities and counties have moved to adopt the precautionary principles as basis for decision making about issues affecting human health and the environment.

In Europe the Precautionary Principle is a cornerstone of the REACH legislation. REACH is the European Unions approach to managing health and environmental issues for future generations. The precaution principle is rapidly becoming the scientific and philosophical backbone for regulation to ensure human and environmental health.

The precautionary principle according to the European Commission (2000) is described below.

Where action is deemed necessary, measures based on the precautionary principle should be, inter alia:

1. Proportional to the chosen level of protection.
2. Non-discriminatory in their application.
3. Consistent with similar measures already taken.
4. Based on an examination of the potential benefits and costs of action or lack of action (including, where appropriate and feasible, an economic cost/benefit analysis).
5. Subject to review, in the light of new scientific data.
6. Capable of assigning responsibility for producing the scientific evidence necessary for a more comprehensive risk assessment.

Proportionality means tailoring measures to the chosen level of protection. Risk can rarely be reduced to zero, but incomplete risk assessments may greatly reduce the range of options to risk managers. A total ban may not be a proportional response to a potential risk in all cases. However, in certain cases, it is the sole response to a given risk.

Non-discrimination means that comparable situations should not be treated differently, and that different situations should not be treated in the same way, unless there are objective grounds for doing so.

Consistency means that measures should be of comparable scope and nature to those already taken in equivalent areas in which all scientific data are available.

Examining costs and benefits entails comparing the overall cost to the community of action and lack of action, in both the short and long term. This is not simply an economic cost–benefit analysis: its scope is much broader, and includes non-economic

considerations, such as the efficacy of possible options and their acceptability to the public. In the conduct of such an examination, account should be taken of the general principle and the case of law of the Court that the protection of health takes precedence over economic considerations.

Subject to review in the light of new scientific data, means measures based on the precautionary principle should be maintained so long as scientific information is incomplete or inconclusive, and the risk is still considered too high to be imposed on society, in view of chosen level of protection. Measures should be periodically reviewed in the light of scientific progress, and amended as necessary.

Assigning responsibility for producing scientific evidence is already a common consequence of these measures. Countries that impose a prior approval (marketing authorization) requirement on products that they deem dangerous a priori reverse the burden of proving injury, by treating them as dangerous unless and until businesses do the scientific work necessary to demonstrate that they are safe.

Where there is no prior authorization procedure, it may be up to the user or to public authorities to demonstrate the nature of a danger and the level of risk of a product or process. In such cases, a specific precautionary measure might be taken to place the burden of proof upon the producer, manufacturer or importer, but this cannot be made a general rule.

RESOURCES

Books

Goklany IM (2001)
The Precautionary Principle: A Critical Appraisal
Cato Institute, Washington, DC

The author addresses concerns that the precautionary principle can be used to delay or stop advances in technology. The book has chapters addressing global warming, DDT, and bioengineered crops.

Harremoës P, Gee D, MacGarvin M, Stirling A, Keys JB, Vaz JG (2001)
Late Lessons from Early Warnings: The Precautionary Principle 1986–2000
European Environmental Agency, Copenhagen, pp. 210.
Web: http://reports.eea.europa.eu/environmental_issue_report_2001_22/en/Issue_Report_No_22.pdf

This excellent book documents the health and environmental consequences of not addressing early indications of potential for harm. Each chapter addresses a different agent or situation by examining the early indications of potential harm and then documenting the consequences of not acting on this information.

Jones JS, Von Schomberg R (Eds) (2006)
Implementing the Precautionary Principle: Perspectives And Prospects
Edward Elgar Publishing, Northampton, Massachusetts

Address the challenges of implementing the precautionary principle in public policy that directs decision-making. Several chapter address specific topics that might incorporate the precautionary principle.

Marchant GE, Mossman KL (2004)
Arbitrary and Capricious: The Precautionary Principle in the European Union Courts
American Enterprise Institute Press.
Web: http://www.aei.org/books/bookID.787/book_detail.asp

Concerns that the precautionary principle is legally undefined are examined, along with the general view that the precautionary principle is unworkable.

Marco M, Tickner JA (Eds.) (2004)
The Precautionary Principle: Protecting Public Health, the Environment and the Future of our Children
World Health Organization Regional Office for Europe. Copenhagen.
Web: http://www.euro.who.int/document/e83079.pdf

Myers NJ, Raffensperger C (2006)
Precautionary Tools for Reshaping Environmental Policy
MIT Press, Cambridge, MA

One of the challenges of the precautionary principle is applying it to the local situation. Meyers and Raffensperger discuss community-based tools that can be used to develop and implement precautionary approaches.

O'Brien M (2001)
Making Better Environmental Decisions: An Alternative to Risk Assessment
MIT Press, Cambridge MA

While risk assessment is easy to criticize, addressing alternatives is more difficult. O'Brien describes and illustrates some of the weakness of risk assessment and then explores different approaches to making human health and environmental decisions.

Peel J (2005)
The Precautionary Principle in Practice: Environmental Decision-Making and Scientific Uncertainty

Federation Press, Australia
Web: http://www.federationpress.com.au/bookstore/book.asp?isbn=9781862875197

This book focuses on legal issues related to the environment and scientific uncertainty and how to apply the precautionary principle.

Raffensperger C, Tickner J (Eds) (1999)
Protecting Public Health & the Environment: Implementing the Precautionary Principle
Island Press, Washington, DC, pp. 385.

This book developed out of the proceedings of the 1998 Wingspread conference in Racine, Wisconsin. Book chapters are by leaders in the U.S. and internationally covering a range of issues related to applying the precautionary principle.

Smart RC, Hodgson E (Eds) (2008)
Molecular and Biochemical Toxicology, 4th edn
John Wiley and Sons Inc., Hoboken, New Jersey, USA

The fourth edition has been newly revised and covers the underlying biochemical, molecular, and cellular mechanisms through which toxicants produce their adverse effects. Toxicological issues are covered from the molecule to the cell to the organ level including complex methods used in toxicology. Additional topics emphasize the interrelationship between toxicology and genomic sciences (e.g., bioinformatics, proteomics, metabolomics, and toxicogenomics). Further, structure, mechanism, and regulation of xenobiotic metabolizing enzymes, toxicogenetics, and xenobiotic transporters have been emphasized. Other new topics and chapters include molecular epidemiology and genetic susceptibility, DNA damage and mutagenesis, DNA repair, mechanisms of cell death, mitochondrial dysfunction, metals, reproductive toxicology, developmental toxicology, and reactive oxygen/metabolites and toxicity.

Tickner JA (Eds) (2003)
Precaution – Environmental Science and Preventive Public Policy
Island Press, Washington, DC.

This book covers national and international issues on the science and philosophy of applying the precautionary principle to improving public health by preventing harm.

Trouwborst A (2002)
Evolution and Status of the Precautionary Principle in International Law
Kluwer Law International, Cambridge, MA

Starting with a history of the precautionary principle, this book then addresses international applications of the precautionary principle from a legal perspective.

Whiteside KH (2006)
Precautionary Politics: Principle and Practice in Confronting Environmental Risk
The MIT Press, Cambridge, MA.

Environmental ethics and the precautionary principle are examined in light of difference between the United States and Europe.

Organizations

Bay Area Working Group on the Precautionary Principle
c/o Clean Water Fund
111 New Montgomery Street, Suite 600
San Francisco, CA 94105
Web: http://www.takingprecaution.org/

This group has worked to establish the precautionary principle as a basic decision-making tool in the San Francisco area to protect health and the environment.

Center for Health, Environment and Justice – Be Safe
P.O. Box 6806
Falls Church, VA 22040-6806
Phone: 703-237-2249
Email: chej@chej.org
Web: http://www.besafenet.com/

Be Safe coordinates information on the precautionary principle including the precautionary principle clearing house (http://www.besafenet.com/ppc/). Be Safe is sponsored by Center for Health, Environment and Justice, which was founded in 1981, by Lois Gibbs, the community leader at Love Canal. CHEJ seeks to help local citizens and organizations come together and take an organized, unified stand in order to hold industry and government accountable and work toward a healthy, sustainable future.

Science and Environmental Health Network – Precautionary Principle
PMB 282
217 Welch Ave. Ste 101
Ames Iowa 50014
Phone: (515) 268-0600
Fax: (515) 268-0604
Email: info@sehn.org
Web: http://www.sehn.org/precaution.html

The mission of Science and Environmental Health Network is to engage communities and governments in the effective application of science to protect and restore public and ecosystem health. They have an extensive section on the precautionary principle.

Seattle Precautionary Principle Working Group
Collaborative on Health and the Environment – Washington (CHE-WA)
Institute for Children's Environmental Health (ICEH)
1646 Dow Road
Freeland, WA 98249
Phone: 360-331-7904
Fax: 360-331-7908
Email: iceh@iceh.org
Web: http://washington.chenw.org/PPgroup.html

Working with the Collaborative on Health in the Environment Washington (CHE-WA), this group developed a white paper and other documents related to establishing the precautionary principle as a decision making tool in Washington State.

Radiation

BRUCE BUSBY

INTRODUCTION

For many, certain images come to mind when they hear the word 'radiation,' such as mushroom clouds, smoke rising from Chernobyl, Three Mile Island cooling towers and those famous radiation mutants – the Incredible Hulk, Spiderman, and the Fantastic Four. Mass media has played a role in creating erroneous ideas and myths about radiation. The Internet and World Wide Web provide information resources for the public and professionals. Indeed, there might be too much information available, some good and some bad. This article is meant to provide a reference to what the author considers to be useful sources of books, articles, and online information about radiation.

The general public is leery of and understands little of what radiation is or what it is not. In the simplest terms, radiation is energy in transit in the form of high-speed particles or electromagnetic waves. In typical usage, the word radiation means the ionizing radiation, i.e. radiation with enough energy to release electrons in the material it interacts with, such as gamma rays and beta particles. Non-ionizing radiation sources such as microwaves or radio waves can also be a hazard though.

Radioactive materials, substances that give off radiation, are found naturally in everything we touch, eat, and inhale. The Earth's atmosphere is continually bombarded with cosmic radiation, some of which reaches the surface. Radiation is a known carcinogen and mutagen to which every human on the planet is exposed to every second of every day. Radiation is a natural part of our environment and it plays important roles in medicine, industry, and academic research.

Far from being an unknown force that is hard to detect, radiation characteristics are well known and radiation is easy to detect down to small quantities.

RESOURCES

Books

ANSI Z136 Working group (2007)
ANSI Z136.1 Safe Use of Lasers
Laser Institute of America.

The technical safety standard for lasers is the Z136 series and the revised ANSI Z136.1 (2007) provides guidance for the safe use of lasers and laser systems by defining control measures for each of the four laser classes.

BEIR VI Committee (1999)
Health Effects of Exposure to Radon: BEIR VI
National Academies Press.

The report is from the Committee on Health Risks of Exposure to Radon (BEIR VI), part of the National Research Council and National Academy of Sciences to estimate the risk from radon. It contains a very comprehensive listing of sources and references.

BEIR VII Committee (2005)
Health Risks from Exposure to Low Levels of Ionizing Radiations: BEIR VII Phase 2
National Academies Press.

The report is from the Committee to Assess Health Risks from Exposure to Low Levels of Ionizing Radiation (BEIR VII), part of the National Research Council and National Academy of Sciences, to estimate

the risk from low-level radiation. It contains a very comprehensive listing of sources and references.

Herman Cember (1996)
Introduction to Health Physic, 3rd Edition
McGraw-Hill Medical.

Textbook and reference on radiation physics, interactions and protection, with chapters also on non-ionizing radiation. Good overall review of radiation safety, nuclear processes, internal and external dosimetry, detection, and monitoring.

Merril Eisenbud and Thomas Gesell (1997)
Environmental Radioactivity, 4th Edition
Academic Press.

Textbook and reference for radioactivity in the environment from natural and human-produced sources including accidents. Comprehensive look at all aspects of environmental radioactivity, from source to detection to impact on humans.

Eric Hall and Amato J Giaccia (2005)
Radiobiology for the Radiologist, 6th Edition
Lippincott Williams & Wilkins.

Textbook and reference for radiation biology. This book is used often as a textbook for medical schools, health physics graduate programs, and as a reference for anyone interested in radiation biology and medical use of radiation.

IARC and WHO (2002)
Non-Ionizing Radiation, Part 1: Static and Extremely Low-Frequency (ELF) Electric and Magnetic Fields (IARC Monographs on the Evaluation of Carcinogenic Risks to Humans)
World Health Organization.

This IARC/WHO document evaluates possible carcinogenic hazards from exposures to static and extremely low-frequency (ELF) electric and magnetic fields.

Glenn F Knoll (2000)
Radiation Detection and Measurement, 3rd Edition
Wiley.

Textbook and reference for radiation-detection instrumentation. This work covers topics of instrument electronics, detector design, as well as information on typical detectors used in the field and laboratory.

James Martin (2000)
Physics for Radiation Protection: A Handbook
Wiley-VCH.

Textbook and reference for radiation physics. A very comprehensive publication with a historical perspective of radiation physics. Covers early discoveries in radiation use to modern-day applications. Designed to be used as a textbook for health physicist students, can also be used in all fields needing a basis in radiation physics.

Mike Stabin (2007)
Radiation Protection and Dosimetry: An Introduction to Health Physics
Springer Science.

Textbook and reference for the field of radiation protection (health physics). This new text is organized to introduce the reader to basic principles of radiation emission and propagation, to review current knowledge and historical aspects of the biological effects of radiation, and to cover important operational topics such as radiation shielding and dosimetry.

James E Turner (2007)
Atoms, Radiation, and Radiation Protection, 3rd Edition
Wiley-Interscience.

Introductory textbook and reference on radiation physics, interactions, and protection. Covers diverse topics of decay, matter interactions, detection, and risk. Often used by health physicists as a reference.

Andrew W Wood, Colin Roy (Eds) (2005)
Non-Ionizing Radiation Protection
Wiley-Interscience.

A work based on an Australian expert group's work and covers radio frequencies, ELF, UV, lasers, and ultrasound.

Journals

The Health Physics Journal (1958–)
Lippincott Williams & Wilkins.
Web: http://www.health-physics.com/
Official journal of the Health Physics Society

Health Physics provides peer-reviewed articles on radiation, radiation safety, and health effects.

Journal of Radiological Protection (1981–)
Institute of Physics Publishing.
Official journal of the Society for Radiological Protection (UK)
Web: http://www.iop.org/EJ/journal/0952-4746

Journal of Radiological Protection provides peer-reviewed articles on radiation protection including non-ionizing radiations as well as ionizing radiations.

Medical Physics (1997–)
American Association of Physicists in Medicine

Web: http://www.medphys.org/

Medical Physics provides peer-reviewed articles on radiation use in medical applications.

Operational Radiation Safety (1999–)
Lippincott Williams & Wilkins.
Web: http://www.health-physics.com/

Published by the Health Physics Society quarterly with peer-reviewed articles on operational radiation safety topics.

Radiation Research (2000–)
Allen Press, Inc.
Official journal of the Radiation Research Society
Web: http://www.rrjournal.org

Radiation Research provides peer-reviewed articles on basic research on radiation, including health effects.

Organizations

American Academy of Health Physics (AAHP)
1313 Dolley Madison Blvd Ste 402
McLean, VA 22101
Phone: 703-790-1745 X25
Fax: 703-790-2672
E-mail: aahp@BurkInc.com
Web: http://www.hps1.org/aahp/

The AAHP provides information on Certified Health Physicists and the process of certification. Forms, deadlines, exams are all available.

American Association of Physicists in Medicine (AAPM)
One Physics Ellipse
College Park, MD 20740
2007.aapm@aapm.org
Phone: (301) 209-3350
Fax: (301) 209-0862

Web: http://www.aapm.org

The AAPM mission is to advance the practice of physics in medicine and biology (i.e., Medical Physics) by encouraging innovative research and development, disseminating scientific and technical information, fostering the education and professional development of medical physicists, and promoting the highest quality medical services for patients.

Food and Drug Administration (FDA)
U.S. Food and Drug Administration
5600 Fishers Lane, Rockville MD 20857-0001
Phone: 1-888-INFO-FDA (1-888-463-6332)
Web: http://www.fda.gov

The FDA is part of the U.S. Department of Health and Human Services. FDA's Center for Devices and Radiological Health oversees radiation safety of medical imaging systems, security systems (i.e., screening systems for airline security), and industrial and electronic consumer products that emit radiation (i.e., microwave ovens, lasers, and tanning booths). For these products, FDA establishes performance standards and recommends good practices. The FDA is responsible for review and approval of radioactive drugs and mammography.

Health Physics Society (HPS)
1313 Dolley Madison Boulevard
Suite 402
McLean, Virginia 22101
Phone: 703-790-1745
Fax: 703-790-2672
Email: hps@BurkInc.com
Web: http://www.hps.org/

The HPS is a professional organization whose mission is excellence in the science, education and practice of radiation safety. Publishes the peer-reviewed journal *Health Physics*.

International Atomic Energy Agency (IAEA)
P.O. Box 100
Wagramer Strasse 5
A-1400 Vienna, Austria
Phone: (+431) 2600-0
Fax: (+431) 2600-7
Email: Official.Mail@iaea.org
Web: http://www.iaea.org

IAEA, often called the nuclear watchdog agency of the United Nations, has a much broader perspective, providing information on worldwide use of nuclear power and radiation, nuclear safeguards and safety, nuclear law and conventions, nuclear fusion, and Chernobyl.

International Commission on Non-Ionizing Radiation Protection (ICNIRP)
ICNIRP c/o BfS
Ingolstaedter Landstr. 1
85764 Oberschleissheim
Germany
Phone: +49 1888 333 2156
Fax: +49 1888 333 2155
Email: G.ziegelberger@icnirp.org
Web: http://www.icnirp.de/index.html

ICNIRP provides information on the protection against the adverse health effects of non-ionizing radiation.

International Commission on Radiation Protection (ICRP)
SE-171 16 Stockholm
Sweden
Telefax: +46 8 729 729 8
Email: scient.secretary@icrp.org
Web: http://www.icrp.org/

ICRP reviews the fundamental principles and quantitative bases upon which appropriate radiation protection measures can be established. ICRP offers its recommendations to regulatory and advisory agencies on radiological protection. While ICRP has no formal power to impose its proposals on anyone, in fact legislation in most countries adheres closely to ICRP recommendations.

International Commission on Radiation Units and Measurements (ICRU)
7910 Woodmont Avenue, Suite 400
Bethesda, MD 20814-3095
Phone: (301) 657-2652
Email: icru@icru.org
Web: http://www.icru.org

ICRU's principal objective is the development of recommendations regarding quantities and units of radiation and radioactivity and procedures suitable for the measurement.

International Radiation Protection Association (IRPA)
Web: http://www2000.irpa.net/

IRPA provides association and communications for radiation protection activities in all countries and is dedicated to advancing radiation protection all over the world. The IRPA is made up of associate radiation protection societies from around the world.

National Council on Radiation Protection & Measurements (NCRP)
7910 Woodmont Avenue, Suite 400,
Bethesda, Maryland 20814-3095

Phone: (301) 657-2652
Email: schauer@NCRPonline.org
Web: http://www.ncrponline.org

Chartered by U.S. Congress in 1964 as the National Council on Radiation Protection and Measurements. Their goal is to collect, analyze, develop, and disseminate, in the public interest, information and recommendations about protection against radiation and radiation measurements, quantities and units, particularly those concerned with radiation protection. The NCRP publishes recommendation in reports, commentaries, proceedings and lectures.

Occupational Safety and Health Administration (OSHA)
Occupational Safety & Health Administration
200 Constitution Avenue, NW
Washington, DC 20210
Phone: 1-800-321-OSHA
Web: http://www.osha.gov

The OSHA is part of the U.S. Department of Labor. They are responsible for regulation of radiation sources not covered by other government agencies, and in addition, non-ionizing radiation sources for workers.

Radiation Effects Research Foundation
5-2 Hijiyama Park,
Minami-ku, Hiroshima, 732-0815
Phone: 082-261-3131
Web: http://www.rerf.jp/

The objective of the Radiation Effects Research Foundation (RERF) is to conduct research, for peaceful purposes, on the medical effects of radiation on man, with a view to contributing to the health and welfare of the atomic-bomb survivors and to the enhancement of the health of mankind.

Radiation Research Society
PO Box 7050
Lawrence, KS 66044-8897
Phone: 1-800-627-0326
Fax: 1-785-843-1234
Email: sstarr@allenpress.com
Web: http://www.radres.org/

The Radiation Research Society's objectives are to encourage the advancement of radiation research and to promote dissemination of knowledge in the field. Publishes peer-reviewed journal *Radiation Research*.

Society of Nuclear Medicine (SNM)
1850 Samuel Morse Drive
Reston, Virginia 20190
Phone: (703) 708.9000
Web: http://www.snm.org

SNM is an international scientific and professional organization dedicated to promoting the science, technology and practical applications of nuclear medicine to diagnose, manage, and treat diseases.

U.S. Department of Energy (DOE)
1000 Independence Ave., SW
Washington, DC 20585
Phone: (202) 586-4403
Email: The.Secretary@hq.doe.gov
Web: http://www.energy.gov

The DOE as a cabinet-level agency has multiple missions, with cleaning up prior nuclear-related sites (e.g. Hanford, INEL, Oakridge) being a priority, as well as maintaining the country's nuclear weapon complexes.

U.S. Environmental Protection Agency (EPA)
Ariel Rios Building
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Phone: (202) 272-0167
Email: radiation.questions@epa.gov
Web: http://www.epa.gov

The EPA regulates radioactive air and water emissions and provides guidance on radon. Also on the EPA web site are full text versions of more than a dozen major statutes and laws, such as National Environmental Policy Act, that form the legal basis for the programs of the EPA.

U.S. Nuclear Regulatory Commission (NRC)
U.S. Nuclear Regulatory Commission, Office of Public Affairs (OPA)
Washington, D.C. 20555
Phone: 800-368-5642
Email: opa@nrc.gov
Web: http://www.nrc.gov

NRC has the responsibility for regulating much of the use of radiation and nuclear power in the United States.

Databases

Exploring the Table of Isotopes
Ernest O. Lawrence Berkeley National Laboratory
Web: http://ie.lbl.gov/education/isotopes.htm

Provides nuclear data in an easy-to-retrieve format.

The National Nuclear Data Center (NNDC)
Sponsored by the Brookhaven National Laboratory and the Department of Energy's Offices of Nuclear Physics and Science.
Web: http://www.nndc.bnl.gov/

The NNDC provides nuclear- and radiation-related databases. For example, NuDat is the database for evaluated nuclear structure and decay data, with a good web interface for data retrieval. The NNDC also provides evaluated atomic masses, graphic displays of nuclear structure, radiation interaction data, and chart of the nuclides, datasheets, and references.

XCOM: Photon Cross Sections Database
Supported in part by the Department of Energy, Office of Health and Environmental Research; National Institute of Standards and Technology
Web: http://physics.nist.gov/PhysRefData/Xcom/Text/XCOM.html

Used to calculate photon cross-sections for scattering, photoelectric absorption, and pair production, as well as total attenuation coefficients, for any element, compound, or mixture.

Other Resources

ABC's of Nuclear Science
Web: http://www.lbl.gov/nsd/education/ABC/index.html

The ABC's of Nuclear Science is a brief introduction to nuclear science.

Radiation Information Network (RIN)
Idaho State University
Web: http://www.physics.isu.edu/radinf/

RIN provides information of basics of radiation.

The Regulation and Use of Radioisotopes in Today's World
US Nuclear Regulatory Commission
Web: http://www.nrc.gov/reading-rm/doc-collections/nuregs/brochures/br0217/

Good reference describing the many uses in industry, medicine, and research for radioactive material.

What You Need To Know About Radiation, 1996
Lauriston S. Taylor
Student Chapter of the Health Physics Society of the Idaho State University
Web: http://www.physics.isu.edu/radinf/lst.htm

Paper published by an icon in radiation protection, meant to provide an easy to understand description of radiation and its associated risks.

CHAPTER

45

Regulatory Toxicology

AMANDA S. PERSAD

INTRODUCTION

Interdependence exists between toxicology and regulatory development. Many government programs use the results of toxicology studies to support regulation of chemicals and other toxic substances. Some government programs impose regulations on the conduct of toxicology studies, while other programs have more informal methods of encouraging and promoting high-quality toxicology studies. This interplay between regulation and toxicology defines the construct of regulatory toxicology. For chemical regulation, the potential for human hazard from exposure, the magnitude of risk, the cost and consequence of regulation may be taken into account. In the U.S., regulatory bodies like the Environmental Protection Agency (EPA), the Food and Drug Administration (FDA), the Occupational Safety and Health Administration (OSHA), and the Consumer Product Safety Commission (CSPC) are responsible for regulating chemical hazards. Many agencies have prescribed testing standards for the conduct of toxicology research. For example, the FDA has established that investigational drugs must be evaluated in preclinical studies in order to protect human subjects in subsequent clinical trials (21 C.F.R. § 312.22, 2006).

In addition to imposing regulations on the conduct of toxicology studies, the regulatory process has promoted research in previously uncharted areas through the establishment of programs like the High Production Volume Challenge Program and the National Toxicology Program, and the passing of Acts like the 1976 Toxic Substances Control Act and the 1996 Food Quality Protection Act. In return, advances in toxicological research have offered cutting-edge tools to the regulatory community such as toxicogenomics, physiologically based pharmacokinetics, and alternatives to animal testing (Green 2006). With the ever-broadening knowledge base of toxicology, some regulatory decisions have been revisited and amended. For example, in 1996 the provision of the Food, Drug and Cosmetic Act applicable to pesticide residues on food was amended to allow pesticide residues that have a carcinogenic potential of less than 1 in a million. This decision was fueled by the understanding that carcinogenic potential is dependent on the dose and potency, and there is an exposure level below which the risk may be considered 'de minimus' or negligible (Merrill 2003).

This chapter provides an overview of resources in regulatory toxicology from the last 10 years.

RESOURCES

Books

Ashford NA, Caldart CC (Eds.) (1996)
Technology, Law, and the Working Environment
Island Press, Washington, DC

Designed to provide an understanding of the roles of the agencies, courts, and industry and how technical, scientific, and economic considerations interface within the legal framework.

Benson BW, Lang PL (1998)
Handbook of Good Laboratory Practice
Taylor & Francis, Washington, DC

Provides a detailed analysis for the clear understanding of and compliance with GLP regulations for field and laboratory studies. Using key examples, the book details what each regulation means and why it is important to the process of safety evaluation. The book also offers practical means of implementation.

Candolfi, M. P. (2003)
Guidance Document on Regulatory Testing and Risk Assessment Procedures for Plant Protection Products with Non-Target Arthropods: From the Escort 2 Workshop (European Standard Characteristics of Non-Target Arthropod Regulatory Testing): BART , EPPO/CoE , OECD , and IOBC Workshop organized in conjunction with SETAC-Europe and EC
Society of Environmental Toxicology and Chemistry, Pensacola
Web: http://www.versailles.inra.fr/ssm/documents/doceval/eu/ecotox/ESCORT2.doc

Chengelis CP, Holson JF, Gad SC (Eds.) (2001)
Regulatory Toxicology, 2nd Edition
Taylor and Francis, New York

Presents a clear and practical guide to the government regulations that govern why and how toxicology/safety testing is done and how the results of such testing are reported and used in regulating the entry and use of products in the marketplace.

Cranor CF (1993)
Regulating Toxic Substances: A Philosophy of Science and the Law
Oxford University Press, New York

Addresses the role of science in the control of toxic substances through ethics, philosophy of law, epidemiology, tort law, regulatory law, and risk assessment.

Fisher LJ, Holmstead CR, Hayes DJ, Holmstead JR, Slater GS, Rawson WK, Winik PL (1995)
Toxic Substances and Pesticides Regulation Deskbook
Environmental Law Institute, Washington, DC

Provides full text for the currently existing 19 environmental laws. The book is designed to benefit anyone in the field by providing access to the text in an orderly and understandable fashion.

Geltman EG (1998)
Environmental Law Library
Lewis, Boca Raton, FL

In three volumes, this book presents a library of explanations of environmental regulations. Includes permit procedures and provides case law references.

Green S (Ed.) (2006)
Toxicology and Regulatory Process
Taylor and Francis Group, New York

Through the use of detailed examples, this book illustrates the relationship between toxicology and the regulation of chemicals, pharmaceuticals, herbal and nutritional supplements, and other food substances.

Hubbert WT, Hagstad HV, Hughes KL, Spangler E, Hinton MH (1996)
Food Safety and Quality Assurance: Foods of Animal Origin, 2nd Edition
Iowa State Press, Ames, IA

Basic reference for veterinarians, extension specialists, and others who help food-animal producers throughout the food chain to provide a safe product to consumers. This book covers both microbial and non-microbial agents, modern food-processing techniques, and social and political concerns in food safety and quality assurance.

Levine B (2003)
Principles of Forensic Toxicology, 2nd Edition
AACC Press, Washington, DC

Provides an introduction to postmortem forensic toxicology, analytical principles, including both theory and applications, methodologies, and commonly encountered analytes, including alcohol, benzodiazepines, γ-hydroxybutyrate, miscellaneous central nervous system depressants, opioids, cocaine, marijuana, amfetamines/sympathomimetic amines, hallucinogens, anticonvulsants, antiarrhythmics, antidepressants, neuroleptics, carbon monoxide/cyanide, inhalants, and metals.

Marcus PA, Willig JT (Eds.) (1997)
Improving Environmental Management and Advancing Sustainable Development
Wiley, New York

Focuses on the implementation of the ISO 14,000 program by the industrial community. The book contains five sections dealing with the global challenge of voluntary management standards; gaining support within a company; registration, certification, and implementation issues; implementation impact and tools; and advancing sustainable development as a competitive tool.

Marrs TC, Ballantyne B (Eds.) (2003)
Pesticide Toxicology and International Regulation
Wiley, John & Sons, West Sussex, UK

Provides a global prospective of how major classes of insecticides, fungicides, and herbicides are regulated. The book also discusses occupational risk to pesticides as well as poisoning through contaminated foodstuffs.

Montgomery L (1995)
Health and Safety Guidelines for the Laboratory
ASCP Press, Chicago, IL

Describes the essentials of the standards, interpreting the basic requirements for compliance and the scope and terminology of the hazard communication standard, the formaldehyde standard, the occupational exposures to hazardous chemicals in laboratories standard, and the bloodborne pathogen standard.

O'Neil MJ (2006)
The Merck Index: An Encyclopedia of Chemicals, Drugs, and Biologicals, 14th Edition
John Wiley & Sons, Hoboken, NJ

Provides an index of chemicals, drugs, and biologicals that contains more than 10 000 monographs with each monograph providing a concise description of a single substance or a small group of closely related compounds.

Pisano DJ, Mantus D (Eds.) (2003)
FDA Regulatory Affairs: A Guide for Prescription Drugs, Medical Devices, and Biologics
CRC Press, Boca Raton, FL

Examines the key aspects of the drug approval process taking into account the Federal Food, Drug and Cosmetic Act, Current Good Manufacturing Practices, Good Clinical Practices, Quality System Compliance, and FDA inspection processes and enforcement options.

van Leeuwen CJ, Vermeire TG (Eds.) (2007)
Risk Assessment of Chemicals: An Introduction, 2nd Edition
Springer, Netherlands

A concise guide that provides background and training material on five major areas, including: (1) risk management of industrial chemicals, (2) exposure assessment, (3) human health and ecological effects assessment and risk characterization, (4) data and data estimation, and (5) risk assessment and management of chemicals in the EU (REACH), U.S.A., Japan, and Canada.

Zeiger E, Auletta A, Cavagnaro J (1997)
Validation and Regulatory Acceptance of Toxicological Test Methods
DIANE Publishing Company, Darby

Review of methods being developed and implemented to better understand biologic mechanisms behind toxicological processes.

Journals

Clinical Research and Regulatory Affairs (1983–)
Taylor and Francis, Philadelphia

Rapid communication, peer-reviewed journal that publishes original, scientific articles that pertain to advancements in clinical research and regulatory affairs in the area of drug, device, and biological development.

Food and Drug Law Journal (1945–)
Food and Drug Law Institute, United States
Web: http://www.fdli.org/pubs/Journal%20Online/

Publishes in-depth, analytical articles, providing insight into the actions of the U.S. Food and Drug Administration, the U.S. Federal Trade Commission, and the U.S. Department of Agriculture, how the courts interpret these actions, and the reaction of industry.

Regulatory Toxicology and Pharmacology (1981–)
Academic Press, Danvers

Includes peer-reviewed articles on issues that surround the generation, evaluation, and interpretation of experimental animal and human data as well as the interpretation of scientific knowledge as it influences regulatory decision-making.

Organizations

Environmental Law Institute
2000 L Street, NW, Suite 620
Washington, DC 20036
Phone: 202-939-3800
Fax: 202-939-3868
Email: law@eli.org
Web: http://www.eli.org

A non-profit, tax-exempt organization that provides information in the form of publications (*Environmental Law Reporter* and *The Environmental Forum*), training courses, seminars, and research programs on environmental issues. The organization also offers advice and policy recommendations regarding these issues.

The Food Drug and Law Institute
1155 15th Street, NW, Suite 800
Phone: 800-956-6293, 202-371-1420
Fax: 202-371-0649
Email: Comments@fdli.org
Web: http://www.fdli.org

A non-profit organization that provides education and training in the practice of food and drug law and regulation. FDLI also publishes the peer-reviewed *Food and Drug Law Journal*, among other publications.

Government Institutes
Scarecrow Press, Inc.
15200 NBN Way, Building B
Blue Ridge Summit, PA 17214
Phone: 800-462-6420, 717-794-3800
Fax: 800-338-4550, 717-794-3803
Email: custserv@rowman.com
Web: http://www.govinstpress.com

The institute provides information and training on a host of topics relevant to environmental, health, and safety professionals.

International Life Sciences Institute
One Thomas Circle, NW, 9th Floor
Washington, DC 20005
Phone: 202-659-0074
Fax: 202-659-3859
E-mail: ilsi@ilsi.org
Web: http://www.ilsi.org

An international non-profit foundation that is committed to furthering the understanding of scientific issues such as environmental concerns, food safety, toxicology, and risk assessment.

ILSI is affiliated with the World Health Organization and is involved in projects with the International Agency for Research on Cancer and the International Programme on Chemical Safety.

International Society for Regulatory Toxicology and Pharmacology
6546 Belleview Drive
Columbia, MD 21046
Phone: 410-992-9083
Fax: 410-740-9181
Web: http://www.isrtp.org

An organization that provides an open public forum for both scientists and policy makers to discuss and promote toxicology and pharmacology. The Society sponsors the peer-reviewed journal *Regulatory Toxicology and Pharmacology.*

Regulatory and Safety Evaluation Specialty Section (RSESS)
Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
Email: sothq@toxicology.org
Web: http://www.toxicology.org/ISOT/SS/regulatorysafety/

A specialty section within the Society of Toxicology that promotes the development of sound governmental policies and regulations based on contemporary scientific knowledge arising from the disciplines encompassed by the field of toxicology.

Society for Risk Analysis
1313 Dolley Madison Blvd, Suite 402
McLean, VA 22101
Phone: 703-790-1745
Email: sra@burkinc.com
Web: http://www.sra.org

Society that provides an open forum for scientists interested in all related aspects of risk analysis. The Society promotes dialogue and discussion of risk assessment through annual meetings and the publication of the peer-reviewed journal *Risk Analysis.*

CHAPTER

46

Risk Assessment

AMANDA S. PERSAD AND TODD STEDEFORD

INTRODUCTION

The concept of weighing risks and benefits dates back to antiquity. Over the last 50 years, with the escalating number of chemicals in the environment, regulatory agencies have been forced to address the issue of the adverse health risks from potential exposure. Nurtured by regulatory decision-making, the discipline of science-based risk assessment emerged in the 1950s, and gained momentum in the 1970s with the advent of human health risk assessment. Though science-based risk assessment includes both human health risk assessment and ecological risk assessment, the term 'risk assessment' in toxicology generally refers to the former.

Within the scope of toxicology, human health risk assessment is defined as the 'systematic scientific characterization of potential adverse health effects resulting from human exposures to hazardous agents or situations' (Faustman & Omenn 2003). It is a process by which toxicology, epidemiology, and environmental research are meshed to provide an overall understanding of risk. Risk assessments are used (1) as input to cost–benefit analyses (e.g., in terms of balancing drug and pesticide safety and efficacy), (2) to set target levels of risk, (3) to set priorities for program activities, and (4) to estimate residual risks and extent of risk reduction upon implementation of risk-reduction efforts (Faustman & Omenn 2003).

Human health risk assessment does not exist in a vacuum, but rather is part of a larger framework that includes synthesizing information from basic research and providing scientific support to risk management decision making and risk communication. Globally, one of the most accepted risk assessment/risk management frameworks is the paradigm put forth by the National Research Council (NRC) of the U.S. National Academy of Sciences (NRC 1983). According to this paradigm, risk assessment is comprised of four steps or components: hazard identification, dose–response assessment, exposure assessment, and risk characterization. The last step combines information from the first three steps to provide an estimate of the risk. This approach can be tiered and iterative, depending on the goals and needs of the risk assessment, and the available data and possible ways to manage the risks.

Hazard identification, the first in the four-step risk assessment paradigm, is the process used to determine whether exposure to a chemical or other agent may result in an adverse human health effect. Hazard identification relies on information from animal and epidemiology studies and, to a lesser extent, in vitro assays and structure/activity relationships. Decisions or conclusions from this step are often synthesized and described in terms of a weight or level of evidence. Once a hazard has been identified, a dose–response assessment, the second step in the risk assessment paradigm, is performed to describe the relationship between the dose or concentration of the chemical and the incidence of disease or adverse health effect in exposed groups. The resulting data are plotted to produce a dose–response curve, which is an integral part of determining quantitative estimates for risk characterization. In constructing and interpreting a dose–response curve, a number of factors are considered including intensity and pattern of exposure, individual differences in susceptibility, and the relevance of the risk to humans if results from animal bioassays were utilized. The underlying goal of exposure

assessment, the third step in the risk assessment process, is to determine the amount of the chemical or agent that is reaching the target tissues. Here the focus is on the exposure itself and involves gathering information on the intensity, frequency, and duration of human exposure or estimating exposures from the release of chemicals into the environment and calculating the level of total exposure. Risk characterization is the culminating step in which information from the hazard identification, dose–response assessment, and the exposure assessment are synthesized in an effort to characterize risk for a particular chemical or agent. Risk characterization is dependent on the preceding steps in the risk assessment process.

Though this risk assessment paradigm has been incorporated by public health and regulatory agencies worldwide, many organizations have developed guidance for evaluating and quantifying risk. To help implement the Registration, Evaluation, Authorisation, and Restriction of CHemicals (REACH) legislation, the European Commission and the European Chemicals Agency has developed technical guidance documents and associated databases for industry to conduct chemical safety assessments (EC 2006, ECHA 2008). These assessments will need to demonstrate that the intended uses and reasonably foreseeable exposures associated with the lifecycle of a REACH-impacted chemical are safe for the people and the environment in all EU member states. In addition, as a possible tool for use in REACH, the European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC) has developed a framework to perform efficient risk assessments on the large volume of assigned chemicals (ECETOC 2004). This risk assessment process, known as targeted risk assessment, entails a three-tiered or step-wise approach for identifying and prioritizing the assessment of risk based on the characteristics of potential exposure. The first tier, Tier 0, is designed to screen chemicals and conditions with general exposure or low hazard potential out of the process. Chemicals and conditions that survive through Tier 0 are evaluated in Tier 1, a process that distinguishes chemicals or conditions that require 'no further risk assessment' from those that require more detailed investigation. Tier 1 uses key exposure scenarios, predicted exposures, and a generic hazard evaluation. This tier relies on the cooperation between producers and the downstream users to identify the potential hazards of these chemicals. Chemicals not eliminated from further review in Tier 1 undergo detailed risk assessment in Tier 2, using a framework similar to the NRC's four-step risk assessment process.

Similar in principle to human health risk assessment, ecological risk assessment is the process that evaluates the likelihood that an adverse effect may occur as a result of exposure to a stressor (EPA 1998). These assessments are used to (1) predict future adverse effects, (2) evaluate a resource and factors that might impact or affect that resource, and (3) determine causative factors for an observed effect (Sergeant 2002). The ecological risk assessment paradigm is comprised of three major steps or components: problem formulation, analysis, and risk characterization. The problem formulation step involves the collaboration of risk assessors, risk managers, and interested parties. This step structures the analysis, which entails characterizing exposure and ecological effects. Analogous to NRC's risk assessment paradigm, risk characterization in ecological risk assessment integrates exposure and ecological effects as it describes the risk. Unlike human hazard risk assessment, ecological risk assessment often does not follow a sequential format but involves interaction of the different components (Sergeant 2002).

The development of sophisticated tools and methodologies in toxicology, epidemiology, and statistics has fuelled refinement of risk assessment estimates. With the advent of physiologically based pharmacokinetics (PBPK) modeling, chemical-specific adjustment factors (CSAF), and body weight scaling, more precise risk estimates can be derived. Additionally, the use of biomarkers has aided in better exposure assessment.

Today, risk assessment research has widespread applications and influences fields that may seem far removed from its regulatory toxicology roots. For example, in the field of international trade law, under the Sanitary and Phytosanitary (SPS) Agreement, countries wishing to implement food safety or pest control measures that impact trade must provide scientific evidence in the form of a risk assessment to establish and maintain such measures (Lugard & Smart 2006).

This chapter provides resources for both human health and ecological risk assessment. The information resources provided are presented in the following order: 'Books', 'Journals', 'Journal articles', 'Organizations', 'Databases', and 'Other resources'. Since government agencies are a continual source of guidelines and information on different aspects of risk assessment, a compilation of each agency's general risk assessment documents is provided in the 'Other resources' section.

RESOURCES

Books

Asante-Duah, D.K. (2002)
Public Health Risk Assessment for Human Exposure to Chemicals
Kluwer Academic Publishers, Norwell

Geared towards both students and professionals in health-related and environmental disciplines. This book presents important tools and methodologies for assessing risk from exposure to chemicals both within the workplace and in the general environment.

Bahr NJ (1997)
System Safety Engineering and Risk Assessment: A Practical Approach
Taylor & Francis Group, New York

A comprehensive, practical guide on how to build safety into products and industrial processes. Includes how to implement a cost-effective safety management program, how to set up data management systems, how to set up an accident investigation board, and how to carry out risk assessment and risk evaluation.

Bateman M (2006)
Tolley's Practical Risk Assessment Handbook, 5th Edition
Butterworth-Heinemann, Oxford, UK

Comprehensive overview of risk assessment as it relates to legislation in the United Kingdom. In addition to risk assessment principles, this book covers key aspects of Control of Substances Hazardous to Health (COSHH) regulations and Dangerous Substances and Explosive Atmospheres Regulations (DSEAR).

Colditz G, Stein CJ (2003)
Handbook of Cancer Risk Assessment and Prevention
Jones and Bartlett Publishers, Boston, MA

Designed as a practical guide for healthcare providers. This handbook presents in depth information on over a dozen of the most common cancers in the U.S. and key lifestyle behaviors that can impact cancer risks.

Chyczewski L, Pluygers E, Niklinski J (2002)
Endocrine Disrupters and Carcinogenic Risk Assessment
IOS Press, Amsterdam

Focuses on biologically based risk assessment and the development of biologically based models of carcinogenesis.

Edler L, Kitsos CP (Eds.) (2005)
Quantitative Methods for Cancer and Human Health Risk Assessment
J. Wiley, New York

Comprehensive text covering biological, toxicological, and medical approaches in the risk assessment of both cancer and non-cancer endpoints.

Eisler R (2000)
Handbook of Chemical Risk Assessment: Health Hazards to Humans, Plants, and Animals, Three Volume Set
CRC Press, Boca Raton, FL

Compilation of chemicals introduced into the environment from human activity. For each chemical, information regarding physical, chemical, and metabolic properties as well as uses, adverse effects, and proposed regulatory criteria for the protection of human health and the environment are presented.

European Monitoring Centre for Drugs and Drug Addiction (1999)
Guidelines for the Risk Assessment of New Synthetic Drugs
Office for Official Publications of the European Communities, Luxembourg

Provides a history to the European Union's Joint Action concerning the information exchange, risk assessment and control of new synthetic drugs, with discussion on how it operates, along with an outline of the basic principles, a conceptual framework, and quality information for future risk assessments.

Flaherty DK (1999)
Immunotoxicology and Risk Assessment
Kluwer Academic Publishers, New York

Describes basic immunological principles, in terms of toxicology and risk assessment, at the cellular and molecular level.

Forsythe S (2002)
The Microbiological Risk Assessment of Food
Blackwell Science, Danvers

Presents basic tenets of microbial risk assessment (MRA) as well as practical information on how to implement such programs. This user-friendly book illustrates MRA implementation through case studies.

Frantzen KA (Ed.) (2001)
Risk-Based Analysis for Environmental Managers
CRC Press, Danvers

Practical guide on how to integrate the risk assessment process into impact decision making.

Goehl TJ (Ed.) (2004)
Genomics And Risk Assessment: A Reprint from the Journal, Environmental Health Perspectives
Diane Publishing Company, Darby

A mini-monograph containing over a dozen articles on the application of genomics in risk assessment.

Greenberg BM, Hull RN, Roberts Jr, MH, Gensemer RW (Eds.) (2001)
Environmental Toxicology and Risk Assessment: Science, Policy, and Standardization – Implications for Environmental Decisions, 10th Volume
ASTM International, West Conshohocken

Tenth volume in a series of books on environmental toxicology and risk assessment. Other books in this series include *Recent Achievements in Environmental Fate and Transport, Modeling in Risk Assessment, Standardization of Biomarkers for Endocrine Disrupters*.

Jayjock MA, Lynch J, Nelson DI (Eds.) (2000)
Risk Assessment Principles for the Industrial Hygienist
American Industrial Hygiene Association, Fairfax

Presents risk assessment principles as it applies to industrial hygienists and environmental scientists. In addition to the basic tenets, the book discusses the integration of risk assessment and industrial hygiene.

Kruse J, Verhaar H, De Raat WK (Eds.) (2002)
The Practical Applicability of Toxicokinetic Models in the Risk Assessment of Chemicals
Kluwer Academic Publishers, Dordrecht

Based on the two-day symposium by the OpdenKamp Registration and Notification in 2000. Some of the topics include occupational toxicology and monitoring, exposure to organic solvents, dose–response relationship in carcinogenicity, and species to species extrapolation.

Lalloo F, Kerr B, Friedman JM, Evans DG (Eds.) (2005)
Risk Assessment And Management in Cancer Genetics
Oxford University Press, Oxford

Practical guide designed for healthcare professionals. This book outlines risk assessment and risk management through common familial cancers.

Lerche I, Glaesser W (2006)
Environmental Risk Assessment – Quantitative Measures, Anthropogenic Influences, Human Impact
Springer-Verlag, Berlin

Focuses on environmental and health risk problems related to contamination. The book includes discussion on sparse datasets and political, social and economical issues with regard to environmental contamination and human health.

Lipscomb JC, Ohanian GW (Eds.) (2006)
Toxicokinetics And Risk Assessment
Informa Healthcare, Richmond

Describes the non-cancer risk assessment process and the application of physiologically based pharmacokinetic (PBPK) modeling in human health risk assessment. Through examples, this text demonstrates the use of toxicokinetics as a means of better informing values for uncertainty factors.

National Research Council (NRC) (1983)
Risk Assessment in the Federal Government: Managing the Process
National Academy Press, Washington, DC.

Provides case studies on formaldehyde, nitrite, and asbestos and an in-depth discussion of a four-step risk assessment paradigm, consisting of hazard identification, dose–response assessment, exposure assessment, and risk characterization.

National Research Council (2000)
Scientific Frontiers in Developmental Toxicology and Risk Assessment

National Academy Press, Washington, DC

Presents the current approaches used in developmental defects risk assessment. This book identifies key areas of uncertainty and evaluates the current understanding of the mechanisms of action of chemicals in terms of developmental defects.

Ostergaard G, Larsen JC, Nielsen E (2007)
Principles of Toxicologic Risk Assessment
Taylor & Francis, Boca Raton

Presents key aspects of conducting toxicological risk assessments. In addition to providing an in-depth perspective of the risk assessment paradigm, this book discusses different approaches to regarding the evaluation of chemical mixtures.

Pastorok RA, Bartell SM, Ferson S, Ginzburg LR (Eds.) (2001)
Ecological Modeling in Risk Assessment: Chemical Effects on Populations, Ecosystems and Landscapes
CRC Press, Danvers

Comprehensive text that describes ecological models and their potential use in risk assessment.

Paustenbach DJ (Ed.) (2002)
Human and Ecological Risk Assessment: Theory and Practice
Wiley-Interscience, New York

Comprehensive resources on different aspects of risk assessment. This book serves as a textbook for understanding the basic tenets of risk assessment and as a 'how-to' guide in conducting and interpreting risk assessments.

Pellston Workshop on Multiple Stressors in Ecological Risk Management, Jeffery Allen Foran, Susan A Ferenc, SETAC (Society), SETAC Foundation for Environmental Education (1999)
Multiple Stressors in Ecological Risk and Impact Assessment
SETAC Foundation, Pensacola

Based on a 1997 workshop by the ILSI Risk Science Institute and the Society of Environmental Toxicology and Chemistry (SETAC). The workshop was aimed at developing a framework to assess, compare, and manage the impacts of multiple stressors on biological systems.

Reddy MB, Yang RSH, Clewell III HJ, Andersen ME (2005)
Physiologically Based Pharmacokinetic Modeling: Science and Applications
John Wily & Sons, Hoboken

Describes the development and application of physiologically based pharmacokinetic modeling to an array of chemicals and mixtures.

Ricci PF (2005)
Environmental and Health Risk Assessment and Management: Principles and Practices
Springer, Dordrecht

Discusses the legal, economic, and practical assessment and management surrounding risk via exposure to environmental and occupational hazards. The book addresses issues such as environmental and health law, environmental economics, and risk-based methodologies.

Sadhra SS, Rampal KG (Eds.) (1999)
Occupational Health: Risk Assessment and Management
Blackwell Science, Malden

Covers risk assessment and management as it pertains to occupational health. Geared towards health and safety managers, industrial hygienists, and healthcare professionals, this book provides both a theoretical and practical approach to occupational health issues.

Salem H, Olajos E (Eds.) (1999)
Toxicology in Risk Assessment
Taylor & Francis, Philadelphia

A broad-based practical guide to risk assessment. This book provides detailed insight into risk assessment, risk management, and risk communication and discussion on ethical, legal, and economic implications.

Scheringer M (2002)
Persistence and Spatial Range of Environmental Chemicals – New Ethical and Scientific Concepts for Risk Assessment
Wiley-VCH, Weinheim

Introduces the concept of persistence and spatial range as measures of environmental threats.

Shields PG (Ed.) (2005)
Cancer Risk Assessment
Marcel Dekker Incorporated, New York

Presents cancer risk assessment by taking into account the evaluation of etiological agents, real-world environments, and individual rates of exposure.

Shields PG (2005)
Methods for Cancer Risk Assessment
Taylor & Francis, Boca Raton

Provides a practical approach to conducting risk assessment utilizing biomarkers and taking into account genetic susceptibilities.

Sonnemann G, Castells F, Schuhmacher M (2003)
Integrated Life-Cycle and Risk Assessment for Industrial Processes
CRC Press, Boca Raton

Describes the combined use of life-cycle assessment and risk assessment in estimating environmental damage. This book serves as a practical resource for environmental analysis and decision making.

Suter GW, Efroymson R, Sample BE, Jones DS (2000)
Ecological Risk Assessment for Contaminated Sites
CRC Press, Boca Raton

Focuses on how to perform ecological risk assessments for Superfund sites and locations contaminated by improper waste disposal or chemical spills.

Tweeddale M (2003)
Managing Risk and Reliability of Process Plants
Elsevier, Burlington

Provides a systematic and integrated approach to risk assessment, risk analysis, and risk management. The text uses case studies and worked examples to illustrate concepts throughout the book.

United Nations Environment Programme, International Labour Organisation, World Health Organisation (2004)
IPCS Risk Assessment Terminology
World Health Organisation, Geneva

Compilation of internationally harmonized generic and technical terms used in risk assessment.

United Nations Environment Programme, International Labour Organisation, World Health Organization, Inter-Organization Programme for the Sound Management of Chemicals, International Program on Chemical Safety, WHO Task Group on Environmental Health Criteria for Human Health: Principles and Approaches (2001)
Neurotoxicity Risk Assessment for Human Health
World Health Organization, Geneva

Summarizes the scientific knowledge base on which principles and methods involved in neurotoxicity risk assessment are based. Provides a framework for public health officials, research and regulatory scientists, and risk managers on the use and interpretation of neurotoxicity data from human and animal studies.

U.S. Environmental Protection Agency (1995)
Risk Assessment Methodologies for Toxic Air Pollutants
Government Institutes, Rockville

Handbook describing methods for estimating risks from toxic air pollutants.

van Leeuwen CJ, Vermeire TG (2007)
Risk Assessment of Chemicals: An Introduction, 2nd Edition
Springer, The Netherlands

A concise guide that provides background and training material on five major areas, including: (1) risk management of industrial chemicals, (2) exposure assessment, (3) human health and ecological effects assessment and risk characterization, (4) data and data estimation, and (5) risk assessment and management of chemicals in the EU (REACH), U.S., Japan, and Canada.

World Health Organisation (2005)
Chemical Safety of Drinking-water Assessing Priorities for Risk Assessment
Renouf Publishing Company, Ottawa

Provides guidance of the chemical safety of drinking water. This book is designed to assist users at both a local and national level establish which chemicals should be given priority in developing strategies for risk management and monitoring.

Journals

Human and Ecological Risk Assessment (1995–)
Web: http://www.aehs.com/journals/humanandecojournal/

Aimed at providing a framework for professionals researching and assessing developments in both human and ecological risk assessments.

Journal of Risk Research (1998–)
Taylor and Francis, London

Publishes theoretical and empirical research articles relating to risk analysis from a broad spectrum of disciplines.

Regulatory Toxicology and Pharmacology (1981–)
Academic Press, Danvers

Includes peer-reviewed articles on issues that surround the generation, evaluation, and interpretation of experimental animal and human data as well as the interpretation of scientific knowledge as it influences regulatory decision-making.

Risk Analysis (1981–)
Blackwell Publishing

Publishes empirical research and commentaries dealing with risk issues as well as conference proceedings from the Society for Risk Analysis annual meetings.

Risk: Health, Safety, and Environment (1990–2002)
Web: http://www.piercelaw.edu/risk/profRisk.htm

Publication of the Franklin Pierce Law Center; journal currently inactive.

Stochastic Environmental Research and Risk Assessment (1987–)
Springer, Berlin

Publishes research papers, reviews and technical notes on stochastic and probabilistic approaches to environmental sciences and engineering.

Organizations

California EPA – Office of Environmental Health Hazard Assessment
1001 I Street
Post Office Box 4010
Sacramento, CA 95812
Phone: (916) 324-7572
Web: http://www.oehha.ca.gov/

Develops health-protective exposure standards for air, water, and land to recommend to regulatory agencies. The office also maintains its publicly available *Toxicity Criteria Database* and provides toxicological information to aide in the risk assessment process.

CIIT Centers for Health Research
6 Davis Drive
P.O. Box 12137
Research Triangle Park, NC 27709-2137
Phone: 919-558-1200
Web: http://www.ciit.org/

Private, not-for-profit research organization created to promote the use of the best possible science for human health risk assessments and to enhances public health by conducting leading-edge, interdisciplinary research that elucidates the mechanisms of action of chemicals in biological systems.

European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC)
Avenue Edmond Van Nieuwenhuyse 4 Bte 6
B-1160 Brussels, Belgium
Phone: 32-2-675-3600
Fax: 32-2-675-3625
Email: info@ecetoc.org
Web: http://www.ecetoc.org

European center that promotes the use of sound science in the assessment of human health effects and environmental impact of chemicals. ECETOC provides a forum for regulators and scientists to evaluate the safe use of chemicals.

European Chemicals Agency (ECHA)
Annankatu 18
00120 Helsinki, Finland
Phone: 358-9-686180
Email: http://echa.europa.eu/about/contact.asp
Web: http://echa.europa.eu/

Manages and carries out the technical, scientific, and administrative aspects of REACH. Provides the Member States and the institutions of the Community with the best possible scientific and technical advice on questions relating to chemicals, which fall under REACH. Manages IT-based guidance documents, tools, and databases, and ensures that information on chemicals is publicly accessible.

Consumer Products Safety & Quality Unit, Formerly Known as the European Chemicals Bureau (ECB)
TP582
Institute for Health and Consumer Protection
Joint Research Centre, Ispra Site

European Commission
Via fermi 1
I-21020 Ispra (VA), Italy
Web: http://ecb.jrc.it

Provides scientific and technical support for the implementation of EU legislation regarding the safe use of chemicals. The ECB coordinates risk assessment programs, drafts technical guidance on risk assessment, and provides information on legal classification and labeling, QSAR and REACH.

Harvard Center for Risk Analysis
Landmark Center
P.O. Box 15677
401 Park Dr.
Boston MA 02215
Phone: 617-998-1039
Fax: 617-384-8859
Email: hcra@hsph.harvard.edu
Web: http://www.hcra.harvard.edu

Focuses on research and education on risk analysis and other related disciplines. Additionally, the Center strives to further public discourse on risk through the publication of their newsletter *Risk in Perspective*.

Health Canada – Environmental & Workplace Health
Environmental Health Assessment Services
Health Canada
269 Laurier Ave. 5th Floor, A.L. 4905B
Ottawa, Ontario K1A 0K9 Canada
Phone: (613) 948-2875
Web: http://www.hc-sc.gc.ca/ewh-semt/index_e.html

Provides information on human health and environmental risk assessments by establishing tools and guidance and conducting training to aide in the risk assessment process.

Institute of Environment and Health
Interdepartmental Group on Health Risks from Chemicals (IGHRC)
Cranfield University
Silsoe, Bedfordshire MK45 4DT, UK
Phone: +44 (0) 1525 863002
Web: http://www.silsoe.cranfield.ac.uk/ieh/

The IGHRC comprises representatives of UK government departments, research councils, and agencies, and aims to stimulate the development of new improved approaches to the assessment of risks to human health from chemicals.

International Agency for Research on Cancer (IARC)
150 Cours Albert Thomas
69372 Lyon CEDEX 08, France
Phone: +33 (0)4 72 73 84 85
Fax: +33 (0)4 72 73 85 75
Email: www@iarc.fr
Web: http://www.iarc.fr

Part of the World Health Organization, responsible for the coordinating and conducting research on human cancer etiology. Publications are an integral part of the IARC's mission producing monographs on over 900 substances evaluating carcinogenic risk as well as other handbooks and manuals that aide in the risk assessment process.

International Programme on Chemical Safety (IPCS)
International Labor Organisation, United Nations Environmental Program, World Health Organisation
20 Avenue Appia
CH-1211 Geneva 27, Switzerland
Phone: +41 22 791 3590
Fax: +41 22 791 4848
Web: http://www.who.int/ipcs

Repository of information on chemical risks to human health, methods for chemical assessment, chemicals in food and poison information. IPCS houses a number of publications, databases and tools for risk assessment including the Concise International Chemical Assessment Documents (CICADs) listing, Environmental Health Criteria (EHC) documents, INCHEM search tool, INTOX databank, Pesticide Safety Data Sheets, and International Chemical Safety Cards.

International Life Sciences Institute (ILSI)
One Thomas Circle, NW, 9th Floor
Washington, DC 20005
Phone: 202-659-0074
Fax: 202-659-3859
Email: ilsi@ilsi.org
Web: http://www.ilsi.org

An international non-profit foundation that is committed to furthering the understanding of scientific issues such as environmental concerns, food safety, toxicology, and risk assessment.

ILSI is affiliated with the World Health Organization and is involved in projects with the International Agency for Research on Cancer and the International Programme on Chemical Safety.

International Society of Exposure Science (ISES, formerly International Society of Expossure Analysis, ISEA)
c/o JSI Research and Training Institute
44 Farnsworth Street
Boston, MA 02210

Phone: 617-482-9485
Fax: 617-482-0617
Web: http://www.iseaweb.org

Founded to foster and advance the field of exposure analysis in both human populations and the environment. This Society encourages scientific discussion on exposure analysis through annual meetings and is also responsible for the publication of the recently renamed *Journal of Exposure Science and Environmental Epidemiology*.

National Center for Environmental Assessment (NCEA)
U.S. Environmental Protection Agency
Email: ncea.webmaster@epa.gov
Web: http://www.epa.gov/ncea

Repository of guidance documents, tools, and databases on human health and ecological risk assessment. The Center houses the Integrated Risk Information System (IRIS), and Causal Analysis/Diagnosis Decision Information System (CADDIS) as well as tools such as benchmark dose software and Flowthru data reader and other modeling documentation.

Risk Assessment Forum
U.S. Environmental Protection Agency
Email: risk.forum@epa.gov
Web: http://cfpub.epa.gov/ncea/raf/index.cfm

Formally part of the National Center of Environmental Assessment, this forum, now under direct supervision of the U.S. EPA's Office of the Assistant Administrator, serves as a standing committee of senior EPA scientists promoting Agency-wide consensus on difficult and controversial risk assessment issues.

Society for Risk Analysis
1313 Dolley Madison Blvd, Suite 402
McLean, VA 22101
Phone: 703-790-1745
Email: sra@burkinc.com
Web: http://www.sra.org

Society that provides an open forum for scientists interested in all related aspects of risk analysis. The Society promotes dialogue and discussion of risk assessment through annual meetings and the publication of the peer-reviewed journal *Risk Analysis.*

Toxicology Excellence for Risk Assessment (TERA)
2300 Montana Avenue, Suite 409
Cincinnati OH 45211
Phone: 513-542-7475
Fax: 513-542-7487
Email: tera@tera.org
Web: http://www.tera.org

A non-profit, 501(c)(3) corporation that is focused on developing and communicating risk assessment information. TERA maintains the International Toxicity Estimates for Risk (ITER) database, provides risk assessment values for chemicals through their Verifiable Estimates for Risk Assessment (VERA), and facilitates research and education activities relating to risk assessment.

Databases

Agency for Toxic Substances and Disease Registry (ATSDR)
U.S. Department of Health and Human Services
Web: http://www.atsdr.cdc.gov

Repository of public health assessments on chemicals found at hazardous waste sites. Registry includes minimal risk levels (MRLs), TOX Faqs, and toxicological profiles on almost 300 substances.

Concise International Chemical Assessment Documents
International Programme on Chemical Safety (IPCS)
Web: http://www.who.int/ipcs/index.html

Series of risk assessment documents that review the effects of chemicals or chemical mixtures on human health or the environment.

Environmental Information Management System (EIMS)
U.S. Environmental Protection Agency
Web: http://www.epa.gov/eims/eims.html

A data warehouse storing, managing, and delivering descriptive information for datasets, databases, documents, models, and other scientific documentation that might aide in environmental research.

IARC Monographs Database on Carcinogenic Risks to Humans
International Agency for Research on Cancer (IARC)
http://monographs.iarc.fr

A monograph series in which over 900 biological, chemical, and physical agents have been assessed for potential human carcinogenicity.

Integrated Risk Information System (IRIS)
U.S. Environmental Protection Agency
Web: http://www.epa.gov/iris

Searchable database of over 500 chemical assessments, providing qualitative and quantitative chronic health information as part of the hazard identification and dose–response components of the risk assessment process.

International Toxicity Estimates for Risk (ITER) Database
Toxicology Excellence for Risk Assessment

Web: http://www.tera.org/iter

Searchable database of human health risk values and cancer classifications for over 600 chemicals from multiple organizations worldwide.

Risk Assessment Information System (RAIS)
U.S. Department of Energy, Office of Environmental Management, Oak Ridge Operations Office
Web: http://rais.ornl.gov

Searchable, web-based database that provides toxicity values and profiles of chemicals from multiple sources including U.S. EPA and ATSDR. The website also provides guidance documents and tools for human and ecological risk assessment.

Toxicity Criteria Database
California EPA – Office of Environmental Health Hazard Assessment
Web: http://www.oehha.ca.gov/risk/ChemicalDB/index.asp

Provides chemical-specific cancer potency information and California public health goals for hundreds of chemicals.

CHAPTER

47

Target Sites: General

TODD STEDEFORD

INTRODUCTION

The U.S. Environmental Protection Agency's (EPA) Integrated Risk Information System (IRIS) defines 'toxicology' as '[t]he study of harmful interactions between chemical, physical, or biological agents and biological systems' (IRIS n.d.). In the field of toxicology, and in science in general, it is often necessary to carve out a niche based on specialized interests and research activities. It is not uncommon for toxicologists to focus their research on a particular organ or organ system. For example, a neurotoxicologist specializes in research on chemicals that may produce or protect against adverse effects on the nervous system.

Chemical exposures may produce adverse effects to more than one part of the body. Typically, the organ(s) that is affected by a chemical is referred to as the 'target organ'. IRIS defines a 'target organ' as '[t]he biological organ(s) most adversely affected by exposure to a chemical, physical, or biological agent' (IRIS n.d.). For example, chronic consumption of alcoholic beverages has been associated with adverse effects to the liver, heart, and brain (Spies et al 2001, Koike & Sobue 2006, Yip & Burt 2006). Therefore, these organs are considered the target organs for alcohol-induced toxicity.

Because of the breadth of data on organ-specific toxicants, many specialized books, journals, organizations, and databases exist that aid toxicologists with sharing their findings with the scientific community as well as educating generalists or specialists from other disciplines in a particular subspecialty of toxicology.

This chapter provides resources on general organ toxicity and serves as a prelude to the more in-depth coverage of organ-specific resources provided in later chapters. A selection of books and journal articles addressing organ toxicity is provided, along with international organizations devoted to the toxicology of particular organ systems. In addition, an assortment of open-access databases, which provide full-text information on chemicals that cause directed toxicity to specific organs, has been compiled.

RESOURCES

Books

Acosta D Jr (2001)
Cardiovascular Toxicology, 3rd Edition
Taylor & Francis, New York, New York
Web: http://www.taylorandfrancis.com/

Provides information on cardiovascular toxicology, including biological mechanisms as factors in the toxicity of chemicals and drugs to the cardiovascular system,

methods and principles of cell injury, cardiotoxicants, and vascular toxicity.

Chiou GCY (1999)
Ophthalmic Toxicology, 2nd Edition
Taylor & Francis, Philadelphia, Pennsylvania
Web: http://www.taylorandfrancis.com/

Covers specific actions and affinities of ophthalmic poisons to various eye tissues, research methods in vivo and in vitro, toxicities of chemicals via systemic and/or local delivery, and medical treatment of chemical injuries.

Gad SC (2007)
Toxicology of the Gastrointestinal Tract
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Provides an overview of the gastrointestinal system involved in the toxicity of exogenous agents, including normal structures and functions, regulatory mechanisms of control, and the role of absorption and metabolism in the systemic toxicity of toxic agents.

Gardner DE (2006)
Toxicology of the Lung, 4th Edition
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Provides a comprehensive introduction to inhalation toxicology and environmental and occupational lung disease. Focuses on the assessment of findings from clinical human, animal toxicology studies, and in vitro model of pulmonary toxicology. Explores the value of procedures presently being used to evaluate the risks associated with airborne contaminants

Harry GJ, Tilson HA (2008)
Neurotoxicology, 3rd Edition
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Provides in-depth coverage of the neurobiological basis underlying neurotoxic sites and modes of action.

Hood RD (2006)
Developmental and Reproductive Toxicology, 2nd Edition
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Covers genomics/proteomics, endocrine disruptors, testing for male and female reproductive toxicity, data interpretation in developmental and reproductive toxicity testing, non-clinical juvenile toxicity testing, and the FDA perspective on risk assessment. It includes material on postnatal developmental milestones and extensive glossaries of developmental defect terminology.

Hoyer PB (2004)
Ovarian Toxicology
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Provides coverage on ovarian physiology, ovarian target sites, and the effects of specific chemicals demonstrated in animal studies and in human epidemiological data.

Luebke R, House R, Kimber I (2007)
Immunotoxicology and Immunopharmacology, 3rd Edition
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Provides the latest methodologies for estimating human health risk from exposure to drugs and chemical agents, includes sections on immunopharmacology and immunotoxicology of therapeutics, developmental immunotoxicology, and neuroimmunology.

Maibach HI (2001)
Toxicology of Skin
Taylor & Francis, Philadelphia, PA
Web: http://www.taylorandfrancis.com/

Provides findings in skin toxicology including irritant dermatitis, percutaneous absorption, allergic contact dermatitis, contact urticaria, as well as wound healing, dermatological drugs, and in vitro viability assays.

Plaa GL, Hewitt WR (1998)
Toxicology of the Liver, 2nd Edition
Taylor & Francis, Washington, DC
Web: http://www.taylorandfrancis.com/

Reviews the characteristics of chemically induced hepatotoxicity, its mechanisms, and cholestasis.

Pour PM (2006)
Toxicology of the Pancreas
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Discusses the detoxification and toxification process at the cellular and sub-cellular level, the distribution of phase 1 and phase 2 drug-metabolizing enzymes and their role in pancreatic disease, and the role of diet and toxicants on pancreatic disease, as well as the role of altered genes in the integrity of the pancreas, and comparative toxicology in humans and experimental animals.

Salem H, Katz SA (2005)
Inhalation Toxicology, 2nd Edition

CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Focuses on regulatory aspects of exposure and testing, testing equipment and methods, biomarkers, pathology, allergies, and immunology, irritation of the respiratory tract, and risk assessment. It also covers the inhalation of bioaerosols and toxins, ranging from anthrax to household molds. Other topics include low-level exposure toxicology, theory modeling, pharmaceutical aerosols, and the effects of individual toxicants such as tobacco smoke and chemical warfare agents.

Tarloff JB, Lash LH (2005)
Toxicology of the Kidney, 3rd Edition
CRC Press, Boca Raton, FL
Web: http://www.crcpress.com/

Focuses on the correlation between anatomy, biochemistry, and physiology of the kidney, and how this correlation is related to concepts of clinical nephrotoxicity and renal failure in humans and how animal models can be used to understand the mechanisms of human renal disease.

Zimmerman HJ (1999)
Hepatotoxicity: The Adverse Effects of Drugs and Other Chemicals on the Liver, 2nd Edition
Lippincott, Williams, & Wilkins, Philadelphia, PA

Provides coverage on general aspects of interactions between chemicals and the liver, an introduction to experimental hepatotoxicity, hepatic risks of chemicals in the environment, and drug-induced hepatic injury.

Journals

Alimentary Pharmacology & Therapeutics (1987–)
Blackwell Publishing, UK
Web: http://www.blackwellpublishing.com/journal.asp?ref=0269-2813

Concerned with the effects of drugs on the human gastrointestinal and hepato-biliary systems, particularly with relevance to clinical practice. The Journal accepts original papers concerned with all aspects of basic and clinical pharmacology, pharmacokinetics, and the therapeutic use of drugs in the alimentary tract including the liver, gall-bladder, and pancreas.

American Journal of Nephrology (1981–)
S. Karger AG, Switzerland
Web: http://www.karger.com/AJN

Focuses on timely topics including: basic science (cell, molecular, or animal research) and translational research dealing with mechanisms of disease or drug effects in man or animal models.

Birth Defects Research. Part B, Developmental and Reproductive Toxicology (2003–)
John Wiley & Sons, Inc., U.S.
Web: http://www.interscience.wiley.com/jpages/1542-9733/

Publishes articles focused on identifying the causes, mechanisms, and manifestations of abnormal development or reproduction, whether genetically, gestationally, or postnatally induced; and whether expressed as a lethality, malformation, growth retardation, or functional aberration.

Cardiovascular Toxicology (2001–)
Humana Press, Inc., U.S.
Web: http://www.humanapress.com/

Publishes articles that describe molecular mechanisms and signal pathways of cardiovascular toxicity, cardiovascular effects of environmental toxicants and pollutants, safety data of detrimental effects of new cardiovascular drugs and gene therapy, and the cardiovascular toxicity of non-cardiovascular drugs and therapies.

Current Opinion in Nephrology and Hypertension (1992–)
Lippincott Williams & Wilkins, U.S.
Web: http://www.co-nephrolhypertens.com/

Provides coverage on key subjects in nephrology, spanning topics such as circulation and hemodynamics; pathophysiology of hypertension; epidemiology and prevention; mineral metabolism; and pharmacology and therapeutics.

Cutaneous and Ocular Toxicology (2005–)
Taylor & Francis, Inc., UK
Web: http://www.tandf.co.uk/journals/titles/15569527.asp

Provides coverage on all types of harm to the cutaneous and ocular systems. Areas of particular interest include medical products, consumers and household products, as well as environmental and occupational exposures.

Frontiers of Gastrointestinal Research (1975–)
S. Karger AG, Switzerland
Web: http://www.karger.com/FGARE

Covers pathological, pharmacological, diagnostic, and therapeutic considerations relating to the digestive system, as well as the latest techniques and instrumentation used in the management of gastrointestinal disorders.

Hepatology (1981–)
John Wiley & Sons, Inc., U.S.
Web: http://www3.interscience.wiley.com/cgi-bin/jhome/106570044

Publishes articles concerning all aspects of liver structure, function, and disease as well as immunology, chronic hepatitis, viral hepatitis, cirrhosis, genetic and metabolic liver diseases and their complications, liver cancer, and drug metabolism.

Journal of Cardiovascular Pharmacology (1979–)
Lippincott Williams & Wilkins, U.S.
Web: http://www.cardiovascularpharm.com/

Provides information on the physiological and pharmacological bases of drug action, metabolism, drug interaction, side effects, and clinical results with both new and established cardiovascular drugs.

Journal of Cardiovascular Pharmacology and Therapeutics (1996–)
SAGE Publications, U.S.
Web: http://cpt.sagepub.com/

Offers cardiologists, clinical pharmacologists, and researchers involved in disease-relevant clinical and experimental investigations of newer cardiovascular drugs and other therapeutic options.

Immunopharmacology and Immunotoxicology (1987–)
Taylor & Francis, Inc., UK
Web: http://www.tandf.co.uk/journals/titles/08923973.asp

Specializes in coverage on immunomodifying agents to treat diseases such as cancer, immunodeficiency, chronic infection, allergy, and inflammatory and autoimmune disorders the action of agents on specific parameters of the immune system, mediated directly or through soluble cytokines secreted by various cellular components of the immune system the adverse or positive effects of xenobiotics on the immune system, including chemicals, metals, food additives, and airborne pollutants.

Inhalation Toxicology (1989–)
Taylor & Francis, Inc., UK
Web: http://www.tandf.co.uk/journals/titles/08958378.asp

Publishes articles addressing how the respiratory system functions in health and disease, the pathogenesis and mechanism of injury, extrapolation of animal data to humans, effects of inhaled substances on extra-pulmonary systems, and reliable and innovative models for predicting human disease.

International Immunopharmacology (2001–)
Elsevier B.V., Netherlands
Web: http://www.elsevier.com/

Aimed at publishing original research papers pertinent to the overlapping areas of immunology, pharmacology, cytokine biology, immunotherapy, immunopathology, and immunotoxicology.

Journal of Ocular Pharmacology and Therapeutics (1995–)
Mary Ann Liebert, Inc., U.S.
Web: http://www.liebertpub.com/publication.aspx?pub_id=40

Publishes articles addressing the pharmacokinetics and pharmacodynamics of biopharmaceuticals related to the treatment of the eye, and also a variety of other topics, including: glaucoma, cataracts, retinal degeneration, proliferative disorders of the eye, ocular infection, trauma, and toxicology, ocular drug delivery and biotransformation, ocular pharmacotherapy/clinical trials, gene therapy, ocular metabolic disorders, ocular ischemia and blood flow, and ocular inflammatory and immune disorders.

Neuropharmacology (1962–)
Elsevier B.V., Netherlands
Web: http://www.elsevier.com/

Includes broad coverage on a variety of topics including: neurotransmitters and their receptors, ion channels, systems (e.g. cognitive function of hippocampus), behavior, psychopharmacology (animal models of psychiatric disorders), depression, epilepsy, ischemia, neuroprotection, drugs of abuse, and pain.

NeuroToxicology (1979–)
Elsevier B.V., Netherlands
Web: http://www.neurotoxicology.com/journal.htm

Specializes in publishing original research papers dealing with the effects of toxic substances on the nervous system of humans and experimental animals of all ages. The Journal emphasizes papers dealing with the neurotoxic effects of environmentally significant chemical hazards, manufactured drugs, and naturally occurring compounds.

Neurotoxicology and Teratology (1979–)
Elsevier B.V., Netherlands
Web: http://www.elsevier.com/locate/neutera

Presents original reports of systemic studies in the areas of adult neurotoxicology and developmental neurotoxicology in which the primary emphasis and theoretical context are on the nervous system and/or behavior. The Journal publishes original studies that cover the developmental and adult neurotoxicity of pesticides, drugs of abuse, pharmaceuticals, solvents,

heavy metals, organometals, general industrial-use compounds, marine and plant toxins, atmospheric reaction compounds, and physical agents such as radiation and noise.

Pancreatology (2001–)
S. Karger AG, Switzerland
Web: http://www.karger.com/PAN

Dedicated to the understanding and treatment of pancreatic disease, this multidisciplinary periodical combines findings from various fields, including: gastroenterology, oncology, surgery, pharmacology, cell and molecular biology as well as endocrinology, immunology, and epidemiology, in order to present an integral picture.

Pulmonary Pharmacology & Therapeutics (1997–)
Elsevier B.V., Netherlands
Web: http://www.elsevier.com/

Broad coverage of the major diseases of the lung including asthma, cystic fibrosis, pulmonary circulation, ARDS, carcinoma, bronchitis, emphysema, and drug delivery.

Reproductive Toxicology (1988–)
Elsevier B.V., Netherlands
Web: http://www.elsevier.com/

Provides broad coverage on all aspects of reproduction, including the formation and maturation of male and female gametes, sexual function, the events surrounding the fusion of gametes and the development of the fertilized ovum, nourishment and transport of the conceptus within the genital tract, implantation, embryogenesis, intrauterine growth, placentation and placental function, parturition, lactation, and neonatal survival.

Skin Pharmacology and Physiology (2004–)
S. Karger AG, Switzerland
Web: http://www.karger.com/SPP

Aimed at the presentation of research on skin therapy, skin care, cosmeceuticals, quasi-drugs, and pharmacokinetics, pharmacodynamics, and xenobiotic metabolism in skin.

Vascular Pharmacology (1970–)
Elsevier B.V., Netherlands
Web: http://www.elsevier.com/

Provides broad coverage of vascular pharmacology, including angiogenesis, growth factors, nitric oxide, cell signaling, vasoactive mediators, hypertension, atherosclerosis, metabolic diseases, blood element–vessel wall interactions, thrombosis, microcirculation, vascular developmental biology and remodeling, vascular inflammation, and immunity.

Organizations

Behavioral Toxicology Society
John Chelonis, Secretary
Department of Psychology
State University of New York (SUNY), College at Brockport
350 New Campus Drive
Brockport, New York 14420
Email: jcheloni@brockport.edu
Web: http://www.behavioraltoxicology.org/

Formed in 1982, the BTS is a non-profit society that promotes excellence in scientific research into the effects of toxic agents on behavior and the nervous system; provides a forum for the presentation, discussion, and dissemination of relevant research; educates professionals and lay persons about the contributions to public health made in this field; and stimulates new growth and interest in behavioral toxicology in scientists engaged in the broader areas of behavioral sciences, neuroscience, toxicology, pharmacology, and risk assessment.

Dermal Toxicology Specialty Section
Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
Email: sothq@toxicology.org
Web: http://www.toxicology.org/isot/ss/specsection.asp#DERMAL

Founded in 1999, the objectives of the Dermal Toxicology Specialty Section are to provide a forum for the interaction of individuals involved in risk assessment, pharmacokinetics, dermal penetration/absorption, hypersensitivity and dermal toxicity, regulatory issues, basic skin biology, and other professionals working in the field of dermal research.

Immunotoxicology Specialty Section
Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
Email: sothq@toxicology.org
Web: http://www.toxicology.org/isot/ss/specsection.asp#IMMUNOTOXICOLOGY

Founded in 1985, the Immunotoxicology Specialty Section consists of members of the Society of Toxicology aimed at promoting immunotoxicology as a discipline by: (1) increasing the understanding of the impact that xenobiotics have on the immune system; (2) advocating research into the mechanisms of immunomodulation; and (3) encouraging the development of new methods and techniques to improve risk assessment.

Inhalation and Respiratory Specialty Section (ISS)
Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
Email: sothq@toxicology.org
Web: http://www.toxicology.org/isot/ss/specsection.asp#INHALATION

Founded in 1987, the ISS provides a focus for members of the Society of Toxicology dealing with the impact of airborne chemicals and particles on the body, including: indoor and outdoor air pollution, occupational exposure to airborne contaminants, therapeutic drug delivery by inhalation, deposition and pharmacokinetics of agents delivered by the inhalation route, and interactions between inhaled materials and infectious allergic stimuli.

International Neurotoxicology Association
Dr. Philip Bushnell, Secretary
Neurotoxicology Division, MD-B105-04
National Health and Environmental Effects Research Laboratory (NHEERL)
U.S. Environmental Protection Agency
Research Triangle Park, North Carolina 27711
Email: bushnell.philip@epa.gov
Web: http://www.neurotoxicology.org/

A non-profit association that holds annual meetings that promote collaboration between neurotoxicologists and scientists from other fields with the aim to delineate the basic mechanisms of neurotoxic insults. The INA's website provides visitors open-access to newsletters, information on forthcoming meetings, other links of interest, including a compilation of academic and government laboratories, books, reports, and book reviews, companies, industry laboratories and consulting services, grant information, neurotoxicology journals, and neurotoxicology societies.

International Society of Skin Pharmacology and Physiology
ISP Office
Ms. Susanna Ludwig, c/o S. Karger AG
Allschwilerstrasse 10
P.O. Box
CH-4009 Basel, Switzerland
Phone: 41 61 306 1280
Fax: 41 61 306 1234
Email: e.coscino@karger.ch
Web: http://www.isp-society.org/

Founded in 2003, the Society provides a high-profile international forum that promotes scientific activities of skin pharmacology and physiology, using molecular tools and state-of-the-art techniques and methodology.

Neurobehavioral Teratology Society
Dr. Susan M. Melnick, Secretary
SK Bio-Pharmaceuticals
22-10 State Route 208 South
Fair Lawn, New Jersey 07410
Email: melnicks@skbp.com
Web: http://www.nbts.org/

Established in 1977, the NBTS' purpose is to understand the behavioral and developmental alterations that result from genetic and environmental perturbations of the nervous system during the pre- and perinatal period. NBTS is also focused on communicating such findings to physicians, scientists, public health officials, and the general public in order to promote awareness and lessen the risks for teratologic occurrences in the population at large.

Neurotoxicology Specialty Section
Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
Email: sothq@toxicology.org
Web: http://www.toxicology.org/isot/ss/specsection.asp#NEUROTOXICOLOGY

Founded in 1983, the Neurotoxicology Specialty Section consists of members of the Society of Toxicology who are interested in the adverse effects of chemical, biological, or physical agents on the structure and function of the nervous system.

Reproductive and Developmental Specialty Section
Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3115
Fax: 703-438-3113
Email: sothq@toxicology.org
Web: http://www.toxicology.org/isot/ss/specsection.asp#REPRODUCTIVE

Founded in 1995, the Reproductive and Developmental Specialty Section consists of members of the Society of Toxicology focused on assessing toxicology of the reproductive system or development of offspring, including all areas of male and female reproductions, developmental biology, teratology, and developmental and reproductive risk assessment.

The Teratology Society
1821 Michael Faraday Drive, Suite 300
Reston, Virginia 20190
Phone: 703-438-3104
Fax: 703-438-3113
Email: tshq@teratology.org
Web: http://teratology.org/

Founded in 1960, the purpose of the society is to foster the exchange of information relating to congenital (birth) defects including their nature, cause, mechanism, and prevention by drawing from a wide range of scientific fields including pediatrics, anatomy, epidemiology, pharmacology and industrial toxicology, developmental biology, obstetrics, pathology, genetics, and dentistry.

Databases

Integrated Risk Information System
U.S. Environmental Protection Agency
Web: http://www.epa.gov/iris

An open-access, searchable database that contains human health assessments on over 500 chemicals. The 'Search IRIS' option allows users to identify chemicals that cause critical effects, precursor effects, or tumor types in specific tissues, e.g., liver, kidney, lung, etc.

IPCS INCHEM
International Programme on Chemical Safety
Web: http://www.inchem.org/pages/search.html

An open-access, searchable database that allows users to search by keywords (e.g., hepatotoxicity, nephrotoxicity, etc.) through multiple resources, including: Concise International Chemical Assessment Documents, Environmental Health Criteria Monographs, Poison Information Monographs, etc., to obtain organ-specific toxicant information.

IPCS INTOX Databank
International Programme on Chemical Safety
Web: http://www.intox.org/databank/index.htm

An online databank that contains physical, chemical, and toxicological information on chemicals, pharmaceuticals, animals, plants, bacteria, fungi, as well as treatment guides, antidotes, and supplemental documents.

The Merck Manual of Medical Information – Second Home Edition, Online Version
Merck & Co., Inc.
Web: http://www.merck.com/mmhe/index.html

An open-access, online manual with broad coverage of medical topics including: blood disorders; bone, joint, and muscle disorders; brain, spinal cord, and nerve disorders; digestive disorders; disorders of nutrition and metabolism; ear, nose, and throat disorders; eye disorders; heart and blood vessel disorders; hormonal disorders; immune disorders; infections; kidney and urinary tract disorders; liver and gallbladder disorders; lung and airway disorders; and skin disorders.

The Merck Veterinary Manual
Merck & Co., Inc.
Web: http://www.merckvetmanual.com/mvm/index.jsp

An open-access, online manual that provides in-depth coverage of advances in veterinary science, the emergence of new pathogens and new diseases, advances in diagnosis and treatment, and expanded coverage of specialty fields such as cardiology, neurology, ophthalmology, toxicology, and emergency medicine.

PathMax
Shawn E. Cowper, M.D.
Web: http://www.pathmax.com/

An open-access, online collection of links for general subject areas (e.g., medicine, pathology, anatomy) and specific subject areas (e.g., dermatopathology, hematopathology, neuropathology, etc.).

CHAPTER

48

Target Sites: Cardiovascular

TONY COX

INTRODUCTION

Cardiovascular toxicology has advanced rapidly in recent years, in part due to public health and policy needs to understand human health impacts of air pollutants such as diesel exhaust, environmental tobacco smoke, and fine particulate matter. Interactions of cardiovascular and other organ systems in complex diseases, such as chronic obstructive pulmonary disease, have also increased appreciation and use of cardiovascular toxicology by toxicologists in other areas. The books and articles in this section provide an up-to-date understanding of key principles, research issues, and applications of cardiovascular toxicology.

RESOURCES

Books

Acosta D, Jr (Ed.) (2001)
Cardiovascular Toxicology, Third Edition (Target Organ Toxicology Series)
Taylor & Francis, London and New York

Following an introduction to cardiovascular toxicology, this 17-chapter, multi-author book (available from the publishers in either hardcopy or as an e-book) explains molecular and cellular mechanisms and principles by which xenobiotics can potentially damage the cardiovascular system. Chapters discuss methods for investigating acute and chronic toxicity of drugs to the cardiovascular system, including in vitro cytotoxicity modeling, assessment of cardiovascular function in conscious animals, and use of mechanistic information on apoptosis and pathobiology of myocardial ischemic injury. Effects of particular agents (including antibiotics, lipopolysaccharides, catecholamines, CNS agents, steroidal agents, and chemotherapeutic agents) are reviewed in light of mechanisms by which xenobiotics or ischemic/hypoxic conditions may injure myocardial cells. A chapter entitled 'Passive Smoking Causes Heart Disease' argues for this conclusion. The book closes with major reviews of molecular- and cell-level mechanisms of vascular toxicology and the toxicity and pathobiology of drugs and chemicals to the myocardium and vascular system.

Web: http://www.amazon.com/Cardiovascular-Toxicology-Target-Organ/dp/0881679372
Note: Fourth Edition is scheduled for October, 2008.

Baskin SI (1991) (Ed.)
Principles of Cardiac Toxicology
CRC Press, Boca Raton, FL

This edited volume introduces principles and applications of cardiovascular toxicology to students and clinicians attempting to gain an understanding of how drugs and chemicals can impair cardiac or vascular tissues. The first three chapters cover anatomical, biochemical, and physiological principles of cardiac function and toxicology, respectively. Chapter 4 examines cardiac histopathology. The remaining chapters (5–18) discuss cardiotoxic effects of foods, organophosphates and related compounds, drugs (including digitalis and emetine and analogs) catecholamines, cyanide, trace metals, various cardiac depressants, and carbon monoxide.

Bishop SP, Kerns WD (1997) (Eds.)
Cardiovascular Toxicology
Elsevier Science, Inc., New York (Pergamon Imprint)
Web: http://www.elsevier.com/wps/find/bookvolume.cws_home/30368/vol8

This volume consists of 25 chapters, averaging about 20 pages each, by various experts, many from pharmaceutical companies, medical schools, and hospitals. Following an introductory chapter on the heart and blood vessels as target organs for toxic effects of xenobiotics, the book is divided into six sections: four chapters providing background on cardiovascular biology and molecular pharmacology; eight chapters on evaluation of the cardiovascular system by MRI, ECG, echocardiography, functional and morphological methods, and in vitro tests; three chapters on cardiovascular and responses to endothelial, smooth muscle, vascular, and myocardial injuries; eight chapters on cardiovascular toxicology (including pathogenesis of agent-caused arterial and myocardial lesions, inflammatory mechanisms of toxic and allergic reactions of the heart and blood vessels); and a final section on hazard identification and risk assessment, consisting of a single chapter on managing cardiovascular risk in phase 1 trials.

See also:

Dhalla NS, Rupp H, Aubie A, Pierce GN (Eds.) (2001)
Pathophysiology of Cardiovascular Disease (Series: Progress in Experimental Cardiology)
Kluwer Academic Publishers, Norwell, MA (now Springer, New York)

Discusses mechanisms, pathways, and experimental data on heart and vascular dysfunction and disease; ischemic heart disease; and therapeutic interventions.

Journals

Many journals address aspects of cardiovascular medicine, surgery, treatment, epidemiology, and drug research. However, relatively few journals specialize in cardiovascular toxicology. The following is an exception.

Cardiovascular Toxicology (2001–)
Humana Press, Totowa, NJ
Web: http://humanapress.com/index.php?option=com_journalshome&task=viewjournaldetails&journalmasterid=18&category=journals

Cardiovascular Toxicology publishes articles on molecular mechanisms and pathways of cardiovascular toxicity; safety data for new cardiovascular drugs; and experimental and clinical data and molecular biological studies elucidating adverse cardiovascular effects of environmental pollutants, drugs (both cardiovascular and non-cardiovascular) and therapies.

See also:

International Journal of Cardiology (1981–)
Elsevier, Amsterdam and New York
Web: http://ees.elsevier.com/ijc/

The *International Journal of Cardiology* publishes basic research and clinical papers on cardiology of interest to clinicians and research workers. The focus is not cardiac toxicology per se, but some articles do address toxic effects of drugs and molecular mechanisms of heart injury by drugs and other agents.

Journal of Molecular and Cellular Cardiology (1970–)
Elsevier, Amsterdam and New York (Academic Press Imprint, London and New York)
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/622889/description#description

The *Journal of Molecular and Cellular Cardiology* focuses on basic and clinical aspects of the molecular cell biology, physiology (for heart and smooth muscle), pharmacology, and pathophysiology of the heart and cardiovascular system. This focus includes experimental and clinical aspects of heart disease that reflect altered molecular and cellular properties of the heart and cardiovascular system, including its metabolism and cardiac performance and pathophysiology.

Environmental Health Perspectives (1972–)
Web: http://www.ehponline.org/docs/admin/about.html
The National Institute of Environmental Health Sciences (NIEHS), United States

Environmental Health Perspectives (EHP), published by the United States' National Institute of Environmental Health Sciences (NIEHS), is a leading monthly journal for research on potential impacts of the environment on human health. It has a section specifically on cardiovascular effects.

Toxicological Sciences (1998– Continues Fundamental and Applied Toxicology)
Oxford University Press, U.S.
Web: http://toxsci.oxfordjournals.org/

Toxicological Sciences is a publication of the Society for Toxicology. Although not specializing in cardiovascular toxicology, it does include some excellent articles on aspects of cardiovascular toxicology.

CHAPTER

49

Target Sites: Endocrine

KAREN CHOU

INTRODUCTION

The endocrine system, along with the nervous system, comprise the primary regulators of body metabolism. While the nervous system acts through electrical impulses and neurotransmitters, the endocrine system operates through chemical messengers called hormones. Hormone production is regulated by a chain of choreographed interactions of many endocrine organs. As a response to physiological and environmental stress, hormones are synthesized and secreted in a timely and quantitative manner. They travel in the bloodstream to different parts of the body to elicit characteristic cellular responses through hormone-specific receptors in target endocrine organs. Upon binding to receptors at target organs, the hormone–receptor complex initiates a cascade of signal transduction reactions, which ultimately modulate expressions of genes, thus regulating physiological and cellular reactions that are essential for reproduction, growth, development, immune reactions, and neurobehavioral functions.

Furthermore, hormone production is controlled by negative feedback mechanisms. When there is sufficient concentration of a hormone in circulation, a control mechanism will send signals back to the hormone-producing organ to inhibit further hormone production. This mechanism prevents excessive stimulation and maintains the stability of the cellular status.

Many environmental factors, including the light cycle, temperature, naturally occurring ingredients in food, and anthropogenic pollutants, interact with the endocrine system and influence hormone production. Substances with the ability to interfere with hormone levels in the endocrine system, however, do not necessarily pose any health risk for humans and other organisms. The endocrine system has the capacity to tolerate moderate external challenges by evoking the above-described adaptable control/feedback mechanisms, thus maintaining functional homeostasis of the body. However, deleterious health effects could occur when the control mechanisms of equilibrium are overwhelmed by excessive amounts of exposure to endocrine disruptors.

Endocrine dysfunction could result from having either an excessive or insufficient amount of hormone production or failure to induce proper cellular responses. Excessive amounts of hormones may be caused by overproduction, rapid release from storage, decreased rate of metabolism or decreased excretion, while insufficient amount of hormone production may be caused by decreases in hormone synthesis or release, increased rate of metabolism or rapid excretion. Cellular injury of endocrine organs and altered enzymatic activities of hormone synthesis and metabolism could be the underlying etiology of endocrine toxicity. Endocrine dysfunction may also result from exposure to substances with structures similar to hormones that are capable of binding to receptors, thus either mimicking the function of a hormone or inhibiting the function of the normal hormone–receptor complex. An endocrine toxic substance may also change the way hormones are transported in circulation by adhering to or changing the amount of hormone-binding protein. In such cases, either the total concentration of a hormone or the amount in free form (i.e. biologically available form) can be altered. Furthermore, hormones are also involved in the differentiation and development of interrelated endocrine organs and the nervous systems.

The potential of a substance to cause developmental effects depends not only on the amount of exposure, but also on the timing of exposure in an organism's stage of life. During gestation and prepuberty, morphological and functional development in a fetus and young animal are highly sensitive to endocrine-disrupting agents.

RESOURCES

Books

Beck-Peccoz P (Ed) (2004)
Syndromes of Hormone Resistance on the Hypothalamic-Pituitary-Thyroid Axis
Kluwer Academic Publishers Group, Dordrecht, Netherlands

A book in the *Endocrine Updates* series. The authors explore the fundamental mechanisms and pathogenesis for thyroid hormone structure–function defects and provide information on clinical syndromes of thyroid hormone and thyroid-stimulating hormone resistance, the mechanisms of action of the various hormones, etiopathology of the syndromes, instruments for diagnosis, as well as the difficulties in managing these diseases.

Chou K (2005)
Endocrine System
In: Encyclopedia of Toxicology, Wexler P, et al. (Eds.), 2nd Edition
Elsevier Inc., London

This chapter, in the second edition of *Encyclopedia of Toxicology*, provides a concise overview of the endocrine system and presents the major aspects of the biological nature of endocrine disruptors, including the maintenance of homeostasis of body functions and mechanisms of endocrine disorders. It also summarizes potential etiology of endocrine disruption by using examples of endocrine disruptors in the environment.

Chyczewski L, Niklinski J, Pluygers E (Eds.) (2001)
Endocrine Disruptors and Carcinogenic Risk Assessment
IOS Press, Amsterdam, Netherlands

As a volume in the *NATO Science Series: Life and Behavioral Sciences* (Volume 340), it is devoted to the study of the endocrine-related effects on human health with special reference to carcinogenesis and the assessment of carcinogenic risk. The topics include basic information at the general, cellular, and molecular levels. The paradigm of Biologically Based Risk Assessment is introduced.

Committee on Hormonally Active Agents in the Environment, National Research Council (1999)
Hormonally Active Agents in the Environment
National Academy Press, Washington, DC

This book examines the science behind the prospect of 'estrogen mimics' threatening health and well-being, from the level of ecosystems and populations to individual people and animals. The committee identifies research needs and offers specific recommendations to decision makers. It evaluates the literature on hormonally active agents in the environment; identifies known and suspected toxicological mechanisms and effects in fish, wildlife, and humans; and examines whether and how exposure to hormonally active agents occurs in diet, in pharmaceuticals, and from industrial releases into the environment. It also identifies significant uncertainties, limitations of knowledge, and weaknesses in the scientific literature. The book is available online: http://www.nap.edu/catalog/6029.html#toc.

Crain DA, Guillette LJ Jr (Eds.) (2000)
Environmental Endocrine Disruptors: An Evolutionary Perspective
Taylor & Francis, New York

This book deals with the research aspects of endocrine disruption caused by exposure to contaminants in humans and other mammals and vertebrates. It addresses the problem of endocrine-disrupting contaminates from an evolutionary, comparative perspective. Initial chapters provide a background on the evolution of the vertebrate endocrine system and the evolution of vertebrate systems associated with lipid storage and utilization. Additional chapters examine specific aspects of endocrine disruption, including effects on the reproductive, immune, and nervous systems, the liver, and thyroid. Each chapter takes into consideration the evolution of endocrine signaling, the comparative nature of the supporting data, and differential biological effects between adults and developing embryos.

Harvey PW, Rush KC, Cockburn A (Eds.) (1999)
Endocrine and Hormonal Toxicology
John Wiley & Sons, Chichester, UK

This book addresses the integrated role of the endocrine system and hormones in toxicological responses and the mechanistic and molecular basis for toxicity in organs. It discusses the types of endocrine toxicity, endocrine organs as toxicological targets, comparative endocrine carcinogenesis, and hormonal mechanisms of toxicity in the immune, nervous, cardiovascular,

hepatic, renal, dermal, gastrointestinal, and reproductive systems. Specific sections are devoted to endocrine-disrupting chemicals, hormonal mechanisms in breast cancer, and regulatory trends in endocrine and hormonal toxicology.

Haschek WM, Rousseaux CG, Wallig MA (Eds.) (2001)
Handbook of Toxicologic Pathology: Two-Volume Set, 2nd Edition
Academic Press, San Diego, CA.

This two-volume handbook describes principles of toxicology and toxicological pathology. In addition to general toxicology and pathology, Volume 1 focuses on the practice of toxicological pathology and selected topics on pathological testing, risk assessment, risk communication, and agent-specific pathological toxicology. It contains a specific chapter on environmental toxicants, including endocrine disruptors (ED) and heavy metals. Volume 2 contains 18 chapters of discussions of organ-specific toxicologic pathology with an emphasis on organ systems and the effects that toxicity has on their structure and functions. It also covers several endocrine system-related topics, including reproductive systems, the nervous system, and developmental toxicity.

Henshel DS, Black MC, Harrass MC (Eds) (1999)
Environmental Toxicology and Risk Assessment: Standardization of Biomarkers for Endocrine Disruption and Environmental Assessment, Eighth Volume, STP 1364
ASTM, West Conshohocken, PA

A collection of 29 peer-reviewed papers that provide information on invertebrate and vertebrate endocrine-disruptor screening assays and tests, in vitro endocrine-disruptor testing, and an industrial perspective on endocrine screening testing. It focuses on the use of biomarker endpoints in toxicology and risk assessment, including biochemical, developmental, behavioral, and endocrine indicators. Specific topics include aquatic toxicology, behavioral toxicology, biochemical indicators, developmental indicators, endocrine indicators, biodegradation, and fate of chemicals, quality assurance and quality control within laboratory and field studies, risk assessment and communication, and harmonization of standards development. This may be a reference book for professionals dealing with product and chemical safety and chemical treatment and disposal issues.

Keith LH (1997)
Environmental Endocrine Disruptors: A Handbook of Property Data
Wiley, New York

Available in both print and electronic form, this book provides information on chemical, physical, and toxicological properties of known and suspected environmental endocrine disruptors, including properties and analytical methods for 67 agents. A searchable CD-ROM version is also available.

Keith LH, Jones-Lepp TL, Needham LL (Eds.) (2000)
Analysis of Environmental Endocrine Disruptors
American Chemical Society, Blacksburg, Virginia

This is a collection of lectures of the American Chemical Society Symposium series, focusing on several endocrine disruptors, their adverse effects on humans and animals, as well as related regulatory approaches. For the exposure and environmental contamination assessment, there are sections that describe the sources of endocrine disruptors, strategies for screening, and methods of monitoring environment media, including techniques of chemical analysis and bioassays.

Kendall R, Dickerson R, Giesy J, Suk W (Eds.) (1998)
Principles and Processes for Evaluating Endocrine Disruption in Wildlife
SETAC Press, FL

This is a joint effort of scientists from academia, government, and industry, as a result of the Workshop on Principles and Processes for Evaluating Endocrine Disruption in Wildlife (1996). It provides principles and processes for evaluating the effects of endocrine-disrupting chemicals in wildlife. It is written as a reference for educational purposes for environmental and industrial managers and planners in their decision-making involving endocrine-disrupting chemicals and protecting wildlife.

Lechago J, Gould VE, Bloodworth JMB (Eds.) (1997)
Bloodworth's Endocrine Pathology, 3rd Edition
Williams & Wilkins, Baltimore, MD

A review of endocrine system pathology, covering the aspects of mechanisms of hormone action, molecular and cellular basics of endocrine neoplasia, neurohypophysis, hypothalamus, and the pineal gland. The discussion includes endocrine aspects of the male and female reproductive systems.

McLachlan JA, Guillette LJ, Iquchi T, Toscano WA, Jr (Eds.) (2001)
Environmental Hormones: The Scientific Basis of Endocrine Disruption
New York Academy of Science, New York

This volume of the Annals of the New York Academy of Sciences aims to assist molecular endocrinologists, clinicians, and field biologists in their understanding of endocrine-disruption-related cellular and molecular biology, clinical medicine, and ecosystem dynamics.

Metzler M (Ed.) (2001)
Endocrine Disruptors, Part 1 and Part 2
Springer-Verlag, Berlin, Heidelberg, New York

As a part of the Handbook of Environmental Chemistry series, these two books are sub-volumes within the *Endocrine Disruptors: Volume 3*, dealing with endocrine disruption and endocrine active compounds. It covers the major classes of endocrine active chemicals, methods for their detection and their association with health disturbances in humans and wildlife. The etiology of several endocrine-disruptor-associated human diseases is illustrated. The book also stresses the concept that hormonally active agents can cause both adverse and beneficial effects.

Naz RK (Ed.) (1999)
Endocrine Disruptors: Effects on Male and Female Reproductive System
CRC Press LLC, Boca Raton, FL

This book examines the reproductive and health hazards of endocrine disruptors in the environment. It provides collective knowledge from multiple disciplinary areas, from epidemiology to the etiology of endocrine disruptions, with an emphasis on the effects and mechanisms of their action on sex differentiation during development, fertility, and breast cancer. It also addresses the effects of endocrine disruption on the male reproductive system, focusing on male fertility and the development of benign prostate hyperplasia and prostate cancer.

Norris DO, Carr JA (Eds.) (2005)
Endocrine Disruption: Biological Bases for Health Effects in Wildlife and Humans
Oxford University Press, New York

This is a three-volume book that describes the mechanisms, activities, risks, and health effects of the six most recognized chemical classes of endocrine disruptors: dioxins and other halogenated aromatic hydrocarbons, PCBs, DDT and other organochlorine pesticides, heavy metals, alkylphenol surfactants, and natural plant chemicals.

Journals

Birth Defects Research, Part B, Developmental and Reproductive Toxicology
John Wiley & Sons, Inc., Hoboken, New Jersey
Web: http://sciserver.lanl.gov/cgi-bin/sciserv.pl?collection=journals&journal=15429733

Original research and reviews in fields related to embryo-fetal development and reproduction, effects of chemical, biological, or physical agents on any aspect of the reproductive cycle, including the endocrine control of reproduction and development, safety studies, the mechanism of action of a toxicant or its risk to humans. There are also letters to the editor, short reviews, and commentaries.

BMC Endocrine Disorders
BioMed Central, London
Web: http://www.biomedcentral.com/bmcendocrdisord/

Original peer-reviewed research articles in all aspects of the prevention, diagnosis, and management of endocrine disorders, as well as related molecular genetics, pathophysiology, and epidemiology.

Clinical Endocrinology (1965–)
Blackwell Publishing, Malden, MD
Web: http://www.blackwellpublishing.com/journal.asp?ref=0300-0664&site=1

Papers and reviews which focus on the clinical aspects of endocrinology, including the clinical application of molecular endocrinology. It features reviews, original papers, commentaries, cases of the month, book reviews, and letters to the editor.

Comparative Biochemistry and Physiology Part C. Pharmacology, Toxicology and Endocrinology
Pergamon-Elsevier Ltd.
Web: http://www.sciencedirect.com/science/journal/07428413

The Journal receives editorial direction from all of the major societies in the field. It publishes articles concerned with chemical and drug action at different levels of organization, biotransformation of xenobiotics, mechanisms of toxicity, including reactive oxygen species and carcinogenesis, endocrine disruptors, natural products chemistry, and signal transduction with a molecular approach to these fields.

Endocrine-Related Cancer
Society for Endocrinology, Chevy Chase, MD
Web: http://erc.endocrinology-journals.org/

A global forum for basic, clinical, and experimental investigations which concern endocrine-related cancer in human and animal subjects. The journal publishes reviews, both submitted and commissioned, and also, from time to time, the proceedings of the world's key meetings in the field. Original research papers are only published if they are of exceptional quality. All papers are peer-reviewed and published with the minimum of delay.

Endocrine Reviews (1980–)
Endocrine Society, Chevy Chase, MD

Web: http://intl-edrv.endojournals.org

This journal contains reviews of the recently published books, articles, and other publications relating to the study of the endocrine system, such as endocrine disruptors and endocrine toxicology.

General and Comparative Endocrinology
Elsevier Inc., London
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/622837/description?navopenmenu=−2

The Journal has a strong focus on basic endocrinology and occasionally features brief reviews. The topics include cellular mechanisms of hormone action; functional, developmental, and evolutionary aspects of vertebrate and invertebrate endocrine systems; neuroendocrinology and reproductive biology.

Reviews in Endocrine & Metabolic Disorders (2000–)
Springer, Netherlands
Web: http://www.ingentaconnect.com/content/klu/remd

A relatively new quarterly review journal in which articles are limited to 8 to 10 pages long, to appeal to both clinical and academic endocrinologists. It includes both basic science and clinical knowledge in the broad area of endocrinology and metabolism. Each issue, with ten to twelve articles, is devoted to a single topic; with some topics extending over multiple issues.

Trends in Endocrinology and Metabolism
Elsevier Inc., London
Web: http://www.sciencedirect.com/science/journal/10432760

A review journal with ten issues per year. It provides critical reviews of recent advances across the field of endocrinology and metabolism. The content focuses not only on fundamental research but also on clinical disease and advances in therapy. Articles are directly commissioned from authors by the Editor-in-Chief on the basis of recommendations from the editorial board and other researchers to ensure that coverage encompasses the most interesting and important advances in the field of endocrinology, and that the articles are written by knowledgeable and respected authors. It also contains reports on meetings and symposia, correspondence, and book reviews.

Organizations

Agency for Toxic Substances and Disease Registry (1980)
ATSDR Region 8
999 18th Street
Denver, CO 80202-2466
Phone: 303-312-7010
Fax: 303-312-7018
Phone: 1-888-422-8737
Email: tucker.glenn@epa.gov
Web: http://www.atsdr.cdc.gov

The Agency for Toxic Substances and Disease Registry (ATSDR) is a federal public health agency based in Atlanta, Georgia, under the U.S. Department of Health and Human Services. ATSDR's mission is to 'serve the public by using the best science, taking responsive public health actions, and providing trusted health information to prevent harmful exposures and disease related exposures to toxic substances.' It produces 'Toxicological Profiles' for hazardous substances found at National Priorities List sites. Endocrine-disrupting nature is reviewed in many of the chemical specific 'Profiles.' The agency also conducts many in-class and distance education and training programs to the public, environmental researchers, and health professional on many environmental health related topics, which include public health assessments, exposure investigation, community involvement, and health risk communication.

U.S. Environmental Protection Agency
Ariel Rios Building
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460

Email: opp-web-comments@epa.gov
Web: http://www.epa.gov

The United States Environmental Protection Agency (USEPA), first established in 1970, aims to protect human health and the environment. USEPA leads the nation's environmental science, research, education, and assessment efforts by developing and enforcing regulations, offering financial assistance, performing environmental research, sponsoring voluntary partnerships and programs, advancing environmental education, and publishing related information. To achieve its multiple goals, the USEPA consisted of many divisions, centers, offices and laboratories, including the National Exposure Research Laboratory (NERL), Office of Pollution Prevention and Toxic Substances, Congressional and Intergovernmental relations, Office of Science Coordination and Policy, Office of Research and Development and the National Agriculture Compliance Assistance Center. Many of the USEPA's programs have components related to managing endocrine disruptors in the environment. Examples of these programs are the Endocrine Disruptor Screening Program, Endocrine Disruptors Research Initiative, Brownfield Program, and the NERL Endocrine Disruptor Compounds Research.

The Endocrine Society
8401 Connecticut Avenue
Suite 900
Chevy Chase, MD 20815-5817
Phone: 301-941-0200
Web: http://www.endo-society.org/

The Society holds annual scientific meetings focusing on the recent developments in endocrinology. It publishes four peer-reviewed journals about endocrinology and metabolism: *The Journal of Clinical Endocrinology and Metabolism, Endocrinology, Molecular Endocrinology,* and *Endocrine Reviews*. These journals provide information on advances in endocrine research and clinical treatment of endocrine disorders such as diabetes, reproductive dysfunction, osteoporosis, thyroid disease, obesity/lipids, growth hormone, pituitary tumors, and adrenal

insufficiency. Its members represent a broad range of disciplines associated with endocrinology, including clinicians, researchers, educators, fellows, students, industry professionals, and health professionals.

Society for Endocrinology
22 Apex Court, Woodlands, Bradley Stoke, Bristol
BS32 4JT, UK
Phone: +44 (0)1454 642200
Fax: +44 (0)1454 642222
Reg. in England No. 349408
Reg. Charity No. 266813
Web: http://www.endocrinology.org/

This is an international society based in the United Kingdom. Its members include researchers, clinicians, and nurses who work with hormones. The society's primary foci are to provide a focus for sub-specialties within endocrinology to strengthen the overall discipline and provide a framework for different groups to come together to communicate and promote interdisciplinary interests within the Society; and to increase the profile of endocrinology as a specialty.

Databases

Endocrine Disruptors Knowledge Base (EDKB)
National Center for Toxicological Research,
U.S. Food and Drug Administration
Web: http://www.fda.gov/nctr/science/centers/toxicoinformatics/edkb/index.htm

This searchable database contains biological activity information, QSAR training sets, and computational models to predict estrogen and androgen activity. It is designed 'to serve as a resource for research and regulatory scientists and other interested parties to make use of an existing body of knowledge, foster the development of computational predictive toxicology models, and reduce dependency upon slow and expensive animal experiments.' It also provides website links to access other datasets and online models. The Knowledge Base is administered by NCTR's Center for Toxicoinformatics.

Other Resources

Endocrine News
Endocrine Society, Chevy Chase, Maryland
Web: http://www.endo-society.org/news/endocrine_news/

A monthly magazine published by The Endocrine Society. It is the source of trends and insights for members of the endocrine community. Special sections include Trends & Insights, Viewpoint, Spotlight on Policy, Feature Articles of Tri-Point Series (series explore subject areas from three different angles – the basic researcher, the clinical researcher, and the physician in practice), Practice Resources, A Look Back, and a Classified Section.

Our Stolen Future
Web: http://www.ourstolenfuture.org/

This is the website for the authors of the book 'Our Stolen Future,' where regular updates about science related to endocrine disruption are posted. 'The book Our Stolen Future brought world-wide attention to scientific discoveries about endocrine disruption and the fact that common contaminants can interfere with the natural signals controlling development of the fetus.' The website contains recent developments and information on endocrine disruptors. The site also has links to other related websites. There is also information regarding policy debates and a forum for public inputs.

CHAPTER

50

Target Sites: Gastrointestinal

MARION JOSEPH FEDORUK

The gastrointestinal (GI) system is composed of a luminal GI tract lined by mucous membranes and associated digestive organs, including the liver, exocrine pancreas, and gallbladder. This chapter focuses on the GI tract. The liver and pancreas are discussed in other sections of this book.

The primary function of the GI tract is absorption of nutrients, ions, and water from foods and water. This requires digestion that involves the breakdown or hydrolysis of food into smaller molecules in preparation for absorption into the body. Absorption refers to the transport of nutrients, ions, and water across intestinal cells into the body for metabolism.

The GI tract consists of five general segments, each with various specialized cell types that reflect a unique function. The oral cavity and hypopharynx initiate the process of digestion by mechanically breaking down and mixing food with salivary enzymes. The esophagus, a gullet, propels food from the hypopharynx to the stomach. The stomach further digests food by secreting gastric acid and the proteolytic precursor enzyme pepsinogen, which break down food. The stomach also churns food into smaller sizes through peristaltic action. Food is stored in the stomach and released to the small intestine in a controlled fashion to facilitate optimal absorption.

Absorption occurs primarily in the small intestine, which consists of three segments: duodenum, jejunum, and ileum. Pancreatic juices and enzymes are secreted into the proximal small intestine (duodenum), where they assist in digestion by breaking down nutrients into small molecules that can be absorbed directly. Bile acids are secreted through the bile duct into the duodenum to help form micelles that emulsify and facilitate the absorption of lipids. Most absorption occurs in the jejunum and ileum. The colon, the final segment of the GI tract, largely serves to absorb water and ions, including sodium, magnesium, and chloride, from undigested food passed from the ileum. Non-digestible carbohydrates, or fiber, and other unabsorbed materials are mixed with intestinal bacteria, known as gut flora, to form solid feces, which are stored and later eliminated from the colon.

The GI tract tube consists of (1) an inner mucosal layer that contains mucus-secreting cells and specialized cells; (2) a submucosal layer that consists of loose connective tissue containing blood and lymphatic vessels, inflammatory cells, and nerve fibers; (3) a muscular layer containing many smooth muscles, which is responsible for peristalsis and emesis; and (4) a serosal layer or covering that encloses the tube.

The epithelial cell is the most specialized cell in the intestine. This cell provides a barrier between the intestinal contents and the interior of the tube. Epithelial cell functions include nutrient absorption and immune response, which includes signaling to immune cells about the presence of microbial pathogens in the gut. The epithelial cell compartment is also one of the most rapidly proliferating pools of cells in the body and is very sensitive to xenobiotics or radiation that affect cell cycles.

The lymphatic tissue forms the GI mucosal immune system, which represents the largest lymphoid compartment in the human body. The neural tissue found throughout the GI tract is organized into a neural plexus that functions as an enteric nervous system and coordinates movement of luminal contents through the GI tract. Metabolism of ingested xenobiotics may occur

in the GI tract. Intestinal epithelial cells can metabolize compounds through multiple enzymatic pathways, including glucoronidation, sulfation, acetylation, and hydroxylation. Similar enzymes are also found in liver cells. Intestinal epithelial cells also contain export pumps that may secrete xenobiotic agents into the intestinal tract. Many factors may affect intestinal enzyme and/or export pump activity, including other xenobiotics, foods, or herbal products. For example, ingestion of grapefruit juice is recognized to inhibit intestinal CYP3A, possibly leading to exaggerated effects from statins and calcium channel blockers. Also, levels of enzymes such as glucuronidases vary significantly among individuals and may play a role in the detoxification of carcinogens and colorectal cancer.

The GI tract is colonized by endogenous bacteria or host flora. Over 40 types of bacteria have been detected in the intestine. There are approximately ten times more bacteria in the gut than human cells in the body. Host flora perform metabolic functions and serve to ferment undigested carbohydrates in the colon into short-chain fatty acids, which can be used for energy by colon cells. Host flora also play a role in immunity, growth repression of harmful microorganisms, growth of epithelial cells, and biotransformation of xenobiotics. Loss of intestinal flora following antibiotic therapy can lead to overgrowth of pathogenic organisms. Probiotic formulations of bacteria that are non-pathogenic and part of the human flora may be used as prophylatics or therapeutic agents for certain GI conditions.

From a toxicological perspective, the GI tract is an important organ system, because it serves as a site of entry for a broad array of toxicants. The GI tract has the second-largest surface area, after the lung, which is in direct contact with the external environment. Agents contacting the GI tract include foods, food contaminants, oral medications, and environmental contaminants found in water and soil that are swallowed inadvertently. Ingestion cases represent about 78% of the two million calls made to the U.S. Poison Control Centers in 2004. In addition, inhaled particles can be cleared from the lung via the mucociliary tree, and subsequently swallowed, resulting in direct contact with GI mucosa.

Agents known to cause inflammation of the stomach include caustics, arsenic, iron, mercuric chloride, alcohols, antineoplastics, salicylates, podophyllin, and non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs also interfere with the gastric mucosal barrier by inhibition of cyclooxygenase. Caustics (e.g., sodium hydroxide found in lye, drain cleaners) can produce severe liquefactive necrosis of the esophagus and permanent scarring. The type of toxic effect that is manifested depends on several factors, including the chemical characteristics of the agent, dose, magnitude of exposure, and type of tissue involved. Factors that affect the degree of tissue injury or destruction include the amount ingested, duration of contact with tissue, concentration, pH, physical form, and titratable alkaline and acid reserve.

Gastrointestinal function can also be affected by interaction with cellular receptors of the enteric nervous system. Stimulation of cholinergic muscarinic receptors by agents such as cholinesterase inhibitors (organophosphate pesticides and carbamates) and nicotine and opioid withdrawal can lead to an increase in motility and secretions of the GI tract. This process can lead to symptoms of abdominal pain, cramps, and diarrhea. Similarly, the administration of drugs that block with cholinergic muscarinic receptor functioning (e.g., atropine, tricyclic antidepressants, opiates, and sedative hypnotic medications) can slow motility and lead to constipation. In general, agents that exhibit parasympathetic activity promote motility while sympathetic agents decrease motility.

Indirect toxic effects of xenobiotics include vomiting as a consequence of the interaction of a chemical with the central chemoreceptor zone or vomiting center in the fourth ventricle of the brain. Glycosides, opiates, nicotine, and possibly carbon monoxide may act in this manner. Vomiting can also occur as a consequence of local GI-tract stimulation from a wide array of agents, including soaps, detergents, solvents, metals (e.g., arsenic and thallium), and toxins associated with several types of food poisoning.

The GI tract can also be a site of hypersensitivity reactions. For example, angioedema of the mouth, including the pharynx, can occur following use of several medications, including ACE inhibitors. The reaction is mediated via immunoglobin E (IgE).

Cancers of the GI tract constitute a large proportion of malignancies in the U.S. In 2006, GI cancers represented about 20% of all cancer deaths in the U.S., while colon cancers were nearly 10%, pancreas 5%, and esophagus and stomach 4.5%. Multiple causal factors have been postulated for one or more of these cancers, including diet, smoking, alcohol, medications, occupation, environment (including water and air pollution), and ionizing radiation. There are considerable geographic differences between cancer incidence of the same organ. In addition, migration studies have demonstrated that migrants who move to new countries, over time, will experience the same risks or cancer rate as people in the host country for some GI tumors.

Oral cavity cancers have been associated with cigarettes, alcohol, chewing tobacco or snuff, or betel nut quid (popular in parts of Asia). Esophageal cancer has

been related to the use of alcohol and nitrosamines and possibly chewing of betel nut. Diets high in fats and red meats may increase the risk of colon cancer by changing the intestinal flora or increasing the concentration of bile acids due to a secondary effect on metabolism of xenobiotics. Negative associations have been associated with intake of fresh vegetables and meats. Cancer of the rectum not only shares some risk factors with colon cancer overall, but also has distinct characteristics possibly related to sexually transmitted infections, chronic inflammation, and cigarette smoking.

RESOURCES

Books

Gad S (Ed.) (2007)
Toxicology of the Gastrointestinal Tract
Target Organ Toxicology Series
CRC Press, Boca Raton, FL.

Part of the Target Organ Toxicology Series, this is one of the few textbooks that address GI-tract toxicology. The chapters describe GI-tract anatomy, function, development, and functional assessment, as well as canine GI function, GI toxicology, and animal models to assess GI toxicity.

Kotler K, Flomenbaum N (2006)
Gastrointestinal Principles
In: Goldfrank's Toxicologic Emergencies (Chapter 25). Flomenbaum NE, Goldfrank LR, Hoffman RS, Howland MA, Lewin NA, Nelson LS (Eds.), Eighth edition
New York, McGraw-Hill.

This authoritative medical toxicology text is an excellent review of GI-tract anatomy, physiology, and pathology, and the toxicological effects of medications, biologic agents, radiation, and household products on GI function. This text describes symptom patterns, clinical findings, and medical management of a broad range of agents that can affect the GI system through direct and indirect mechanisms.

Shottenfeld D, Fraumeni J (Eds.)
Cancer Epidemiology and Prevention, 2nd Edition
New York, Oxford University Press.

This authoritative text discusses cancer epidemiology and causation, with detailed discussion of environmental, occupational, medicinal, dietary, infectious agents, ionizing, and solar radiation risk factors. This text includes separate chapters for cancers of the oral cavity and pharynx, esophagus, stomach, pancreas, small intestine, and large intestine.

Journals

Gastroenterology

This is the official journal of the American Gastroenterological Association (AGA) Institute (http://www.gastro.org). The publication website of AGA has lists of relevant listings of resources such as journals, reports, and books related to gastroenterology. It is the most important and popular journal in the field of GI-related disease and toxicology. It delivers up-to-date and authoritative coverage of both basic and clinical gastroenterology. Articles and reports by leading researchers on the latest treatments for diseases, and an exclusive correspondence section provides important information related to GI tract diseases and toxicology. Original research is organized into the Clinical Alimentary Tract; Clinical Liver, Pancreas and Biliary; Basic Alimentary Tract; and Basic Liver, Pancreas and Biliary. This journal also bridges the gap between basic and clinical science based on their publications of comprehensive reviews on important topics such as pancreatitis and liver disease. Additional features may include monthly special features in Gastroenterology, Gastroenterology and Hepatology News, Imaging and Advanced Technology, Clinical Challenges and Images in GI, Selected Summaries, Print and Media Reviews, Continuing Medical Education Activities, Editorials, Correspondence, and Biographical Sketches. This journal was ranked 1st out of 48 gastroenterology and hepatology titles on the 2006 ISI Journal Citation Reports®, published by Thomson Scientific (excerpted from http://www.gastrojournal.org/).

Journal Articles

Toxin-induced GI-tract pathology

Parora AS, Murray JA (2000) Iatrogenic esophagitis. Curr. Gastroenterol. Rep. 2(3): 224–229.

This paper examines nearly 1000 reported cases of drug-induced esophagitis. The article describes medications that have caused esophagitis. Associated clinical features are also described.

Parfitt JR, Driman DK (2007) Pathological effects of drugs on the gastrointestinal tract: A review. Hum. Pathol. 38(4): 527–536.

This review describes the morphological and pathophysiological features of drug-related injury of the upper and lower GI tract. Pathological findings associated with common medications are described. Practical guidelines for the recognition and diagnosis of drug-induced GI pathology are also proposed.

Price AB (2003) Pathology of drug-associated gastrointestinal disease. Br. J. Clin. Pharmacol. 56(5): 477–482.

This article describes diagnostic criteria for drug-associated GI disease, including histological features of the gut associated with drug-related GI disease, and clues for diagnosing a drug-induced injury.

Agent-specific publications

Fortun PJ, Hawkey CJ (2007) Nonsteroidal antiinflammatory drugs and the small intestine. Curr. Opin. Gastroenterol. 23(2): 134–141.

This article is an examination of literature concerning the toxic effects of non-steroidal anti-inflammatory drugs on small-bowel toxicity, and development of a subclinical small-bowel enteropathy. The clinical relevance and role of non-cyclooxygenase-mediated toxicity mechanisms of action are discussed.

Franke A, Teyssen S, Singer MV (2005) Alcohol-related diseases of the esophagus and stomach. Dig. Dis. 23(3–4): 204–213.

This article reviews the effects of acute and chronic alcohol consumption on function, inflammation, and cancer of the esophagus and the stomach. Pathophysiologic mechanisms for esophageal and gastric diseases are reviewed.

Guarner F (2006) Enteric flora in health and disease. Digestion 73(Suppl 1): 5–12.

This paper examines the scientific literature concerning the role of bacterial enteric flora on digestion and absorption. It covers intestinal, epithelium, and immune function and disease, including colon cancer, inflammatory bowel disease, and multi-organ failure.

McGarr SE, Ridlon JM, Hylemon PB (2005) Diet, anaerobic bacterial metabolism, and colon cancer: A review of the literature. J. Clin. Gastroenterol. 39(2): 98–109.

This literature review analyzes publications on the relationships between dietary habits, microbial flora, and cancer risk. Use of fecal flora analysis for colon cancer screening and diagnosis are also evaluated. Special discussion on bile acid metabolism is included. Chemopreventive, anticarcinogenic, and detoxifying activities of probiotics are discussed.

Niazi M, Kondru A, Levy J, Bloom AA (1997) Spectrum of ischemic colitis in cocaine users. Dig. Dis. Sci. 42(7): 1537–1541.

This article describes the clinical, endoscopic, and histopathologic findings observed in seven patients with cocaine colitis.

Ramasamy K, Gumaste VV (2003) Corrosive ingestion in adults. J. Clin. Gastroenterol. 37(2): 119–124.

This article is a review of medical management of corrosive substance ingestion and factors that affect clinical outcomes. Acute and chronic effects from ingestion and the role of steroid therapy are examined.

Salzman M, O'Malley RN (2007) Updates on the evaluation and management of caustic exposures. Emerg. Med. Clin. North Am. 25(2): 459–476.

This article provides guidelines for medical management of caustic ingestions, including controversies in patient care. Management of hydrofluoric acid ingestion, including use of antidotes, is also addressed.

Online web-based resources

American Cancer Society
Web: http://www.cancer.org/docroot/home/index.asp

This site provides information on GI and other cancers, cancer screening guidelines, and the roles of alcohol, nutrition, and other factors in cancer development.

GastroSource
Web: http://www.gastrosource.com/frameset_GI_NEW.asp

This free online website, maintained by Astra Zeneca, contains scientific and educational material for healthcare professionals interested in gastroenterology. Site content is targeted to clinical diagnosis and treatment of GI diseases. This source provides teaching materials, including access to PowerPoint® slides concerning NSAIDs toxicity. This site is dedicated to publication updates on NSAIDs.

CHAPTER

51

Target Sites: Hematopoietic

TONY COX

INTRODUCTION

Understanding of hematopoiesis (blood formation) has improved dramatically in recent years, due in part to rapid discovery and progress in two areas: (1) Improved molecular-biological understanding of the roles of the cytokine network and of the multiple roles and interactions of individual cytokines and their receptors in regulating hematopoiesis and maintaining homeostasis; and (2) Biomathematical and computer simulation models of normal and perturbed hematopoiesis. There are many other important aspects to hematopoiesis toxicology, including the crucial roles played by the bone marrow stromal microenvironment, marrow enzymes, and interactions among events in the bone marrow (the primary site of adult hematopoiesis) and in other systems (especially the immune system) and organs involved in development and regulation of hematopoiesis (e.g., the liver and kidney). Recent advances in understanding regulation of hematopoiesis by the cytokine network and quantitative simulation modeling of hematopoiesis have each been very fruitful in focusing, consolidating, and organizing the huge amounts of information now available about hematopoiesis to make it more useful in toxicology research and applications.

This section identifies resources that can be used to help quickly understand aspects of the current state-of-the-art in hematopoiesis that are most useful in toxicology and modeling. Over 60 journals and dozens of high-quality monographs and textbooks deal with aspects of hematotoxicity and hematopoiesis. Therefore, this section emphasizes resources that synthesize much of what is known and that provide practical computational models that can be used in planning and interpreting results of hematotoxicity investigations.

RESOURCES

Books

The following texts provide useful overviews of hematopoiesis and summaries of experimental and clinical methods and data. Although more recent work has deepened understanding of many details, even the older books on this list are still useful today. A newcomer to this area might begin with early chapters in the introductory texts of McKenzie or Stevens for quick overviews of normal and perturbed hematopoiesis, then read relevant chapters in the collections edited by Irons and by Zon.

Irons RD (Ed.) (1985)
Toxicology of the Blood and Bone Marrow
Raven Press, New York

Provides an overview of hematology and a summary of methods and approaches to the study of blood and bone marrow toxicity. Areas covered include development, structure, and function of the bone marrow, regulation of hemopoiesis, toxicology of the erythrocyte and granulocyte/macrophage lineages, use of stem cell assays, flow cytofluorometry, and cytogenetic techniques for assessing bone marrow damage.

McKenzie SB (2009)
Clinical Laboratory Hematology 2nd edition
Pearson/Prentice Hall, USA
ISBN-10: 0135137322
ISBN-13: 978-0135137321

Web: http://www.amazon.com/Clinical-Laboratory-Hematology-Shirlyn-McKenzie/dp/0130199966

Succinctly reviews the structure and function of hematopoietic organs and normal blood cells. This text gives an up-to-date introduction to clinical hematology, emphasizing the use of a range of laboratory techniques and diagnostic tests to identify leukemic, myelodysplastic, and non-leukemic disorders of hematopoiesis. A related free website offers supplementary information and on-line quizzes on key topics. This site is at: http://wps.prenhall.com/chet_mckenzie_clinicallabhema_1/0,7639,700799-main,00.html/.

Metcalf D (1988)
The Molecular Control of Blood Cells
Harvard University Press, Cambridge, MA
ISBN: 0674581571
ISBN-13: 978-0674581579

This short, beautifully written monograph introduces the key colony-stimulating factors (CSFs) involved in regulating the differentiation and maturation of granulocytes and macrophages and discusses their interactions and roles within hematopoiesis. (The edited volume by Zon updates much of this material, and includes an introductory survey paper by Metcalf, but is much longer.)

Stevens M (1997)
Fundamentals of Clinical Hematology
Saunders, Philadelphia
ISBN: 0721641776

Gives a relatively brief (320 pages of text organized in 16 chapters) introduction to the basic components of hematopoiesis: leukocytes (granulocytes, monocytes-macrophages, lymphocytes and plasma cells, and leukocyte testing); erythrocytes (including normal and diseased responses and erythrocyte testing); hemostasis and its maintenance by thrombocytes (platelets) and by coagulation and fibrinolysis; and body fluid analysis and clinical laboratory practice.

Wichmann HE (Ed.) (1985)
Mathematical Modeling of Cell Proliferation: Stem Cell Regulation in Hemopoiesis: Erythropoietic Suppression, Combined Stresses, Drug Effects
Crc Pr I Llc
ISBN-10: 0849355044
ISBN-13: 978-0849355042

Wichmann HE, Loeffler M (1985)
Mathematical Modeling of Cell Proliferation: Stem Cell Regulation in Hemopoiesis. Vol. 1: Model Description, Irradiation, Erythropoietic Stimulation
Crc Pr I Llc

Shows how a wealth of experimental data (primarily from laboratory rats and mice) can be integrated into and explained by a mathematical model consisting of multiple compartments connected by flows of cells and non-linear feedback control loops. The model is described by a system of ordinary differential equations and algebraic equations with parameter values for cell birth and death rates and transit times estimated from experimental data.

Zon LI (2001)
Hematopoiesis: A Developmental Approach
Oxford University Press, New York
ISBN-10: 0195124502
ISBN-13: 978-0195124507

This edited volume is divided into sections on hematopoietic progenitor cells and stem cells; early embryology and ontology; important factors in signaling (including surveys of gene-level regulation of myelopoiesis, signal transduction in hematopoiesis, roles of chemokines and of transcriptional control of erythrocyte and megakaryocyte development); myeloid and lymphoid biology, genetics of blood formation, stroma, and vascularzation. The first section – approximately 150 pages on hematopoietic progenitor cells and stem cells – surveys hematopoietic stem cell biology (development, regulation and homeostasis and isolation and purification techniques) as well as aspects of hematopoietic stem cell cultures and gene therapy.

Online Textbooks

American Society of Hematology Self-Assessment Program (ASH-SAP)

The American Society of Hematology offers an online textbook of hematology (http://www.ash-sap.org/ebooks/view.asp) and a set of online tests for continuing medical education credit and certification. Access depends on buying the textbook. The self-assessment program is directed at internists, hematologists, pediatricians, and hematology-oncology fellows.

Journals

A current list of journals in hematology can be found online, e.g., using the following link: http://www.medbioworld.com/cgi-bin/displaycontents.cgi?table=med&type=Journals&filecode=(M)%20Hematology.

Current information and research articles on normal, stressed, and pathological hematology, including leukemia and anemia, can be found in the following journals.

Blood
The American Society of Hematology (ASH), Washington, DC
Web: http://www.bloodjournal.org/

Experimental Hematology (1970–)
Elsevier, Amsterdam, Netherlands.
ISSN: 0301-472X
Web: http://www.exphem.org/

This journal of the International Society for Experimental Hematology publishes original research articles, reviews, and abstracts of the annual meeting of the International Society for Experimental Hematology. Includes articles on in vivo and ex vivo studies of hematopoietic cell cycle regulation, roles of the cytokines network, gene therapy, normal and malignant hematopoiesis, immunobiology, the stromal microenvironment, and molecular genetics, signal transduction, and stem cell biology for hematopoietic cells.

International Journal of Laboratory Hematology
Wiley, USA
Print ISSN: 1751-5521
Online ISSN: 1751-553X
Frequency: Bi-monthly
The official journal of the International Society of Laboratory Hematology.

Organizations

American Society of Hematology (ASH)
1900 M Street, NW, Suite 200
Washington, DC 20036
Phone: 202.776.0544
Fax: 202.776.0545
Email: ash@hematology.org
Web: http://www.hematology.org/

ASH's mission is 'to further the understanding, diagnosis, treatment, and prevention of disorders affecting the blood, bone marrow, and the immunologic, hemostatic and vascular systems, by promoting research, clinical care, education, training, and advocacy in hematology.'

International Society for Experimental Hematology (ISEH)
2025 M Street, N.W., Suite 800, Washington, DC 20036-3309, USA
Phone: (+1/202) 367-1183
Fax: (+1/202) 367-2183
Email: ISEH@smithbucklin.com
Web: http://www.iseh.org/

ISEH's mission is 'to further basic translational and clinical research and to foster communication, education, collaboration in the field of experimental hematology and stem cell biology' by providing up-to-date scientific information on advances in experimental hematology.

Databases

Integrated Risk Information System (IRIS)
Sponsored by the U.S. Environmental Protection Agency (EPA) Office of Research and Development, National Center for Environmental Assessment.
Web: http://www.epa.gov/iris/

The Integrated Risk Information System (IRIS) database allows keyword search for information about potential human health effects of environmental chemicals. It 'is intended for those without extensive training in toxicology, but with some knowledge of health sciences.' IRIS provides oral reference doses and inhalation reference concentrations (RfDs and RfCs, respectively) for chronic noncarcinogenic health effects and hazard identification, and oral slope factors, and oral and inhalation unit risks for carcinogenic effects.

The Risk Assessment Information System (RAIS)
Sponsored by U.S. Department of Energy (DOE), Office of Environmental Management, Oak Ridge Operations (ORO) Office
Web: http://rais.ornl.gov/

Like IRIS, this resource allows quick online search using keywords such as 'hematopoiesis' and retrieves descriptions of health effects of chemicals in the system's database.

CHAPTER

52

Target Sites: Immune

JACQUES DESCOTES

INTRODUCTION

Immunotoxicology, the science of poisons to the immune system, is devoted to the study of adverse effects of pharmaceuticals and all other chemicals on the immune responsiveness of treated or exposed living hosts (immunosuppression and immunostimulation) as well as the induction of hypersensitivity and autoimmunity. Although immunotoxicology is an active area of toxicology, this is still a relatively small area. Therefore, an extensive list of all books devoted to immunotoxicology published since 1999 is provided below. Because immunotoxicology is a cornerstone between toxicology and immunology, key immunology textbooks potentially useful for toxicologists with limited immunological background in immunology are listed as well. Over the past 30 years, the main focus of immunotoxicologists has been on non-clinical aspects of immunotoxicity, especially from a mechanistic or regulatory perspective. A lot of efforts have been paid to designing and validating animal models and in vitro assays useful for the non-clinical evaluation of immunotoxicity and risk assessment. This is reflected in the selection of journal articles among the most relevant review articles on immunotoxicology published since 2000.

RESOURCES

Books

Cohen MD, Zelikoff ZT, Schlesinger RB (2000)
Pulmonary Immunotoxicology
Springer, Boston, MA

A source of information about how a pollutant might affect susceptibility to infection, allergies, or other lung diseases associated with the immune system. The first six chapters provide the reader with the basic background on the structure of the respiratory system, the pulmonary immune system, the fate of inhaled gases and particles, and the allergic, fibrotic, or autoimmune diseases that can affect the lung. The next 10 chapters give specific examples of immunotoxicants and the last two chapters deal with risk assessment and biomarkers.

Descotes J (1999)
An Introduction to Immunotoxicology
Taylor & Francis, London.

Provides a concise, but broad-ranging introduction to key immunological issues. The first section explores the health consequences of immunotoxicity. The book next describes the latest methods used to detect and evaluate, preclinically and clinically, the unexpected immunotoxic effects of xenobiotics.

Descotes J (2004)
Immunotoxicology of Drugs and Chemicals: an Experimental and Clinical Approach. Vol. 1: Principles and Methods of Immunotoxicology
Elsevier, Amsterdam

For students and toxicologists specializing in immunotoxicology. Provides a detailed description of immunological issues including adverse health consequences of immunotoxicity, currently available methods used to detect and evaluate, preclinically and clinically, the unexpected immunotoxic effects of xenobiotics, regulatory requirements, and possible strategies applicable to immunotoxicity risk assessment.

Detrick B, Hamilton RG, Folds JD (Eds.) (2006)
Manual of Molecular and Clinical Laboratory Immunology, 7th edition
ASM Press, Washington, DC.

A very comprehensive textbook providing a detailed description of most standard and recent methods in molecular and clinical laboratory immunology. Covers nearly all current aspects of immunology techniques.

Frankel AE (Ed.) (1998)
Clinical Application of Immunotoxins
Springer-Verlag, Berlin

A reference source for review of results seen with immunotoxins in patients. Covers targeted toxins, ribosome inactivating proteins, bacterial toxins, and clinical trials. Volume 234 of *Current Topics in Microbiology and Immunology*.

Holladay S (Ed.) (2004)
Developmental Immunotoxicology
CRC Press, Boca Raton, FL

For specializing students and toxicologists. Provides an extensive overview of the adverse postnatal immunotoxicological consequences of perinatal exposure. Describes different models used to study developmental immunotoxicology and examples of specific developmental immunotoxic agents, including therapeutics.

House RV, Descotes J (Eds.) (2007)
Cytokines in Human Health: Immunotoxicology, Pathology and Clinical Applications
Humana Press, Totowa, NJ

Provides information on recent advances in the understanding of cytokines' roles in selected organs of toxicity, immunotoxicity, and clinical pathological conditions on a number of levels ranging from basic research to highly applied therapeutic applications.

Kimber I, Selgrade MJ (Eds.) (1998)
T Lymphocytes in Immunotoxicology
Wiley, Chichester, UK

For graduate students and professionals specializing in immunotoxicology, immunopharmacology, and clinical allergy. Provides a review of research into functional subpopulations of T lymphocytes.

Male D, Brostoff J, Roth DB, Roitt I (2006)
Immunology, 7th edition
Mosby-Elsevier, London

Latest edition of the famous immunology textbook for students and toxicologists with no particular immunological background.

Nijkamp FP, Parnham MJ (Eds.) (2005)
Principles of Immunopharmacology, 2nd edition
Birkhauser Verlag, Basel, Switzerland

Provides essential knowledge on the immune response, its diagnosis and modification by drugs and chemicals. The first section of the book includes a basic introduction to immunology and its relevance for human disease. The second section deals with immunodiagnostics. The book concludes with a chapter on immunotoxicology.

Repetto RC (1996)
Pesticides and the Immune System
World Resource Institute, Washington, DC

Considers pesticides' effects on the immune system as an emerging issue imperfectly understood by those evaluating health risks of chemical exposures. The evidence assembled in this report underscores the need to continue improving our understanding of such risks.

Smialowicz RJ, Holsapple MP (Eds.) (1996)
Experimental Immunotoxicology
CRC Press, Boca Raton, FL

Provides information on advances in experimental immunotoxicology. The major sections include definitions and approaches, target organ specificity in immunotoxicology, chemical-induced immunosuppression, and chemical-induced immunoenhancement.

Tryphonas H, Fournier M, Blakley BR, Smits JEG, Brousseau P (Eds.) (2005)
Investigative Immunotoxicology
CRC Press, Boca Raton, FL

Provides a critical evaluation of current immunotoxicological models and approaches, and their contribution to the overall assessment of chemical-induced adverse health effects on humans and the ecosystem.

Vohr HW (Ed.) (2005)
Encyclopedic Reference of Immunotoxicology
Springer-Verlag, Berlin

First book devoted to immunotoxicology that is presented in an encyclopedic format. All entries are organized in alphabetical order and a description for each item is provided by a panel of specialists in the area. Each chapter also includes a regulatory section with related guidelines. Conflicting opinions are detailed in the 'Pros and Cons' section of several chapters.

World Health Organization (WHO) (1996)
Principles and Methods for Assessing Direct Immunotoxicity Associated with Exposure to Chemicals
WHO, Geneva.

Volume 180 of the monographic series *Environmental Health Criteria*.

Offers a thorough look at immunotoxicology, health impacts of selected immunotoxic agents, strategies for testing the immunotoxicity of chemicals in animals, methods of immunotoxicology in experimental animals, essentials of immunotoxicity assessment in humans, and risk assessment.

Zelikoff J, Thomas PT (Eds.) (1998)
Taylor & Francis, London
Immunotoxicology of Environmental and Occupational Metals

Provides information on the immunotoxic effects of selected metals encountered environmentally and occupationally.

Journals

Immunopharmacology and Immunotoxicology
Informa Healthcare
Frequency: 4 issues per year

This international journal is an authoritative source for groundbreaking clinical and basic research in immunopharmacology and immunotoxicology. It publishes original scientific papers, brief communications, and reviews on the alterations of the immune system and other important topics such as the disease-mediating capacity of immunomodulating agents. This journal also features experimental and clinical results on cytokines and chemokines, vaccines, nutrition, and neuroimmunopharmacology. *Immunopharmacology and Immunotoxicology* provides up-to-date and comprehensive coverage on immunomodifying agents to treat diseases such as cancer, immunodeficiency, chronic infection, allergy, and inflammatory and autoimmune disorders. Further, the journal also focuses on the action of agents on specific parameters of the immune system, mediated directly or through soluble cytokines secreted by various cellular components of the immune system. Furthermore, the adverse or positive effects of xenobiotics on the immune system, including chemicals, metals, food additives, and airborne pollutants are covered in the journal (excerpted from http://www.gbhap.com/journals/journal.asp?issn=0892-3973&linktype=1).

Journal of Immunotoxicology
Informa Healthcare
Frequency: 4 issues per year

This is a peer-reviewed journal – a singular forum for the immunotoxicologists, immunologists, and toxicologists in academia, government, consulting, and industry to publish their original research and to be made aware of the research findings in a timely manner. Several subdisciplines are also presented in the journal, including molecular, developmental, pulmonary, regulatory, nutritional, mechanistic, wildlife, and environmental immunotoxicology, immunology, and toxicology. Original research articles as well as timely comprehensive reviews are published (excerpted from http://www.tandf.co.uk/journals/titles/1547691X.asp).

Perspectives in Experimental and Clinical Immunotoxicology
Free electronic journal: http://www.school-immunotoxicology.org/inter.php?rubrique=34.

Additional information on this online journal and summer school of immunotoxicology can be obtained from this website. This website has preliminary information on 'Immunotoxibase.' See Database section of the chapter for additional information.

Databases

IMMUNOTOXIBASE

This is intended to be a comprehensive immunotoxicology database providing the latest available information on the adverse effects on the immune system of all kinds of chemicals including medicinal products, agrochemicals, industrial, household and environmental chemicals, cosmetics, food additives and ingredients, natural substances, and any other chemicals.

Web: http://www.school-immunotoxicology.org/inter.php?rubrique=34.

IMMTOX

Initial version of this immunotoxicology database was based on a 1992 publication by Luster et al in *Fundamental Applied Toxicology* (18: 200–210). It includes battery of immunotoxicology test summary results for at least 70 chemicals from National Toxicology Program (NTP) immunology study data in B6C3F1 mice, and supplemented by mouse study information for additional chemicals extracted from online NTP Immunology Study Reports (http://ntp.niehs.nih.gov/).

This is excerpted from: http://www.epa.gov/ncct/dsstox/WorkInProgress.html.

CHAPTER

53

Target Sites: Kidney

GARY O. RANKIN AND MONICE A. VALENTOVIC

INTRODUCTION

The kidney serves many important functions within the body including maintaining homeostasis of electrolytes, excretion of waste products, stimulation of red blood cell formation, and contributing to vitamin D metabolism. The kidney is also a target for the toxic effects of a wide range of compounds including drugs (e.g. cisplatin, amphotericin B, cyclosporine), metals (e.g. mercury, lead, cadmium), agricultural chemicals (e.g. paraquat), halogenated solvents (e.g. chloroform, trichloroethylene), natural products (e.g. mycotoxins), anoxiants (e.g. carbon monoxide, cyanide), and many other compounds.

The reasons for the kidney's susceptibility to the toxic effects of drug and non-drug chemicals are related closely to its normal kidney function. The kidney is a highly dynamic organ, receiving 20–25% of the cardiac output. Thus, chemicals that enter the blood are rapidly distributed to the kidney. As a result, the kidney often sees high concentrations of absorbed chemicals and/or their toxic metabolites. The kidney can also concentrate organic anions or cations within proximal tubule cells via the various organic anion (e.g. OATs) or organic cation (e.g. OCTs) transport systems to levels that are much higher than blood levels. Concentration of the luminal fluid as it passes toward the transition from the descending to the ascending limb of the loop of Henle can lead to the precipitation of poorly water-soluble compounds, such as oxalate, methotrexate or some of the early sulfa drugs which can lead to obstruction of flow and, possibly, renal failure.

Since the nephron must transport large amounts of electrolytes and organic compounds across the basolateral (blood side) and luminal or apical membranes to promote secretory and reabsorptive functions, the nephron has a high requirement for producing energy in the form of ATP to support the active transport processes. Thus, any chemical or chemical metabolite capable of decreasing the ability of mitochondria to produce ATP can induce nephrotoxicity.

The kidney also contains enzymes which can bioactivate chemicals to the ultimate nephrotoxic species. For example, proximal tubule cells contain a number of the cytochromes P450 which are capable of bioactivating a wide range of chemicals to nephrotoxic metabolites, including halogenated hydrocarbons such as chloroform and carbon tetrachloride and drugs such as acetaminophen. The cyclo-oxygenase enzymes located in renal tissue that are critical for producing renal prostaglandins may also play a role in bioactivating aminophenols and other related compounds via a co-oxidation mechanism. Also, there is a vast literature concerning the nephrotoxicity induced by glutathione conjugates of halogenated hydrocarbons and their subsequent metabolites (cysteine and N-acetylcysteine conjugates). The kidney has the enzymes necessary to form many of these metabolites directly or process glutathione-derived metabolites formed primarily in the liver to the ultimate nephrotoxicant species.

RESOURCES

Books

General textbooks and reference books on toxicology usually contain chapters related to nephrotoxicants. Books focused on kidney toxicology include the following.

Broe ME, de Porter GA, Bennett WM, Verpooten GA (eds) (2003)
Clinical Nephrotoxins: Renal Injury from Drugs and Chemicals
Springer, San Diego, CA.
ISBN: 978-1-4020-1277-8.

Goldstein RS (Volume Ed.), Sipes IG, McQueen CA, Gandolfi AJ (Eds-in-chief) (1997)
Comprehensive Toxicology: Volume 7, Renal Toxicology
Pergamon, Elsevier Science Ltd., New York.
ISBN: 0-08-042972-6.

Tarloff JB, Lash LH (Eds) (2005)
Toxicology of the Kidney, 3rd Edition
Target Organ Toxicology Series, Hayes AW, Thomas JA, Gardner DE (Series Eds)
CRC Press, Boca Raton, FL.
ISBN: 0-415-24864-7

Zalups RK, Lash LH (eds) (1996)
Methods in Renal Toxicology
CRC Press, Boca Raton, FL.
ISBN: 0-8493-3341-5

CHAPTER

54

Target Sites: Liver

JANET KESTER

INTRODUCTION

Liver injury by chemical substances has been recognized for more than 100 years. The liver's anatomical and functional interposition between the digestive tract and the systemic circulation is responsible for both its primary role in metabolism of xenobiotics and its susceptibility to their toxic actions. It directly receives all ingested material absorbed from the intestine (except lipid chylomicrons). The absorbed materials are taken up and further metabolized by the liver or transformed and released to the blood for utilization or storage elsewhere in the body.

RESOURCES

Textbooks

General Texts

Byer T, Wright T, Manns M (2006)
Zakim and Boyer's Hepatology, 5th Edition
W.B. Saunders, Philadelphia, PA.

The latest update of a definitive two-volume medical text that is also available online. The emphasis is largely clinical, but Section I (Chapters 1 through 11) provides a superb current overview of liver anatomy and pathophysiology. Section IV (Chapters 26 through 29) covers 'toxin mediated liver injury' (a misnomer as the term 'toxin' specifically refers to compounds produced by organisms).

Kanel GC, Korula J (2005)
Atlas of Liver Pathology. 2nd Edition
W.B. Saunders, Philadelphia, PA.

A beautifully illustrated medical textbook reflecting the most recent World Health Organization classification of liver and biliary tract diseases. Chapter 4 discusses alcoholic liver disease, and Chapter 5 discusses other forms of toxic liver cell injury. Excellent source of basic information for the pathologically inclined.

Texts with Focus on Toxicology

Dienes J-P, Leuschner U, Lohse AW, Manns MP (2005)
Autoimmune Liver Disease (Falk Symposium)
Springer, Dordrecht, The Netherlands.
ISBN-10: 1402028946, ISBN-13: 978-1402028946.

This book, authored by hepatologists of different countries, memorializes the proceedings of Falk Symposium 142 on 'Autoimmune Liver Disease' held in Freiburg, Germany, on 12–13 October 2004. It describes possible mechanisms of pathogenesis and discusses diagnostic criteria and treatment options, with particular emphasis on childhood autoimmune hepatitis.

Kaplowitz N, DeLeve LD (2007)
Drug-Induced Liver Disease, 2nd Edition
ISBN: 9780849398964.

Drugs are the most common cause of toxic liver injury in the United States. Chapters written by international authorities are divided into four main sections dealing with: (1) mechanisms of liver injury; (2) diagnosis and

management; (3) hepatoxicity of specific drugs; and (4) regulatory perspectives.

Plaa GL, Hewitt WR (Eds) (1998)
Toxicology of the Liver (Target Organ Toxicology Series), 2nd Edition
Taylor & Francis, London.
ISBN 1-56032-719-7.

This book aims to provide state-of-the-art reviews of selected areas of hepatotoxicity. It is divided into three parts: characterization of chemical-induced hepatotoxicity, mechanisms, of hepatotoxicity, and cholestasis.

Romano JA, Lukey BJ, Salem H (2007)
Chemical Warfare Agents: Chemistry, Pharmacology, Toxicology, and Therapeutics, Second Edition

Sahu S (Ed.) (2008)
Hepatotoxicity: From Genomics to In Vitro and In Vivo Models
John Wiley & Sons, Ltd., Chichester, UK

Zimmerman HJ (1999)
Hepatotoxicity: The Adverse Effects of Drugs and Other Chemicals on the Liver, 2nd Edition
Lippincott Williams & Wilkins, Philadelphia, PA.

CHAPTER

55

Target Sites: Nervous System

ABBY A. LI

INTRODUCTION

The nervous system is composed of billions of neurons and supporting glial cells that are interconnected to form complex integrated electrochemical circuits. It is through these neuronal circuits that animals perceive and respond to external stimuli, and coordinate the activities of all other organ systems. All mental activity including thought, learning, and memory are controlled by the nervous system.

Neurotoxicity can be defined as unintended adverse effects on the structure and function of the nervous system. Although the nervous system has compensatory and adaptive mechanisms, the nervous system is more sensitive to some injuries because of its limited ability to regenerate compared to other organ systems. The developing nervous system is especially vulnerable to injury because of the lack of a complete blood–brain barrier and because interference to critical processes such as neurogenesis, migration, and programmed cell death have profound effects on the development of the nervous system. The potential for neurotoxicity also depends upon the route, pattern and duration of exposure, the metabolism of the chemical, and the ability of the chemical to pass through the blood–brain barrier.

The field of neurotoxicity draws from disciplines of neuroscience, physiology, psychology, biochemistry, and others. Much neurotoxicological research focuses on identifying adverse outcomes on the structure and/or function of the nervous system (both central and peripheral) due to exposure to chemicals, and determining the mechanisms for these toxic responses. In addition, neurotoxicologists develop, validate, and refine methodology with which to accomplish these goals. Neurotoxic agents are also used to develop animal models of clinical syndromes, to aid in studying the causes of, and therapy for, these diseases.

Multidisciplinary approaches are necessary to study the integration of the highly interconnected nervous system. This ranges from molecular studies of genes and proteins, cellular studies of neurons, to interactions between neurons, to behavior, including higher levels of learning and memory. While most studies are conducted using laboratory animals, cell cultures, or isolated cells, epidemiological studies of humans are critical for relating the laboratory findings to the human population.

The following reference list focuses primarily on selected books and publications that review the neurotoxic potential of natural and synthetic chemicals and/or the methods used to detect or characterize neurotoxic effects. Books that have contributions from multiple experts covering wide range of topics are emphasized. These general references can be used as resources for more in-depth publications of original research on the neurotoxicity of specific chemicals. Websites for general guidance on neurotoxicity testing are included at the end of this list because they are free to the public and provide useful introductions to the field of neurotoxicology.

RESOURCES

Books

Annau Z (Ed.) (1986)
Neurobehavioral Toxicology
Johns Hopkins University Press, Baltimore, MD.

Addresses research strategies for evaluating behavioral effects of neurotoxic chemicals, examines the effects of exposure to neurotoxic chemicals during critical periods in the development of the nervous system, considers mechanism of toxicity at the neurobehavioral level, and deals with epidemiological and experimental approaches to neurobehavioral toxicity.

Arlien-Soborg P (1992)
Solvent Neurotoxicity
CRC Press, Boca Raton, FL.

A comprehensive look at solvent neurotoxicity. The first chapter describes methods for assessing human neurological effects. The remaining chapters present research and epidemiological data regarding classic neurotoxins.

Aschner M, Costa L (2004)
The Role of Glia in Neurotoxicity, 2nd edition
CRC Press, Boca Raton, FL.

Glia are identified as an essential and modifiable component of the nervous system. This book is concerned with the reciprocal relationships between neurons and glia that are vital for mutual differentiation, development, and optimal functioning of the CNS.

Bellinger DC (2006)
Human Developmental Neurotoxicology
Taylor & Francis/CRC Press

This reference describes recent developments in the design, execution, analysis, and interpretation of human developmental neurotoxicology studies. This reference focuses on dose–response/effect relationships and discusses challenges in measuring exposure to different types of chemicals, including selected metals, organic pollutants, pesticides, and recreational and therapeutic drugs.

Berent S, Albers J (2005)
Neurobehavioral Toxicology: Neuropsychological and Neurological Perspectives, Vol. 1 (Vol 2, 2005 and Vol 3 were scheduled to be published in 2007)
Taylor & Francis, Inc., New York.

This three-volume series is focused on human clinical case studies and addresses general issues that need to be considered when evaluating case studies.

Bleecker ML, Hansen JA (Eds.) (1994)
Occupational Neurology and Clinical Neurotoxicology
Williams & Wilkins, Baltimore, MD.

Defines the multidisciplinary components of occupational neurology, including study design, exposure assessment, methods for quantifying dysfunction, outcomes associated with exposure to neurotoxins, and ergonomic stressors. The text offers several perspectives on the issues in the field and specifically does not present classical animal experimentation.

Brust JC (1996)
Handbook of Neurotoxic Side Effects of Prescription Drugs
Butterworth-Heinemann, Boston, MA

Presents in a concise manner the reports from the literature that deal with the unwanted nervous system effects of prescription drugs. The arrangement allows easy access to specifics on either a drug or a drug class. Supporting information from animal studies is often included for reference purposes.

Chang LW (1994)
Principles of Neurotoxicology
Taylor and Francis, New York

Presents the basics of neurotoxicology. Covers neurotoxicology of the central and peripheral nervous systems, behavioral aspects of laboratory assessment and modeling, and biochemical and molecular neurotoxicology.

Chang LW, Dyer RS (1995)
Handbook of Neurotoxicology
Dekker, New York

Volume 36 of *Neurological Disease and Therapy.* Focuses on the effects and mechanisms of major categories of neurotoxicants. Part I covers the traditional neurotoxicants – metals, organic solvents, and agricultural chemicals. Part II covers the non-traditional neurotoxicants – natural neurotoxins, drugs of abuse, and narcotics/environmental agents.

Chang LW, Slikker W (Eds.) (1995)
Neurotoxicology: Approaches and Methods
Academic Press, San Diego, CA

Covers in-depth basic principles of neurotoxicity, current concepts on the effects and mechanisms of various classes of neurotoxicants, and state-of-the-art approaches and methods in toxicologic research and testing. The first sections consider whole-animal integrated responses, followed by detailed methods for teasing out the mechanisms of damage, the descriptions of the specific agents, and targets within the nervous system.

Cooper JR, Bloom FE, Roth RH (2003)
Biochemical Basis of Neuropharmacology, 8th edition
Oxford University Press, New York

Concentrates on the biochemistry and physiology of nervous tissue, with an emphasis on neurotransmitters. Also discusses neuropharmacologic agents and their actions.

Crawley J (Ed.) (1997)
Current Protocols in Neuroscience
Wiley, New York

Up-to-date collection of neuroscience methods. The publication draws from techniques in neurophysiology, neuroanatomy, neuropharmacology, and behavioral neuroscience to meet the specific needs of researchers in the full range of disciplines that are involved in studying the brain, nervous system, and corresponding behaviors.
Web: http://www.currentprotocols.com/WileyCDA/CPTitle/isbn-0471163597.html

European Centre for Ectoxicology and Toxicology of Chemicals (ECETOC) (1992)
Monograph No. 18: Evaluation of the Neurotoxic Potential of Chemicals
ECETOC, Brussels

Examines the current test methods for the evaluation of the neurotoxic potential of chemicals in order to provide adequate safeguards for human health. A tiered testing strategy is recommended for this evaluation.

Feldman RG (1998)
Occupational and Environmental Neurotoxicology
Lippincott Williams & Wilkins, Philadelphia, PA

Presents clinically relevant information on a number of major neurotoxicants. Describes chemical structure, sources of exposure, recommended exposure limits, metabolism, symptoms, and therapeutic measures.

Harry GJ (Ed.) (1994)
Developmental Neurotoxicology
CRC Press, Boca Raton, FL.

Addresses the basic principles of development in structure and functional components and presents information covering the various methodological approaches. Evidence for the value of examination of the developing nervous system for environmentally induced perturbations is well covered. Chemical effects in the system as well as methods to assess such end points are discussed.

Hartman DE (2007)
Neuropsychological Toxicology: Identification and Assessment of Human Neurotoxic Syndromes, 3rd Edition
Plenum, New York

Intended as a reference for clinical practitioners who must evaluate the history, symptoms, behavior, and neuropsychological functioning of individuals exposed to neurotoxic substances. The book focuses on human psychological applications of toxicology research. The book contains a basic overview, an evaluation of neurotoxic syndromes, the effects of metals, solvents, alcohol, drugs, pesticides, and other neurotoxins, and psychosomatic disorders and forensic issues.

Jain KK (2001)
Drug-Induced Neurological Disorders, 2nd, revised and expanded edition
Hogrefe & Huber, Seattle

Covers the wide range of central nervous system disorders which have been related to use of drugs and drug families.

Kostrzewa RM (Ed.) (1998)
Highly Selective Neurotoxins: Basic and Clinical Applications
Humana Press, Totowa, NJ

Critically reviews and evaluates the most common and important neurotoxins used today to precisely destroy selected neurons. Describes the mechanisms of action plus the limits on the use and clinical applicability of these neurotoxins.

Lowndes HE (1987)
Electrophysiology in Neurotoxicology
CRC Press, Boca Raton, FL.

A good basic text regarding the major techniques of electrophysiology. The first volume contains four chapters which include the structure, function, and pharmacology of acetylcholine and sodium channel receptors; the effects of toxic agents on neural membranes; physiology of synaptic transmission; and clinically used electrophysiological end points.

Maines MD, Costa LG, Reed DJ, Sass S, Sipes IG (initiated 1999; continually updating)
Current Protocols in Toxicology
John Wiley and Sons, Inc.

Included in this compendium is a section on methods for in vivo and in vitro testing for neurotoxicity, as well as animal models of neurotoxicity. Updates with new or revised methodology are sent out several times a year.

Massaro EJ (Ed.) (2001).
Handbook of Neurotoxicology, Volume 1 and Volume 2
Humana Press

Leading experts review the status of research in in vivo neurotoxicology of a wide spectrum of neurotoxicologic agents. The first volume focuses on natural and human-made neurotoxins. The second volume discusses neurobehavioral and imaging methods for evaluating neurotoxins.

Moser A (Ed.) (1998)
Pharmacology of Endogenous Neurotoxins: A Handbook
Birkhauser, Boston, MA

Surveys some of the important areas of neurotoxicological research and the impact of endogenously synthesized heterocyclic neurotoxins on normal and patho-physiological regulation in the central nervous system.

Moser VC, Aschner M, Richardson RJ, Philbert MA (2007)
Toxic Responses of the Nervous System
In: Casarett and Doull's Toxicology: The Basic Science of Poisons, 6th edition
McGraw-Hill Co.

Overview chapter provides biological factors rendering the nervous system sensitive to toxicity, It also includes a thorough discussion of mechanisms of different manifestations of neurotoxicity, as well as prototypical chemicals which produce neurotoxicity.

Niesink RJM (1998)
Introduction to Neurobehavioral Toxicology: Food and Environment
CRC Press, Boca Raton, FL.

Examines the effects of chemicals on the central and peripheral nervous system and the subsequent changes in behavior, with a focus on the toxicity of food components and behavioral effects of environmental toxicants.

Pentreath V (Ed.) (1999)
Experimental in Vitro Neurotoxicology
Taylor & Francis, Philadelphia, PA

Covers the accelerating field of in vitro replacement tests for whole animal models. The main impetus for this shift comes from the increased understanding of the behavior and properties of different types of nerve cells in vitro.

Slikker W, Chang LW (Eds.) (1998)
Handbook of Developmental Neurotoxicology
Academic Press, San Diego, CA.

Provides a comprehensive account of the impacts, mechanisms, and clinical relevances of chemicals on the development of the nervous system.

Spencer PS, Schaumburg HH, Ludolph AC (Eds.) (2000)
Experimental and Clinical Neurotoxicology, 2nd Edition
Oxford University Press, New York.

The first edition of the book laid the groundwork for the field of neurotoxicology. This second edition is an essential reference for anyone concerned with the neurotoxic potential of drugs, experimental agents, environmental pollutants, and other substances. The second edition has been reorganized and completely rewritten and covers nearly 450 chemical compounds. The first edition is available on the web (see web references below).

Tilson HA, Harry GJ (1999)
Neurotoxicology, 2nd Edition
Taylor & Francis, Philadelphia, PA.

Provides the basis for an understanding of the sites and mechanisms of neurotoxicity as well as the adverse effects of chemicals on the nervous system. Recent advances in neurotoxicological research are reviewed.

Tipton KF, Dajas F (Eds.) (1994)
Neurotoxins in Neurobiology: Their Actions and Applications
Ellis Horwood, New York.

Includes information on how toxins are obtained and fractionated; tabulation of toxin sources and their nature and actions; and synthetic toxins and their possible relationship to CNS diseases.

Journals

Neurotoxicity Research (1999–)
F.P.Graham Publishing Co., Montain Home, TN
Web: http://www.fpgrahamco.com/Neuro/index.html

Neurotoxicity Research is the official journal of the Neurotoxicity Society, publishing research on processes and mechanisms in neurodegeneration, neuroregeneration, neurotropic action, and neuroprotection.

Neurotoxicology (1979–)
Elsevier, Orlando, FL
Web: http://www.neurotoxicology.com/journal.htm

Neurotoxicology is a well-respected journal that publishes research and reviews on the effects of toxic substances on the nervous system of humans and experimental animals of all ages.

Neurotoxicology and Teratology (1979–)
Elsevier, Orlando, FL
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/525481/description#description

Neurotoxicology and Teratology is sponsored by the Behavioral Toxicology Society and the Neurobehavioral Teratology Society. The journal publishes studies on developmental and adult neurotoxicity of animals and humans, as well as reviews and commentary.

Organizations

Behavioral Toxicology Society (BTS)
No official address, check website
Web: http://www.behavioraltoxicology.org

Founded in 1982, BTS promote research and forums for the presentation of research on the effects of toxic agents on behavior and the nervous system.

Institute of Neurotoxicology & Neurological Disorders (INND)
8232 14th Ave NE
Seattle, WA 98115
Phone: 206-527-0926
Fax: 206-525-5102
Email: sgilbert@innd.org
Web: www.asmalldoseof.org ("A Small Dose of Toxicology")
Web: www.toxipedia.org – connecting science and people

INND was founded almost ten years ago and focuses on education and policy issues related to neurotoxicology.

International Neurotoxicology Association (INA)
No official address, check website
Web: http://www.neurotoxicology.org

INA was founded in the early 1980s to foster and support an international perspective on neurotoxicology. They hold an international meeting every two years.

Neurobehavioral Teratology Society (NBTS)
No official address, check website
Web: http://www.nbts.org/

The Neurobehavioral Teratology Society, formed in 1977, focuses on understanding the behavioral and developmental alterations that result from genetic and environmental perturbations of the nervous system during the pre- and perinatal period. The society publishes the journal *Neurotoxicology and Teratology* and hosts an annual conference.

Neurotoxicity Society
Richard M Kostrzewa PhD
Professor, Department of Pharmacology
Quillen College of Medicine
East Tennessee State University
PO Box 70,577

Rm. 1-44, Carl Jones Hall at VA Mtn Home
Johnson City, TN 37614-1708
USA
Web: http://www.neurotoxicitysociety.org

The aim of the Neurotoxicity Society is to unite basic and clinical scientists working on neurotoxicity issues.

Neurotoxicology Specialty Section of the Society of Toxicology
No official address, check website
Web: http://www.toxicology.org/isot/ss/neurotox/neuro.html

This group works to promote collaboration and networking amongst neurotoxicologists associated with the Society of Toxicology.

CHAPTER

56

Target Sites: Respiratory

VICTORIA A. CASSANO, AND TEE L. GUIDOTTI

INTRODUCTION

The lung is both a major pathway for toxic exposures and a vulnerable target organ in its own right. Receiving many liters of airflow per day, it has evolved a variety of host defenses and barriers to protect its structures, especially the delicate alveolar membrane. For that reason, pulmonary toxicology cannot be understood without a firm grasp of host defense mechanisms. Concepts of the respiratory tract as a target organ have changed fundamentally in the last 10 years with the discovery of ultrafine particles and their seeming ability to avoid these defense mechanisms, penetrate the vascular barrier and exert effects outside the lung. As well, the lung is a relatively limited (although not simple) structure which can respond only in a few different ways to a toxic event. The inflammatory effects of ultrafines and of synthetic nano-sized particles (see Dusts and Fibers) were initially unexpected and their study has opened new doors to the investigation of the lung and its responses. Inhalation toxicology is one of the most technically difficult fields of experimental toxicology and the study of particles presents particular challenges.

RESOURCES

Books

Bernstein IL, Chan-Young M, Malo J, Bernstein DI (Eds.) (2006)
Asthma in the Workplace Third Edition
Taylor and Francis, New York.

Prepared by leading experts in occupational asthma, this reference book addresses mechanisms, evaluation, workplace allergens and triggers, diagnosis, treatment, and categories of causative agents, asthma genetics, environmental monitoring, skin and pulmonary interactions and the value of allergy testing, and surveillance. Does not go into much detail on aggravational asthma or irritant-induced asthma.

Bush RK (Ed.) (2001)
Environmental Asthma
Marcel Dekker, New York

An excellent summary of what is known regarding environmental factors and the immunology and pathophysiology of occupational and environmental asthma. The book discusses individual allergens and pollutants, describes methods of investigation and clinical evaluation, the role of inflammatory mediators, atopy, immunotherapy, and indoor air quality.

Chiyotani Kv, Hosoda Y, Aizawa Y (1998)
Advances in the Prevention of Occupational Respiratory Diseases
Proceedings of the 9th International Conference, Tokyo, Japan, 13–16 October 1997
Elsevier, Amsterdam; San Diego

A conference proceedings monograph devoted to prevention of occupational respiratory diseases from the 9th International Conference on Lung Diseases in Kyoto. This conference series is sponsored by the International Labour Organisation and represents a key source for specific issues of regulation and international standardization of methodology. A valuable resource for the specialist, not suitable for the general user.

Cohen MD, Zeilikoff JT, Schlesinger RB (2000)
Pulmonary Immunotoxicology
Kluwer Academic Publishers, Boston, MA

http://www.directtextbook.com/author/This is a comprehensive source on the immune system of the respiratory tract, containing information useful in inhalation toxicology, immunotoxicology studies, and biomarkers. Divided into four sections: basic science, pathophysiology, immunological outcomes, and agents known to alter the immune function of the respiratory tract. Includes discussion of risk assessment and application of principles to regulation and prevention, which is more complicated for immune and immunotoxicologic responses than for other effects upon the lungs.

Cordasco EM, Demeter SL, Zenz C (Eds.) (1995)
Environmental Respiratory Diseases
Van Nostrand, New York

This reference book came out at the same time as the Harber et al text and did not fare well in the competition for sales. It is now hard to find. However, it has several chapters that bring together material not easily found elsewhere, such as toxic inhalation and pulmonary edema, the investigation of building-associated outbreaks, and respiratory health in the aerospace sector.

Corren J, Togias A, Bousquet J (2003)
Upper and Lower Respiratory Disease
Marcel Dekker, New York

Other sources cover the lower respiratory tract well but this source is unusual in providing a comprehensive view of the upper and lower respiratory tract, both as anatomic divisions and as interacting structures. Discusses physiology, immunology, and mechanisms of disease with a special emphasis on rhinitis and sinusitis. A valuable resource for the specialist, not suitable for the general user.

Gardner DL, Crapo JD, McLellan RO (Eds.) (1999)
Toxicology of the Lung, 3rd Edition
Taylor and Francis, Philadelphia, PA

This is an authoritative sourcebook for inhalation toxicology, covering anatomy, physiology, particle behavior, carcinogenicity, airways reactivity, and immunology. Although equal attention is paid to human and animal models, the emphasis is on research and applications of research for purposes of regulation, not clinical issues. Indispensable for the serious inhalation toxicologist.

Harber P, Schenker M, Balmes J (Eds.) (1995)
Occupational and Environmental Respiratory Diseases
Mosby, St. Louis, MO

Authoritative and comprehensive reference work on the diagnosis, management, and prevention of occupational and environmental respiratory diseases. Describes the clinical presentation of lung diseases, diagnostic methods, diseases associated with specific occupations and industries, clinical management of specific disorders, regulatory issues, compensation, and assessment of pulmonary impairment.

Hendrick D, Beckett W, Burge PS (Eds.) (2002)
Occupational Disorders of the Lung: Recognition, Management and prevention, 1st Edition
W.B. Saunders, London, New York

An authoritative textbook on occupational lung disorders with several unusual features. Issues of legislation and compensation management are addressed in unusual detail, for many countries. A feature called 'Difficult Cases' provides guidance from leading pulmonary and occupational disease specialists.

Laurent G, Shapiro S (2006)
Encyclopedia of Respiratory Medicine (Four volume set (1–4))
Academic Press, New York

This publication provides a comprehensive coverage of the complete field of respiratory medicine. It also provides a vital interface between the pure and clinical science environments covering various aspects of respiratory medicine from the relevant molecular biology to the treatment of diseases that affect the respiratory system. Further, it includes lung cells – the structural components of the lung and key molecules that regulate lung function as well as all the major respiratory diseases. The target audiences (upper level undergraduates, graduate students, post docs and professionals in pulmonology, biochemistry, cell biology, immunology, physiology, anesthesiology, intensive care, and respiratory medicine) will find this source of information very important. This publication is also available online via ScienceDirect (www.sciencedirect.com) which features extensive browsing, searching, and internal cross-referencing between articles in the work. Additionally, dynamic linking to journal articles and abstract databases are also available. The following topics are included in these four volumes: Anatomy and development of the respiratory tract; Anesthesia and surgery; Biologic processes and associated cells and molecules; Defence mechanisms; Diagnostic evaluation; Disorders of the control of breathing; Disorders of the pleura; Disorders of pulmonary circulation; Environmental and occupational disease; Exercise Infectious diseases; Infiltrative and interstitial lung diseases; Laboratory techniques for studying the lung in health and disease; Lung growth; Lung injury

defence and repair; Lung tissues; Manifestations of respiratory disease; Mechanics; Morphogenesis; Neonatal and pediatric lung; Neoplasms; Obstructive diseases; Oxygen delivery; Peripheral gas exchange; Pulmonary circulation and fluid exchange; Pulmonary gas exchange; Respiratory failure; Respiratory manifestations of extrapulmonary disease; Respiratory physiology; Respiratory pharmacology; and Sleep.

Qi G (1994)
The Atlas of Occupational Lung Diseases
Shanxi Science Technology Publishers, Taiyuan City, China

An outstanding refer.ence work, difficult to find but invaluable for the investigator engaged in studies of the pneumoconioses. Provides chest films, ink drawings, and short descriptions. Unfortunately, only labels are provided for diagnosis. There are no occupational histories or histology provided. Captions are in English, Chinese, Japanese, French, and Russian.

Salem H, Katz SA (2006)
Inhalation Toxicology, 2nd Edition
Taylor and Francis Group, CRC Press, Boca Raton, FL

This book provides practicing professional, student, scientist, academic, commercial, industrial, and governmental sectors on regulatory aspects of exposure and testing, testing equipment and procedures, biomarkers and pathology of exposure, respiratory allergy and irritation of the respiratory tract, risk assessment, bioaerosols ranging from household molds to anthrax and botulinum toxins, low-level exposures, toxicology theory and modeling, and toxic effects of some individual toxicants ranging from tobacco smoke to botulinum toxins. Furthermore, this book recognizes that the 100-m^2 surface of the lungs coupled with 15-l/min respiration rate provide opportunity for the entry of toxic and therapeutic chemicals into the human body via inhalation pathway. Transfer across the alveolar–gas interface is rapid and often enhanced by large partition coefficients. Toxicokinetic models have been developed for the absorption, distribution, metabolism, and inhaled chemicals. Recently, this approach has been extended to understand exposure to biologic materials such as mold and fungi. Emerging proteomics and genomic approaches are also included in this book. Other chapters on topics such as updated testing procedures and testing equipment have been included in this book. Recent changes in the European and North American guidelines for testing procedures are also included in the book.

Schwartz MI, King TE (2003)
Interstitial Lung Disease, 4th Edition
BC Dekker, London

Many occupational and environmental lung diseases affect the connective tissue skeleton of the lung and the structures between airspaces, called the interstitium. However, many interstitial lung diseases have other causes or no known cause. This reference book describes methods of diagnosis and describes the various interstitial lung diseases. It is therefore valuable not only for its toxicological content but in sorting out alternatives and the differential diagnosis when patients present with an interstitial disease pattern.

Swift DL, Foster WM (1999)
Air Pollutants and the Respiratory Tract, Second Edition (Lung Biology in Health and Disease)
Marcel Dekker, New York

An authoritative survey of the state of the art of air pollution studies as of the date of publication. Includes coverage of basic biology, epidemiology, methodology, sources, clinical evaluation, and details of specific toxic effects. As with all monographs, new information may arise since the date of publication. In this case, the gap falls mostly in coverage of fine and ultrafine particulate air pollution and mechanisms of cardiovascular response.

Journals

Inhalation Toxicology
Informa Healthcare, UK

This is a peer-reviewed publication that provides an important forum for the accomplishments and advancements in concepts, approaches, and procedures to evaluate the health risk associated with airborne chemicals. Topics include original research, reviews, symposiums and workshops focusing on how the respiratory system functions in health and disease, the pathogenesis and mechanism of injury, extrapolation of animal data to humans, effects of inhaled substances on extrapulmonary systems, and reliable and innovative models for predicting human disease. This journal is listed in Index Medicus/MEDLINE and other services and has been ranked 16th out of a total of 63 journals in toxicology, placing it in the top 25% of all toxicology journals. This description has been excerpted from http://www.tandf.co.uk/journals/titles/08958378.asp.

CHAPTER

57

Target Sites: Sensory

LEWIS NELSON

INTRODUCTION

Among the most complex of mammalian organs are the special sensory organs, engendering great sensitivity to toxicologic assault. Humans and other animals have developed sophisticated mechanisms to prevent the special sensory organs from injury by bloodborne toxins. Despite the development of this 'blood–organ barrier,' certain toxins are characteristically capable of gaining access to the organs and causing injury. Furthermore, given their obligatory exposure to the environment, these organs remain susceptible to external chemical assault.

RESOURCES

Books

Campbell KCM (2006)
Pharmacology and Ototoxicity for Audiologists
Thomson Delmar Learning, Clifton Park, NY

Clinically focused text for paraprofessionals involved in clinical practice.

Chiou GCY (1999)
Ophthalmic Toxicology, 2nd Edition (Target Organ Toxicology Series)
CRC, New York

A classic discussion of the basic science of toxicology, including in vitro and animal models of toxicity.

Donaldson K, Borm P (2006)
Particle Toxicology
CRC, Boca Raton, FL

Though not specific to nasal toxicology, this book reviews the pathophysiology and research methodology of inhalational toxins.

Fraunfelder FT, Fraunfelder FW (Eds.) (2001)
Drug-Induced Ocular Side Effects, 5th Edition
Butterworth Heinemann, Boston, MA

Fraunfelder FT, Fraunfelder FW, Chambers WA (2008)
Clinical Ocular Toxicology
Saunders, New York

Grant WM, Schuman JS (1993)
Toxicology of the Eye, 4th Edition
Charles C. Thomas Publisher, Springfield, IL

This is the most authoritative and comprehensive work on the subject. The text summarizes mechanisms of injury, clinical findings, and treatment of more than 3000 substances in an alphabetized format.

Hayes AW (1985)
Toxicology of the Eye, Ear, and Other Special Senses
CRC, New York

This book reviews the fundamental clinical science of toxic exposures of the special senses. Although not specifically focused on human senses, it discusses both the clinical and laboratory assessment in animals following exposure.

Miller FJ, Boorman GA (1995)
Nasal Toxicity and Dosimetry of Inhaled Xenobiotics
CRC, New York

Roland PS, Rutka JA (2004)
Ototoxicity
B.C. Decker, Hamilton, ON, Canada

This book serves as a resource for the human ototoxic potential of drugs used in clinical practice. It discusses both the ototoxicity of drugs used for non-otic conditions as well as the toxicity of otopharmaceuticals.

(2001)
The Wills Eye Drug Guide: Diagnostic and Therapeutic Medications, 2nd Edition
Lippincott Williams & Wilkins, Philadelphia, PA

Clearly focused on ophthalmic pharmacology.

CHAPTER

58

Target Sites: Skin

JULIE GOODMAN AND CARRIE YU

INTRODUCTION

The skin is the largest organ in the human body, with surface area of approximately $2\,m^2$ in an adult male. It serves the vital purpose of acting as a barrier between the human and the outside world, moderating both the introduction of foreign substances and the escape of body fluids and heat. In addition to serving as a physical barrier, the skin has the ability to metabolize some of the agents that pass through it. Human skin is made up of two layers, with the surface of the skin made up of an unvascularized external epidermis with a highly vascularized dermis located just below that. The skin is not an impermeable barrier, however, and many substances have the ability to penetrate the skin. This ability to pass through the skin is affected by many factors including area of the body where skin is located, preexisting skin diseases, genetic factors, temperature, humidity, and season. Skin toxicology examines the ability of various potentially toxic substances to affect the skin and to pass through the skin and into general systemic circulation to cause other potential effects.

RESOURCES

Books

Anderson BD, Wexler P (Eds.) (2005)
Encyclopedia of Toxicology, 2nd Edition
Elsevier, San Diego, CA.

Includes several skin-related topics: Safety Testing, Clinical Studies by A Pagnoni, Skin by P Robinson, Toxicity Testing, Alternatives by SC Gad, Toxicity Testing, Dermal by SE Gad and SC Gad, and Toxicity Testing, Irritation by PJ Hakkinen.

Baker S, Driver J, McCallum D (Eds.) (2001)
Residential Exposure Assessment. A Sourcebook
Kluwer Academic/Plenum Publishers, New York.

Includes Chapter 5 by P Robinson and C Ferenbacher on dermal exposure in residences.

Chilcott RP, Price S (Eds.) (2008)
Principles and Practice of Skin Toxicology
John Wiley & Sons, Chichester, UK.

Discusses principles of skin absorption, methods for assessing skin toxicity (both in vivo and in vitro testing), clinical and occupational skin toxicity, and regulating aspects.

Maibach HI, Strauss S (2001)
Toxicology of Skin
Taylor and Francis, Philadelphia, PA.

Part of Target Organ Toxicology Series.

Olin SS (Ed.) (1999)
Exposure to Contaminants in Drinking Water. Estimating Uptake through the Skin and by Inhalation
CRC Press, Boca Raton, FL.

Presents the current state of the science for assessing dermal and inhalation exposures from various uses of residential water. Includes the identification and review of available information resources, models, and approaches, along with several exposure assessment case studies. For example, Chapter 6 by AL Bunge and JN McDougal is on dermal uptake.

Riviere JE (Ed.) (2005)
Dermal Absorption Models in Toxicology and Pharmacology
Taylor and Francis, CRC Press, Boca Raton, FL.

Roberts MS, Walters KA (Eds.) (2008)
Dermal Absorption and Toxicity Assessment, 2nd Edition
Informa Healthcare, New York.

This book provides a state-of-the-art overview of the dermal absorption process, and is divided into sections covering skin structure and absorption, measurement of absorption, modeling of dermal absorption and risk assessment, skin toxicity and its prevention, regulatory issues and specific examples of the absorption of environmental materials. It also covers the methods used to assess skin absorption and the various governmental and industrial programs concerned with skin permeation and toxicity, including alternative in silico, in vitro, and in vivo strategies to conduct studies for regulatory approval.

U.S. Environmental Protection Agency (EPA) (2000)
Summary Report for the Workshop on Issues Associated with Dermal Exposure and Uptake
USEPA, Washington, DC.
Web: http://cfpub.epa.gov/ncea/raf/recordisplay.cfm?deid=20679

The EPA Risk Assessment Forum organized a workshop on December 10 and 11, 1998, to address generic technical issues related to dermal exposure and risk assessment that were raised during the February 1998 peer review of the Superfund Dermal Guidance (SDG). The issues were organized into four categories: (1) dermal exposure to contaminants in water, (2) dermal exposure to contaminants in soil, (3) adjustment of toxicity factors to reflect absorbed dose, and (4) risk characterization and uncertainty analysis for dermal assessments. This report summarizes the discussions at the workshop.

U.S. Environmental Protection Agency (EPA) (2004)
Risk Assessment Guidance for Superfund (RAGS). Volume I: Human Health Evaluation Manual (Part E, Supplemental guidance for dermal risk assessment) (Final)
USEPA, Washington, DC.
Web: http://www.epa.gov/oswer/riskassessment/ragse/index.htm.

The EPA developed Risk Assessment Guidance for Superfund: Volume I Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) to address human health risk related to dermal exposures. Parts A, B, C, and D address other aspects of a human health risk assessment on a Superfund site. Part E uses a consistent methodology for assessing the exposures from the dermal pathway for Superfund human health risk assessments. Part E does not address dermal exposure to vapors.

Presents and sponsors programs and educational activities; acts as a resource to the SOT in dermal toxicology; relates developments in dermal toxicology to SOT activities; and stimulates growth in the science of dermal toxicology.

CHAPTER

59

Terrorism and Warfare (Chemical, Biological, and Radioactive and Nuclear)

BARBARA PRICE AND RICHARD PRICE

INTRODUCTION

Previous editions of *Information Resources in Toxicology* have not contained a chapter on Terrorism and Warfare (Chemical, Biological and Radioactive and Nuclear CBRN); but in fact, the use of chemicals, biological and toxin agents, and radiological materials as military weapons does not fall under conventional weapons. These materials, used in war and in terrorism, are often referred to as weapons of mass destruction (WMD). In many cases, this is a misnomer and in fact these weapons do not destroy as much as they cause fear, require extensive and intensive medical treatment that ties up civilian and military medical facilities and material, limit the use of areas contaminated with these agents (denial of material and terrain), and, require careful time-consuming decontamination. These WMD, especially radioactive agents, are sometimes more aptly referred to as weapons of mass disruption because although they can kill many people, their biggest effect is disruption of operations.

Both the Chemical Weapons Convention and the Biological Toxin Weapon Convention, although originally developed to deal with military use of CB agents, include sections that can be applied to civilian and terrorist use. However, this is not the main thrust for either convention. Terrorism is not always defined the same way by different groups or from the same perspective. Terrorism used here refers to attacks on civilians and non-military targets to incite fear among targeted groups to bend them to another's political motives, whether that of an individual, a group, or a state. Distinguishing terrorist attacks from military attacks and even industrial accidents is not always straightforward. There may also be difficulties in proving a terrorist component to a military attack, especially if the collateral damage releases CBRN agents that can threaten civilian populations. When is an attack on a chemical plant not a strategic military target, but instead done to collaterally release chemicals to terrorize the local civilian population? It is not always easy to differentiate these.

Chemicals, toxins, and biological agents have been used for many years as weapons in war and as weapons of terror. World War I saw the first military organized use of chemicals, specifically chlorine and mustard, between the British and the Germans as the first effective use of chemical agents. However before that, chemicals had been used as far back as 1000 BC when Chinese used arsenic in fires to poison their enemies.

The first generally cited use of biological agents in war is in 184 BC when Hannibal's forces threw snakes into his enemies' boats during a naval battle, and then 1364 when the Tartars threw dead plague victim bodies into the walled city of Kaffa with the intention of causing plague. Another example in more modern history frequently cited is the British, fighting the French and Indian Wars in North America, who gave the Indians blankets contaminated with dried body fluids from smallpox victims.

Groups with political motives have used chemical, biological, and radiological materials as agents to terrorize populations and enhance their apparent power

when their real power is small. Recent examples include: Aum Shimrykio's use of nerve agents in Tokyo, 1990, ricin in an umbrella in London to kill a former Bulgarian citizen in 1978; a religious cult sprayed a food bar in The Dalles Oregon, with *Salmonella* to create city-wide illness and thwart an election in 1984; *Shigella* reportedly used by groups in Myanmar in the 1990s to weaken the Karen ethnic group on the Thai–Myanmar border; butyric acid used in attacks on abortion clinics in the US; and, most recently, Po-210, a difficult-to-produce isotope, was used to kill a former Russian citizen in 2006. These are a few recent uses designed to induce terror among the victims and those associated with them. In many cases the use of CBRN agents sends the message that more agents that may be more dangerous may be next.

In the 1990s, terrorism and terrorist threats became more widespread with the attention gained by the Aum Shinrykio Cult, the poisonings in The Dalles, butryic acid attacks at abortion clinics, and other isolated incidents. These increased dramatically after the September and October 2001 attacks on the World Trade Center in NYC and the Pentagon in Washington DC, and the 'anthrax letters' in the USA. Speculation on the threat of CBRN terrorism became 'popular.' Consequently almost every medical, military, and 'soldier of fortune' magazine and journal has had at least one article on CBRN terrorism's threat and medical treatment. There are hundreds of websites and dozens of books in the popular literature that are devoted to or include a discussion of the CBRN terrorism threat. Many of these include mistakes and inaccuracies. The sources cited here are those that are reliable.

The tactics behind the use of CBRN agents for terrorism are different to those agents used as military CBRN weapons. The 'payload,' i.e., the amount of agent needed to cause a significant disruption in operations, is much smaller than in military use. It does not matter if the amount of agent is limited to a plastic bag, as in the Tokyo subway attack. The method of dispersal can be crude and inefficient, such as an umbrella to puncture the bag. The delivery can be even simpler, because bombs and missiles are not needed to deliver the agent to where people are. The goal of the terrorist is often just to be noticed and incite fear.

Chemical Terrorism

Military chemical warfare agents, nerve agents (sarin, soman, tabun, VX, etc.), blister agents (mustard), choking agents (phosgene), blood agents (cyanides), are only a few of the many chemicals that can be used for terrorism. Many of the chemicals used in manufacturing and chemical processes in the industrial world have been characterized for their toxicity, but most have not been.

Our industrial society manufactures, ships, stores, and uses many toxic industrial chemicals (TICs) and materials (TIMs), most of them safely. In our safety-conscious and post-Bhopal and post-9/11 world, these TICs (and TIMs) can present possible threats to our safety and security. The manufacture, shipping, and storing of TICs and TIMs are essential in the industrial world, however, they also represent a weakness that could be exploited by determined terrorist groups. There are many different scenarios which can be imagined, e.g., the direct use of TICs by attackers (state or terrorist groups), the collateral release of TICs by attacks with conventional explosives and weapons, large-scale TIC attacks, more local or personalized attacks, etc. Preparations for protecting the employees and nearby public from such threats include evaluating the potential threat and also the medical treatment. For those TICs and facilities that present the largest threat in terms of potential for release and impact to the surrounding communities, preparations for medical treatment can be expensive and should be prioritized. A medical stockpile containing equipment and materials, including drugs, for treating them can then be assembled. The medical stockpile will be different in different areas of countries, depending upon industrial facilities and budgets.

Most CBRN or terrorism scenarios have a safety counterpart, i.e., the scenario can be viewed as a safety assessment. For example, a plant safety assessment that evaluates explosive reactions and releases from worker error can be essentially the same assessment used to protect a plant from sabotage or even a terrorist attack. Other scenarios unrelated to a terrorist threat can look at the environmental release and pollution potential or pollution mitigation. Each industrial facility should have as part of its safety plan, provisions to treat those workers and even nearby citizens who may be exposed to the chemicals and materials used, made, and stored at the facility. This can be a very expensive undertaking, but should be considered part of business operations. The prioritization of drugs and equipment for medical treatment is part of a safety analysis for the industrial facility.

If the consideration is an attack by terrorists, with a large choice of scenarios, it is difficult to predict which ones are most likely. At first glance scenarios with the most toxic chemicals might seem to be the best choices and consequently the most likely terrorist weapon. However, a more balanced view may discover both physical and historical properties that can differentiate between choices. It is useful to evaluate TICs from the standpoint of possible use by terrorists, as well as from safety viewpoints.

Biological Terrorism

Biological agents are usually those that can cause a disease, primarily infectious diseases from bacteria, viruses, rickettsia, and protein changes, such as prions. Biological agents also include toxins produced by specific agents, such as bacterial toxins, which are easily made in the organism, such as anthrax, clostridium, and botulinum toxins.

One of the important topics in characterizing and detecting bioterrorism, terrorism using biological agents, as well as covert use of biological weapons and covert biological warfare (BW), is determining whether or not a disease has occurred from natural sources or is the result of an intentional release. Unlike many of the chemical terrorism scenarios, bioterrorism may occur against a background of disease. Are there 5% more cases of West Nile Fever than occurred last year or has the incidence of flu increased by 50% compared to the same time last year? Are there anthrax spores in the background soils and are they the same type of anthrax spores that are in the dust?

A robust public health infrastructure is one of the best ways to prevent or mitigate bioterrorism. Such a public health system will be one that already monitors diseases in its populations so that it is possible to distinguish between intentional and natural occurrences of disease. A good public health system will also be flexible enough to provide sufficient medications, doctors, nurses, and beds in the event of a bioterrorist attack or any number of natural disasters that may increase population susceptibility to disease.

A good source for learning about chemical and biological terrorism and public health is at CDC's website, http://www.bt.cdc.gov/.

Radiological Terrorism

Radioactive materials have many uses in industrial societies. They may be used in medical procedures, radioisotopes, in which case they emit low energies and are in low concentrations. Other radioactive materials, especially alpha emitters, may be used for very short-range ionization, as in the Americium-241 that is used in smoke detectors.

There is a very large distinction between nuclear terrorism or attacks and radiological terrorism. The former threatens the release of huge amounts of energy in a nuclear explosion with a nuclear bomb. A nuclear bomb also releases radioactive materials created during the fission of the bomb and from the starting materials.

Radiological terrorism involves the use of conventional weapons to disperse or spread radioactive materials. The radioactive materials may be in a nuclear power plant or recycling plant; this would be an attack with conventional weapons on a nuclear facility. Alternatively, the radioactive materials may be included in the bomb, the so-called 'dirty bomb' or radiological bomb or Radiological Dispersal Device (RDD).

Another option that is also called radiological terrorism is the placement of highly radioactive materials, radioactive emitting device (RED), in a high-traffic area without any protection for the exposed population, such as placing a cobalt-60 tube in a schoolyard.

A good source for learning about nuclear and radiological terrorism is at the website for the Nuclear Threat Initiative http://www.nti.org/.

RESOURCES

In the Resources section, those materials that include chapters or discussions on the use of CBRN agents by terrorists or in terrorist-like incidents are highlighted. There are many resources for descriptions of classic military CBRN agents and these are not all included in this list unless they also include a discussion of terrorism use.

Books

Many books, and even novels, have been written on the use of CBRN agents, especially military use. Only a few of the more authoritative books are listed here. There are few books devoted to CBRN terrorism, although some of the books on CBRN or NBC weapons have included a chapter on terrorism.

Sidell FR, Takafuji ET, Franz DR (Eds.) (1997)
Medical Aspects of Chemical and Biological Warfare
Borden Institute
Office of the Surgeon General, Department of the Army, USA
Washington, DC
Web: http://www.bordeninstitute.army.mil/published_volumes/chemBio/fm.pdf

This is the definitive military discussion of chemical and biological agents, weaponry, and effects from the perspective of the US military. This book has chapters on the history of CB use, descriptions of the 'classic military' CB agents, and medical treatment of military exposed to these agents. The new edition includes a discussion on the use of these CB agents in terrorism incidents.

Somani SM (Editor), Romano Jr JA
Chemical Warfare Agents: Toxicity at Low Levels
Chemical Warfare Agents: Toxicity at Low Levels, First Edition (December, 2000), Second Edition (November 2007)
464 pages First Edition
CRC Press, Boca Raton, FL.
ISBN-10: 0849308720
ISBN-13: 978-0849308727

This book, first published in 2000, was recently updated and includes a chapter on the effects of chemical exposures resulting from terrorism incidents and was scheduled to be published in November 2007. The book focuses on the more subtle changes, physiological and biochemical, which occur at less than lethal exposures to chemical agents. Most of the chapter authors have been involved in military medical defense research for many years and the chapters reflect this history and perspective.

SIPRI Scorpion Series
Stockholm International Peace Research Institute, SIPRI
Signalistgatan 9
SE-169 70 Solna
Sweden
Phone: +46-8-655 97 00
Fax: +46-8-655 97 33
Email: sipri@sipri.org

The Stockholm International Peace Research Institute, SIPRI, has published a series of books as part of the Chemical and Biological Warfare (CBW) Project. Volume 1 was published in 1985 and the last, Volume 19, was published in 2001. The SIPRI CBW Studies series (the Scorpion series, a reference to toxins) covers a wide variety of issues related to the work of the CBW Project. The listing is presented on http://www.sipri.org/contents/publications/CBWstudies.html.

SIPRI Books in Scorpion Series
No. 19. The Evolution of Biological Disarmament
Nicholas A. Sims (2001)
Oxford University Press
ISBN 0-19-829578-2, paperback, 210 pages

No. 18. Biological and Toxin Weapons: Research, Development and Use from the Middle Ages to 1945
Erhard Geissler, John Ellis van Courtland Moon (Eds.) (1999)
Oxford University Press
ISBN 0-19-829579-0, paperback, 296 pages

No. 17. Chemical Weapons Destruction in Russia: Political, Legal and Technical Aspects
John Hart, Cynthia Miller (Eds.) (1998)
Oxford University Press
ISBN 0-19-829569-3, paperback, 176 pages

No. 16. The Challenge of Old Chemical Munitions and Toxic Armament Wastes
Thomas Stock, Karlheinz Lohs (Eds.) (1996)
Oxford University Press
ISBN 0-19-829190-6, paperback, 356 pages

No. 15. Control of Dual-Threat Agents: The Vaccines for Peace Programme
Erhard Geissler, John P. Woodall (Eds.) (1994)
Oxford University Press
ISBN 0-19-829172-8, paperback, 282 pages

No. 14. Verification under the Chemical Weapons Convention: On-Site Inspection in Chemical Industry Facilities
Trapp R (1993)
Oxford University Press
ISBN 0-19-829160-4, paperback, 132 pages

No. 13. Verification of Dual-use Chemicals under the Chemical Weapons Convention: The Case of Thiodiglycol
Lundin SJ (Ed.) (1991)
Oxford University Press
ISBN 0-19-829156-6, paperback, 156 pages

No. 12. Views on Possible Verification Measures for the Biological Weapons Convention
Lundin SJ (Ed.) (1991)
Oxford University Press
ISBN 0-19-829142-6, paperback, 140 pages

No. 11. National Implementation of the Future Chemical Weapons Convention
Thomas Stock, Ronald Sutherland (Eds.) (1990)
Oxford University Press
ISBN 0-19-827837-3, paperback, 186 pages

No. 10. Strengthening the Biological Weapons Convention by Confidence-Building Measures
Erhard Geissler (Ed.) (1990)
Oxford University Press
ISBN 0-19-829139-6, paperback, 220 pages

No. 9. Non-Production by Industry of Chemical-Warfare Agents: Technical Verification Under a Chemical Weapons Convention
SJ Lundin (Ed.) (1988)
Oxford University Press
ISBN 0-19-829129-9, paperback, 265 pages

No. 8. International Organization for Chemical Disarmament
Nicholas A. Sims (1987)

Oxford University Press
ISBN 0-19-829121-3, paperback, 158 pages

No. 7. Chemical Weapon Free Zones?
Ralf Trapp (Ed.) (1987)
Oxford University Press
ISBN 0-19-829113-2, paperback, 211 pages

No. 6. Chemical and Biological Warfare Developments: 1985
Julian Perry Robinson (1986)
Oxford University Press
ISBN 0-19-829110-8, paperback, 110 pages

No. 5. The Chemical Industry and the Projected Chemical Weapons Convention: Proceedings of a SIPRI/Pugwash Conference, Volume II
Oxford University Press
ISBN 0-19-829109-4, paperback, 233 pages

No. 4. The Chemical Industry and the Projected Chemical Weapons Convention: Proceedings of a SIPRI/Pugwash Conference, Volume I (1986)
Oxford University Press
ISBN 0-19-829107-8, paperback, 147 pages

No. 3. The Detoxification and Natural Degradation of Chemical Warfare Agents
Ralf Trapp (1985)
Taylor & Francis
ISBN 0-85066-309-1, paperback, 104 pages

No. 2. Chemical Warfare Arms Control: A Framework for Considering Policy Alternatives
Julian Perry Robinson (1985)
Taylor & Francis
ISBN 0-85066-308-3, paperback, 116 pages

No. 1. Effects of Chemical Warfare: A Selective Review and Bibliography of British State Papers
Andy Thomas (1985)
Taylor & Francis
ISBN 0-85066-307-5, paperback, 116 pages

Journals

Journals that publish articles in CBRN or NBC terrorism abound. Especially in the last few years, articles have been published in journals devoted to topics from military medicine to pediatric health. A quick search of the PubMed database for chemical terrorism lists 99 articles, only nine were published before September 2001. A similar search for bioterrorism lists 3818 articles, only 176 articles were published before September 2001.

Journal of Medical Chemical, Biological, and Radiological Defense (2002–)
Web: www.JMedCBRN.org

The *Journal of Medical Chemical, Biological, and Radiological Defense* is devoted to peer-reviewed articles in medical defense and specifically chemical, biological, and radiological defense. Articles feature descriptions of medical treatment and medical countermeasures, clinical studies, medical defense policy and doctrine, both for the military and civilian terrorism issues. The archives section includes hard-to-find technical reports, articles, and proceedings and upcoming scientific conferences in CBRN defense and terrorism issues.

Journal Articles

Since 2001 the number of articles discussing terrorism in general and CBRN terrorism specifically has increased dramatically as noted above. Many of the articles are reviews or surveys of preparedness, nevertheless, the articles listed provide a reasonable introduction to the topic of CBRN terrorism. The articles listed in this section are good introductory articles in well-known professional journals by credible authors. It is not an exclusive listing but it can serve as the beginning of any research in the area. Preference was given to articles with open access.

Chemical Terrorism

Neurological aspects of biological and chemical terrorism: a review for neurologists
Martin CO, Adams HP Jr (2003)
Arch. Neurol. 60(1): 21–25. Review.
Web: http://archneur.ama-assn.org/cgi/content/full/60/1/21

This article reviews four agents that have a history of military or terrorist use: cyanide poisons, organophosphate poisons, botulinum toxin, and anthrax.

Tokyo – protecting the health care worker during a chemical mass casualty event: an important issue of continuing relevance
Okumura S, Okumura T, Ishimatsu S, Miura K, Maekawa H, Naito T (2005)
Critical Care 9: 397–400; doi:10.1186/cc3062
Web: http://ccforum.com/content/9/4/397/abstract

And the related commentary

The problem of secondary contamination following chemical agent release
David Baker (2005)

SAMU 75, Hopital Necker – Enfants Malades, Paris, France and Chemical Hazards and Poisons Division, Health Protection Agency, Guy's and St Thomas's Trust, London, UK

Critical Care 9: 323–324 doi:10.1186/cc3509 at http://ccforum.com/content/9/4/323

This article and its companion commentary provide a good discussion of the importance of decontamination and the treatment of populations exposed in a chemical attack.

Chemical terrorism attacks: update on antidotes
Emerg. Med. Clin. North Am. 2007; 25(2): 567–595
Lawrence DT, Kirk, MA

Blue Ridge Poison Center, Division of Medical Toxicology, Department of Emergency Medicine, University of Virginia, P.O. Box 800744, Charlottesville, VA 22908-0774, USA.

There is well-founded concern that a chemical or radioactive agent will at some point be used as a weapon of terror. There are several antidotes that, if used correctly in a timely fashion, can help lessen the harm caused by these agents. This article is meant to introduce the clinician to several such agents, along with the antidotes useful in the management of exposure to these. It covers the indications, administration, and precautions for using these antidotes.

Antidotes for nerve agent poisoning: should we differentiate children from adults?
Baker MD (2007)
Curr. Opin. Pediatr. 19(2): 211–215
Division of Pediatric Emergency Medicine, Department of Pediatrics, University of Alabama Birmingham, Birmingham, Alabama, USA
Email: mbaker@peds.uab.edu

Chemical terrorism presents a threat to the civilian population, including children. Nerve agent antidotes are available in prepackaged autoinjectors that can be delivered rapidly following an exposure. This review examines the evidence supporting the use of nerve agent antidotes in children. It is an example of how military antidotes and treatments will need to be adapted for a civilian population with children, elderly, and mature adults, and immune-compromised individuals.

Biological Terrorism (Bioterrorism)

The Microbial Rosetta Stone Database: A compilation of global and emerging infectious microorganisms and bioterrorist threat agents
Ecker DJ, Sampath R, Willett P, et al (2005)
BMC Microbiology 5: 19
Full text available at http://www.biomedcentral.com/1471-2180/5/19

The Microbial Rosetta Stone database relates microorganism names, taxonomic classifications, diseases, specific detection and treatment protocols, and relevant literature. The database structure facilitates linkage to public genomic databases. This paper focuses on the information in the database for pathogens that impact global public health, emerging infectious organisms, and bioterrorist threat agents.

The Microbial Rosetta Stone is available at http://www.microbialrosettastone.com/. The database provides public access to up-to-date taxonomic classifications of organisms that cause human diseases, improves the consistency of nomenclature in disease reporting, and provides useful links between different public genomic and public health databases.

Occurrence and overlap of natural disasters, complex emergencies and epidemics during the past decade (1995–2004)
Paul B Spiegel, Phuoc Le, Mija-Tesse Ververs, Peter Salama (2007)
Conflict and Health 1: 2; doi:10.1186/1752-1505-1-2
Published 1 March 2007
Web: http://www.conflictandhealth.com/content/1/1/2/abstract

The fields of expertise of natural disasters and complex emergencies (CEs) are quite distinct, with different tools for mitigation and response as well as different types of competent organizations and qualified professionals who respond. However, natural disasters and CEs can occur concurrently in the same geographic location, and epidemics can occur during or following either event. Epidemics commonly occur during CEs. The data presented in this article do not support the often-repeated assertion that epidemics, especially large-scale epidemics, commonly occur following large-scale natural disasters. This observation has important policy and programmatic implications when preparing and responding to epidemics. There is an important and previously unrecognized overlap between natural disasters and CEs. Training and tools are needed to help bridge the gap between the different type of organizations and professionals who respond to natural disasters and CEs to ensure an integrated and coordinated response.

Agroterrorism: where are we in the ongoing war on terrorism?
Crutchley TM, Rodgers JB, Whiteside HP Jr, Vanier M, Terndrup TE (2007)
J. Food Prot. 70(3): 791–804
University of Alabama at Birmingham, Department of Nutrition Sciences, 1675 University Boulevard, Birmingham, Alabama 35294, USA.
Email: tcrutchley@uabmc.edu

Many of the characteristics of agricultural infrastructure that contribute to its high productivity and efficiency

also make it extremely vulnerable to a terrorist attack by a biological weapon. As a result of continuing criticism, many initiatives at all levels of the US government and within the private sector are directed to improve detection and response to an agroterrorist attack. This article discusses how outbreaks, such as the 1999 West Nile outbreak, the 2001 anthrax attacks, the 2003 monkeypox outbreak, and the 2004 *Escherichia coli* O157:H7 outbreak, have demonstrated the need for improvements in the areas of communication, emergency response and surveillance efforts, and education for all levels of government, the agricultural community, and the private sector.

Public Health Assessment of Potential Biological Terrorism Agents
Lisa D Rotz, Ali S Khan, Scott R Lillibridge, Stephen M Ostroff, James M Hughes (2002)
Centers for Disease Control and Prevention, Atlanta, Georgia
Emerg. Infect. Dis. 8.
Web: http://www.cdc.gov/ncidod/eid/vol8no2/01-0164.htm

This is one of the few classic papers in the field. Many biological agents can cause illness in humans, but not all are capable of affecting public health and medical infrastructures on a large scale. The Working Group on Civilian Biodefense, using an expert panel consensus-based process, identified several biological agents as potential high-impact agents against civilian populations using a method for assessing potential biological threat agents that would provide a reviewable, reproducible means for standardized evaluations of these threats. This report outlines the overall selection and prioritization process used to determine the biological agents for public health preparedness activities. The selection and prioritization was conducted in 1999, but remains the best documented prioritization of agents.

Radiological Terrorism

Vulnerability of populations and the urban health care systems to nuclear weapon attack – examples from four American cities
William C Bell, Cham E Dallas (2007)
Center for Mass Destruction Defense, College of Pharmacy, University of Georgia, Athens, GA 30602, USA
Intern. J. Health Geog. 6: 5; doi:10.1186/1476-072X-6-5
Web: http://www.ij-healthgeographics.com/content/6/1/5

This paper has quickly become one of the most cited papers in the field. The implications are beyond the radiological and nuclear examples given and apply equally well to chemical and biological attacks. The effects of 20 kiloton and 550 kiloton nuclear detonations on high-priority target cities are presented for New York City, Chicago, Washington DC, and Atlanta. Thermal, blast, and radiation effects are described, and affected populations are calculated using 2000 block level census data. Weapons of 100 Kts and up are primarily incendiary or radiation weapons, able to cause burns and start fires at distances greater than they can significantly damage buildings, and to poison populations through radiation injuries well downwind in the case of surface detonations. With weapons below 100 Kts, blast effects tend to be stronger than primary thermal effects from surface bursts. From the point of view of medical casualty treatment and administrative response, there is an ominous pattern where these fatalities and casualties geographically fall in relation to the location of hospital and administrative facilities. It is demonstrated that a staggering number of the main hospitals, trauma centers, and other medical assets are likely to be in the fatality plume, rendering them essentially inoperable in a crisis.

Radiological weapons: what type of threat?
Mapstone J, Brett S (2005)
Critical Care 9: 223–225
Web: http://ccforum.com/content/9/3/223

The risks of radiological weapons are discussed. Unless a hospital has a nuclear reactor nearby, it is unlikely that radiological incidents will feature high on the major incident plan. Recently, health protection agencies have again started to provide guidance on these issues, following a perceived heightened threat from terrorism. This article attempts to demystify the risks and describe the extra actions that should be considered at a hospital in order to effectively deal with the aftermath of such an attack.

Organizations

Applied Science and Analysis, ASA, Inc.
PO Box 6409
Kaneohe, HI 96744
Phone: 808-235-8010
Fax: 808-432-9670
Email: info@asanltr.com
Web: www.asanltr.com

ASA was started in 1983 to foster international exchange of information on chemical, biological, and radiological defense issues. ASA developed and publishes the ASA Newsletter devoted to issues in CBRN

defense and especially the exchange of information. ASA developed the Chemical Biological and Radiological Medical Treatment Symposium, CBMTS, series to discuss research, policy, innovations in the medical treatment of CBRN casualties, prevention of CBRN casualties, and crisis and consequence management of the after effects of CBRN releases.

Harvard-Sussex Program (HSP)
Science and Technology Policy Research, SPRU
Freeman Centre University of Sussex
BrightonEast Sussex BN1 9QE, UK
Phone: +44 (0)1273 678 172
Fax: +44 (0)1273 685 865
Email: hspoffice@sussex.ac.uk
Web: http://www.sussex.ac.uk/

This program was started by a collaboration of Matthew Meselson at Harvard and Julian Perry Robinson at Sussex to instill the traditions, practice, and benefits of scholarship into the formation of public policy on issues involving biological and chemical weapons. University-based research and publication, other forms of international communication, constructive association with people in policy-shaping and policy-making circles, and training of young people are the means HSP uses. In addition, HSP maintains national and international frameworks for discourse, study and consensus-building that bring together scientists and other scholars with officials of governmental and intergovernmental bodies.

Motivating HSP is the urgency of concerns raised by biological and chemical weapons as potential instruments of terror, coercion and mass killing, whether in the hands of warring nations or of non-state entities. HSP therefore favors efforts to eliminate these weapons globally and to prevent the hostile exploitation of biotechnology. It supports efforts to maintain and enhance the moral, political, and legal constraints and prohibitions against the hostile use of disease. If the existing norms against CBW were to fail, biological and chemical weapons of the kinds developed during the years of the East–West Cold War could furnish relatively simple means for the attack of people, animals, and crops over large areas. Even more menacing, in the longer term, would be a world in which the dual-use nature of new biotechnology, now advancing very rapidly, were exploited for those purposes.

Monterey Institute of International Studies, Center for Nonproliferation Studies (CNS)

US Department of Health and Human Services (HHS)
The US Department of Health and Human Services
200 Independence Avenue, S.W.
Washington, D.C. 20201
Phone: 202-619-0257 or 1-877-696-6775
Web: www.dhs.gov

HHS is the 'government's principal agency for protecting the health of all Americans and providing essential human services.' HHS is responsible for national health, has a website that lists major resources, including CBRN weapons and their characteristics and countermeasures, environmental disaster, and bioterrorism. Through the website there are links to other authoritative sources (http://www.hhs.gov/disasters/).

The family of agencies within the US DHHS that deal with health issues, including protection from CBRN terrorism, includes.
ATSDR—Agency for Toxic Substances & Disease Registry
CDC—Centers for Disease Control & Prevention
NIH—National Institutes of Health

Agency for Toxic Substances & Disease Registry
ATSDR
CDC-INFO
Public inquiries: 800-CDC-INFO or 800-232-4636
TTY 888-232-6348 24 Hours/Day
E-mail: cdcinfo@cdc.gov
CDC Emergency Response: 770-488-7100
www.atsdr.cdc.gov

The ATSDR serves the public by using the best science, taking responsive public health actions, and providing trusted health information to prevent harmful exposures and diseases related to toxic substances.

The US Centers for Disease Control and Prevention (CDC)
1600 Clifton Rd.
Atlanta, GA 30333, USA
Phone: 404 639-3311
Public inquiries: (404) 639-3534/(800) 311-3435
Web: www.cdc.gov

CDC's mission is 'to promote health and quality of life by preventing and controlling disease, injury, and disability.' CDC has an extensive website 'intended to increase the nation's ability to prepare for and respond to public health emergencies.' The most comprehensive website for CBRN terrorism is at http://www.bt.cdc.gov/. This site is a portal to information about individual

CBRN agents, agent effects and disease, training, monitoring, detecting, mitigating, decontaminating after an attack by CBRN agents.

US Department of Homeland Security (DHS)
Washington, D.C. 20528
Phone: 202-282-8000
Web: www.dhs.gov

DHS has as its mission securing the homeland. DHS is the organization in the US with prime responsibility for handling the results of CBRN terrorism on civilians. This includes managing national health emergencies in the event of pandemics, even if the origin is natural. In the event of a national emergency, there will be some overlap and integration of the HHS and DHS responsibilities. The DHS website is http://www.dhs.gov/index.shtm. Information from DHS can be found on at least two sources, www.whitehouse.gov, and directly for the citizen at www.ready.gov.

The best description of DHS is at http://www.whitehouse.gov/deptofhomeland/toc.html/. Two especially useful pages from www.whitehouse.gov are those for Emergency Preparedness and Response, http://www.whitehouse.gov/deptofhomeland/sect4.html, and Chemical, Biological, Radiological, and Nuclear Countermeasures, http://www.whitehouse.gov/deptofhomeland/sect5.html/.

World Health Organization (WHO)
Avenue Appia 20
CH-1211 Geneva 27
Switzerland
Phone: +41 22 791 2111
Fax: +41 22 791 3111
Web: http://www.who.int/

WHO has a website with guidance for public health response to deliberate chemical and biological agent releases, http://www.who.int/csr/delibepidemics/en/. This document and others on the WHO website, provide a broad overview of what may need to be taken into account in building public-health preparedness against deliberate releases of biological or chemical agents. It was prepared as a response to Member States requests for assistance. The new guidance, 2006, is an update to that provided in 2004 and first prepared in 1970 as *Health Aspects of Biological and Chemical Weapons*.

The section on information resources is particularly useful and is grouped into three categories: major texts and general sources: authoritative books or monographs covering several aspects of preparedness, task-specific information resources, such as threat and hazard identification, hazard evaluation and planning for hazard management, and hazard reduction and control, and, references to major websites hosting authoritative information that may be updated frequently (http://www.who.int/csr/delibepidemics/annex6.pdf).

Nuclear Threat Initiative (NTI)
Senator Sam Nunn and Ted Turner founded the Nuclear Threat Initiative (NTI) in January 2001. NTI's mission is to strengthen global security by reducing the risk of use and preventing the spread of chemical, biological, radiological, and nuclear weapons. NTI seeks to raise public awareness, serve as a catalyst for new thinking and take direct action to reduce these threats. They operate a website with information on CBR agents and weapons (http://www.nti.org).

The Biological and Chemical Weapons Nonproliferation and Response Program (BCWNRP)
The Henry L. Stimson Center
1111 19th Street
Twelfth Floor
Washington, DC 20036
Phone: 202.223.5956
Fax: 202.238.9604
Email: info@stimson.org
http://www.stimson.org/cbw/programhome.cfm

The BCWNRP examines the distinct issues associated with biological and chemical weapons, as well as the technologies and regulatory frameworks designed to minimize the risk that these agents pose to human security.

Chemical and biological weapons share a characteristic distinct from nuclear weapons: fairly easily acquired raw materials (for most pathogens or chemicals) that either have legitimate uses or occur naturally. The CBW project focuses on the history of biological and chemical weapons, measures to control their proliferation (including domestic laws and international regimes), and weapons destruction technologies. Technical reports examine the likelihood of terrorism involving chemical and biological weapons, as well as technologies and policies to prevent or counter their use.

Databases

There are several databases on the explicit use of CBRN agents as terrorist weapons, but most list the characteristics of the CBRN agents, toxicology, physical properties, effects, symptoms, etc.

HSP CBW Events Data-Base
Harvard-Sussex Program

HSP has a searchable database recording some 15 000 events during the past two decades that have been associated with CBW. It is a systematic record of events back to 1987 in and around the world of CBW, searchable via the text-retrieval application in which it

is held. The 'News Chronology' feature in The CBW Conventions Bulletin is drawn from it.

HSP also has collected a bibliographical database recording some 4500 publications on or around the subject of CBW. This is the HSP CBW Publications Data-Base, a continually updated register of substantial new publications in the field back to 1987 that is excerpted for the 'Recent Publications' feature of the Bulletin. It is held in EndNote, so as to facilitate searching and manipulation.

Educational Module on Chemical and Biological Weapons (CBW) Non-proliferation
Stockholm International Peace Research Institute (SIPRI)
Web: http://www.sipri.org/contents/webmaster/databases

The CBW module is designed to educate the interested layperson (at basic and intermediate levels, an advanced version is planned) in non-proliferation in general and CBW non-proliferation in particular. Case studies are on Iraq and Libya and understanding why and how each decided to develop and acquire CBW.

Monterey Proliferation Databases
Center for Nonproliferation Studies (CNS)
460 Pierce Street, Monterey, CA 93940, USA
CNS maintains the following proliferation databases on http://cns.miis.edu/dbinfo/about.htm/

ChemBio Weapons and WMD Terrorism Database
China WMD and Arms Control Database
HEU Reduction and Elimination Database
Inventory of International Nonproliferation Organizations and Regimes
NIS Trafficking Database
Nuclear and Missile Developments Database
Submarine Proliferation Database
WMD Country Profiles Database

Thanks to a grant from the Nuclear Threat Initiative (NTI), CNS has made its databases available to the public as part of the NTI Research Library on www.nti.org/

The CNS proliferation databases contain information compiled from hundreds of source publications, including United Nations and International Atomic Energy Agency documents, trade journals, government and defense publications, periodicals and electronic news sources, academic journals, US congressional testimony, conference proceedings, book chapters, correspondence from international advisors, unpublished papers, and Internet sources. These databases contain continually updated information about the global proliferation of weapons of mass destruction (nuclear, chemical, and biological) and their delivery systems.

Of particular interest is the ***ChemBio Weapons and WMD Terrorism News Archive***. The ChemBio Weapons and WMD Terrorism News Archive is compiled from the tri-weekly news service offered by the Washington office of the Center for Non-proliferation Studies at the Monterey Institute of International Studies. This news list serve archive consists of links to and key excerpts from articles, testimony, newspaper and magazine articles, government reports, speeches, and specialized news reporting services. Topics covered include CBW state programs, non-proliferation treaties and verification measures, destruction of CBW, incidents involving chemical, biological, radiological, and nuclear weapons (CBRN) including, threats, hoaxes, international contaminations, poisonings or agent release, threat assessment, national and international policies, and legislation.

Please contact the Monterey Terrorism Research and Education Program (MonTREP) for information about the WMD Terrorism Database and the Incident Response Database.

Other Resources

There are many websites wherein chemical and biological terrorism and the agents are described and characterized. Many of the sites are collections from the general public and interested historians, without any outside review. The websites noted here are only a sampling and, in general, are more reliable sources.

Applied Science and Analysis (ASA)
ASA Newsletter, ISSN 1057-9419
ASA,
Kaneohe, HI 96744
Email: info@asanltr.com
Web: www.asanltr.com

Available by subscription, with selected articles are on http://www.asanltr.com/. This newsletter is published by ASA every 2 months and is a primary source of information on CBRN internationally since 1987. The ASA Newsletter covers technical articles, contracts, equipment, history, and policy. The use of industrial chemicals as 'chemical weapons,' sometimes called eco-terrorism, has been addressed in this newsletter since 1992.

Stockholm International Peace Research Institute (SIPRI)
Signalistgatan 9

SE-169 70 Solna
Sweden
Phone: +46-8-655 97 00
Fax: +46-8-655 97 33
Email: sipri@sipri.org

SIPRI has published a six-volume set of CBW primers on one CD. This is available from SIPRI at http://www.sipri.org/contents/publications/cdrom.html/.

Volume I. The Rise of CB Weapons (1971)

A description of the main lines of development in the technology underlying CBW and in the constraints affecting use of chemical and biological weapons. The period covered is approximately 1914–45, although more recent developments in CW technology are also described. In addition, the volume includes an account of all instances known to SIPRI when CB weapons have been used in war, or when their use has been alleged; in this case the timespan is 1914–70.

Volume II. CB Weapons Today (1973)

A description of the present state of CBW technology and of national CBW programs and policies. It also includes a discussion of the attractions and liabilities of CB weapons, and of the consequences, intentional or unintentional, which might follow their use.

Volume III. CBW and the Law of War (1973)

A description of the legal limitations on the use of chemical and biological weapons. It comprises discussions of the field of application of the Geneva Protocol, particularly as regards non-lethal chemical weapons and anti-plant agents, of the existence, development, and scope of the prohibition of CBW provided by the customary law of war, and of the application to CBW of general principles of the law of war. It also reviews the juristic works in this field.

Volume IV. CB Disarmament Negotiations, 1920–1970 (1971)

A review of the activities of the League of Nations and the United Nations in extending and reinforcing the prohibitions concerning chemical and biological weapons, including a report of recent negotiations for international CB disarmament. The volume also contains an account of those instances when formal complaints of the use of CB weapons have been made to the two world organizations.

Volume V. Technical Aspects of Early Warning and Verification (1971)

A discussion of measures that might be adopted to prevent future CBW. The volume describes steps that might be taken to strengthen the legal prohibition of CBW, and the problems and possibilities, including those of verification, involved in the negotiation of CB disarmament.

Volume VI. The Prevention of CBW (1975)

A technical account of SIPRI research on methods of early warning and identification of biological warfare agents, together with a description of two experimental SIPRI projects on CB verification. The first project concerns the non-production of BW agents and involved visits to biological laboratories in several countries; the second concerns the non-production of organophosphorus CW agents and summarizes the results of a symposium.

CBW Bulletin of the Harvard-Sussex Program

The CBW Conventions Bulletin, formerly The Chemical Weapons Convention Bulletin, is the quarterly journal of the Harvard Sussex Program, providing news, background, and comment on chemical and biological warfare issues. It is edited jointly by Matthew Meselson and Julian Perry Robinson, with the HSP Advisory Board serving as its Editorial Committee. The Bulletin offers its readers a News Chronology, which is a systematic account of events in and around the CBW world during the previous 3 months; a listing of notable Recent Publications in the field; a calendar of key scheduled forthcoming events in the CBW world; detailed reviews of the latest developments within the Organization for the Prohibition of Chemical Weapons (OPCW) in The Hague; and reports on the activities concerning the Biological Weapons Convention in Geneva. The journal also offers its readers editorial comment on matters of the moment as well as authoritative invited comment and comments, and there is an occasional Historical Note addressing an event of the past that has particular salience for the present. A selective book-reviews feature was inaugurated in the December 2005 issue.

CHAPTER

60

Testing Methods and Toxicity Assessment (Including Alternatives)

YURI BRUINEN DE BRUIN, CHANTRA ESKES, INGRID LANGEZAAL, SANDRA COECKE, AGNIESZKA KINSNER-OVASKAINEN, AND PERTTI J. HAKKINEN

INTRODUCTION

Many sources exist that contain valuable information on toxicology testing methods comprising in vivo (use of whole animals) and in vitro (use of artificial environment outside of living organisms) testing methods. The information resources presented below relate to chemical substances and are collected to provide key guidance on available information on in vivo, in vitro, and other toxicological testing and assessment methods (e.g., in silico toxicological methods performed on computer or via computer simulation), on relevant databases, published literature, books and journals, teaching aids, and finally organizations, foundations, and testing laboratories involved in toxicity assessment. The current information is of relevance for research, applied sciences and policy implementation purposes, such as the implementation of the European Union's (EU's) chemicals policy REACH (Registration, Evaluation, Authorisation, and Restriction of CHemicals) or the GPSD (General Product Safety Directive). The provided information resources are recommended starting points when searching for information on testing methods, alternative testing methods and computational assessment methods. The latter methods are better described elsewhere in this book (Charles A. Pittinger, Use of Software Models to Predict Health and Environmental Hazards and Risks). The reader should take note, however, that the information provided is not a comprehensive listing given the ever-expanding number of Internet and Web resources that are becoming available.

Search Strategy on Information Resources and Selection Criteria

The search strategy and selection criteria used in the current work faced three challenges concerning (1) selection of a number of information resources facilitating a more focused search, (2) screening of the information resources based on predefined terms, and (3) setting up a mechanism to categorize the relevance of the information towards testing methods and toxicity assessment.

Selection of Information Resources

The first search criterion consisted of a selection of initial information resources most known to the authors to contain relevant information comprising cross reference database search options such as Alternatives to Animal Testing (ALTWEB), (U.S.) National Library of Medicine's Specialized Information Services databases and information resources (PUBMED, TOXNET, TOXLINE, IRIS, etc.), ScienceDirect, Scirus, European Commission and European Agencies websites, U.S. Environmental Protection Agency (EPA) websites, World Health Organization (WHO), Organisation for Economic

Co-operation and Development (OECD), Interagency Coordination Committee on the Validation of Alternative Methods (ICCVAM) and Japanese Center for the Validation of Alternative Methods (JaCVAM), but also the search portals 'British Library,' 'Library of Congress,' 'Google,' 'Google Book Search,' and 'Google Scholar Beta' together with 'Amazon.com' were used.

Screening of Information Resources

The second search criterion was to screen the above information resources by the use of one or a combination of the search terms 'Alternative testing,' 'Chemical substances,' 'Chemicals,' 'In-vitro,' 'In-vivo,' 'Journal,' 'Newsletter,' 'Review,' 'Testing methods,' 'Toxicity assessment,' 'Toxicity testing,' 'Toxicology,' 'Funds,' and/or 'Foundations.'

Selection Criteria

The selection criteria included a categorization of each information resource on its relevance to testing methods and toxicity assessment. The journals, newspapers, books, databases, funds, and organizations were selected on the basis of 'appearance and format' (e.g., article vs. review, multi source and information databases vs. literature database, traditional toxicity testing databases vs. alternative testing databases, etc.), 'date of reference,' 'accessibility,' 'quality of information,' and eventually on basis of 'frequency ranking.' The respective information resources presented in this chapter were among the most recent resources frequently used to publish relevant information on testing methods and toxicity assessment. The authors also used references cited in the selected information and selected articles or any known relevant information not retrieved with the above-mentioned strategies.

TOXICITY TESTING METHODS

Testing methods for toxicity assessment have a variety of uses ranging from research and development to more applied regulatory testing for the purpose, such as registering a new chemical substance. If traditionally they involved the use of experimental animals, there is a tendency today to make more and more use of alternatives that refine, reduce, or replace the animal testing. The following provides sources of information on testing methods for toxicity assessment based on the potential uses and needs, as well as on whether they involve traditional animal testing or alternative methods to animal testing.

Testing methods for regulatory purposes

Regulatory testing methods and guidelines for toxicity testing of chemical substances

This section focuses on the regulatory testing methods recommended for the toxicity assessment of chemical substances at international level by the OECD, at the European level by the regulations on chemical substances, and at the US level by the Environmental Protection Agency for the testing of toxic substances. Regulation for other specific types of products such as biocides and pesticides was not considered here.

OECD Guidelines for the Testing of Chemicals – Section 4: Human Health Effects

The OECD Guidelines for the Testing of Chemicals are a collection of the most relevant internationally agreed testing methods used to characterize potential hazards of new and existing chemical substance and chemical preparations/mixtures. They represent a basic set of tools that are primarily for use in regulatory safety testing and subsequent chemical product notification and chemical registration. They can also be used for a variety of other purposes including the selection/ranking of candidate chemical substances during the development of new chemical substances and products and in toxicology research. OECD Test Guidelines (TG) should not be confused with data requirements, which are the prerogative of national authorities. It is also not possible to devise 'standard' testing methods appropriate for all chemical substances/chemical products. Therefore, judgment must be exercised in each case to assess the suitability of a particular method.

Web: http://www.oecd.org/document/55/0,2340,en_2649_34377_2349687_1_1_1_1,00.html and http://www.oecd.org/document/12/0,2340,en_2649_34377_1898188_1_1_1_1,00.html.

OECD series on Principles of Good Laboratory Practice and Compliance Monitoring

The primary objective of the OECD Principles of GLP is to ensure the generation of high-quality and reliable test data related to the safety of industrial chemical substances and preparations in the framework of harmonizing testing procedures for the mutual acceptance of data.

Web: http://www.oecd.org/document/63/0,2340,en_2649_34381_2346175_1_1_1_1,00.html and http://miranda.sourceoecd.org/vl=1121627/cl=73/nw=1/rpsv/cw/vhosts/oecdjournals/1607310x/v1n6/contp1-1.htm.

Annex V to the EU Dangerous Substance Directive 67/548/EEC – Part B Methods for Determination of Toxicity

Annex V to the EU Dangerous Substances Directive contains testing methods for the determination of the toxicological properties recommended in the European Union for the notification of new chemical substances. These methods are based on recognized and recommended methods by competent international bodies, in particular the OECD, or are adopted from national standards or scientific consensus methods. Animal tests and studies shall be conducted in accordance with national regulations and shall take into account humane principles and international developments in the field of animal welfare. Testing methods in Annex V are regularly updated and new methods are introduced as required. This annex might be modified in view of the EU REACH regulation on chemicals entered into force on the 1st of June 2007 (see next paragraph).

Web: http://ecb.jrc.it/testing-methods/.

Registration, Evaluation, Authorisation, and Restriction of CHemicals (REACH) EU Regulation 1907/2006

The REACH regulation adopted in December 2006 establishes a new EU regulatory framework for the testing of chemicals. It requires toxicity testing to be conducted in accordance to test methods laid down in a Commission Regulation which is to be adopted by the Commission, or in the meanwhile in accordance with other international test methods recognized by the Commission as being appropriate, such as Annex V to the EU Dangerous Substance Directive.

Web: http://ecb.jrc.it/reach/, http://reach.jrc.it/, and http://echa.europa.eu/.

US Environmental Protection Agency (US EPA) – Office of Prevention, Pesticides and Toxic Substances Harmonized Test Guidelines – Series 870 Health Effects Test Guidelines

The harmonized test guidelines have been developed for testing of pesticides and toxic chemical substances, and the development of test data that must be submitted to the Agency for review under Federal regulations. The purpose is to minimize variations among the testing procedures that must be performed to meet US EPA's data requirements under the Toxic Substances Control Act (TSCA) and the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).

Web: http://www.epa.gov/opptsfrs/publications/OPPTS_Harmonized/870_Health_Effects_Test_Guidelines/Series.

Validated Alternative Methods to Animal Testing

Validation is the process that establishes the scientific relevance and reliability of a testing method for a specific purpose. Formal endorsement of the scientific validity of an alternative testing method is a current requirement for inclusion of a new method into regulatory testing guidelines.

Validation Principles

OECD Guidance Document on the Validation and International Acceptance of New or Updated Testing Methods for Hazard Assessment

OECD Series on Testing and Assessment N. 34, ENV/JM/MONO (2005) 14, 96 pp. Paris, France: OECD.

The document outlines general principles, important considerations, illustrative examples, potential challenges, and the results of experience gained in the area of testing method validation.

Web: http://appli1.oecd.org/olis/2005doc.nsf/linkto/env-jm-mono(2005)14.

A Modular Approach to the ECVAM Principles on Test Validity

Hartung T, Bremer S, Casati S, et al (2004) ATLA 32: 467–472.

This article presents a new approach to structure the information required for evaluating the validation status of an alternative method.

Web: http://ecvam.jrc.it/index.htm.

The principles of weight of evidence validation of testing methods and testing strategies

Balls M, Amcoff P, Bremer S, et al ATLA 34: 1–19.

This workshop report presents the principles and elements for consideration for undertaking a retrospective validation of an alternative method.

Web: http://ecvam.jrc.it/index.htm.

Practical Aspects of the Validation of Toxicity Test Procedures. ECVAM Workshop Report 5

Balls M, Blaauboer BJ, Fentem JH, (1995) ATLA 23: 129–147.

This workshop report presents the principles for the validation of an alternative method to animal testing.

Web: http://ecvam.jrc.it/index.htm.

The Role of Prevalidation in the Development, Validation and Acceptance of Alternative Methods. ECVAM Prevalidation Task Force Report 1

Curren, Southee, Spielmann, Liebsch, Fentem, Balls (1995) ATLA 23: 211–217.

This workshop report presents a description of the prevalidation phase before an assay enters a formal validation study.

Web: http://ecvam.jrc.it/index.htm.

ICCVAM Guidelines for the Nomination and Submission of New, Revised, and Alternative Testing Methods

ICCVAM (2003)

NIH Publication No. 03-4508, 50 pp. Research Triangle Park, NC, USA: National Institute of Environmental Health Sciences (NIEHS)

This document provides practical guidance on information and data requirements, in support of a validation assessment. The guidance assures availability of sufficient information for evaluation of the validation status of testing methods.

Web: http://www.iccvam.niehs.nih.gov/methods/methods.htm.

Guidance on Good Cell Culture Practice – A report of the second ECVAM task force on Good Cell Culture Practice

Coecke S, Balls M, Bowe G, et al (2005) ATLA 33: 261–287

The maintenance of high standards is fundamental to all good scientific practice, and is essential for maximizing the reproducibility, reliability, credibility, acceptance, and proper application of any results produced. The Guidance on Good Cell Culture Practice (GCCP) promotes the maintenance of these standards and the reduction of uncertainty in the development and application of animal and human cell and tissue culture procedures and products by encouraging greater international harmonization, rationalization, and standardization of laboratory practices, quality control systems, safety procedures, recording and reporting, and compliance with laws, regulations, and ethical principles.

Web (for the task force reports): http://ecvam.jrc.it/index.htm.

Validated Alternative Methods to Animal Testing

Information on validated alternative methods can be found in the following internet sites of international bodies performing formal validation of alternatives to animal testing.

The European Centre for the Validation of Alternative Methods (ECVAM)

ECVAM is the European Centre responsible for the formal validation of alternative methods for toxicity testing. Formal validation is obtained through an official statement made by the ECVAM Scientific Advisory Committee (ESAC). Once validated, the alternative methods are proposed for inclusion in official guidelines. Formally validated alternatives included in the EU and OECD guidelines exist for the following endpoints: skin corrosion, phototoxicity, percutaneous absorption, skin sensitization, acute toxicity, and batch potency testing of erysipelas and tetanus vaccines. In addition, recently validated alternatives not yet included in the guidelines exist for the following endpoints: genotoxicity, pyrogenicity, acute aquatic toxicity, embryotoxicity, and prediction of acute neutropenia.

Web: http://ecvam.jrc.it/index.htm.

The US Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM) and The National Toxicology Program Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM)

ICCVAM's mission is to facilitate development, validation, and regulatory acceptance of new and revised regulatory alternative methods to animal testing. NICEATM administers the ICCVAM and provides scientific and operational support for ICCVAM-related activities. Alternative methods on the following endpoints were submitted to ICCVAM for review: dermal corrosivity and irritation, phototoxicity, acute toxicity, immunotoxicity, pyrogenicity, developmental toxicity, biologics and vaccines, ocular toxicity, and endocrine disruptors. Method-related guidelines exist for the following endpoints: acute toxicity, dermal sensitization and corrosivity, phototoxicity, developmental toxicity, and endocrine disruptors.

Web: http://iccvam.niehs.nih.gov/.

The Japanese Center for the Validation of Alternative Methods (JaCVAM)

JaCVAM supports validation, evaluation, and international communication of alternative methods to animal testing. It has current activities on alternative methods for the following endpoints: phototoxicity, skin sensitization, corrosivity, skin irritation, endocrine disruptors, and mutagenicity.

Web: http://wwwsoc.nii.ac.jp/jsaae/KOJIMA.pdf.

Other Recommended Methods

Besides the regulatory testing required by official regulations, the scientific committees and trade associations reported below have reported toxicological

testing methods that might be useful for specific industrial needs.

The Scientific Committee on Consumer Products (SCCP)

The SCCP is a European Commission-sponsored committee that addresses questions related to the safety of non-food consumer products for consideration by the members of the European Union. In particular, it has produced notes of guidance on the testing of cosmetic ingredients and their safety evaluation.

Web: http://ec.europa.eu/health/ph_risk/committees/04_sccp/docs/sccp_o_03j.pdf.

The European Cosmetic Toiletry and Perfumery Association (COLIPA)

COLIPA is the European Trade Association representing the interests of the cosmetic, toiletry, and perfumery industry. Amongst its activities, it contributes to product quality and consumer safety and promotes research into alternatives to animal testing. It has also developed guideline documents for the safety assessment of cosmetic products, skin tolerance of potential irritant cosmetic ingredients, percutaneous absorption/penetration assessment, and on human skin compatibility.

Web: http://www.colipa.com/site/index.cfm?SID=15588&L0=15604&OBJ=15832.

The European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC)

ECETOC is a non-profit association of companies with interests in the manufacture and use of chemical substances. It was established to provide a scientific forum through which the expertise of the European chemical industry could be harnessed to research, review, assess, and publish studies on the ecotoxicology and toxicology of chemical substances. It proposes a series of monographs on comprehensive reviews of generic topics or issues fundamental to the application of sound science in evaluating the hazards and risks of chemical substances to human health and the environment.

Web: http://www.ecetoc.org/Content/Default.asp.

SCIENTIFIC INFORMATION

Information related to alternative (in vitro) and traditional (in vivo) testing methods and toxicity assessment can be found from numerous resources. This section is an update of the previous chapter on Toxicology Testing Methods and Laboratories that was part of the 3rd edition of the Information Resources in Toxicology and currently presents a non-exhaustive overview of scientific literature published after 1990 (books, journals, and papers), internet databases, and newsletters that can be consulted to start searching for toxicology-related information.

RESOURCES

Books

Arnold DL, Grice HC, Krewski DR (1990)
Handbook of in Vivo Toxicity Testing
Academic Press, San Diego, CA.
ISBN: 0120633809.

Information on in vivo toxicity testing methodologies.

Atterwill CK, Goldfarb P, Purcell W (2000)
Approaches to High Throughput Toxicity Screening
Taylor & Francis, New York.

Integrated approach to in vitro toxicology and ADME screening using new technologies and discusses how they might be applied to the pre-clinical safety assessment and 'lead optimization' of new pharmaceutical products in drug discovery.

Barile FA (2007)
Principles of Toxicology Testing
CRC
ISBN-13: 978-0849390258.

Principles of animal toxicology testing with in vitro alternative methods to highlight the importance of both fields for interpretation of the significance and relevance of the other.

Boelsterli UA (2007)
Mechanistic Toxicology: The Molecular Basis of How Chemicals Disrupt Biological Targets, 2nd Edition
CRC.
ISBN-13: 978-0849372728.

Information on molecular biology and biochemistry with the characteristics of toxic effects induced by drugs, environmental chemicals, and other xenobiotics.

Bus JS, Costa LG, Hodgson E, Lawrence DA, Reed DJ (2007)
Current Protocols in Toxicology
John Wiley & Sons Inc.

Best practices collection of laboratory protocols for accurate, efficient assessments of toxicity in whole

organisms, organs and tissues, cells, and biochemical pathways.

Cronin MTD, Livingstone DA (2004)
Predicting Chemical Toxicity and Fate
Taylor & Francis
ISBN: 0415271800.

State of the art on prediction methods of toxicity and fate of chemical substances both to man and in the environment with a strong focus on Quantitative Structure–Activity Relationships (QSARs).

Derelanko MJ, Hollinger MA (2001)
Handbook of Toxicology, 2nd Edition
CRC.
ISBN-13: 978-0849303708.

Diverse assortment of basic information to design, conduct, and interpret toxicology studies and to perform risk assessments.

Ecobichon DJ (1997)
The Basis of Toxicity Testing
CRC.
ISBN: 0849385547.mailto:

Includes the principles and concepts behind various types of in vivo and in vitro toxicological studies; the design, conduct, and interpretation of studies; the latest developments in alternatives to animal studies; the types of studies required by regulatory agencies; and sections on various risk assessment-related topics.

Fan AM (1996)
Toxicology and Risk Assessment
Marcel Dekker
ISBN: 0824794907.

Fundamental principles and concepts of toxicology and risk assessment including sections on clinical testing, risk assessment of chemical substances and hazardous materials, the application of animal data to human health risk assessment, mathematical models, statistical approaches, environmental laws, information resources, and risk management.

Frazier JM, Frazier M (1992)
In vitro Toxicity Testing
Marcel Dekker
ISBN: 0824786149.

Potential application of in vitro procedures to identify and quantify the toxicological risk to target organs associated with the use of commercial products and therapeutic drugs.

Gad SC (2000)
In vitro Toxicology
Taylor & Francis
ISBN: 1560327693 2000.

Principles of in vitro toxicology and in vitro toxicity testing methods.

Gad SC (2001)
Regulatory Toxicology, 2nd Edition
CRC.
ISBN-13: 978-0415239196.

Safety and toxicity testing of chemical substances.

Gad SC (2007)
Animal Models in Toxicology
CRC/Taylor & Francis
ISBN: 9780824754075.

A practical guide to the common statistical problems encountered in toxicology and the methodologies that are available to solve them.

Harry S, Sidney K (1999)
Toxicity Assessment Alternatives
Humana Press
ISBN: 0896037878.

Information on toxicity assessment alternatives on developments on mechanically based alternatives, current trends and future projections, hazard assessment applications, and the validation of alternatives. Achieved and accepted alternatives to animal testing are explained by various scientific and regulatory communities, such as the use of transgenic models that reduce the time and cost of carcinogenicity testing, the use of tissue cultures for the assessment of endocrine-disrupting chemical substances, and the application of molecular modeling to explain chemical toxicity.

Hayes AW (2007)
Principles and Methods of Toxicology, 5th Edition
CRC
ISBN-13: 978-0849337789.

Fundamental principles and applied methods of toxicology.

Hodgson E (2004)
A Textbook of Modern Toxicology, 3rd Edition
Wiley-Interscience
ISBN-13: 978-0471265085.

A book on toxicology describing the physical and chemical study of all the known poisonous substances, as well as the methods of testing for them, their action on the living body, and the postmortem results they occasion.

Hood RD (1997)
Handbook of Developmental Toxicology

CRC.
ISBN: 0849301351.

Encompasses the study of toxicant effects on development, from conception through puberty.

Jacobson-Kram D, Keller KA (2006)
Toxicology Testing Handbook. Principles, Applications and Data Interpretation, 2nd Edition
Marcel Dekker.ISBN: 9780849338588 and ISBN 10: 0849338581.

Provides data on issues such as species selection, dose level and dosing regimens, animal models, routes of exposure, statistical evaluation, data interpretation, adherence to good laboratory practices, fulfillment of regulatory requirements including registering products in international markets, and provides guidance on how to evaluate the quality of a Contract Research Organization (CRO).

Jolles G, Cordier A (1992)
In vitro Methods in Toxicology
Academic Press
ISBN 0123881757.

This book covers general aspects of in vitro testing, target organ toxicity, reproductive toxicity and carcinogenesis, and deals with in vitro toxicity.

Klaassen CD (2001)
Casarett and Doull's Toxicology: The Basic Science of Poisons, 6th Edition
McGraw-Hill Professional
ISBN-13: 978-0071347211.

A book on modern toxicology, including the principles, concepts, mechanisms, and modes of thought that are the foundation of the discipline.

Klaassen CD, Watkins JB (2003)
Casarett & Doull's Essentials of Toxicology, 1st Edition
McGraw-Hill Professional
ISBN-13: 978-0071389143.

A book that introduces the science of toxicology.

Kram DJ (2001)
Toxicology Testing Handbook: Principles, Applications, and Data Interpretation, 1st Edition
Informa HealthcareISBN-10: 0824700732, ISBN-13: 978-0824700737.

Information on scientific research in the field of toxicity testing.

Lee CJ, Lee LH, Wu CL, Lee BR, Chen ML (2006)
Clinical Trials of Drugs and Biopharmaceuticals.
CRC.
ISBN: 0849321859.

Drugs development and approval and pre-clinical evaluations of pharmacological activity and safety.

Liansky S, Macmillan R, Dupus J (1996)
Alternatives to Animal Testing
CPL Press, Newbury, UK

This book contains the proceedings of a 1995 conference organized by the European Cosmetic, Toiletry and Perfumery Association (COLIPA). Includes the text of keynote addresses, roundtable discussions, and other presentations.

Marquardt H, Schäfer SG, McClellan RO (1999)
Toxicology, 1st Edition
Academic Press
ISBN-13: 978-0124732704.

An introduction to the science of toxicology.

Newman MC, Unger MA (2003)
Fundamentals of Ecotoxicology
CRC.
ISBN: 1566705983.

Information on the sources, transport, and fate of major classes of contaminants in terrestrial, freshwater, and marine systems.

O'Hare S, Atterwill CK (1995)
In vitro Toxicity Testing Protocols
Humana Press
ISBN: 0896032825.

A collection of proven, state-of-the-art methods that toxicologists can use in carrying out laboratory studies.

Riviere J (2006)
Biological Concepts and Techniques in Toxicology: An Integrated Approach
Taylor & Francis/CRC Press.
ISBN: 9780824729790 and ISBN: 10: 082472979X.

Describes the integration of new scientific concepts into routine toxicologic testing procedures, highlights new methods and concepts that may have a major impact on toxicology, presents an overview of the impact of hormesis on interpretation of dose–response relationships, discusses the use of biological data and test systems in toxicology, reviews current approaches to nanomaterials, forensics, and pharmaceutics, and reviews developments in toxicokinetics.

Salem H, Katz SA (1998)
Advances in Animal Alternatives for Safety and Efficacy Testing
CRC.
ISBN: 1560326239.

Presents up-to-date concepts and approaches to the theory and practice of alternatives to animal testing and promotes technology transfer.

Salem H, Katz SA (2003)
Alternative Toxicological Methods
CRC Press.
ISBN: 9780849315282 and ISBN 10: 084931528X.

Describes recent progress made in developing and validating replacement, reduction, and refinement alternatives to animal testing, and the use of genomics and proteomics, engineered tissue equivalents for screening ocular injury, and gene array techniques in skin biology.

Schiefer HB, Irvine DG, Buzik SC (1997)
Understanding Toxicology: Chemicals, Their Benefits and Risks
CRC.
ISBN-13: 978-0849326868.

A general overview of toxicology, presenting the facts and underlying principles needed by non-specialists for making decisions about potentially hazardous substances in everyday settings.

Stine KE, Brown TM (2006)
Principles of Toxicology, 2nd Edition
CRC
ISBN-13: 978-0849328565.

Comprehensive textbook introducing the science of toxicology at the undergraduate or graduate level.

Timbrell JA (2001)
Introduction to Toxicology, 3rd Edition
CRC.
ISBN-13: 978-0415247627.

This book introduces fundamental concepts of toxicology and builds upon these using topical and historical examples.

Winder C, Stacey NH (2004)
Occupational Toxicology
Taylor & Francis
ISBN: 0748409181.

Basic tenets of the science of toxicology that underpin the application of toxicological information to the workplace.

Woolley A (2003)
A Guide to Practical Toxicology: Evaluation, Prediction and Risk, 1st Edition
CRC.
ISBN-13: 978-0748409235.

Background information on toxicological method or process.

Journals

ALTEX

Official journal of the Middle European Society for Alternatives to Testing in Animals (MEGAT).

Archives of Toxicology

ATLA (Alternatives to Laboratory Animals)

Basic & Clinical Pharmacology & Toxicology

Cell Biology and Toxicology

Critical Reviews in Toxicology

Ecotoxicology and Environmental Safety

Environmental Health Perspectives (EHP)

The journal of the (U.S.) National Institute of Environmental Health Sciences.

Environmental Toxicology and Chemistry

Experimental and Toxicologic Pathology

Food and Chemical Toxicology

Human and Experimental Toxicology

International Agency for Research on Cancer (IARC) Scientific Publications

The Institute for Laboratory Animal Research (ILAR) Journal and e-Journal

Inhalation Toxicology

Toxicology Mechanisms and Methods

Special Issues, Supplements and Review Articles

Alternatives to Laboratory Animals (ATLA) (2005), Volume 33, Supplement 1, July 2005. ***Alternative (Non-Animal) Methods for Cosmetics Testing: Current Status and Future Prospects***

This supplement is a report prepared in the context of the 7th Amendment of the Cosmetics Directive for Establishing the Timetable for Phasing Out Animal Testing and deals with safety and testing data requirements and practices for various toxicological endpoint.

Alternatives to Laboratory Animals (ATLA) (2006), Volume 34, Supplement 1, March 2006.

This supplement deals with various toxicity endpoint testing requirements in the frame of REACH.

Environmental Health Perspectives Supplements (1998), Volume 106, Number S2, April 1998. ***Alternative Testing Methodologies; Human Health Effects of Dioxins and Furans***

This supplement contains about 43 papers providing information on toxicity testing, alternative testing methods including organ toxicity, and ecotoxicity.

Review Articles

Bakand S, Winder C, Khalil C, Hayes A (2005) Toxicity assessment of industrial chemicals and airborne contaminants: transition from *in vivo* to *in vitro* testing methods: a review. Inhal. Toxicol. 17(13): 775–787.

Baker VA (2001) Endocrine disrupters – testing strategies to assess human hazard. Toxicol. In Vitro 15(4–5): 413–419.

Bhogal N, Grindon C, Combes R, Balls M (2005) Toxicity testing: creating a revolution based on new technologies. Trends Biotechnol. 23(6): 299–307.

Bremer S, Hartung T (2004) The use of embryonic stem cells for regulatory developmental toxicity testing *in vitro* – the current status of test development. Curr. Pharm. Des. 10(22): 2733–2747.

Coecke S, Eskes C, Gartlon J, et al (2006) The value of alternative testing for neurotoxicity in the context of regulatory needs. Env. Tox. Pharmacol. 21(2): 153–167.

Combes RD (2004) Peer review of validation studies: an assessment of the role of the OECD by reference to the validation of the uterotrophic assay for endocrine disruptors. Altern. Lab. Anim. 32(2): 111–117.

Cooper RL, Lamb JC, Barlow SM, et al (2006) A tiered approach to life stages testing for agricultural chemical safety assessment. Crit. Rev. Toxicol. 36(1): 69–98.

Doe JE, Boobis AR, Blacker A, et al (2006) A tiered approach to systemic toxicity testing for agricultural chemical safety assessment. Crit. Rev. Toxicol. 36(1): 37–68.

ECVAM Workshop Reports. A series of reports that review the status on specific topics related to alternative methods and make recommendations about the best way forward, to promote the integration of in vitro tests and other alternative methods in the regulatory process. Available online: http://www.ecvam/index.htm.

Grindon C, Combes R, Cronin MT, Roberts DW, Garrod J (2006) A review of the status of alternative approaches to animal testing and the development of integrated testing strategies for assessing the toxicity of chemicals under REACH – a summary of a DEFRA-funded project conducted by Liverpool John Moores University and FRAME. Altern. Lab. Anim. 34(Suppl 1): 149–158.

Stitzel KA (2002) Tiered testing strategies – acute local toxicity. ILAR J. 43(Suppl): S21–S26.

Databases

Multi Source and Information Databases

DIMDI-Medical Knowledge Online

Provides information in all fields of the life sciences to the interested public.

Web: https://gripsdb.dimdi.de/websearch/servlet/Gate?accessid=bfrAnimaltBasicEn#__DEFANCHOR.

Entrez

Cross-database search page linked to 31 information resources on bibliographies, toxicology, nucleotide sequences, protein sequences, macromolecular structures, whole genomes, etc.

Web: http://www.ncbi.nlm.nih.gov/gquery/gquery.fcgi.

ESIS (European chemical Substances Information System)

Portal to database containing information about chemical substances such as physical and chemical properties, Classification and Labeling, Risk and Safety Phrases and Risk Assessment.

Web: http://ecb.jrc.it/esis/.

MDL Discovery Knowledge

Reference works, literature links, and the world's most comprehensive collection of bioactivity, chemical sourcing, synthetic methodology, metabolism, toxicology, and Environment, Health, and Safety (EH&S) databases.

Web: http://www.mdli.com/products/knowledge/index.jsp.

Multi-Database Search

Search all factual chemical databases.

Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?Multi.

(U.S.) National Library of Medicine

The world's largest medical library providing access to multiple major databases materials and information and research services in all areas of biomedicine and health care.

Web: http://www.nlm.nih.gov/.

Includes:
TOXNET (free online)

Network of databases on toxicology, hazardous chemical substances, and environmental health. National Library of Medicine, Specialized Information Services cluster of databases on toxicology, hazardous chemical substances, and related areas.

Web: http://toxnet.nlm.nih.gov/.

Literature Search Databases

AGRICOLA (AGRICultural OnLine Access) (free online)

Information on animal science, veterinary science, farming practices, housing and husbandry practices, alternative farming systems and other animal agriculture literature.

Web: http://agricola.nal.usda.gov/.

ALTBIB

Bibliography on alternatives to the use of live vertebrates in biomedical research and testing.

Web: http://toxnet.nlm.nih.gov/altbib.html.
Alternative Farming http://www.awionline.org/farm/Altfrm.htm (free online)

Published and online information on factory farming and humane alternatives.

Web: http://www.awionline.org/farm/Altfrm.htm.

ANZCCART

Information for animal carers, animal ethics committee members, and scientists as well as other interested parties.

Web: http://www.adelaide.edu.au/ANZCCART/.

ASFA (Aquatic Sciences and Fisheries Abstracts)

Dissemination of information on aquatic sciences and fisheries to the world community, bearing in mind the special interests of developing countries in this field.

Web: http://www.fao.org/fi/website/FIRetrieveAction.do?dom=org&xml=asfa_prog.xml.

CAB (fee based)

Information on life sciences, animal science, animal health, animal production, molecular biology, genetics, biotechnology, breeding, and beyond.

Web: http://www.cabi-publishing.org/AbstractDatabases.asp?SubjectArea=&Subject=&Section=dc&PID=125.

EMBASE (fee based)

A comprehensive international database on pharmacological and biomedical literature.

Web: http://www.embase.com/.

Environmental Enrichment for Primates (free online)

An annotated database on environmental enrichment and refinement of husbandry for non-human primates.

Web: http://www.awionline.org/lab_animals/biblio/enrich.htm/.

InterNICHE (free online)

A library of multimedia CD-ROMs, videos, and models focusing on animal use and alternatives within the biological sciences.

Web: http://www.interniche.org/alt_loan.html#disc.

PrimateLit Database (free online)

Bibliographic access to the scientific literature on non-human primates for the research and educational communities.

Web: http://www.awionline.org/lab_animals/LAREF/enriop.htm.

PubMed/MEDLINE (free online)

Database with millions of references, primarily from MEDLINE, to journal articles in life sciences with a concentration on biomedicine.

Web: http://www.ncbi.nlm.nih.gov/entrez/query.fcgi.

SCIRUS (free online)

Offers a comprehensive science-specific search engine on the Internet, designed for scientists and researchers. It provides access to scientific, scholarly, technical, and medical data, as well as the latest reports, peer-reviewed articles, patents, pre prints, and journals that other search engines miss.

Web: http://www.scirus.com/srsapp/advanced/index.jsp.

ScienceDirect (partially free)

An advanced web delivery systems for scientific, technical and medical information.

Web: http://www.sciencedirect.com/.

SCOPUS (fee based)

Scopus is the largest abstract and citation database of research literature and quality web sources.

Web: http://www.scopus.com/scopus/home.url.

TEXTBASE (free online)

A collection of information on current textbooks within the field of laboratory animal science.

Web: http://oslovet.veths.no/fag.aspx?fag=58&mnu=databases_2.

Thomson Scientific

Information on academic, government, corporate, and pharma R&D.

Web: http://scientific.thomson.com/.

Toxicology Literature Online (TOXLINE)

References from toxicology literature.

Web: http://www.toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?TOXLINE.

Traditional Testing Methods Databases

ECOTOX (free online)

Provides single chemical toxicity information for aquatic and terrestrial life.

Web: http://cfpub.epa.gov/ecotox/.

ECOTOX

Database with information on single chemical toxicity for aquatic life, terrestrial plants and wildlife.

Web: http://cfpub.epa.gov/ecotox/.

Haz-Map

Information on hazardous chemical substances and occupational diseases.

Web: http://hazmap.nlm.nih.gov/.

ILAR – Animal Models and Strains Database (free online)

Search engine for information on animal models or strains of animals used for research.

Web: http://dels.nas.edu/ilar_n/ilarhome/search_amsst.shtml.

Individual Animal Pathology Database

Search for chronic studies collected in the NTP's Toxicology Database Management System and Carcinogenesis Bioassay Data System.

Web: https://ntp-apps.niehs.nih.gov/iacf/demo/tdms-menu.cfm.

Jackson Laboratory Resources (free online)

The site provides access to a variety of mouse strain and genetic resource databases, including the Mice Database, Mouse Genome Informatics, and International Mouse Strains Resources.

Web: http://www.jax.org/resources/index.html.

National Center for Research Resources (NCRR)

Provides information on unique technologies, instrumentation, facilities, animal models, genetic stocks, and biomaterials.

Web: http://www.ncrr.nih.gov/.

NIH Model Organisms for Biomedical Research (free online)

Information about national and international activities and major resources that are being developed to facilitate biomedical research using the animal models, such as mice, rats, frogs, zebra-fish, fruit fly, round worm, amoebae, fungus, yeast, and plants.

Web: http://www.nih.gov/science/models/.

Registry of Toxic Effects of Chemical Substances (RTECS)

A compendium of toxicity data extracted from the open scientific literature on primary irritation, mutagenic effects, reproductive effects, carcinogenic effects, acute toxicity, and other multiple dose toxicity.

Web: http://www.cdc.gov/niosh/rtecs/default.html.

Zebra Fish Information Network (ZFIN)

ZFIN serves as the zebra fish model organism database providing resources for the laboratory use of zebra fish, developing and supporting integrated zebra fish genetics, maintaining the definitive reference data on zebra fish research information, facilitating the use of zebra fish as a model for human biology and serving the needs of the research community.

Web: http://zfin.org/cgi-bin/webdriver?MIval=aa-ZDB_home.apg.

Alternative testing methods databases

Alternatives to Animal Testing on the Web (Altweb)

Internet information platform on alternatives to animals in testing and education and research comprising technical information such as databases, Internet search engine, network of experts, etc.

Web: http://altweb.jhsph.edu.

AnimAlt-ZEBET

Provides information on alternatives to animal experiments on the Internet.

Web: http://www.bfr.bund.de/cd/1508.

DB-ALM

ECVAM database service on alternative methods to animal experimentation containing literature, in vitro methods, QSAR models, and more.

Web: http://ecvam-dbalm.jrc.cec.eu.int/.

InVitroDerm

Alternatives to skin irritation and corrosion testing in animals.

Web: http://www.invitroderm.com/.

INVITTOX (free online)

Listing of protocols presenting up-to-date technical information on the performance of in vitro techniques and methodologies currently in use and under development with critical assessment comments on their applications, advantages, and drawbacks.

Web: http://www.invittox.com/.

Animal welfare databases

AltWeb – Humane Endpoints Database (free online)

This database is designed to help investigators find the earliest 'endpoint' that is compatible with the scientific objectives of their research.

Web: http://apps1.jhsph.edu/altweb/humane/.

AltWeb Pain Management (Anesthesia/Analgesia) Database (free online)

Information on anesthesia and analgesia for laboratory animals and available drugs and their side effects.

Web: http://apps1.jhsph.edu/altweb/aadb/aadb_search.cfm.

Practical Enrichment Options Database (free online)

This Animal Welfare Institute database disseminates enrichment ideas and practical tips from the 'Laboratory Animals Refinement and Enrichment Forum' and from other published information.

Web: http://www.awionline.org/lab_animals/LAREF/enriop.htm.

Refinement of Housing and Handling Conditions and Environmental Enrichment for Animals kept in Laboratories (free online)

Two databases on refinement and enrichment for non-primate and primate animals kept in laboratories disseminating reference material on all aspects of refinement of housing and handling conditions and environmental enrichment for all animals kept in research, testing, and teaching institutions.

Web: http://www.awionline.org/lab_animals/biblio/laball.htm.

Wildlife Information Network (WIN) (free online)

To provide information on the health and management of free-ranging and captive animals and emerging infectious diseases to wildlife professionals and decision-makers worldwide.

Web: http://www.wildlifeinformation.org/.

Other Databases (ongoing projects, education and training)

Alternatives in Education Database (free online)

Information on alternatives to the use of animals in education.

Web: http://avar.org/alted/.

Computer Retrieval of Information on Scientific Projects (CRISP) (free online)

Database of federally funded biomedical research projects conducted at universities, hospitals, and other research institutions. It provides information on human diseases, therapeutic interventions, clinical trials, and preclinical research.

Web: http://crisp.cit.nih.gov/.

DoD Biomedical Research Database (free online)

Information on research, testing and training related to infectious diseases, biological hazards, toxicology, medical chemical defense, medical biological defense, clinical medicine, clinical surgery, physical protection, training, and graduate medical education.

Web: http://www.dtic.mil/biosys/org/brd/index.htm.

ERIC Education Resources Information Center

Bibliographic records of education literature plus a growing collection of full text.

Web: http://www.eric.ed.gov/.

EURCA Alternatives Database (free online)

Detailed descriptions of alternatives (focusing on alternatives in education), along with reviews and comments on their use and suitability, based upon the 3Rs concept.

Web: http://www.eurca.org/index.asp.

European Resource Centre for Alternatives in Higher Education EURCA

Promotion of the use of alternatives to using animals in higher education.

Web: http://www.eurca.org/.

GenBank (free online)

Genetic sequence database that is an annotated collection of all publicly available DNA sequences.

Web: http://www.ncbi.nlm.nih.gov/Genbank/index.html.

Individual Studies Database

Search tool on toxicological studies by chemical name.

Web: http://ntp-apps.niehs.nih.gov/ntp_tox/index.cfm.

Intute (free online)

A service providing access to web resources for education and research, evaluated and selected by a network of subject specialists.

Web: http://www.intute.ac.uk/healthandlifesciences/.

MedWeb

A catalog of biomedical and health-related websites.

Web: http://www.medweb.emory.edu/MedWeb/.

N-CLASS Database

Database on environmental hazard classification.

Web: http://apps.kemi.se/nclass/default.asp.

NORINA (free online)

Information on over 3800 audiovisual aids that may be used as alternatives or supplements to the use of animals in teaching.

Web: http://oslovet.veths.no/fag.aspx?fag = 57.

Porcine Immunology and Nutrition Database (PIN) (free online)

Database focusing on immunologically related genes.

Web: http://www.ba.ars.usda.gov/nrfl/nutri-immun-db/n3rfl_query1.html.

U.S. Food and Drug Administration

Portal to information on food, drugs, medical devices, biologics, animal feed and drugs, cosmetics, radiation-emitting products.

Web: http://www.fda.gov/default.htm.

Zoological Record (fee based)

World's oldest continuing database of animal biology.

Web: http://scientific.thomson.com/products/zr/.

Newsletters

Adis Newsletters

The Adis Newsletters database contains all the news and full-text articles from the following three newsletter publications: Inpharma® (INP); ReactionsTM (REA); and Pharmacoeconomics & Outcomes NewsTM (PON). These three newsletters bring together the most important developments in drugs and drug therapy from the world's biomedical literature, major meetings, and symposia.

Web: http://library.dialog.com/bluesheets/html/bl0428.html.

AltNews

Information about research, technology, grants, corporate–scientific collaborations, government rulings, seminars, databases, educational resources, and issues and debates in the alternatives community.

Web: http://altweb.jhsph.edu/index.htm.

Animal Welfare Information Center (AWIC)

Information about animal welfare and the reduction of testing animals.

Web: http://awic.nal.usda.gov/nal_display/index.php?info_center=3&tax_level=1&tax_subject=190.

European Commission, Joint Research Centre, European Centre for the Validation and Evaluation of Alternative Methods (ECVAM) Newsletter

Reports the scientific and technical aspects of the work carried out and co-ordinated by the ECVAM in support of European legislation on the development of alternative methods.

Web: http://ecvam.jrc.it/.

European Commission, Joint Research Centre, European Chemicals Bureau (ECB) Newsletter

Reports the scientific and technical aspects of the work carried out and co-ordinated by the ECB in support of European legislation on chemical substances control.

Web: http://ecb.jrc.it/newsletter/.

The Society of Toxicology Communiqué

Published online four times annually (Spring, Summer/Fall, Winter, and Special Issue) on toxicological issues.

Web: http://www.toxicology.org/ai/pub/communique.asp.

Organizations

The following organizations are involved in the field of toxicology and toxicity testing, and include non-/governmental organizations, fund-providing organizations, foundations, associations, federations, and testing laboratories.

Governmental

Animal Welfare Information Center (AWIC)
U.S. Department of Agriculture
Web: http://awic.nal.usda.gov.

Centre for Documentation and Evaluation of Alternatives to Animal Experiments (ZEBET)
Web: http://www.bfr.bund.de/cd/1591.

European Chemicals Agency (ECHA)
Web: http://echa.europa.eu/.

European Commission, Joint Research Centre (JRC)
Web: http://www.jrc.cec.eu.int/

European Chemicals Bureau (ECB)
Web: http://ecb.jrc.it.

European Centre for the Validation of Alternative Methods (ECVAM)
Web: http://ecvam.jrc.it/index.htm.

Physical and Chemical Exposure Unit (PCE)
Web: http://web.jrc.ec.europa.eu/pce/.

(U.S.) Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM) and The National Toxicology Program Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM)
Web: http://iccvam.niehs.nih.gov/home.htm.

Organization for Economic Co-operation and Development (OECD)
Web: http://www.oecd.org/.

(U.S.) National Institute of Environmental Health Sciences (NIEHS)
Web: http://www.niehs.nih.gov.

(U.S.) National Toxicology Program
Web: http://ntp.niehs.nih.gov/index.cfm.

United Nations

Testing Laboratories

The New Chemicals Database of the European Commission's European Chemicals Bureau can be used to identify the testing laboratories that are most frequently used for testing of toxicological properties of chemical substances. Laboratories can be selected on basis of the quantity of substances tested (i.e. more than 764 times (May 2007)), and accessibility of the contract laboratories to the general public. The following

presents a few search engines that are useful tools to find testing laboratories all over the world.

Search Engines for Testing Laboratories

American Society for Testing and Materials (ASTM)

An on-line full text search for services and locations of testing laboratories.

Web: http://www.astm.org/labs.

ContractLaboratory.com

An online search engine to find laboratories for all chemical research and testing.

Web: http://www.contractlaboratory.com.

Michigan Environmental Laboratory Directory

An online search engine helping the general public find laboratories that offer environmental and drinking water laboratory testing services to meet their needs.

Web: http://www.deq.state.mi.us/labs/.

Websites (discussion forums, testing method resource center, and expert commentaries)

AltTox
Web: http://www.AltTox.org

AltTox.org's goal is to advance non-animal methods of toxicity testing through online discussion and information exchange. The website is designed to encourage the exchange of technical and policy information on in vitro and in silico methods, with the target audience including industry, government, academia, non-governmental organizations, and the public. AltTox includes:

- AltTox.org Forums as online discussion forums covering a range of topics within four major categories: Toxicity Endpoints & Tests, Emerging Technologies, Programs & Policies, and Overarching Challenges & Opportunities.
- Toxicity Testing Resource Center (TTRC) providing a comprehensive source of information on non-animal methods of toxicity testing.
- 'Way Forward' invited expert commentaries.

Also being planned for AltTox are online workshops and virtual meetings. AltTox is being developed and supported through a collaboration of the Procter & Gamble Company (P&G) and the Humane Society of the United States (HSUS). AltTox content will be overseen by an editorial board of subject matter experts who will also serve as forum moderators.

Acknowledgments

The authors would like to thank the following persons from the European Commission's Joint Research Centre, Institute of Health and Consumer Protection for their contributions and review; Prof. Dr. Thomas Hartung (Unithead of ECVAM – European Centre for Validation of Alternative Methods), Dr. Dimitrios Kotzias (Unithead of PCE – Physical and Chemical Exposure), Prof. Dr. Steven Eisenreich (Unithead of ECB – European Chemicals Bureau), Andrew Worth (Action leader of the ECB – Computational Toxicology Group) and Dr. Elke Anklam (Director of the Institute for Health and Consumer Protection).

CHAPTER

61

Veterinary Toxicology

ROBERT H POPPENGA AND WAYNE SPOO

INTRODUCTION

Veterinary toxicology has grown into a multifaceted discipline that utilizes many diverse sources of toxicologic information. Veterinary toxicologists can be involved in basic toxicology research, clinical toxicology, regulatory toxicology, chemical risk assessment and chemical food safety in private, academic, clinical, government, and commercial settings, among others. Like many areas of science, veterinary toxicology information is being generated at rates much higher than most professionals can access it and incorporate its principles into practice. Veterinary toxicologists need access to a wide variety of information sources to remain abreast of current toxicologic information and to make sound clinical choices. The internet has provided the veterinary toxicologist with a valuable tool to access both historical and cutting-edge research information in a timely and cost-effective manner.

The diverse information needs of veterinary toxicologists can be illustrated by using veterinary clinical toxicology as an example. Veterinary clinical toxicologists are concerned with exposure assessment of many animal species to a bewildering array of potentially toxic chemicals (both naturally occurring and synthetic), investigation of animal deaths believed to be associated with toxicant exposure, selection of appropriate samples and tests to assist in reaching a diagnosis and the interpretation of analytical data derived from such testing. Also, they serve as an information resource for a diverse clientele seeking toxicity information to be used in a preventative fashion. For example, it is not unusual for veterinary toxicologists to receive inquiries concerning the potential toxicity of a plant found in the environment of an animal. Unfortunately, in many situations, there is little toxicity information available for a given toxicant that is specific for the species of animal involved. As a result, veterinary clinical toxicologists often integrate toxicity data from multiple sources to make informed 'weight of evidence' judgments about the potential hazard associated with the presence of a toxicant in the environment or the clinical relevance of a toxicant exposure. We list some of the more important and easily assessable sources below.

RESOURCES

Books

Adams HR (Ed.) (2001)
Veterinary Pharmacology and Therapeutics, 8th Edition
Blackwell Publishing, Ames, IA

Provides a comprehensive resource on the basic and applied principles of veterinary pharmacology and therapeutics. Focuses on basic mechanisms of representative drugs from the important classes of therapeutic agents. Emphasizes pharmacodynamics and pharmacokinetics as well as their clinical application.

Beyer WN, Heinx GH, Redmon-Norwood AW (Eds.) (1996)
Environmental Contaminants in Wildlife: Interpreting Tissue Concentrations
Lewis Publishers, Boca Raton, FL

A multi-authored textbook that provides practical information relating environmental contaminant

concentrations in tissues of wildlife to adverse health effects. Environmental contaminants discussed include organochlorine insecticides, polychlorinated biphenyls, dioxins, polycyclic aromatic hydrocarbons, lead, mercury, cadmium, selenium, and fluoride. The species discussed include terrestrial and marine mammals and birds, fish, and aquatic invertebrates. Contains extensive references for each topic.

Boothe DM (2001)
Small Animal Clinical Pharmacology and Therapeutics
W.B. Saunders Co., Philadephia, PA

A multi-authored introductory textbook of veterinary clinical pharmacology with a focus on dogs and cats. Sections include an introduction to drug use in small animals, major drug categories such as antimicrobials, anthelmintics, anti-inflammatories, corticosteroids, chemotherapeutic agents, immunomodulators, and biologic response modifiers, and use of drugs based upon affected organ systems.

Burrows GE, Tyrl RJ (2001)
Toxic Plants of North America
Iowa State University Press, Ames, IA

A definitive guide to toxic plants of veterinary significance in North America. Chapters are organized based upon plant families which are further divided by plant genera. For each genus there is extensive discussion of taxonomy and morphology, distribution and habitat, disease problems, disease genesis, clinical signs, pathology, and treatment. Extensive reference lists for each plant genera.

Campbell A, Chapman M (2000)
Handbook of Poisoning in Dogs and Cats
Blackwell Science Ltd., Oxford, UK

An introductory textbook of veterinary toxicology organized in a toxicant specific format and based upon calls received by the Veterinary Poisons Information Service in London. For each toxicant its source, clinical presentation, incidence of intoxication, toxicity, mechanisms of toxicity, kinetics and metabolism, laboratory diagnosis, postmortem findings, and treatment are discussed.

Cheeke PR (1998)
Natural Toxicants in Feeds, Forages, and Poisonous Plants, 2nd Edition
Interstate Publishers, Inc., Danville, IL

A good introduction to naturally occurring toxins in animal feeds and forages and in plants poisonous for livestock. Discusses mycotoxins, the effects of plant toxins on specific organ systems, toxins resulting from animal feed processing and naturally occurring carcinogens.

Fairbrother A, Locke LN, Hoff GL (Eds.) (1996)
Noninfectious Disease of Widlife, 2nd Edition
Iowa State University Press, Ames, IA

A multi-authored textbook that discusses a number of toxicants that impact wild animal populations such as mycotoxins, endrocrine disruptors, cholinesterase-inhibiting and organochlorine pesticides, PCBs and dioxins, cyanide, lead, mercury, selenium, and petroleum.

Fowler ME (1993)
Veterinary Zootoxicology
CRC Press, Boca Raton, FL

Provides facts, techniques, methodologies, and regimens for the more effective clinical management of animals poisoned or envenomated by other animals.

Gardner SC, Oberdörster E (Eds.) (2006)
Toxicology of Reptiles
CRC Taylor and Francis, Boca Raton, FL

A multi-authored textbook that provides an introduction to and current knowledge of reptile toxicology. Chapters discuss global threats to reptile populations, tools for assessing contaminant exposures and effects, contaminant effects on important organ systems and development. References for each chapter are up-to-date and extensive.

Gfeller RW, Messonnier SP (2004)
Small Animal Toxicology and Poisonings, 2nd Edition
Mosby, St. Louis, MO

An introductory textbook of clinical veterinary toxicology with a focus on dogs and cats. Toxicants are listed alphabetically and cover sources, mechanisms of action, clinical findings, and treatment. The target audience is emergency and critical care veterinarians. Suggested readings are provided for each toxicant but extensive references are not provided.

Gupta RC (Ed.) (2007)
Veterinary Toxicology: Basic and Clinical Principles
Elsevier, Academic Press, New York

A comprehensive book directed at not only veterinarians but also other health professionals addressing the issue of animal and human toxicology. Chapters address the diagnoses of poisoning from plants, animals, and chemicals. Other topics include target organ toxicity, radiation, FDA regulatory issues, and ethics in veterinary toxicology.

Humphreys D (1988)
Veterinary Toxicology, 3rd Edition
Bailliere Tindall, Philadelphia, PA

Compendium of information regarding agents used in veterinary practice. The agent groupings include minerals and inorganics, toxic gases and vapors, drugs, pesticides, poisonous plants, mycotoxins, venomous bites and stings, and radioactive materials.

Joint FAO/WHO Expert Committee on Food Additives
Residues of Some Veterinary Drugs in Animals and Foods: Monographs
Food and Agriculture Organization of the United Nations, Rome

Published periodically with the *FAO Food and Nutrition Paper* series. Summarizes the safety data on selected veterinary drug residues. Each monograph covers biological data of the drug, metabolism studies, and evaluations. Extensive bibliographies are included.

Joint FAO/WHO Expert Committee on Food Additives
Toxicological Evaluation of Certain Veterinary Drug Residues in Food
World Health Organization, Geneva

Published periodically within the *WHO Food Additives* series. Summarizes the safety data on selected veterinary drug residues. Each monograph covers biological data of the drug, toxicological studies, and evaluations. Extensive bibliographies are included.

Jubb KVE, Kennedy PC, Palmer N (1993)
Pathology of Domestic Animals (Vol. 1, 2 and 3)
Academic Press, San Diego, CA

A comprehensive, three-volume textbook of domestic animal pathology organized on an organ system basis. Covers degenerative, congenital, inflammatory, infectious, nutritional, neoplastic, traumatic, and toxicant-induced diseases.

Kahn CM (Ed.) (2005)
The Merck Veterinary Manual, 9th Edition
Merck and Company, Whitehouse Station, NJ

This veterinary medical textbook provides broad coverage of animal diseases and includes fairly extensive coverage of animal intoxications in a separate section of the manual. Multiple authors contribute to the information. No references are provided. The information is also accessible online at: http://www.merckvetmanual.com/mvm/index.jsp/.

Knight AP, Walker RG (2001)
A Guide to Plant Poisoning of Animals in North America
Teton NewMedia, Jackson, WY

A concise textbook of plants poisonous to North American animals. Plants are discussed on an organ system basis. The focus of the book is on the clinical problems associated with plant ingestion. Pictures of the plants and maps of their distribution are provided.

Lorgue G, Lechenet J, Riviere A, et al (1996)
Clinical Veterinary Toxicology
Blackwell, Oxford, UK

English-language edition of an original French publication, providing succinct advice on the management of animal poisoning.

Messonnier G (1997)
Handbook of Small Animal Toxicology and Poisonings
Mosby, St. Louis, MO

A portable handbook providing practitioners with ready access to information on all aspects of toxicoses and poisonings of dogs and cats, including patient assessment and management details.

Moats WA, Medina MB (Eds.) (1996)
Veterinary Drug Residues
American Chemical Society, Washington, DC

Covers drug residues in animal tissues because they may be toxic in food products, they may produce pharmacologic effects in consumers, or they may cause allergic reactions in sensitive individuals. The book points out the need to adhere to prescribed dosages and withdrawal times and warns against the use of unauthorized materials. A total of 18 chapters develop the topic in detail.

Murphy MJ (1996)
A Field Guide to Common Animal Poisons
Iowa State University Press, Ames, IA

A quick reference for veterinary practitioners and students. Discusses the prevalence of animal exposure to toxins, and provides treatment regimens, toxin summaries, selected bibliographies, additional sources of information, and indices of toxins.

Osweiler GD (1996)
Toxicology
Williams & Wilkins, Baltimore, MD

Presents an outline for independent study for the practicing veterinarian. The basic sections include the general principles of toxicology, how toxicants affect major body systems at the clinical level, and specific agents. The format of this book makes it useful to general toxicologists as well.

Osweiler GD, Carson TL, Buck WB, Van Gelder GA (1985)
Clinical and Diagnostic Veterinary Toxicology, 3rd Edition
Kendall/Hunt, Dubuque, IA

An older but still useful introductory textbook of basic and clinical veterinary toxicology. Directed toward the veterinary student for the purpose of discussing clinical and diagnostic areas. Following the presentation of basic toxicologic concepts, metals, feed-related toxicants, industry-related toxicants, antibacterials, fungicides, herbicides, insecticides, toxic gases, household and commercial products, biotoxins, and plant-related toxins are discussed.

Peterson ME, Talcott PA (Eds.) (2006)
Small Animal Toxicology, 2nd Edition
Elsevier Saunders, St. Louis, MO

A multi-authored comprehensive textbook of clinical veterinary toxicology with a focus on dogs and cats, although other species such as reptiles and birds are considered. General chapters cover toxicologic concepts, obtaining a clinical history, patient management, diagnosis of intoxications, adverse drug reactions, use of human poison control centers, and disaster management. Specific toxicants are covered in separate chapters. Reference lists are extensive.

Plumb DC (2005)
Veterinary Drug Handbook, 5th Edition
PharmaVet Inc., Stockholm, WI (worldwide print distribution by Blackwell Publishing Professional, Ames, IA)

A one-volume veterinary compendium including both drugs approved for veterinary species and non-approved drugs routinely used. The book includes adverse effects, warnings, overdosage, acute toxicity, and drug reactions.

Plumlee KH (Ed.) (2004)
Clinical Veterinary Toxicology
Mosby, St. Louis, MO

A multi-authored, comprehensive introductory textbook of veterinary toxicology covering the principles of toxicology, manifestations of toxicoses and specific toxicants of importance to veterinary medicine.

Roder JD (2001)
Veterinary Toxicology
Butterworth-Heinemann, Woburn, MA

An introductory textbook of veterinary toxicology providing an overview of veterinary toxicology, clinical presentations, and diagnosis of common veterinary toxicants according to affected organ systems, the pathophysiologic aspects of selected toxicant mechanisms and therapeutic approaches to the intoxicated patient. Limited references are provided.

Sundlof SF, Riviere JE, Craigmill AL, (Eds.) (1996)
Handbook of Comparative Pharmacokinetics and Residues of Veterinary Therapeutic Drugs
CRC Press, Boca Raton, FL

Data are presented on antimicrobial drugs, therapeutic agents, pesticides, growth promoters, and environmental contaminants. Information includes physicochemical constants and chemical structures, legal tissue tolerances, and pharmacokinetic parameters derived from the literature analysis.

Feed Additive Compendium 2006
Miller Publishing Company, Minnetonka, MN

Contains a complete listing of animal drugs approved by the FDA for inclusion in animal feeds along with inclusion rates. Regulatory issues related to inclusion of drugs in livestock feeds are discussed. Updated annually.

Journals

Clinical Toxicology (2005–)
Taylor and Francis, Philadephia, PA

The official journal of the American Academy of Clinical Toxicology and the European Association of Poisons Centres. Articles focus on human clinical toxicology but most of the articles are relevant to veterinary toxicology as well. It is a continuation of the *Journal of Toxicology Clinical Toxicology* (1982–2004).

Journal of Medical Toxicology (2005–)
University of Pennsylvania Press, Philadelphia, PA

The official journal of the American College of Medical Toxicology. Articles focus on the diagnosis, management, and prevention of poisoning/toxicity and other adverse health effects resulting from medications, chemicals, occupational and environmental substances, and biological hazards. The journal publishes original articles, illustrative cases, review articles, and other special features.

Journal of Toxicologic Pathology (1978–)
Taylor and Francis, Philadelphia, PA

The official journal of the Society of Toxicologic Pathologists. Articles focus on the multidisciplinary elements that constitute toxicologic pathology, including spontaneous and experimentally induced morphological and functional changes, environmental exposures, case reports, and risk assessment and investigative techniques. The journal publishes original articles, symposia papers, brief communications, current topic reviews, current issues, and fast-track articles.

Journal of Veterinary Diagnostic Investigation (1988–)
Allen Press, Lawrence, KS
Web: http://jvdi.org/

Articles pertain to all aspects of veterinary diagnostic science. The major disciplines are anatomical pathology, bacteriology/mycology, clinical pathology, epidemiology, immunology, laboratory information management, molecular biology, parasitology, public health, toxicology, and virology.

Veterinary and Human Toxicology (1977–2005)
Comparative Toxicology Laboratories, Kansas State University, Manhattan, KS

This journal published review and original research articles pertaining to human and veterinary toxicology.

Organizations

American Academy of Veterinary and Comparative Toxicology
c/o Dr. Michelle Mostrom
North Dakota State University
182 Van Es Hall, PO Box 5406
Fargo, ND 58105
Phone: 701-231-7529
Fax: 701-231-7514
Email: michelle.mostrom@ndsu.nodak.edu

Organization that serves as an umbrella for veterinary toxicologists and veterinary forensic chemists. Provides educational programs to its members.

American Association of Veterinary and Laboratory Diagnosticians
AAVLD Secretary/Treasurer
c/o Dr. Alex Ardans
PO Box 1770
Davis, CA 95617
Phone: 530-752-9719
Fax: 30-752-5680
Email: areitz@cahfs.ucdavis.edu
Web: http://www.aavld.org/mc/page.do

The American Association of Veterinary Laboratory Diagnosticians (AAVLD) is a not-for-profit professional organization which seeks to: disseminate information relating to the diagnosis of animal diseases, coordinate diagnostic activities of regulatory, research and service laboratories, establish uniform diagnostic techniques, improve existing diagnostic techniques, and develop new diagnostic techniques.

American Board of Veterinary Toxicology
c/o Dr. Birgit Puschner
California Animal Health and Food Safety Laboratory
W. Health Science Drive
Davis, CA 95616
Phone: 530-752-6322
Fax: 530-752-3361
Web: http://www.abvt.org

Organization that certifies, by examination, veterinarians with training in veterinary toxicology.

American College of Toxicology
9650 Rockville Pike
Bethesda, Maryland 20814
Phone: (301) 634-7840
Fax: (301) 634-7852
Email: ekagan@actox.org /clemire@actox.org
Web: http://www.actox.org

The mission of the American College of Toxicology is to educate and lead professionals in industry, government, and related areas of toxicology by actively promoting the exchange of information and perspectives on the current status of safety assessment and the application of new developments in toxicology.

American Society for the Prevention of Cruelty to Animals National Animal Poison Control Center
Dana B. Farbman, CVT, Senior Manager, Client and Professional Relations
ASPCA Animal Poison Control Center
1717 South Philo Road, Suite #36
Urbana, IL 61802
Phone: 217-337-5030
Fax: 217-344-3586 (fax)
Email: napcc@aspca.org
Web: http://www.aspca.org/site/PageServer?pagename=pro_apcc

The ASPCA Animal Poison Control Center is dedicated to helping animals exposed to potentially hazardous substances by providing 24-hour veterinary diagnostic and treatment recommendations. The center conducts toxicology educational programs and non-traditional research.

The International Association of Forensic Toxicologists
Alain G. Verstraete, MD, Secretary
Laboratory of Clinical Biology-Toxicology
Ghent University Hospital
De Pintelaan 185-B-9000 Gent, Belgium
Phone: 32-9-240-3407
Fax: 32-9-240-4985
Email: alain.verstraete@ugent.be

An international association whose members are actively engaged in analytical toxicology or allied areas. The aims of the association are to promote cooperation and coordination of efforts among members and to encourage research in forensic toxicology. Its website has a compendium of therapeutic and toxic plasma drug and chemical concentrations, an archive of their bulletin and case notes and reviews.

Society of Toxicology
1821 Michael Faraday Drive, Suite 300
Reston VA 20190
Phone : (703) 438-3115
Fax : (703) 438-3113
Email : sothq@toxicology.org
Web: http://www.toxicology.org

The mission of the Society of Toxicology is to advance science to enhance human, animal, and environmental health through understanding of toxicology.

Databases

The internet is replete with information related to veterinary toxicology and is a rich resource for obtaining information quickly. Internet sources of information related to veterinary toxicology are too numerous to list, however some of the more important and reliable sites are listed below.

ATSDR Toxicology Profiles
Agency for Toxic Substances and Disease Registry
Department of Health and Human Services
Web: http://www.atsdr.cdc.gov/

By Congressional mandate, the Agency for Toxic Substances and Disease Registry (ATSDR) produces 'toxicological profiles' for hazardous substances found at National Priorities List (NPL) sites. These hazardous substances are ranked based on frequency of occurrence at NPL sites, toxicity, and potential for human exposure.

EXTOXNET
A cooperative effort of University of California-Davis, Oregon State University,

Michigan State University, Cornell University, and the University of Idaho.
Primary files are maintained and archived at Oregon State University.
Web: http://extoxnet.orst.edu/

The EXTOXNET InfoBase provides a variety of information about pesticides. Pesticide Information Profiles (PIPs) provide information on specific pesticides; Toxicology Information Briefs (TIBs) contain a discussion of certain concepts in toxicology and environmental chemistry. Other topic areas include: Toxicology Issues of Concern (TICs), Factsheets, News about Toxicology Issues, Newsletters, Resources for Toxicology Information, and Technical Information.

FishBase

A global information system covering just about everything on all known fish species. FishBase contains information for research scientists, fisheries managers, zoologists, and veterinarians.
Web: http://www.fishbase.org/search.php

Hazardous Substances Data Bank (HSDB)

Online database covering the toxicology of potentially hazardous chemicals.
Web: http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?HSDB

Poisonous Plant Database
U.S. Food and Drug Administration, Center for Food Safety and Nutrition
Web: http://www.cfsan.fda.gov/~djw/plantox.html

This database contains references to the scientific literature describing studies of the toxic properties and effects of plants and plant parts.

PubMed
U.S. National Library of Medicine, National Institutes of Health
Web: http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?DB=pubmed

PubMed is a database that includes over 16 million citations from MEDLINE and other life science journals for biomedical articles back to the 1950s. PubMed includes links to full-text articles and other related resources.

SCIRUS

Comprehensive science-specific search engine designed for scientists and researchers. It provides access to scientific, scholarly, technical, and medical data, as well as the latest reports, peer-reviewed articles, patents, preprints, and journals that other search engines miss. SCIRUS indexes and searches special sources such as ScienceDirect (access to full-text journals published by Elsevier Science), BioMed Cental (an independent online publishing house providing free access to the peer-reviewed biological and medical research it publishes), as well as other databases such as PubMed, the NASA Technical Reports databases and various other databases.
Web: http://www.scirus.com/srsapp/advanced/index.jsp

Toxicology Information for Veterinarians
A website sponsored by the Sir James Dunn Animal Welfare Center of the Atlantic Veterinary College.
Web: http://www.upei.ca/~toxinfo/news.htm

The website is part of an Atlantic Veterinary College, Animal Welfare Center-funded project to improve the care of poisoned animals throughout Atlantic Canada by providing veterinarians with reliable toxicologic information. It has sources of toxicologic information pertaining to animals, advice on sample collection for toxicologic analyses, and toxic dose calculations.

TOXNET
U.S. National Library of Medicine, National Institutes of Health
Web: http://toxnet.nlm.nih.gov

Contains databases on toxicology, hazardous chemicals, environmental health, and toxic releases.

USDA National Agricultural Library

USDA NAL lists a number of databases on biomedical research, biological science, animal science, veterinary medicine, fish and wildlife research, toxicology and specialized alternative methods.
Web: http://awic.nal.usda.gov/nal_display/index.php?info_center=3&tax_level=2&tax_subject=184&topic_id=1115&placement_default=0#T

Veterinary Gateway of Intute

Veterinary Gateway is a free online service providing access to the very best Web resources for education and research. The service is created by a network of UK universities and partners. Subject specialists select and evaluate the websites their database and write descriptions of the resources. The database contains over 110 000 records.
Web: http://www.intute.ac.uk/

Other Resources

Canadian Poisonous Plants Information System
Web: http://www.cbif.gc.ca/pls/pp/poison

The website presents data on plants that cause poisoning in livestock, pets, and humans. The plants include native, introduced, and cultivated outdoor plants as well as indoor plants that are found in Canada. Some food and herbal plants are also included that may cause potential poisoning problems.

Cornell Poisonous Plants
Web: http://www.ansci.cornell.edu/plants/

This is a website that includes plant images, pictures of affected animals and presentations concerning the botany, chemistry, toxicology, diagnosis, and prevention of poisoning of animals by plants and other natural flora.

Current Awareness in Clinical Toxicology

This is a monthly bibliography of recent toxicology-related articles in the scientific literature. It is a members-only benefit of the American Academy of Clinical Toxicology and is produced for the American Academy of Clinical Toxicology.

Food Animal Residue Avoidance Databank (FARAD)
Web: http://www.farad.org

FARAD is a computer-based decision support system designed to provide livestock producers, Extension specialists, and veterinarians with practical information on how to avoid drug, pesticide, and environmental contaminant residue problems.

Indiana Plants Poisonous to Livestock and Pets

Searchable database of poisonous plants produced by the Cooperative Extension Service, Purdue University.
Web: http://www.vet.purdue.edu/depts/addl/toxic/cover1.htm

VETTOX listserv
Restricted to members; moderator: Raisbeck@uwyo.edu/.

An online discussion group of veterinary toxicologists, chemists, and other veterinary health professionals.

Other poisonous plant databases
Web: http://vein.library.usyd.edu.au/links/toxicology.html#plantsus
Web: http://vein.library.usyd.edu.au/links/toxicology.html#plantsoz

Organizations

PHILIP WEXLER, PERTTI J. HAKKINEN, ASISH MOHAPATRA, AND STEVEN G GILBERT

INTRODUCTION

The organizations listed in this chapter are government agencies, professional societies, trade associations, research institutes, non-governmental organizations (NGOs), centers or departments of universities, and others involved with toxicology and human health and environmental risk assessment activities. They are primarily based in the United States, but select organizations from other countries have also been listed if judged to be of worldwide interest. Further information on organizations in countries outside the U.S. is available in the country chapters of this book. It is beyond the scope of this book to include all the relevant organizations within U.S. state, regional, and local jurisdictions.

Overlaps in jurisdiction exist among agencies with toxicology and related disciplines in their missions. For instance, a given chemical may be subjected to different regulatory requirements depending on its use (e.g., food additive, manufacturing solvent, or chemical emulsion) or on its classification (e.g., analytical reagent, stored as a bulk stock chemical, or chemical or toxic waste). This has led to some regulatory confusion among agencies and the industries they regulate, and has contributed to the public's lack of understanding about the science and policies related to chemicals and other materials in the environment. These complex and sometimes controversial issues are addressed by various interagency coordinating groups and councils, as listed under 'Special groups' at the end of this chapter.

The non-governmental organizations, typically designated as non-profit organizations, fall into two major categories: (i) special interest groups with a goal of providing information and perspectives to the public, policy- and decision makers, and elected officials, and (ii) public interest groups that attempt to serve as advocates and resources of information on issues. These organizations include professional associations and societies, independent and trade associations, accrediting and certifying boards, and private research and policy groups.

Individual industrial, consulting, and other for-profit toxicology-related organizations are generally not included in this chapter. However, many of the trade associations listed serve specific manufacturing and business interests, e.g., specific types of chemicals and consumer products.

Private industries are important sources of data and information related to toxicology and related disciplines of environmental and occupational medicine and health, with their websites often providing access to a wide range of information. For example, the Right-to-Know laws, Toxics Release Inventory (TRI) and emergency preparedness, and ISO 14000 environmental management standards have led to new sources data and information such as material safety data sheets (MSDSs), environmental auditing reports, and specific requirements for disclosure of environmental information in corporate annual reports and other documents. In upcoming years, compliance of companies with the European Union's Registration, Evaluation, Authorisation, and Restriction of Substances (REACH) legislation is expected to lead to large amounts of chemical- and product-related information being shared between companies, with government agencies, which will become accessible via websites such as the European Chemicals Agency (ECHA, www.echa.europa.eu/). Legislation similar to REACH is being

considered for other countries, e.g., the U.S. EPA's Chemical Assessment and Management Program (ChAMP, www.epa.gov/champ/) and will lead to additional important web-based sources of chemical-related information.

Adding to the complexity of seeking information on the regulatory and policy aspects of toxicology are the activities of state, county, and municipal agencies and departments in the United States. These agencies provide additional levels of regulatory compliance and support basic and applied scientific and technical research. For example, the Toxics Use Reduction Institute (TURI) at the University of Massachusetts Lowell has been a leader establishing chemical use policy and working with business to reduce the use of hazardous chemicals (www.turi.org). As mentioned earlier, it is beyond the scope of this book to provide a detailed inventory of environmental and health agencies for each state, territory, county, and municipality as has been provided for the federal government. However, the following major resources can be used to find local agencies:

- Association of State and Territorial Health Officials (ASTHO) (http://www.astho.org/)
- Environmental Council of the States (ECOS) (http://www.ecos.org/)
- National Association of Clean Air Agencies (http://www.4cleanair.org/index.asp.)
- National Association of Counties (NACo) (http://www.naco.org/)
- National Association of County and City Health Officials (NACCHO) (http://www.naccho.org/)
- National Conference of Local Environmental Health Administrators (NCLEHA) (http://www.ncleha.org/)
- National League of Cities (NLC) (http://www.nlc.org/).

The State and Local Government on the Net Directory (http://www.statelocalgov.net/) provides one-stop access to the official websites of thousands of state agencies and city and county governments.

EPA's American Indian Tribal Portal (http://www.epa.gov/tribalportal) offers links to many American Indian Organizations. The U.S. Department of Health and Human Service's (DHHS) Indian Health Service (http://www.epa.gov/tribalporta) is useful for finding links to organizations concerned with American Indian Health.

GuideStar (http://www.guidestar.com) is a good source for information about non-profit organizations.

Some sources to consider for locating additional organizations are:

DIRLINE
Web: http://dirline.nlm.nih.gov

From the U.S. National Library of Medicine (NLM), DIRLINE is an online database containing location and descriptive information about a wide variety of information resources such as organizations, research resources, projects, and databases concerned with health and biomedicine, toxicology included.

Gale Directory Library
Web: http://www.gale.cengage.com/Directory Library

Offers titles such as the *Encyclopedia of Associations*, the *Consulting and Consulting Organizations Directory*, and the *Encyclopedia of Governmental Advisory Organizations*.

LISTING OF ORGANIZATIONS

Academy of Toxicological Sciences (ATS)
Web: http://www.acadtoxsci.org/

The Academy of Toxicological Sciences (ATS) has certified toxicologists since 1981. The certification shows recognition from their peers about their expertise and sound scientific judgment, and these toxicologists are awarded the title of Fellow. The ATS vision is to be recognized as the leading international organization that certifies toxicologists based on their education, professional experience, demonstrated achievement, proven ability, and scientific expertise.

Agency for Toxic Substances and Disease Registry (ATSDR)
Web: http://www.atsdr.cdc.gov

ATSDR is an agency of the Centers for Disease Control and Prevention of the U.S. Department of Health and Human Services, with the mission of preventing exposure and adverse human health effects and diminished quality of life associated with exposure to hazardous substances from waste sites, unplanned releases, and other sources of pollution present in the environment. Functions include public health assessments of waste sites, health consultations concerning specific hazardous substances, health surveillance and registries, response to emergency release of hazardous substances, applied research in support of public health assessments, information development and dissemination, and education and training concerning hazardous substances. ATSDR develops toxicological profiles (http://www.atsdr.cdc.gov/toxpro2.html) for hazardous substances found at National Priority List sites and for the Department of Defense and the Department of Energy for substances related to federal sites. Within these documents, ATSDR develops minimal risk values (MRLs; see http://www.atsdr.cdc.

gov/mrls.html). Also available is ATSDR's ToxFAQs™ (http://www.atsdr.cdc.gov/toxfaq.html), a series of summaries about hazardous substances and their health effects. Information for this series is excerpted from the ATSDR Toxicological Profiles and Public Health Statements. The ATSDR Science Corner (http://www.atsdr.cdc.gov/cx.html) is a user-friendly gateway to environmental health information and resources.

Air and Waste Management Association (AWMA)
Web: http://www.awma.org

AWMA is a non-profit, technical and educational association with over 8000 members in over 65 countries. AWMA's vision is to be the premier international environmental organization promoting global responsibility. Members include toxicologists and others in industry, academia, government agencies, and elsewhere. It provides networking among government agencies at federal, state, county, and municipal levels and interactions among government agencies, industries, businesses, and academics. Publications include newsletters, a journal (*Journal of the Air & Waste Management Association*), and a publications catalog.

Alliance for Risk Assessment (ARA)
Web: http://allianceforrisk.org

The Alliance for Risk Assessment (ARA) is a collaboration of organizations that fosters the development of technical chemical risk assessment products and services, through a collaborative effort of specialists and organizations dedicated to protecting public health by improving the process and efficiency of risk assessment, and to increasing the capacity for developing risk values to meet growing demand. The ARA coordinates with Federal and State Agencies whenever possible, to ensure the best use of available resources, and to avoid duplication of effort.

American Academy of Clinical Toxicology (AACT)
Web: http://clintox.org

Members include physicians and others interested in clinical toxicology. AACT promotes the study of health effects of poisons on humans and animals, and unites into one group scientists and clinicians whose research, clinical, and academic experience focus on clinical toxicology. It fosters a better understanding of the principles and practice of clinical toxicology, and encourages development of new therapies and treatment in clinical toxicology. AACT facilitates information exchange among individual members and organizations interested in clinical toxicology, and defines the position of clinical toxicologists on toxicology-related issues. *Clinical Toxicology* is the official journal of the AACT, the European Association of Poisons Centres and Clinical Toxicologists, and the American Association of Poison Control Centers.

American Academy of Environmental Medicine (AAEM)
(Formerly the Society for Clinical Ecology)
Web: http://www.aaemonline.org/

Founded in 1965, this association of physicians and others interested in the clinical aspect of environmental medicine promotes an understanding of environmental illness and methods of controlling environmental illness. Produces educational aids such as tapes and audiovisual presentations and provides database searches and member information. Publications include a newsletter and the *Journal of Nutritional and Environmental Medicine*.

American Academy of Forensic Sciences (AAFS)
Web: http://www.aafs.org

The nearly 6000 members of AAFS are divided into ten sections spanning the forensic enterprise, and include physicians, attorneys, dentists, toxicologists, physical anthropologists, document examiners, psychiatrists, physicists, engineers, criminalists, educators, and others. Each AFFS section provides opportunities for professional development, personal contacts, awards, and recognition, and many sections publish periodic newsletters and mailings. Other AAFS publications include the *Journal of Forensic Sciences*.

American Association for Clinical Chemistry (AACC)
(Formerly the American Association of Clinical Chemists)
Web: http://www.aacc.org

AACC's members include clinical laboratory professionals, physicians, research scientists and other individuals involved with clinical chemistry and clinical laboratory science disciplines. It sponsors many scientific meetings each year and conducts an extensive government affairs program. AACC produces six periodicals and is also a major publisher of clinical laboratory science and practice books. The periodicals include *Clinical Chemistry* (AAC's flagship journal), *Clinical Laboratory News*, *Clinical & Forensic Toxicology News* (*CFT News*), and *AACC eNews.*

American Association for Laboratory Animal Science (AALAS)
Web: http://www.aalas.org

Non-profit organization whose mission is to serve society through education and the advancement of responsible laboratory animal care and use. Offers a certification program, training materials, and publishes

Comparative Medicine, the *Journal of the American Association for Laboratory Animal Science (JAALAS), TechTalk,* and *AALAS in Action.*

American Association of Occupational Health Nurses (AAOHN)
Web: http://www.aaohn.org

An organization of registered professional nurses employed in a variety of public and private settings that addresses occupational and environmental health matters. Provides a certification process for demonstrating specialty skills in occupational health nursing.

American Association of Poison Control Centers (AAPCC)
Web: http://www.aapcc.org

AAPCC member poison centers maintain a 24-hour Poison Help hotline. It is continuously staffed by pharmacists, physicians, nurses, and poison information providers who are toxicology specialists. The Poison Help hotline provides immediate access to poison exposure management instructions and information on potential poisons. AAPCC member poison centers provide educational outreach through the 1-800-222-1222 phone line to prevent poison emergencies. The general public may use the number to ask questions about the proper handling and ventilation related to household products, bites and stings, plants, over-the-counter and prescription medications, drugs, alcohol, hydrocarbons, carbon monoxide, and other types of potentially toxic fumes and gases. AAPCC maintains the only poison information and surveillance database in the United States. It offers real-time monitoring of unusual poisoning patterns, chemical exposures, and other potential public health hazards. AAPCC provides a network of toxicology experts ready to speak on more than 20 subject area specialties, including chemical and biological weapons, 'pharming' (the misuse of prescription drugs), carbon monoxide, and childhood poisoning. Media are invited to request expert interviews.

American Board of Clinical Metal Toxicology (ABCMT)
Web: http://abcmt.org/

Formerly the American Board of Chelation Therapy, The American Board of Clinical Metal Toxicology is dedicated to establishing and maintaining guidelines and standards for the practice of clinical metal toxicology and to the assurance of a superior level of competence on the part of physicians treating patients with this spectrum of expanding global afflictions. These standards are reflected in certification by the American Board of Clinical Metal Toxicology and by the requirement for periodic recertification.

American Board of Environmental Medicine (ABEM)
Web: http://www.americanboardofenvironmental-medicine.org/

The Board's mission is to establish and maintain the educational and testing criteria for board certification to ensure optimal standard and quality of the environmental physician.

American Board of Forensic Toxicology (ABFT)
Web: http://www.abft.org/

Forensic toxicology encompasses the measurement of alcohol, drugs, and other toxic substances in biological specimens and interpretation of such results in a medicolegal context. The purpose of the American Board of Forensic Toxicology is to establish and enhance voluntary standards for the practice of forensic toxicology and for the examination and recognition of scientists and laboratories providing forensic toxicology services.

American Board for Occupational Health Nurses Inc. (ABOHN)
Web: http://www.abohn.org/

The American Board for Occupational Health Nurses (ABOHN) was established as an independent nursing specialty certification board in 1972. ABOHN was formed to develop and conduct a program of certification for qualified occupational health nurses. ABOHN is a charter member of the American Board of Nursing Specialties (ABNS), a national approval body for nursing specialty certification programs.

American Board of Toxicology Inc. (ABT)
Web: http://www.abtox.org/

Members include toxicologists certified by this organization. The ABT was formed in 1979 to enhance the science of toxicology by establishing standards for professional practice by certification of individuals in general toxicology. The purposes for which the Board is organized are to encourage the study of the science of toxicology, to stimulate its advancement by establishing standards for professional practice, to prepare and administer procedures including tests for the implementation of such standards, and to confer recognition by certificates or otherwise upon those members of the profession who, measured against such standards, demonstrate competence.

American Board of Veterinary Toxicology (ABVT)
Web: http://www.abvt.org

The American Board of Veterinary Toxicology (ABVT) is an internationally recognized certifying body for veterinarians demonstrating broad knowledge and expertise in many aspects of toxicology. The Board is a

specialty organization of the American Veterinary Medical Association, established in 1967. The combination of veterinary training and expertise in toxicology has made Diplomates of ABVT unique and highly effective in a variety of careers. ABVT Diplomates play important roles in ensuring animal, human, and environmental health around the world.

American Chemistry Council (ACC)
(Formerly the Chemical Manufacturers Association)
Web: http://www.americanchemistry.com/

ACC is a trade association representing the U.S. chemical industry. Since 1988, members have improved their environmental, health, safety, and security performance through the Responsible Care initiative. Participation in Responsible Care, a global initiative, is mandatory for ACC member companies, all of which have made CEO-level commitments to uphold these program elements. Includes divisions on plastics, chlorine chemistry, and chemical products and technology. Publishes *American Chemistry* magazine.

American Chemical Society (ACS)
Web: http://www.acs.org

The American Chemical Society (ACS) is the world's largest scientific society and one of the world's leading sources of authoritative scientific information. A nonprofit organization, chartered by Congress, ACS is at the forefront of the evolving worldwide chemical enterprise and the premier professional home for chemists, chemical engineers, and related professions around the globe. Publisher of numerous journals including: *Chemical and Engineering News, Chemical Research in Toxicology, Environmental Science and Technology,* and *Nano Letters*. Includes a technical division on Chemical Toxicology (http://web.mit.edu/toxms/www/index.html). The mission of the ACS Green Chemistry Institute (http://www.acs.org/greenchemistry) is to advance the implementation of green chemistry principles into all aspects of the chemical enterprise.

American College of Laboratory Animal Medicine (ACLAM)
Web: http://www.aclam.org

The American College of Laboratory Animal Medicine (ACLAM) advances the humane care and responsible use of laboratory animals through certification of veterinary specialists, professional development, education, and research. Establishes standards of education, training, experience, and expertise necessary to become qualified as a specialist and recognizes that achievement through board certification.

American College of Medical Toxicology (ACMT)
Web: http://www.acmt.net

Medical toxicology is a medical subspecialty focusing on the diagnosis, management, and prevention of poisoning/toxicity and other adverse health effects due to medications, chemicals, occupational and environmental toxins, and biological agents, and is officially recognized as a medical subspecialty by the American Board of Medical Specialties. The American College of Medical Toxicology is a professional, non-profit association of physicians with recognized expertise in medical toxicology. The College is dedicated to advancing the science and practice of medical toxicology through a variety of activities.

American College of Occupational and Environmental Medicine (ACOEM)
Web: http://www.acoem.org

Founded in 1916, ACOEM is the nation's largest medical society dedicated to promoting the health of workers through preventive medicine, clinical care, research, and education. The College also conducts continuing education courses such as Basic Curriculum in Occupational Medicine and offers training in Drug/Alcohol Testing, Impairment and Disability Evaluation, and Board Review in Occupational Medicine.

American College of Toxicology (ACT)
Web: http://www.actox.org

The mission of the American College of Toxicology is to educate and lead professionals in industry, government, and related areas of toxicology by actively promoting the exchange of information and perspectives on the current status of safety assessment and the application of new developments in toxicology. ACT maintains an outstanding collection of toxicology-related links to its website. The ACT newsletter is available on the website, as are announcements of upcoming meetings. Publications include a newsletter and journal (*International Journal of Toxicology*, formerly the *Journal of American College of Toxicology*).

American College of Veterinary Pathologists
Web: http://www.acvp.org/about/

The American College of Veterinary Pathologists (ACVP) is an organization of board-certified scientists that has been setting the standard for veterinary pathology since 1949. By promoting excellence in veterinary pathology, ACVP improves and protects human and animal health for the betterment of society.

American Conference of Governmental Industrial Hygienists (ACGIH)
Web: http://www.acgih.org

ACGIH is a member-based organization and community of professionals that advances worker health and safety through education and the development and

dissemination of scientific and technical knowledge. Members include individuals interested in industrial hygiene and in exchanging ideas and promoting standards and techniques in industrial health. Publishes *Journal of Occupational and Environmental Hygiene*, and numerous other documents including the annual *Threshold Limit Values and Biological Exposure Indices*. Sponsors or co-sponsors many meetings and offers relevant courses related to industrial hygiene.

American Council on Science and Health (ACSH)
Web: http://www.acsh.org/

The American Council on Science and Health (ACSH) is a consumer education consortium concerned with issues related to food, nutrition, chemicals, pharmaceuticals, lifestyle, the environment, and health. ACSH is an independent, non-profit, tax-exempt organization.

American Industrial Hygiene Association (AIHA)
Web: http://www.aiha.org

AIHA is one of the largest international associations serving the needs of occupational and environmental health professionals practicing industrial hygiene in industry, government, labor, academic institutions, and independent organizations. It works in conjunction with the American Board of Industrial Hygiene to promote certification of hygienists; administers comprehensive education programs; and operates laboratory accreditation programs.

American Public Health Association (APHA)
Web: http://www.apha.org

The American Public Health Association is the oldest, largest, and most diverse organization of public health professionals in the world and has been working to improve public health since 1872. The Association aims to protect all Americans and their communities from preventable, serious health threats and strives to assure community-based health promotion and disease prevention activities and preventive health services are universally accessible in the United States. Publishes the peer-reviewed *American Journal of Public Health* and the newspaper *The Nation's Health*.

American Society for Clinical Pharmacology and Therapeutics (ASCPT)
Web: http://www.ascpt.org

The American Society for Clinical Pharmacology and Therapeutics (ASCPT) consists of professionals whose primary interest is to promote and advance the science of human pharmacology and therapeutics. The Society is the largest scientific and professional organization serving the discipline of Clinical Pharmacology. Publishes *Clinical Pharmacology and Therapeutics*.

American Society for Pharmacology and Experimental Therapeutics (ASPET)
Web: http://www.aspet.org

The American Society for Pharmacology and Experimental Therapeutics (ASPET) is a scientific society whose members conduct basic and clinical pharmacological research in academia, industry, and the government. Its members research efforts help develop new medicines and therapeutic agents to fight existing and emerging diseases. Publishes journals such as *Drug Metabolism and Disposition*, *the Journal of Pharmacology* and *Experimental Therapeutics,* and *Molecular Pharmacology*. Their Division for Toxicology serves members with interests in all aspects of toxicology.

American Type Culture Collection (ATCC)
Web: http://www.atcc.org/

ATCC is a private, non-profit biological resource center (BRC) and research organization whose mission focuses on the acquisition, authentication, production, preservation, development, and distribution of standard reference microorganisms, cell lines, and other materials for research in the life sciences.

(U.S.) Army Center for Health Promotion & Preventive Medicine
Web: http://chppm-www.apgea.army.mil

The mission of this center is to provide worldwide technical support for implementing preventive medicine, public health, and health promotion/wellness services into all aspects of America's Army and the Army Community anticipating and rapidly responding to operational needs and adaptable to a changing world environment.

Association of Environmental Health and Sciences (AEHS)
Web: http://www.aehs.com

AEHS was created to facilitate communication and foster cooperation among professionals concerned with the challenge of soil protection and cleanup. AEHS provides a network to exchange information across disciplines and affiliations sharing a common interest in the broadly defined area of soils and health.

Association of Government Toxicologists (AGT)
Web: http://www.agovtox.org

The AGT was founded in 1983 to promote and facilitate the acquisition and utilization of knowledge in toxicology and to provide opportunities for government toxicologists to meet and exchange ideas. Persons who are employed by the federal government and who are qualified in toxicology or a related field

are eligible to be full members. Persons who were once employed by the federal government, who are employed by a state government in a non-academic position, or who are full-time federal government contractors and who are qualified in toxicology or a related field are eligible to be associate members.

Association International de la Savonnerie, de la Detergence et des Produits d'Entretien
(Association for Soaps, Detergents and Maintenance Products, AISE)
Web: http://www.aise-net.org/

AISE is the official representative body of the soaps, detergents, and maintenance products industry in Europe. It supports the objectives and implementation of European legislation aimed at harmonizing and specifying standards to ensure the protection of consumers, customers, people at work, and the environment. The industry has also developed and participated in several voluntary safety-related initiatives to ensure the safety of its products.

Association of Occupational and Environmental Clinics (AOEC)
Web: http://www.aoec.org/

Established in 1987 to improve the practice of occupational and environmental health through information sharing and collaborative research. The chief long-term goal of AOEC is to facilitate the prevention and treatment of occupational and environmental illnesses and injuries through collaborative reporting and investigation of health problems. Publications include a newsletter.

Association of State and Territorial Health Officials (ASTHO)
Web: http://www.astho.org

Provides services and programs to coordinate broad health-related functions and activities at the local community level. ASTHO's Environmental Health Project is working with CDC's National Center for Environmental Health (NCEH) to enhance environmental health services within state public health agencies. Works with other national organizations dealing with health issues, such as the National Association of County and City Health Officials.

British Industrial Biological Research Association (BIBRA)
Web: http://www.bibra-information.co.uk/

A well-regarded British consulting firm addressing the majority of the problems experienced both by company managers with responsibility for toxicological safety, and toxicologists themselves, including everything to do with REACH legislation. They have developed an extensive toxicity databank, ToxLook, and TRACE, a bibliographic database in chemical toxicology, and publish the monthly *Toxicology and Regulatory News*.

Canadian Centre for Occupational Health and Safety (CCOHS)
Web: http://www.ccohs.ca

CCOHS is a Canadian federal government agency based in Hamilton, Ontario, which serves to support the vision of eliminating all Canadian work-related illnesses and injuries. CCOHS offers a variety of products and services, including OSH Works for online management of health and safety programs; courses offered online and on site; MSDS services; legislation services; webinars and conferences. Among their databases, some offered free, and some by subscription, are MSDS (and its French version FTSS), CHEMINFO, CHEMpendium, RTECS, ILO Encyclopedia of Occupational Health and Safety, and ChemIndex.. CCOHS, in cooperation with the International Program on Chemical Safety (IPCS) also offers the INCHEM suite of databases at http://www.inchem.org/.

Canadian Network of Toxicology Centres (CNTC)
Web: http://www.uoguelph.ca/cntc/

The CNTC is a national network of collaborating government and academic researchers. The goals include promoting communication among CNTC member scientists and the public and educating Canadians about toxicology.

Center for Health, Environment, and Justice (CHEJ)
Web: http://www.chej.org/

CHEJ, formerly the Citizens Clearinghouse for Hazardous Waste (CCHW), was founded in 1981 by Lois Gibbs, the leader of the campaign at Love Canal. This national group works to build healthy communities, with social justice, economic well-being, and democratic governance. They believe this can happen when individuals from communities have the power to play an integral role in promoting human health and environmental integrity. They have produced a wide variety of publications dealing with issues such as cancer clusters, asthma, brownfields, MTBE, indoor air pollution, poisoned schools, pesticides, and drinking water.

Center for Science in the Public Interest (CSPI)
Web: http://www.cspinet.org

A strong advocate for nutrition and health, food safety, alcohol policy, and sound science. CSPI carved out a niche as a voice of the American public on

nutrition, food safety, health, and other issues during a boom of consumer and environmental protection awareness in the early 1970s. CSPI has sought to educate the public, advocate government policies that are consistent with scientific evidence on health and environmental issues, and counter industry's influence on public opinion and public policies. Publisher of the *Nutrition Action Healthletter*.

Centers for Disease Control and Prevention, U.S. (CDC)
Web: http://www.cdc.gov

CDC's stated mission is to 'to promote health and quality of life by preventing and controlling disease, injury, and disability.' They have strong programs in environmental health (including toxic substances), emergency preparedness and response, and worker safety and health, among others. Publishes the *National Report on Human Exposure to Environmental Chemicals*. CDC's National Center for Environmental Health plans, directs, and coordinates a national program to maintain and improve the health of the American people by promoting a healthy environment and by preventing premature death and avoidable illness and disability caused by non-infectious, non-occupational environmental and related factors. Its Agency for Toxic Substances and Disease Registry (see above) is a major purveyor of information related to toxicology.

Chemical Industry Institute of Toxicology (CIIT)
(See The Hamner Institutes for Health Sciences)

Chemical Safety and Hazard Investigation Board, U.S.
Web: http://www.chemsafety.gov

The CSB is an independent federal agency charged with investigating industrial chemical accidents. It conducts root cause investigations of chemical accidents at fixed industrial facilities. The agency does not issue fines or citations, but does make recommendations to plants, regulatory agencies such as the Occupational Safety and Health Administration (OSHA) and the Environmental Protection Agency (EPA), industry organizations, and labor groups. Congress designed the CSB to be non-regulatory and independent of other agencies so that its investigations might, where appropriate, review the effectiveness of regulations and regulatory enforcement.

Children's Environmental Health Network (CEHN)
Web: http://www.cehn.org

CEHN is a national multi-disciplinary organization whose mission is to protect the fetus and the child from environmental health hazards and promote a healthy environment. To achieve this mission, CEHN works to promote the development of sound public health and child-focused national policy, stimulate prevention-oriented research, educate health professionals, policy makers and community members in preventive strategies, and elevate public awareness of environmental hazards to children.

Consumer Product Safety Commission, U.S. (CPSC)
Web: http://www.cpsc.gov

The U.S. Consumer Product Safety Commission is charged with protecting the public from unreasonable risks of serious injury or death from more than 15 000 types of consumer products under the agency's jurisdiction. The CPSC is committed to protecting consumers and families from products that pose a fire, electrical, chemical, or mechanical hazard or can injure children. CPSC's National Electronic Injury Surveillance System (NEISS) is a national probability sample of hospitals in the U.S. and its territories. Patient information is collected from each NEISS hospital for every emergency visit involving an injury associated with consumer products. From this sample, the total number of product-related injuries treated in hospital emergency rooms nationwide can be estimated.

Cosmetic Ingredient Review (CIR)
Web: http://www.cir-safety.org/

The Cosmetic Ingredient Review (CIR) was established in 1976 by the Cosmetic, Toiletry & Fragrance Association (CTFA) with support of the U.S. Food & Drug Administration and the Consumer Federation of America. Although funded by CTFA, CIR and the review process are independent from CTFA and the cosmetics industry. The Cosmetic Ingredient Review thoroughly reviews and assesses the safety of ingredients used in cosmetics in an open, unbiased, and expert manner, and publishes the results in the open, peer-reviewed scientific literature.

Cosmetic, Toiletry, and Fragrance Association (CTFA)
(See Personal Care Products Council)

(U.S.) Council on Environmental Quality (CEQ)
Web: http://www.whitehouse.gov/ceq/

The Council on Environmental Quality coordinates federal environmental efforts and works closely with agencies and other White House offices in the development of environmental policies and initiatives. In addition, CEQ reports annually to the President on the state of the environment; oversees federal agency implementation of the environmental impact assessment process; and acts as a referee when agencies disagree over the adequacy of such assessments.

CropLife International
Web: www.croplife.org

CropLife International is a global federation representing the plant science industry. They address international developments in the area of crop protection (pesticides), agbiotechnology (GMOs) and sustainable agriculture. CropLife America (http://www.croplifeamerica.org/) is the nation's largest trade organization for agriculture and pest management. They are the voice of the industry that ensures the safe and responsible use of pesticides in order to provide a safe, affordable, and abundant food supply.

U.S. Department of Agriculture (USDA)
(See also National Agricultural Library)
Web: http://www.usda.gov

USDA provides leadership on food, agriculture, natural resources, and related issues based on sound public policy, the best available science, and efficient management. Their Food Safety and Inspection Service (FSIS) is the public health agency responsible for ensuring that the nation's commercial supply of meat, poultry, and egg products is safe, wholesome, and correctly labeled and packaged, as required by the Federal Meat Inspection Act, the Poultry Products Inspection Act, and the Egg Products Inspection Act.

(U.S.) Department of Defense (DoD)
Web: http://www.defenselink.mil/

The U.S. Defense Department is involved in a fair number of projects involving toxicology and environmental health. A few examples of programs associated with or related to the DoD are – the Defense Department's Chemical, Biological, Radiological and Nuclear Defense Information Analysis Center (http://www.cbrniac.apgea.army.mil/); the Veterans Health Administration (http://www.1.va.gov/health/index.asp); Armed Forces Institute of Pathology (AFIP) (http://www.afip.org) (see above); the Army Environmental Command (http://aec.army.mil/usaec/); the Army's Edgewood Chemical Biological Center (http://www.edgewood.army.mil/); the Army's Research Institute of Environmental Medicine (http://www.usariem.army.mil/); the Navy's risk communication program (http://www-nehc.med.navy.mil/); the Air Force Center for Engineering and the Environment (http://www.afcee.brooks.af.mil/); and the Coast Guard's National Response Center (http://www.nrc.uscg.mil/nrchp.html).

(U.S.) Department of Energy (DOE)
Web: http://www.doe.gov

The Department of Energy's overarching mission is to advance the national, economic, and energy security of the United States; to promote scientific and technological innovation in support of that mission; and to ensure the environmental cleanup of the national nuclear weapons complex. DOE is charged with cleaning up contaminated sites and disposing of radioactive waste left behind as a byproduct of nuclear weapons production, nuclear-powered naval vessels, and commercial nuclear energy production. DOE must mitigate the risks and hazards posed by the legacy of nuclear weapons production and research. In addition, they must deal with the environmental legacy of the Cold War.

(U.S.) Department of Health and Human Services (DHHS)
(Also see other DHHS listings)
Web: http://www.hhs.gov

DHHS is the United States government's principal agency for protecting the health of all Americans and providing essential human services, especially for those who are least able to help themselves. Toxicology and environmental health-related activities are dispersed throughout many operating divisions of the Department, such as the National Institutes of Health (http://www.nih.gov), the Food and Drug Administration (http://www.fda.gov), and the Centers for Disease Control and Prevention (http://www.cdc.gov).

(U.S.) Department of Housing and Urban Development (HUD), Office of Healthy Homes and Lead Hazard Control (OHHLHC)
Web: http://www.hud.gov/offices/lead/index.cfm

The Office of Healthy Homes and Lead Hazard Control (OHHLHC) was established under the HUD to eliminate lead-based paint hazards in privately owned and low-income houses. The OHHLHC funds state and local governments to develop cost-effective ways to reduce lead-based paint hazards. Furthermore, the office enforces HUD's lead-based paint regulations, provides public outreach and technical assistance, and conducts technical studies to help protect children and their families from health and safety hazards in the home.

(U.S.) Department of Interior
Web: http://www.doi.gov

The Mission of the DOI is to protect and provide access to the US natural and cultural heritage and honor trust responsibilities to Indian Tribes and commitments to island communities. The DOI Interior has established five goals: (1) Resource Protection; (2) Resource Use; (3) Recreation; (4) Serving Communities; (5) Management Excellence. These broad goals also include dealing with effects of chemicals and toxic threats to plants and animals. The Fish and Wildlife Service (FWS) (http://www.fws.gov) is responsible for

the conservation and protection of fish and wildlife and their respective habitats, including the effects of pesticides, chemical contaminant, and other toxic threats to these resources. The U.S. Geological Survey (USGS) (http://www.usgs.gov) provides comprehensive geographic and cartographic services, including the production of resources and delivery of services to analyze chemicals in the environment, groundwater and aquifer protection, the movement of chemical contaminants through waters and soils.

(U.S.) Department of Justice, Environment and Natural Resources Division
Web: http://www.usdoj.gov/enrd/

Nearly one-half of the Division's lawyers bring cases against those who violate the nation's civil and criminal pollution-control laws. Others defend environmental challenges to government programs and activities and represent the United States in matters concerning the stewardship of the nation's natural resources and public lands.

(U.S.) Department of Transportation (DOT)
Web: http://www.dot.gov

The DOT's stated mission is 'to serve the United States by ensuring a fast, safe, efficient, accessible and convenient transportation system that meets our vital national interests and enhances the quality of life of the American people, today and into the future.' Its Pipeline and Hazardous Materials Safety Administration concerns itself with pipeline and hazardous materials failures (http://www.phmsa.dot.gov/).

Ecological and Toxicological Association of the Dyes and Organic Pigments Manufacturers
Web: http://www.etad.com/

ETAD represents manufacturers of synthetic organic colorants and strives towards minimizing possible impacts on health and the environment by economical means and encourages harmonization of health and environmental regulations in key geographical areas. It also promotes responsible environmental and health risk management measures during manufacture, transport, use, and disposal of synthetic organic colorant products. ETAD maintains a literature references database (http://www1.etad.com/index.htm) that offers member companies ready access to information resources in ETAD's areas of interest.

Environmental Defense Fund (EDF)
Web: http://www.edf.org

EDF covers a broad range of regional, national, and environmental issues. It is dedicated to protecting the environmental rights (e.g., clean air and water, healthy, nourishing food, and a flourishing ecosystem) of all people. EDF was the original creator of the popular website scorecard.org. In November 2005, EDF transferred ownership of Scorecard to Green Media Toolshed (GMT), a non-profit organization.

Environmental Health Research Foundation (EHRF)
Web: http://www.biomonitoringinfo.org/

The Environmental Health Research Foundation (EHRF) is a non-profit, non-partisan scientific research foundation seeking to improve the analysis and communication of health and environmental science.

Environmental Law Institute (ELI)
Web: http://www.eli.org

ELI has played a pivotal role in shaping the fields of environmental law, policy, and management within the U.S. and abroad. ELI is an internationally recognized, not-for-profit, research and education center. It provides training courses and seminars, research programs, and policy recommendations. ELI advances innovation and solutions to environmental challenges via several publications such as 'Environmental Law Reporter®,' 'The Environmental Forum,' 'National Wetlands Newsletter,' and books on environmental law and policy.

Environmental Mutagen Society (EMS)
Web: http://www.ems-us.org

The EMS has been the primary scientific society that has fostered research on the basic mechanisms of mutagenesis as well as on the application of this knowledge in the field of genetic toxicology. The EMS is affiliated with the International Association of Environmental Mutagen Societies (IAEMS; http://www.iaems.net/). The membership is composed of a unique mix of academic, government, and industrial scientists and policy makers. In addition, the EMS publishes a peer-reviewed journal *Environmental and Molecular Mutagenesis*.

Environmental & Occupational Health Sciences Institute (EOHSI)
Web: http://eohsi.rutgers.edu

A joint institute of the Robert Wood Johnson Medical School and Rutgers University, EOHSI develops environmental and occupational health education materials for schools, the workplace, and community, including videos and teaching guides, fact sheets, and newsletters. EOHSI is an international resource for basic and clinical research in environmental health sciences and exposure assessment and promotes environmental health education and public policy.

(U.S.) Environmental Protection Agency (EPA)
Web: http://www.epa.gov

Founded in 1970, the mission of the US EPA is to protect human health and environment. Of particular relevance to toxicology and risk assessment are: The National Center for Environmental Assessment (NCEA; http://cfpub.epa.gov/ncea/), and the Office of Pollution Prevention and Toxics (OPPT) (http://www.epa.gov/oppt/) which manages programs under the Toxic Substances Control Act (TSCA) and the Pollution Prevention Act (PPA) of 1990. It also manages a variety of environmental stewardship programs that encourage companies to reduce and prevent pollution. EPA's numerous databases are described in the Databases section of this book. They include the Integrated Risk Information System and the Toxics Release Inventory. The EPA National Library Network (http://www.epa.gov/libraries/) provides access to information about the environment and related scientific, technical, management, and policy information.

Environmental Research Foundation
Web: http://www.rachel.org/

The Environmental Research Foundation was founded in 1980. It supports grassroots activists working on toxics and social justice issues through the publication of *Rachel's News* and the *Precaution Reporter*. They work to prevent harm to the environment and human health and providing resources to environmental justice (EJ) community groups to better protect their local communities. Their mission is justice and sustainable prosperity for all people.

ERASM (Environmental Risk Assessment and Management)
Web: http://www.erasm.org/

This joint platform of the European detergent and surfactants producers represented by their associations AISE (Association Internationale de la Savonnerie, de la Détergence et des Produits d'Entretien) and CESIO (Comité Européen des Agents Surface et de leurs Intermédiaires Organiques), initiates and co-ordinates joint industry activities for improving and enlarging the basis for and the knowledge about the risk assessment of detergent-based surfactants in environmental compartments.

Environmental Working Group
Web: http://www.ewg.org/

The mission of the Environmental Working Group (EWG) is to use the power of public information to protect public health and the environment. EWG specializes in providing useful resources (like Skin Deep and the Shoppers' Guide to Pesticides in Produce) to consumers while simultaneously pushing for national policy change.

Environment Canada
Web: http://www.ec.gc.ca

Environment Canada (EC) is the federal government environmental agency in Canada that is mandated to preserve and enhance the quality of the natural environment; conserve Canada's renewable resources; conserve and protect Canada's water resources; forecast weather and environmental change; enforce rules relating to boundary waters; and coordinate environmental policies and programs for the federal government.

European Association of Poisons Centres and Clinical Toxicologists (EAPCCT)
Web: http://www.eapcct.org

Members include clinical toxicologists and others. The purpose is to improve interactions between clinical toxicologists and poison information specialists. Publishes a newsletter and the journal *Clinical Toxicology*. 'EAPCCT unites clinical toxicologists in poisons centers, universities, hospitals, or in government agencies and encourage research into all aspects of poisoning … it facilitates the collection, exchange and dissemination of relevant information among individual members, poisons centres and organisations interested in clinical toxicology. It also promotes training and set standards for the practice of, clinical toxicology and encourages professional standards in poisons centres and in the management of poisoned patients. Collaboration with international and integrational organizations such as World Health Organization (WHO) and European communities forms the basis of this organization's project works.'

European Centre for Ecotoxicology and Toxicology of Chemicals (ECETOC)
Web: http://www.ecetoc.org/

ECETOC is a scientific, non-profit-making, non-commercial trade association with a mission to act as an independent, credible, peer-reviewed technical resource to all concerned with the identification of research needs and provision of scientific rationale for the assessment of health effects and environmental impact, and thereby to justify industry's licence and freedom to operate. Publishes Joint Assessment of Commodity Chemicals (JACC) reports and other useful publications, and convenes task forces to investigate toxicological issues.

European Chemical Industry Council (CEFIC)
Web: http://www.cefic.be

CEFIC is both the forum and the voice of the European chemical industry. Members are chemical federations

and manufacturers, and it represents, directly or indirectly, chemical companies that account for nearly a third of world chemical production. It has numerous working groups related to chemical safety and the regulation of chemicals, and sponsors research related to toxicology and other risk assessment.

European Chemicals Agency (ECHA)
Web: http://ec.europa.eu/echa/home_en.html
